You can create custom reports that show capacity and relationship information for resources. Capacity and relationship reports can contain detailed information about the properties of monitored resources, and the available space and capacity of those resources. You access custom capacity and relationship reports from the Tivoli Storage Productivity Centerweb-based GUI, and you create the reports in Tivoli Common Reporting.

"Adding filters to reports" on page 1220
You can use filters with capacity and relationship reports. Filters allow you to show only certain data that complies with your criteria. You add filters to your capacity and relationship reports when you create the reports.

Viewing and creating reports in Tivoli Common Reporting

You access reports from the Tivoli Storage Productivity Center web-based GUI, and work with the reports in Tivoli Common Reporting.

When you view and create reports, you can navigate from predefined reports to custom reports and from custom reports to predefined reports within Tivoli Common Reporting. You do not have to return to the web-based GUI.

1. From the Tivoli Common Reporting user interface, click the **Home** icon , if you are not on the Tivoli Common Reporting home page.
2. Depending on the type of report that you want to work with, complete one of the following actions on the **Public Folders** tab:
   - To view predefined reports, click **IBM Tivoli Productivity Center Predefined Reports**.
   - To create a basic custom report with limited formatting, complete the following steps:
     a. Click **IBM Tivoli Productivity Center Packages**.
     b. Click the package from which you want to create a report.
     c. Select **Launch** > **Query Studio**.
   - To create a report and apply advanced formatting features to the report, complete the following steps:
     a. Click **IBM Tivoli Productivity Center Packages**.
     b. Click the package from which you want to create a report.

c. Select **Launch** > **Report Studio**.

Searching the predefined reports for a property or performance metric

You can search the contents of the predefined reports. You can check which reports contain a property or performance metric. For example, you can list the reports that contain the Storage Pool Name property or the Port Receive I/O Rate performance metric.

Before you can search the content of predefined reports, a search index must be created for the reports.

Tip: If there is no search index, you can search only the titles and descriptions of the reports, not the contents. To search the titles and descriptions of reports, select **Name field**, **Description field**, or **Name or description field** from the search options list.

1. In the search field beside the **Home** icon in Tivoli Common Reporting, type the name of the property or metric in quotation marks. For example, type "Storage Pool Name" or "Port Receive I/O Rate".
2. Select **Full text and all fields** from the search options list.
3. Click the search icon. The list of reports that contain the property or metric is displayed in the search results.
4. Optional: Alternatively, you can search the online help for properties or metrics. To search the online help, complete the following steps:
   a. In Tivoli Common Reporting, click any predefined report.
   b. Click the **Help** link at the upper right of the page.
   c. In the **Search** field, type the name of the property or metric in quotation marks, and then click **Go**. The list of help topics that contains the property or metric is displayed in the search results.

Related tasks:

"Creating a search index of reports, report views, and folders" on page 811
You can create a search index of the reports, report views, and folders in Tivoli Common Reporting.

Related information:

IBM Cognos Business Intelligence 10.2.0 Information Center
For more information about searching for items in Tivoli Common Reporting, see the IBM Cognos Business Intelligence 10.2.0 Information Center at pic.dhe.ibm.com/infocenter/cbi/v10r2m0/index.jsp. Search for "Searching for entries using full text and all fields".

Scenarios

Use these scenarios to learn how to use Tivoli Storage Productivity Center reports to analyze the most active volumes on hypervisors and to monitor the performance of a critical application. You can learn how to investigate a degradation in the performance of a storage pool. You can also learn how to identify the relationships between a storage system and other resources.

Related information:

IBM Tivoli Storage Productivity Center Information Center
For information about the concepts behind the tasks that are associated with these scenarios, see the Tivoli Storage Productivity Center Information Center at http://publib.boulder.ibm.com/infocenter/tivihelp/v59r1/index.jsp.

Analyzing the volumes on the most active hypervisors

In this scenario, you use the predefined reports for hypervisors to analyze the volumes on hypervisors. You can view the most active volumes. Then, you can view summary information for a hypervisor and details for individual volumes. You can also use this scenario to analyze the volumes on servers, agentless servers, and cluster resource groups.

You have 10-20 volumes on the hypervisors in your storage environment. You receive reports that the performance of some volumes is slow. You want to analyze the performance of these volumes as a group, and the performance of individual volumes.

1. Run the Most Active Hypervisors report. Use the chart in the report output to see the 20 hypervisors that have the most active volumes. The most active volumes have the greatest aggregate load. You see that the volumes on one hypervisor are considerably more active than the volumes on other hypervisors. You want to investigate that hypervisor.
2. To analyze the activity on this hypervisor, click the name of the hypervisor in the report table. The Summarized Performance of Volumes by Hypervisor report runs for the hypervisor. Use the report to see summarized performance metrics for the volumes on the hypervisor. You can also use the report to see the aggregate load and the average response time of the volumes on the hypervisor. In the charts and the table on the report, you see that the I/O response times for the hypervisor are slower than normal.
3. To investigate the individual volumes on the hypervisor, click the name of the hypervisor in the report table. The Performance of Volumes by Hypervisor report runs for the hypervisor. Use the report to see the performance metrics for individual volumes on the hypervisor. Use the report to identify the contribution of individual volumes to the load of a particular hypervisor in your storage environment. In the charts and the table on the report, you see that the I/O response times for one volume are slow.

You identified the volume with the slow I/O response times. You can now copy data to the other volumes to more evenly distribute the load of the volumes.

Related reference:

"Most Active Hypervisors report" on page 951
Shows a chart of the 20 hypervisors that have the most active volumes. The most active volumes have the greatest aggregate load.

"Summarized Performance of Volumes by Hypervisor report" on page 953
Shows summarized performance metrics for volumes on a hypervisor. Use the report to identify the aggregate load and the average response time of a particular hypervisor.

"Performance of Volumes by Hypervisor report" on page 955
Shows the performance metrics for volumes on a hypervisor. Use the report to identify the contribution of individual volumes to the load of a particular hypervisor in your storage environment.

Monitoring daily the performance of volumes

In this scenario, you create a report view from a predefined report to run a daily report about the performance of volumes. You can also use this scenario to monitor any other resources and performance metrics.

You have applications that are critical to your business. The applications access volumes in your storage environment. You want to monitor daily the performance of the volumes to confirm that they are functioning correctly. To monitor the volumes, you must create a report view to run a daily report about the performance of volumes.

1. In the Tivoli Storage Productivity Center web-based GUI, select **Reporting** > **View predefined reports**.
2. Click **Storage Systems**, and then click **Volumes**.
3. Click the **Report View** icon for the Compare Performance of Multiple Volumes report.
4. Type a name for the report view, then click **Finish**.
5. Click the **Schedule** icon for the report view.
6. Check all seven days of the week on the **By Week** tab.
7. In the **Options** area, check **Override the default values**, and select **HTML** and **PDF** formats.
8. In the **Prompt values** area, check **Override the default values**, and then click **Set**.
9. Specify the storage systems and the volumes that you want to monitor, and then click **Next**.
10. Select the following performance metrics:
    - Total Overall I/O Rate (ops/s)
    - Overall Response Time (ms/op)
    - Total Data Rate (MiB/s)
    - Total Overall Cache Hit Percentage
11. Specify an interval and a reporting period for the report view, and then click **Finish**.
12. Click **OK** to save the schedule, format, and prompt value settings.

View the output of this report every day to confirm that these volumes are functioning correctly. Click the report view to view the latest output for the report. If the report output is not displayed, make sure that the **Default action** for report view in the properties of the report view is set to **View most recent report**.

Related reference:

"Compare Performance of Multiple Volumes report" on page 1058
Shows up to four performance metrics for multiple volumes over time. Use the report to compare the performance metrics for volumes that are on storage systems.

Investigating a degradation in the performance of a storage pool

You can use the Compare Performance of One Pool over Time Ranges report to analyze a change in the performance of a storage pool. You can also use this scenario to compare the performance metrics of storage systems, switches, and switch ports over two periods of time.

In the previous three days, the performance of a storage pool has significantly degraded. You want to investigate the reasons for the degradation. To do this, use the Compare Performance of One Pool over Time Ranges report to compare the recent poor performance of the pool with a period when the performance was normal.

1. In the Tivoli Storage Productivity Center web-based GUI, select **Reporting** > **View predefined reports**.
2. Click **Storage Systems**, and then click **Pools**.
3. Click **Compare Performance of One Pool over Time Ranges**.
4. Specify the storage system and the pool whose performance has degraded.
5. Specify the performance metric that you want to analyze, for example **Overall Response Time (ms/op)**.
6. Specify an interval.
7. Specify two custom date ranges for the two reporting periods. Specify the previous three days as one reporting period. For the other reporting period, specify a period when the performance of the pool was normal.
8. Click **Finish**.

To investigate other possible reasons for the degradation, run the report again, and select another metric.

Related reference:

"Compare Performance of One Pool over Time Ranges report" on page 1034
Shows one performance metric on one pool over two time periods. For example, you can use this report to compare the I/O rate for this week and last week.

Identifying the relationships between a storage system and other resources

In this scenario, you use a predefined relationships report to identify the relationships between a storage system and other servers or hypervisors. You can also use this scenario to identify the relationships between storage systems and NAS, pools, and volumes. Use this scenario to identify the relationships between storage virtualizers and servers, hypervisors, NAS, pools, and volumes.

You want to take a storage system offline and migrate the volumes to another storage system. To prepare for the migration, you first identify which servers or hypervisors are affected when the storage system goes offline.

1. In the Tivoli Storage Productivity Center web-based GUI, select **Reporting** > **View predefined reports**.
2. Click **Storage Resource Relationships Summary**.
3. From the **Storage systems** list, select the storage system that you plan to take offline.
4. Click **Finish**.

View the output of the report to see which servers or hypervisors are affected when the storage system goes offline. You can now migrate the volumes.

Related reference:

"Storage Resource Relationships Summary report" on page 931
Shows the end-to-end relationship from a server to back-end storage. The report shows servers, hypervisors, NAS, storage systems, storage virtualizers, pools, and volumes.

Configuring

You can configure Tivoli Storage Productivity Center reports so that you can save report outputs to your local file system, or as attachments in emails. You can also configure Tivoli Storage Productivity Center reports so that you can run reports for multiple Tivoli Storage Productivity Center servers from one Tivoli Common Reporting server.

Setting options for reports

When you schedule or run a report, you can specify the output format and how the report is delivered.

You can select output formats for the report. For example, you can select PDF, HTML, and other formats. If you choose PDF as the format for your report, you can set options such as the orientation and paper size for reports.

You can also specify to print the report, to send the report by email, and other delivery options.

1. Navigate to a report in Tivoli Common Reporting.
2. Depending on whether you want to schedule a report or run a report, do one of the following steps:
   - To schedule a report, and select format and delivery options, click the **Schedule** icon .
   - To run a report, and select format and delivery options, click the **Run with options** icon . To set advanced options, click **advanced options**, and then select **Run in the background**.

Related information:

IBM Cognos Business Intelligence 10.2.0 Information Center

For more information about report options, see the IBM Cognos Business Intelligence 10.2.0 Information Center at pic.dhe.ibm.com/infocenter/cbi/v10r2m0/index.jsp. To schedule a report, search for “Schedule an Entry”. To select formats for reports, search for “Report Formats”. To select delivery options for reports, search for “Distributing Reports”. To set advanced report options, search for “Advanced Report Options”.

Scheduling a report to run with predefined options

You can schedule a report to run on different systems and with different options that you define. To monitor the performance of different sets of volumes, you can schedule a Compare Performance of Multiple Volumes report for each of the sets.

You can specify schedules and output formats for the reports, and different ways to share the reports.

To schedule a report to run with parameters that you specify, you first create a report view from the report. Then, you schedule the report and set the parameters and options in the report view.

If the report from which a report view was created is updated, the report view is also updated.

1. In the Tivoli Storage Productivity Center web-based GUI, select **Reporting** > **View predefined reports**.

2. Click the **Report View** icon for the report.
3. Type a name for the report view, then click **Finish**.
4. Click the **Schedule** icon for the report view.
5. In the schedule area, specify when and with what frequency you want the report to run.
6. In the **Options** area, check **Override the default values**, and select the formats for the report.
7. In the **Prompt values** area, check **Override the default values**, and then click **Set**.
8. Specify parameters for the report. For example, you can specify the resources, the interval, and the reporting period for the report.
9. Click **OK** to save the schedule, format, and prompt value settings.

After the report runs for the first time, click the report view to view the latest output for the report. If the report output is not displayed, make sure that the **Default action** for report view in the properties of the report view is set to **View most recent report**.

Related tasks:

"Monitoring daily the performance of volumes" on page 802
In this scenario, you create a report view from a predefined report to run a daily report about the performance of volumes. You can also use this scenario to monitor any other resources and performance metrics.

Related information:

IBM Cognos Business Intelligence 10.2.0 Information Center
For more information about report views, see the IBM Cognos Business Intelligence 10.2.0 Information Center at pic.dhe.ibm.com/infocenter/cbi/v10r2m0/index.jsp. Search for "Create a Report View".

Creating a copy of a predefined report

Create a copy of a predefined report if you want to modify report. You might want to modify the queries that the report uses, or to add or remove a column. Changes to the predefined report do not affect copies of the report.

When you create a copy of a report, the links to related reports in the report output do not work correctly.

If the predefined report is changed during an upgrade, the copy of the report is not affected. If you modify a predefined report instead of creating a copy and then you upgrade your reports software, your modifications might be overwritten.

1. In the Tivoli Storage Productivity Center web-based GUI, select **Reporting** > **View predefined reports**.
2. Navigate to the report that to want to copy, and then click the check box that is next to the title of the report.
3. Click the **Copy** icon .
4. Optional: Navigate to a folder where you want to store the copy of the report. For example, **My Folders**.
5. Click the **Paste** icon .
6. Optional: To change the name of the report, click the **Properties** icon , type the name in the **Name** field, and then click **OK**.

Related information:

IBM Cognos Business Intelligence 10.2.0 Information Center
For more information about copies of reports, see the IBM Cognos Business Intelligence 10.2.0 Information Center at pic.dhe.ibm.com/infocenter/cbi/v10r2m0/index.jsp. Search for “Copy an Entry”.

Starting the IBM Cognos Configuration GUI

You can use the IBM Cognos Configuration GUI to configure IBM Cognos components. For example, you can configure an archive location for the output of reports, and configure a connection between Tivoli Common Reporting and an SMTP server.

To start IBM Cognos Configuration GUI, follow the instructions for your operating system:

Windows
Click **Start** > **Tivoli Common Reporting 3.1.0.1** > **Cognos Configuration**.

Alternatively, you can run the `tcr_cogconfig.bat` file in the *JazzSM_install_directory*`\reporting\cognos\bin64` directory.

AIX or Linux
Log on to a graphical session, and then run the `tcr_cogconfig.sh` script in the *JazzSM_install_directory*`/reporting/cognos/bin64` directory.

Sending reports by email

To send reports as attachments in email messages, configure a connection between Tivoli Common Reporting and an SMTP server.

If you use Red Hat Enterprise Linux 5, you must set the *LD_PRELOAD* environment variable to open the IBM Cognos Configuration GUI. To set the environment variable, issue the following command:

```
setenv LD_PRELOAD /usr/lib64/libfreetype.so
```

You use the IBM Cognos Configuration GUI to configure a connection between Tivoli Common Reporting and an SMTP server. When you configure the connection to the SMTP server, you can send the custom and predefined reports that you create as email attachments.

1. Open the IBM Cognos Configuration GUI.
2. On the Explorer pane, click **Data Access**.
3. Click **Notification**, and then enter values in the following fields:

   SMTP Mail Server
   Enter the host name and port number of the mail server.

   Account and password
   Leave the field blank if authentication is not required to log on to the mail server. If authentication is required to log on to the mail server, click the **Edit** icon. Enter a valid user ID and password, and then click **OK**.

   Default sender
   Enter the email address of the sender.
4. To ensure that the connection to the mail server is correctly configured, right-click **Notification**, and then click **Test**.
5. Click **Save**.

6. On the Explorer pane, right-click **Local Configuration**, and then click **Restart**.

Related tasks:

"Starting the IBM Cognos Configuration GUI" on page 806
You can use the IBM Cognos Configuration GUI to configure IBM Cognos components. For example, you can configure an archive location for the output of reports, and configure a connection between Tivoli Common Reporting and an SMTP server.

Specifying locations for saving reports

You can configure reports to save the report output to your local file system. You specify a root directory in the file system in which the output of reports can be saved in the IBM Cognos Configuration GUI. You specify the locations in which you want to save the output of reports. Then, you can configure individual reports to save the report output to a location in the file system. For example, you can schedule a report and configure the report output to be saved to a location like `E:\tpcreports\sales` or `/usr/tpcreports/sales`.

Specifying a root directory for saving reports

You can specify a root directory in the file system in which the output of reports can be saved. To do this, you configure an archive location in IBM Cognos Configuration.

1. Open the IBM Cognos Configuration GUI.
2. Select **Actions** > **Edit Global Configuration**.
3. Click the **General** tab.
4. In the **Archive Location File System Root** field, enter a file URI. For example, enter `file:///e:/tpcreports` or `file:///usr/tpcreports`.
5. Click **OK**.
6. Select **Actions** > **Restart**.

Related tasks:

"Starting the IBM Cognos Configuration GUI" on page 806
You can use the IBM Cognos Configuration GUI to configure IBM Cognos components. For example, you can configure an archive location for the output of reports, and configure a connection between Tivoli Common Reporting and an SMTP server.

Specifying file system locations for reports

You can specify the locations in which you want to save the output of reports in Tivoli Common Reporting.

You must configure the root directory of the locations that you specify in IBM Cognos Configuration.

1. In Tivoli Storage Productivity Center, select **Reporting** > **View Predefined Reports**.
2. From the **Launch** menu in Tivoli Common Reporting, click **Administration**.
3. Click the **Configuration** tab.
4. Click **Dispatchers and Services**.
5. Click the **Define File System Locations** icon .
6. On the Define file system locations page, click **New**.

7. Specify a name and the directory for the location on the file system, and then click **Finish**. For example, enter `sales`. The directory is created the first time that the output of a report for the directory is created. Repeat this step to configure more file system locations.
8. To stop Tivoli Common Reporting, follow the instructions for your operating system:
   - Windows

     ```
     c:\program files\IBM\JazzSM\profiles\bin\stopServer.bat server_name
      -username JazzSM_username -password JazzSM_password
     ```

   - AIX or Linux

     ```
     /opt/IBM/JazzSM/profile/bin/stopServer.sh server_name
      -username JazzSM_username -password JazzSM_password
     ```

9. To restart Tivoli Common Reporting, follow the instructions for your operating system:
   - Windows

     ```
     c:\program files\IBM\JazzSM\profiles\bin\startServer.bat server_name
     ```

   - AIX or Linux

     ```
     /opt/IBM/JazzSM/profile/bin/startServer.sh server_name
     ```

Specifying a report to save the report output to a file system

You can configure a report to save the report output to a location in a file system. You can also specify the file name for the report output, and whether to append a date and time to the file name.

You must configure the locations in which you want to save the output of reports in Tivoli Common Reporting.

1. In Tivoli Common Reporting, click the **Schedule** icon for a report.
2. Select **Override the default values**.
3. In the **Delivery** area, select **Save to the file system**.
4. Optional: Click **Edit the options** to specify the file name to use, and the location of the report on the file system. You can also specify what to do if a file name exists. For example, you can specify to use the report name as the file name. You can click **Make the file names unique and append a timestamp** to add the date and time to the file name.
5. Click **OK**.

Setting up multiple connections to the TPCDB data source

In Tivoli Common Reporting, you can add multiple connections to the Tivoli Storage Productivity Center data source so that you can run reports against multiple Tivoli Storage Productivity Center databases (TPCDBs). If you create multiple connections, you can run reports for multiple Tivoli Storage Productivity Center servers from one Tivoli Common Reporting server. You can also develop and test reports on multiple TPCDB databases in your storage environment.

After you add multiple connections to the TPCDB data source, when you run a report you select the TPCDB database to connect to.

1. On the Tivoli Common Reporting server, add the remote TPCDB database to the system database catalog, and assign an alias to the database. For example, you can catalog the remote TPCDB database as TPCSRV1.
2. In the Tivoli Storage Productivity Center web-based GUI, select **Reporting** > **View predefined reports**.

3. Click **Launch** > **Administration**, and click the **Configuration** tab.
4. Click the **TPCDB** data source, and click the **New Connection** icon .
5. Enter the alias that you created in step 1 on page 808 in the **Name** field, and then click **Next**.
6. From the **Type** list, select **DB2**, and then click **Next**.
7. Enter the alias that you created in step 1 on page 808 in the **DB2 database name** field.
8. Click **Signons**, select **Password**, and then enter a user ID and password for the remote database.
9. Click **Test the connection**, and then click **Test**. Verify that the status of the connection is `Succeeded`.
10. Click **Close**, and then click **Close** again.
11. Click **Finish**.
12. If you scheduled reports, modify the parameters of all scheduled reports to specify the database against which to run the report.

Customizing the logo and title of reports

You can change the logo that is displayed in all Tivoli Storage Productivity Center reports and the title of individual reports. Before you modify predefined reports, create backup copies of them.

Creating a folder in Tivoli Common Reporting

You can create a folder to store backup copies of the predefined reports that you want to modify or for custom reports that you create.

1. In the Tivoli Common Reporting user interface, if you are not on the Tivoli Common Reporting home page, click the **Home** icon .
2. Click the tab where you want to create the folder. For example, click **Public Folders**.
3. Click the **New Folder** icon .
4. Specify a name for the folder, and then click **Finish**. For example, enter `Backups` as the name of the folder.

Creating a backup copy of a report

Before you modify a predefined report, create a backup copy of the report.

1. In Tivoli Common Reporting, create a folder in which to store the backup copy.
2. Navigate to the report of which you want to create a backup copy.
3. Click the check box that is next to the title of the report.

4. Click the **Copy** icon .
5. Navigate to the folder that you created in step 1 on page 809.
6. Click the **Paste** icon .

Related tasks:

"Creating a folder in Tivoli Common Reporting" on page 809
You can create a folder to store backup copies of the predefined reports that you want to modify or for custom reports that you create.

Changing the logo for all reports

You can change the logo that is displayed in the output of all reports. The default logo is the IBM Tivoli logo. You can change the image to your company logo or to another image.

Make sure that your logo is approximately the same size as the IBM Tivoli logo that is in all predefined reports. The image file for the IBM Tivoli logo is at the following location:

JazzSM_installation_directory/IBM/JazzSM/profile/installedApps/JazzSMNode01Cell/IBM Cognos.ear/p2pd.war/tivoli/tcr_common/images/tivoli.gif

1. To store images for your company, create a directory, for example, /myCompany/images, at the following location:

   JazzSM_installation_directory/IBM/JazzSM/profile/installedApps/JazzSMNode01Cell/IBM Cognos.ear/p2pd.war
2. Copy the logo image to the new directory, for example, /myCompany/images/myLogo.jpg.
3. In Tivoli Common Reporting, click the **Public Folders** tab, and then click **Tivoli Storage Productivity Center Report Layouts**.
4. Create a backup copy of the report_page_template file.
5. Click the **Edit with Report Studio** icon for the report_page_template file.
6. Click the IBM Tivoli image in the work area.
7. Double-click the **URL** property in the **Properties** pane.
8. Modify the image URL to refer to your logo image. For example, you can specify the following image URL:

   ../myCompany/images/myLogo.jpg
9. Select **File** > **Save**.

Related tasks:

"Creating a backup copy of a report" on page 809
Before you modify a predefined report, create a backup copy of the report.

Modifying the title of a report

You can change the title that is displayed in the output of a report.

You modify the title in Report Studio. You can also change the title of the report by setting a property for the report in IBM Cognos Connection. However, if you change this property, then other reports cannot link to the report. That is, if you click a link to the report with the changed property in other reports, the report is not displayed.

1. In Tivoli Common Reporting, navigate to the location of the report whose title you want to change.
2. Create a backup copy of the report.

3. Click the **Edit with Report Studio** icon for the report. A message is displayed about the package.
4. Click the **Close** icon on the message.
5. Click the report header in the work area.
6. Double-click the **Overrides** property in the **Properties** pane.
7. Select the **report_name** check box, and click **OK**.
8. Click the **Toolbox** icon in the content pane.
9. Drag a **Text Item** object from the Toolbox and drop the object on the **Drop item to override component child** text in the work area.
10. Type the new title for the report in the Text dialog box, and click **OK**.
11. Select **File** > **Save**.

To change the title back to the default title, double-click the **Overrides** property, and clear the **report_name** check box.

Related tasks:

"Creating a backup copy of a report" on page 809
Before you modify a predefined report, create a backup copy of the report.

Creating a search index of reports, report views, and folders

You can create a search index of the reports, report views, and folders in Tivoli Common Reporting.

Use the search index to search the reports to identify whether the reports contain a property or performance metric.

Tip: If there is no search index, you can search only the titles and descriptions of the reports, not the contents.

1. In Tivoli Storage Productivity Center, select **Reporting** > **View Predefined Reports**.
2. From the **Launch** menu in Tivoli Common Reporting, click **Administration**.
3. Click the **Index Search** tab.
4. Select the following check boxes in the **Indexable Types** area:
   - **Folder**
   - **Report**
   - **Report view**
5. Click **Save**.
6. Click the **Configuration** tab, and then click **Content Administration**.
7. Click the **New Index Update** icon .
8. Type a name for the index update task, then click **Next**.
9. Select the check box beside each of the items that you want to include in the index update task. For example, select the **Public Folders** check box.
10. Click **Next**.
11. To specify the schedule and scope of the index update task, select one of the following options:
    - **Save and run once**: Specify the scope after you click **Finish**.
    - **Save and schedule**: Specify the schedule and the scope after you click **Finish**.

- **Save only**: Specify the scope when you run the task.

  When you specify the scope, you specify whether to index all items, or only items that changed since the last index was updated.

12. Click **Finish**.
13. To run the index update task immediately, click the **Run with options** icon.

Configuring security for Tivoli Common Reporting with the default authentication configuration

Use WebSphere Application Server to specify which user IDs can log on to Tivoli Common Reporting. By default, all user IDs have administrative privileges for Tivoli Common Reporting. In Tivoli Common Reporting, you can specify which user IDs and groups of user IDs can use reports, report tools, and report administration functions.

You can configure security in the following ways:

- Create user IDs in WebSphere Application Server.
- Create groups of user IDs in Tivoli Common Reporting.
- Assign administrative privileges to administrator IDs and remove administrative privileges from other user IDs.
- Specify which user IDs or groups can access individual reports or report folders.
- Specify which user IDs or groups can access individual Tivoli Common Reporting functions.

The default authentication configuration for Tivoli Storage Productivity Center uses the built-in file repository of the WebSphere Application Server.

Creating user IDs in WebSphere Application Server

To manage the security of users in Tivoli Common Reporting, you can create user IDs in WebSphere Application Server.

This task is only required if you use the built-in file repository of the WebSphere Application Server to configure security. This task is not required if you use LDAP or OS authentication methods.

To complete this task, you must open the WebSphere Integrated Solutions Console for the instance of WebSphere Application Server that is running Tivoli Common Reporting.

1. To open the WebSphere Integrated Solutions Console, open a web browser, and open one of the following web addresses:

- `http://hostname:port/ibm/console/logon.jsp`
- `https://hostname:port/ibm/console/logon.jsp`

The host name is the server name or IP address for the server that is running WebSphere Application Server. The port is the port number for the same server.

The port number differs depending on which protocol you used (http or https) and the options that you selected when you installed Tivoli Storage Productivity Center. The default port for http 16315 and the default port for https is 16316. For example, you might open the following web address: `http://storage.example.com:16315/ibm/console/logon.jsp`

2. Log on to the WebSphere Integrated Solutions Console with administrator privileges.
3. To create a new user ID, complete the following steps:
   a. Select **Users and Groups** > **Manage Users**.
   b. Click **Create**.
   c. Enter the details of the user ID, and then click **Create**.

   To create more user IDs, repeat this step.
4. To give administrative privileges to users on WebSphere Application Server, complete the following steps:
   a. Select **Users and Groups** > **Administrative User Roles**.
   b. Click **Add**.
   c. Search for the user IDs that you want, select the user IDs, and then add the user IDs to the **Mapped to role** list.
   d. Select **Admin Security Manager** and **Administrator** in the roles list.
   e. Click **OK**, and then click **Save**.

Example: Creating user IDs

Create administrator IDs, normal user IDs, and restricted user IDs.

1. Log on to the WebSphere Integrated Solutions Console.
2. Create two administrator IDs, tcradmin1 and tcradmin2, two normal user IDs, tcrnormaluser1, tcrnormaluser2, and one restricted user, tcrrestricteduser1.
3. Add the roles **Admin Security Manager** and **Administrator** to the two administrator IDs tcradmin1 and tcradmin2.

Create groups of user IDs in Tivoli Common Reporting.

Related tasks:

"Creating groups of user IDs in Tivoli Common Reporting" on page 814
To make it easier to manage security, you can create groups of user IDs in Tivoli Common Reporting.

Related information:

IBM WebSphere Application Server Version 8.5 Information Center
For more information about administrative roles, see the IBM WebSphere Application Server Version 8.5 Information Center at pic.dhe.ibm.com/infocenter/wasinfo/v8r5/index.jsp. Search for "Administrative roles".

Opening Tivoli Common Reporting

You can use Tivoli Common Reporting to configure security for Tivoli Storage Productivity Center reports.

Open a web browser, and open the following web address:
`https://servername:port/tarf/servlet/dispatch`
The host name is the server name or IP address for the server that is running Tivoli Common Reporting. The port is the port number for the same server.
For example, you might open the following web address:
`https://storage.example.com:16311/tarf/servlet/dispatch`

Tip: Alternatively, in the Tivoli Storage Productivity Center web-based GUI, select **Reporting** > **View predefined reports**.

Creating groups of user IDs in Tivoli Common Reporting

To make it easier to manage security, you can create groups of user IDs in Tivoli Common Reporting.

1. Open Tivoli Common Reporting.
2. Log on to Tivoli Common Reporting with administrative privileges.
3. From the **Launch** menu, click **Administration**.
4. Click the **Security** tab.
5. Click the **Cognos** directory.
6. To create a group of user IDs, complete the following steps:
   a. Click the **New Group** icon .
   b. Enter the details of the group, and then click **Next**.
   c. Click **Add** on the "Select the members" page.
   d. Click the **VMMProvider** directory, and after the page refreshes, click **Search**.
   e. Search for the user ID that you want, and select the check box for the user ID.
   f. Add the user ID to the **Selected entries** list, and then click **OK**.
   g. Click **Finish**.

   To create more groups of user IDs, repeat step 6.

Example: Creating groups of user IDs

Organize the different types of IDs into groups. It is easier to manage security when you create groups of user IDs. This example uses the user IDs that you created in WebSphere Application Server.

1. Log on to Tivoli Common Reporting with the tcradmin1 ID.
2. Create a group for administrators, tcradminGroup, and add the user IDs tcradmin1 and tcradmin2 to the group.

   Tip: If you add the user ID of the administrator that was used to install Jazz for Service Management, the default administrator for Jazz for Service Management becomes an administrator of Tivoli Common Reporting also.
3. Create a group for normal users, tcrnormaluserGroup, and add the user IDs tcrnormaluser1 and tcrnormaluser2 to the group.
4. Create a group for administrators, tcrrestricteduserGroup, and add the user ID tcrrestricteduser1 to the group.

Restrict administrative privileges in Tivoli Common Reporting.

Related tasks:

"Opening Tivoli Common Reporting" on page 813
You can use Tivoli Common Reporting to configure security for Tivoli Storage Productivity Center reports.

"Restricting administrative privileges for users in Tivoli Common Reporting"
By default, all user IDs have administrative privileges. To restrict administrative privileges, you must first add the group of user IDs that you want to have administrative privileges to an administrative role in Tivoli Common Reporting. Then, you can remove other user IDs from the administrative role.

"Creating user IDs in WebSphere Application Server" on page 812
To manage the security of users in Tivoli Common Reporting, you can create user IDs in WebSphere Application Server.

Restricting administrative privileges for users in Tivoli Common Reporting

By default, all user IDs have administrative privileges. To restrict administrative privileges, you must first add the group of user IDs that you want to have administrative privileges to an administrative role in Tivoli Common Reporting. Then, you can remove other user IDs from the administrative role.

Tivoli Common Reporting includes predefined security roles. User IDs and groups must be members of security roles to use individual functions. For example, if a user ID is a member of the **System Administrators** role, then that user ID has administrative privileges.

Tivoli Common Reporting also includes predefined groups. The **Everyone** group includes all user IDs. By default, the **System Administrators** role includes the **Everyone** group. Therefore, by default all user IDs have administrative privileges.

To restrict who has administrative privileges, you must first add the group of user IDs that you want to have administrative privileges to the **System Administrators** role. Then, you must remove the **Everyone** group from the **System Administrators** role.

1. Open Tivoli Common Reporting.
2. Log on to Tivoli Common Reporting with administrative privileges.
3. From the **Launch** menu, click **Administration**.
4. Click the **Security** tab.
5. Click the **Properties** icon for the **System Administrators** role. If the **System Administrators** role is not visible, scroll down.
6. Click the **Members** tab.
7. Click **Add** on the "Set properties" page.
8. Click the **Cognos** directory.
9. Select the check box for the group of user IDs that you want to have administrative privileges, and then add the group to the **Selected entries** list.
10. Click **OK**.
11. Select the check box for the **Everyone** group.
12. Click **Remove** and then click **OK**.

Example: Restricting administrative privileges to the users in a group of user IDs

Assign administrative privileges to one group of user IDs, and remove administrative privileges from other user IDs to control which users can complete administrative tasks.

This example uses the following user IDs and group IDs:

tcradmin1
This user ID is a member of tcradminGroup. This group has administrative privileges for WebSphere Application Server and Tivoli Common Reporting.

tcrnormaluser1
This user ID is a member of tcrnormalGroup. This group does not have administrative privileges for WebSphere Application Server or Tivoli Common Reporting.

1. Log on to Tivoli Common Reporting with the tcradmin1 ID.
2. Add the tcradminGroup group to the **System Administrators** role.
3. Remove the **Everyone** group from the **System Administrators** role.
4. Click **Logoff**.
5. To verify that not all user IDs have administrative privileges, complete the following steps:
   a. Log on to Tivoli Common Reporting with the tcrnormaluser1 ID.
   b. Click the **Launch** menu in Tivoli Common Reporting.
      If the **Administration** item is not displayed on the **Launch** menu, not all users have administrative privileges.

Related information:

IBM Cognos Business Intelligence 10.2.0 Information Center
For more information about the Everyone group, see the IBM Cognos Business Intelligence 10.2.0 Information Center at pic.dhe.ibm.com/infocenter/cbi/v10r2m0/index.jsp. Search for “Built-in Entries”.

Specifying access to reports in Tivoli Common Reporting

You can grant or deny access to reports or to a report folder in Tivoli Common Reporting. For example, you can prevent a user or group of users from viewing hypervisor reports.

1. Open Tivoli Common Reporting.
2. Log on to Tivoli Common Reporting with administrator privileges.
3. Click **IBM Tivoli Productivity Center Predefined Reports**.
4. Click the **Properties** icon for the report or reports folder to which you want to restrict access.
5. Click the **Permissions** tab.
6. Select the **Override the access permissions acquired from the parent entry** check box.
7. After the page refreshes, click **Add**.
8. Click the **Cognos** directory and after the page refreshes, click **Search**.
9. Search for the user ID or group that you want, and select the check box for the user ID or group.
10. Add the user ID or group to the **Selected entries** list, and then click **OK**.

11. On the **Permissions** tab, select the check box for the user ID or group.
12. Select the **Deny** check box or the **Grant** check box for each of the permissions that you require.
13. Click **OK**.

Example: Preventing a group of users from viewing hypervisor reports

This example shows how to prevent the users in the tcrnormaluserGroup group from accessing the reports in the **Hypervisors** folder.

This example uses the following user IDs and group IDs:

tcradmin1
: This user ID is a member of tcradminGroup. This group has administrative privileges for WebSphere Application Server and Tivoli Common Reporting.

tcrnormaluser1
: This user ID is a member of tcrnormalGroup. This group does not have administrative privileges for WebSphere Application Server or Tivoli Common Reporting.

1. Log on to Tivoli Common Reporting with the tcradmin1 ID.
2. Click **IBM Tivoli Productivity Center Predefined Reports**.
3. Click the **Properties** icon for the **Hypervisors** folder.
4. Click the **Permissions** tab.
5. Select the **Override the access permissions acquired from the parent entry** check box.
6. After the page refreshes, click **Add**.
7. Search the **Cognos** directory for the tcrnormaluserGroup group, and then add tcrnormaluserGroup to the **Selected entries** list.
8. On the **Permissions** tab, select the check box for tcrnormaluserGroup.
9. Select the **Deny** check box for all of the permissions for tcrnormaluserGroup, and then click **OK**.
10. To verify that user IDs in tcrnormaluserGroup do not have access to the hypervisor reports, complete the following steps:
    a. Log on to Tivoli Common Reporting with the user ID and password of a member of tcrnormaluserGroup. For example, log on with the tcrnormaluser1 ID.
    b. Click **IBM Tivoli Productivity Center Predefined Reports**.

       If the **Hypervisors** folder is not displayed in the reports list, the tcrnormaluser1 ID does not have access to the hypervisor reports.

Controlling access to Report Studio

You can control access to functions in Tivoli Common Reporting by using predefined security roles. You assign groups of user IDs to security roles. For example, you can control which users can create or edit reports in Report Studio.

Tivoli Common Reporting includes predefined security roles. User IDs and groups must be members of security roles to use individual functions. For example, if a user ID is a member of the **Authors** role, the user can use the Report Studio tool to create or edit reports.

Tivoli Common Reporting also includes predefined groups. The **Everyone** group includes all authenticated users. By default, the **Authors** role includes the **Everyone** group. Therefore, by default all authenticated users can use Report Studio.

To control access to Report Studio and other Tivoli Common Reporting functions, use the predefined security roles with the groups of user IDs that you create.

For example, to control who can use Report Studio, you take the following general steps:

1. Add the groups of user IDs that you want to use the tools to the **Authors** and **Express Authors** roles.
2. Remove all other user IDs from the **Authors** and **Express Authors** roles. That is, remove the **Everyone** group from the roles.
3. Grant permissions to the **HTML Items in Report** capability to the **Everyone** group.

This procedure describes the general steps in more detail.

1. Open Tivoli Common Reporting.
2. Log on to Tivoli Common Reporting with administrator privileges.
3. From the **Launch** menu, click **Administration**.
4. Click the **Security** tab.
5. To assign a group of users to the **Authors** role and remove the **Everyone** group from the role, complete the following steps:
   a. Click the **Cognos** directory, and then click the **Properties** icon for the **Authors** role.
   b. Click the **Members** tab, and then click **Add**.
   c. Click the **Cognos** directory.
   d. Select the check box for the group, and then add it to the **Selected entries** list.
   e. Click **OK**.
   f. Select the check box for the **Everyone** user.
   g. Click **Remove**, and then click **OK**.

   Repeat this step for the **Express Authors** role.
6. To grant permissions to the **HTML Items in Report** function, complete the following steps:
   a. On the **Security** tab, click **Capabilities**.
   b. Click **Report Studio** in the **Capability** list.
   c. Click the **Actions** icon beside the **HTML Items in Report** list, and then select **Set properties**.
   d. Click the **Permissions** tab.
   e. Select the **Override the access permissions acquired from the parent entry** check box.
   f. Click **Add**.
   g. Click the **Cognos** directory.
   h. Select the check box for the **Everyone** group, and then add it to the **Selected entries** list.
   i. Click **OK**.

j. Select the check box for the **Everyone** group, and then elect the **Grant** check box for the **Execute** and **Traverse** permissions.

k. Click **OK**.

Example: Allowing and restricting access to Report Studio

This example shows how to allow access to Report Studio to groups of administrators and other users. The example also shows how to restrict access by some users to these tools.

This example uses the following user IDs and group IDs:

This example uses the following user IDs and group IDs:

tcradmin1
: This user ID is a member of tcradminGroup. This group has administrative privileges for WebSphere Application Server and Tivoli Common Reporting.

tcrnormaluser1
: This user ID is a member of tcrnormalGroup. This group does not have administrative privileges for WebSphere Application Server or Tivoli Common Reporting.

tcrrestricteduser1
: This user ID is a member of tcrrestrictedGroup. This group does not have administrative privileges for WebSphere Application Server or Tivoli Common Reporting.

1. Assign the tcrnormalGroup group to the **Authors** role, and remove the **Everyone** group from the role.
2. Assign the tcrnormalGroup group to the **Express Authors** role, and remove the **Everyone** group from the role.
3. Assign the tcradminGroup group to the **Authors** and **Express Authors** roles.
4. For the **HTML Items in Report** capability, grant **Execute** and **Traverse** permissions to the **Everyone** group.
5. To verify that users who are in tcrrestrictedGroup cannot use Report Studio, complete the following steps:
   a. Log on to Tivoli Common Reporting with the user ID and password of a member of tcrrestrictedGroup. For example, log on with the tcrrestricteduser1 ID.
   b. Click the **Launch** menu in Tivoli Common Reporting.

      If the Report Studio item is not on the **Launch** menu, users who are in tcrrestrictedGroup cannot use the tool.

Related tasks:

"Opening Tivoli Common Reporting" on page 813
You can use Tivoli Common Reporting to configure security for Tivoli Storage Productivity Center reports.

Related information:

IBM Cognos Business Intelligence 10.2.0 Information Center
For more information about predefined groups and roles like Authors, see the IBM Cognos Business Intelligence 10.2.0 Information Center at pic.dhe.ibm.com/infocenter/cbi/v10r2m0/index.jsp. Search for "Predefined Entries".

Storage virtualizer reports that are available when you upgrade

If you upgrade from Tivoli Storage Productivity Center V5.1, V5.1.1, or V5.1.1.1 to V5.2, you might experience problems with reports.

Review the following table of solutions to common problems with reports:

Problem	Solution
In Tivoli Storage Productivity Center V5.2, no predefined reports are designed specifically for storage virtualizers.	Run predefined reports about storage systems, and select **Storage Virtualizer** in the **Storage System Configuration** list.
Tivoli Storage Productivity Center V5.2 contains a reports package, Performance. This package replaces the IBM Tivoli Storage Productivity Center Performance package. When you upgrade from Tivoli Storage Productivity Center V5.1, V5.1.1, or V5.1.1.1 to V5.2, you can continue to use the IBM Tivoli Storage Productivity Center Performance package in V5.2. Reports that are designed specifically for storage virtualizers are only available in this package. However, the following reports from V5.1, V5.1.1, and V5.1.1.1 do not function correctly in V5.2: • Storage Systems - Most Active Ports Report • Storage System - Port Details Report • Storage Systems - Most Active Arrays Report • Storage System - Array Details Report	View one of the following predefined reports about storage systems in V5.2: • Most Active Ports • Performance of One Port • Most Active RAID Arrays • Performance of One RAID Array
If you used the IBM Tivoli Storage Productivity Center Performance package in V5.1, V5.1.1, or V5.1.1.1 to create custom reports, you might need to re-create those reports.	If your custom reports use the following data, you must re-create the reports in the Performance package: • Performance metrics for ports on DS8000 and DS6000 systems • Performance metrics for RAID arrays
If you used the IBM Tivoli Storage Productivity Center Resources package in V5.1, V5.1.1, or V5.1.1.1 to create custom reports, you might need to re-create those reports.	If your custom reports use data about VMware file systems, you must re-create the reports in the Capacity and Relationships package.
In Tivoli Storage Productivity Center V5.2, the predefined reports about storage tiering are not in the same folder as V5.1, V5.1.1, or V5.1.1.1.	In Tivoli Storage Productivity Center V5.2, go to the **Public Folders** > **IBM Tivoli Productivity Center Packages** > **Storage Tiering** folder.

Storage virtualizer resource reports

Storage virtualizer resource reports show the space statistics for storage virtualizers. The reports also show the space statistics for local disks, managed disks, pools, and volumes on storage virtualizers.

Running the Storage Virtualizers - Space Report

To see information about the capacity of pools, managed disks (MDisks), and volumes on storage virtualizers, run the Storage Virtualizers - Space Report.

To run the report with the default settings, click **Finish**. By default all of the storage virtualizers in the list are selected.

Tip: To select a resource, click the resource. To select multiple resources, press Ctrl and click the resources. To select a series of resources, select the first resource, and then press Shift and click the last resource.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Resources**.
2. Click `Storage Virtualizer`.
3. Click **Storage Virtualizers - Space Report**.
4. Optional: Select one or more storage virtualizers.
5. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection was unsuccessful, a message is displayed in the report.

Related reference:

"Storage Virtualizers - Space Report"
The Storage Virtualizers - Space Report shows the space statistics for pools, managed disks (MDisks), disks, volumes, and virtual volumes on storage virtualizers.

Storage Virtualizers - Space Report

The Storage Virtualizers - Space Report shows the space statistics for pools, managed disks (MDisks), disks, volumes, and virtual volumes on storage virtualizers.

Charts

The bar chart shows the used space and available space for pools on storage virtualizers.

Report output

For each storage virtualizer, the following information is provided:

Storage Virtualizer Name
A user-defined name of the storage virtualizer. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage virtualizer was added for monitoring.

Storage Virtualizer Location
The physical location of a storage virtualizer. The location is defined when a storage virtualizer is added to Tivoli Storage Productivity Center. You can add or edit the location of the storage virtualizer in the **Properties** pane for the storage system in the web-based GUI.

Storage Virtualizer Total Pool Capacity (GiB)
The total amount of storage space in pools on the storage virtualizer.

Storage Virtualizer Pool Used Space (GiB)
The amount of allocated space that is used by the volumes in a pool, which includes thin-provisioned and standard volumes.

For SAN Volume Controller and Storwize V7000, you can pre-allocate thin-provisioned volume space when the volumes are created. For these storage systems, the Storage Virtualizer Pool Used Space might be different than the Storage Virtualizer Pool Allocated Space for pools that contain thin-provisioned volumes. For pools with compressed volumes on SAN Volume Controller and Storwize V7000, the Storage Virtualizer Pool Used Space reflects the size of compressed data written to disk. As the data changes the Storage Virtualizer Pool Used Space may at times be less than the Storage Virtualizer Pool Allocated Space.

For pools with volumes that are not thin provisioned or compressed in SAN Volume Controller, Storwize V7000, and other storage systems, the values for Storage Virtualizer Pool Used Space and Storage Virtualizer Pool Allocated Space are equal.

This value is accurate as of the most recent time that Tivoli Storage Productivity Center collected data about a pool. Because data collection is run on a set schedule and the used space on volumes can change rapidly, the value in this column might not be 100% accurate for the current state of volumes.

Storage Virtualizer Pool Available Space (GiB)
The amount of space in a pool that is not reserved for volumes.

Storage Virtualizer Physical Allocation Percentage
The percentage of physical space in storage virtualizer pools that is reserved for volumes. This value is always less than or equal to 100% because you cannot reserve more physical space than is available in the pools.

Tivoli Storage Productivity Center uses the following formula to determine the allocation percentage:

```
(allocated space ÷ pool capacity) × 100
```

For example, the physical allocation percentage is 25% for a total storage virtualizer pool size of 200 GiB. Therefore, the space that is reserved for volumes is 50 GiB.

Storage Virtualizer Virtual Allocation Percentage
The percentage of physical space in storage virtualizer pools that is committed to the total virtual capacity of the volumes in the pool. In thin-provisioned environments, this percentage exceeds 100% if a pool is overcommitted (over-provisioned).

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

```
(total volume capacity ÷ pool capacity) × 100
```

For example, the allocation percentage is 200% for a total pool size of 15 GiB. Therefore, the virtual capacity that is committed to the volumes in the pools is 30 GiB.

This configuration means that twice as much space is committed than is physically contained in the pools. If the allocation percentage is 100% for the same pools, then the virtual capacity that is committed to the pools is 15 GiB. This configuration means that all the physical capacity of the pools is already allocated to volumes.

An allocation percentage that is higher than 100% is considered aggressive. The pools have insufficient physical capacity to satisfy the maximum allocation for all the thin-provisioned volumes in the pools. In such cases,

use the Storage Virtualizer Shortfall Percentage property to estimate how critical the shortage of space is for storage virtualizer pools.

This value is only available for pools with thin-provisioned volumes.

This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Shortfall Percentage
The percentage of the remaining unallocated volume space in storage virtualizer pools that is not available to be allocated. The higher the percentage, the more critical the shortfall of pool space.

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

`(unallocatable space ÷ (volume space - used volume space)) × 100`

You can use this percentage to determine when the amount of overcommitted space in pools reaches a critically high level. For example, the physical space in pools might be less than the committed virtual space. In this case, the pools do not have enough space to fulfill the commitment to virtual space.

This Storage Virtualizer Shortfall Percentage represents the percentage of the committed virtual space that is not available in pools. As more space is used over time by volumes while the pool capacity remains the same, this percentage increases.

For example, the physical capacity of pools is 70 GiB, but 150 GiB of virtual space is committed to thin-provisioned volumes. If the volumes are using 50 GiB, then there is still 100 GiB committed to those volumes (150 GiB - 50 GiB). There is only 20 GiB of available pool space (70 GiB - 50 GiB). Because only 20 GiB of pool space is available, 80 GiB of the committed space cannot be allocated (100 GiB - 20 GiB). In this case, the percentage of committed space that is unavailable is 80% (80 GiB ÷ 100 GiB × 100).

This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

This property is available only for storage virtualizer pools with thin-provisioned volumes.

Storage Virtualizer Volume Allocated Space (GiB)
The amount of space that is reserved for a volume.

The space that is allocated for a thin-provisioned volume is less than its virtual capacity, which is shown in Storage Virtualizer Capacity.

This value is equal to Storage Virtualizer Volume Used Space for the following storage systems:

- Storage systems other than SAN Volume Controller and Storwize V7000
- SAN Volume Controller and Storwize V7000 storage systems that are not thin-provisioned

Storage Virtualizer MDisk Capacity (GiB)
The amount of storage space on the managed disk.

Storage Virtualizer MDisk Available Space (GiB)
The amount of space on managed disks that is available in a pool, or is available to be added to a pool.

Storage Virtualizer Total Volume Capacity (GiB)
The amount of virtual volume space on all volumes on the storage virtualizer.

Storage Virtualizer Volume Assigned Space (GiB)
The amount of virtual volume space that is assigned to the server or storage virtualizer.

Storage Virtualizer Disk Capacity (GiB)
The amount of local disk storage on the storage virtualizer. The local disks are the internal disk drives.

Storage Virtualizer Overhead (GiB)
The amount of space that is used for system management. The amount of space also includes space that is reserved for redundancy.

Storage Virtualizer Number of Volumes
The number of volumes on a resource.

Storage Virtualizer Number of MDisks
The number of managed disks on a resource.

Report links

To open related reports, click the name of the storage virtualizer, click **Go To**, and then click the name of the report. You can open the following related reports:

- The Storage Virtualizer - Pools Space Report
- The Storage Virtualizer - Volumes Space Report
- The Managed Disks Capacity
- The Storage Virtualizer - Local Disks Space Report
- The Storage Virtualizers - Historical Space Report

Related tasks:

"Running the Storage Virtualizers - Space Report" on page 821
To see information about the capacity of pools, managed disks (MDisks), and volumes on storage virtualizers, run the Storage Virtualizers - Space Report.

Running the Managed Disks Capacity report

To see information about used space and available space on managed disks (MDisks) on storage virtualizers, run the Managed Disks Capacity report.

Tip: To select a resource, click the resource. To select multiple resources, press Ctrl and click the resources. To select a series of resources, select the first resource, and then press Shift and click the last resource.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.
2. Click **Storage Systems**.
3. Click **Managed Disks**.
4. Click **Managed Disks Capacity**.
5. Optional: Select the configuration of the storage systems.
6. Select one or more storage systems.
7. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection was unsuccessful, a message is displayed in the report.

"Managed Disks Capacity report"
Shows a chart of the 20 managed disks with the most available space, and a table with space statistics for all managed disks. Use the report to review space availability in your managed disks.

Managed Disks Capacity report

Shows a chart of the 20 managed disks with the most available space, and a table with space statistics for all managed disks. Use the report to review space availability in your managed disks.

Restriction: This report applies only to SAN Volume Controller, Storwize, and Hitachi Universal Storage Platform V systems.

Charts

The bar chart shows the used space and the available space for managed disk on storage systems.

Report output

For each managed disk on a storage system, the following information is provided:

Storage System MDisk Name
The name that was assigned to the managed disk on a storage system when it was added to the system.

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Storage System MDisk Capacity (GiB)
The amount of storage space on the managed disk.

Storage System MDisk Used Space (GiB)
The amount of used space on the managed disk.

Storage System MDisk Available Space (GiB)
The amount of storage space that is available on a managed disk. This value is only available for Storwize V7000 storage systems that are configured as back-end storage.

Storage MDisk RAID Level
The RAID level of the managed disk, such as RAID 5 or RAID 10. The RAID level affects the performance and fault tolerance of the volumes that are allocated from the managed disk.

Storage System MDisk Type
The type of managed disk on a storage system. For example, the disk on a storage system can be a local managed disk.

Storage System MDisk Mode
The access mode of a managed disk on a storage virtualizer. The access mode describes how extents are provided for virtual disks. Extents can be provided to virtual disks in the following ways:

Array Extents are provided from local disks.

Managed
Extents are provided from a back-end storage volume.

Unmanaged
The managed disk is not used in the system.

Storage System MDisk Strip Size (KB)
The RAID strip size on a managed disk on a storage system.

Storage System MDisk Is Balanced
Shows whether LUNs are balanced across storage controllers on the managed disk. If this value is `Yes`, the LUNs are balanced.

Storage System MDisk Fast Write State
Shows whether the cache for a volume on a disk that is managed by a storage system is empty, contains data, or is corrupted.

Storage System MDisk Write Verify
Shows whether all write operations on a managed disk on a storage system are verified by an immediate follow-up read operation. The follow-up read operation verifies that the write operation was successful. If this value is `Yes`, all write operations are verified by a follow-up read operation.

Running the Storage Virtualizer - Pools Space Report

To see information about the used space and available space in pools on storage virtualizers, run the Storage Virtualizer - Pools Space Report.

To run the report with the default settings, click **Finish**. By default all of the storage virtualizers in the list are selected.

Tip: To select a resource, click the resource. To select multiple resources, press Ctrl and click the resources. To select a series of resources, select the first resource, and then press Shift and click the last resource.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Resources**.
2. Click `Storage Virtualizer`.
3. Click **Storage Virtualizer - Pools Space Report**.
4. Optional: Select one or more storage virtualizers.
5. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection was unsuccessful, a message is displayed in the report.

on storage virtualizers.

Storage Virtualizer - Pools Space Report

The Storage Virtualizer - Pools Space Report shows the space statistics for pools on storage virtualizers.

Charts

The bar chart shows the used space and available space for pools on storage virtualizers.

Report output

Storage Virtualizer Pool Name
The name that was assigned to the pool when it was added to the system.

Storage Virtualizer Name
A user-defined name of the storage virtualizer. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage virtualizer was added for monitoring.

Storage Virtualizer Pool Capacity (GiB)
The total amount of storage space in a pool.

Storage Virtualizer Pool Used Space (GiB)
The amount of allocated space that is used by the volumes in a pool, which includes thin-provisioned and standard volumes.

For SAN Volume Controller and Storwize V7000, you can pre-allocate thin-provisioned volume space when the volumes are created. For these storage systems, the Storage Virtualizer Pool Used Space might be different than the Storage Virtualizer Pool Allocated Space for pools that contain thin-provisioned volumes. For pools with compressed volumes on SAN Volume Controller and Storwize V7000, the Storage Virtualizer Pool Used Space reflects the size of compressed data written to disk. As the data changes the Storage Virtualizer Pool Used Space may at times be less than the Storage Virtualizer Pool Allocated Space.

For pools with volumes that are not thin provisioned or compressed in SAN Volume Controller, Storwize V7000, and other storage systems, the values for Storage Virtualizer Pool Used Space and Storage Virtualizer Pool Allocated Space are equal.

This value is accurate as of the most recent time that Tivoli Storage Productivity Center collected data about a pool. Because data collection is run on a set schedule and the used space on volumes can change rapidly, the value in this column might not be 100% accurate for the current state of volumes.

Storage Virtualizer Pool Available Space (GiB)
The amount of space in a pool that is not reserved for volumes.

Storage Virtualizer Pool Allocated Space (GiB)
The amount of space that is reserved for all the volumes in a pool, which includes both thin-provisioned and standard volumes.

The space that is allocated for thin-provisioned volumes is less than their virtual capacity. The Storage Virtualizer Pool Total Volume Capacity (GiB) property shows the virtual capacity of the volumes. If a pool does not contain thin-provisioned volumes, this value is the same as the value of the Storage Virtualizer Pool Total Volume Capacity (GiB) property.

This value is equal to Storage Virtualizer Used Space (GiB) for volumes that are not thin provisioned.

Storage Virtualizer Pool Used Volume Space (GiB)
The amount of allocated space that is used by the volumes in a pool, which includes thin-provisioned and standard volumes.

For SAN Volume Controller and Storwize V7000, you can preallocate thin-provisioned volume space when volumes are created. For these storage systems, the Storage Virtualizer Pool Used Space might be different than the Storage Virtualizer Pool Allocated Space for pools that contain thin-provisioned volumes. In other cases, the values for Storage Virtualizer Pool Used Space and Storage Virtualizer Pool Allocated Space are equal.

This value is accurate as of the most recent time that Tivoli Storage Productivity Center collected data about a volume. The value in this property might not be 100% accurate for the current state of volumes. This inaccuracy might occur because data collection is run on a set schedule and the used space on volumes can change rapidly.

Storage Virtualizer Pool Total Volume Capacity (GiB)
The total storage space on all the volumes in a pool, which includes thin-provisioned and standard volumes. For thin-provisioned volumes, this value includes virtual space.

Storage Virtualizer Pool Extent Size (MiB)
The size of the extents that were specified when a pool was created. This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Pool Number of Storage Volumes
The number of volumes in the storage virtualizer pool.

Storage Virtualizer Pool Number of MDisks
The number of managed disks on a resource.

Storage Virtualizer Pool Assigned Volume Space (GiB)
The amount of space in the pool that is on volumes that are assigned to a server or storage virtualizer.

Storage Virtualizer Pool Unassigned Volume Space (GiB)
The amount of volume space in the pool that is not assigned to a server or storage virtualizer.

Storage Virtualizer Pool Physical Allocation Percentage
The percentage of physical space in a pool that is reserved for volumes. This value is always less than or equal to 100% because you cannot reserve more physical space than is available in a pool.

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

$(\text{allocated space} \div \text{pool capacity}) \times 100$

For example, the physical allocation percentage is 25% for a total pool size of 200 GiB. Therefore, the space that is reserved for volumes is 50 GiB.

Storage Virtualizer Pool Virtual Allocation Percentage
The percentage of physical space in a pool that is committed to the total virtual capacity of the volumes in the pool. In thin-provisioned environments, this percentage exceeds 100% if a pool is overcommitted (over-provisioned).

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

`(total volume capacity ÷ pool capacity) × 100`

For example, for a total pool size of 15 GiB, the allocation percentage might be 200%. In this case, the virtual capacity that is committed to the volumes in the pool is 30 GiB. This configuration means that twice as much space is committed than is physically contained in the pool. If the allocation percentage is 100% for the same pool, then the virtual capacity that is committed to the pool is 15 GiB. This configuration means that all the physical capacity of the pool is already allocated to volumes.

An allocation percentage that is higher than 100% is considered aggressive. The pool has insufficient physical capacity to satisfy the maximum allocation for all the thin-provisioned volumes in the pool. In such cases, use the Storage Virtualizer Pool Shortfall Percentage property to estimate how critical the shortage of space is for storage system pools.

This value is only available for pools with thin-provisioned volumes.

Storage Virtualizer Pool Shortfall Percentage
The percentage of the remaining unallocated volume space in a pool that is not available to be allocated. The higher the percentage, the more critical the shortfall of pool space.

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

`(unallocatable space ÷ (total volume capacity − allocated space)) × 100`

You can use this percentage to determine when the amount of overcommitted space in a pool reaches a critically high level. For example, the physical space in a pool might be less than the committed virtual space. In this case, the pool does not have enough space to fulfill the commitment to virtual space.

This value represents the percentage of the committed virtual space that is not available in a pool. As more space is used over time by volumes while the pool capacity remains the same, this percentage increases.

For example, the physical capacity of a pool is 70 GiB, but 150 GiB of virtual space is committed to thin-provisioned volumes. If the volumes are using 50 GiB, then there is still 100 GiB committed to those volumes (150 GiB - 50 GiB). There is only 20 GiB of available pool space (70 GiB - 50 GiB). Because only 20 GiB of pool space is available, 80 GiB of the committed space cannot be allocated (100 GiB - 20 GiB). In this case, the percentage of committed space that cannot be allocated is 80% (80 GiB ÷ 100 GiB × 100).

This value is only available for pools with thin-provisioned volumes.

This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Pool RAID Level
The RAID level of the resource, such as RAID 5 or RAID 10. The RAID level affects the performance and fault tolerance of the volumes that are allocated from the resource.

Storage Virtualizer Pool Is Thin Provisioned
Shows whether a pool, volume, or volume copy is thin-provisioned. If this value is `Yes`, the resource is thin-provisioned.

Storage Virtualizer Pool Is Solid State
Shows whether there are solid-state drives in the pool. This property can contain the following values:

Mixed The pool contains both hard disk drives and solid-state drives.

Non solid state
The pool contains no solid-state drives.

Solid state
The pool contains a least one solid-state drive.

Storage Virtualizer Pool Warning Level
The percentage of used capacity of the resource at which a warning is generated. This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Charts

The bar chart shows the used space for volumes on storage virtualizers.

Report output

For each volume on a storage virtualizer, the following information is provided:

Storage Virtualizer Volume Name
The name that was assigned to the storage virtualizer volume when it was added to the system.

Storage Virtualizer Pool Name
The name that was assigned to the pool when it was added to the system.

Storage Virtualizer Name
A user-defined name of the storage virtualizer. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage virtualizer was added for monitoring.

Storage Virtualizer Volume Copy ID
The identifier of a volume copy. This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Volume Copy Is Primary
Shows whether the volume copy is the primary volume copy. This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Volume Used Space (GiB)
The amount of allocated space that is used by a volume.

For SAN Volume Controller and Storwize V7000, you can preallocate thin-provisioned volume space when the volumes are created. In these cases, the Storage Virtualizer Volume Used Space (GiB) might be different than the Storage Virtualizer Volume Allocated Space (GiB). For volumes

that are not thin provisioned, the values for Storage Virtualizer Volume Used Space (GiB) and Storage Virtualizer Volume Allocated Space (GiB) are equal.

This value is accurate as of the most recent time that Tivoli Storage Productivity Center collected data about a volume. The value in this property might not be 100% accurate for the current state of volumes. This inaccuracy might occur because data collection is run on a set schedule and the used space on volumes can change rapidly.

Storage Virtualizer Volume Capacity (GiB)
The total amount of storage space that is committed to a volume.

For thin-provisioned volumes, this value represents the virtual capacity of the volume.

Storage Virtualizer Volume Overhead (GiB)
The amount of space that is used for system management. The amount of space also includes space that is reserved for redundancy.

Storage Virtualizer Volume Allocated Space (GiB)
The amount of space that is reserved for a volume.

The space that is allocated for a thin-provisioned volume is less than its virtual capacity, which is shown in Storage Virtualizer Capacity.

This value is equal to Storage Virtualizer Volume Used Space for the following storage systems:

- Storage systems other than SAN Volume Controller and Storwize V7000
- SAN Volume Controller and Storwize V7000 storage systems that are not thin-provisioned

Storage Virtualizer Volume Physical Allocation Percentage
The percentage of physical space that is reserved for a volume. This value is always less than or equal to 100% because you cannot reserve more physical space than is available.

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

`(allocated space ÷ capacity) × 100`

For example, the physical allocation percentage is 25% for a volume size of 200 GiB. Therefore the space that is reserved for volumes is 50 GiB.

Storage Virtualizer Volume Shortfall Percentage
The percentage of the remaining unallocated volume space in a pool that is not available to be allocated to a volume. The higher the percentage, the more critical the shortfall of space.

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

`(unallocatable volume space ÷ unallocated volume space) × 100`

You can use this percentage to determine when the amount of overcommitted space in a pool reaches a critically high level for the volume. For example, the physical space in a pool might be less than the committed virtual space. In this case, the pool does not have enough space to fulfill the commitment to virtual space for a volume.

This value represents the percentage of the committed virtual space that is not available in a pool. As more space is used over time by a volume while the pool capacity remains the same, this percentage increases.

For example, the remaining physical capacity of a pool is 70 GiB, however, 150 GiB of virtual space is committed to a thin-provisioned volume. If the volume is using 50 GiB, then there is still 100 GiB committed to that volume (150 GiB - 50 GiB). There is a shortfall of 30 GiB (70 GiB remaining pool space - 100 GiB remaining commitment of volume space to the volume). The volume is overcommitted by 30 GiB based on the available space in the pool. The shortfall is 30% when you use the following calculation:

`(100 GiB unallocated volume space - 70 GiB remaining pool space) ÷ 100 GiB unallocated volume space × 100`

This value is only available for pools with thin-provisioned volumes.

Storage Virtualizer Volume Used Allocated Space Percentage
The percentage of reserved space for a volume that is being used. This value is always less than or equal to 100% because a volume cannot use more space than is allocated.

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

`(used space ÷ allocated space) × 100`

This property is available only for SAN Volume Controller and Storwize V7000 volumes.

Storage Virtualizer Volume Is Assigned
Shows whether the volume is assigned to a server. If this value is `Yes`, the volume is assigned to a server.

Storage Virtualizer Volume Is Thin Provisioned
Shows whether a pool, volume, or volume copy is thin-provisioned. If this value is `Yes`, the resource is thin-provisioned.

Storage Virtualizer Volume Warning Level
The percentage of used capacity of the volume at which a warning is generated. This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Volume Type
The type of storage virtualizer volume. For example, the storage virtualizer volume can be striped, sequential, or another type of storage virtualizer volume. This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Volume Grain Size (KiB)
The grain size with which a thin-provisioned volume was created. This value is typically 32, 64, 128, or 256 KiB. Larger grain sizes maximize performance, whereas smaller grain sizes maximize space efficiency. Grain sizes also limit the maximum virtual space of a volume.

This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Volume RAID Level
The RAID level of a storage virtualizer volume, such as RAID 5 or RAID 10. The RAID level affects the performance and fault tolerance of the volumes that are allocated from the resource.

Charts

The chart shows the most active I/O groups on storage virtualizers. By default, I/O groups are sorted by the total overall I/O rate.

Tip: To change the sort order, select a value from the **Sort Order** list.

Report output

The information that is provided for I/O groups is as follows:

Storage Virtualizer Name
A user-defined name of the storage virtualizer. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage virtualizer was added for monitoring.

Storage Virtualizer I/O Group Name
The name that was assigned to the I/O group on a storage virtualizer when it was added to the system.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Total Normal I/O Rate (ops/s)
The average number of nonsequential I/O operations per second. This value includes both read and write operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Processor Utilization Percentage
The average percentage of time that the processors are busy.

Tip: To change the sort order, select a value from the **Sort Order** list.

Report output

The information that is provided for MDisks is as follows:

Storage Virtualizer Name
A user-defined name of the storage virtualizer. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage virtualizer was added for monitoring.

Storage Virtualizer Pool Name
The name that was assigned to the pool when it was added to the system.

Storage Virtualizer MDisk Name
The name that was assigned to the managed disk on a storage virtualizer when it was added to the system.

Overall Back-End Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Total Back-End I/O Rate (ops/s)
The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

Total Back-End Data Rate (MiB/s)
The average rate at which data is transmitted between the back-end storage resources and the component. The rate is measured in MiB per second and includes both read and write operations.

Storage Virtualizers - Most Active Pools Report

The Storage Virtualizers - Most Active Pools Report shows the performance statistics for the most active pools on storage virtualizers. Use the report to monitor the performance of pools over a specified period.

Charts

The chart shows the most active pools on storage virtualizers. By default, pools are sorted by the total overall I/O rate.

Tip: To change the sort order, select a value from the **Sort Order** list.

Report output

The information that is provided for pools is as follows:

Storage Virtualizer Name
A user-defined name of the storage virtualizer. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage virtualizer was added for monitoring.

Storage Virtualizer Pool Name
The name that was assigned to the pool when it was added to the system.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Related reports

To open related reports, click the name of the resource or device, click **Go To**, and then click the name of the report. You can open the following related reports:

- Storage Virtualizer - Details Report
- Storage Virtualizer - Pool Details Report
- Storage Virtualizers - Most Active MDisks Report
- Storage Virtualizers - Most Active Volumes Report
- Storage Resource Relationships Summary

Related tasks:

"Running the Storage Virtualizers - Most Active Pools Report" on page 839
To see which pools are most active on your storage virtualizers, run the Storage Virtualizers - Most Active Pools Report.

Running the Storage Virtualizers - Most Active Volumes Report

To see which volumes are most active on storage virtualizers, run the Storage Virtualizers - Most Active Volumes Report.

To run the report with the default settings, click **Finish**. By default all of the storage virtualizers are selected.

Tip: To select a resource, click the resource. To select multiple resources, press Ctrl and click the resources. To select a series of resources, select the first resource, and then press Shift and click the last resource.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Performance**.
2. Click `Storage Virtualizer`.
3. Click **Storage Virtualizers - Most Active Volumes Report**.
4. Optional: Select a storage virtualizer, and then select a sort order.
5. Optional: Select an interval.
6. Optional: To limit the time frame of the report, specify a date filter or a custom date range. To reduce the amount of information that is shown in the report, change the default date filter. It is easier to analyze small amounts of information over shorter periods.

Tip: To specify a start date and an end date, select **Custom date range** from the list of filters.

7. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection was unsuccessful, a message is displayed in the report.

Storage Virtualizers - Most Active Volumes Report

The Storage Virtualizers - Most Active Volumes Report shows the performance statistics for the most active volumes on storage virtualizers. Use the report to monitor the performance of volumes over a specified period.

Charts

The chart shows the most active volumes on storage virtualizers. By default, volumes are sorted by the total overall I/O rate.

Tip: To change the sort order, select a value from the **Sort Order** list.

Report output

The information that is provided for volumes is as follows:

Storage Virtualizer Name
A user-defined name of the storage virtualizer. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage virtualizer was added for monitoring.

Storage Virtualizer Pool Name
The name that was assigned to the pool when it was added to the system.

Storage Virtualizer I/O Group Name
The name that was assigned to the I/O group on a storage virtualizer when it was added to the system.

Storage Virtualizer Volume Name
The name that was assigned to the storage virtualizer volume when it was added to the system.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Volume Utilization
The average percentage of time that the volume is busy.

Storage Virtualizers - Most Active Ports Report

The Storage Virtualizers - Most Active Ports Report shows the performance statistics for the most active ports on storage virtualizers. Use the report to monitor the performance of ports over a specified period.

Charts

The chart shows the most active ports on storage virtualizers. By default, ports are sorted by the total port I/O rate.

Tip: To change the sort order, select a value from the **Sort Order** list.

Report output

The information that is provided for ports is as follows:

Storage Virtualizer Name
A user-defined name of the storage virtualizer. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage virtualizer was added for monitoring.

Storage Virtualizer Port Name
An alphanumeric string that identifies a storage virtualizer port.

Total Port I/O Rate (ops/s)
The average number of send operations and receive operations per second.

Total Port Data Rate (MiB/s)
The average rate at which data is transferred through the port. The rate is measured in MiB per second and includes both send and receive operations.

Overall Port Bandwidth Percentage
The percentage of the port bandwidth that is used for send operations and receive operations. This value is an indicator of port bandwidth usage that is based on the speed of the port.

Related reports

Storage virtualizer performance details reports

Storage virtualizer reports about performance details show information about the performance of storage virtualizers, and information about the performance of the resources related to storage virtualizers.

Running the Storage Virtualizer - Details Report

To see information about the performance of storage virtualizers, run the Storage Virtualizer - Details Report.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Performance**.
2. Click `Storage Virtualizer`.
3. Click **Storage Virtualizer Performance Details Report**.
4. Select a storage virtualizer.
5. Optional: Select an interval.

6. Optional: To limit the time frame of the report, specify a date filter or a custom date range. To reduce the amount of information that is shown in the report, change the default date filter. It is easier to analyze small amounts of information over shorter periods.

   Tip: To specify a start date and an end date, select **Custom date range** from the list of filters.
7. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection was unsuccessful, a message is displayed in the report.

Related reference:

"Storage Virtualizer - Details Report"
The Storage Virtualizer - Details Report shows the performance statistics for a storage virtualizer. Use the report to monitor the performance of a storage virtualizer over a specified period.

Storage Virtualizer - Details Report

The Storage Virtualizer - Details Report shows the performance statistics for a storage virtualizer. Use the report to monitor the performance of a storage virtualizer over a specified period.

Charts

The charts show the following performance statistics for the storage virtualizer:

- Total overall rates for I/O operations, and the total overall response times
- The overall I/O rates for read and write operations, and the response times for read and write operations
- The data rates for read and write operations, and the total data rates
- The overall cache hit percentage for read operations, the cache delay percentage for write operations, and the utilization percentage for processors

Report output

The information that is provided for a storage virtualizer is as follows:

Storage Virtualizer Name
A user-defined name of the storage virtualizer. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage virtualizer was added for monitoring.

Day or Hour or Time
The day, hour, or time at which the information about the specified resource or device is provided. Whether the day, hour, or time is displayed depends on the interval that you select for the report.

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Write Cache Delay Percentage
The percentage of I/O operations that are delayed because there is not enough space in the write cache.

The only operations that can be delayed are write operations, but the value is calculated as an average of all I/O operations.

Processor Utilization Percentage
The average percentage of time that the processors are busy.

Storage Virtualizer - MDisk Details Report

The Storage Virtualizer - MDisk Details Report shows the performance statistics for a managed disk (MDisk) on a storage virtualizer. Use the report to monitor the performance of an MDisk over a specified period.

Charts

The charts show the following performance statistics for an MDisk on a storage virtualizer:

- The total I/O rates for back-end operations, and the total response times for back-end operations
- The I/O rates for read and write back-end operations, and the response times for read and write back-end operations
- The total data rates for back-end operations, and the data rates for read and write back-end operations
- The overall queue times for back-end operations, and the queue times for read and write back-end operations

Report output

The information that is provided for an MDisk is as follows:

Storage Virtualizer Name
A user-defined name of the storage virtualizer. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage virtualizer was added for monitoring.

Storage Virtualizer Pool Name
The name that was assigned to the pool when it was added to the system.

Storage Virtualizer MDisk Name
The name that was assigned to the managed disk on a storage virtualizer when it was added to the system.

Day or Hour or Time
The day, hour, or time at which the information about the specified resource or device is provided. Whether the day, hour, or time is displayed depends on the interval that you select for the report.

Back-End Read I/O Rate (ops/s)
The average number of read operations per second that are issued to the back-end storage resources.

Back-End Write I/O Rate (ops/s)
The average number of write operations per second that are issued to the back-end storage resources.

Total Back-End I/O Rate (ops/s)
The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

Back-End Read Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Back-End Write Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Overall Back-End Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Back-End Read Data Rate (MiB/s)
The average number of MiB per second that are read from the back-end storage resources.

Back-End Write Data Rate (MiB/s)
The average number of MiB per second that are written to the back-end storage resources.

Total Back-End Data Rate (MiB/s)
The average rate at which data is transmitted between the back-end storage resources and the component. The rate is measured in MiB per second and includes both read and write operations.

Back-End Read Queue Time (ms/op)
The average number of milliseconds that a read operation spends in the queue before the operation is sent to the back-end storage resources.

Back-End Write Queue Time (ms/op)
The average number of milliseconds that a write operation spends in the queue before the operation is sent to the back-end storage resources.

Overall Back-End Queue Time (ms/op)
The average number of milliseconds that a read or a write operation spends in the queue before the operation is sent to the back-end storage resources.

- The total I/O rates for back-end operations, and overall response times for back-end operations
- The I/O rates for back-end read operations and back-end write operations, and the response rates for back-end read and back-end write operations

Report output

The information that is provided for a pool is as follows:

Storage Virtualizer Name
A user-defined name of the storage virtualizer. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage virtualizer was added for monitoring.

Storage Virtualizer Pool Name
The name that was assigned to the pool when it was added to the system.

Day or Hour or Time
The day, hour, or time at which the information about the specified resource or device is provided. Whether the day, hour, or time is displayed depends on the interval that you select for the report.

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Back-End Read I/O Rate (ops/s)
The average number of read operations per second that are issued to the back-end storage resources.

Back-End Write I/O Rate (ops/s)
The average number of write operations per second that are issued to the back-end storage resources.

Total Back-End I/O Rate (ops/s)
The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

4. Select a storage virtualizer.
5. Select a volume. To select a volume, complete the following steps:
   a. Type a keyword. For example, type `lun`, to find the names of volumes that start with `lun`. To change the default search option, click **Options**. Use the percent sign as a wildcard. For example, type `a%` to find volume names that begin with 'a' or 'A'. Type `%a` to find volume names that begin with or contain the letter 'a' or 'A'. You can type `%` to retrieve all of the volumes on a resource.

b. Click **Search**. If the search is successful, the names of the volumes are displayed in the **Choice** list.
c. From the list, select a volume.

6. Optional: Select an interval.
7. Optional: To limit the time frame of the report, specify a date filter or a custom date range. To reduce the amount of information that is shown in the report, change the default date filter. It is easier to analyze small amounts of information over shorter periods.

   Tip: To specify a start date and an end date, select **Custom date range** from the list of filters.
8. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection was unsuccessful, a message is displayed in the report.

Storage Virtualizer - Volume Details Report

The Storage Virtualizer - Volume Details Report shows the performance statistics of a volume on a storage virtualizer. Use the report to monitor the performance of a volume over a specified period.

Charts

The charts show the following performance statistics for a volume on a storage virtualizer:

- The total overall rates for I/O operations, and the total response times
- The overall rates for I/O read operations, the overall rates for I/O write operations, the response times for read operations, and the response times for write operations
- The data rates for read operations, the data rates for write operations, and the total data rates
- The overall cache hit percentage for read operations, the cache delay percentage for write operations, and the utilization percentage for volumes

Report output

The information that is provided for a volume is as follows:

Storage Virtualizer Name
A user-defined name of the storage virtualizer. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage virtualizer was added for monitoring.

Day or Hour or Time
The day, hour, or time at which the information about the specified resource or device is provided. Whether the day, hour, or time is displayed depends on the interval that you select for the report.

Storage Virtualizer Pool Name
The name that was assigned to the pool when it was added to the system.

Storage Virtualizer Volume Name
The name that was assigned to the storage virtualizer volume when it was added to the system.

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Write Cache Delay Percentage
The percentage of I/O operations that are delayed because there is not enough space in the write cache.

The only operations that can be delayed are write operations, but the value is calculated as an average of all I/O operations.

Volume Utilization
The average percentage of time that the volume is busy.

Related reports

Storage Virtualizer - Port Details Report

The Storage Virtualizer - Port Details Report shows the performance statistics for a port on a storage virtualizer. Use the report to monitor the performance of a port over a specified period.

Charts

The charts show the following performance statistics for a port on a storage virtualizer:

- The total I/O rates
- The send I/O rates for ports, and the receive I/O rates for ports
- The send data rates for ports, the receive data rates for ports, and the total data rates for ports
- The overall bandwidth percentage for ports

Report output

The information that is provided for ports is as follows:

Storage Virtualizer Name
A user-defined name of the storage virtualizer. If a name was not defined,

Tivoli Storage Productivity Center shows the name that was defined when the storage virtualizer was added for monitoring.

Storage Virtualizer Port Name
An alphanumeric string that identifies a storage virtualizer port.

Day or Hour or Time
The day, hour, or time at which the information about the specified resource or device is provided. Whether the day, hour, or time is displayed depends on the interval that you select for the report.

Port Send I/O Rate (ops/s)
The average number of I/O operations per second for operations in which data is sent from a port.

Port Receive I/O Rate (ops/s)
The average number of I/O operations per second for operations in which the port receives data.

Total Port I/O Rate (ops/s)
The average number of send operations and receive operations per second.

Port Send Data Rate (MiB/s)
The average rate at which data is sent through the port. The rate is measured in MiB per second.

Port Receive Data Rate (MiB/s)
The average rate at which data is received by the port. The rate is measured in MiB per second.

Total Port Data Rate (MiB/s)
The average rate at which data is transferred through the port. The rate is measured in MiB per second and includes both send and receive operations.

Overall Port Bandwidth Percentage
The percentage of the port bandwidth that is used for send operations and receive operations. This value is an indicator of port bandwidth usage that is based on the speed of the port.

Predefined reports about historical information

You can run predefined reports about historical information to monitor how space is used on storage systems and storage virtualizers over a specified period.

You can run predefined reports that show how space is used on storage systems and related resources such as pools and volumes.

Running the Storage Virtualizers - Historical Space Report

To see how space on storage virtualizers is used, run the Storage Virtualizers - Historical Space Report.

To run the report with the default settings, click **Finish**. By default all of the storage virtualizers are selected.

Tip: To select a resource, click the resource. To select multiple resources, press Ctrl and click the resources. To select a series of resources, select the first resource, and then press Shift and click the last resource.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Historical Information**.
2. Click `Storage Virtualizer`.
3. Click **Storage Virtualizers - Historical Space Report**.
4. Optional: Select one or more storage virtualizers.
5. Optional: Select an interval.
6. Optional: To limit the time frame of the report, specify a date filter or a custom date range. To reduce the amount of information that is shown in the report, change the default date filter. It is easier to analyze small amounts of information over shorter periods.

   Tip: To specify a start date and an end date, select **Custom date range** from the list of filters.
7. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection was unsuccessful, a message is displayed in the report.

Storage Virtualizers - Historical Space Report

The Storage Virtualizers - Historical Space Report shows the usage of space on storage virtualizers over a specified period. Use the report to determine whether additional storage resources are required.

Charts

The chart shows the following space statistics for the storage virtualizers:

- The capacity of the pools on the storage virtualizers
- The used space in the pools on the storage virtualizers
- The available space in the pools on the storage virtualizers
- The capacity of the virtual volumes on the storage virtualizers
- The capacity of the managed disks (MDisks) on the storage virtualizers

Report output

The following information is included in reports for storage virtualizers:

Storage Virtualizer Name
A user-defined name of the storage virtualizer. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage virtualizer was added for monitoring.

Date The date that the data was collected for the report.

Storage Virtualizer Pool Total Volume Capacity (GiB)
The total storage space on all the volumes in a pool, which includes thin-provisioned and standard volumes. For thin-provisioned volumes, this value includes virtual space.

Storage Virtualizer Pool Used Space (GiB)
The amount of allocated space that is used by the volumes in a pool, which includes thin-provisioned and standard volumes.

For SAN Volume Controller and Storwize V7000, you can pre-allocate thin-provisioned volume space when the volumes are created. For these storage systems, the Storage Virtualizer Pool Used Space might be different than the Storage Virtualizer Pool Allocated Space for pools that contain thin-provisioned volumes. For pools with compressed volumes on SAN Volume Controller and Storwize V7000, the Storage Virtualizer Pool Used Space reflects the size of compressed data written to disk. As the data changes the Storage Virtualizer Pool Used Space may at times be less than the Storage Virtualizer Pool Allocated Space.

For pools with volumes that are not thin provisioned or compressed in SAN Volume Controller, Storwize V7000, and other storage systems, the values for Storage Virtualizer Pool Used Space and Storage Virtualizer Pool Allocated Space are equal.

This value is accurate as of the most recent time that Tivoli Storage Productivity Center collected data about a pool. Because data collection is run on a set schedule and the used space on volumes can change rapidly, the value in this column might not be 100% accurate for the current state of volumes.

Storage Virtualizer Pool Available Space (GiB)
The amount of space in a pool that is not reserved for volumes.

Storage Virtualizer Volume Allocated Space (GiB)
The amount of space that is reserved for a volume.

The space that is allocated for a thin-provisioned volume is less than its virtual capacity, which is shown in Storage Virtualizer Capacity.

This value is equal to Storage Virtualizer Volume Used Space for the following storage systems:

- Storage systems other than SAN Volume Controller and Storwize V7000
- SAN Volume Controller and Storwize V7000 storage systems that are not thin-provisioned

Storage Virtualizer MDisk Capacity (GiB)
The amount of storage space on the managed disk.

Storage Virtualizer MDisk Available Space (GiB)
The amount of space on managed disks that is available in a pool, or is available to be added to a pool.

Storage Virtualizer Total Volume Capacity (GiB)
The amount of virtual volume space on all volumes on the storage virtualizer.

Storage Virtualizer Volume Assigned Space (GiB)
The amount of virtual volume space that is assigned to the server or storage virtualizer.

Storage Virtualizer Disk Capacity (GiB)
The amount of local disk storage on the storage virtualizer. The local disks are the internal disk drives.

Storage Virtualizer Overhead (GiB)
The amount of space that is used for system management. The amount of space also includes space that is reserved for redundancy.

Storage Virtualizer Number of Volumes
The number of volumes in the storage virtualizer pool.

Storage Virtualizer Number of MDisks
The number of managed disks on a resource.

Running the Storage Virtualizer - Pools Historical Space Report

To see how space in pools on a storage virtualizer is used, run the Storage Virtualizer - Pools Historical Space Report.

You can see how space in a pool on a storage virtualizer, or in pools in a storage resource group, are used.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Historical Information**.
2. Click `Storage Virtualizer`.
3. Click **Storage Virtualizer - Pools Historical Space Report**.
4. Required: Select the type of historical space report that you want to create.
5. Optional: You can filter the type of data that you want to see in a report. You can select either of the following options:
   - **Of a Pool in a Storage Virtualizer**
     a. Click **Next**.
     b. Select a storage virtualizer, and then select a pool.
   - **Of Pools in a Storage Resource Group**
     a. Click **Next**.
     b. Select a storage resource group.
6. Optional: Select an interval.
7. Optional: To limit the time frame of the report, specify a date filter or a custom date range. To reduce the amount of information that is shown in the report, change the default date filter. It is easier to analyze small amounts of information over shorter periods.

   Tip: To specify a start date and an end date, select **Custom date range** from the list of filters.
8. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection was unsuccessful, a message is displayed in the report.

Storage Virtualizer - Pools Historical Space Report

The Storage Virtualizer - Pools Historical Space Report shows the usage of space in a pool on a storage virtualizer, or of pools in a storage resource group over a specified period. Use the report to determine whether additional storage resources are required.

Charts

The chart shows the following space statistics for the pool on the storage virtualizer:

- The capacity of the pool
- The used space in the pool
- The available space in the pool

- The virtual volume capacity of the pool
- The real volume capacity of the pool

The chart shows the following space statistics for the pools in the storage resource group:

- The capacity of the pools
- The used space in the pools
- The available space in the pools
- The virtual volume capacity of the pools
- The real volume capacity of the pools

Report output

The following information is included in reports for a pool on a storage virtualizer, or for pools in a storage resource group:

Storage Virtualizer Name
A user-defined name of the storage virtualizer. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage virtualizer was added for monitoring.

Storage Virtualizer Pool Name
The name that was assigned to the pool when it was added to the system.

Date The date that the data was collected for the report.

Storage Virtualizer Pool Capacity (GiB)
The total amount of storage space in a pool.

Storage Virtualizer Pool Available Space (GiB)
The amount of space in a pool that is not reserved for volumes.

Storage Virtualizer Pool Used Space (GiB)
The amount of allocated space that is used by the volumes in a pool, which includes thin-provisioned and standard volumes.

For SAN Volume Controller and Storwize V7000, you can pre-allocate thin-provisioned volume space when the volumes are created. For these storage systems, the Storage Virtualizer Pool Used Space might be different than the Storage Virtualizer Pool Allocated Space for pools that contain thin-provisioned volumes. For pools with compressed volumes on SAN Volume Controller and Storwize V7000, the Storage Virtualizer Pool Used Space reflects the size of compressed data written to disk. As the data changes the Storage Virtualizer Pool Used Space may at times be less than the Storage Virtualizer Pool Allocated Space.

For pools with volumes that are not thin provisioned or compressed in SAN Volume Controller, Storwize V7000, and other storage systems, the values for Storage Virtualizer Pool Used Space and Storage Virtualizer Pool Allocated Space are equal.

This value is accurate as of the most recent time that Tivoli Storage Productivity Center collected data about a pool. Because data collection is run on a set schedule and the used space on volumes can change rapidly, the value in this column might not be 100% accurate for the current state of volumes.

Storage Virtualizer Pool Used Volume Space (GiB)
The amount of allocated space that is used by the volumes in a pool, which includes thin-provisioned and standard volumes.

For SAN Volume Controller and Storwize V7000, you can preallocate thin-provisioned volume space when volumes are created. For these storage systems, the Storage Virtualizer Pool Used Space might be different than the Storage Virtualizer Pool Allocated Space for pools that contain thin-provisioned volumes. In other cases, the values for Storage Virtualizer Pool Used Space and Storage Virtualizer Pool Allocated Space are equal.

This value is accurate as of the most recent time that Tivoli Storage Productivity Center collected data about a volume. The value in this property might not be 100% accurate for the current state of volumes. This inaccuracy might occur because data collection is run on a set schedule and the used space on volumes can change rapidly.

Storage Virtualizer Pool Allocated Space (GiB)
The amount of space that is reserved for all the volumes in a pool, which includes both thin-provisioned and standard volumes.

The space that is allocated for thin-provisioned volumes is less than their virtual capacity. The Storage Virtualizer Pool Total Volume Capacity (GiB) property shows the virtual capacity of the volumes. If a pool does not contain thin-provisioned volumes, this value is the same as the value of the Storage Virtualizer Pool Total Volume Capacity (GiB) property.

This value is equal to Storage Virtualizer Used Space (GiB) for volumes that are not thin provisioned.

Storage Virtualizer Pool Total Volume Capacity (GiB)
The total storage space on all the volumes in a pool, which includes thin-provisioned and standard volumes. For thin-provisioned volumes, this value includes virtual space.

Storage Virtualizer Pool Assigned Volume Space (GiB)
The amount of space in the pool that is on volumes that are assigned to a server or storage virtualizer.

Storage Virtualizer Pool Unassigned Volume Space (GiB)
The amount of volume space in the pool that is not assigned to a server or storage virtualizer.

Storage Virtualizer Pool Number of Storage Volumes
The number of volumes in the storage virtualizer pool.

Storage Virtualizer Pool Number of MDisks
The number of managed disks on a resource.

Running the Storage Virtualizer - Volumes Historical Space Report

To see how space on volumes on a storage virtualizer is used, run the Storage Virtualizer - Volumes Historical Space Report

You can see how space on a volume on a storage virtualizer, or on volumes in a storage resource group, are used.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Historical Information**.
2. Click `Storage Virtualizer`.
3. Click **Storage Virtualizer - Volumes Historical Space Report**.

4. Required: Select the type of historical space report that you want to create.
5. Optional: You can filter the type of data that you want to see in a report. You can select either of the following options:
   - **Of a Volume in a Storage Virtualizer**
     a. Click **Next**.
     b. Select a storage virtualizer.
     c. Type a keyword and click **Search**. For example, type `lun`, to find the names of volumes that start with `lun`. To change the default search option, click **Options**.

        Tip: Use the percent sign (%) as a wildcard. For example, type `a%` to find volume names that begin with 'a' or 'A'. Type `%a` to find volume names that begin with or contain the letter 'a' or 'A'. You can type `%` to retrieve all of the volumes on a resource.
     d. Select a volume.
   - **Of Volumes in a Storage Resource Group**
     a. Click **Next**.
     b. Select a storage resource group.
6. Optional: Select an interval.
7. Optional: To limit the time frame of the report, specify a date filter or a custom date range. To reduce the amount of information that is shown in the report, change the default date filter. It is easier to analyze small amounts of information over shorter periods.

   Tip: To specify a start date and an end date, select **Custom date range** from the list of filters.
8. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection was unsuccessful, a message is displayed in the report.

Storage Virtualizer - Volumes Historical Space Report

The Storage Virtualizer - Volumes Historical Space Report shows the usage of space on a volume on a storage virtualizer, or on volumes in a storage resource group over a specified period. Use the report to determine whether additional storage resources are required.

Charts

The chart shows the following space statistics for the volume on the storage virtualizer:

- The capacity of the volume
- The used space on the volume
- The real space on the volume

The chart shows the following space statistics for the volumes in the storage resource group:

- The capacity of the volumes
- The used space on the volumes
- The real space on the volumes

If the volume is thin provisioned, the chart shows the total amount of virtual space that is allocated to the volume, and the total amount of real space that is used by the volume.

Report output

The following information is included in reports for a volume on a storage virtualizer, or for volumes in a storage resource group:

Storage Virtualizer Name
A user-defined name of the storage virtualizer. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage virtualizer was added for monitoring.

Storage Virtualizer Pool Name
The name that was assigned to the pool when it was added to the system.

Storage Virtualizer Volume Name
The name that was assigned to the storage virtualizer volume when it was added to the system.

Date The date that the data was collected for the report.

Storage Virtualizer Volume Capacity (GiB)
The total amount of storage space that is committed to a volume.

For thin-provisioned volumes, this value represents the virtual capacity of the volume.

Storage Virtualizer Volume Overhead
The amount of space that is used for system management. The amount of space also includes space that is reserved for redundancy.

Storage Virtualizer Volume Used Space (GiB)
The amount of allocated space that is used by a volume.

For SAN Volume Controller and Storwize V7000, you can preallocate thin-provisioned volume space when the volumes are created. In these cases, the Storage Virtualizer Volume Used Space (GiB) might be different than the Storage Virtualizer Volume Allocated Space (GiB). For volumes that are not thin provisioned, the values for Storage Virtualizer Volume Used Space (GiB) and Storage Virtualizer Volume Allocated Space (GiB) are equal.

This value is accurate as of the most recent time that Tivoli Storage Productivity Center collected data about a volume. The value in this property might not be 100% accurate for the current state of volumes. This inaccuracy might occur because data collection is run on a set schedule and the used space on volumes can change rapidly.

Storage Virtualizer Volume Allocated Space (GiB)
The amount of space that is reserved for a volume.

The space that is allocated for a thin-provisioned volume is less than its virtual capacity, which is shown in Storage Virtualizer Capacity.

This value is equal to Storage Virtualizer Volume Used Space for the following storage systems:

- Storage systems other than SAN Volume Controller and Storwize V7000
- SAN Volume Controller and Storwize V7000 storage systems that are not thin-provisioned

Running the Storage Systems Historical Capacity report

To see changes in the usage of space on storage systems over a specified period, run the Storage Systems Historical Capacity report.

To run the report with the default settings, click **Finish**. By default all of the storage systems are selected.

Tip: To select a resource, click the resource. To select multiple resources, press Ctrl and click the resources. To select a series of resources, select the first resource, and then press Shift and click the last resource.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.
2. Click **Storage Systems**.
3. Click **Storage Systems Historical Capacity**.
4. Optional: Select the configuration of the storage systems.
5. Select one or more storage systems.
6. Select an interval.
7. To set the time frame of the report, specify a reporting period. It is easier to analyze small amounts of information over shorter periods.

   Tip: To specify a start date and an end date, select **Custom date range** from the list of reporting periods.
8. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection was unsuccessful, a message is displayed in the report.

Related reference:

Storage Systems Historical Capacity report

Shows the usage of space on storage systems over a specified period. Use the report to analyze changes in your storage system requirements.

Charts

The chart shows the following space statistics for the storage systems:

- The capacity of the pools on the storage systems
- The used space in the pools on the storage systems
- The available space in the pools on the storage systems
- The capacity of the volumes on the storage systems
- The available space on the managed disks on the storage systems
- The capacity of the managed disks on the storage systems

Report output

The following information is included in reports for storage systems:

Storage System Name
A user-defined name of the storage system. If a name was not defined,

Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Date The date that the data was collected for the report.

Storage System Pool Capacity (GiB)
The amount of storage space in pools that are on the storage system. For an XIV system, this value represents the physical capacity of the pool, not the virtual capacity. For other storage systems, this value might also include overhead space if the pool is unformatted.

Storage System Used Pool Space (GiB)
The amount of space that is in use in all pools on a storage system.

Storage System Available Pool Space (GiB)
The amount of unused space in pools that are on the storage system.

Storage System Volume Capacity (GiB)
The amount of space on all volumes on the storage system.

Storage System Number of Volumes
The number of volumes on a resource.

Storage System Number of Disks
The number of physical disks on the storage system. For a Storwize V7000 storage system that is configured as a back-end device, the value is the number of managed disks on the storage system.

Storage System Overhead (GiB)
The amount of space that is used for system management. The amount of space also includes space that is reserved for redundancy.

Storage System Unallocated Disk Space (GiB)
The amount of disk space that can be added to a pool.

Storage System Volume Capacity Assigned to MDisks (GiB)
The amount of space that is on volumes that are assigned to a storage virtualizer to use as managed disks.

Storage System Disk Capacity (GiB)
The amount of storage space on physical disks in a storage system, excluding spare disks. This value is not shown for Storwize V7000 storage systems that are configured as back-end storage.

Storage System Total Disk Capacity (GiB)
The amount of space on physical disks on a storage system, including spare disks.

Storage System Assigned Volume Space (GiB)
The amount of space in the pool that is on volumes that are assigned to a server or storage virtualizer.

Storage System Volume Capacity for z/OS (GiB)
The amount of space on all volumes on the storage system that the z/OS operating system can use.

Storage System Real Available Pool Space (GiB)
The amount of unused space in pools that have an associated soft size on an XIV system. The soft size of a pool is the virtual size of a thin-provisioned pool.

Storage System Real Configured Pool Space (GiB)
The amount of storage space that is in pools that have an associated soft size on an XIV system. The soft size of a pool is the virtual size of a thin-provisioned pool.

Storage System MDisk Capacity (GiB)
The amount of storage space on the managed disk.

Storage System MDisk Available Space (GiB)
The amount of storage space that is available on a managed disk. This value is only available for Storwize V7000 storage systems that are configured as back-end storage.

Related tasks:

"Running the Storage Systems Historical Capacity report" on page 866
To see changes in the usage of space on storage systems over a specified period, run the Storage Systems Historical Capacity report.

Running the Pools Historical Capacity report

To see how space in pools on storage systems is used, run the Pools Historical Capacity report.

You can see how space in a pool on a storage system, or in pools in a storage resource group, are used.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.
2. Click **Storage Systems**.
3. Click **Pools**.
4. Click **Pools Historical Capacity**.
5. Select the type of historical space report that you want to create. You can select either of the following options:
   - **Of a Pool in a Storage System**
     a. Click **Next**.
     b. Optional: Select the configuration of the storage system.
     c. Select a storage system, and then select a pool.
   - **Of Pools in a Storage Resource Group**
     a. Click **Next**.
     b. Optional: Select the configuration of the storage system.
     c. Select a storage resource group.
6. Select an interval.
7. To set the time frame of the report, specify a reporting period. It is easier to analyze small amounts of information over shorter periods.

   Tip: To specify a start date and an end date, select **Custom date range** from the list of reporting periods.
8. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection was unsuccessful, a message is displayed in the report.

Charts

The chart shows the following space statistics for the pool on a storage system:

- The capacity of the pool
- The used space in the pool
- The available space in the pool
- The virtual volume capacity of the pool
- The used volume space in the pool
- The allocated space in the pool

The chart shows the following space statistics for the pool in the storage resource group:

- The capacity of the pools
- The used space in the pools
- The available space in the pools
- The virtual volume capacity of the pools
- The used volume space in the pools
- The allocated space in the pool

Report output

The following information is included in reports for a pool on a storage system or for pools in a storage resource group:

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Storage Pool Name
The name that was assigned to the pool when it was added to the system.

Date The date that the data was collected for the report.

Storage System Pool Capacity (GiB)
The amount of storage space in pools that are on the storage system. For

an XIV system, this value represents the physical capacity of the pool, not the virtual capacity. For other storage systems, this value might also include overhead space if the pool is unformatted.

Storage Pool Available Space (GiB)
The amount of space in a pool that is not reserved for volumes.

Tivoli Storage Productivity Center uses the following formula to determine this value:

```
pool capacity - allocated space
```

For XIV systems, this value represents the unallocated physical space in the pool, not the unallocated virtual space. For some storage systems, this value usually includes only the usable capacity, but might also include overhead space if the pool is unformatted.

Storage Pool Allocated Space (GiB)
The amount of space that is reserved for all the volumes in a pool, which includes both thin-provisioned and standard volumes. The space that is allocated for thin-provisioned volumes is less than their virtual capacity, which is shown in the Storage Pool Total Volume Capacity (GiB) property. If a pool does not contain thin-provisioned volumes, this value is the same as the value in the Storage Pool Total Volume Capacity (GiB) property. This value is equal to the value in the Storage Pool Used Volume Space (GiB) property for the following storage systems:

- Storage systems other than Storwize V7000 systems that are configured as back-end storage
- Storwize V7000 storage systems that are configured as back-end storage, and that are not thin-provisioned

Storage Pool Used Space (GiB)
The amount of storage space that is used in the pool.

Storage Pool Total Volume Capacity (GiB)
The total storage space on all the volumes in a pool, which includes thin-provisioned and standard volumes. For thin-provisioned volumes, this value includes virtual space.

Storage Pool Used Volume Space (GiB)
The amount of allocated space that is used by the volumes in a pool, which includes thin-provisioned and standard volumes.

For SAN Volume Controller and Storwize V7000, you can preallocate thin-provisioned volume space when volumes are created. For these storage systems, the Storage Pool Used Space might be different than the Storage Pool Allocated Space for pools that contain thin-provisioned volumes. In other cases, the values for Storage Pool Used Space and Storage Pool Allocated Space are equal.

This value is accurate as of the most recent time that Tivoli Storage Productivity Center collected data about a volume. The value in this property might not be 100% accurate for the current state of volumes. This inaccuracy might occur because data collection is run on a set schedule and the used space on volumes can change rapidly.

Storage Pool Assigned Volume Space (GiB)
The amount of space in the pool that is on volumes that are assigned to a server or storage virtualizer.

Storage Pool Unassigned Volume Space (GiB)
The amount of volume space in the pool that is not assigned to a server or storage virtualizer.

Storage Pool Real Configured Space (GiB)
The amount of storage space that is in pools that have an associated soft size on an XIV system. The soft size of a pool is the virtual size of a thin-provisioned pool.

Storage System MDisk Available Space (GiB)
The amount of storage space that is available on a managed disk. This value is only available for Storwize V7000 storage systems that are configured as back-end storage.

Storage Pool Number of MDisks
The number of managed disks in a storage pool.

Storage Pool Number of Storage Volumes
The number of volumes in the storage pool.

Related tasks:

"Running the Pools Historical Capacity report" on page 868
To see how space in pools on storage systems is used, run the Pools Historical Capacity report.

Running the Volumes Historical Capacity report

To see how space on volumes on storage systems is used, run the Volumes Historical Capacity report.

You can see how space on a volume on a storage system, or on volumes in a storage resource group, are used.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.
2. Click **Storage Systems**.
3. Click **Volumes**.
4. Click **Volumes Historical Capacity**.
5. Select the type of historical capacity report that you want to create. You can select either of the following options:
   - **Of a Volume in a Storage System**
     a. Click **Next**.
     b. Optional: Select the configuration of the storage system.
     c. Select a storage system.
     d. Type a keyword and click **Search**. For example, type `lun`, to find the names of volumes that start with `lun`. To change the default search option, click **Options**.

        Tip: Use the percent sign (%) as a wildcard. For example, type `a%` to find volume names that begin with 'a' or 'A'. Type `%a` to find volume names that begin with or contain the letter 'a' or 'A'. You can type `%` to retrieve all of the volumes on a resource.
     e. Select a volume.
   - **Of Volumes in a Storage Resource Group**
     a. Click **Next**.
     b. Select a storage resource group.
6. Select an interval.

7. To set the time frame of the report, specify a reporting period. It is easier to analyze small amounts of information over shorter periods.

   Tip: To specify a start date and an end date, select **Custom date range** from the list of reporting periods.
8. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection was unsuccessful, a message is displayed in the report.

Related reference:

"Volumes Historical Capacity report"
Shows the usage of space on volumes over a specified period. Use the report to analyze changes in your volume requirements, particularly the increasing usage of space on thin-provisioned volumes.

Volumes Historical Capacity report

Shows the usage of space on volumes over a specified period. Use the report to analyze changes in your volume requirements, particularly the increasing usage of space on thin-provisioned volumes.

Charts

The chart shows the following space statistics for the volume on a storage system:

- The capacity of the volume
- The used space on the volume
- The space on the volume that is used for system management
- The allocated space on the volume

The chart shows the following space statistics for the volumes in a storage resource group:

- The capacity of the volumes
- The used space on the volumes
- The space on the volumes that is used for system management
- The allocated space on the volume

If the volume is thin provisioned, the chart shows the total amount of virtual space that is allocated to the volume, and the total amount of real space that is used by the volume.

Report output

The following information is included in reports for a volume on a storage system, or for volumes in a storage resource group:

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`,

the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Storage Pool Name
The name that was assigned to the pool when it was added to the system.

Storage Volume Name
The name that was assigned to the storage volume when it was added to the system.

Date The date that the data was collected for the report.

Storage Volume Capacity (GiB)
The total amount of storage space that is committed to a volume.

For thin-provisioned volumes, this value represents the virtual capacity of the volume.

For XIV systems, this value represents the physical (hard) capacity of the volume, not the virtual (soft) capacity. For other storage systems, this value might also include overhead space if the pool is unformatted.

Storage Volume Used Space (GiB)
The amount of allocated space that is used by a volume.

For SAN Volume Controller and Storwize V7000, you can preallocate thin-provisioned volume space when the volumes are created. In these cases, the Storage Volume Used Space (GiB) might be different than the Storage Volume Allocated Space (GiB). For volumes that are not thin provisioned, the values for Storage Volume Used Space (GiB) and Storage Volume Allocated Space (GiB) are equal.

This value is accurate as of the most recent time that Tivoli Storage Productivity Center collected data about a volume. The value in this property might not be 100% accurate for the current state of volumes. This inaccuracy might occur because data collection is run on a set schedule and the used space on volumes can change rapidly.

Storage Volume Allocated Space (GiB)
The amount of space that is reserved for a volume. The space that is allocated for a thin-provisioned volume is less than its virtual capacity, which is shown in the Storage Volume Capacity (GiB) property. This value is equal to the value in the Storage Volume Used Space (GiB) property for the following storage systems:

- Storage systems other than Storwize V7000 systems that are configured as back-end storage
- Storwize V7000 storage systems that are configured as back-end storage, and that are not thin-provisioned

Storage Volume Overhead (GiB)
The amount of space that is used for system management. The amount of space also includes space that is reserved for redundancy.

To see how space on volumes on storage systems is used, run the Volumes Historical Capacity report.

Storage virtualizer custom reports about performance

You can use IBM Tivoli Common Reporting to create custom performance reports about storage virtualizers. Performance reports can contain detailed information about the performance of monitored storage virtualizers, and some of the properties of those storage virtualizers.

You can create performance reports for storage virtualizers and their components. You can add performance metrics for volumes, back-end arrays, caches, ports, port errors, and other metrics to performance reports. For example, you can add key metrics to a report to create and generate a performance chart for a specific volume of a storage virtualizer. All the performance metrics from the stand-alone GUI are available in the new reporting interface.

Data for storage virtualizers in performance reports

You can include general information, capacity data, properties, and other information about storage virtualizers in performance reports.

Information about storage virtualizers

You can create performance reports that include the following information:

Storage Virtualizer Name
A user-defined name of the storage virtualizer. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage virtualizer was added for monitoring.

Capacity and usage data

You can create performance reports that include the following information:

Storage Virtualizer Total Pool Capacity (GiB)
The total amount of storage space in pools on the storage virtualizer.

Storage Virtualizer Pool Used Space (GiB)
The amount of allocated space that is used by the volumes in a pool, which includes thin-provisioned and standard volumes.

For SAN Volume Controller and Storwize V7000, you can pre-allocate thin-provisioned volume space when the volumes are created. For these storage systems, the Storage Virtualizer Pool Used Space might be different than the Storage Virtualizer Pool Allocated Space for pools that contain thin-provisioned volumes. For pools with compressed volumes on SAN Volume Controller and Storwize V7000, the Storage Virtualizer Pool Used Space reflects the size of compressed data written to disk. As the data changes the Storage Virtualizer Pool Used Space may at times be less than the Storage Virtualizer Pool Allocated Space.

For pools with volumes that are not thin provisioned or compressed in SAN Volume Controller, Storwize V7000, and other storage systems, the values for Storage Virtualizer Pool Used Space and Storage Virtualizer Pool Allocated Space are equal.

This value is accurate as of the most recent time that Tivoli Storage Productivity Center collected data about a pool. Because data collection is run on a set schedule and the used space on volumes can change rapidly, the value in this column might not be 100% accurate for the current state of volumes.

Storage Virtualizer Pool Available Space (GiB)
The amount of space in a pool that is not reserved for volumes.

Storage Virtualizer Total Volume Capacity (GiB)
The amount of virtual volume space on all volumes on the storage virtualizer.

Storage Virtualizer Volume Allocated Space (GiB)
The amount of space that is reserved for a volume.

The space that is allocated for a thin-provisioned volume is less than its virtual capacity, which is shown in Storage Virtualizer Capacity.

This value is equal to Storage Virtualizer Volume Used Space for the following storage systems:

- Storage systems other than SAN Volume Controller and Storwize V7000
- SAN Volume Controller and Storwize V7000 storage systems that are not thin-provisioned

Storage Virtualizer Volume Assigned Space (GiB)
The amount of virtual volume space that is assigned to the server or storage virtualizer.

Storage Virtualizer MDisk Available Space (GiB)
The amount of space on managed disks that is available in a pool, or is available to be added to a pool.

Storage Virtualizer MDisk Capacity (GiB)
The amount of storage space on the managed disk.

Storage Virtualizer Disk Capacity (GiB)
The amount of local disk storage on the storage virtualizer. The local disks are the internal disk drives.

Storage Virtualizer Number of MDisks
The number of managed disks on a resource.

Storage Virtualizer Number of Volumes
The number of volumes on a resource.

Storage Virtualizer Overhead (GiB)
The amount of space that is used for system management. The amount of space also includes space that is reserved for redundancy.

Storage Virtualizer Physical Allocation Percentage
The percentage of physical space in storage virtualizer pools that is reserved for volumes. This value is always less than or equal to 100% because you cannot reserve more physical space than is available in the pools.

Tivoli Storage Productivity Center uses the following formula to determine the allocation percentage:

`(allocated space ÷ pool capacity) × 100`

For example, the physical allocation percentage is 25% for a total storage virtualizer pool size of 200 GiB. Therefore, the space that is reserved for volumes is 50 GiB.

Storage Virtualizer Virtual Allocation Percentage
The percentage of physical space in storage virtualizer pools that is committed to the total virtual capacity of the volumes in the pool. In thin-provisioned environments, this percentage exceeds 100% if a pool is overcommitted (over-provisioned).

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

`(total volume capacity ÷ pool capacity) × 100`

For example, the allocation percentage is 200% for a total pool size of 15 GiB. Therefore, the virtual capacity that is committed to the volumes in the pools is 30 GiB.

This configuration means that twice as much space is committed than is physically contained in the pools. If the allocation percentage is 100% for the same pools, then the virtual capacity that is committed to the pools is 15 GiB. This configuration means that all the physical capacity of the pools is already allocated to volumes.

An allocation percentage that is higher than 100% is considered aggressive. The pools have insufficient physical capacity to satisfy the maximum allocation for all the thin-provisioned volumes in the pools. In such cases, use the Storage Virtualizer Shortfall Percentage property to estimate how critical the shortage of space is for storage virtualizer pools.

This value is only available for pools with thin-provisioned volumes.

This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Shortfall Percentage

The percentage of the remaining unallocated volume space in storage virtualizer pools that is not available to be allocated. The higher the percentage, the more critical the shortfall of pool space.

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

`(unallocatable space ÷ (volume space - used volume space)) × 100`

You can use this percentage to determine when the amount of overcommitted space in pools reaches a critically high level. For example, the physical space in pools might be less than the committed virtual space. In this case, the pools do not have enough space to fulfill the commitment to virtual space.

This Storage Virtualizer Shortfall Percentage represents the percentage of the committed virtual space that is not available in pools. As more space is used over time by volumes while the pool capacity remains the same, this percentage increases.

For example, the physical capacity of pools is 70 GiB, but 150 GiB of virtual space is committed to thin-provisioned volumes. If the volumes are using 50 GiB, then there is still 100 GiB committed to those volumes (150 GiB - 50 GiB). There is only 20 GiB of available pool space (70 GiB - 50 GiB). Because only 20 GiB of pool space is available, 80 GiB of the committed space cannot be allocated (100 GiB - 20 GiB). In this case, the percentage of committed space that is unavailable is 80% (80 GiB ÷ 100 GiB × 100).

This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

This property is available only for storage virtualizer pools with thin-provisioned volumes.

Component properties

You can create performance reports that include the following information:

Storage Virtualizer Access Information
The URL from which you can access the storage system or storage virtualizer.

Storage Virtualizer Alias
Shows an alternative name for a storage virtualizer.

Storage Virtualizer Code Level
The microcode or firmware level of the storage virtualizer.

Storage Virtualizer Time Zone
The time zone in which a resource is located.

Storage Virtualizer Custom Tag 1, 2, and 3
User-defined text that is associated with a storage virtualizer. You can add or edit the custom tags for a storage virtualizer on the **Properties** page of the storage system in the Tivoli Storage Productivity Center web-based GUI.

Storage Virtualizer User Provided Name
The name that was specified for the storage virtualizer in the storage environment.

Storage Virtualizer Is Compression Active
Shows whether the compression feature is enabled on the storage virtualizer. If this value is `Yes`, the compression feature is enabled.

Status information

You can create performance reports that include the following information:

Storage Virtualizer Status
The condition of the resource, for example normal, warning, or error.

Storage Virtualizer Is Detected
Shows whether the resource was detected the last time that data was collected. If this value is `Yes`, the resource was detected.

Storage Virtualizer Last Data Collection
The date and time when storage statistics were last collected from the resource.

Storage Virtualizer Last Data Collection Status
The condition of the last data collection. The status can show if the collection was a success, a failure, or if data was collected from the resource.

Vendor, model, and device information

You can create performance reports that include the following information:

Storage Virtualizer IP Address
The IP address of the resource.

Storage Virtualizer Serial Number
The serial number of the resource.

Storage Virtualizer Type
The type of storage virtualizer. For example, the storage virtualizer can be an **IBM Storwize V7000** system, an **IBM SAN Volume Controller** system, or another type of storage virtualizer.

Storage Virtualizer Model
The model name or model number of the resource.

Storage Virtualizer Vendor
The vendor who supplied the resource.

Performance metrics for storage virtualizers:

You can include performance data for ports, port errors, volumes, caches, back-end arrays, and other data for storage virtualizers in performance reports.

Port data

You can create performance reports that include the following information:

Port Send I/O Rate (ops/s)
The average number of I/O operations per second for operations in which data is sent from a port.

Port Receive I/O Rate (ops/s)
The average number of I/O operations per second for operations in which the port receives data.

Total Port I/O Rate (ops/s)
The average number of send operations and receive operations per second.

Port Send Data Rate (MiB/s)
The average rate at which data is sent through the port. The rate is measured in MiB per second.

Port Receive Data Rate (MiB/s)
The average rate at which data is received by the port. The rate is measured in MiB per second.

Total Port Data Rate (MiB/s)
The average rate at which data is transferred through the port. The rate is measured in MiB per second and includes both send and receive operations.

Port to Host Send I/O Rate (ops/s)
The average number of exchanges per second that are sent to host computers.

Port to Host Receive I/O Rate (ops/s)
The average number of exchanges per second that are received from host computers.

Total Port to Host I/O Rate (ops/s)
The average number of exchanges per second that are transmitted between host computers and the component.

Port to Disk Send I/O Rate (ops/s)
The average number of exchanges per second that are sent to back-end storage resources.

Port to Disk Receive I/O Rate (ops/s)
The average number of exchanges per second that are received from back-end storage resources.

Total Port to Disk I/O Rate (ops/s)
The average number of exchanges per second that are transmitted between back-end storage resources and the component. This value includes both send and receive operations.

Port to Local Node Send I/O Rate (ops/s)
The average number of exchanges per second that are sent to other nodes that are in the local SAN Volume Controller cluster.

Port to Local Node Receive I/O Rate (ops/s)
The average number of exchanges per second that are received from other nodes that are in the local SAN Volume Controller cluster.

Total Port to Local Node I/O Rate (ops/s)
The average number of exchanges per second that are transmitted between the component and other nodes that are in the local SAN Volume Controller cluster.

Port to Remote Node Send I/O Rate (ops/s)
The average number of exchanges per second that are sent to nodes that are in the remote SAN Volume Controller cluster.

Port to Remote Node Receive I/O Rate (ops/s)
The average number of exchanges per second that are received from nodes that are in the remote SAN Volume Controller cluster.

Total Port to Remote Node I/O Rate (ops/s)
The average number of exchanges per second that are transmitted between the component and nodes that are in the remote SAN Volume Controller cluster.

Port to Host Send Data Rate (MiB/s)
The average rate at which data is sent to host computers. The rate is measured in MiB per second.

Port to Host Receive Data Rate (MiB/s)
The average rate at which data is received from host computers. The rate is measured in MiB per second.

Total Port to Host Data Rate (MiB/s)
The average rate at which data is transmitted between host computers and the component. The rate is measured in MiB per second and includes both send and receive operations.

Port to Disk Send Data Rate (MiB/s)
The average rate at which data is sent to back-end storage resources. The rate is measured in MiB per second.

Port to Disk Receive Data Rate (MiB/s)
The average rate at which data is received from back-end storage resources. The rate is measured in MiB per second.

Total Port to Disk Data Rate (MiB/s)
The average rate at which data is transmitted between back-end storage resources and the component. The rate is measured in MiB per second and includes both send and receive operations.

Port to Local Node Send Data Rate (MiB/s)
The average rate at which data is sent to other nodes that are in the local SAN Volume Controller cluster. The rate is measured in MiB per second.

Port to Local Node Receive Data Rate (MiB/s)
The average rate at which data is received from other nodes that are in the local SAN Volume Controller cluster. The rate is measured in MiB per second.

Total Port to Local Node Data Rate (MiB/s)
The average rate at which data is transmitted between the component and other nodes that are in the local SAN Volume Controller cluster. The rate is measured in MiB per second.

Port to Remote Node Send Data Rate (MiB/s)
The average rate at which data is sent to nodes that are in the remote SAN Volume Controller cluster. The rate is measured in MiB per second.

Port to Remote Node Receive Data Rate (MiB/s)
The average rate at which data is received from nodes that are in the remote SAN Volume Controller cluster. The rate is measured in MiB per second.

Total Port to Remote Node Data Rate (MiB/s)
The average rate at which data is transmitted between the component and nodes that are in the remote SAN Volume Controller cluster. The rate is measured in MiB per second.

Port to Local Node Send Response Time (ms/op)
The average number of milliseconds to complete a send operation to another node that is in the local SAN Volume Controller cluster. This value represents the external response time of the transfers.

Port to Local Node Receive Response Time (ms/op)
The average number of milliseconds to complete a receive operation from another node that is in the local SAN Volume Controller cluster. This value represents the external response time of the transfers.

Overall Port to Local Node Response Time (ms/op)
The average number of milliseconds to complete a send or receive operation with another node that is in the local SAN Volume Controller cluster. This value represents the external response time of the transfers.

Port to Local Node Send Queue Time (ms/op)
The average time in milliseconds that a send operation spends in the queue before the operation is processed. This value represents the queue time for send operations that are issued to other nodes that are in the local SAN Volume Controller cluster.

Port to Local Node Receive Queue Time (ms/op)
The average time in milliseconds that a receive operation spends in the queue before the operation is processed. This value represents the queue time for receive operations that are issued from other nodes that are in the local SAN Volume Controller cluster.

Overall Port to Local Node Queue Time (ms/op)
The average number of milliseconds that a send or receive operation spends in the queue before the operation is processed. This value is for send and receive operations that are issued between the component and other nodes that are in the local SAN Volume Controller cluster.

Port to Remote Node Send Response Time (ms/op)
The average number of milliseconds to complete a send operation to a node that is in the remote SAN Volume Controller cluster. This value represents the external response time of the transfers.

Port to Remote Node Receive Response Time (ms/op)
The average number of milliseconds to complete a receive operation from a node that is in the remote SAN Volume Controller cluster. This value represents the external response time of the transfers.

Overall Port to Remote Node Response Time (ms/op)
The average number of milliseconds to complete a send operation to, or a receive operation from a node in the remote SAN Volume Controller cluster. This value represents the external response time of the transfers.

Port to Remote Node Send Queue Time (ms/op)
The average time in milliseconds that a send operation spends in the queue before the operation is processed. This value represents the queue time for send operations that are issued to a node that is in the remote SAN Volume Controller cluster.

Port to Remote Node Receive Queue Time (ms/op)
The average time in milliseconds that a receive operation spends in the queue before the operation is processed. This value represents the queue time for receive operations that are issued from a node that is in the remote SAN Volume Controller cluster.

Overall Port to Remote Node Queue Time (ms/op)
The average number of milliseconds that a send or receive operation spends in the queue before the operation is processed. This value is for send and receive operations that are issued between the component and a node that is in the remote SAN Volume Controller cluster.

Port error data

You can create performance reports that include the following information:

Link Failure Rate (count/s)
The average number of link errors per second.

Loss of Sync Rate (count/s)
The average number of times per second that synchronization is lost.

Synchronization is assumed lost after a timeout interval expires.

Loss of Signal Rate (count/s)
The average number of times per second that the signal is lost.

CRC Error Rate (count/s)
The average number of frames per second that are received in which a cyclic redundancy check (CRC) error is detected. A CRC error is detected when the CRC in the transmitted frame does not match the CRC computed by the receiver.

Primitive Sequence Protocol Error Rate (count/s)
The average number of primitive sequence protocol errors per second that are detected.

This error occurs when there is a link failure for a port.

Invalid Transmission Word Rate (count/s)
The average number of bit errors per second that are detected.

Volume data

You can create performance reports that include the following information:

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation.

Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation.

Overall Transfer Size (KiB/op)
The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

Cache data

You can create performance reports that include the following information:

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Overall Write Cache Hit Percentage
The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

Total Overall Cache Hit Percentage
The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Disk to Cache Transfer Rate (ops/s)
The average number of tracks that are transferred per second from the disks to the cache.

Cache to Disk Transfer Rate (ops/s)
The average number of tracks per second that are transferred from the cache to the disks.

Write Cache Delay Percentage
The percentage of I/O operations that are delayed because there is not enough space in the write cache.

The only operations that can be delayed are write operations, but the value is calculated as an average of all I/O operations.

Write Cache Delay I/O Rate (ops/s)
The average number of I/O operations per second that are delayed because there is not enough space in the write cache.

The only operations that can be delayed are write operations, but the value is calculated as an average of all I/O operations.

Read Ahead Percentage of Cache Hits
The percentage of all read-cache hits that occur on pre-staged data.

Dirty Write Percentage of Cache Hits
The percentage of all cache write operations that occur on data in the cache that is marked as modified. This value represents how effectively write operations are coalesced before the data is written to disk.

Write Cache Overflow Percentage
The percentage of write operations that are delayed because there is not enough space in the write cache.

Write Cache Overflow I/O Rate (ops/s)
The average number of write operations per second that are delayed because there is not enough space in the write cache.

Write Cache Flush Through Percentage
The percentage of tracks that is written to disk in flush-through mode.

Write Cache Flush Through I/O Rate (ops/s)
The average number of tracks per second that are written to disk in flush-through mode.

Write Cache Write Through Percentage
The percentage of tracks that is written to disk in write-through mode.

Write Cache Write Through I/O Rate (ops/s)
The average number of tracks per second that are written to disk in write-through mode.

Back-end array data

You can create performance reports that include the following information:

Back-End Read I/O Rate (ops/s)
The average number of read operations per second that are issued to the back-end storage resources.

Back-End Write I/O Rate (ops/s)
The average number of write operations per second that are issued to the back-end storage resources.

Total Back-End I/O Rate (ops/s)
The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

Back-End Read Data Rate (MiB/s)
The average number of MiB per second that are read from the back-end storage resources.

Back-End Write Data Rate (MiB/s)
The average number of MiB per second that are written to the back-end storage resources.

Total Back-End Data Rate (MiB/s)
The average rate at which data is transmitted between the back-end storage resources and the component. The rate is measured in MiB per second and includes both read and write operations.

Back-End Read Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Back-End Write Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Overall Back-End Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Back-End Read Queue Time (ms/op)
The average number of milliseconds that a read operation spends in the queue before the operation is sent to the back-end storage resources.

Back-End Write Queue Time (ms/op)
The average number of milliseconds that a write operation spends in the queue before the operation is sent to the back-end storage resources.

Overall Back-End Queue Time (ms/op)
The average number of milliseconds that a read or a write operation spends in the queue before the operation is sent to the back-end storage resources.

Back-End Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation from the back-end storage resources.

Back-End Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation to the back-end storage resources.

Overall Back-End Transfer Size (KiB/op)
The average transfer size, in KiB, of a read or a write operation to the back-end storage resources.

Peak Back-End Read Response Time (ms)
The longest time for a back-end storage resource to respond to a read operation.

Peak Back-End Write Response Time (ms)
The longest time for a back-end storage resource to respond to a write operation.

Peak Back-End Read Queue Time (ms)
The longest time that a read operation spends in the queue before the operation is sent to the back-end storage resources.

Peak Back-End Write Queue Time (ms)
The longest time that a write operation spends in the queue before the operation is sent to the back-end storage resources.

Other data

You can create performance reports that include the following information:

Global Mirror Write I/O Rate (op/s)
The average number of write operations per second that are issued to the Global Mirror secondary site.

Global Mirror Overlapping Write Percentage
The percentage of overlapping write operations that are issued by the Global Mirror primary site.

For SAN Volume Controller software releases 4.3.1 and later, some overlapping writes are processed in parallel and are excluded from this value. For SAN Volume Controller software releases 4.3.0 and earlier, all overlapping writes are serialized.

Global Mirror Overlapping Write I/O Rate (op/s)
The average number of overlapping write operations per second that are issued by the Global Mirror primary site.

For SAN Volume Controller software releases 4.3.1 and later, some overlapping writes are processed in parallel and are excluded from this value. For SAN Volume Controller software releases 4.3.0 and earlier, all overlapping writes are serialized.

Peak Read Response Time (ms)
The longest time to complete a read operation.

Peak Write Response Time (ms)
The longest time to complete a write operation.

Global Mirror Secondary Write Lag (ms/op)
The average number of milliseconds to service a secondary write operation for Global Mirror. This value does not include the time to service the primary write operation.

You monitor the value of Global Mirror Secondary Write Lag to identify delays that occurred during the process of writing data to the secondary site.

Processor Utilization Percentage
The average percentage of time that the processors are busy.

Overall Host Attributed Response Time Percentage
The percentage of the average response time that can be attributed to delays from host systems. This value includes both read response times and write response times, and can help you diagnose slow hosts and fabrics that are not working efficiently.

The value is based on the following conditions:

- For read response time, the time that it takes for hosts to respond to transfer-ready notifications from the SAN Volume Controller nodes.
- For write response time, the time that it takes for hosts to send the write data after the node responds to a transfer-ready notification.

Zero Buffer-to-Buffer Credit Timer (microseconds)
The number of microseconds that the port is not able to send frames between ports because there is insufficient buffer-to-buffer credit.

In Fibre Channel technology, buffer-to-buffer credit is used to control the flow of frames between ports. Buffer-to-buffer credit is measured from the last time that the node was reset.

Performance metrics for storage systems that are configured to virtualize storage:

A storage environment can include a Hitachi Universal Storage Platform V system that is configured to virtualize storage. You can include performance data for volumes, and cache data for these systems in performance reports.

Volume data

You can create performance reports that include the following information:

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation.

Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation.

Overall Transfer Size (KiB/op)
The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Cache data

You can create performance reports that include the following information:

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Overall Write Cache Hit Percentage
The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

Total Overall Cache Hit Percentage
The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Data for managed disks on storage virtualizers in performance reports

You can include general information, capacity data, properties, and other information about managed disks on storage virtualizers in performance reports.

Information about managed disks on storage virtualizers

You can create performance reports that include the following information:

Storage Virtualizer Name
A user-defined name of the storage virtualizer. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage virtualizer was added for monitoring.

Storage Virtualizer Pool Name
The name that was assigned to the pool when it was added to the system.

Storage Virtualizer MDisk Name
The name that was assigned to the managed disk on a storage virtualizer when it was added to the system.

Capacity and usage data

You can create performance reports that include the following information:

Storage Virtualizer MDisk Capacity (GiB)
The amount of storage space on the managed disk.

Storage Virtualizer MDisk Available Space (GiB)
The amount of space on managed disks that is available in a pool, or is available to be added to a pool.

Storage Virtualizer MDisk Strip Size (KB)
The RAID strip size on a managed disk on a storage virtualizer. This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Component properties

You can create performance reports that include the following information:

Storage Virtualizer MDisk RAID Level
The RAID level of the managed disk, such as RAID 5 or RAID 10. The RAID level affects the performance and fault tolerance of the volumes that are allocated from the managed disk.

This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer MDisk Spare Goal
The number of spare drives that are required to maintain redundancy. Use spare drives to protect against drive failures in the array on a managed disk on a storage virtualizer.

This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer MDisk Type
The type of managed disk on a storage virtualizer. For example, the storage virtualizer can be a local or virtual managed disk.

Storage Virtualizer MDisk Mode
The access mode of a managed disk on a storage virtualizer. The access mode describes how extents are provided for virtual disks. Extents can be provided to virtual disks in the following ways:

Array Extents are provided from local disks.

Managed
Extents are provided from a back-end storage volume.

Unmanaged
The managed disk is not used in the system.

This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer MDisk Is Balanced
Shows whether LUNs are balanced across storage controllers on the managed disk. If this value is `Yes`, the LUNs are balanced.

This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer MDisk Fast Write State
Shows whether the cache for a volume on a disk that is managed by a storage virtualizer is empty, contains data, or is corrupted. This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer MDisk Write Verify
Shows whether all write operations on a managed disk on a storage virtualizer are verified by an immediate follow-up read operation. The follow-up read operation verifies that the write operation was successful. If this value is `Yes`, all write operations are verified by a follow-up read operation.

This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Status information

You can create performance reports that include the following information:

Storage Virtualizer MDisk Status
The condition of the resource, for example normal, warning, or error.

Storage Virtualizer MDisk Native Status
Shows the level of access of nodes in the system to a managed disk or volume on a storage virtualizer. The level of access can be online, offline, degraded, or excluded.

This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Performance metrics for managed disks on storage virtualizers:

You can include performance data for back-end arrays on storage-virtualizer managed disks in performance reports.

Back-end array data

You can create performance reports that include the following information:

Back-End Read I/O Rate (ops/s)
The average number of read operations per second that are issued to the back-end storage resources.

Back-End Write I/O Rate (ops/s)
The average number of write operations per second that are issued to the back-end storage resources.

Total Back-End I/O Rate (ops/s)
The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

Back-End Read Data Rate (MiB/s)
The average number of MiB per second that are read from the back-end storage resources.

Back-End Write Data Rate (MiB/s)
The average number of MiB per second that are written to the back-end storage resources.

Total Back-End Data Rate (MiB/s)
The average rate at which data is transmitted between the back-end storage resources and the component. The rate is measured in MiB per second and includes both read and write operations.

Back-End Read Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Back-End Write Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Overall Back-End Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Back-End Read Queue Time (ms/op)
The average number of milliseconds that a read operation spends in the queue before the operation is sent to the back-end storage resources.

Back-End Write Queue Time (ms/op)
The average number of milliseconds that a write operation spends in the queue before the operation is sent to the back-end storage resources.

Overall Back-End Queue Time (ms/op)
The average number of milliseconds that a read or a write operation spends in the queue before the operation is sent to the back-end storage resources.

Back-End Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation from the back-end storage resources.

Back-End Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation to the back-end storage resources.

Overall Back-End Transfer Size (KiB/op)
The average transfer size, in KiB, of a read or a write operation to the back-end storage resources.

Peak Back-End Read Response Time (ms)
The longest time for a back-end storage resource to respond to a read operation.

Peak Back-End Write Response Time (ms)
The longest time for a back-end storage resource to respond to a write operation.

Peak Back-End Read Queue Time (ms)
The longest time that a read operation spends in the queue before the operation is sent to the back-end storage resources.

Peak Back-End Write Queue Time (ms)
The longest time that a write operation spends in the queue before the operation is sent to the back-end storage resources.

Data for storage virtualizer volumes in performance reports

You can include general information, capacity data, properties, and other information about storage virtualizer volumes in performance reports.

Information about storage virtualizer volumes

You can create performance reports that include the following information:

Storage Virtualizer Name
A user-defined name of the storage virtualizer. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage virtualizer was added for monitoring.

Storage Virtualizer Pool Name
The name that was assigned to the pool when it was added to the system.

Storage Virtualizer I/O Group Name
The name that was assigned to the I/O group on a storage virtualizer when it was added to the system.

Storage Virtualizer Volume Name
The name that was assigned to the storage virtualizer volume when it was added to the system.

Storage Virtualizer Volume Assigned Host Alias
The user-defined name that is assigned to the port on the server. Volumes are associated with the name of the port on the server.

Capacity and usage data

You can create performance reports that include the following information:

Storage Virtualizer Volume Capacity (GiB)
The total amount of storage space that is committed to a volume.

For thin-provisioned volumes, this value represents the virtual capacity of the volume.

Storage Virtualizer Volume Allocated Space (GiB)
The amount of space that is reserved for a volume.

The space that is allocated for a thin-provisioned volume is less than its virtual capacity, which is shown in Storage Virtualizer Capacity.

This value is equal to Storage Virtualizer Volume Used Space for the following storage systems:

- Storage systems other than SAN Volume Controller and Storwize V7000
- SAN Volume Controller and Storwize V7000 storage systems that are not thin-provisioned

Storage Virtualizer Volume Used Space (GiB)
The amount of allocated space that is used by a volume.

For SAN Volume Controller and Storwize V7000, you can preallocate thin-provisioned volume space when the volumes are created. In these cases, the Storage Virtualizer Volume Used Space (GiB) might be different than the Storage Virtualizer Volume Allocated Space (GiB). For volumes that are not thin provisioned, the values for Storage Virtualizer Volume Used Space (GiB) and Storage Virtualizer Volume Allocated Space (GiB) are equal.

This value is accurate as of the most recent time that Tivoli Storage Productivity Center collected data about a volume. The value in this property might not be 100% accurate for the current state of volumes. This inaccuracy might occur because data collection is run on a set schedule and the used space on volumes can change rapidly.

Storage Virtualizer Volume Overhead (GiB)
The amount of space that is used for system management. The amount of space also includes space that is reserved for redundancy.

Storage Virtualizer Volume Used Allocated Space Percentage
The percentage of reserved space for a volume that is being used. This value is always less than or equal to 100% because a volume cannot use more space than is allocated.

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

```
(used space ÷ allocated space) × 100
```

This property is available only for SAN Volume Controller and Storwize V7000 volumes.

Storage Virtualizer Volume Unallocated Space (GiB)
The amount of space in a pool that is not reserved for a volume.

Tivoli Storage Productivity Center uses the following formula to determine the value:

```
capacity - allocated space
```

Storage Virtualizer Volume Physical Allocation Percentage
The percentage of physical space that is reserved for a volume. This value is always less than or equal to 100% because you cannot reserve more physical space than is available.

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

```
(allocated space ÷ capacity) × 100
```

For example, the physical allocation percentage is 25% for a volume size of 200 GiB. Therefore the space that is reserved for volumes is 50 GiB.

Storage Virtualizer Volume Unused Space (GiB)
The amount of space that is allocated to a volume and is not yet used.

Tivoli Storage Productivity Center uses the following formula to determine this value:

```
allocated space - used Space
```

This property is available only for SAN Volume Controller and Storwize V7000 pools.

Storage Virtualizer Volume Shortfall Percentage
The percentage of the remaining unallocated volume space in a pool that is not available to be allocated to a volume. The higher the percentage, the more critical the shortfall of space.

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

```
(unallocatable volume space ÷ unallocated volume space) × 100
```

You can use this percentage to determine when the amount of overcommitted space in a pool reaches a critically high level for the volume. For example, the physical space in a pool might be less than the committed virtual space. In this case, the pool does not have enough space to fulfill the commitment to virtual space for a volume.

This value represents the percentage of the committed virtual space that is not available in a pool. As more space is used over time by a volume while the pool capacity remains the same, this percentage increases.

For example, the remaining physical capacity of a pool is 70 GiB, however, 150 GiB of virtual space is committed to a thin-provisioned volume. If the volume is using 50 GiB, then there is still 100 GiB committed to that volume (150 GiB - 50 GiB). There is a shortfall of 30 GiB (70 GiB remaining pool space - 100 GiB remaining commitment of volume space to the volume). The volume is overcommitted by 30 GiB based on the available space in the pool. The shortfall is 30% when you use the following calculation:

```
(100 GiB unallocated volume space - 70 GiB remaining pool space) ÷ 100 GiB
unallocated volume space × 100
```

This value is only available for pools with thin-provisioned volumes.

Storage Virtualizer Volume Unallocatable Space (GiB)
The unallocatable storage space in GiB of a thin-provisioned volume. Unallocatable space cannot be supplied by the pool to which the volume belongs.

Storage Virtualizer Volume Uncompressed Capacity (GiB)
The amount of storage space that is used if the compressed volume space is uncompressed. For example, if 100 GiB of uncompressed data is compressed, and the size of the compressed data is 20 GiB, the value is 100.

Component properties

You can create performance reports that include the following information:

Storage Virtualizer Volume Type
The type of storage virtualizer volume. For example, the storage virtualizer volume can be striped, sequential, or another type of storage virtualizer volume. This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Volume WWN
The worldwide name of the volume.

Storage Virtualizer Volume Fast Write State
Shows whether the cache for a volume on a disk that is managed by a storage virtualizer is empty, contains data, or is corrupted.

Storage Virtualizer Volume Grain Size (KiB)
The grain size with which a thin-provisioned volume was created. This value is typically 32, 64, 128, or 256 KiB. Larger grain sizes maximize performance, whereas smaller grain sizes maximize space efficiency. Grain sizes also limit the maximum virtual space of a volume.

Storage Virtualizer Volume Is Assigned
Shows whether the volume is assigned to a server. If this value is `Yes`, the volume is assigned to a server.

Storage Virtualizer Volume Is Auto Expand Enabled
Shows whether a volume or volume copy can allocate new extents from a pool automatically. Volumes or volume copies might allocate new extents to expand the real capacity of the storage virtualizer volume or volume copy. If this value is `Yes`, the volume or volume copy can allocate new extents from a pool automatically.

Storage Virtualizer Volume Is Encryptable
Shows whether the resource can be encrypted. If this value is `Yes`, the resource can be encrypted.

Storage Virtualizer Volume Is Encrypted
Shows whether the resource is encrypted. If this value is `Yes`, the resource is encrypted.

Storage Virtualizer Volume Is Thin Provisioned
Shows whether a pool, volume, or volume copy is thin-provisioned. If this value is `Yes`, the resource is thin-provisioned.

Storage Virtualizer Volume Metro Mirror Name
The name of the Metro Mirror that keeps the synchronous copy of the storage virtualizer volume.

Storage Virtualizer Volume Mirror Count
The number of mirrors that keep a synchronous copy of the resource.

Storage Virtualizer Volume Preferred Node
The number of the storage virtualizer node that is used for I/O operations for the storage virtualizer volume.

Storage Virtualizer Volume Throttle
The maximum number of commands that the storage virtualizer volume can queue.

Storage Virtualizer Volume Warning Level
The percentage of used capacity of the resource at which a warning is generated.

Storage Virtualizer Volume Copy Relationship
Shows whether a volume or a copy of a volume is in a FlashCopy relationship or a point-in-time relationship. This property can contain the following values:

Source Relationship
The volume is the source of the relationship.

Target Relationship
The volume is the target of the relationship.

Both Source and Target Relationship
The volume is both the source and target of the relationship.

Storage Virtualizer Volume Is Compressed
Shows whether the storage virtualizer volume is compressed. If this value is `Yes`, the volume is compressed.

Storage Virtualizer Volume RAID Level
The RAID level of a storage virtualizer volume, such as RAID 5 or RAID 10. The RAID level affects the performance and fault tolerance of the volumes that are allocated from the resource.

Status information

You can create performance reports that include the following information:

Storage Virtualizer Volume Status
The condition of the resource, for example normal, warning, or error.

Storage Virtualizer Volume Is Detected
Shows whether the resource was detected the last time that data was collected. If this value is `Yes`, the resource was detected.

Storage Virtualizer Volume Native Status
Shows the level of access of nodes in the system to the storage virtualizer managed disk or volume. The level of access can be online, offline, degraded, or excluded.

Performance metrics for storage virtualizer volumes:

You can include performance data for volumes, caches, and other data for storage virtualizer volumes in performance reports.

Volume data

You can create performance reports that include the following information:

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation.

Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation.

Overall Transfer Size (KiB/op)
The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

Volume Utilization
The average percentage of time that the volume is busy.

Maximum Read I/O Rate (ops/s)
The maximum read I/O rate of the volume in operations per second. This metric is only available for daily data for SAN Volume Controller and Storwize V7000 systems.

Maximum Write I/O Rate (ops/s)
The maximum write I/O rate of the volume in operations per second. This metric is only available for daily data for SAN Volume Controller and Storwize V7000 systems.

Maximum Read Response Time (ms/op)
The maximum read response time of the volume in milliseconds per operation. This metric is only available for daily data for SAN Volume Controller and Storwize V7000 systems.

Maximum Write Response Time (ms/op)
The maximum write response time of the volume in milliseconds per operation. This metric is only available for daily data for SAN Volume Controller and Storwize V7000 systems.

Maximum Write I/O Size (KiB)
The maximum size of write I/O operations in kibibytes. This metric is only available for daily data for SAN Volume Controller and Storwize V7000 systems.

Maximum Volume Utilization Percentage
The maximum period in percentage that the volume is busy. This metric is only available for daily data for SAN Volume Controller and Storwize V7000 systems.

Cache data

You can create performance reports that include the following information:

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Overall Write Cache Hit Percentage
The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

Total Overall Cache Hit Percentage
The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Disk to Cache Transfer Rate (ops/s)
The average number of tracks that are transferred per second from the disks to the cache.

Cache to Disk Transfer Rate (ops/s)
The average number of tracks per second that are transferred from the cache to the disks.

Write Cache Delay Percentage
The percentage of I/O operations that are delayed because there is not enough space in the write cache.

The only operations that can be delayed are write operations, but the value is calculated as an average of all I/O operations.

Write Cache Delay I/O Rate (ops/s)
The average number of I/O operations per second that are delayed because there is not enough space in the write cache.

The only operations that can be delayed are write operations, but the value is calculated as an average of all I/O operations.

Read Ahead Percentage of Cache Hits
The percentage of all read-cache hits that occur on pre-staged data.

Dirty Write Percentage of Cache Hits
The percentage of all cache write operations that occur on data in the cache that is marked as modified. This value represents how effectively write operations are coalesced before the data is written to disk.

Write Cache Overflow Percentage
The percentage of write operations that are delayed because there is not enough space in the write cache.

Write Cache Overflow I/O Rate (ops/s)
The average number of write operations per second that are delayed because there is not enough space in the write cache.

Write Cache Flush Through Percentage
The percentage of tracks that is written to disk in flush-through mode.

Write Cache Flush Through I/O Rate (ops/s)
The average number of tracks per second that are written to disk in flush-through mode.

Write Cache Write Through Percentage
The percentage of tracks that is written to disk in write-through mode.

Write Cache Write Through I/O Rate (ops/s)
The average number of tracks per second that are written to disk in write-through mode.

Maximum Read Cache Hit Percentage
The maximum number of cache hits in percentage for sequential and nonsequential read operations for the volume over a specified interval. This metric is only available for daily data for SAN Volume Controller and Storwize V7000 systems.

Maximum Write Cache Delay I/O Rate (ops/s)
The maximum number of delayed I/O operations per second for the volume, where the delay occurred because of space constraints or other conditions.

This metric is only available for daily data for SAN Volume Controller and Storwize V7000 systems.

Other data

You can create performance reports that include the following information:

Global Mirror Write I/O Rate (op/s)
The average number of write operations per second that are issued to the Global Mirror secondary site.

Global Mirror Overlapping Write Percentage
The percentage of overlapping write operations that are issued by the Global Mirror primary site.

For SAN Volume Controller software releases 4.3.1 and later, some overlapping writes are processed in parallel and are excluded from this value. For SAN Volume Controller software releases 4.3.0 and earlier, all overlapping writes are serialized.

Global Mirror Overlapping Write I/O Rate (op/s)
The average number of overlapping write operations per second that are issued by the Global Mirror primary site.

For SAN Volume Controller software releases 4.3.1 and later, some overlapping writes are processed in parallel and are excluded from this value. For SAN Volume Controller software releases 4.3.0 and earlier, all overlapping writes are serialized.

Peak Read Response Time (ms)
The longest time to complete a read operation.

Peak Write Response Time (ms)
The longest time to complete a write operation.

Global Mirror Secondary Write Lag (ms/op)
The average number of milliseconds to service a secondary write operation for Global Mirror. This value does not include the time to service the primary write operation.

You monitor the value of Global Mirror Secondary Write Lag to identify delays that occurred during the process of writing data to the secondary site.

Overall Host Attributed Response Time Percentage
The percentage of the average response time that can be attributed to delays from host systems. This value includes both read response times

and write response times, and can help you diagnose slow hosts and fabrics that are not working efficiently.

The value is based on the following conditions:

- For read response time, the time that it takes for hosts to respond to transfer-ready notifications from the SAN Volume Controller nodes.
- For write response time, the time that it takes for hosts to send the write data after the node responds to a transfer-ready notification.

Nonpreferred Node Usage Percentage
The overall percentage of I/O operations that are completed, or data that is transferred over the non-preferred nodes of the virtual disks.

Performance metrics for volumes on storage systems that are configured to virtualize storage:

A storage environment can include a Hitachi Universal Storage Platform V system that is configured to virtualize storage. You can include performance data for volumes and caches for storage system volumes on these systems in performance reports.

Volume data

You can create performance reports that include the following information:

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation.

Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation.

Overall Transfer Size (KiB/op)
The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Volume Utilization
The average percentage of time that the volume is busy.

Cache data

You can create performance reports that include the following information:

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Overall Write Cache Hit Percentage
The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

Total Overall Cache Hit Percentage
The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Data for storage virtualizer nodes in performance reports

You can include properties, and other information about storage virtualizer nodes in performance reports.

Information about storage virtualizer nodes

You can create performance reports that include the following information:

Storage Virtualizer Name
A user-defined name of the storage virtualizer. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage virtualizer was added for monitoring.

Storage Virtualizer Node Name
The name that was assigned to the storage virtualizer node when it was added to the system.

Storage Virtualizer I/O Group Name
The name that was assigned to the I/O group on a storage virtualizer when it was added to the system.

Component properties

You can create performance reports that include the following information:

Storage Virtualizer Node IP Address
The IP address of the resource.

Storage Virtualizer Node WWN
The worldwide name of the node.

Storage Virtualizer Node Configuration
The number of the node for the resource. This value can be either `0` or `1`.

Status information

You can create performance reports that include the following information:

Storage Virtualizer Node Status
Shows whether a storage virtualizer node is online.

Performance metrics for storage virtualizer nodes:

You can include port data, front end data, cache data, back-end data, and other data for storage virtualizer nodes in performance reports.

Port data

You can create performance reports that include the following information:

Port Send I/O Rate (ops/s)
The average number of I/O operations per second for operations in which data is sent from a port.

Port Receive I/O Rate (ops/s)
The average number of I/O operations per second for operations in which the port receives data.

Total Port I/O Rate (ops/s)
The average number of send operations and receive operations per second.

Port Send Data Rate (MiB/s)
The average rate at which data is sent through the port. The rate is measured in MiB per second.

Port Receive Data Rate (MiB/s)
The average rate at which data is received by the port. The rate is measured in MiB per second.

Total Port Data Rate (MiB/s)
The average rate at which data is transferred through the port. The rate is measured in MiB per second and includes both send and receive operations.

Port to Host Send I/O Rate (ops/s)
The average number of exchanges per second that are sent to host computers.

Port to Host Receive I/O Rate (ops/s)
The average number of exchanges per second that are received from host computers.

Total Port to Host I/O Rate (ops/s)
The average number of exchanges per second that are transmitted between host computers and the component.

Port to Disk Send I/O Rate (ops/s)
The average number of exchanges per second that are sent to back-end storage resources.

Port to Disk Receive I/O Rate (ops/s)
The average number of exchanges per second that are received from back-end storage resources.

Total Port to Disk I/O Rate (ops/s)
The average number of exchanges per second that are transmitted between back-end storage resources and the component. This value includes both send and receive operations.

Port to Local Node Send I/O Rate (ops/s)
The average number of exchanges per second that are sent to other nodes that are in the local SAN Volume Controller cluster.

Port to Local Node Receive I/O Rate (ops/s)
The average number of exchanges per second that are received from other nodes that are in the local SAN Volume Controller cluster.

Total Port to Local Node I/O Rate (ops/s)
The average number of exchanges per second that are transmitted between the component and other nodes that are in the local SAN Volume Controller cluster.

Port to Remote Node Send I/O Rate (ops/s)
The average number of exchanges per second that are sent to nodes that are in the remote SAN Volume Controller cluster.

Port to Remote Node Receive I/O Rate (ops/s)
The average number of exchanges per second that are received from nodes that are in the remote SAN Volume Controller cluster.

Total Port to Remote Node I/O Rate (ops/s)
The average number of exchanges per second that are transmitted between the component and nodes that are in the remote SAN Volume Controller cluster.

Port to Host Send Data Rate (MiB/s)
The average rate at which data is sent to host computers. The rate is measured in MiB per second.

Port to Host Receive Data Rate (MiB/s)
The average rate at which data is received from host computers. The rate is measured in MiB per second.

Total Port to Host Data Rate (MiB/s)
The average rate at which data is transmitted between host computers and the component. The rate is measured in MiB per second and includes both send and receive operations.

Port to Disk Send Data Rate (MiB/s)
The average rate at which data is sent to back-end storage resources. The rate is measured in MiB per second.

Port to Disk Receive Data Rate (MiB/s)
The average rate at which data is received from back-end storage resources. The rate is measured in MiB per second.

Total Port to Disk Data Rate (MiB/s)
The average rate at which data is transmitted between back-end storage resources and the component. The rate is measured in MiB per second and includes both send and receive operations.

Port to Local Node Send Data Rate (MiB/s)
The average rate at which data is sent to other nodes that are in the local SAN Volume Controller cluster. The rate is measured in MiB per second.

Port to Local Node Receive Data Rate (MiB/s)
The average rate at which data is received from other nodes that are in the local SAN Volume Controller cluster. The rate is measured in MiB per second.

Total Port to Local Node Data Rate (MiB/s)
The average rate at which data is transmitted between the component and other nodes that are in the local SAN Volume Controller cluster. The rate is measured in MiB per second.

Port to Remote Node Send Data Rate (MiB/s)
The average rate at which data is sent to nodes that are in the remote SAN Volume Controller cluster. The rate is measured in MiB per second.

Port to Remote Node Receive Data Rate (MiB/s)
The average rate at which data is received from nodes that are in the remote SAN Volume Controller cluster. The rate is measured in MiB per second.

Total Port to Remote Node Data Rate (MiB/s)
The average rate at which data is transmitted between the component and nodes that are in the remote SAN Volume Controller cluster. The rate is measured in MiB per second.

Port to Local Node Send Response Time (ms/op)
The average number of milliseconds to complete a send operation to another node that is in the local SAN Volume Controller cluster. This value represents the external response time of the transfers.

Port to Local Node Receive Response Time (ms/op)
The average number of milliseconds to complete a receive operation from another node that is in the local SAN Volume Controller cluster. This value represents the external response time of the transfers.

Overall Port to Local Node Response Time (ms/op)
The average number of milliseconds to complete a send or receive operation with another node that is in the local SAN Volume Controller cluster. This value represents the external response time of the transfers.

Port to Local Node Send Queue Time (ms/op)
The average time in milliseconds that a send operation spends in the queue before the operation is processed. This value represents the queue time for send operations that are issued to other nodes that are in the local SAN Volume Controller cluster.

Port to Local Node Receive Queue Time (ms/op)
The average time in milliseconds that a receive operation spends in the queue before the operation is processed. This value represents the queue time for receive operations that are issued from other nodes that are in the local SAN Volume Controller cluster.

Overall Port to Local Node Queue Time (ms/op)
The average number of milliseconds that a send or receive operation spends in the queue before the operation is processed. This value is for send and receive operations that are issued between the component and other nodes that are in the local SAN Volume Controller cluster.

Port to Remote Node Send Response Time (ms/op)
The average number of milliseconds to complete a send operation to a node that is in the remote SAN Volume Controller cluster. This value represents the external response time of the transfers.

Port to Remote Node Receive Response Time (ms/op)
The average number of milliseconds to complete a receive operation from a node that is in the remote SAN Volume Controller cluster. This value represents the external response time of the transfers.

Overall Port to Remote Node Response Time (ms/op)
The average number of milliseconds to complete a send operation to, or a receive operation from a node in the remote SAN Volume Controller cluster. This value represents the external response time of the transfers.

Port to Remote Node Send Queue Time (ms/op)
The average time in milliseconds that a send operation spends in the queue before the operation is processed. This value represents the queue time for send operations that are issued to a node that is in the remote SAN Volume Controller cluster.

Port to Remote Node Receive Queue Time (ms/op)
The average time in milliseconds that a receive operation spends in the queue before the operation is processed. This value represents the queue time for receive operations that are issued from a node that is in the remote SAN Volume Controller cluster.

Overall Port to Remote Node Queue Time (ms/op)
The average number of milliseconds that a send or receive operation spends in the queue before the operation is processed. This value is for send and receive operations that are issued between the component and a node that is in the remote SAN Volume Controller cluster.

Front end data

You can create performance reports that include the following information:

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation.

Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation.

Overall Transfer Size (KiB/op)
The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Cache data

You can create performance reports that include the following information:

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Overall Write Cache Hit Percentage
The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

Total Overall Cache Hit Percentage
The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Write Cache Delay Percentage
The percentage of I/O operations that are delayed because there is not enough space in the write cache.

The only operations that can be delayed are write operations, but the value is calculated as an average of all I/O operations.

Read Ahead Percentage of Cache Hits
The percentage of all read-cache hits that occur on pre-staged data.

Dirty Write Percentage of Cache Hits
The percentage of all cache write operations that occur on data in the cache that is marked as modified. This value represents how effectively write operations are coalesced before the data is written to disk.

Write Cache Overflow Percentage
The percentage of write operations that are delayed because there is not enough space in the write cache.

Write Cache Flush Through Percentage
The percentage of tracks that is written to disk in flush-through mode.

Write Cache Write Through Percentage
The percentage of tracks that is written to disk in write-through mode.

Write Cache Delay I/O Rate (ops/s)
The average number of I/O operations per second that are delayed because there is not enough space in the write cache.

The only operations that can be delayed are write operations, but the value is calculated as an average of all I/O operations.

Write Cache Overflow I/O Rate (ops/s)
The average number of write operations per second that are delayed because there is not enough space in the write cache.

Write Cache Flush Through I/O Rate (ops/s)
The average number of tracks per second that are written to disk in flush-through mode.

Write Cache Write Through I/O Rate (ops/s)
The average number of tracks per second that are written to disk in write-through mode.

Disk to Cache Transfer Rate (ops/s)
The average number of tracks that are transferred per second from the disks to the cache.

Cache to Disk Transfer Rate (ops/s)
The average number of tracks per second that are transferred from the cache to the disks.

Back-end data

You can create performance reports that include the following information:

Back-End Read I/O Rate (ops/s)
The average number of read operations per second that are issued to the back-end storage resources.

Back-End Write I/O Rate (ops/s)
The average number of write operations per second that are issued to the back-end storage resources.

Total Back-End I/O Rate (ops/s)
The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

Back-End Read Data Rate (MiB/s)
The average number of MiB per second that are read from the back-end storage resources.

Back-End Write Data Rate (MiB/s)
The average number of MiB per second that are written to the back-end storage resources.

Total Back-End Data Rate (MiB/s)
The average rate at which data is transmitted between the back-end storage resources and the component. The rate is measured in MiB per second and includes both read and write operations.

Back-End Read Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Back-End Write Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Overall Back-End Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Back-End Read Queue Time (ms/op)
The average number of milliseconds that a read operation spends in the queue before the operation is sent to the back-end storage resources.

Back-End Write Queue Time (ms/op)
The average number of milliseconds that a write operation spends in the queue before the operation is sent to the back-end storage resources.

Overall Back-End Queue Time (ms/op)
The average number of milliseconds that a read or a write operation spends in the queue before the operation is sent to the back-end storage resources.

Back-End Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation from the back-end storage resources.

Back-End Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation to the back-end storage resources.

Overall Back-End Transfer Size (KiB/op)
The average transfer size, in KiB, of a read or a write operation to the back-end storage resources.

Peak Back-End Read Response Time (ms)
The longest time for a back-end storage resource to respond to a read operation.

Peak Back-End Write Response Time (ms)
The longest time for a back-end storage resource to respond to a write operation.

Peak Back-End Read Queue Time (ms)
The longest time that a read operation spends in the queue before the operation is sent to the back-end storage resources.

Peak Back-End Write Queue Time (ms)
The longest time that a write operation spends in the queue before the operation is sent to the back-end storage resources.

Other data

You can create performance reports that include the following information:

Global Mirror Write I/O Rate (op/s)
The average number of write operations per second that are issued to the Global Mirror secondary site.

Global Mirror Overlapping Write Percentage
The percentage of overlapping write operations that are issued by the Global Mirror primary site.

For SAN Volume Controller software releases 4.3.1 and later, some overlapping writes are processed in parallel and are excluded from this value. For SAN Volume Controller software releases 4.3.0 and earlier, all overlapping writes are serialized.

Global Mirror Overlapping Write I/O Rate (op/s)
The average number of overlapping write operations per second that are issued by the Global Mirror primary site.

For SAN Volume Controller software releases 4.3.1 and later, some overlapping writes are processed in parallel and are excluded from this value. For SAN Volume Controller software releases 4.3.0 and earlier, all overlapping writes are serialized.

Global Mirror Secondary Write Lag (ms/op)
The average number of milliseconds to service a secondary write operation for Global Mirror. This value does not include the time to service the primary write operation.

You monitor the value of Global Mirror Secondary Write Lag to identify delays that occurred during the process of writing data to the secondary site.

Peak Read Response Time (ms)
The longest time to complete a read operation.

Peak Write Response Time (ms)
The longest time to complete a write operation.

Link Failure Rate (count/s)
The average number of link errors per second.

Loss of Sync Rate (count/s)
The average number of times per second that synchronization is lost.

Synchronization is assumed lost after a timeout interval expires.

Loss of Signal Rate (count/s)
The average number of times per second that the signal is lost.

CRC Error Rate (count/s)
The average number of frames per second that are received in which a cyclic redundancy check (CRC) error is detected. A CRC error is detected when the CRC in the transmitted frame does not match the CRC computed by the receiver.

Primitive Sequence Protocol Error Rate (count/s)
The average number of primitive sequence protocol errors per second that are detected.

This error occurs when there is a link failure for a port.

Invalid Transmission Word Rate (count/s)
The average number of bit errors per second that are detected.

Processor Utilization Percentage
The average percentage of time that the processors are busy.

Overall Host Attributed Response Time Percentage
The percentage of the average response time that can be attributed to delays from host systems. This value includes both read response times and write response times, and can help you diagnose slow hosts and fabrics that are not working efficiently.

The value is based on the following conditions:

- For read response time, the time that it takes for hosts to respond to transfer-ready notifications from the SAN Volume Controller nodes.
- For write response time, the time that it takes for hosts to send the write data after the node responds to a transfer-ready notification.

Zero Buffer-to-Buffer Credit Timer (microseconds)
The number of microseconds that the port is not able to send frames between ports because there is insufficient buffer-to-buffer credit.

In Fibre Channel technology, buffer-to-buffer credit is used to control the flow of frames between ports. Buffer-to-buffer credit is measured from the last time that the node was reset.

Data for storage virtualizer I/O groups in performance reports

You can include general information, capacity data, and properties of storage virtualizer I/O groups in performance reports.

Information about storage virtualizer I/O groups

You can create performance reports that include the following information:

Storage Virtualizer Name
A user-defined name of the storage virtualizer. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage virtualizer was added for monitoring.

Storage Virtualizer I/O Group Name
The name that was assigned to the I/O group on a storage virtualizer when it was added to the system.

Capacity and usage data

You can create performance reports that include the following information:

Storage Virtualizer I/O Group Mirroring Total Memory (MiB)
The total amount of memory that is allocated on the nodes in an I/O group to provide volume mirroring functions.

Storage Virtualizer I/O Group Mirroring Free Memory (MiB)
The amount of available memory on the nodes in an I/O group to provide volume mirroring functions.

Storage Virtualizer I/O Group FlashCopy Total Memory (MiB)
The total amount of memory that is allocated on the nodes in an I/O group to provide FlashCopy mirroring functions.

Storage Virtualizer I/O Group FlashCopy Free Memory (MiB)
The amount of available memory on the nodes in an I/O group to provide FlashCopy mirroring functions.

Storage Virtualizer I/O Group Remote Copy Total Memory (MiB)
The total amount of memory that is allocated on the nodes in an I/O group to provide mirroring functions by using a remote copy.

Storage Virtualizer I/O Group Remote Copy Free Memory (MiB)
The amount of available memory on the nodes in an I/O group to provide mirroring functions by using a remote copy.

Storage Virtualizer I/O Group RAID Total Memory (MiB)
The total amount of memory that is allocated on the nodes in an I/O group to provide RAID mirroring functions.

Storage Virtualizer I/O Group RAID Free Memory (MiB)
The amount of available memory on the nodes in an I/O group to provide RAID mirroring functions.

Component properties

You can create performance reports that include the following information:

Storage Virtualizer I/O Group Maintenance
Shows whether the I/O group is in maintenance mode. If this value is `Yes`, the I/O group is in maintenance mode.

Storage Virtualizer I/O Group Is Compression Active
Shows whether the compression feature is enabled on the volumes in the storage virtualizer I/O group. If this value is `Yes`, the compression feature is enabled.

Storage Virtualizer I/O Group Is Compression Supported
Shows whether the compression feature is available for volumes in the storage virtualizer I/O group. If this value is `Yes`, the compression feature is available.

Performance metrics for storage virtualizer I/O groups:

You can include performance data for ports, volumes, caches, back-end arrays, and other data for storage virtualizer I/O groups in performance reports.

Port data

You can create performance reports that include the following information:

Port Send I/O Rate (ops/s)
The average number of I/O operations per second for operations in which data is sent from a port.

Port Receive I/O Rate (ops/s)
The average number of I/O operations per second for operations in which the port receives data.

Total Port I/O Rate (ops/s)
The average number of send operations and receive operations per second.

Port Send Data Rate (MiB/s)
The average rate at which data is sent through the port. The rate is measured in MiB per second.

Port Receive Data Rate (MiB/s)
The average rate at which data is received by the port. The rate is measured in MiB per second.

Total Port Data Rate (MiB/s)
The average rate at which data is transferred through the port. The rate is measured in MiB per second and includes both send and receive operations.

Port to Host Send I/O Rate (ops/s)
The average number of exchanges per second that are sent to host computers.

Port to Host Receive I/O Rate (ops/s)
The average number of exchanges per second that are received from host computers.

Total Port to Host I/O Rate (ops/s)
The average number of exchanges per second that are transmitted between host computers and the component.

Port to Disk Send I/O Rate (ops/s)
The average number of exchanges per second that are sent to back-end storage resources.

Port to Disk Receive I/O Rate (ops/s)
The average number of exchanges per second that are received from back-end storage resources.

Total Port to Disk I/O Rate (ops/s)
The average number of exchanges per second that are transmitted between back-end storage resources and the component. This value includes both send and receive operations.

Port to Local Node Send I/O Rate (ops/s)
The average number of exchanges per second that are sent to other nodes that are in the local SAN Volume Controller cluster.

Port to Local Node Receive I/O Rate (ops/s)
The average number of exchanges per second that are received from other nodes that are in the local SAN Volume Controller cluster.

Total Port to Local Node I/O Rate (ops/s)
The average number of exchanges per second that are transmitted between the component and other nodes that are in the local SAN Volume Controller cluster.

Port to Remote Node Send I/O Rate (ops/s)
The average number of exchanges per second that are sent to nodes that are in the remote SAN Volume Controller cluster.

Port to Remote Node Receive I/O Rate (ops/s)
The average number of exchanges per second that are received from nodes that are in the remote SAN Volume Controller cluster.

Total Port to Remote Node I/O Rate (ops/s)
The average number of exchanges per second that are transmitted between the component and nodes that are in the remote SAN Volume Controller cluster.

Port to Host Send Data Rate (MiB/s)
The average rate at which data is sent to host computers. The rate is measured in MiB per second.

Port to Host Receive Data Rate (MiB/s)
The average rate at which data is received from host computers. The rate is measured in MiB per second.

Total Port to Host Data Rate (MiB/s)
The average rate at which data is transmitted between host computers and the component. The rate is measured in MiB per second and includes both send and receive operations.

Port to Disk Send Data Rate (MiB/s)
The average rate at which data is sent to back-end storage resources. The rate is measured in MiB per second.

Port to Disk Receive Data Rate (MiB/s)
The average rate at which data is received from back-end storage resources. The rate is measured in MiB per second.

Total Port to Disk Data Rate (MiB/s)
The average rate at which data is transmitted between back-end storage resources and the component. The rate is measured in MiB per second and includes both send and receive operations.

Port to Local Node Send Data Rate (MiB/s)
The average rate at which data is sent to other nodes that are in the local SAN Volume Controller cluster. The rate is measured in MiB per second.

Port to Local Node Receive Data Rate (MiB/s)
The average rate at which data is received from other nodes that are in the local SAN Volume Controller cluster. The rate is measured in MiB per second.

Total Port to Local Node Data Rate (MiB/s)
The average rate at which data is transmitted between the component and other nodes that are in the local SAN Volume Controller cluster. The rate is measured in MiB per second.

Port to Remote Node Send Data Rate (MiB/s)
The average rate at which data is sent to nodes that are in the remote SAN Volume Controller cluster. The rate is measured in MiB per second.

Port to Remote Node Receive Data Rate (MiB/s)
The average rate at which data is received from nodes that are in the remote SAN Volume Controller cluster. The rate is measured in MiB per second.

Total Port to Remote Node Data Rate (MiB/s)
The average rate at which data is transmitted between the component and nodes that are in the remote SAN Volume Controller cluster. The rate is measured in MiB per second.

Port to Local Node Send Response Time (ms/op)
The average number of milliseconds to complete a send operation to another node that is in the local SAN Volume Controller cluster. This value represents the external response time of the transfers.

Port to Local Node Receive Response Time (ms/op)
The average number of milliseconds to complete a receive operation from another node that is in the local SAN Volume Controller cluster. This value represents the external response time of the transfers.

Overall Port to Local Node Response Time (ms/op)
The average number of milliseconds to complete a send or receive

operation with another node that is in the local SAN Volume Controller cluster. This value represents the external response time of the transfers.

Port to Local Node Send Queue Time (ms/op)
The average time in milliseconds that a send operation spends in the queue before the operation is processed. This value represents the queue time for send operations that are issued to other nodes that are in the local SAN Volume Controller cluster.

Port to Local Node Receive Queue Time (ms/op)
The average time in milliseconds that a receive operation spends in the queue before the operation is processed. This value represents the queue time for receive operations that are issued from other nodes that are in the local SAN Volume Controller cluster.

Overall Port to Local Node Queue Time (ms/op)
The average number of milliseconds that a send or receive operation spends in the queue before the operation is processed. This value is for send and receive operations that are issued between the component and other nodes that are in the local SAN Volume Controller cluster.

Port to Remote Node Send Response Time (ms/op)
The average number of milliseconds to complete a send operation to a node that is in the remote SAN Volume Controller cluster. This value represents the external response time of the transfers.

Port to Remote Node Receive Response Time (ms/op)
The average number of milliseconds to complete a receive operation from a node that is in the remote SAN Volume Controller cluster. This value represents the external response time of the transfers.

Overall Port to Remote Node Response Time (ms/op)
The average number of milliseconds to complete a send operation to, or a receive operation from a node in the remote SAN Volume Controller cluster. This value represents the external response time of the transfers.

Port to Remote Node Send Queue Time (ms/op)
The average time in milliseconds that a send operation spends in the queue before the operation is processed. This value represents the queue time for send operations that are issued to a node that is in the remote SAN Volume Controller cluster.

Port to Remote Node Receive Queue Time (ms/op)
The average time in milliseconds that a receive operation spends in the queue before the operation is processed. This value represents the queue time for receive operations that are issued from a node that is in the remote SAN Volume Controller cluster.

Overall Port to Remote Node Queue Time (ms/op)
The average number of milliseconds that a send or receive operation spends in the queue before the operation is processed. This value is for send and receive operations that are issued between the component and a node that is in the remote SAN Volume Controller cluster.

Volume data

You can create performance reports that include the following information:

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation.

Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation.

Overall Transfer Size (KiB/op)
The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

Back-end array data

You can create performance reports that include the following information:

Back-End Read Data Rate (MiB/s)
The average number of MiB per second that are read from the back-end storage resources.

Back-End Write Data Rate (MiB/s)
The average number of MiB per second that are written to the back-end storage resources.

Total Back-End I/O Rate (ops/s)
The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

Back-End Read I/O Rate (ops/s)
The average number of read operations per second that are issued to the back-end storage resources.

Back-End Write I/O Rate (ops/s)
The average number of write operations per second that are issued to the back-end storage resources.

Total Back-End Data Rate (MiB/s)
The average rate at which data is transmitted between the back-end storage resources and the component. The rate is measured in MiB per second and includes both read and write operations.

Back-End Read Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Back-End Write Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Overall Back-End Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Back-End Read Queue Time (ms/op)
The average number of milliseconds that a read operation spends in the queue before the operation is sent to the back-end storage resources.

Back-End Write Queue Time (ms/op)
The average number of milliseconds that a write operation spends in the queue before the operation is sent to the back-end storage resources.

Overall Back-End Queue Time (ms/op)
The average number of milliseconds that a read or a write operation spends in the queue before the operation is sent to the back-end storage resources.

Back-End Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation from the back-end storage resources.

Back-End Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation to the back-end storage resources.

Overall Back-End Transfer Size (KiB/op)
The average transfer size, in KiB, of a read or a write operation to the back-end storage resources.

Peak Back-End Read Response Time (ms)
The longest time for a back-end storage resource to respond to a read operation.

Peak Back-End Write Response Time (ms)
The longest time for a back-end storage resource to respond to a write operation.

Peak Back-End Read Queue Time (ms)
The longest time that a read operation spends in the queue before the operation is sent to the back-end storage resources.

Peak Back-End Write Queue Time (ms)
The longest time that a write operation spends in the queue before the operation is sent to the back-end storage resources.

Cache data

You can create performance reports that include the following information:

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Overall Write Cache Hit Percentage
The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

Total Overall Cache Hit Percentage
The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Disk to Cache Transfer Rate (ops/s)
The average number of tracks that are transferred per second from the disks to the cache.

Cache to Disk Transfer Rate (ops/s)
The average number of tracks per second that are transferred from the cache to the disks.

Write Cache Delay Percentage
The percentage of I/O operations that are delayed because there is not enough space in the write cache.

The only operations that can be delayed are write operations, but the value is calculated as an average of all I/O operations.

Write Cache Delay I/O Rate (ops/s)
The average number of I/O operations per second that are delayed because there is not enough space in the write cache.

The only operations that can be delayed are write operations, but the value is calculated as an average of all I/O operations.

Read Ahead Percentage of Cache Hits
The percentage of all read-cache hits that occur on pre-staged data.

Dirty Write Percentage of Cache Hits
The percentage of all cache write operations that occur on data in the cache that is marked as modified. This value represents how effectively write operations are coalesced before the data is written to disk.

Write Cache Overflow Percentage
The percentage of write operations that are delayed because there is not enough space in the write cache.

Write Cache Overflow I/O Rate (ops/s)
The average number of write operations per second that are delayed because there is not enough space in the write cache.

Write Cache Flush Through Percentage
The percentage of tracks that is written to disk in flush-through mode.

Write Cache Flush Through I/O Rate (ops/s)
The average number of tracks per second that are written to disk in flush-through mode.

Write Cache Write Through Percentage
The percentage of tracks that is written to disk in write-through mode.

Write Cache Write Through I/O Rate (ops/s)
The average number of tracks per second that are written to disk in write-through mode.

Other data

You can create performance reports that include the following information:

Global Mirror Write I/O Rate (op/s)
The average number of write operations per second that are issued to the Global Mirror secondary site.

Global Mirror Overlapping Write Percentage
The percentage of overlapping write operations that are issued by the Global Mirror primary site.

For SAN Volume Controller software releases 4.3.1 and later, some overlapping writes are processed in parallel and are excluded from this value. For SAN Volume Controller software releases 4.3.0 and earlier, all overlapping writes are serialized.

Global Mirror Overlapping Write I/O Rate (op/s)
The average number of overlapping write operations per second that are issued by the Global Mirror primary site.

For SAN Volume Controller software releases 4.3.1 and later, some overlapping writes are processed in parallel and are excluded from this value. For SAN Volume Controller software releases 4.3.0 and earlier, all overlapping writes are serialized.

Peak Read Response Time (ms)
The longest time to complete a read operation.

Peak Write Response Time (ms)
The longest time to complete a write operation.

Global Mirror Secondary Write Lag (ms/op)
The average number of milliseconds to service a secondary write operation for Global Mirror. This value does not include the time to service the primary write operation.

You monitor the value of Global Mirror Secondary Write Lag to identify delays that occurred during the process of writing data to the secondary site.

Link Failure Rate (count/s)
The average number of link errors per second.

Loss of Sync Rate (count/s)
The average number of times per second that synchronization is lost.

Synchronization is assumed lost after a timeout interval expires.

Loss of Signal Rate (count/s)
The average number of times per second that the signal is lost.

CRC Error Rate (count/s)
The average number of frames per second that are received in which a cyclic redundancy check (CRC) error is detected. A CRC error is detected when the CRC in the transmitted frame does not match the CRC computed by the receiver.

Processor Utilization Percentage
The average percentage of time that the processors are busy.

Overall Host Attributed Response Time Percentage
The percentage of the average response time that can be attributed to delays from host systems. This value includes both read response times and write response times, and can help you diagnose slow hosts and fabrics that are not working efficiently.

The value is based on the following conditions:

- For read response time, the time that it takes for hosts to respond to transfer-ready notifications from the SAN Volume Controller nodes.
- For write response time, the time that it takes for hosts to send the write data after the node responds to a transfer-ready notification.

Nonpreferred Node Usage Percentage
The overall percentage of I/O operations that are completed, or data that is transferred over the non-preferred nodes of the virtual disks.

Primitive Sequence Protocol Error Rate (count/s)
The average number of primitive sequence protocol errors per second that are detected.

This error occurs when there is a link failure for a port.

Invalid Transmission Word Rate (count/s)
The average number of bit errors per second that are detected.

Zero Buffer-to-Buffer Credit Timer (microseconds)
The number of microseconds that the port is not able to send frames between ports because there is insufficient buffer-to-buffer credit.

In Fibre Channel technology, buffer-to-buffer credit is used to control the flow of frames between ports. Buffer-to-buffer credit is measured from the last time that the node was reset.

Data for storage virtualizer ports in performance reports

You can include properties and other information about storage virtualizer ports in performance reports.

Information about storage virtualizer ports

You can create performance reports that include the following information:

Storage Virtualizer Name
A user-defined name of the storage virtualizer. If a name was not defined,

Tivoli Storage Productivity Center shows the name that was defined when the storage virtualizer was added for monitoring.

Storage Virtualizer Node Name
The name that was assigned to the storage virtualizer node when it was added to the system.

Storage Virtualizer Port Name
An alphanumeric string that identifies a storage virtualizer port.

Component properties

You can create performance reports that include the following information:

Storage Virtualizer Port Number
The port number on the resource.

Storage Virtualizer Port Type
The type of port on the storage system, storage virtualizer, or switch. For example, the port type can be N_Port, F_Port, or another type of port.

Storage Virtualizer Port Speed (GiB)
The speed of a port, which is measured in GiB per second.

Status information

You can create performance reports that include the following information:

Storage Virtualizer Port Status
The condition of the resource, for example normal, warning, or error.

Storage Virtualizer Port Is Detected
Shows whether the resource was detected the last time that data was collected. If this value is `Yes`, the resource was detected.

Storage Virtualizer Port Enabled State
Shows whether a port is enabled, disabled, or is enabled but offline.

Performance metrics for storage virtualizer ports:

You can include performance data about storage virtualizer ports and port errors in performance reports.

Port data

You can create performance reports that include the following information:

Port Send I/O Rate (ops/s)
The average number of I/O operations per second for operations in which data is sent from a port.

Port Receive I/O Rate (ops/s)
The average number of I/O operations per second for operations in which the port receives data.

Total Port I/O Rate (ops/s)
The average number of send operations and receive operations per second.

Port Send Data Rate (MiB/s)
The average rate at which data is sent through the port. The rate is measured in MiB per second.

Port Receive Data Rate (MiB/s)
The average rate at which data is received by the port. The rate is measured in MiB per second.

Total Port Data Rate (MiB/s)
The average rate at which data is transferred through the port. The rate is measured in MiB per second and includes both send and receive operations.

Port to Host Send I/O Rate (ops/s)
The average number of exchanges per second that are sent to host computers.

Port to Host Receive I/O Rate (ops/s)
The average number of exchanges per second that are received from host computers.

Total Port to Host I/O Rate (ops/s)
The average number of exchanges per second that are transmitted between host computers and the component.

Port to Disk Send I/O Rate (ops/s)
The average number of exchanges per second that are sent to back-end storage resources.

Port to Disk Receive I/O Rate (ops/s)
The average number of exchanges per second that are received from back-end storage resources.

Total Port to Disk I/O Rate (ops/s)
The average number of exchanges per second that are transmitted between back-end storage resources and the component. This value includes both send and receive operations.

Port to Local Node Send I/O Rate (ops/s)
The average number of exchanges per second that are sent to other nodes that are in the local SAN Volume Controller cluster.

Port to Local Node Receive I/O Rate (ops/s)
The average number of exchanges per second that are received from other nodes that are in the local SAN Volume Controller cluster.

Total Port to Local Node I/O Rate (ops/s)
The average number of exchanges per second that are transmitted between the component and other nodes that are in the local SAN Volume Controller cluster.

Port to Remote Node Send I/O Rate (ops/s)
The average number of exchanges per second that are sent to nodes that are in the remote SAN Volume Controller cluster.

Port to Remote Node Receive I/O Rate (ops/s)
The average number of exchanges per second that are received from nodes that are in the remote SAN Volume Controller cluster.

Total Port to Remote Node I/O Rate (ops/s)
The average number of exchanges per second that are transmitted between the component and nodes that are in the remote SAN Volume Controller cluster.

Port to Host Send Data Rate (MiB/s)
The average rate at which data is sent to host computers. The rate is measured in MiB per second.

Port to Host Receive Data Rate (MiB/s)
The average rate at which data is received from host computers. The rate is measured in MiB per second.

Total Port to Host Data Rate (MiB/s)
The average rate at which data is transmitted between host computers and the component. The rate is measured in MiB per second and includes both send and receive operations.

Port to Disk Send Data Rate (MiB/s)
The average rate at which data is sent to back-end storage resources. The rate is measured in MiB per second.

Port to Disk Receive Data Rate (MiB/s)
The average rate at which data is received from back-end storage resources. The rate is measured in MiB per second.

Total Port to Disk Data Rate (MiB/s)
The average rate at which data is transmitted between back-end storage resources and the component. The rate is measured in MiB per second and includes both send and receive operations.

Port to Local Node Receive Data Rate (MiB/s)
The average rate at which data is received from other nodes that are in the local SAN Volume Controller cluster. The rate is measured in MiB per second.

Port to Local Node Send Data Rate (MiB/s)
The average rate at which data is sent to other nodes that are in the local SAN Volume Controller cluster. The rate is measured in MiB per second.

Total Port to Local Node Data Rate (MiB/s)
The average rate at which data is transmitted between the component and other nodes that are in the local SAN Volume Controller cluster. The rate is measured in MiB per second.

Port to Remote Node Receive Data Rate (MiB/s)
The average rate at which data is received from nodes that are in the remote SAN Volume Controller cluster. The rate is measured in MiB per second.

Port to Remote Node Send Data Rate (MiB/s)
The average rate at which data is sent to nodes that are in the remote SAN Volume Controller cluster. The rate is measured in MiB per second.

Total Port to Remote Node Data Rate (MiB/s)
The average rate at which data is transmitted between the component and nodes that are in the remote SAN Volume Controller cluster. The rate is measured in MiB per second.

Port Send Bandwidth Percentage
The percentage of the port bandwidth that is used for send operations. This value is an indicator of port bandwidth usage that is based on the speed of the port.

Port Receive Bandwidth Percentage
The percentage of the port bandwidth that is used for receive operations. This value is an indicator of port bandwidth usage that is based on the speed of the port.

Overall Port Bandwidth Percentage
The percentage of the port bandwidth that is used for send operations and receive operations. This value is an indicator of port bandwidth usage that is based on the speed of the port.

Port error data

You can create performance reports that include the following information:

Link Failure Rate (count/s)
The average number of link errors per second.

Loss of Sync Rate (count/s)
The average number of times per second that synchronization is lost.

Synchronization is assumed lost after a timeout interval expires.

Loss of Signal Rate (count/s)
The average number of times per second that the signal is lost.

CRC Error Rate (count/s)
The average number of frames per second that are received in which a cyclic redundancy check (CRC) error is detected. A CRC error is detected when the CRC in the transmitted frame does not match the CRC computed by the receiver.

Primitive Sequence Protocol Error Rate (count/s)
The average number of primitive sequence protocol errors per second that are detected.

This error occurs when there is a link failure for a port.

Invalid Transmission Word Rate (count/s)
The average number of bit errors per second that are detected.

Zero Buffer-to-Buffer Credit Timer (microseconds)
The number of microseconds that the port is not able to send frames between ports because there is insufficient buffer-to-buffer credit.

In Fibre Channel technology, buffer-to-buffer credit is used to control the flow of frames between ports. Buffer-to-buffer credit is measured from the last time that the node was reset.

Zero Buffer-to-Buffer Credit Percentage
The amount of time, as a percentage, that the port was not able to send frames between ports because of insufficient buffer-to-buffer credit. The amount of time value is measured from the last time that the node was reset. In Fibre Channel technology, buffer-to-buffer credit is used to control the flow of frames between ports.

Performance metrics for ports on storage systems that are configured to virtualize storage:

A storage environment can include a Hitachi Universal Storage Platform V system that is configured to virtualize storage. You can include performance data for ports on these systems in performance reports.

Port data

You can create performance reports that include the following information:

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation.

Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation.

Overall Transfer Size (KiB/op)
The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

Port Send I/O Rate (ops/s)
The average number of I/O operations per second for operations in which data is sent from a port.

Port Receive I/O Rate (ops/s)
The average number of I/O operations per second for operations in which the port receives data.

Total Port I/O Rate (ops/s)
The average number of send operations and receive operations per second.

Data for storage virtualizer pools in performance reports

You can include general information, capacity data, properties, and other information about storage virtualizer pools in performance reports.

Information about storage virtualizer pools

You can create performance reports that include the following information:

Storage Virtualizer Name
A user-defined name of the storage virtualizer. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage virtualizer was added for monitoring.

Storage Virtualizer Pool Name
The name that was assigned to the pool when it was added to the system.

Capacity and usage data

You can create performance reports that include the following information:

Storage Virtualizer Pool Capacity (GiB)
The total amount of storage space in a pool.

Storage Virtualizer Pool Available Space (GiB)
The amount of space in a pool that is not reserved for volumes.

Storage Virtualizer Pool Total Volume Capacity (GiB)
The total storage space on all the volumes in a pool, which includes thin-provisioned and standard volumes. For thin-provisioned volumes, this value includes virtual space.

Storage Virtualizer Pool Allocated Space (GiB)
The amount of space that is reserved for all the volumes in a pool, which includes both thin-provisioned and standard volumes.

The space that is allocated for thin-provisioned volumes is less than their virtual capacity. The Storage Virtualizer Pool Total Volume Capacity (GiB) property shows the virtual capacity of the volumes. If a pool does not contain thin-provisioned volumes, this value is the same as the value of the Storage Virtualizer Pool Total Volume Capacity (GiB) property.

This value is equal to Storage Virtualizer Used Space (GiB) for volumes that are not thin provisioned.

Storage Virtualizer Pool Used Volume Space (GiB)
The amount of allocated space that is used by the volumes in a pool, which includes thin-provisioned and standard volumes.

For SAN Volume Controller and Storwize V7000, you can preallocate thin-provisioned volume space when volumes are created. For these storage systems, the Storage Virtualizer Pool Used Space might be different than the Storage Virtualizer Pool Allocated Space for pools that contain thin-provisioned volumes. In other cases, the values for Storage Virtualizer Pool Used Space and Storage Virtualizer Pool Allocated Space are equal.

This value is accurate as of the most recent time that Tivoli Storage Productivity Center collected data about a volume. The value in this property might not be 100% accurate for the current state of volumes. This inaccuracy might occur because data collection is run on a set schedule and the used space on volumes can change rapidly.

Storage Virtualizer Pool Extent Size (MiB)
The size of the extents that were specified when a pool was created. This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Pool Assigned Volume Space (GiB)
The amount of space in the pool that is on volumes that are assigned to a server or storage virtualizer.

Storage Virtualizer Pool Unassigned Volume Space (GiB)
The amount of volume space in the pool that is not assigned to a server or storage virtualizer.

Storage Virtualizer Pool Number of Storage Volumes
The number of volumes in the storage virtualizer pool.

Storage Virtualizer Pool Number of MDisks
The number of managed disks on a resource.

Storage Virtualizer Pool Physical Allocation Percentage
The percentage of physical space in a pool that is reserved for volumes. This value is always less than or equal to 100% because you cannot reserve more physical space than is available in a pool.

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

$(\text{allocated space} \div \text{pool capacity}) \times 100$

For example, the physical allocation percentage is 25% for a total pool size of 200 GiB. Therefore, the space that is reserved for volumes is 50 GiB.

Storage Virtualizer Pool Virtual Allocation Percentage
The percentage of physical space in a pool that is committed to the total

virtual capacity of the volumes in the pool. In thin-provisioned environments, this percentage exceeds 100% if a pool is overcommitted (over-provisioned).

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

`(total volume capacity ÷ pool capacity) × 100`

For example, for a total pool size of 15 GiB, the allocation percentage might be 200%. In this case, the virtual capacity that is committed to the volumes in the pool is 30 GiB. This configuration means that twice as much space is committed than is physically contained in the pool. If the allocation percentage is 100% for the same pool, then the virtual capacity that is committed to the pool is 15 GiB. This configuration means that all the physical capacity of the pool is already allocated to volumes.

An allocation percentage that is higher than 100% is considered aggressive. The pool has insufficient physical capacity to satisfy the maximum allocation for all the thin-provisioned volumes in the pool. In such cases, use the Storage Virtualizer Pool Shortfall Percentage property to estimate how critical the shortage of space is for storage system pools.

This value is only available for pools with thin-provisioned volumes.

Storage Virtualizer Pool Shortfall Percentage
The percentage of the remaining unallocated volume space in a pool that is not available to be allocated. The higher the percentage, the more critical the shortfall of pool space.

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

`(unallocatable space ÷ (total volume capacity − allocated space)) × 100`

You can use this percentage to determine when the amount of overcommitted space in a pool reaches a critically high level. For example, the physical space in a pool might be less than the committed virtual space. In this case, the pool does not have enough space to fulfill the commitment to virtual space.

This value represents the percentage of the committed virtual space that is not available in a pool. As more space is used over time by volumes while the pool capacity remains the same, this percentage increases.

For example, the physical capacity of a pool is 70 GiB, but 150 GiB of virtual space is committed to thin-provisioned volumes. If the volumes are using 50 GiB, then there is still 100 GiB committed to those volumes (150 GiB - 50 GiB). There is only 20 GiB of available pool space (70 GiB - 50 GiB). Because only 20 GiB of pool space is available, 80 GiB of the committed space cannot be allocated (100 GiB - 20 GiB). In this case, the percentage of committed space that cannot be allocated is 80% (80 GiB ÷ 100 GiB × 100).

This value is only available for pools with thin-provisioned volumes.

This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Pool Unallocated Volume Space (GiB)
The amount of the Total Volume Capacity in the pool that is not allocated.

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

```
total volume capacity – allocated space
```

The space that is allocated for thin-provisioned volumes is typically less than their virtual capacity. Therefore, the unallocated space represents the difference between the virtual capacity and the allocated space for all the volumes in the pool.

Storage Virtualizer Pool Unused Volume Space (GiB)
The amount of space that is allocated to the volumes in a pool and is not yet used.

Tivoli Storage Productivity Center uses the following formula to determine this value:

```
allocated space – used pool space
```

This property is available only for SAN Volume Controller and Storwize V7000 pools.

Storage Virtualizer Pool Unallocatable Volume Space (GiB)
The amount of space by which the Total Volume Capacity exceeds the physical capacity of a pool.

In thin-provisioned environments, it is possible to over commit (over provision) storage in a pool. If you create volumes with more virtual capacity than can be physically allocated in the pool, you can over commit storage in the pool.

This value represents the amount of volume space that cannot be allocated based on the current capacity of the pool.

Storage Virtualizer Pool Used Space Percentage
The percentage of allocated space that is used by the volumes in a pool, which includes thin-provisioned and standard volumes.

Storage Virtualizer Pool Compressed Virtual Capacity (GiB)
The total virtual capacity of all the volumes that are compressed in a storage virtualizer pool.

Storage Virtualizer Pool Compressed Capacity (GiB)
The amount of storage space that is used by compressed volumes in a storage virtualizer pool. For example, if 100 GiB of uncompressed data is compressed, and the size of the compressed data is 20 GiB, the value is 20.

Storage Virtualizer Pool Uncompressed Capacity (GiB)
The amount of storage space that is used if the compressed volume space is uncompressed. For example, if 100 GiB of uncompressed data is compressed, and the size of the compressed data is 20 GiB, the value is 100.

Component properties

You can create performance reports that include the following information:

Storage Virtualizer Pool Is Encryptable
Shows whether the storage virtualizer pool can be encrypted. If this value is `Yes`, the storage virtualizer pool can be encrypted.

This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Pool Is Encrypted
Shows whether the resource is encrypted. If this value is `Yes`, the resource is encrypted.

Storage Virtualizer Pool Is Solid State
Shows whether there are solid-state drives in the pool. This property can contain the following values:

Mixed The pool contains both hard disk drives and solid-state drives.

Non solid state
The pool contains no solid-state drives.

Solid state
The pool contains a least one solid-state drive.

Storage Virtualizer Pool Is Thin Provisioned
Shows whether a pool, volume, or volume copy is thin-provisioned. If this value is `Yes`, the resource is thin-provisioned.

Storage Virtualizer Pool RAID Level
The RAID level of the resource, such as RAID 5 or RAID 10. The RAID level affects the performance and fault tolerance of the volumes that are allocated from the resource.

Storage Virtualizer Pool Warning Level
The percentage of used capacity of the resource at which a warning is generated. This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Pool Is Compression Active
Shows whether the compression feature is enabled on the storage virtualizer pool. If this value is `Yes`, the compression feature is enabled.

Status information

You can create performance reports that include the following information:

Storage Virtualizer Pool Status
The condition of the resource, for example normal, warning, or error.

Storage Virtualizer Pool Is Detected
Shows whether the resource was detected the last time that data was collected. If this value is `Yes`, the resource was detected.

Performance metrics for storage virtualizer pools:

You can include performance data for volumes and back-end arrays for storage virtualizer pools in performance reports.

Volume data

You can create performance reports that include the following information:

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation.

Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation.

Overall Transfer Size (KiB/op)
The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

Maximum Read I/O Rate (ops/s)
The maximum read I/O rate of the volume in operations per second. This metric is only available for daily data for SAN Volume Controller and Storwize V7000 systems.

Back-end array data

You can create performance reports that include the following information:

Back-End Read I/O Rate (ops/s)
The average number of read operations per second that are issued to the back-end storage resources.

Back-End Write I/O Rate (ops/s)
The average number of write operations per second that are issued to the back-end storage resources.

Total Back-End I/O Rate (ops/s)
The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

Back-End Read Data Rate (MiB/s)
The average number of MiB per second that are read from the back-end storage resources.

Back-End Write Data Rate (MiB/s)
The average number of MiB per second that are written to the back-end storage resources.

Total Back-End Data Rate (MiB/s)
The average rate at which data is transmitted between the back-end storage resources and the component. The rate is measured in MiB per second and includes both read and write operations.

Back-End Read Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Back-End Write Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Overall Back-End Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Back-End Read Queue Time (ms/op)
The average number of milliseconds that a read operation spends in the queue before the operation is sent to the back-end storage resources.

Back-End Write Queue Time (ms/op)
The average number of milliseconds that a write operation spends in the queue before the operation is sent to the back-end storage resources.

Overall Back-End Queue Time (ms/op)
The average number of milliseconds that a read or a write operation spends in the queue before the operation is sent to the back-end storage resources.

Back-End Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation from the back-end storage resources.

Back-End Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation to the back-end storage resources.

Overall Back-End Transfer Size (KiB/op)
The average transfer size, in KiB, of a read or a write operation to the back-end storage resources.

Peak Back-End Read Response Time (ms)
The longest time for a back-end storage resource to respond to a read operation.

Peak Back-End Write Response Time (ms)
The longest time for a back-end storage resource to respond to a write operation.

Peak Back-End Read Queue Time (ms)
The longest time that a read operation spends in the queue before the operation is sent to the back-end storage resources.

Peak Back-End Write Queue Time (ms)
The longest time that a write operation spends in the queue before the operation is sent to the back-end storage resources.

Maximum Back-End Read I/O Rate (ops/s)
The maximum number of read operations per second that are issued to the back-end storage resources. This metric is only available for daily data for SAN Volume Controller and Storwize V7000 systems.

Maximum Back-End Write I/O Rate (ops/s)
The maximum number of write operations per second that are issued to the back-end storage resources. This metric is only available for daily data for SAN Volume Controller and Storwize V7000 systems.

Maximum Back-End Read Response Time (ms/op)
The maximum number of milliseconds for the back-end storage resources to respond to a read operation. This metric is only available for daily data for SAN Volume Controller and Storwize V7000 systems.

Maximum Back-End Write Response Time (ms/op)
The maximum number of milliseconds for the back-end storage resources to respond to a write operation. This metric is only available for daily data for SAN Volume Controller and Storwize V7000 systems.

Predefined reports about resource relationships

You can run predefined reports about the end-to-end relationship from a server to back-end storage. You can also run reports about the end-to-end relationship from file systems on servers to volumes on storage pools.

Running the Storage Resource Relationships Summary report

To show the relationships between storage resources, run the Storage Resource Relationships Summary report.

To run the report with the default settings, click **Finish**.

Tip: To select a resource, click the resource. To select multiple resources, press Ctrl and click the resources. To select a series of resources, select the first resource, and then press Shift and click the last resource.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.
2. Click **Storage Resource Relationships Summary**.
3. Optional: Select one or more of the following:
   a. Servers
   b. Hypervisors
   c. NAS resources
   d. Storage virtualizers
   e. Storage systems
4. Click **Finish**.

If the resources that you selected are not related, or if no data is available, a message is displayed in the report.

Restriction: To create a report when you select a single resource, the selected resource must be connected to other resources.

Related reference:

"Storage Resource Relationships Summary report"
Shows the end-to-end relationship from a server to back-end storage. The report shows servers, hypervisors, NAS, storage systems, storage virtualizers, pools, and volumes.

Storage Resource Relationships Summary report

Shows the end-to-end relationship from a server to back-end storage. The report shows servers, hypervisors, NAS, storage systems, storage virtualizers, pools, and volumes.

Report output

Information is provided about related resources and the devices, such as managed disks (MDisks), that are related to resources.

Server Name
The fully qualified domain name of the server. For example, the name of a server might be `server.example.com`.

Hypervisor Name
The fully qualified domain name of the hypervisor. For example, the name of a hypervisor might be `hypervisor.example.com`.

NAS Name
The fully qualified domain name of the NAS device. For example, the name of a NAS device might be `nas.example.com`.

Storage Virtualizer Name
A user-defined name of the storage virtualizer. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage virtualizer was added for monitoring.

Storage Virtualizer Volume Name
The name that was assigned to the storage virtualizer volume when it was added to the system.

Storage Virtualizer Volume Assigned Host Connection
The host connection to which the storage virtualizer volume is assigned. The host connection is a definition in the storage virtualizer that contains the WWPN for the server. The storage virtualizer uses the WWPN to assign volumes to servers.

Storage Virtualizer Pool Name
The name that was assigned to the pool when it was added to the system.

Storage Virtualizer MDisk Name
The name that was assigned to the managed disk on a storage virtualizer when it was added to the system.

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage Volume Assigned Host Connection
The host connection to which the storage volume is assigned. The host connection is a definition in the storage system that contains the WWPN for the server. The storage system uses the WWPN to assign volumes to servers.

Storage Volume Name
The name that was assigned to the storage volume when it was added to the system.

Storage Pool Name
The name that was assigned to the pool when it was added to the system.

Related reports

To open other reports that are related to a resource in this report, click the name of the resource. You can open the following related reports for the resources in this report:

Resource	Related reports
Storage system	Performance of One Storage System
Volume	Performance of One Volume
Managed disk	Performance of One Managed Disk
Storage pool	Most Active Pools, Performance of One Pool

Related tasks:

"Running the Storage Resource Relationships Summary report" on page 930
To show the relationships between storage resources, run the Storage Resource Relationships Summary report.

Running the Storage Resource Relationships Summary (Configurable) report

To show the relationships between resources, run the Storage Resource Relationships Summary (Configurable) report. You can show or hide resources, and you can hide resources that are not related to other resources or storage devices.

To run the report with the default settings, click **Finish**. Servers, storage systems, storage virtualizers, and their related resources are shown in the report.

Tip: To select a resource, click the resource. To select multiple resources, press Ctrl and click the resources. To select a series of resources, select the first resource, and then press Shift and click the last resource.

Tip: To create a report for a single resource, the selected resource must be connected to other storage devices or resources. To create a report about two or more selected resources, the resources that you select must be related.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.
2. Click **Storage Resource Relationships Summary (Configurable)**.
3. Optional: Select the storage resources that you want to show in the report.
4. Optional: Specify whether you want to show or hide a resource that is related to other storage devices such as a file system, but not to other resources. For example, a server has a related file system. You can show the server and its related storage devices in the report, or you can hide the resource and its related storage devices in the report.
5. Optional: Click **Finish** to run the report.
6. Optional: Click **Next**. In the Select storage resources page, select one or more of the following:

a. Servers
b. Hypervisors
c. NAS resources
d. Storage virtualizers
e. Storage systems

7. Click **Finish**.

If the resources that you selected are not related, or if no data is available, a message is displayed in the report.

Related reference:

"Storage Resource Relationships Summary (Configurable) report"

Storage Resource Relationships Summary (Configurable) report

Shows the end-to-end relationship from a server to back-end storage. You can configure which resources to show in the report.

Report output

Information is provided about related resources and the devices, such as managed disks (MDisks), that are related to resources.

Server Name
The fully qualified domain name of the server. For example, the name of a server might be `server.example.com`.

Server Disk Path
The identifier that specifies a path to a server disk, for example `/dev/hdisk0`.

Logical Volume Path
The path to a logical volume on a resource, for example `/dev/hd1`.

File System Mount Point
The name or mount point of the file system for the resource. For example, on Microsoft Windows systems, the value in this property might be `c:\` or `d:\`. On operating systems such as AIX, Linux, Solaris, or HP-UX, the mount point might be `/opt` or `/export/home`.

Hypervisor Name
The fully qualified domain name of the hypervisor. For example, the name of a hypervisor might be `hypervisor.example.com`.

Hypervisor Disk Path
The identifier that specifies a path to a hypervisor server disk, for example `vmhba1:0:0`.

NAS Name
The fully qualified domain name of the NAS device. For example, the name of a NAS device might be `nas.example.com`.

NAS Export Name
The name of the exported file system.

Storage Virtualizer Name
A user-defined name of the storage virtualizer. If a name was not defined,

Tivoli Storage Productivity Center shows the name that was defined when the storage virtualizer was added for monitoring.

Storage Virtualizer Volume Assigned Host Connection
The host connection to which the storage virtualizer volume is assigned. The host connection is a definition in the storage virtualizer that contains the WWPN for the server. The storage virtualizer uses the WWPN to assign volumes to servers.

Storage Virtualizer Volume Name
The name that was assigned to the storage virtualizer volume when it was added to the system.

Storage Virtualizer Pool Name
The name that was assigned to the pool when it was added to the system.

Storage Virtualizer MDisk Name
The name that was assigned to the managed disk on a storage virtualizer when it was added to the system.

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Storage Volume Assigned Host Connection
The host connection to which the storage volume is assigned. The host connection is a definition in the storage system that contains the WWPN for the server. The storage system uses the WWPN to assign volumes to servers.

Storage Volume Name
The name that was assigned to the storage volume when it was added to the system.

Storage Pool Name
The name that was assigned to the pool when it was added to the system.

Related reports

To open other reports that are related to a resource in this report, click the name of the resource. You can open the following related reports for the resources in this report:

Resource	Related reports
Storage system	Performance of One Storage System
Volume	Performance of One Volume
Managed disk	Performance of One Managed Disk
Storage pool	Most Active Pools, Performance of One Pool

Related tasks:

"Running the Storage Resource Relationships Summary (Configurable) report" on page 932
To show the relationships between resources, run the Storage Resource Relationships Summary (Configurable) report. You can show or hide resources, and you can hide resources that are not related to other resources or storage devices.

Running the File System to Volume Relationships report

To show the end-to-end relationship from file systems on servers to volumes on storage pools, run the File System to Volume Relationships.

Tip: To select a resource, click the resource. To select multiple resources, press Ctrl and click the resources. To select a series of resources, select the first resource, and then press Shift and click the last resource.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.
2. Click **File System to Volume Relationships**.
3. Select one or more servers.
4. Select the storage virtualizers and storage systems that the storage pools are in. You can select both storage virtualizers and storage systems, storage virtualizers only, or storage systems only.
5. Click **Finish**.

If the resources that you selected are not related, or if no data is available, a message is displayed in the report.

Restriction: To create a report when you select a single resource, the selected resource must be connected to other resources.

Related reference:

"File System to Volume Relationships report"
Shows the end-to-end relationship from file systems on servers to volumes on storage pools. The report shows the usage of space on file systems over a specified period. Use the report to analyze changes in your file system requirements.

File System to Volume Relationships report

Shows the end-to-end relationship from file systems on servers to volumes on storage pools. The report shows the usage of space on file systems over a specified period. Use the report to analyze changes in your file system requirements.

Report output

The information that is provided about the servers, storage virtualizers, storage systems, pools, and volumes is as follows:

Server Name
The fully qualified domain name of the server. For example, the name of a server might be `server.example.com`.

File System Mount Point
The name or mount point of the file system for the resource. For example, on Microsoft Windows systems, the value in this property might be `c:\` or `d:\`. On operating systems such as AIX, Linux, Solaris, or HP-UX, the mount point might be `/opt` or `/export/home`.

Server Disk Path
The identifier that specifies a path to a server disk, for example `/dev/hdisk0`.

A server disk might have one or more disk paths. To identify unique server disks, add the Server Disk Serial Number property to the report, and group the server disks by the serial number.

File System Capacity (GiB)
The amount of storage space on the file system of the resource.

File System Available Space (GiB)
The amount of unused storage space in the file system of the resource.

File System Available Space Percentage
The percentage of space in the file system that is unused.

Storage Virtualizer Name
A user-defined name of the storage virtualizer. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage virtualizer was added for monitoring.

Storage Virtualizer Volume Name
The name that was assigned to the storage virtualizer volume when it was added to the system.

Storage Virtualizer Volume Is Thin Provisioned
Shows whether a volume or volume copy is thin-provisioned. If this value is `Yes`, the resource is thin-provisioned.

Storage Virtualizer Volume Allocated Space Percentage
The percentage of space on a volume that is reserved.

This property applies only to volumes on SAN Volume Controller and Storwize V7000 systems.

Storage Virtualizer Volume Used Space Percentage
The percentage of reserved space that is being used on a volume.

This property applies only to volumes on SAN Volume Controller and Storwize V7000 systems.

Storage Virtualizer Pool Name
The name that was assigned to the pool when the pool was added to the system.

Storage Virtualizer Pool Available Space (GiB)
The amount of space in a pool that is not reserved for volumes.

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage Volume Name
The name that was assigned to the storage volume when it was added to the system.

Storage Volume Is Thin Provisioned
Shows whether a volume or volume copy is thin-provisioned. If this value is `Yes`, the resource is thin-provisioned.

Storage Volume Allocated Space Percentage
The percentage of space on a volume that is reserved.

This property applies only to volumes on SAN Volume Controller and Storwize V7000 systems.

Storage Volume Used Space Percentage
The percentage of reserved space that is being used on a volume.

This property applies only to volumes on SAN Volume Controller and Storwize V7000 systems.

Storage Pool Name
The name that was assigned to the pool when it was added to the system.

Storage Pool Available Space (GiB)
The amount of space in a pool that is not reserved for volumes.

Tivoli Storage Productivity Center uses the following formula to determine this value:

```
pool capacity - allocated space
```

For XIV systems, this value represents the unallocated physical space in the pool, not the unallocated virtual space. For some storage systems, this value usually includes only the usable capacity, but might also include overhead space if the pool is unformatted.

Related tasks:

"Running the File System to Volume Relationships report" on page 935
To show the end-to-end relationship from file systems on servers to volumes on storage pools, run the File System to Volume Relationships.

Predefined reports about switches and switch ports

You can run predefined reports to analyze and compare the performance of switches and switch ports.

Predefined reports about switches

You can run predefined reports to analyze and compare the performance of switches.

Running the Performance of One Switch report

To see information about the performance of a switch, run the Performance of One Switch report.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.
2. Click **Fabrics and Switches**.
3. Click **Switches**.
4. Click **Performance of One Switch**.
5. Select a switch.
6. Optional: Select an interval.
7. To set the time frame of the report, specify a reporting period. It is easier to analyze small amounts of information over shorter periods.

   Tip: To specify a start date and an end date, select **Custom date range** from the list of reporting periods.
8. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection was unsuccessful, a message is displayed in the report.

Related reference:

"Performance of One Switch report"
Shows three charts, and a table of performance metrics for a switch over a time period that you specify. Use the report to analyze the performance of a switch.

Performance of One Switch report

Shows three charts, and a table of performance metrics for a switch over a time period that you specify. Use the report to analyze the performance of a switch.

Charts

The charts show the following performance metrics for the ports on the switch:

- The send frame rates, the receive frame rates, and the total frame rates
- The send data rates, the receive data rates, and the total data rates
- The send bandwidth percentages, the receive bandwidth percentages, and the overall bandwidth percentages

Report output

The following information is provided in the report for the period that you specified:

Switch Name
The user-defined name for the switch, or the name that was assigned to the switch by the vendor.

Switch Location
The physical location of a switch. The location is defined when a switch is added to Tivoli Storage Productivity Center. You can add or edit the location of the switch in the **Properties** pane of the switch in the web-based GUI.

Port Send Frame Rate (frames/s)
The average number of frames per second that are sent through the port.

Port Receive Frame Rate (frames/s)
The average number of frames per second that are received by the port.

Total Port Frame Rate (frames/s)
The average number of frames per second that are transferred. This value includes frames that are sent and frames that are received by the port.

Port Send Data Rate (MiB/s)
The average rate at which data is sent through the port. The rate is measured in MiB per second.

Port Receive Data Rate (MiB/s)
The average rate at which data is received by the port. The rate is measured in MiB per second.

Total Port Data Rate (MiB/s)
The average rate at which data is transferred through the port. The rate is measured in MiB per second and includes both send and receive operations.

Port Send Bandwidth Percentage
The percentage of the port bandwidth that is used for send operations. This value is an indicator of port bandwidth usage that is based on the speed of the port.

Port Receive Bandwidth Percentage
The percentage of the port bandwidth that is used for receive operations. This value is an indicator of port bandwidth usage that is based on the speed of the port.

Overall Port Bandwidth Percentage
The percentage of the port bandwidth that is used for send operations and receive operations. This value is an indicator of port bandwidth usage that is based on the speed of the port.

Related reports

To open the Most Active Switch Ports report, click the name of the switch in the report table.

Related tasks:

To see information about the performance of a switch, run the Performance of One Switch report.

Running the Compare Performance of Multiple Switches report

Use the Compare Performance of Multiple Switches report to compare up to four performance metrics for multiple switches. For example, you can compare bandwidth percentages, data rates, and frame rates.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.
2. Click **Fabrics and Switches**.
3. Click **Switches**.
4. Click **Compare Performance of Multiple Switches**.
5. Select the switches, and then click **Next**.
6. Select the category of performance metric that you want to include in the report, and then select the performance metric.
7. Optional: To add more metrics to the report, complete the following steps:
   a. Click **Add Metric**.
   b. Select the category of performance metric, and then select the performance metric.
   c. If you want to remove the last metric that you added, click **Remove Metric**.
8. Optional: Select an interval.
9. To set the time frame of the report, specify a reporting period. It is easier to analyze small amounts of information over shorter periods.

   Tip: To specify a start date and an end date, select **Custom date range** from the list of reporting periods.
10. Click **Finish**.

If the resources that you selected are not related, or if no data is available, a message is displayed in the report.

If information is not available for any of the resources that you selected, those resources are not included in the report.

Compare Performance of Multiple Switches report

Shows up to four performance metrics for multiple switches over time. Use the report to compare the performance metrics for switches.

Charts

The charts show the performance metrics for the switches that you selected for the period that you specified.

Report output

The following information is provided in the report:

Performance metrics
Shows the data for each performance metric.

Switch names
Shows the names of the switches, and the performance metric data for each switch.

Related tasks:

"Running the Compare Performance of Multiple Switches report" on page 939
Use the Compare Performance of Multiple Switches report to compare up to four performance metrics for multiple switches. For example, you can compare bandwidth percentages, data rates, and frame rates.

Running the Compare Performance of One Switch over Time Ranges report

To compare a performance metric for one switch in two date ranges, run the Compare Performance of One Switch over Time Ranges report.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.
2. Click **Fabrics and Switches**.
3. Click **Switches**.
4. Click **Compare Performance of One Switch over Time Ranges**.
5. Select the switch.
6. Select the category of performance metric about which you want a report, and then select the performance metric.
7. Select an interval.
8. Specify the two date ranges or reporting periods that you want to compare. For example, you can compare the performance metric for this week with last week.

   Tip: To specify a start date and an end date for a reporting period, select **Custom Date Range** from the list of reporting periods.
9. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection was unsuccessful, a message is displayed in the report.

Related reference:

"Compare Performance of One Switch over Time Ranges report"
Shows one performance metric on one switch over two time periods. For example, you can use the report to compare the I/O rate for this week and last week.

Compare Performance of One Switch over Time Ranges report

Shows one performance metric on one switch over two time periods. For example, you can use the report to compare the I/O rate for this week and last week.

Charts

The chart shows the performance data of the switch on the performance metric you selected, over the time periods that you selected.

Report output

The following information is provided in the report:

Switch Name
The user-defined name for the switch, or the name that was assigned to the switch by the vendor.

Day in Range
The number of the day in the date range at which the performance metric data was collected, relative to the date range that you specified. The number of days that are shown is determined by the reporting period that was selected for the report. If **Last 30 Days** was selected, then entries for days 1 - 30 are shown on the report.

Hour in Range
The number of the hour in the day at which the performance metric data was collected. For example, `0` is between 12:00:00 a.m. and 12:59:59 a.m., 1 is between 01:00:00 a.m. and 01:59:59 a.m.

Minute in Range
The interval of minutes during which the performance metric data was collected. For example, `0` shows that performance data was collected 0 - 5 minutes after the hour. Similarly, `5` shows that the performance data that was collected 5 - 10 minutes after the hour.

First Date Range
The details of the performance metric data in the first date range. The details are displayed in two columns in the First Date Range column. Depending on the interval that you selected, the Time, Day, or Hour column shows the time at which the performance metric data was collected. The column with the performance metric name shows the data for the performance metric for the first date range.

Second Date Range
The details of the performance metric data in the second date range. The details are displayed in two columns in the Second Date Range column. Depending on the interval that you selected, the Time, Day, or Hour column shows the time at which the performance metric data was collected. The column with the performance metric name shows the data for the performance metric for the second date range.

Related tasks:

Predefined reports about switch ports

You can run predefined reports to analyze and compare the performance of switch ports.

Running the Most Active Switch Ports report

To see which ports are most active on switches, run the Most Active Switch Ports report.

Tip: To select a resource, click the resource. To select multiple resources, press Ctrl and click the resources. To select a series of resources, select the first resource, and then press Shift and click the last resource.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.
2. Click **Fabrics and Switches**.
3. Click **Switch Ports**.
4. Click **Most Active Switch Ports**.
5. Select the switches, and then select a sort order.
6. To set the time frame of the report, specify a reporting period. If the report does not include a particular resource that you want to see, select a reporting period for which data is available for the resource.

   Tip: To specify a start date and an end date, select **Custom date range** from the list of reporting periods.
7. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection was unsuccessful, a message is displayed in the report.

Related reference:

"Most Active Switch Ports report"
Shows a chart of the 20 switches that are most active, and details for all switches, for a time period that you specify. Use the report to analyze the performance of switches.

Most Active Switch Ports report

Shows a chart of the 20 switches that are most active, and details for all switches, for a time period that you specify. Use the report to analyze the performance of switches.

Charts

The bar chart shows the most active ports on the switch. By default, ports are sorted by the total frame rate.

Tip: To change the sort order, select a value from the **Sort Order** list.

Report output

The information that is provided about the most active ports on switches is as follows:

Switch Name
The user-defined name for the switch, or the name that was assigned to the switch by the vendor.

Switch Blade Slot Number
The number of the slot on the switch to which the blade is attached. This property applies to ports on blades.

Switch Port Number
The number of the port on the switch.

Switch Port WWPN
The worldwide port name of the port on the switch.

Total Port Frame Rate (frames/s)
The average number of frames per second that are transferred. This value includes frames that are sent and frames that are received by the port.

Total Port Data Rate (MiB/s)
The average rate at which data is transferred through the port. The rate is measured in MiB per second and includes both send and receive operations.

Overall Port Bandwidth Percentage
The percentage of the port bandwidth that is used for send operations and receive operations. This value is an indicator of port bandwidth usage that is based on the speed of the port.

Performance of One Switch Port report

Shows four charts, and a table of performance metrics for a switch port. Use this report to view multiple performance metric types on the same chart. For example, you can view I/O rate and response time metrics on the same chart.

Charts

The charts show the following performance statistics for the port:

- The send frame rate, the receive frame rate, and the total frame rate
- The send data rate, the receive data rate, and the total data rate
- The send bandwidth percentage, the receive bandwidth percentage, and the overall bandwidth percentage
- The error rates

Report output

The following information is provided in the report for the period that you specified:

Switch Name
The user-defined name for the switch, or the name that was assigned to the switch by the vendor.

Switch Blade Slot Number
The number of the slot on the switch to which the blade is attached. This property applies to ports on blades.

Switch Port Number
The number of the port on the switch.

Switch Port WWPN
The worldwide port name of the port on the switch.

Port Send Frame Rate (frames/s)
The average number of frames per second that are sent through the port.

Port Receive Frame Rate (frames/s)
The average number of frames per second that are received by the port.

Total Port Frame Rate (frames/s)
The average number of frames per second that are transferred. This value includes frames that are sent and frames that are received by the port.

Port Send Data Rate (MiB/s)
The average rate at which data is sent through the port. The rate is measured in MiB per second.

Port Receive Data Rate (MiB/s)
The average rate at which data is received by the port. The rate is measured in MiB per second.

Total Port Data Rate (MiB/s)
The average rate at which data is transferred through the port. The rate is measured in MiB per second and includes both send and receive operations.

Port Send Bandwidth Percentage
The percentage of the port bandwidth that is used for send operations. This value is an indicator of port bandwidth usage that is based on the speed of the port.

Port Receive Bandwidth Percentage
The percentage of the port bandwidth that is used for receive operations. This value is an indicator of port bandwidth usage that is based on the speed of the port.

Overall Port Bandwidth Percentage
The percentage of the port bandwidth that is used for send operations and receive operations. This value is an indicator of port bandwidth usage that is based on the speed of the port.

Error Frame Rate (count/s)
The average number of error frames per second that are received. An error frame is a frame that violates the Fibre Channel Protocol.

Discarded Frame Rate (count/s)
The average number of frames per second that are discarded because host buffers are unavailable for the port.

Link Failure Rate (count/s)
The average number of link errors per second.

CRC Error Rate (count/s)
The average number of frames per second that are received in which a cyclic redundancy check (CRC) error is detected. A CRC error is detected when the CRC in the transmitted frame does not match the CRC computed by the receiver.

Discarded Class 3 Frame Rate (count/s)
The average number of class 3 frames per second that are discarded.

Invalid Transmission Word Rate (count/s)
The average number of bit errors per second that are detected.

Related reports

To open the Most Active Switch Ports report, click the name of the switch in the report table.

Related tasks:

To see information about the performance of a switch port, run the Performance of One Switch Port report.

Running the Compare Performance of Multiple Switch Ports report

Use the Compare Performance of Multiple Switch Ports report to compare up to four performance metrics for multiple switch ports. For example, you can compare bandwidth percentages, data rates, and I/O rates.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.
2. Click **Fabrics and Switches**.
3. Click **Switch Ports**.
4. Click **Compare Performance of Multiple Switch Ports**.
5. Select the switches.
6. Select switch ports. To select switch ports, complete the following steps:
   a. Type a keyword. For example, type `example1` to find the names of switch ports that start with `example1`. To change the default search option, click **Options**. Use the percent sign as a wildcard. For example, type `a%` to find switch ports with names begin with 'a' or 'A'. Type `%a` to find switch ports with names that begin with or contain the letter 'a' or 'A'. You can type `%` to retrieve all of the switch ports on a resource.
   b. Click **Search**. If the search is successful, the switch ports are displayed in the **Results** list.
   c. Select the switch ports that you require from the list, and then click **Insert**.
7. Click **Next**.
8. Select the category of performance metric that you want to include in the report, and then select the performance metric.
9. Optional: To add more metrics to the report, complete the following steps:
   a. Click **Add Metric**.
   b. Select the category of performance metric, and then select the performance metric.
   c. If you want to remove the last metric that you added, click **Remove Metric**.
10. Optional: Select an interval.
11. To set the time frame of the report, specify a reporting period. It is easier to analyze small amounts of information over shorter periods.

    Tip: To specify a start date and an end date, select **Custom date range** from the list of reporting periods.
12. Click **Finish**.

If the resources that you selected are not related, or if no data is available, a message is displayed in the report.

If information is not available for any of the resources that you selected, those resources are not included in the report.

Compare Performance of Multiple Switch Ports report

Shows up to four performance metrics for multiple switch ports over time. Use the report to compare the performance metrics for switch ports.

Charts

The charts show the performance metrics for the switch ports that you selected for the period that you specified.

Report output

The following information is provided in the report:

Performance metrics
Shows the data for each performance metric.

Switch names
Shows the names of the switches, and the performance metric data for each switch.

Slot numbers
Shows the slot numbers, and the performance metric data for each slot.

Switch port numbers
Shows the port numbers, and the performance metric data for each switch port number.

Related tasks:

Running the Compare Performance of One Switch Port over Time Ranges report

To compare a performance metric for one switch port in two date ranges, run the Compare Performance of One Switch Port over Time Ranges report.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.
2. Click **Fabrics and Switches**.
3. Click **Switch Ports**.
4. Click **Compare Performance of One Switch Port over Time Ranges**.
5. Select the switch that the port is on.
6. If the switch is on a blade, select the slot number of the blade that the port is on.
7. Select the number of the port.
8. Select the category of performance metric about which you want a report, and then select the performance metric.
9. Select an interval.

10. Specify the two date ranges or reporting periods that you want to compare. For example, you can compare the performance metric for this week with last week.

    Tip: To specify a start date and an end date for a reporting period, select **Custom Date Range** from the list of reporting periods.
11. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection was unsuccessful, a message is displayed in the report.

Related reference:

Compare Performance of One Switch Port over Time Ranges report

Shows one performance metric on one switch port over two time periods. For example, you can use this report to compare the I/O rate for this week and last week.

Charts

The chart shows the performance data of the switch port on the performance metric you selected, over the time periods that you selected.

Report output

The following information is provided in the report:

Switch Name
The user-defined name for the switch, or the name that was assigned to the switch by the vendor.

Switch Blade Slot Number
The number of the slot on the switch to which the blade is attached. This property applies to ports on blades.

Switch Port Number
The number of the port on the switch.

Switch Port WWPN
The worldwide port name of the port on the switch.

Day in Range
The number of the day in the date range at which the performance metric data was collected, relative to the date range that you specified. The number of days that are shown is determined by the reporting period that was selected for the report. If **Last 30 Days** was selected, then entries for days 1 - 30 are shown on the report.

Hour in Range
The number of the hour in the day at which the performance metric data was collected. For example, `0` is between 12:00:00 a.m. and 12:59:59 a.m., 1 is between 01:00:00 a.m. and 01:59:59 a.m.

Minute in Range
The interval of minutes during which the performance metric data was collected. For example, `0` shows that performance data was collected 0 - 5 minutes after the hour. Similarly, `5` shows that the performance data that was collected 5 - 10 minutes after the hour.

First Date Range
The details of the performance metric data in the first date range. The details are displayed in two columns in the First Date Range column. Depending on the interval that you selected, the Time, Day, or Hour column shows the time at which the performance metric data was collected. The column with the performance metric name shows the data for the performance metric for the first date range.

Second Date Range
The details of the performance metric data in the second date range. The details are displayed in two columns in the Second Date Range column. Depending on the interval that you selected, the Time, Day, or Hour column shows the time at which the performance metric data was collected. The column with the performance metric name shows the data for the performance metric for the second date range.

Predefined reports about hypervisors

You can run predefined reports to analyze the capacity and performance of hypervisors.

Running the Hypervisors Capacity report

To see information about the capacity of disks on hypervisors, run the Hypervisors Capacity report.

Tip: To select a resource, click the resource. To select multiple resources, press Ctrl and click the resources. To select a series of resources, select the first resource, and then press Shift and click the last resource.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.
2. Click **Hypervisors**.
3. Click **Hypervisors Capacity**.
4. Optional: Select a hypervisor cluster.
5. Select one or more hypervisors.
6. Optional: Select a storage resources sort order.
7. Optional: Select a sort order.
8. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection was unsuccessful, a message is displayed in the report.

Related reference:

"Hypervisors Capacity report"

Hypervisors Capacity report

Shows a chart of the 20 hypervisors with the most allocated space, and a table with space statistics for all hypervisors. Use the report to review space allocation in your hypervisors.

Charts

The bar chart shows the used space and available space on hypervisors.

Report output

For each hypervisor, the following information is provided:

Hypervisor Name
The fully qualified domain name of the hypervisor. For example, the name of a hypervisor might be `hypervisor.example.com`.

Hypervisor Location
The physical location of a hypervisor. The location is defined when a hypervisor is added to Tivoli Storage Productivity Center. You can add or edit the location of the hypervisor in the **Properties** pane of the hypervisor in the web-based GUI.

Hypervisor Cluster Name
The name of a cluster that is monitored in your storage environment. A cluster is a group of hypervisors that collaborate for the purposes of workload balancing and failover.

Hypervisor Total Disk Capacity (GiB)
The amount of storage space that is on a hypervisor.

Hypervisor Total Disk Available Space (GiB)
The amount of unused storage space on all disks on a hypervisor.

Hypervisor Total Disk Used Space (GiB)
The amount of storage space that is used on all disks on a hypervisor.

Hypervisor Total Disk Used Space (%)
The amount of storage space that is used on a hypervisor.

Hypervisor Data Store Capacity (GiB)
The amount of storage space that is on the hypervisor data store.

Hypervisor Data Store Available Space (GiB)
The amount of unused storage space on a hypervisor data store.

Hypervisor Data Store Used Space (GiB)
The amount of storage space that is used on a hypervisor data store.

Hypervisor Data Store Used Space (%)
The percentage of storage space that is used on all disks on a hypervisor.

Related reports

To open related reports, click the name of the hypervisor and then click the name of the report. You can open the following related reports:

- Hypervisor Disks Capacity
- Hypervisor Data Stores Capacity

Related tasks:

Most Active Hypervisors report

Shows a chart of the 20 hypervisors that have the most active volumes. The most active volumes have the greatest aggregate load.

Charts

The bar chart shows the most active hypervisors. By default, hypervisors are sorted by the total I/O rate.

Tip: To change the sort order, select a value from the **Sort Order** list.

Report output

The information that is provided about the most active hypervisors is as follows:

Hypervisor Name
The fully qualified domain name of the hypervisor. For example, the name of a hypervisor might be `hypervisor.example.com`.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Volume Utilization
The average percentage of time that the volume is busy.

Related reports

Summarized Performance of Volumes by Hypervisor report

Shows summarized performance metrics for volumes on a hypervisor. Use the report to identify the aggregate load and the average response time of a particular hypervisor.

Charts

The charts show the following performance metrics for the volumes on a hypervisor:

- The total I/O rates and the total response times
- The read I/O rates, the write I/O rates, the read response times, and the write response times
- The read data rates, the write date rates, and the total data rates
- The read cache percentages and the write cache percentages

Report output

The following information is provided in the report for the period that you specified:

Hypervisor Name
The fully qualified domain name of the hypervisor. For example, the name of a hypervisor might be `hypervisor.example.com`.

Day, hour, or time
The day, hour, or time at which the information about the specified resource or device was collected. Whether the day, hour, or time is displayed depends on the interval that you select for the report.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation, across all volumes on the hypervisor. This value includes both read and write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second, across all volumes on the hypervisor. This value includes both sequential and nonsequential operations. The average value for each volume is added to give a total I/O rate for all volumes on the hypervisor.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations, across all volumes on the hypervisor. The average value for each volume is added to give a total data rate for all volumes on the hypervisor.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation, across all volumes on the hypervisor.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation, across all volumes on the hypervisor.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read

operations, across all volumes on the hypervisor. The average value for each volume is added to give a read data rate for all volumes on the hypervisor.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations, across all volumes on the hypervisor. The average value for each volume is added to give a write data rate for all volumes on the hypervisor.

Overall Read I/O Rate (ops/s)
The average number of read operations per second, which is totaled for all volumes on the hypervisor. This value includes both sequential and nonsequential read operations.

Overall Write I/O Rate (ops/s)
The average number of write operations per second, which is totaled for all volumes on the hypervisor. This value includes both sequential and nonsequential write operations.

Overall Read Cache Hit Percentage
The average percentage of all read operations that find data in the cache, across all volumes on the hypervisor. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Overall Write Cache Hit Percentage
The average percentage of all write operations that are handled in the cache, across all volumes on the hypervisor. This value includes both sequential and nonsequential write operations.

Charts

The charts show the following performance metrics for the volumes:

- The total overall I/O rates. The chart shows the contribution of each volume to the overall load on the hypervisor.
- The total data rates. The chart shows the contribution of each volume to the overall load on the hypervisor.
- The volume utilization percentages. The utilization percentage of each volume is displayed relative to the utilization percentage of the other volumes.
- The total response times. The response time of each volume is displayed relative to the response time of the other volumes.

Report output

The following information is provided in the report for the period that you specified:

Hypervisor Name
The fully qualified domain name of the hypervisor. For example, the name of a hypervisor might be `hypervisor.example.com`.

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage Pool Name
The name that was assigned to the pool when it was added to the system.

Storage Volume Name
The name that was assigned to the storage volume when it was added to the system.

Day, hour, or time
The day, hour, or time at which the information about the specified resource or device was collected. Whether the day, hour, or time is displayed depends on the interval that you select for the report.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Volume Utilization
The average percentage of time that the volume is busy.

Shows a chart of the 20 hypervisor data stores with the most allocated space. This report also shows a table with space statistics for all hypervisor data stores. Use the report to review space allocation in your hypervisor data stores.

Charts

The bar chart shows the used space and available space for data stores on hypervisors.

Report output

For each hypervisor, the following information is provided:

Hypervisor Cluster Name
The name of a cluster that is monitored in your storage environment. A cluster is a group of hypervisors that collaborate for the purposes of workload balancing and failover.

Hypervisor Data Store
The path to the VMware ESX data store on the hypervisor, for example `datastore_svc3c`.

Hypervisor Data Store Cluster Name
The name of the cluster, if the data store is a member of a data store cluster. If the data store is not a member of a data store cluster, no information is displayed.

Hypervisor Data Store Type
The type of file system that the hypervisor data store uses. For example, the type can be NFS or VMFS.

Hypervisor System Mount Point
The name or mount point of the file system for the resource. For example, on Microsoft Windows systems, the value in this property might be `c:\`or `d:\`. On operating systems such as AIX, Linux, Solaris, or HP-UX, the mount point might be `/opt`or `/export/home`.

Hypervisor Data Store Capacity (GiB)
The amount of storage space that is on the hypervisor data store.

Hypervisor Data Store Used Space (GiB)
The amount of storage space that is used on a hypervisor data store.

Hypervisor Data Store Available Space (GiB)
The amount of unused storage space on a hypervisor data store.

Hypervisor Data Store Used Space (%)
The percentage of storage space that is used on all disks on a hypervisor.

Hypervisor File System Capacity (GiB)
The amount of storage space on the file system of the hypervisor.

Hypervisor File System Available Space (GiB)
The amount of unused storage space in the file system of the hypervisor.

Related tasks:

Shows a chart of the 20 hypervisor disks with the most allocated space, and a table with space statistics for all hypervisor disks. Use the report to review space allocation in your hypervisor disks.

Charts

The bar chart shows the used space and available space on hypervisors.

Report output

For each hypervisor, the following information is provided:

Hypervisor Cluster Name
The name of a cluster that is monitored in your storage environment. A cluster is a group of hypervisors that collaborate for the purposes of workload balancing and failover.

Hypervisor Disk Path
The identifier that specifies a path to a hypervisor disk, for example `/dev/hdisk0`.

Tip: A hypervisor disk might have one or more disk paths. To identify unique hypervisor disks, add the Hypervisor Disk Serial Number property to the report, and group the server disks by the serial number.

Hypervisor Disk Capacity (GiB)
The amount of storage space that is on a hypervisor disk.

Hypervisor Disk Available Space (GiB)
The amount of unused storage space that is on a hypervisor disk.

Hypervisor Disk Used Space (GiB)
The amount of storage space that is used on a hypervisor disk.

Hypervisor Disk Used Space (%)
The amount of storage space that is used on a hypervisor disk.

Hypervisor Disk Status
The status of a disk on the hypervisor. Use the status to determine the condition of the disk, and if any actions must be taken. For example, if a

disk has an Error status, take immediate action to correct the problem. If the disk has an Operational status, then it is operating normally and no further action is required.

Hypervisor Disk Vendor
The vendor who supplied the hypervisor disk.

Hypervisor Disk Model
The model name or model number of the hypervisor disk.

Hypervisor Disk Serial Number
The serial number of the hypervisor disk.

Hypervisor Disk Firmware Version
The version number of the firmware that is running on the hypervisor disk.

Related tasks:

"Servers Capacity report"
Shows a summary of the available and used disk space, and the available and used file systems, for servers. Use the report to identify servers that are running out of space.

Servers Capacity report

Shows a summary of the available and used disk space, and the available and used file systems, for servers. Use the report to identify servers that are running out of space.

Charts

The bar chart shows the capacity, used space, available space, and percentage of used space for disks on servers. Dots are used to represent the total space that is used by the file system, and the total space that is available to the file system on the server. You can position the cursor over the dot to show the amount of used space or the amount of available space for the file system. The position of the dot that is used to represent the total space that is available to the file system is also used to show the total capacity of the file system.

Tip: To change the sort order, select a value from the **Sort Order** list.

Report output

For each server, the following information is provided:

Server Name
The fully qualified domain name of the server. For example, the name of a server might be `server.example.com`.

Server Location
The physical location of a server. The location is defined when a server is added to Tivoli Storage Productivity Center. You can add or edit the location of the server in the **Properties** pane of the server in the web-based GUI.

Server Total Disk Capacity (GiB)
The amount of storage space that is on a server.

Server Total Disk Used Space (GiB)
The amount of storage space that is used on all disks on a server.

Server Total Disk Available Space (GiB)
The amount of unused storage space on all disks on a server.

Server Total Disk Used Space (%)
The percentage of used storage space on all disks on the server.

Server Total File System Capacity (GiB)
The amount of storage space on the file system of the resource.

Server Total File System Used Space (GiB)
The amount of used storage space in the file system of the resource.

Server Total File System Available Space (GiB)
The amount of unused storage space in the file system of the resource.

Server Total File System Used Space (%)
The amount of used storage space in the file system of the resource.

Shows a chart of the 20 servers that have the most active volumes. The most active volumes have the greatest aggregate load.

Most Active Servers report

Shows a chart of the 20 servers that have the most active volumes. The most active volumes have the greatest aggregate load.

Charts

The bar chart shows the most active servers. By default, servers are sorted by the total I/O rate.

Tip: To change the sort order, select a value from the **Sort Order** list.

Report output

The information that is provided about the most active storage systems is as follows:

Server Name
The fully qualified domain name of the server. For example, the name of a server might be `server.example.com`.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Volume Utilization
The average percentage of time that the volume is busy.

Summarized Performance of Volumes by Server report

Shows summarized performance metrics for volumes on a server. Use the report to identify the aggregate load and the average response time of a particular server.

Charts

The charts show the following performance metrics for the volumes on a server:

- The total I/O rates and the total response times
- The read I/O rates, the write I/O rates, the read response times, and the write response times
- The read data rates, the write date rates, and the total data rates
- The read cache percentages and the write cache percentages

Report output

The following information is provided in the report for the period that you specified:

Server Name
The fully qualified domain name of the server. For example, the name of a server might be `server.example.com`.

Day, hour, or time
The day, hour, or time at which the information about the specified resource or device was collected. Whether the day, hour, or time is displayed depends on the interval that you select for the report.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation, across all volumes on the server. This value includes both read and write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second, across all volumes on the server. This value includes both sequential and nonsequential operations. The average value for each volume is added to give a total I/O rate for all volumes on the server.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations, across all volumes on the server. The average value for each volume is added to give a total data rate for all volumes on the server.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation, across all volumes on the server.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation, across all volumes on the server.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations, across all volumes on the server. The average value for each volume is added to give a read data rate for all volumes on the server.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write

operations, across all volumes on the server. The average value for each volume is added to give a write data rate for all volumes on the server.

Overall Read I/O Rate (ops/s)
The average number of read operations per second, which is totaled for all volumes on the server. This value includes both sequential and nonsequential read operations.

Overall Write I/O Rate (ops/s)
The average number of write operations per second, which is totaled for all volumes on the server. This value includes both sequential and nonsequential write operations.

Overall Read Cache Hit Percentage
The average percentage of all read operations that find data in the cache, across all volumes on the server. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Overall Write Cache Hit Percentage
The average percentage of all write operations that are handled in the cache, across all volumes on the server. This value includes both sequential and nonsequential write operations.

Performance of Volumes by Server report

Shows the performance metrics for volumes on a server. Use the report to identify the contribution of individual volumes to the load of a particular server in your storage environment.

Charts

The charts show the following performance metrics for the volumes:

- The total overall I/O rates. The chart shows the contribution of each volume to the overall load on the server.
- The total data rates. The chart shows the contribution of each volume to the overall load on the server.
- The volume utilization percentages. The utilization percentage of each volume is displayed relative to the utilization percentage of the other volumes.
- The total response times. The response time of each volume is displayed relative to the response time of the other volumes.

Report output

The following information is provided in the report for the period that you specified:

Server Name
The fully qualified domain name of the server. For example, the name of a server might be `server.example.com`.

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage Pool Name
The name that was assigned to the pool when it was added to the system.

Storage Volume Name
The name that was assigned to the storage volume when it was added to the system.

Day, hour, or time
The day, hour, or time at which the information about the specified resource or device was collected. Whether the day, hour, or time is displayed depends on the interval that you select for the report.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Volume Utilization
The average percentage of time that the volume is busy.

Charts

The bar chart shows the capacity, used space, available space, and percentage of used space for disks on servers.

Tip: To change the sort order, select a value from the **Sort Order** list.

Report output

For each server, the following information is provided:

Server Disk Path
The identifier that specifies a path to a server disk, for example `/dev/hdisk0`.

Server Disk Capacity (GiB)
The amount of storage space that is on a server disk.

Server Disk Available Space (GiB)
The amount of unused storage space that is on a server disk.

Server Disk Used Space (GiB)
The amount of storage space that is used on a server disk.

Server Disk Used Space (%)
The percentage of used storage space on the disk.

Server Disk Status
The condition of the resource, for example normal, warning, or error.

Server Disk Firmware Version
The version number of the firmware that is running on the disk.

Server Disk Model
The model name or model number of the resource.

Server Disk Vendor
The vendor who supplied the resource.

Charts

The bar chart shows the capacity, used space, available space, and percentage of used space for file systems on servers.

Tip: To change the sort order, select a value from the **Sort Order** list.

Report output

For each server, the following information is provided:

File System Mount Point
The name or mount point of the file system for the resource. For example, on Microsoft Windows systems, the value in this property might be `c:\` or `d:\`. On operating systems such as AIX, Linux, Solaris, or HP-UX, the mount point might be `/opt` or `/export/home`.

File System Type
The type of file system that the resource uses.

File System Used Space (GiB)
The amount of used storage space in the file system of the resource.

File System Available Space (GiB)
The amount of unused storage space in the file system of the resource.

File System Capacity (GiB)
The amount of storage space on the file system of the resource.

File System Used Space (%)
The percentage of used space in the file system on the server.

File System Available Inodes
The number of unused inodes in file systems on the operating system.

File System Used Inodes
The number of used inodes in file systems on the operating system.

Tip: For Microsoft Windows systems, this property is blank.

Storage Systems Capacity report

Shows a chart of the 20 storage systems with the most used space, and a table with details of all storage systems. Use the report to review the space allocation in your storage systems.

Charts

The bar chart shows the used space and available space for pools on storage systems.

Report output

For each storage system, the following information is provided:

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Storage System Type
The type of storage system. For example, the storage system can be an **IBM System Storage DS8800** system, an **IBM System Storage DS8700** system, an **IBM System Storage XIV** system, or another type of storage system.

Storage System Location
The physical location of a storage system. The location is defined when a storage system is added to Tivoli Storage Productivity Center. You can add or edit the location of the storage system in the **Properties** pane of the storage system in the web-based GUI.

Storage System Pool Capacity (GiB)
The amount of storage space in pools that are on the storage system. For an XIV system, this value represents the physical capacity of the pool, not the virtual capacity. For other storage systems, this value might also include overhead space if the pool is unformatted.

Storage System Used Pool Space (GiB)
The amount of space that is in use in all pools on a storage system.

Storage System Pool Available Space (GiB)
The amount of space in a pool that is not reserved for volumes.

For XIV systems, this value represents the unallocated physical space in the pool, not the unallocated virtual space. For some storage systems, this value usually includes only the usable capacity, but might also include overhead space if the pool is unformatted.

Storage System Physical Allocation Percentage
The percentage of physical space in storage system pools that is reserved for volumes. This value is always less than or equal to 100% because you cannot reserve more physical space than is available in the pools.

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

`(allocated pool space ÷ pool capacity) × 100`

For example, the physical allocation percentage is 25% for a 200 GiB storage pool. Therefore, the space that is reserved for volumes is 50 GiB.

Storage System Virtual Allocation Percentage
The percentage of physical space in storage system pools that is committed to the total virtual capacity of the volumes in the pool. In thin-provisioned environments, this percentage exceeds 100% if a pool is overcommitted (over-provisioned).

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

`(total volume capacity ÷ pool capacity) × 100`

For example, for a total pool size of 15 GiB, the allocation percentage might be 200%. Therefore, the virtual capacity that is committed to the volumes in the pools is 30 GiB. This configuration means that twice as much space is committed than is physically contained in the pools. If the

allocation percentage is 100% for the same pools, then the virtual capacity that is committed to the pools is 15 GiB. This configuration means that all the physical capacity of the pools is already allocated to volumes.

An allocation percentage that is higher than 100% is considered aggressive. The pools have insufficient physical capacity to satisfy the maximum allocation for all the thin-provisioned volumes in the pools. In such cases, use the Storage System Shortfall Percentage property to estimate how critical the shortage of space is for storage system pools.

Storage System Shortfall Percentage
The percentage of the remaining unallocated volume space in storage system pools that is not available to be allocated. The higher the percentage, the more critical the shortfall of pool space.

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

`(unallocatable space ÷ (volume space - used volume space)) × 100`

You can use this percentage to determine when the amount of overcommitted space in pools reaches a critically high level. For example, the physical space in pools might be less than the committed virtual space. In this case, the pools do not have enough space to fulfill the commitment to virtual space for a volume.

This value represents the percentage of the committed virtual space that is not available in pools. As more space is used over time by volumes while the pool capacity remains the same, this percentage increases.

For example, the physical capacity of pools is 70 GiB, but 150 GiB of virtual space is committed to thin-provisioned volumes. If the volumes are using 50 GiB, then there is still 100 GiB committed to those volumes (150 GiB - 50 GiB). There is only 20 GiB of available pool space (70 GiB - 50 GiB). Because only 20 GiB of pool space is available, 80 GiB of the committed space cannot be allocated (100 GiB - 20 GiB). In this case, the percentage of committed space that is unavailable is 80% (80 GiB ÷ 100 GiB × 100).

This value is only available for pools with thin-provisioned volumes.

Storage System Volume Capacity (GiB)
The amount of space on all volumes on the storage system.

Storage System Number of Volumes
The number of volumes on a resource.

Storage System Number of Disks
The number of physical disks on the storage system. For a Storwize V7000 storage system that is configured as a back-end device, the value is the number of managed disks on the storage system.

Storage System Overhead (GiB)
The amount of space that is used for system management. The amount of space also includes space that is reserved for redundancy.

Storage System Unallocated Disk Space (GiB)
The amount of disk space that can be added to a pool.

Storage System Volume Capacity Assigned to MDisks (GiB)
The amount of space that is on volumes that are assigned to a storage virtualizer to use as managed disks.

Storage System Disk Capacity (GiB)
The total amount of space that is on a physical disk on the storage system.

Storage System Total Disk Capacity (GiB)
The amount of space on physical disks on a storage system, including spare disks.

Storage System Cache (GiB)
The size of the cache on the storage system. This value is not shown for Storwize V7000 storage systems that are configured as back-end storage.

Storage System Assigned Volume Space (GiB)
The amount of space in the pool that is on volumes that are assigned to a server or storage virtualizer.

Storage System Volume Capacity for z/OS
The amount of space on all volumes on the storage system that the z/OS operating system can use.

Storage System Real Available Pool Space (GiB)
The amount of unused space in pools that have an associated soft size on an XIV system. The soft size of a pool is the virtual size of a thin-provisioned pool.

Storage System Real Configured Pool Space (GiB)
The amount of storage space that is in pools that have an associated soft size on an XIV system. The soft size of a pool is the virtual size of a thin-provisioned pool.

Storage System MDisk Available Space (GiB)
The amount of storage space that is available on a managed disk. This value is only available for Storwize V7000 storage systems that are configured as back-end storage.

Storage Systems Historical Capacity report

Shows the usage of space on storage systems over a specified period. Use the report to analyze changes in your storage system requirements.

Charts

The chart shows the following space statistics for the storage systems:

- The capacity of the pools on the storage systems
- The used space in the pools on the storage systems
- The available space in the pools on the storage systems
- The capacity of the volumes on the storage systems
- The available space on the managed disks on the storage systems
- The capacity of the managed disks on the storage systems

Report output

The following information is included in reports for storage systems:

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Date The date that the data was collected for the report.

Storage System Pool Capacity (GiB)
The amount of storage space in pools that are on the storage system. For an XIV system, this value represents the physical capacity of the pool, not the virtual capacity. For other storage systems, this value might also include overhead space if the pool is unformatted.

Storage System Used Pool Space (GiB)
The amount of space that is in use in all pools on a storage system.

Storage System Available Pool Space (GiB)
The amount of unused space in pools that are on the storage system.

Storage System Volume Capacity (GiB)
The amount of space on all volumes on the storage system.

Storage System Number of Volumes
The number of volumes on a resource.

Storage System Number of Disks
The number of physical disks on the storage system. For a Storwize V7000 storage system that is configured as a back-end device, the value is the number of managed disks on the storage system.

Storage System Overhead (GiB)
The amount of space that is used for system management. The amount of space also includes space that is reserved for redundancy.

Storage System Unallocated Disk Space (GiB)
The amount of disk space that can be added to a pool.

Storage System Volume Capacity Assigned to MDisks (GiB)
The amount of space that is on volumes that are assigned to a storage virtualizer to use as managed disks.

Storage System Disk Capacity (GiB)
The amount of storage space on physical disks in a storage system, excluding spare disks. This value is not shown for Storwize V7000 storage systems that are configured as back-end storage.

Storage System Total Disk Capacity (GiB)
The amount of space on physical disks on a storage system, including spare disks.

Storage System Assigned Volume Space (GiB)
The amount of space in the pool that is on volumes that are assigned to a server or storage virtualizer.

Storage System Volume Capacity for z/OS (GiB)
The amount of space on all volumes on the storage system that the z/OS operating system can use.

Storage System Real Available Pool Space (GiB)
The amount of unused space in pools that have an associated soft size on an XIV system. The soft size of a pool is the virtual size of a thin-provisioned pool.

Storage System Real Configured Pool Space (GiB)
The amount of storage space that is in pools that have an associated soft size on an XIV system. The soft size of a pool is the virtual size of a thin-provisioned pool.

Storage System MDisk Capacity (GiB)
The amount of storage space on the managed disk.

Storage System MDisk Available Space (GiB)
The amount of storage space that is available on a managed disk. This value is only available for Storwize V7000 storage systems that are configured as back-end storage.

Running the Most Active Storage Systems report

To see which storage systems are the most active, run the Most Active Storage Systems report.

To run the report with the default settings, click **Finish**. By default all of the storage systems are selected.

Tip: To select a resource, click the resource. To select multiple resources, press Ctrl and click the resources. To select a series of resources, select the first resource, and then press Shift and click the last resource.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.
2. Click **Storage Systems**.
3. Click **Most Active Storage Systems**.
4. Optional: Select the configuration of the storage systems.
5. Select the storage systems, and then select a sort order.
6. To set the time frame of the report, specify a reporting period. If the report does not include a particular resource that you want to see, select a reporting period for which data is available for the resource.

   Tip: To specify a start date and an end date, select **Custom date range** from the list of reporting periods.
7. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection was unsuccessful, a message is displayed in the report.

Related reference:

"Most Active Storage Systems report"
Shows a chart of the 20 storage systems that are most active, and details for all storage systems, for a time period that you specify. Use the report to analyze the performance of storage systems.

Most Active Storage Systems report

Shows a chart of the 20 storage systems that are most active, and details for all storage systems, for a time period that you specify. Use the report to analyze the performance of storage systems.

Charts

The bar chart shows the most active storage systems. By default, storage systems are sorted by the total I/O rate.

Tip: To change the sort order, select a value from the **Sort Order** list.

Report output

The information that is provided about the most active storage systems is as follows:

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage System Location
The physical location of a storage system. The location is defined when a storage system is added to Tivoli Storage Productivity Center. You can add or edit the location of the storage system in the **Properties** pane of the storage system in the web-based GUI.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Related reports

To open related reports, click the name of the storage system and then click the name of the report. You can open the following related reports:

- Most Active Host Connections
- Most Active Nodes
- Most Active IO Groups
- Most Active Disks
- Most Active Managed Disks

Performance of One Storage System report

Shows four charts, and a table of performance metrics for a storage system over a time period that you specify. Use the report to analyze the performance of a storage system.

Charts

The charts show the following performance metrics for a storage system:

- The total I/O rates, and the total response times
- The read I/O rates, write I/O rates, and response times
- The read data rates, and the write data rates
- The read cache hit percentages, and the write cache hit percentages

Report output

The following information is provided in the report for the period that you specified:

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage System Location
The physical location of a storage system. The location is defined when a storage system is added to Tivoli Storage Productivity Center. You can add or edit the location of the storage system in the **Properties** pane of the storage system in the web-based GUI.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Overall Write Cache Hit Percentage
The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

Related reports

Running the Compare Performance of Multiple Storage Systems report

Use the Compare Performance of Multiple Storage Systems report to compare up to four performance metrics on multiple storage systems. For example, you can compare cache percentages, data rates, and I/O rates.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.
2. Click **Storage Systems**.
3. Click **Compare Performance of Multiple Storage Systems**.
4. Select the storage systems, and then click **Next**.
5. Select the category of performance metric that you want to include in the report, and then select the performance metric.
6. Optional: To add more metrics to the report, complete the following steps:
   a. Click **Add Metric**.
   b. Select the category of performance metric, and then select the performance metric.
   c. If you want to remove the last metric that you added, click **Remove Metric**.
7. Optional: Select an interval.
8. To set the time frame of the report, specify a reporting period. It is easier to analyze small amounts of information over shorter periods.

   Tip: To specify a start date and an end date, select **Custom date range** from the list of reporting periods.
9. Click **Finish**.

If the resources that you selected are not related, or if no data is available, a message is displayed in the report.

If information is not available for any of the resources that you selected, those resources are not included in the report.

Running the Compare Performance of One Storage System over Time Ranges report

To compare a performance metric for one storage system in two date ranges, run the Compare Performance of One Storage System over Time Ranges report.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.
2. Click **Storage Systems**.
3. Click **Compare Performance of One Storage System over Time Ranges**.
4. Optional: Select the configuration of the storage systems.
5. Select the storage system.
6. Select the category of performance metric about which you want a report, and then select the performance metric.
7. Select an interval.
8. Specify the two date ranges or reporting periods that you want to compare. For example, you can compare the performance metric for this week with last week.

   Tip: To specify a start date and an end date for a reporting period, select **Custom Date Range** from the list of reporting periods.
9. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection was unsuccessful, a message is displayed in the report.

Related reference:

Compare Performance of One Storage System over Time Ranges report

Shows one performance metric on one storage system over two time periods. For example, you can use this report to compare the I/O rate for this week and last week.

Charts

The chart shows the performance data of the storage system on the performance metric you selected, over the time periods that you selected.

Report output

The following information is provided in the report:

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Day in Range
The number of the day in the date range at which the performance metric data was collected, relative to the date range that you specified. The number of days that are shown is determined by the reporting period that was selected for the report. If **Last 30 Days** was selected, then entries for days 1 - 30 are shown on the report.

Hour in Range
The number of the hour in the day at which the performance metric data was collected. For example, `0` is between 12:00:00 a.m. and 12:59:59 a.m., 1 is between 01:00:00 a.m. and 01:59:59 a.m.

Minute in Range
The interval of minutes during which the performance metric data was collected. For example, `0` shows that performance data was collected 0 - 5 minutes after the hour. Similarly, `5` shows that the performance data that was collected 5 - 10 minutes after the hour.

First Date Range
The details of the performance metric data in the first date range. The details are displayed in two columns in the First Date Range column. Depending on the interval that you selected, the Time, Day, or Hour column shows the time at which the performance metric data was collected. The column with the performance metric name shows the data for the performance metric for the first date range.

Second Date Range
The details of the performance metric data in the second date range. The details are displayed in two columns in the Second Date Range column. Depending on the interval that you selected, the Time, Day, or Hour column shows the time at which the performance metric data was

collected. The column with the performance metric name shows the data for the performance metric for the second date range.

Shows a chart of the 20 controllers or modules that are most active, and details for all storage systems, for a time period that you specify. Use the report to analyze the performance of controllers or modules.

Restriction: This report applies only to DS8000, DS5000, XIV systems, and vendor-acquired systems.

Charts

The bar chart shows the most active controllers or modules on storage systems. By default, controllers or modules are sorted by the overall I/O rate.

Tip: To change the sort order, select a value from the **Sort Order** list.

Report output

The information that is provided about the most active controllers or modules is as follows:

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage System Controller or Module Name
The name that was assigned to the controller or module when it was added to the system.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Performance of One Controller or Module report

Shows four charts, and a table of performance metrics for a controller or module over a time period. Use the report to analyze the performance of a controller or module.

Restriction: This report applies only to DS8000, DS5000, XIV systems, and vendor-acquired systems.

Charts

The charts show the following performance metrics for each controller or module on a storage system:

- The total I/O rates, and the total response times
- The read I/O rates, the write I/O rates, and the response times
- The read data rates, and the write data rates
- The overall cache hit percentage for read operations and write operations, and the utilization percentage for processors

Report output

The following information is provided in the report for the period that you specified:

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage System Controller Name or Module Name
The name that was assigned to the controller or module when it was added to the system.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Overall Write Cache Hit Percentage
The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

Performance of One Node report

Shows four charts, and a table of performance metrics for a node over a time period. Use the report to analyze the performance of a node.

Restriction: This report applies only to SAN Volume Controller and Storwize systems.

Charts

The charts show the following performance statistics for a node on a storage system:

- The total overall I/O rates, and the total response times
- The overall I/O rates for read and write operations, the response times for read and write operations
- The data rates for read and write operations, and the total data rates
- The overall cache hit percentage for read operations, the cache delay percentage for write operations, and the utilization percentage for processors

Report output

The following information is provided in the report for the period that you specified:

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Storage I/O Group Name
The name that was assigned to the I/O group when it was added to the system.

Storage Node Name
The name that was assigned to the storage system node when it was added to the system.

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Write Cache Delay Percentage
The percentage of I/O operations that are delayed because there is not enough space in the write cache.

The only operations that can be delayed are write operations, but the value is calculated as an average of all I/O operations.

Processor Utilization Percentage
The average percentage of time that the processors are busy.

Running the Compare Performance of Multiple Controllers and Modules report

Use this report to compare up to four performance metrics for multiple controllers and modules that are on storage systems. For example, you can compare data rates, I/O rates, and response times.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.
2. Click **Storage Systems**.
3. Click **Controllers, Modules, and Nodes**.
4. Click **Compare Performance of Multiple Controllers and Modules**.
5. Select the storage systems, and then click **Refresh**.
6. Select the controllers and modules, and then click **Next**.
7. Select the category of performance metric that you want to include in the report, and then select the performance metric.
8. Optional: To add more metrics to the report, complete the following steps:
   a. Click **Add Metric**.
   b. Select the category of performance metric, and then select the performance metric.
   c. If you want to remove the last metric that you added, click **Remove Metric**.
9. Optional: Select an interval.
10. To set the time frame of the report, specify a reporting period. It is easier to analyze small amounts of information over shorter periods.

    Tip: To specify a start date and an end date, select **Custom date range** from the list of reporting periods.
11. Click **Finish**.

If the resources that you selected are not related, or if no data is available, a message is displayed in the report.

If information is not available for any of the resources that you selected, those resources are not included in the report.

Compare Performance of Multiple Controllers and Modules report

Shows up to four performance metrics for multiple controllers or modules over time. Use the report to compare the performance metrics for controllers or modules that are on storage systems.

Restriction: This report applies only to DS8000, DS5000, XIV systems, and vendor-acquired systems.

Charts

The charts show the performance metrics for the controllers and modules that you selected for the period that you specified.

Report output

The following information is provided in the report:

Performance metric
Shows the time at which the performance metric data was collected.

Storage system names
Shows the names of the storage systems, and the performance metric data for each storage system.

Controller and modules
Shows the names of the controllers and modules, and the performance metric data for each controller and module.

Related tasks:

Predefined reports about disks

You can run predefined reports to analyze the capacity of disks and performance of local disks.

Running the Disks Capacity report

Run the Disks Capacity report to see information about the capacity of disks on storage systems.

Tip: To select a resource, click the resource. To select multiple resources, press Ctrl and click the resources. To select a series of resources, select the first resource, and then press Shift and click the last resource.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.
2. Click **Storage Systems**.
3. Click **Disks**.
4. Click **Disks Capacity**.
5. Optional: Select the configuration of the storage systems.
6. Select one or more storage systems.
7. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection was unsuccessful, a message is displayed in the report.

Related reference:

"Disks Capacity report"

Disks Capacity report

Shows a chart of the disk classes with the most allocated space, and a table with space statistics for all disks by class. Use the report to review space allocation in your disks.

Charts

The bar chart shows the capacity of disks, grouped by storage class, on storage systems.

Report output

For each disk on a storage system, the following information is provided:

Storage Disk Class
The storage technology of the disk. This property applies only to DS8000, DS5000, and DS4000 storage systems. This property can contain the following values:

FC The disk is a Fibre Channel disk.

Nearline ATA
The disk is a nearline Advanced Technology Attachment disk.

Nearline SAS
The disk is a nearline serial-attached SCSI disk.

SAS The disk is a serial-attached SCSI disk.

SATA The disk is a Serial Advanced Technology Attachment disk.

SSD The disk is a solid-state drive.

Unavailable
The disk is on a DS5000 or DS4000 series system, and is not a solid-state drive.

Storage Disk Name
The name that was assigned to the storage disk when it was added to the system.

Storage System Type
The type of storage system. For example, the storage system can be an **IBM System Storage DS8800** system, an **IBM System Storage DS8700** system, an **IBM System Storage XIV** system, or another type of storage system.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Storage Pool Name
The name that was assigned to the pool when it was added to the system.

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage Disk Tag
A number that identifies the array to which a disk belongs. This property applies only to DS8000, DS6000, and TotalStorage Enterprise Storage Server storage systems.

Storage Disk Vendor
The vendor who supplied the resource.

Storage Disk Model
The model name or model number of the resource.

Storage Disk Serial Number
The serial number of the resource.

Storage Disk Firmware Version
The version number of the firmware that is running on the disk.

Storage Disk Capacity (GiB)
The amount of storage space that is on a physical disk on the storage system.

Storage Disk Speed (RPM)
The speed of the disk.

Related tasks:

"Running the Disks Capacity report" on page 994
Run the Disks Capacity report to see information about the capacity of disks on storage systems.

Running the Most Active Disks report

To see which local disks that are on storage systems are the most active, use the Most Active Disks report. This report shows information only for SAN Volume Controller and Storwize V7000 storage systems.

To run the report with the default settings, click **Finish**. By default all of the storage systems are selected.

Tip: To select a resource, click the resource. To select multiple resources, press Ctrl and click the resources. To select a series of resources, select the first resource, and then press Shift and click the last resource.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.
2. Click **Storage Systems**.
3. Click **Disks**.
4. Click **Most Active Disks**.
5. Optional: Select the configuration of the storage systems.
6. Select the storage systems, and then select a sort order.
7. To set the time frame of the report, specify a reporting period. If the report does not include a particular resource that you want to see, select a reporting period for which data is available for the resource.

   Tip: To specify a start date and an end date, select **Custom date range** from the list of reporting periods.
8. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection was unsuccessful, a message is displayed in the report.

Related reference:

"Most Active Disks report"
Shows a chart of the 20 local disks that are most active, and details for all local disks, for a time period that you specify. Use the report to analyze the performance of local disks.

Most Active Disks report

Shows a chart of the 20 local disks that are most active, and details for all local disks, for a time period that you specify. Use the report to analyze the performance of local disks.

Restriction: This report applies only to SAN Volume Controller and Storwize systems.

Charts

The bar chart shows the most active local disks that are on storage systems. By default, local disks are sorted by the total I/O rate.

Tip: To change the sort order, select a value from the **Sort Order** list.

Report output

The information that is provided about the most active local disks that are on storage systems is as follows:

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage MDisk Name
The name that was assigned to the managed disk when it was added to the system.

Storage Local Disk Name
The name that was assigned to the local disk on the storage system when the local disk was created on the system.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Storage Local Disk Storage Class
The storage technology of the local disk on a storage system. For example, the storage class can be a serial-attached SCSI (SAS) or solid-state drive (SSD).

Storage Local Disk Speed (RPM)
The speed of the local disk on a storage system.

Storage Local Disk Capacity (GiB)
The amount of storage space on the local disk.

Overall Back-End Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Total Back-End I/O Rate (ops/s)
The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

Total Back-End Data Rate (MiB/s)
The average rate at which data is transmitted between the back-end storage resources and the component. The rate is measured in MiB per second and includes both read and write operations.

Performance of One Disk report

Shows four charts, and a table of performance metrics for a local disk over a time period. Use the report to analyze the performance of a local disk.

Restriction: This report applies only to SAN Volume Controller and Storwize systems.

Charts

The charts show the following performance metrics for a local disk on a storage system:

- The total back-end I/O rates and the overall back-end response times
- The read I/O rates, the write I/O rates, the read response times, and the write response times
- The read data rates, the write date rates, and the total date rates
- The read queue times, the write queue times, and the overall queue times

Report output

The following information is provided in the report for the period that you specified:

Storage System Name
A user-defined name of the storage system. If a name was not defined,

Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Storage MDisk Name
The name that was assigned to the managed disk when it was added to the system.

Storage Local Disk Name
The name that was assigned to the local disk on the storage system when the local disk was created on the system.

Storage Local Disk Storage Class
The storage technology of the local disk on a storage system. For example, the storage class can be a serial-attached SCSI (SAS) or solid-state drive (SSD).

Storage Local Disk Speed (RPM)
The speed of the local disk on a storage system.

Storage Local Disk Capacity (GiB)
The amount of storage space on the local disk.

Back-End Read I/O Rate (ops/s)
The average number of read operations per second that are issued to the back-end storage resources.

Back-End Write I/O Rate (ops/s)
The average number of write operations per second that are issued to the back-end storage resources.

Total Back-End I/O Rate (ops/s)
The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

Back-End Read Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Back-End Write Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Overall Back-End Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Back-End Read Data Rate (MiB/s)
The average number of MiB per second that are read from the back-end storage resources.

Back-End Write Data Rate (MiB/s)
The average number of MiB per second that are written to the back-end storage resources.

Total Back-End Data Rate (MiB/s)
The average rate at which data is transmitted between the back-end storage resources and the component. The rate is measured in MiB per second and includes both read and write operations.

Back-End Read Queue Time (ms/op)
The average number of milliseconds that a read operation spends in the queue before the operation is sent to the back-end storage resources.

Back-End Write Queue Time (ms/op)
The average number of milliseconds that a write operation spends in the queue before the operation is sent to the back-end storage resources.

Overall Back-End Queue Time (ms/op)
The average number of milliseconds that a read or a write operation spends in the queue before the operation is sent to the back-end storage resources.

Running the Compare Performance of Multiple Disks report

Use the Compare Performance of Multiple Disks report to compare up to four performance metrics for multiple local disks that are on storage systems. You can view reports about local disks on SAN Volume Controller, Storwize V7000, Storwize V7000 Unified, and Storwize V3700 systems. For example, you can compare cache percentages, data rates, and I/O rates.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.
2. Click **Storage Systems**.
3. Click **Disks**.
4. Click **Compare Performance of Multiple Disks**.
5. Select the storage systems, and then click **Refresh**.
6. Select the local disks, and then click **Next**.
7. Select the category of performance metric that you want to include in the report, and then select the performance metric.
8. Optional: To add more metrics to the report, complete the following steps:
   a. Click **Add Metric**.
   b. Select the category of performance metric, and then select the performance metric.

c. If you want to remove the last metric that you added, click **Remove Metric**.

9. Optional: Select an interval.
10. To set the time frame of the report, specify a reporting period. It is easier to analyze small amounts of information over shorter periods.

    Tip: To specify a start date and an end date, select **Custom date range** from the list of reporting periods.
11. Click **Finish**.

If the resources that you selected are not related, or if no data is available, a message is displayed in the report.

If information is not available for any of the resources that you selected, those resources are not included in the report.

Predefined reports about host connections

You can run predefined reports to analyze and compare the performance of volumes on host connections.

Running the Most Active Host Connections report

To see which host connections are the most active, run the Most Active Host Connections report.

Tip: To select a resource, click the resource. To select multiple resources, press Ctrl and click the resources. To select a series of resources, select the first resource, and then press Shift and click the last resource.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.
2. Click **Storage Systems**.
3. Click **Host Connections**.
4. Click **Most Active Host Connections**.
5. Optional: Select the configuration of the storage systems.
6. Select the storage systems, and then select a sort order.
7. To set the time frame of the report, specify a reporting period. If the report does not include a particular resource that you want to see, select a reporting period for which data is available for the resource.

   Tip: To specify a start date and an end date, select **Custom date range** from the list of reporting periods.
8. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection was unsuccessful, a message is displayed in the report.

Related reference:

"Most Active Host Connections report"
Shows a chart of the 20 host connections that have the most active volumes. The most active volumes have the greatest aggregate load.

Most Active Host Connections report

Shows a chart of the 20 host connections that have the most active volumes. The most active volumes have the greatest aggregate load.

Chart

The bar chart shows the most active host connections. By default, host connections are sorted by the total I/O rate.

Tip: To change the sort order, select a value from the **Sort Order** list.

Report output

The information that is provided about the most active host connections is as follows:

Storage Host Connection Name
The user-defined name that describes the server or storage device that is assigned to a volume.

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

XIV Cluster
The name of the cluster, if any, as defined on the XIV system. If no cluster is defined for the host connection, this field is blank.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Resource	Related reports
Host connection	Summarized Performance of Volumes by Host Connection
Storage system	Performance of One Storage System

Related tasks:

"Running the Most Active Host Connections report" on page 1002
To see which host connections are the most active, run the Most Active Host Connections report.

Running the Summarized Performance of Volumes by Host Connection report

To see the load that a particular server adds to your storage environment, use the Summarized Performance of Volumes by Host Connection report.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.

2. Click **Storage Systems**.
3. Click **Host Connections**.
4. Click **Summarized Performance of Volumes by Host Connection**.
5. Select a host connection. To select a host connection, complete the following steps:
   a. Type a keyword. For example, type `example1` to find the names of host connections that start with `example1`. To change the default search option, click **Options**. Use the percent sign as a wildcard. For example, type `a%` to find host connections that begin with 'a' or 'A'. Type `%a` to find host connections that begin with or contain the letter 'a' or 'A'. You can type `%` to retrieve all of the host connections on a resource.
   b. Click **Search**. The report searches the user-defined names for the host connections. The report does not search the server names that are defined when a server is probed. If the search is successful, the host connections are displayed in the **Choice** list.
   c. From the list, select a host connection, and then click **Refresh**.
6. Select the volumes.
7. Optional: Select an interval.
8. To set the time frame of the report, specify a reporting period. It is easier to analyze small amounts of information over shorter periods.

   Tip: To specify a start date and an end date, select **Custom date range** from the list of reporting periods.
9. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection was unsuccessful, a message is displayed in the report.

Related reference:

"Summarized Performance of Volumes by Host Connection report"
Shows summarized performance metrics for volumes on a host connection. Use the report to identify the aggregate load and the average response time of a particular server.

Summarized Performance of Volumes by Host Connection report

Shows summarized performance metrics for volumes on a host connection. Use the report to identify the aggregate load and the average response time of a particular server.

Charts

The charts show the following performance statistics for the volumes on a host connection:

- The total I/O rates and the total response times
- The read I/O rates, the write I/O rates, the read response times, and the write response times
- The read data rates, the write date rates, and the total data rates
- The read cache percentages and the write cache percentages

Report output

The following information is provided in the report for the period that you specified:

Storage Host Connection Name
The user-defined name that describes the server or storage device that is assigned to a volume.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation, across all volumes on the server. This value includes both read and write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second, across all volumes on the server. This value includes both sequential and nonsequential operations. The average value for each volume is added to give a total I/O rate for all volumes on the server.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations, across all volumes on the server. The average value for each volume is added to give a total data rate for all volumes on the server.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation, across all volumes on the server.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation, across all volumes on the server.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations, across all volumes on the server. The average value for each volume is added to give a read data rate for all volumes on the server.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations, across all volumes on the server. The average value for each volume is added to give a write data rate for all volumes on the server.

Overall Read I/O Rate (ops/s)
The average number of read operations per second, which is totaled for all volumes on the server. This value includes both sequential and nonsequential read operations.

Overall Write I/O Rate (ops/s)
The average number of write operations per second, which is totaled for all volumes on the server. This value includes both sequential and nonsequential write operations.

Overall Read Cache Hit Percentage
The average percentage of all read operations that find data in the cache, across all volumes on the server. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Overall Write Cache Hit Percentage
The average percentage of all write operations that are handled in the cache, across all volumes on the server. This value includes both sequential and nonsequential write operations.

in your storage environment.

Performance of Volumes by Host Connection report

Shows the performance metrics for volumes on a host connection. Use the report to identify the contribution of individual volumes to the load of a particular server in your storage environment.

Charts

The charts show the following performance metrics for the volumes:

- The total overall I/O rates. This is a stacked area chart that shows the contribution of each volume to the overall load on the server.
- The total data rates. This is a stacked area chart that shows the contribution of each volume to the overall load on the server.
- The volume utilization percentages. The utilization percentage of each volume is displayed relative to the utilization percentage of the other volumes.
- The total response times. The response time of each volume is displayed relative to the response time of the other volumes.

Report output

The following information is provided in the report for the period that you specified:

Storage Host Connection Name
The user-defined name that describes the server or storage device that is assigned to a volume.

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage Pool Name
The name that was assigned to the pool when it was added to the system.

Storage Volume Name
The name that was assigned to the storage volume when it was added to the system.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Volume Utilization
The average percentage of time that the volume is busy.

Related tasks:

To see performance metrics for the volumes on a server, use the Performance of Volumes by Host Connection report.

Predefined reports about I/O groups

You can run predefined reports to analyze and compare the performance of I/O groups.

Running the Most Active IO Groups report

To see which I/O groups are most active on storage systems, run the Most Active IO Groups report.

To run the report with the default settings, click **Finish**. By default all of the storage systems are selected.

Tip: To select a resource, click the resource. To select multiple resources, press Ctrl and click the resources. To select a series of resources, select the first resource, and then press Shift and click the last resource.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.
2. Click **Storage Systems**.
3. Click **IO Groups**.
4. Click **Most Active IO Groups**.
5. Optional: Select the configuration of the storage systems.
6. Select the storage systems, and then select a sort order.
7. To set the time frame of the report, specify a reporting period. If the report does not include a particular resource that you want to see, select a reporting period for which data is available for the resource.

   Tip: To specify a start date and an end date, select **Custom date range** from the list of reporting periods.
8. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection was unsuccessful, a message is displayed in the report.

Related reference:

"Most Active IO Groups report"
Shows a chart of the 20 I/O groups that are most active, and details for all I/O groups, for a time period that you specify. Use the report to analyze the performance of I/O groups.

Most Active IO Groups report

Shows a chart of the 20 I/O groups that are most active, and details for all I/O groups, for a time period that you specify. Use the report to analyze the performance of I/O groups.

Restriction: This report applies only to SAN Volume Controller and Storwize systems.

Charts

The chart shows the most active I/O groups on storage systems. By default, I/O groups are sorted by the total overall I/O rate.

Tip: To change the sort order, select a value from the **Sort Order** list.

Report output

The information that is provided for I/O groups is as follows:

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage I/O Group Name
The name that was assigned to the I/O group when it was added to the system.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Processor Utilization Percentage
The average percentage of time that the processors are busy.

Related reports

To open other reports that are related to a resource in this report, click the name of the resource. You can open the following related reports for the resources in this report:

Resource	Related reports
Storage system	Performance of One Storage System

To see which I/O groups are most active on storage systems, run the Most Active IO Groups report.

Running the Performance of One IO Group report

To see information about the performance of an I/O group on a storage system, run the Performance of One IO Group report.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.
2. Click **Storage Systems**.
3. Click **IO Groups**.
4. Click **Performance of One IO Group**.

5. Optional: Select the configuration of the storage systems.
6. Select a storage system.
7. Select an I/O group.
8. Optional: Select an interval.
9. To set the time frame of the report, specify a reporting period. It is easier to analyze small amounts of information over shorter periods.

   Tip: To specify a start date and an end date, select **Custom date range** from the list of reporting periods.
10. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection was unsuccessful, a message is displayed in the report.

Related reference:

"Performance of One IO Group report"
Shows four charts, and a table of performance metrics for an I/O group over a time period. Use the report to analyze the performance of an I/O group.

Performance of One IO Group report

Shows four charts, and a table of performance metrics for an I/O group over a time period. Use the report to analyze the performance of an I/O group.

Restriction: This report applies only to SAN Volume Controller and Storwize systems.

Charts

The charts show the following performance metrics for an I/O group on a storage system:

- The total overall I/O rates, and the total response times
- The overall I/O rates for read and write operations, and the response times for read and write operations
- The data rates for read and write operations, and the total data rates
- The overall cache hit percentage for read operations, the cache delay percentage for write operations, and the utilization percentage for processors

Report output

The following information is provided in the report for the period that you specified:

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Storage I/O Group Name
The name that was assigned to the I/O group when it was added to the system.

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Write Cache Delay Percentage
The percentage of I/O operations that are delayed because there is not enough space in the write cache.

The only operations that can be delayed are write operations, but the value is calculated as an average of all I/O operations.

Processor Utilization Percentage
The average percentage of time that the processors are busy.

Related reports

To open related reports, click the name of the storage system and then click the name of the report. You can open the following related reports:

Running the Compare Performance of Multiple IO Groups report

Use the Compare Performance of Multiple IO Groups report to compare up to four performance metrics for multiple I/O groups that are on storage systems. For example, you can compare cache percentages, data rates, and I/O rates.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.
2. Click **Storage Systems**.
3. Click **IO Groups**.
4. Click **Compare Performance of Multiple IO Groups**.
5. Select the storage systems, and then click **Refresh**.
6. Select the I/O groups, and then click **Next**.
7. Select the category of performance metric that you want to include in the report, and then select the performance metric.
8. Optional: To add more metrics to the report, complete the following steps:
   a. Click **Add Metric**.
   b. Select the category of performance metric, and then select the performance metric.
   c. If you want to remove the last metric that you added, click **Remove Metric**.
9. Optional: Select an interval.
10. To set the time frame of the report, specify a reporting period. It is easier to analyze small amounts of information over shorter periods.

    Tip: To specify a start date and an end date, select **Custom date range** from the list of reporting periods.
11. Click **Finish**.

If the resources that you selected are not related, or if no data is available, a message is displayed in the report.

If information is not available for any of the resources that you selected, those resources are not included in the report.

Managed Disks Capacity report

Shows a chart of the 20 managed disks with the most available space, and a table with space statistics for all managed disks. Use the report to review space availability in your managed disks.

Restriction: This report applies only to SAN Volume Controller, Storwize, and Hitachi Universal Storage Platform V systems.

Charts

The bar chart shows the used space and the available space for managed disk on storage systems.

Report output

For each managed disk on a storage system, the following information is provided:

Storage System MDisk Name
The name that was assigned to the managed disk on a storage system when it was added to the system.

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Storage System MDisk Capacity (GiB)
The amount of storage space on the managed disk.

Storage System MDisk Used Space (GiB)
The amount of used space on the managed disk.

Storage System MDisk Available Space (GiB)
The amount of storage space that is available on a managed disk. This value is only available for Storwize V7000 storage systems that are configured as back-end storage.

Storage MDisk RAID Level
The RAID level of the managed disk, such as RAID 5 or RAID 10. The RAID level affects the performance and fault tolerance of the volumes that are allocated from the managed disk.

Storage System MDisk Type
The type of managed disk on a storage system. For example, the disk on a storage system can be a local managed disk.

Storage System MDisk Mode
The access mode of a managed disk on a storage virtualizer. The access mode describes how extents are provided for virtual disks. Extents can be provided to virtual disks in the following ways:

Array Extents are provided from local disks.

Managed
Extents are provided from a back-end storage volume.

Unmanaged
The managed disk is not used in the system.

Storage System MDisk Strip Size (KB)
The RAID strip size on a managed disk on a storage system.

Storage System MDisk Is Balanced
Shows whether LUNs are balanced across storage controllers on the managed disk. If this value is `Yes`, the LUNs are balanced.

Storage System MDisk Fast Write State
Shows whether the cache for a volume on a disk that is managed by a storage system is empty, contains data, or is corrupted.

Storage System MDisk Write Verify
Shows whether all write operations on a managed disk on a storage system are verified by an immediate follow-up read operation. The follow-up read operation verifies that the write operation was successful. If this value is `Yes`, all write operations are verified by a follow-up read operation.

Related tasks:

Most Active Managed Disks report

Shows a chart of the 20 managed disks that are most active, and details for all managed disks, for a time period that you specify. Use the report to analyze the performance of managed disks.

Restriction: This report applies only to SAN Volume Controller, Storwize, and Hitachi Universal Storage Platform V systems.

Charts

The bar chart shows the most active managed disks that are on storage systems. By default, managed disks are sorted by the I/O rate.

Tip: To change the sort order, select a value from the **Sort Order** list.

Report output

The information that is provided about the most active managed disks is as follows:

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage Pool Name
The name that was assigned to the pool when it was added to the system.

Storage MDisk Name
The name that was assigned to the managed disk when it was added to the system.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Overall Back-End Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Total Back-End I/O Rate (ops/s)
The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

Total Back-End Data Rate (MiB/s)
The average rate at which data is transmitted between the back-end storage resources and the component. The rate is measured in MiB per second and includes both read and write operations.

Performance of One Managed Disk report

Shows four charts, and a table of performance metrics for a managed disk over a time period. Use the report to analyze the performance of a managed disk.

Restriction: This report applies only to SAN Volume Controller, Storwize, and Hitachi Universal Storage Platform V systems.

Charts

The charts show the following performance statistics for a managed disk on a storage system:

- The total I/O rates and the total response times
- The read I/O rates, the write I/O rates, the read response times, and the write response times
- The read data rates and the write date rates
- The read cache percentages, the write cache percentages, and the volume utilization percentages

Report output

The following information is provided in the report for the period that you specified:

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Storage Pool Name
The name that was assigned to the pool when it was added to the system.

Storage MDisk Name
The name that was assigned to the managed disk when it was added to the system.

Back-End Read I/O Rate (ops/s)
The average number of read operations per second that are issued to the back-end storage resources.

Back-End Write I/O Rate (ops/s)
The average number of write operations per second that are issued to the back-end storage resources.

Total Back-End I/O Rate (ops/s)
The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

Back-End Read Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Back-End Write Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Overall Back-End Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Back-End Read Data Rate (MiB/s)
The average number of MiB per second that are read from the back-end storage resources.

Back-End Write Data Rate (MiB/s)
The average number of MiB per second that are written to the back-end storage resources.

Total Back-End Data Rate (MiB/s)
The average rate at which data is transmitted between the back-end storage resources and the component. The rate is measured in MiB per second and includes both read and write operations.

Back-End Read Queue Time (ms/op)
The average number of milliseconds that a read operation spends in the queue before the operation is sent to the back-end storage resources.

Back-End Write Queue Time (ms/op)
The average number of milliseconds that a write operation spends in the queue before the operation is sent to the back-end storage resources.

Overall Back-End Queue Time (ms/op)
The average number of milliseconds that a read or a write operation spends in the queue before the operation is sent to the back-end storage resources.

Related reports

To open other reports that are related to a resource in this report, click the name of the resource. You can open the following related reports for the resources in this report:

Resource	Related reports
Storage system	Most Active Managed Disks
Storage pool	Performance of One Pool

Related tasks:

"Running the Performance of One Managed Disk" on page 1017

Running the Compare Performance of Multiple Managed Disks report

Use the Compare Performance of Multiple Managed Disks report to compare up to four performance metrics for multiple managed disks that are on storage systems. For example, you can compare data rates, I/O rates, and response times.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.
2. Click **Storage Systems**.

3. Click **Managed Disks**.
4. Click **Compare Performance of Multiple Managed Disks**.
5. Select the storage systems.
6. Select managed disks. To select managed disks, complete the following steps:
   a. Type a keyword. For example, type `mdisk1` to find the names of managed disks that start with `mdisk1`. To change the default search option, click **Options**. Use the percent sign as a wildcard. For example, type `a%` to find managed disks that begin with 'a' or 'A'. Type `%a` to find managed disks that begin with or contain the letter 'a' or 'A'. You can type `%` to retrieve all of the managed disks on a resource.
   b. Click **Search**. If the search is successful, the managed disks are displayed in the **Results** list.
   c. Select the managed disks that you require from the list, and then click **Insert**.
7. Click **Next**.
8. Select the category of performance metric that you want to include in the report, and then select the performance metric.
9. Optional: To add more metrics to the report, complete the following steps:
   a. Click **Add Metric**.
   b. Select the category of performance metric, and then select the performance metric.
   c. If you want to remove the last metric that you added, click **Remove Metric**.
10. Optional: Select an interval.
11. To set the time frame of the report, specify a reporting period. It is easier to analyze small amounts of information over shorter periods.

    Tip: To specify a start date and an end date, select **Custom date range** from the list of reporting periods.
12. Click **Finish**.

If the resources that you selected are not related, or if no data is available, a message is displayed in the report.

If information is not available for any of the resources that you selected, those resources are not included in the report.

Pools Capacity report

Shows a chart of the 20 pools with the most allocated space, and a table with space statistics for all pools. Use the report to review space allocation in your pools.

Charts

The bar chart shows the used space and available space for pools on storage systems.

Report output

For each pool on a storage system, the following information is provided:

Storage Pool Name
The name that was assigned to the pool when it was added to the system.

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Storage Pool Capacity (GiB)
The total amount of storage space in a pool.

Storage Pool Used Space (GiB)
The amount of storage space that is used in the pool.

Storage Pool Available Space (GiB)
The amount of space in a pool that is not reserved for volumes.

Tivoli Storage Productivity Center uses the following formula to determine this value:

```
pool capacity - allocated space
```

For XIV systems, this value represents the unallocated physical space in the pool, not the unallocated virtual space. For some storage systems, this value usually includes only the usable capacity, but might also include overhead space if the pool is unformatted.

Storage Pool Physical Allocation Percentage
The percentage of physical space in a pool that is reserved for volumes. This value is always less than or equal to 100% because you cannot reserve more physical space than is available in a pool.

Tivoli Storage Productivity Center uses the following formula to determine the allocation percentage:

```
(allocated space ÷ pool capacity) × 100
```

For example, the physical allocation percentage is 25% for a total pool size of 200 GiB. Therefore, the space that is reserved for volumes is 50 GiB.

Storage Pool Virtual Allocation Percentage
The percentage of physical space in a pool that is committed to the total

virtual capacity of the volumes in the pool. In thin-provisioned environments, this percentage exceeds 100% if a pool is overcommitted (over-provisioned).

Tivoli Storage Productivity Center uses the following formula to determine the allocation percentage:

`(total volume capacity ÷ pool capacity) × 100`

For example, the allocation percentage is 200% for a total pool size of 15 GiB. Therefore, the virtual capacity that is committed to the volumes in the pool is 30 GiB.

This configuration means that twice as much space is committed than is physically contained in the pool. If the allocation percentage is 100% for the same pool, then the virtual capacity that is committed to the pool is 15 GiB. This configuration means that all the physical capacity of the pool is already allocated to volumes.

An allocation percentage that is higher than 100% is considered aggressive. The pool has insufficient physical capacity to satisfy the maximum allocation for all the thin-provisioned volumes in the pool. In such cases, you can use the value for Storage Pool Shortfall Percentage to estimate how critical the shortage of space is for a pool.

This value is only available for pools with thin-provisioned volumes.

Storage Pool Shortfall Percentage
The percentage of the remaining unallocated volume space in a pool that is not available to be allocated.

The higher the percentage, the more critical the shortfall of pool space.

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

`(unallocatable space ÷ (virtual capacity − allocated space)) × 100`

You can use this percentage to determine when the amount of overcommitted space in a pool reaches a critically high level. For example, the physical space in a pool might be less than the committed virtual space. In this case, the pool does not have enough space to fulfill the commitment to virtual space.

This value represents the percentage of the committed virtual space that is not available in a pool. As more space is used over time by volumes while the pool capacity remains the same, this percentage increases.

For example, the physical capacity of a pool is 70 GiB, however, 150 GiB of virtual space is committed to thin-provisioned volumes. If the volumes are using 50 GiB, then there is still 100 GiB committed to those volumes (150 GiB - 50 GiB). There is only 20 GiB of available pool space (70 GiB - 50 GiB). Because only 20 GiB of pool space is available, 80 GiB of the committed space cannot be allocated (100 GiB - 20 GiB). In this case, the percentage of committed space that cannot be allocated is 80% (80 GiB ÷ 100 GiB × 100).

This value is only available for pools with thin-provisioned volumes.

Storage Pool Assigned Volume Space (GiB)
The amount of space in the pool that is on volumes that are assigned to a server or storage virtualizer.

Storage Pool Unassigned Volume Space (GiB)
The amount of volume space in the pool that is not assigned to a server or storage virtualizer.

Storage Pool Total Volume Capacity (GiB)
The total storage space on all the volumes in a pool, which includes thin-provisioned and standard volumes. For thin-provisioned volumes, this value includes virtual space.

Storage Pool Allocated Space (GiB)
The amount of space that is reserved for all the volumes in a pool, which includes both thin-provisioned and standard volumes. The space that is allocated for thin-provisioned volumes is less than their virtual capacity, which is shown in the Storage Pool Total Volume Capacity (GiB) property. If a pool does not contain thin-provisioned volumes, this value is the same as the value in the Storage Pool Total Volume Capacity (GiB) property. This value is equal to the value in the Storage Pool Used Volume Space (GiB) property for the following storage systems:

- Storage systems other than Storwize V7000 systems that are configured as back-end storage
- Storwize V7000 storage systems that are configured as back-end storage, and that are not thin-provisioned

Storage Pool Used Volume Space (GiB)
The amount of allocated space that is used by the volumes in a pool, which includes thin-provisioned and standard volumes.

For SAN Volume Controller and Storwize V7000, you can preallocate thin-provisioned volume space when volumes are created. For these storage systems, the Storage Pool Used Space might be different than the Storage Pool Allocated Space for pools that contain thin-provisioned volumes. In other cases, the values for Storage Pool Used Space and Storage Pool Allocated Space are equal.

This value is accurate as of the most recent time that Tivoli Storage Productivity Center collected data about a volume. The value in this property might not be 100% accurate for the current state of volumes. This inaccuracy might occur because data collection is run on a set schedule and the used space on volumes can change rapidly.

Storage Pool Real Configured Space (GiB)
The amount of storage space that is in an XIV system pool that has an associated soft size. The soft size of a pool is the virtual size of a thin-provisioned pool.

Storage Pool Real Available Space (GiB)
The amount of unused space that is in an XIV system pool that has an associated soft size. The soft size of a pool is the virtual size of a thin-provisioned pool.

Storage Pool RAID Level
The RAID level of the resource, such as RAID 5 or RAID 10. The RAID level affects the performance and fault tolerance of the volumes that are allocated from the resource.

Storage Pool Is Thin Provisioned
Shows whether a pool, volume, or volume copy is thin-provisioned. If this value is `Yes`, the resource is thin-provisioned.

Storage Pool Is Solid State
Shows whether there are solid-state drives in the pool. This property can contain the following values:

Mixed The pool contains both hard disk drives and solid-state drives.

Non solid state
The pool contains no solid-state drives.

Solid state
The pool contains a least one solid-state drive.

Storage Pool Number of MDisks
The number of managed disks in a storage pool.

Storage Pool Extent Size (MiB)
The size of the extent that was specified when a pool was created. Smaller extent sizes limit the maximum size of the volumes that can be created in a pool. Smaller extent sizes minimize the amount of potentially wasted space per volume.

This value is only available for Storwize V7000 storage systems that are configured as back-end storage.

Storage Pool Warning Level
The percentage of used capacity of the storage pool at which a warning is generated.

Storage Pool Repository Capacity (GiB)
The amount of space on all extents in the repository of a pool. This space can be used to allocate track space-efficient volumes. This attribute applies only to DS8000 storage systems.

Storage Pool Used Repository Space (GiB)
The amount of space on all extents in the repository of a pool that are allocated. This space can be used to allocate track space-efficient volumes. This attribute applies only to the DS8000 storage systems.

Report links

To open related reports, click the name of the storage pool and then click the name of the report. You can open the following related reports:

- Pools Historical Capacity
- Volumes Capacity

Related tasks:

"Running the Pools Capacity report" on page 1021
To see information about the used and available space of pools on storage systems, run the Pools Capacity report.

Running the Pools Historical Capacity report

To see how space in pools on storage systems is used, run the Pools Historical Capacity report.

You can see how space in a pool on a storage system, or in pools in a storage resource group, are used.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.
2. Click **Storage Systems**.
3. Click **Pools**.

4. Click **Pools Historical Capacity**.
5. Select the type of historical space report that you want to create. You can select either of the following options:
   - **Of a Pool in a Storage System**
     a. Click **Next**.
     b. Optional: Select the configuration of the storage system.
     c. Select a storage system, and then select a pool.
   - **Of Pools in a Storage Resource Group**
     a. Click **Next**.
     b. Optional: Select the configuration of the storage system.
     c. Select a storage resource group.
6. Select an interval.
7. To set the time frame of the report, specify a reporting period. It is easier to analyze small amounts of information over shorter periods.

   Tip: To specify a start date and an end date, select **Custom date range** from the list of reporting periods.
8. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection was unsuccessful, a message is displayed in the report.

Pools Historical Capacity report

Shows the usage of space on storage pools over a specified period. Use the report to analyze changes in your storage pool requirements.

Charts

The chart shows the following space statistics for the pool on a storage system:

- The capacity of the pool
- The used space in the pool
- The available space in the pool
- The virtual volume capacity of the pool
- The used volume space in the pool
- The allocated space in the pool

The chart shows the following space statistics for the pool in the storage resource group:

- The capacity of the pools
- The used space in the pools
- The available space in the pools
- The virtual volume capacity of the pools
- The used volume space in the pools
- The allocated space in the pool

Report output

The following information is included in reports for a pool on a storage system or for pools in a storage resource group:

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Storage Pool Name
The name that was assigned to the pool when it was added to the system.

Date The date that the data was collected for the report.

Storage System Pool Capacity (GiB)
The amount of storage space in pools that are on the storage system. For an XIV system, this value represents the physical capacity of the pool, not the virtual capacity. For other storage systems, this value might also include overhead space if the pool is unformatted.

Storage Pool Available Space (GiB)
The amount of space in a pool that is not reserved for volumes.

Tivoli Storage Productivity Center uses the following formula to determine this value:

```
pool capacity - allocated space
```

For XIV systems, this value represents the unallocated physical space in the pool, not the unallocated virtual space. For some storage systems, this value usually includes only the usable capacity, but might also include overhead space if the pool is unformatted.

Storage Pool Allocated Space (GiB)
The amount of space that is reserved for all the volumes in a pool, which includes both thin-provisioned and standard volumes. The space that is allocated for thin-provisioned volumes is less than their virtual capacity, which is shown in the Storage Pool Total Volume Capacity (GiB) property. If a pool does not contain thin-provisioned volumes, this value is the same as the value in the Storage Pool Total Volume Capacity (GiB) property. This value is equal to the value in the Storage Pool Used Volume Space (GiB) property for the following storage systems:

- Storage systems other than Storwize V7000 systems that are configured as back-end storage
- Storwize V7000 storage systems that are configured as back-end storage, and that are not thin-provisioned

Storage Pool Used Space (GiB)
The amount of storage space that is used in the pool.

Storage Pool Total Volume Capacity (GiB)
The total storage space on all the volumes in a pool, which includes thin-provisioned and standard volumes. For thin-provisioned volumes, this value includes virtual space.

Storage Pool Used Volume Space (GiB)
The amount of allocated space that is used by the volumes in a pool, which includes thin-provisioned and standard volumes.

For SAN Volume Controller and Storwize V7000, you can preallocate thin-provisioned volume space when volumes are created. For these storage systems, the Storage Pool Used Space might be different than the Storage Pool Allocated Space for pools that contain thin-provisioned volumes. In other cases, the values for Storage Pool Used Space and Storage Pool Allocated Space are equal.

This value is accurate as of the most recent time that Tivoli Storage Productivity Center collected data about a volume. The value in this property might not be 100% accurate for the current state of volumes. This inaccuracy might occur because data collection is run on a set schedule and the used space on volumes can change rapidly.

Storage Pool Assigned Volume Space (GiB)
The amount of space in the pool that is on volumes that are assigned to a server or storage virtualizer.

Storage Pool Unassigned Volume Space (GiB)
The amount of volume space in the pool that is not assigned to a server or storage virtualizer.

Storage Pool Real Configured Space (GiB)
The amount of storage space that is in pools that have an associated soft size on an XIV system. The soft size of a pool is the virtual size of a thin-provisioned pool.

Storage System MDisk Available Space (GiB)
The amount of storage space that is available on a managed disk. This value is only available for Storwize V7000 storage systems that are configured as back-end storage.

Storage Pool Number of MDisks
The number of managed disks in a storage pool.

Storage Pool Number of Storage Volumes
The number of volumes in the storage pool.

Most Active Pools report

Shows a chart of the 20 storage pools that are most active, and details for all pools, for a time period that you specify. Use the report to analyze the performance of pools.

Charts

The bar chart shows the most active pools on storage systems. By default, pools are sorted by the I/O rate.

Tip: To change the sort order, select a value from the **Sort Order** list.

Report output

The information that is provided about the most active pools is as follows:

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage Pool Name
The name that was assigned to the pool when it was added to the system.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Performance of One Pool report

Shows four charts, and a table of performance metrics for a storage pool over a time period that you specify. Use the report to analyze the performance of a storage pool.

Charts

The charts show the following performance metrics for a pool on a storage system:

- The total overall rates for I/O operations, and the total response times
- The overall I/O rates for read and write operations, and the response times for read and write operations
- The total I/O rates for back-end operations, and overall response times for back-end operations
- The I/O rates for back-end read operations and back-end write operations, and the response rates for back-end read and back-end write operations

Report output

The following information is provided in the report for the period that you specified:

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage Pool Name
The name that was assigned to the pool when it was added to the system.

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Back-End Read I/O Rate (ops/s)
The average number of read operations per second that are issued to the back-end storage resources.

Back-End Write I/O Rate (ops/s)
The average number of write operations per second that are issued to the back-end storage resources.

Total Back-End I/O Rate (ops/s)
The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

Back-End Read Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Back-End Write Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Overall Back-End Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Running the Compare Performance of Multiple Pools

Use the Compare Performance of Multiple Pools report to compare up to four performance metrics for multiple pools that are on storage systems. For example, you can compare cache percentages, data rates, and I/O rates.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.
2. Click **Storage Systems**.
3. Click **Pools**.
4. Click **Compare Performance of Multiple Pools**.
5. Select the storage systems, and then click **Refresh**.
6. Select the pools, and then click **Next**.
7. Select the category of performance metric that you want to include in the report, and then select the performance metric.
8. Optional: To add more metrics to the report, complete the following steps:
   a. Click **Add Metric**.
   b. Select the category of performance metric, and then select the performance metric.
   c. If you want to remove the last metric that you added, click **Remove Metric**.
9. Optional: Select an interval.
10. To set the time frame of the report, specify a reporting period. It is easier to analyze small amounts of information over shorter periods.

Tip: To specify a start date and an end date, select **Custom date range** from the list of reporting periods.

11. Click **Finish**.

If the resources that you selected are not related, or if no data is available, a message is displayed in the report.

If information is not available for any of the resources that you selected, those resources are not included in the report.

Running the Compare Performance of One Pool over Time Ranges report

To compare a performance metric for one pool in two date ranges, run the Compare Performance of One Pool over Time Ranges report.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.
2. Click **Storage Systems**.

3. Click **Pools**.
4. Click **Compare Performance of One Pool over Time Ranges**.
5. Optional: Select the configuration of the storage systems.
6. Select the storage system.
7. Select the category of performance metric about which you want a report, and then select the performance metric.
8. Select an interval.
9. Specify the two date ranges or reporting periods that you want to compare. For example, you can compare the performance metric for this week with last week.

   Tip: To specify a start date and an end date for a reporting period, select **Custom Date Range** from the list of reporting periods.
10. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection was unsuccessful, a message is displayed in the report.

Compare Performance of One Pool over Time Ranges report

Shows one performance metric on one pool over two time periods. For example, you can use this report to compare the I/O rate for this week and last week.

Charts

The chart shows the performance data of the pool on the performance metric you selected, over the time periods that you selected.

Report output

The following information is provided in the report:

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage Pool Name
The name that was assigned to the pool when it was added to the system.

Day in Range
The number of the day in the date range at which the performance metric data was collected, relative to the date range that you specified. The number of days that are shown is determined by the reporting period that was selected for the report. If **Last 30 Days** was selected, then entries for days 1 - 30 are shown on the report.

Hour in Range
The number of the hour in the day at which the performance metric data was collected. For example, 0 is between 12:00:00 a.m. and 12:59:59 a.m., 1 is between 01:00:00 a.m. and 01:59:59 a.m.

Minute in Range
The interval of minutes during which the performance metric data was collected. For example, `0` shows that performance data was collected 0 - 5 minutes after the hour. Similarly, `5` shows that the performance data that was collected 5 - 10 minutes after the hour.

First Date Range
The details of the performance metric data in the first date range. The details are displayed in two columns in the First Date Range column. Depending on the interval that you selected, the Time, Day, or Hour column shows the time at which the performance metric data was collected. The column with the performance metric name shows the data for the performance metric for the first date range.

Second Date Range
The details of the performance metric data in the second date range. The details are displayed in two columns in the Second Date Range column. Depending on the interval that you selected, the Time, Day, or Hour column shows the time at which the performance metric data was collected. The column with the performance metric name shows the data for the performance metric for the second date range.

Charts

The bar chart shows the most active ports on storage systems. By default, ports are sorted by the I/O rate.

Tip: To change the sort order, select a value from the **Sort Order** list.

Report output

The information that is provided about the most active ports is as follows:

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage Port Name
The name that was assigned to the storage port when the storage system was added to the system.

Storage System Port Location
The physical location of a port on DS8000, DS6000, TotalStorage Enterprise Storage Server storage systems, and on XIV systems. For all other systems, this property shows the WWPN of the port.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Overall Port Response Time (ms/op)
The average number of milliseconds to complete a send or receive operation.

Total Port I/O Rate (ops/s)
The average number of send operations and receive operations per second.

Total Port Data Rate (MiB/s)
The average rate at which data is transferred through the port. The rate is measured in MiB per second and includes both send and receive operations.

Overall Port Bandwidth Percentage
The percentage of the port bandwidth that is used for send operations and receive operations. This value is an indicator of port bandwidth usage that is based on the speed of the port.

"Performance of One Port report"
Shows four charts, and a table of performance metrics for a port over a time period that you specify. Use the report to analyze the performance of a port.

Performance of One Port report

Shows four charts, and a table of performance metrics for a port over a time period that you specify. Use the report to analyze the performance of a port.

Charts

The charts show the following performance metrics for a port on a storage system:

- The total I/O rates, and the total response times
- The read I/O rates, the write I/O rates, and the response times
- The read data rates, the write data rates, and the total data rate

- The send bandwidth percentage, the receive bandwidth percentage, and the overall bandwidth percentage

Report output

The following information is provided in the report for the period that you specified:

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Storage Port Name
The name that was assigned to the storage port when the storage system was added to the system.

Storage System Port Location
The physical location of a port on DS8000, DS6000, TotalStorage Enterprise Storage Server storage systems, and on XIV systems. For all other systems, this property shows the WWPN of the port.

Port Send I/O Rate (ops/s)
The average number of I/O operations per second for operations in which data is sent from a port.

Port Receive I/O Rate (ops/s)
The average number of I/O operations per second for operations in which the port receives data.

Total Port I/O Rate (ops/s)
The average number of send operations and receive operations per second.

Port Send Response Time (ms/op)
The average number of milliseconds to complete a send operation.

Port Receive Response Time (ms/op)
The average number of milliseconds to complete a receive operation.

Overall Port Response Time (ms/op)
The average number of milliseconds to complete a send or receive operation.

Port Send Data Rate (MiB/s)
The average rate at which data is sent through the port. The rate is measured in MiB per second.

Port Receive Data Rate (MiB/s)
The average rate at which data is received by the port. The rate is measured in MiB per second.

Total Port Data Rate (MiB/s)
The average rate at which data is transferred through the port. The rate is measured in MiB per second and includes both send and receive operations.

Port Send Bandwidth Percentage
The percentage of the port bandwidth that is used for send operations. This value is an indicator of port bandwidth usage that is based on the speed of the port.

Port Receive Bandwidth Percentage
The percentage of the port bandwidth that is used for receive operations. This value is an indicator of port bandwidth usage that is based on the speed of the port.

Overall Port Bandwidth Percentage
The percentage of the port bandwidth that is used for send operations and receive operations. This value is an indicator of port bandwidth usage that is based on the speed of the port.

Running the Compare Performance of Multiple Ports report

Use the Compare Performance of Multiple Ports report to compare up to four performance metrics for multiple ports that are on storage systems. For example, you can compare data rates, I/O rates, and bandwidth percentages.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.
2. Click **Storage Systems**.
3. Click **Ports**.
4. Click **Compare Performance of Multiple Ports**.
5. Select the storage systems.
6. Select ports. To select ports, complete the following steps:
   a. Type a keyword. For example, type `port1` to find the names of ports that start with `port1`. To change the default search option, click **Options**. Use the percent sign as a wildcard. For example, type `a%` to find ports that begin with 'a' or 'A'. Type `%a` to find ports that begin with or contain the letter 'a' or 'A'. You can type `%` to retrieve all of the ports on a resource.
   b. Click **Search**. If the search is successful, the ports are displayed in the **Results** list.
   c. Select the ports that you require from the list, and then click **Insert**.
7. Click **Next**.
8. Select the category of performance metric that you want to include in the report, and then select the performance metric.
9. Optional: Select an interval.
10. To set the time frame of the report, specify a reporting period. It is easier to analyze small amounts of information over shorter periods.

    Tip: To specify a start date and an end date, select **Custom date range** from the list of reporting periods.
11. Click **Finish**.

If the resources that you selected are not related, or if no data is available, a message is displayed in the report.

If information is not available for any of the resources that you selected, those resources are not included in the report.

Predefined reports about RAID arrays

You can run predefined reports to analyze and compare the performance of RAID arrays.

Running the Most Active RAID Arrays report

To see which arrays are most active on DS8000, DS6000, and IBM TotalStorage Enterprise Storage Server storage systems, run the Most Active RAID Arrays report.

Tip: To select a resource, click the resource. To select multiple resources, press Ctrl and click the resources. To select a series of resources, select the first resource, and then press Shift and click the last resource.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.
2. Click **Storage Systems**.
3. Click **RAID Arrays**.
4. Click **Most Active RAID Arrays**.
5. Select the storage systems, and then select a sort order.
6. To set the time frame of the report, specify a reporting period. If the report does not include a particular resource that you want to see, select a reporting period for which data is available for the resource.

   Tip: To specify a start date and an end date, select **Custom date range** from the list of reporting periods.
7. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection was unsuccessful, a message is displayed in the report.

Most Active RAID Arrays report

Shows up to four performance metrics for multiple arrays over time. Use the report to compare the performance metrics for arrays that are on storage systems.

Restriction: This report applies only to DS8000, DS6000, and TotalStorage Enterprise Storage Server systems.

Charts

The bar chart shows the most active RAID arrays on DS8000, DS6000, and TotalStorage Enterprise Storage Server storage systems. By default, arrays are sorted by the I/O rate.

Tip: To change the sort order, select a value from the **Sort Order** list.

Report output

The information that is provided about the most active RAID arrays is as follows:

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage Controller Name
The name that was assigned to the controller when it was added to the system.

Storage Pool Name
The name that was assigned to the pool when it was added to the system.

Storage RAID Array Name
The name that was assigned to the RAID array when it was added to the system.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Overall Back-End Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Total Back-End I/O Rate (ops/s)
The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

Total Back-End Data Rate (MiB/s)
The average rate at which data is transmitted between the back-end storage resources and the component. The rate is measured in MiB per second and includes both read and write operations.

Disk Utilization Percentage
The average percentage of time that the disks that are associated with an array are busy.

No value is calculated for this property if there are multiple ranks in the extent pool where the thin-provisioned volumes are allocated. In this case, the value `N/A` is displayed for this property. This limitation applies only to DS8000 storage systems.

If there is only a single rank in the extent pool, the value for this property is calculated regardless of the thin-provisioned volumes.

Report output

The following information is provided in the report for the period that you specified:

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage System Controller Name
The name that was assigned to the controller when it was added to the system.

Storage RAID Array Name
The name that was assigned to the RAID array when it was added to the system.

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Back-End Read I/O Rate (ops/s)
The average number of read operations per second that are issued to the back-end storage resources.

Back-End Write I/O Rate (ops/s)
The average number of write operations per second that are issued to the back-end storage resources.

Total Back-End I/O Rate (ops/s)
The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

Back-End Read Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Back-End Write Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Overall Back-End Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Disk Utilization Percentage

The average percentage of time that the disks that are associated with an array are busy.

No value is calculated for this property if there are multiple ranks in the extent pool where the thin-provisioned volumes are allocated. In this case, the value `N/A` is displayed for this property. This limitation applies only to DS8000 storage systems.

If there is only a single rank in the extent pool, the value for this property is calculated regardless of the thin-provisioned volumes.

Predefined reports about volumes

You can run predefined reports to analyze the capacity and performance of volumes.

Running the Volumes Capacity report

To see information about the capacity of volumes on storage systems, run the Volumes Capacity report.

To run the report with the default settings, click **Finish**. By default all of the storage systems in the list are selected.

Tip: To select a resource, click the resource. To select multiple resources, press Ctrl and click the resources. To select a series of resources, select the first resource, and then press Shift and click the last resource.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.

2. Click **Storage Systems**.
3. Click **Volumes**.
4. Click **Volumes Capacity**.
5. Optional: Select the configuration of the storage systems.
6. Select one or more storage systems.
7. Optional: If you selected SAN Volume Controller or Storwize V7000 storage systems, you can select the type of volume.

Option	Description
All Volumes	Select **All**, the default, to view information about all of the volumes on the selected storage systems.
Only Primary Volumes	Select **Primary** to view information about primary volumes on the selected storage systems.
Only Secondary Volumes	Select **Secondary** to view information about secondary volumes on the selected storage systems.

8. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection was unsuccessful, a message is displayed in the report.

Volumes Capacity report

Shows a chart of the 20 volumes with the most used space, and a table with details of all volumes. Use the report to review the space allocation in your volumes.

Charts

The bar chart shows the used space for volumes on storage systems.

Report output

For each volume on a storage system, the following information is provided:

Storage Volume Name
The name that was assigned to the storage volume when it was added to the system.

Storage Pool Name
The name that was assigned to the pool when it was added to the system.

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`,

the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Storage Volume WWN
The worldwide name of the volume.

Storage Volume Capacity (GiB)
The total amount of storage space that is committed to a volume.

For thin-provisioned volumes, this value represents the virtual capacity of the volume.

For XIV systems, this value represents the physical (hard) capacity of the volume, not the virtual (soft) capacity. For other storage systems, this value might also include overhead space if the pool is unformatted.

Storage Volume Allocated Space (GiB)
The amount of space that is reserved for a volume. The space that is allocated for a thin-provisioned volume is less than its virtual capacity, which is shown in the Storage Volume Capacity (GiB) property. This value is equal to the value in the Storage Volume Used Space (GiB) property for the following storage systems:

- Storage systems other than Storwize V7000 systems that are configured as back-end storage
- Storwize V7000 storage systems that are configured as back-end storage, and that are not thin-provisioned

Storage Volume Used Space (GiB)
The amount of allocated space that is used by a volume.

For SAN Volume Controller and Storwize V7000, you can preallocate thin-provisioned volume space when the volumes are created. In these cases, the Storage Volume Used Space (GiB) might be different than the Storage Volume Allocated Space (GiB). For volumes that are not thin provisioned, the values for Storage Volume Used Space (GiB) and Storage Volume Allocated Space (GiB) are equal.

This value is accurate as of the most recent time that Tivoli Storage Productivity Center collected data about a volume. The value in this property might not be 100% accurate for the current state of volumes. This inaccuracy might occur because data collection is run on a set schedule and the used space on volumes can change rapidly.

Storage Volume Overhead (GiB)
The amount of space that is used for system management. The amount of space also includes space that is reserved for redundancy.

Storage Volume Physical Allocation Percentage
The percentage of physical space that is reserved for a volume. This value is always less than or equal to 100% because you cannot reserve more physical space than is available.

Tivoli Storage Productivity Center uses the following formula to determine this value:

`(allocated space ÷ capacity) × 100`

For example, the physical allocation percentage is 25% for a volume size of 200 GiB. Therefore, the space that is reserved for volumes is 50 GiB.

Storage Volume Shortfall Percentage
The percentage of the remaining unallocated volume space in a pool that is not available to be allocated to a volume.

The higher the percentage, the more critical the shortfall of space.

Tivoli Storage Productivity Center uses the following formula to determine this value:

```
(unallocatable volume Space ÷ volume unallocated space) × 100
```

You can use this percentage to determine when the amount of overcommitted space in pools reaches a critically high level. For example, the physical space in pools might be less than the committed virtual space. In this case, the pools do not have enough space to fulfill the commitment to virtual space for a volume.

This Storage Volume Shortfall Percentage represents the percentage of the committed virtual space that is not available in a pool. As more space is used over time by a volume while the pool capacity remains the same, this percentage increases.

For example, the remaining physical capacity of a pool is 70 GiB, however, 150 GiB of virtual space is committed to a thin-provisioned volume. If the volume is using 50 GiB, then there is still 100 GiB committed to that volume (150 GiB - 50 GiB). There is a shortfall of 30 GiB (70 GiB remaining pool space - 100 GiB remaining commitment of volume space to the volume). The volume is overcommitted by 30 GiB based on the available space in the pool. The shortfall is 30% when you use the following calculation:

```
100 GiB unallocated volume space - 70 GiB remaining
pool space ÷ 100 GiB unallocated volume space × 100
```

Storage Volume Used Allocated Space Percentage
The percentage of reserved space for a volume that is being used. This value is always less than or equal to 100% because a volume cannot use more space than is allocated.

Tivoli Storage Productivity Center uses the following formula to determine this value:

```
(volume used space ÷ volume allocated space) × 100
```

Storage Volume RAID Level
The RAID level of the resource, such as RAID 5 or RAID 10. The RAID level affects the performance and fault tolerance of the volumes that are allocated from the resource.

Storage Volume Is Assigned
Shows whether the volume is assigned to a server. If this value is `Yes`, the volume is assigned to a server.

Storage Volume Is Thin Provisioned
Shows whether a pool, volume, or volume copy is thin-provisioned. If this value is `Yes`, the resource is thin-provisioned.

Storage Volume Type
The type of storage volume. For example, the storage volume can be striped or sequential. This value is only available for SAN Volume Controller and Storwize V7000 storage systems that are configured as back-end storage.

Storage Volume Grain Size (KiB)
The grain size with which a thin-provisioned volume was created. This

value is typically 32, 64, 128, or 256 KiB. Larger grain sizes maximize performance, whereas smaller grain sizes maximize space efficiency. Grain sizes also limit the maximum virtual space of a volume.

This value is only available for SAN Volume Controller and Storwize V7000 storage systems that are configured as back-end storage.

Storage Volume Warning Level
The percentage of volume capacity that is used at which a warning is generated. This value is only available for SAN Volume Controller and Storwize V7000 storage systems that are configured as back-end storage.

Storage Volume Logical Subsystem
The logical subsystem (LSS) to which a volume or pool belongs.

Storage Volume Copy ID
The identifier of a volume copy.

Storage Volume Copy Is Primary
Shows whether the volume copy is the primary volume copy.

Related reports

To open the Volumes Historical Capacity report, click the name of the volume in the report table.

Related tasks:

"Running the Volumes Capacity report" on page 1046
To see information about the capacity of volumes on storage systems, run the Volumes Capacity report.

Running the Volumes Historical Capacity report

To see how space on volumes on storage systems is used, run the Volumes Historical Capacity report.

You can see how space on a volume on a storage system, or on volumes in a storage resource group, are used.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.
2. Click **Storage Systems**.
3. Click **Volumes**.
4. Click **Volumes Historical Capacity**.
5. Select the type of historical capacity report that you want to create. You can select either of the following options:
   - **Of a Volume in a Storage System**
     a. Click **Next**.
     b. Optional: Select the configuration of the storage system.
     c. Select a storage system.
     d. Type a keyword and click **Search**. For example, type `lun`, to find the names of volumes that start with `lun`. To change the default search option, click **Options**.

        Tip: Use the percent sign (%) as a wildcard. For example, type `a%` to find volume names that begin with 'a' or 'A'. Type `%a` to find volume names that begin with or contain the letter 'a' or 'A'. You can type `%` to retrieve all of the volumes on a resource.

e. Select a volume.

- **Of Volumes in a Storage Resource Group**
  a. Click **Next**.
  b. Select a storage resource group.

6. Select an interval.
7. To set the time frame of the report, specify a reporting period. It is easier to analyze small amounts of information over shorter periods.

   Tip: To specify a start date and an end date, select **Custom date range** from the list of reporting periods.
8. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection was unsuccessful, a message is displayed in the report.

Volumes Historical Capacity report

Shows the usage of space on volumes over a specified period. Use the report to analyze changes in your volume requirements, particularly the increasing usage of space on thin-provisioned volumes.

Charts

The chart shows the following space statistics for the volume on a storage system:

- The capacity of the volume
- The used space on the volume
- The space on the volume that is used for system management
- The allocated space on the volume

The chart shows the following space statistics for the volumes in a storage resource group:

- The capacity of the volumes
- The used space on the volumes
- The space on the volumes that is used for system management
- The allocated space on the volume

If the volume is thin provisioned, the chart shows the total amount of virtual space that is allocated to the volume, and the total amount of real space that is used by the volume.

Report output

The following information is included in reports for a volume on a storage system, or for volumes in a storage resource group:

Storage System Name
A user-defined name of the storage system. If a name was not defined,

Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Storage Pool Name
The name that was assigned to the pool when it was added to the system.

Storage Volume Name
The name that was assigned to the storage volume when it was added to the system.

Date The date that the data was collected for the report.

Storage Volume Capacity (GiB)
The total amount of storage space that is committed to a volume.

For thin-provisioned volumes, this value represents the virtual capacity of the volume.

For XIV systems, this value represents the physical (hard) capacity of the volume, not the virtual (soft) capacity. For other storage systems, this value might also include overhead space if the pool is unformatted.

Storage Volume Used Space (GiB)
The amount of allocated space that is used by a volume.

For SAN Volume Controller and Storwize V7000, you can preallocate thin-provisioned volume space when the volumes are created. In these cases, the Storage Volume Used Space (GiB) might be different than the Storage Volume Allocated Space (GiB). For volumes that are not thin provisioned, the values for Storage Volume Used Space (GiB) and Storage Volume Allocated Space (GiB) are equal.

This value is accurate as of the most recent time that Tivoli Storage Productivity Center collected data about a volume. The value in this property might not be 100% accurate for the current state of volumes. This inaccuracy might occur because data collection is run on a set schedule and the used space on volumes can change rapidly.

Storage Volume Allocated Space (GiB)
The amount of space that is reserved for a volume. The space that is allocated for a thin-provisioned volume is less than its virtual capacity, which is shown in the Storage Volume Capacity (GiB) property. This value is equal to the value in the Storage Volume Used Space (GiB) property for the following storage systems:

- Storage systems other than Storwize V7000 systems that are configured as back-end storage
- Storwize V7000 storage systems that are configured as back-end storage, and that are not thin-provisioned

Storage Volume Overhead (GiB)
The amount of space that is used for system management. The amount of space also includes space that is reserved for redundancy.

Running the Most Active Volumes report

To see which volumes are most active on storage systems, run the Most Active Volumes report.

Tip: To select a resource, click the resource. To select multiple resources, press Ctrl and click the resources. To select a series of resources, select the first resource, and then press Shift and click the last resource.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.
2. Click **Storage Systems**.
3. Click **Volumes**.
4. Click **Most Active Volumes**.
5. Optional: Select the configuration of the storage systems.
6. Select the storage systems, and then select a sort order.
7. To set the time frame of the report, specify a reporting period. If the report does not include a particular resource that you want to see, select a reporting period for which data is available for the resource.

   Tip: To specify a start date and an end date, select **Custom date range** from the list of reporting periods.
8. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection was unsuccessful, a message is displayed in the report.

Related reference:

"Most Active Volumes report"
Shows a chart of the 20 volumes that are most active, and details for all volumes, for a time period that you specify. Use the report to analyze the performance of volumes.

Most Active Volumes report

Shows a chart of the 20 volumes that are most active, and details for all volumes, for a time period that you specify. Use the report to analyze the performance of volumes.

Charts

The bar chart shows the most active volumes on storage systems. By default, volumes are sorted by the I/O rate.

Tip: To change the sort order, select a value from the **Sort Order** list.

Report output

The information that is provided about the most active volumes is as follows:

Storage System Name
A user-defined name of the storage system. If a name was not defined,

Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage Pool Name
The name that was assigned to the pool when it was added to the system.

Storage Volume Name
The name that was assigned to the storage volume when it was added to the system.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Volume Utilization
The average percentage of time that the volume is busy.

Related reports

To open other reports that are related to a resource in this report, click the name of the resource. You can open the following related reports for the resources in this report:

Resource	Related reports
Storage system	Performance of One Storage System
Storage pool	Performance of One Pool
Volume	Performance of One Volume, Storage Resource Relationships Summary

Related tasks:

"Running the Most Active Volumes report" on page 1053
To see which volumes are most active on storage systems, run the Most Active Volumes report.

Running the Performance of One Volume report

To see performance metrics for volumes on a storage system, run the Performance of One Volume report.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.
2. Click **Storage Systems**.
3. Click **Volumes**.
4. Click **Performance of One Volume**.
5. Optional: Select the configuration of the storage systems.
6. Select a storage system.
7. Select a volume. To select a volume, complete the following steps:
   a. Type a keyword. For example, type `lun`, to find the names of volumes that start with `lun`. To change the default search option, click **Options**. Use the percent sign as a wildcard. For example, type `a%` to find volume names that begin with 'a' or 'A'. Type `%a` to find volume names that begin with or contain the letter 'a' or 'A'. You can type `%` to retrieve all of the volumes on a resource.
   b. Click **Search**. If the search is successful, the names of the volumes are displayed in the **Choice** list.
   c. From the list, select a volume.
8. Optional: Select an interval.
9. To set the time frame of the report, specify a reporting period. It is easier to analyze small amounts of information over shorter periods.

   Tip: To specify a start date and an end date, select **Custom date range** from the list of reporting periods.
10. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection was unsuccessful, a message is displayed in the report.

"Performance of One Volume report"
Shows four charts, and a table of performance metrics for a volume over a time period that you specify. Use the report to analyze the performance of a volume.

Performance of One Volume report

Shows four charts, and a table of performance metrics for a volume over a time period that you specify. Use the report to analyze the performance of a volume.

Charts

The charts show the following performance metrics for a volume on a storage system:

- The total I/O rates, and the total response times
- The read I/O rates, the write I/O rates, the read response times, and the write response times
- The read data rates, and the write date rates
- The read cache percentages, the write cache percentages, and the volume utilization percentages

Report output

The following information is provided in the report for the period that you specified:

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Storage Pool Name
The name that was assigned to the pool when it was added to the system.

Storage Volume Name
The name that was assigned to the storage volume when it was added to the system.

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Overall Write Cache Hit Percentage
The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

Volume Utilization
The average percentage of time that the volume is busy.

Running the Compare Performance of Multiple Volumes report

Use the Compare Performance of Multiple Volumes report to compare up to four performance metrics for multiple volumes that are on storage systems. For example, you can compare cache percentages, data rates, and I/O rates.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Predefined Reports**.
2. Click **Storage Systems**.
3. Click **Volumes**.
4. Click **Compare Performance of Multiple Volumes**.
5. Select the storage systems.
6. Select volumes. To select volumes, complete the following steps:
   a. Type a keyword. For example, type `example1` to find the names of volumes that start with `example1`. To change the default search option, click **Options**. Use the percent sign as a wildcard. For example, type `a%` to find volumes that begin with 'a' or 'A'. Type `%a` to find volumes that begin with or contain the letter 'a' or 'A'. You can type `%` to retrieve all of the volumes on a resource.
   b. Click **Search**. If the search is successful, the volumes are displayed in the **Results** list.
   c. Select the volumes that you require from the list, and then click **Insert**.
7. Click **Next**.
8. Select the category of performance metric that you want to include in the report, and then select the performance metric.
9. Optional: To add more metrics to the report, complete the following steps:
   a. Click **Add Metric**.
   b. Select the category of performance metric, and then select the performance metric.
   c. If you want to remove the last metric that you added, click **Remove Metric**.
10. Optional: Select an interval.
11. To set the time frame of the report, specify a reporting period. It is easier to analyze small amounts of information over shorter periods.

Tip: To specify a start date and an end date, select **Custom date range** from the list of reporting periods.

12. Click **Finish**.

If the resources that you selected are not related, or if no data is available, a message is displayed in the report.

If information is not available for any of the resources that you selected, those resources are not included in the report.

Predefined reports about storage tiering

Use storage tier reports to help you determine the best storage-tier configuration for your environment.

Information collection

IBM Tivoli Storage Productivity Center collects information from:

- SAN Volume Controller
- Storwize V7000

- Storwize V7000 Unified

Tivoli Storage Productivity Center provides Tivoli Common Reporting reports that show performance and usage data for the SAN Volume Controller, Storwize V7000, and Storwize V7000 Unified systems in your environment.

Workload activity reports

Before you run workload activity reports, you must set the back-end properties of the managed disk (MDisk) groups in your environment.

You can use the Tivoli Storage Productivity Center CLI called tcptool to set the back-end properties of MDisk groups. Alternatively, you can set the properties in the MDisk Group Details page in the Tivoli Storage Productivity Center stand-alone GUI.

With the information that is collected from Tivoli Storage Productivity Center, you can run workload activity reports. The reports provide information about the workload activity of these resources:

- Managed disk (MDisk) groups
- Virtual disks (VDisks) in MDisk groups
- VDisks in storage resource groups
- VDisks in storage virtualizers

By analyzing workload activity reports, you can determine:

- Whether the workload activity of an MDisk group is too low or too high
- Whether a VDisk should be migrated in one of the following ways:
  - To an MDisk group with a faster read I/O capability rate
  - To an MDisk group with a slower read I/O capability rate

Explanation: In the predefined reports about performance, resources, and historical information, MDisk groups are called pools, and VDisks are called volumes.

Related information:

IBM Tivoli Storage Productivity Center Information Center
You can use commands on the Tivoli Storage Productivity Center command-line interface (CLI) to provide information about RAID arrays and back-end storage subsystems. For more information about these commands, see the Tivoli Storage Productivity Center Information Center at http://publib.boulder.ibm.com/infocenter/tivihelp/v59r1/index.jsp. Search for “setarray”, “autosetarray”, and “lsarray”.

Running the Storage Resource Group - VDisk Workload Activity Details report

To see which virtual disks (VDisks) are most active in a storage resource group, run the Storage Resource Group - VDisk Workload Activity Details report.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Packages**.
2. Click **Storage Tiering**.
3. Click **VDisk Workload Activity Reports**.
4. Select **Storage Resource Group - VDisk Workload Activity Details**, then click **Next**.
5. Select a storage virtualizer, and then select a storage resource group.

6. To set the time frame of the report, specify a reporting period. It is easier to analyze small amounts of information over shorter periods.

   Tip: To specify a start date and an end date, select **Custom date range** from the list of reporting periods.
7. Click **Finish**.

Related reference:

"Storage Resource Group - VDisk Workload Activity Details report"
Shows the workload activity of virtual disks (VDisks) in storage resource groups. The workload activity is determined by calculating the average and maximum peak utilization of the VDisks in the group.

Storage Resource Group - VDisk Workload Activity Details report

Shows the workload activity of virtual disks (VDisks) in storage resource groups. The workload activity is determined by calculating the average and maximum peak utilization of the VDisks in the group.

Restriction: This report applies only to SAN Volume Controller and Storwize systems.

Reporting period

The name of the storage virtualizer, the name of the storage resource group, the date filter such as `Last 7 days`, and the reporting period are displayed in the report.

Retention of report data

If you remove an MDisk group or a VDisk, the daily data that is collected for reports is retained for a configurable period. The default is 90 days. If you run a report after the data retention period expired, the daily data for the MDisk group or the VDisk is unavailable.

VDisk migration

If a VDisk is migrated to another MDisk group during a reporting period, daily VDisk reports are produced only for the target MDisk group. For the target MDisk group, VDisk reports are produced from the day that the VDisk is migrated from the source MDisk group until the last day of the reporting period.

Charts

The maximum length of an MDisk group, VDisk, or storage resource group name in charts is 25 characters. Names that are longer than 25 characters are truncated. To indicate that a name is truncated, an ellipsis (...) is appended to the name. For example, if the name of an MDisk group is `myverylongmanageddiskgroupname123` in a chart, it is truncated and displayed as `myverylongmanageddiskgroupname...`

Two charts are displayed:

Most Active VDisks chart

For each storage resource group, two bars are shown:

- A yellow bar that shows average VDisk utilization

- A red bar that shows maximum VDisk utilization

To calculate average VDisk utilization, the following formula is used:

```
average(vdisk_peak_utilization)
```

To calculate maximum VDisk utilization, the following formula is used:

```
maximum(vdisk_peak_utilization)
```

In this sample excerpt of report output for VDisk1, the values that are required to calculate average and maximum VDisk utilization are provided.

VDisk Report Date	VDisk Peak Utilization (%)
Dec 6 2011	86.30
Dec 7 2011	50.01
Dec 8 2011	79.41

To calculate the average value of a VDisk:

1. The values for VDisk1 in the VDisk Utilization (%) column are added:

   ```
   86.30 + 50.01 + 79.41 = 215.72
   ```

2. The total is divided by the number of days that are specified in the date range. For example, if the reporting period spans 3 days, the total is divided by 3.

   ```
   215.72 ÷ 3 = 71.91
   ```

In the sample, the average peak VDisk utilization is 71.91.

In this sample excerpt of report output for VDisk1, the values that are required to calculate average and maximum VDisk utilization are provided.

VDisk Report Date	VDisk Peak Utilization (%)
Dec 6 2011	86.30
Dec 7 2011	50.01
Dec 8 2011	79.41

Least Active VDisks chart

For each storage resource group, two bars are shown:

- A yellow bar that shows average VDisk utilization
- A red bar that shows maximum VDisk utilization

The same formulas that are used in the most active VDisks chart are also used in the least active VDisks chart.

The number of VDisks that a storage resource group uses determines how many VDisks are displayed in each chart, as shown in the table.

Number of VDisks that the storage resource group uses	Number of VDisks in the Most Active VDisks chart	Number of VDisks in the Least Active VDisks chart
≥ 10	5	5
9	5	4
8	4	4
7	4	3

Number of VDisks that the storage resource group uses	Number of VDisks in the Most Active VDisks chart	Number of VDisks in the Least Active VDisks chart
6	3	3
5	3	2
4	2	2
3	2	1
2	1	1
1	1	0

Tip: Click the bar that represents a VDisk in a chart to open the VDisk Details Report. Alternatively, click the name of the VDisk in the report. Click the name of the MDisk group in the report to open the MDisk Group Details Report. To monitor the workload activity of VDisks for all storage resource groups in a storage virtualizer, run the Storage Resource Group - VDisk Workload Activity Report.

Threshold values

The names of the threshold values that are used in the report to monitor workload activity for VDisks are as follows:

- VDisk Max Read Response Time Threshold
- VDisk Max Write Response Time Threshold
- Max Read Cache Hits Time Threshold
- Max Read I/O Rate Threshold
- Max Write I/O Rate Threshold

Threshold values are set during installation. If a threshold value is changed during a reporting period, the original value and the new threshold value are displayed as minimum and maximum values. If, for example, the VDisk maximum read response time threshold value is changed during a reporting period from 70% to 80%, the name of the column is changed to VDisk Max Read Response Time Threshold of {70 - 80%} Exceeded By (hr.:min.). The convention that is used to represent a threshold value is a number followed by the percent sign and enclosed in brackets: *{%}*. When the report is run, the variable value is replaced with the threshold value. To calculate whether read or write response time thresholds are exceeded, the following formula is used: (*maximum_response_time_value* × *maximum_response_time_threshold value*)/100. The result is converted from seconds to hours and minutes, and displayed in the report. Read and write response times are sampled at 5-minute intervals over a 24-hour period.

Report output

The following information is provided about VDisks in the storage resource group:

MDisk Group
The name of the MDisk group.

VDisk The name of the VDisk.

VDisk Report Date
The date that the data was collected for the report.

VDisk Capacity (GB)
The total storage capacity of the VDisk in GB.

VDisk Thin Provisioning Capacity Status
The warning level threshold is set in the thin provisioning profile for the VDisk. The threshold is exceeded when the capacity of the VDisk that is used exceeds or is equal to the warning level threshold. If the used capacity of the VDisk in GB is ≥ the specified warning threshold value, a status value of `Warning` is displayed. If the used capacity of the VDisk in GB is < the specified warning threshold value, a status value of `OK` is displayed. If thin provisioning is not used, a status value of `Not Applicable` is displayed.

VDisk Peak Utilization (%)
The highest value of VDisk utilization over a 24-hour period.

VDisk Read I/O Rate (ops/s)
The read I/O rate of the VDisk in operations per second.

VDisk Max Read I/O Rate (ops/s)
The maximum read I/O rate of the VDisk in operations per second.

VDisk Average Read Response Time (ms/op)
The average read response time in milliseconds per operation.

VDisk Max Read Response Time (ms/op)
The maximum read response time in milliseconds per operation.

VDisk Max Read Response Time Threshold of *{%}* **Exceeded By (hr.:min.)**
The number of hours and minutes that the maximum read response time threshold for the VDisk is exceeded over a 24 hour period.

VDisk Write I/O Rate (ops/s)
The write I/O rate in operations per second.

VDisk Average Write Response Time (ms/op)
The average write response time in milliseconds per operation.

VDisk Max Write Response Time (ms/op)
The maximum write response time in milliseconds per operation.

VDisk Max Write Response Time Threshold of *{%}* **Exceeded By (hr.:min.)**
The number of hours and minutes that the maximum write response time threshold for the VDisk is exceeded over a 24 hour period.

VDisk Max Read Density Rate (ops/s per GB)
The maximum read density rate in operations per second per GB. This value is calculated by dividing the maximum read I/O rate in operations per second by the number of GB that the VDisk was allocated.

VDisk I/O Rate Share of Total VDisk Read I/O Rate (%)
The maximum read I/O rate of the VDisk as a percentage of the total maximum read I/O rate of all the VDisks in the MDisk group.

VDisk Capacity Share of Total VDisk Capacity (%)
The real capacity of the VDisk as a percentage of the real capacity of all the VDisks in the MDisk group.

VDisk Average Read Cache Hits (%)
The average read cache hits in percent.

VDisk Max Read Cache Hits (%)
The maximum read cache hits in percent.

VDisk Max Read Cache Hits Time Threshold of *{%}* **Exceeded By (hr.:min.)**
The number of hours and minutes that the maximum read cache hits time threshold is exceeded over a 24 hour period.

VDisk Max Read I/O Rate Threshold of *{%}* Exceeded By (hr.:min.)
The number of hours and minutes that the maximum read I/O rate threshold is exceeded over a 24 hour period.

VDisk Max Write I/O Rate Threshold of *{%}* Exceeded By (hr.:min.)
The number of hours and minutes that the maximum write I/O rate threshold is exceeded over a 24 hour period.

VDisk Max Write Cache Delay I/O Rate (ops/s)
The maximum write cache delay I/O rate of the VDisk in operations per second.

Threshold values

The names of the threshold values that are used in the report to monitor workload activity for VDisks are as follows:

- VDisk Max Read Response Time Threshold
- VDisk Max Write Response Time Threshold
- Max Read Cache Hits Time Threshold
- Max Read I/O Rate Threshold
- Max Write I/O Rate Threshold

Threshold values are set during installation. If a threshold value is changed during a reporting period, the original value and the new threshold value are displayed as minimum and maximum values. If, for example, the VDisk maximum read response time threshold value is changed during a reporting period from 70% to 80%, the name of the column is changed to VDisk Max Read Response Time Threshold of {70 - 80%} Exceeded By (hr.:min.). The convention that is used to represent a threshold value is a number followed by the percent sign and enclosed in brackets: *{%}*. When the report is run, the variable value is replaced with the threshold value. To calculate whether read or write response time thresholds are exceeded, the following formula is used: (*maximum_response_time_value* × *maximum_response_time_threshold value*)/100. The result is converted from seconds to hours and minutes, and displayed in the report. Read and write response times are sampled at 5-minute intervals over a 24-hour period.

Report output

The following information is displayed about the VDisk:

MDisk Group
The name of the MDisk group.

VDisk The name of the VDisk.

VDisk Report Date
The date that the data was collected for the report.

VDisk Capacity (GB)
The total storage capacity of the VDisk in GB.

VDisk Thin Provisioning Capacity Status
The warning level threshold is set in the thin provisioning profile for the VDisk. The threshold is exceeded when the capacity of the VDisk that is used exceeds or is equal to the warning level threshold. If the used capacity of the VDisk in GB is ≥ the specified warning threshold value, a status value of `Warning` is displayed. If the used capacity of the VDisk in GB is < the specified warning threshold value, a status value of `OK` is displayed. If thin provisioning is not used, a status value of `Not Applicable` is displayed.

VDisk Peak Utilization (%)
The highest value of VDisk utilization over a 24-hour period.

VDisk Read I/O Rate (ops/s)
The read I/O rate of the VDisk in operations per second.

VDisk Max Read I/O Rate (ops/s)
The maximum read I/O rate of the VDisk in operations per second.

VDisk Average Read Response Time (ms/op)
The average read response time in milliseconds per operation.

VDisk Max Read Response Time (ms/op)
The maximum read response time in milliseconds per operation.

VDisk Max Read Response Time Threshold of *{%}* **Exceeded By (hr.:min.)**
The number of hours and minutes that the maximum read response time threshold for the VDisk is exceeded over a 24 hour period.

VDisk Write I/O Rate (ops/s)
The write I/O rate in operations per second.

VDisk Average Write Response Time (ms/op)
The average write response time in milliseconds per operation.

VDisk Max Write Response Time (ms/op)
The maximum write response time in milliseconds per operation.

VDisk Max Write Response Time Threshold of *{%}* **Exceeded By (hr.:min.)**
The number of hours and minutes that the maximum write response time threshold for the VDisk is exceeded over a 24 hour period.

VDisk Max Read Density Rate (ops/s per GB)
The maximum read density rate in operations per second per GB. This value is calculated by dividing the maximum read I/O rate in operations per second by the number of GB that the VDisk was allocated.

VDisk I/O Rate Share of Total VDisk Read I/O Rate (%)
The maximum read I/O rate of the VDisk as a percentage of the total maximum read I/O rate of all the VDisks in the MDisk group.

VDisk Capacity Share of Total VDisk Capacity (%)
The real capacity of the VDisk as a percentage of the real capacity of all the VDisks in the MDisk group.

VDisk Average Read Cache Hits (%)
The average read cache hits in percent.

VDisk Max Read Cache Hits (%)
The maximum read cache hits in percent.

VDisk Max Read Cache Hits Time Threshold of *{%}* **Exceeded By (hr.:min.)**
The number of hours and minutes that the maximum read cache hits time threshold is exceeded over a 24 hour period.

VDisk Max Read I/O Rate Threshold of *{%}* **Exceeded By (hr.:min.)**
The number of hours and minutes that the maximum read I/O rate threshold is exceeded over a 24 hour period.

VDisk Max Write I/O Rate Threshold of *{%}* **Exceeded By (hr.:min.)**
The number of hours and minutes that the maximum write I/O rate threshold is exceeded over a 24 hour period.

VDisk Max Write Cache Delay I/O Rate (ops/s)
The maximum write cache delay I/O rate of the VDisk in operations per second.

"Running the VDisk Details report" on page 1064
To see information about a virtual disk (VDisk), run the VDisk Details report.

Running the MDisk Groups - VDisk Workload Activity report

To see which virtual disks (VDisks) are most active in managed disk (MDisk) groups, run the MDisk Groups - VDisk Workload Activity report.

1. On the **Public Folders** tab, click **IBM Tivoli Productivity Center Packages**.
2. Click **Storage Tiering**.
3. Click **VDisk Workload Activity Reports**.
4. Select **MDisk Groups - VDisk Workload Activity**, then click **Next**.
5. Select a storage virtualizer.
6. To set the time frame of the report, specify a reporting period. It is easier to analyze small amounts of information over shorter periods.

   Tip: To specify a start date and an end date, select **Custom date range** from the list of reporting periods.
7. Click **Finish**.

Related reference:

"MDisk Groups - VDisk Workload Activity report"
Use this report to monitor the performance of virtual disks (VDisks) in managed disk (MDisk) groups. The workload activity of each MDisk group is determined by calculating the average and the maximum peak utilization of the VDisks in the MDisk group.

MDisk Groups - VDisk Workload Activity report

Use this report to monitor the performance of virtual disks (VDisks) in managed disk (MDisk) groups. The workload activity of each MDisk group is determined by calculating the average and the maximum peak utilization of the VDisks in the MDisk group.

Restriction: This report applies only to SAN Volume Controller and Storwize systems.

Reporting period

The name of the storage virtualizer, the date filter such as `Last 7 days`, and the reporting period are displayed in the report.

Retention of report data

If you remove an MDisk group or a VDisk, the daily data that is collected for reports is retained for a configurable period. The default is 90 days. If you run a report after the data retention period expired, the daily data for the MDisk group or the VDisk is unavailable.

VDisk migration

If a VDisk is migrated to another MDisk group during a reporting period, daily VDisk reports are produced only for the target MDisk group. For the target MDisk group, VDisk reports are produced from the day that the VDisk is migrated from the source MDisk group until the last day of the reporting period.

Charts

The maximum length of an MDisk group, VDisk, or storage resource group name in charts is 25 characters. Names that are longer than 25 characters are truncated.

To indicate that a name is truncated, an ellipsis (...) is appended to the name. For example, if the name of an MDisk group is myverylongmanageddiskgroupname123 in a chart, it is truncated and displayed as myverylongmanageddiskgroupname...

Two charts are shown:

Most Active MDisk Groups chart

For each MDisk group two bars are shown:

- A yellow bar that shows average VDisk utilization
- A red bar that shows maximum VDisk utilization

To calculate average VDisk utilization, the following formula is used:

```
average(vdisk_peak_utilization)
```

To calculate maximum VDisk utilization, the following formula is used:

```
maximum(vdisk_peak_utilization)
```

In this sample excerpt of report output for VDisk1, the values that are required to calculate average and maximum VDisk utilization are provided.

VDisk Report Date	VDisk Peak Utilization (%)
Dec 6 2011	86.30
Dec 7 2011	50.01
Dec 8 2011	79.41

To calculate the average value of a VDisk:

1. The values for VDisk1 in the VDisk Utilization (%) column are added:

   ```
   86.30 + 50.01 + 79.41 = 215.72
   ```

2. The total is divided by the number of days that are specified in the date range. For example, if the reporting period spans 3 days, the total is divided by 3.

   ```
   215.72 ÷ 3 = 71.91
   ```

In the sample, the average peak VDisk utilization is 71.91.

For each MDisk group, the maximum VDisk utilization is also shown in the chart. The maximum VDisk utilization is the highest value for a VDisk in the VDisk Utilization (%) column. In the sample, the highest value for VDisk1 is 86.30.

Least Active MDisk Groups chart

For each MDisk group two bars are shown:

- A yellow bar that shows average VDisk utilization
- A red bar that shows maximum VDisk utilization

The same formulas that are used in the most active MDisk group chart are also used in the least active MDisk group chart.

The number of MDisk groups in the storage virtualizer determines how many MDisk groups are shown in each chart, as shown in the following table.

Number of MDisk groups in the storage virtualizer	Number of MDisk groups in the Most Active MDisk Groups chart	Number of MDisk groups in the Least Active MDisk Groups chart
≥ 10	5	5

Number of MDisk groups in the storage virtualizer	Number of MDisk groups in the Most Active MDisk Groups chart	Number of MDisk groups in the Least Active MDisk Groups chart
9	5	4
8	4	4
7	4	3
6	3	3
5	3	2
4	2	2
3	2	1
2	1	1
1	1	0

Tip: Click the bar that represents an MDisk group in a chart to open the MDisk Group - VDisk Workload Activity Details Report. Alternatively, click the name of the MDisk group in the report. Click the name of the VDisk in the report to open the VDisk Details Report.

Threshold values

The names of the threshold values that are used in the report to monitor workload activity for VDisks are as follows:

- VDisk Max Read Response Time Threshold
- VDisk Max Write Response Time Threshold
- Max Read Cache Hits Time Threshold
- Max Read I/O Rate Threshold
- Max Write I/O Rate Threshold

Threshold values are set during installation. If a threshold value is changed during a reporting period, the original value and the new threshold value are displayed as minimum and maximum values. If, for example, the VDisk maximum read response time threshold value is changed during a reporting period from 70% to 80%, the name of the column is changed to VDisk Max Read Response Time Threshold of {70 - 80%} Exceeded By (hr.:min.). The convention that is used to represent a threshold value is a number followed by the percent sign and enclosed in brackets: *{%}*. When the report is run, the variable value is replaced with the threshold value. To calculate whether read or write response time thresholds are exceeded, the following formula is used: (*maximum_response_time_value* × *maximum_response_time_threshold value*)/100. The result is converted from seconds to hours and minutes, and displayed in the report. Read and write response times are sampled at 5-minute intervals over a 24-hour period.

Report output

For each VDisk in an MDisk group, the following information is provided:

MDisk Group
The name of the MDisk group.

VDisk The name of the VDisk.

VDisk Report Date
The date that the data was collected for the report.

VDisk Capacity (GB)
The total storage capacity of the VDisk in GB.

VDisk Thin Provisioning Capacity Status
The warning level threshold is set in the thin provisioning profile for the VDisk. The threshold is exceeded when the capacity of the VDisk that is used exceeds or is equal to the warning level threshold. If the used capacity of the VDisk in GB is ≥ the specified warning threshold value, a status value of `Warning` is displayed. If the used capacity of the VDisk in GB is < the specified warning threshold value, a status value of `OK` is displayed. If thin provisioning is not used, a status value of `Not Applicable` is displayed.

VDisk Peak Utilization (%)
The highest value of VDisk utilization over a 24-hour period.

VDisk Read I/O Rate (ops/s)
The read I/O rate of the VDisk in operations per second.

VDisk Max Read I/O Rate (ops/s)
The maximum read I/O rate of the VDisk in operations per second.

VDisk Average Read Response Time (ms/op)
The average read response time in milliseconds per operation.

VDisk Max Read Response Time (ms/op)
The maximum read response time in milliseconds per operation.

VDisk Max Read Response Time Threshold of *{%}* **Exceeded By (hr.:min.)**
The number of hours and minutes that the maximum read response time threshold for the VDisk is exceeded over a 24 hour period.

VDisk Write I/O Rate (ops/s)
The write I/O rate in operations per second.

VDisk Average Write Response Time (ms/op)
The average write response time in milliseconds per operation.

VDisk Max Write Response Time (ms/op)
The maximum write response time in milliseconds per operation.

VDisk Max Write Response Time Threshold of *{%}* **Exceeded By (hr.:min.)**
The number of hours and minutes that the maximum write response time threshold for the VDisk is exceeded over a 24 hour period.

VDisk Max Read Density Rate (ops/s per GB)
The maximum read density rate in operations per second per GB. This value is calculated by dividing the maximum read I/O rate in operations per second by the number of GB that the VDisk was allocated.

VDisk I/O Rate Share of Total VDisk Read I/O Rate (%)
The maximum read I/O rate of the VDisk as a percentage of the total maximum read I/O rate of all the VDisks in the MDisk group.

VDisk Capacity Share of Total VDisk Capacity (%)
The real capacity of the VDisk as a percentage of the real capacity of all the VDisks in the MDisk group.

VDisk Average Read Cache Hits (%)
The average read cache hits in percent.

VDisk Max Read Cache Hits (%)
The maximum read cache hits in percent.

VDisk Max Read Cache Hits Time Threshold of *{%}* Exceeded By (hr.:min.)
The number of hours and minutes that the maximum read cache hits time threshold is exceeded over a 24 hour period.

VDisk Max Read I/O Rate Threshold of *{%}* Exceeded By (hr.:min.)
The number of hours and minutes that the maximum read I/O rate threshold is exceeded over a 24 hour period.

VDisk Max Write I/O Rate Threshold of *{%}* Exceeded By (hr.:min.)
The number of hours and minutes that the maximum write I/O rate threshold is exceeded over a 24 hour period.

VDisk Max Write Cache Delay I/O Rate (ops/s)
The maximum write cache delay I/O rate of the VDisk in operations per second.

The result is converted from seconds to hours and minutes, and displayed in the report. Read and write response times are sampled at 5-minute intervals over a 24-hour period.

Report output

For each storage resource group in a storage virtualizer, the following information is provided about VDisks:

Storage Resource Group
The name of the storage resource group.

MDisk Group
The name of the MDisk group.

VDisk The name of the VDisk.

VDisk Report Date
The date that the data was collected for the report.

VDisk Capacity (GB)
The total storage capacity of the VDisk in GB.

VDisk Thin Provisioning Capacity Status
The warning level threshold is set in the thin provisioning profile for the VDisk. The threshold is exceeded when the capacity of the VDisk that is used exceeds or is equal to the warning level threshold. If the used capacity of the VDisk in GB is ≥ the specified warning threshold value, a status value of `Warning` is displayed. If the used capacity of the VDisk in GB is < the specified warning threshold value, a status value of `OK` is displayed. If thin provisioning is not used, a status value of `Not Applicable` is displayed.

VDisk Peak Utilization (%)
The highest value of VDisk utilization over a 24-hour period.

VDisk Read I/O Rate (ops/s)
The read I/O rate of the VDisk in operations per second.

VDisk Max Read I/O Rate (ops/s)
The maximum read I/O rate of the VDisk in operations per second.

VDisk Average Read Response Time (ms/op)
The average read response time in milliseconds per operation.

VDisk Max Read Response Time (ms/op)
The maximum read response time in milliseconds per operation.

VDisk Max Read Response Time Threshold of *{%}* **Exceeded By (hr.:min.)**
The number of hours and minutes that the maximum read response time threshold for the VDisk is exceeded over a 24 hour period.

VDisk Write I/O Rate (ops/s)
The write I/O rate in operations per second.

VDisk Average Write Response Time (ms/op)
The average write response time in milliseconds per operation.

VDisk Max Write Response Time (ms/op)
The maximum write response time in milliseconds per operation.

VDisk Max Write Response Time Threshold of *{%}* **Exceeded By (hr.:min.)**
The number of hours and minutes that the maximum write response time threshold for the VDisk is exceeded over a 24 hour period.

VDisk Max Read Density Rate (ops/s per GB)
The maximum read density rate in operations per second per GB. This value is calculated by dividing the maximum read I/O rate in operations per second by the number of GB that the VDisk was allocated.

VDisk I/O Rate Share of Total VDisk Read I/O Rate (%)
The maximum read I/O rate of the VDisk as a percentage of the total maximum read I/O rate of all the VDisks in the MDisk group.

VDisk Capacity Share of Total VDisk Capacity (%)
The real capacity of the VDisk as a percentage of the real capacity of all the VDisks in the MDisk group.

VDisk Average Read Cache Hits (%)
The average read cache hits in percent.

VDisk Max Read Cache Hits (%)
The maximum read cache hits in percent.

VDisk Max Read Cache Hits Time Threshold of *{%}* **Exceeded By (hr.:min.)**
The number of hours and minutes that the maximum read cache hits time threshold is exceeded over a 24 hour period.

VDisk Max Read I/O Rate Threshold of *{%}* Exceeded By (hr.:min.)
The number of hours and minutes that the maximum read I/O rate threshold is exceeded over a 24 hour period.

VDisk Max Write I/O Rate Threshold of *{%}* Exceeded By (hr.:min.)
The number of hours and minutes that the maximum write I/O rate threshold is exceeded over a 24 hour period.

VDisk Max Write Cache Delay I/O Rate (ops/s)
The maximum write cache delay I/O rate of the VDisk in operations per second.

"MDisk Group - VDisk Workload Activity Details report"
Shows the workload activity of virtual disks (VDisks) in a managed disk (MDisk) group. The workload activity is determined by calculating the average and maximum peak utilization of each VDisk.

MDisk Group - VDisk Workload Activity Details report

Shows the workload activity of virtual disks (VDisks) in a managed disk (MDisk) group. The workload activity is determined by calculating the average and maximum peak utilization of each VDisk.

Restriction: This report applies only to SAN Volume Controller and Storwize systems.

Reporting period

The name of the storage virtualizer, the name of the MDisk group, the date filter such as `Last 7 days`, and the reporting period are displayed on the report.

Retention of report data

If you remove an MDisk group or a VDisk, the daily data that is collected for reports is retained for a configurable period. The default is 90 days. If you run a report after the data retention period expired, the daily data for the MDisk group or the VDisk is unavailable.

VDisk migration

If a VDisk is migrated to another MDisk group during a reporting period, daily VDisk reports are produced only for the target MDisk group. For the target MDisk group, VDisk reports are produced from the day that the VDisk is migrated from the source MDisk group until the last day of the reporting period.

Charts

The maximum length of an MDisk group, VDisk, or storage resource group name in charts is 25 characters. Names that are longer than 25 characters are truncated. To indicate that a name is truncated, an ellipsis (...) is appended to the name. For example, if the name of an MDisk group is `myverylongmanageddiskgroupname123` in a chart, it is truncated and displayed as `myverylongmanageddiskgroupname...`

Two charts are shown:

Most Active VDisks chart

For each MDisk group, two bars are shown:

- A yellow bar that shows average VDisk utilization
- A red bar that shows maximum VDisk utilization

To calculate average VDisk utilization, the following formula is used:

```
average(vdisk_peak_utilization)
```

To calculate maximum VDisk utilization, the following formula is used:

```
maximum(vdisk_peak_utilization)
```

In this sample excerpt of report output for VDisk1, the values that are required to calculate average and maximum VDisk utilization are provided.

VDisk Report Date	VDisk Peak Utilization (%)
Dec 6 2011	86.30
Dec 7 2011	50.01
Dec 8 2011	79.41

To calculate the average value of a VDisk:

1. The values for VDisk1 in the VDisk Utilization (%) column are added:
   ```
   86.30 + 50.01 + 79.41 = 215.72
   ```
2. The total is divided by the number of days that are specified in the date range. For example, if the reporting period spans 3 days, the total is divided by 3.
   ```
   215.72 ÷ 3 = 71.91
   ```

In the sample, the average peak VDisk utilization is 71.91.

In this sample excerpt of report output for VDisk1, the values that are required to calculate average and maximum VDisk utilization are provided.

VDisk Report Date	VDisk Peak Utilization (%)
Dec 6 2011	86.30
Dec 7 2011	50.01
Dec 8 2011	79.41

Least Active VDisks chart

For each MDisk group, two bars are shown:

- A yellow bar that shows average VDisk utilization
- A red bar that shows maximum VDisk utilization

The same formulas that are used in the most active MDisk group chart are also used in the least active MDisk group chart.

The number of VDisks in an MDisk group determines how many VDisks are shown in each chart, as shown in the following table.

Number of VDisks in the MDisk group	Number of VDisks in the Most Active VDisks chart	Number of VDisks in the Least Active VDisks chart
≥ 10	5	5
9	5	4
8	4	4
7	4	3
6	3	3
5	3	2
4	2	2
3	2	1
2	1	1
1	1	0

Tip: Click the bar that represents a VDisk in a chart to open the VDisk Details Report. Alternatively, click the name of the VDisk in the report. Click the name of the MDisk group in the report to open the MDisk Group Details Report.

Threshold values

The names of the threshold values that are used in the report to monitor workload activity for VDisks are as follows:

- VDisk Max Read Response Time Threshold
- VDisk Max Write Response Time Threshold
- Max Read Cache Hits Time Threshold
- Max Read I/O Rate Threshold
- Max Write I/O Rate Threshold

Threshold values are set during installation. If a threshold value is changed during a reporting period, the original value and the new threshold value are displayed as minimum and maximum values. If, for example, the VDisk maximum read

response time threshold value is changed during a reporting period from 70% to 80%, the name of the column is changed to VDisk Max Read Response Time Threshold of {70 - 80%} Exceeded By (hr.:min.). The convention that is used to represent a threshold value is a number followed by the percent sign and enclosed in brackets: *{%}*. When the report is run, the variable value is replaced with the threshold value. To calculate whether read or write response time thresholds are exceeded, the following formula is used: (*maximum_response_time_value* × *maximum_response_time_threshold value*)/100. The result is converted from seconds to hours and minutes, and displayed in the report. Read and write response times are sampled at 5-minute intervals over a 24-hour period.

Report output

For each VDisk in an MDisk group, the following information is provided:

MDisk Group
The name of the MDisk group.

VDisk The name of the VDisk.

VDisk Report Date
The date that the data was collected for the report.

VDisk Capacity (GB)
The total storage capacity of the VDisk in GB.

VDisk Thin Provisioning Capacity Status
The warning level threshold is set in the thin provisioning profile for the VDisk. The threshold is exceeded when the capacity of the VDisk that is used exceeds or is equal to the warning level threshold. If the used capacity of the VDisk in GB is ≥ the specified warning threshold value, a status value of `Warning` is displayed. If the used capacity of the VDisk in GB is < the specified warning threshold value, a status value of `OK` is displayed. If thin provisioning is not used, a status value of `Not Applicable` is displayed.

VDisk Peak Utilization (%)
The highest value of VDisk utilization over a 24-hour period.

VDisk Read I/O Rate (ops/s)
The read I/O rate of the VDisk in operations per second.

VDisk Max Read I/O Rate (ops/s)
The maximum read I/O rate of the VDisk in operations per second.

VDisk Average Read Response Time (ms/op)
The average read response time in milliseconds per operation.

VDisk Max Read Response Time (ms/op)
The maximum read response time in milliseconds per operation.

VDisk Max Read Response Time Threshold of *{%}* Exceeded By (hr.:min.)
The number of hours and minutes that the maximum read response time threshold for the VDisk is exceeded over a 24 hour period.

VDisk Write I/O Rate (ops/s)
The write I/O rate in operations per second.

VDisk Average Write Response Time (ms/op)
The average write response time in milliseconds per operation.

VDisk Max Write Response Time (ms/op)
The maximum write response time in milliseconds per operation.

VDisk Max Write Response Time Threshold of *{%}* Exceeded By (hr.:min.)
The number of hours and minutes that the maximum write response time threshold for the VDisk is exceeded over a 24 hour period.

VDisk Max Read Density Rate (ops/s per GB)
The maximum read density rate in operations per second per GB. This value is calculated by dividing the maximum read I/O rate in operations per second by the number of GB that the VDisk was allocated.

VDisk I/O Rate Share of Total VDisk Read I/O Rate (%)
The maximum read I/O rate of the VDisk as a percentage of the total maximum read I/O rate of all the VDisks in the MDisk group.

VDisk Capacity Share of Total VDisk Capacity (%)
The real capacity of the VDisk as a percentage of the real capacity of all the VDisks in the MDisk group.

VDisk Average Read Cache Hits (%)
The average read cache hits in percent.

VDisk Max Read Cache Hits (%)
The maximum read cache hits in percent.

VDisk Max Read Cache Hits Time Threshold of *{%}* Exceeded By (hr.:min.)
The number of hours and minutes that the maximum read cache hits time threshold is exceeded over a 24 hour period.

VDisk Max Read I/O Rate Threshold of *{%}* Exceeded By (hr.:min.)
The number of hours and minutes that the maximum read I/O rate threshold is exceeded over a 24 hour period.

VDisk Max Write I/O Rate Threshold of *{%}* Exceeded By (hr.:min.)
The number of hours and minutes that the maximum write I/O rate threshold is exceeded over a 24 hour period.

VDisk Max Write Cache Delay I/O Rate (ops/s)
The maximum write cache delay I/O rate of the VDisk in operations per second.

Related reference:

"MDisk Group Details report"
Shows the workload activity of a managed disk (MDisk) group. Use the report to analyze storage services for an MDisk group.

MDisk Group Details report

Shows the workload activity of a managed disk (MDisk) group. Use the report to analyze storage services for an MDisk group.

Restriction: This report applies only to SAN Volume Controller and Storwize systems.

Reporting period

The name of the storage virtualizer, the name of the MDisk group, the date filter such as `Last 7 days`, and the reporting period are displayed in the report.

Retention of report data

If you remove an MDisk group or a VDisk, the daily data that is collected for reports is retained for a configurable period. The default is 90 days. If you run a report after the data retention period expired, the daily data for the MDisk group or the VDisk is unavailable.

Read I/O rate capability

If you do not set the back-end pool properties of an MDisk group:

- `Not Set` is displayed in the MDisk Group Read I/O Rate Capability column
- `Not Available` is displayed in the MDisk Group Read I/O Rate Availability column

If the read I/O rate capability of an MDisk group is less than the maximum read I/O rate of the MDisk group, negative values are displayed in the report.

Threshold values

The names of the threshold values in the report that are used to monitor workload activity for MDisk groups are:

- Actual Size Threshold
- Read I/O Rate Threshold
- Max Read Response Time Threshold
- Max Write Response Time Threshold

Threshold values are set during installation. If a threshold value is changed during a reporting period, the original value and the new threshold value are displayed as minimum and maximum values. If, for example, the value of the actual size threshold is changed during a reporting period from 50% to 60%, the name of the column is changed to MDisk Group Available Size < Actual Size Threshold of {50 - 60%}. The convention that is used to represent a threshold value is a number followed by the percent sign and enclosed in brackets: *{%}*. When the report is run, the variable value is replaced with the threshold value. To calculate whether read or write response time thresholds are exceeded, the following formula is used:

$(maximum_response_time_value \times maximum_response_time_threshold_value) \div 100.$

Tip: To monitor the workload activity of all MDisk groups in a storage virtualizer, run the MDisk Groups - Workload Activity report.

Report output

The following information is provided about the MDisk group:

MDisk Group
The name of the MDisk group.

MDisk Group Report Date
The date that the data was collected for the report.

MDisk Group Capacity Status
If the storage capacity that is allocated is less than the actual storage capacity, a status value of `OK` is displayed. If the storage capacity that is allocated is more than the actual storage capacity, a status value of `Warning` is displayed. The actual capacity of the MDisk group is calculated as follows:

$$(\text{mdisk_group_real_capacity_value} \div \text{mdisk_group_capacity_value}) \times 100$$

MDisk Group Capacity (GB)
The total storage capacity in GB of all of the disks in the MDisk group.

MDisk Group Real Capacity (GB)
The total amount in GB of real storage capacity in the MDisk group.

MDisk Group Free Space (GB)
The total amount of remaining capacity in GB that can be allocated to increase the size of an existing VDisk, or allocated to an additional VDisk.

MDisk Group Available Size < Actual Size Threshold of *{%}*
If the amount of storage space that is available for allocation to VDisks is less than the actual size threshold, `Yes` is displayed in the column. If the amount of storage space that is available for allocation to VDisks is more than the actual size threshold, `No` is displayed in the column.

MDisk Group Read I/O Rate (ops/s)
The read I/O rate of the MDisk group in operations per second.

MDisk Group Read I/O Rate Capability (ops/s)
The read I/O capability rate of the MDisk group in operations per second.

Tip: To find out how the read I/O capability rate is calculated, see "Read I/O capability formula" on page 1092

MDisk Group Max Read I/O Rate (ops/s)
The maximum read I/O rate of the MDisk group in operations per second.

MDisk Group Read I/O Rate Availability (ops/s)
The difference between the read I/O capability rate and the maximum read I/O rate in operations per second.

MDisk Group Read I/O Rate Availability < Read I/O Rate Capability Threshold of *{%}*
The availability rate for read I/O operations is compared with the read I/O rate capability threshold. If the availability rate for read I/O operations is less than the read I/O rate capability threshold, `Yes` is displayed in the column. If the availability rate for read I/O operations is more than the read I/O rate capability threshold, `No` is displayed in the column.

MDisk Group Max Read Response Time (ms/op)
The maximum read response time in milliseconds per operation.

MDisk Group Max Read Response Time Threshold of *{%}* Exceeded By (hr.:min.)
The number of hours and minutes that the maximum read response time threshold is exceeded over a 24 hour period.

MDisk Group Average Read Response Time (ms/op)
The average read response time in milliseconds per operation.

MDisk Group Max Write I/O Rate (ops/s)
The maximum write I/O rate in operations per second.

MDisk Group Max Write Response Time (ms/op)
The maximum write response time in milliseconds per operation.

MDisk Group Max Write Response Time Threshold of *{%}* Exceeded By (hr.:min.)
The number of hours and minutes that the maximum write response time threshold is exceeded over a 24 hour period.

MDisk Group Average Write Response Time (ms/op)
The average write response time in milliseconds per operation.

MDisk Group Average Write I/O Size (KB)
The average size of write I/O operations in KB.

"Read I/O capability formula" on page 1092
The read I/O capability formula is used by IBM Tivoli Storage Productivity Center to estimate the workload capacity of managed disk (MDisk) groups.

MDisk Groups - Workload Activity report

Shows the workload activity of managed disk (MDisk) groups. You can use the information that the report provides to investigate which MDisk groups are being underused or overused.

Restriction: This report applies only to SAN Volume Controller and Storwize systems.

Reporting periods

The name of the storage virtualizer, the date filter such as `Last 7 days`, and the reporting period are displayed in the report.

Retention of report data

If you remove an MDisk group or a VDisk, the daily data that is collected for reports is retained for a configurable period. The default is 90 days. If you run a report after the data retention period expired, the daily data for the MDisk group or the VDisk is unavailable.

Read I/O rate capability

To estimate the read I/O rate capability of an MDisk group, you must set the back-end pool properties of MDisk groups.

If you do not set the back-end pool properties of an MDisk group:

- `Not Set` is displayed in the MDisk Group Read I/O Rate Capability column
- `Not Available` is displayed in the MDisk Group Read I/O Rate Availability column

If the read I/O rate capability of an MDisk group is less than the maximum read I/O rate of the MDisk group, negative values are displayed in the report.

Charts

The maximum length of an MDisk group, VDisk, or storage resource group name in charts is 25 characters. Names that are longer than 25 characters are truncated. To indicate that a name is truncated, an ellipsis (...) is appended to the name. For example, if the name of an MDisk group is `myverylongmanageddiskgroupname123` in a chart, it is truncated and displayed as `myverylongmanageddiskgroupname...`

Two charts are displayed:

- Most Active MDisk Groups
- Most Available MDisk Groups

Most Active MDisk Groups

For each MDisk group two bars are used:

- A yellow bar that shows the average activity value
- A red bar that shows the maximum activity value

To calculate the average activity value of an MDisk group, the following formula is used:

```
average(maximum_read_I/O_rate ÷ read_I/O_rate_capability)
```

To calculate the maximum activity value, the following formula is used:

```
maximum(maximum_read_I/O_rate ÷ read_I/O_rate_capability)
```

In this sample excerpt of report output for mdiskgroup1, the values that are required to calculate average and maximum activity values are provided.

MDisk Group Report Date	MDisk Group Read I/O Rate Capability (ops/s)	MDisk Group Max Read I/O Rate (ops/s)
Dec 6 2011	331	216.77
Dec 7 2011	331	256.40
Dec 8 2011	331	270.87

The average activity value of an MDisk group is calculated as follows:

1. For each report in the MDisk group, the value in the MDisk Group Max Read I/O Rate column is divided by the value in the MDisk Group Read I/O Rate Capability column:

   ```
   216.77 ÷ 331 = 0.65
   256.40 ÷ 331 = 0.77
   270.87 ÷ 331 = 0.81
   ```

2. The result of the operation for each report is added:

   ```
   0.65 + 0.77 + 0.81 = 2.23
   ```

3. To get the average value, the total is divided by the number of days that are specified in the date range. For example, if the reporting period spans 3 days, the total is divided by 3.

   ```
   2.23 ÷ 3 = 0.74
   ```

The maximum value of an MDisk group is calculated as follows. For each report in an MDisk group, the value in the MDisk Group Max Read I/O Rate column is divided by the value in the MDisk Group Read I/O Rate Capability column:

```
216.77 ÷ 331 = 0.65
256.40 ÷ 331 = 0.77
270.87 ÷ 331 = 0.81
```

In this sample, the maximum value is 0.81.

Most Available MDisk Groups

For each MDisk group two bars are used:

- A blue bar to represent minimum values
- A red bar to represent average values

In this sample excerpt of report output for mdiskgroup2, the values that are required to calculate minimum and average availability values for MDisk Groups are provided.

MDisk Group Report Date	MDisk Group Read I/O Rate Availability (ops/s)
Dec 6 2011	435.41
Dec 7 2011	560.92
Dec 8 2011	480.95

The minimum value of an MDisk group is calculated as follows:

- For all of the reports for an MDisk group, the lowest value in the MDisk Group Read I/O Rate Availability column is used. In this sample, the lowest value for mdiskgroup2 is 435.41.

The average value of an MDisk group is calculated as follows:

1. For each report in an MDisk group, the values in the MDisk Group Read I/O Rate Availability column are added:

   ```
   435.41 + 560.92 + 480.95 = 1477.28
   ```

2. To get the average value, the total is divided by the number of days that are specified in the date range. (For example, if the reporting period spans 3 days, the total is divided by 3.)

   `1477.28 ÷ 3 = 492.42`

   In this sample, the average value is 492.42.

The number of MDisk groups in a storage virtualizer determines how many MDisk groups are displayed in each chart, as shown in the following table.

Number of MDisk groups in the storage virtualizer	Number of MDisk groups in the Most Active MDisk Groups chart	Number of MDisk groups in the Least Active MDisk Groups chart
≥ 10	5	5
9	5	4
8	4	4
7	4	3
6	3	3
5	3	2
4	2	2
3	2	1
2	1	1
1	1	0

Tip: Click the bar that represents an MDisk group in a chart to open the MDisk Group - VDisk Workload Activity Details Report. Alternatively, you can click the name of the MDisk group in the report.

Threshold values

The names of the threshold values in the report that are used to monitor workload activity for MDisk groups are:

- Actual Size Threshold
- Read I/O Rate Threshold
- Max Read Response Time Threshold
- Max Write Response Time Threshold

Threshold values are set during installation. If a threshold value is changed during a reporting period, the original value and the new threshold value are displayed as minimum and maximum values. If, for example, the value of the actual size threshold is changed during a reporting period from 50% to 60%, the name of the column is changed to MDisk Group Available Size < Actual Size Threshold of {50 - 60%}. The convention that is used to represent a threshold value is a number followed by the percent sign and enclosed in brackets: *{%}*. When the report is run, the variable value is replaced with the threshold value. To calculate whether read or write response time thresholds are exceeded, the following formula is used:

(maximum_response_time_value × *maximum_response_time_threshold_value)*÷ 100.

The result is converted from seconds to hours and minutes, and displayed in the report. Read and write response times are sampled at 5-minute intervals over a 24-hour period.

Report output

For each MDisk group, the following information is provided:

MDisk Group
The name of the MDisk group.

MDisk Group Report Date
The date that the data was collected for the report.

MDisk Group Capacity Status
If the storage capacity that is allocated is less than the actual storage capacity, a status value of `OK` is displayed. If the storage capacity that is allocated is more than the actual storage capacity, a status value of `Warning` is displayed. The actual capacity of the MDisk group is calculated as follows:

```
(mdisk_group_real_capacity_value ÷ mdisk_group_capacity_value) × 100
```

MDisk Group Capacity (GB)
The total storage capacity in GB of all of the disks in the MDisk group.

MDisk Group Real Capacity (GB)
The total amount in GB of real storage capacity in the MDisk group.

MDisk Group Free Space (GB)
The total amount of remaining capacity in GB that can be allocated to increase the size of an existing VDisk, or allocated to an additional VDisk.

MDisk Group Available Size < Actual Size Threshold of *{%}*
If the amount of storage space that is available for allocation to VDisks is less than the actual size threshold, `Yes` is displayed in the column. If the amount of storage space that is available for allocation to VDisks is more than the actual size threshold, `No` is displayed in the column.

MDisk Group Read I/O Rate (ops/s)
The read I/O rate of the MDisk group in operations per second.

MDisk Group Read I/O Rate Capability (ops/s)
The read I/O capability rate of the MDisk group in operations per second.

Tip: To find out how the read I/O capability rate is calculated, see "Read I/O capability formula" on page 1092

MDisk Group Max Read I/O Rate (ops/s)
The maximum read I/O rate of the MDisk group in operations per second.

MDisk Group Read I/O Rate Availability (ops/s)
The difference between the read I/O capability rate and the maximum read I/O rate in operations per second.

MDisk Group Read I/O Rate Availability < Read I/O Rate Capability Threshold of *{%}*
The availability rate for read I/O operations is compared with the read I/O rate capability threshold. If the availability rate for read I/O operations is less than the read I/O rate capability threshold, `Yes` is displayed in the column. If the availability rate for read I/O operations is more than the read I/O rate capability threshold, `No` is displayed in the column.

MDisk Group Max Read Response Time (ms/op)
The maximum read response time in milliseconds per operation.

MDisk Group Max Read Response Time Threshold of *{%}* Exceeded By (hr.:min.)
The number of hours and minutes that the maximum read response time threshold is exceeded over a 24 hour period.

MDisk Group Average Read Response Time (ms/op)
The average read response time in milliseconds per operation.

MDisk Group Max Write I/O Rate (ops/s)
The maximum write I/O rate in operations per second.

MDisk Group Max Write Response Time (ms/op)
The maximum write response time in milliseconds per operation.

MDisk Group Max Write Response Time Threshold of *{%}* Exceeded By (hr.:min.)
The number of hours and minutes that the maximum write response time threshold is exceeded over a 24 hour period.

MDisk Group Average Write Response Time (ms/op)
The average write response time in milliseconds per operation.

MDisk Group Average Write I/O Size (KB)
The average size of write I/O operations in KB.

To see which managed disk (MDisk) groups are most active, run the MDisk Groups - Workload Activity report.

Read I/O capability formula

The read I/O capability formula is used by IBM Tivoli Storage Productivity Center to estimate the workload capacity of managed disk (MDisk) groups.

The estimated workload capacity is compared with the actual workload capacity to assess the most active and least active MDisk groups in a storage subsystem. To monitor the workload activity of MDisk groups, you can run customized reports such as the MDisk Groups - Workload Activity Report. This formula is used for MDisk groups in the following storage systems:

- SAN Volume Controller
- Storwize V3500
- Storwize V3700
- Storwize V7000
- Storwize V7000 Unified

The formula that is used by IBM Tivoli Storage Productivity Center to estimate the read I/O capability rate is:

[Estimated Read I/O Workload * Type of Disk I/O Capability * Number of Disks] / [Estimated Read I/O Workload * (1 – Cache Hit Ratio) + Estimated Write I/O Workload * RAID Type Weighted I/O Ratio]

There are two types of value that are used by the formula:

- Fixed values provided by IBM Tivoli Storage Productivity Center
- Variable values that you must specify for each MDisk group

The following fixed values are used by the formula:

Estimated Read I/O Workload
The estimated read I/O workload of an MDisk group. The estimate is set to a fixed value of 0.7 (70%).

Estimated Write I/O Workload
The estimated write I/O workload of an MDisk group. The estimate is set to a fixed value of 0.3 (30%).

You specify the following variable values for each MDisk group:

Type of Disk I/O Capability
When you specify the type of disk that the back-end pool uses:

- You can accept the default I/O capability per second of the disk
- You can enter a new value for the I/O capability per second of the disk

For example, the default value for the I/O capability rate per second of fiber types of disk with 15,000 revolutions per minute (rpm) is 150 I/O operations per second. To change the I/O capability for a type of disk, you issue the **setbackenddisktype** command and you enter a new value for the **-iops** parameter.

Number of Disks
You specify the number of physical disks that the back-end pool uses.

Cache Hit Ratio
When you specify the type of storage system that the back-end pool uses:

- You can accept the default cache hit ratio for the storage system
- You can enter a new value for the cache hit ratio of the storage system

For example, the default cache hit ratio of the XIV system is 0.7 (70%). To change the cache hit ratio for a type of storage system, you issue the **setbackendtype** command and you enter a new value for the **-cachehit** parameter.

RAID Type Weighted I/O Ratio
When you specify the type of RAID that the back-end pool uses:

- You can accept the default value for the weighted I/O ratio of the type of RAID
- You can enter a new value for the weighted I/O ratio of the type of RAID

For example the weighted I/O ratio for RAID5 types of RAID is 4:1. To change the weighted I/O ratio for a type of RAID, you issue the **setbackendraidtype** command and you enter a new value for the **-weightedio** parameter.

Tip: In the stand-alone GUI, you can set the values for the back-end properties of an MDisk group. You can also use the Tivoli Storage Productivity Center CLI called tcptool to set the values for back-end MDisk groups. See the **setarray** command. To change the variable values that are used by the Read I/O capability formula, you must use the Tivoli Storage Productivity Center CLI.

Example

The following values have been set for a back-end pool. The type of storage system is the XIV system. The type of disk is F15 (Fiber - 15 000 rpm), and the type of RAID is X.

Name of variable	Value
Cache Hit Ratio	0.5 (50%)
Type of Disk I/O Capability	150
RAID Type Weighted I/O Ratio	4
Number of Disks	10

Based on the values that are provided, the read I/O capability per second is:

[0.7 * 150 * 10] / [0.7 * (1 – 0.5) + 0.3 * 4]

The read I/O capability per second rate is 677. (The result of the calculation is rounded to the nearest whole number.)

IBM Tivoli Storage Productivity Center Information Center
You can use commands on the Tivoli Storage Productivity Center command-line interface (CLI) to provide information about RAID arrays and back-end storage subsystems. For more information about these commands, see the Tivoli Storage Productivity Center Information Center at http://publib.boulder.ibm.com/infocenter/tivihelp/v59r1/index.jsp. Search for “setarray”, “setbackendtype”, “setbackenddisktype”, and “setbackendraidtype”.

Changing threshold values in storage tier reports

Use the **setdscfg** command to change the threshold values in workload activity reports for managed disk groups and virtual disks.

To change threshold values, you must know the value of the property key that is associated with the name of the threshold in the report.

1. To start the Tivoli Storage Productivity Center CLI, issue the **tpctool** command.
2. Issue the **setdscfg** command, and then set the following values by using the **-property** parameter:
   a. Specify the name of the threshold with the *property_key* variable.
   b. Specify the new threshold value with the *value* variable.

   The following sample code sets the read I/O rate for MDisk groups to 80%:

   ```
   tpctool setdscfg -url localhost:9550 -user ***** -pwd ***** -property
   ManagedDiskGroupAvailIORate 80
   ```
3. Press Enter.

The value of the threshold is changed.

Related reference:

“Threshold values in storage tier reports”
Threshold values are used to assess the workload activity of managed disk (MDisk) groups and virtual disks (VDisks) in storage tier reports. To change a threshold value, you must know the value of the property key that corresponds with the threshold value that is used in the report.

Threshold values in storage tier reports

Threshold values are used to assess the workload activity of managed disk (MDisk) groups and virtual disks (VDisks) in storage tier reports. To change a

threshold value, you must know the value of the property key that corresponds with the threshold value that is used in the report.

The following table contains the name of the threshold value and the corresponding value of the property key for the following reports:

- The MDisk Groups - Workload Activity Report
- The MDisk Group Details Report

Threshold name in report	Property key value
Actual Size Threshold	*ManagedDiskGroupAvailSize*
Read I/O Rate Threshold	*ManagedDiskGroupAvailIORate*
Max Read Response Time Threshold	*ManagedDiskGroupBERResponseExceeds*
Max Write Response Time Threshold	*ManagedDiskGroupBEWResponseExceeds*

The following table contains the name of the threshold value and the corresponding value of the property key for the following reports:

- MDisk Groups - VDisk Workload Activity Report
- MDisk Groups - VDisk Workload Activity Details Report
- VDisk Details Report
- Storage Resource Group - VDisk Workload Activity Report

Threshold name in report	Property key value
VDisk Max Read Response Time Threshold	VDiskFERResponseExceeds
VDisk Max Write Response Time Threshold	VDiskFEWResponseExceeds
Max Read Cache Hits Time Threshold	VDiskFERHitExceeds
Max Read I/O Rate Threshold	VDiskFEIOExceeds
Max Write I/O Rate Threshold	VDiskFEIOWExceeds

Use the **setdscfg** command to change the threshold values in workload activity reports for managed disk groups and virtual disks.

Custom reports about performance

You can use Tivoli Common Reporting to create custom performance reports. Performance reports can contain detailed information about the performance of monitored resources, and some of the properties of those resources.

The resources for which you can create performance reports are storage systems and their components, storage virtualizers and their components, and switches and switch ports. You can add statistics for volumes, back-end arrays, caches, ports, port errors, and other statistics to performance reports. For example, you can add key statistics to a report to create and generate a performance chart for a specific volume of a storage system.

All the performance metrics from the stand-alone GUI are available in the new reporting interface.

Creating custom performance reports

You can create reports that show performance metrics. Performance reports can contain detailed information about the performance of monitored resources and some of the properties of those resources. You access custom performance reports from the Tivoli Storage Productivity Center web-based GUI, and you create the reports in Tivoli Common Reporting.

When you create a performance report, include properties and metrics for only one type of device in the report.

The list that you use to create performance reports does not include information about the relationships between storage resources. If you include different types of resources in the report, the report might return incorrect results. For example, if you include storage virtualizers and storage systems in a report, the report might return incorrect results.

Tip: Before you run a report, you can preview the report with no data.

You must specify the time interval for which you want to view performance information. You can specify the time interval in the following ways:

- Select a time unit, for example, day, day of week, or week of month.
- Select performance metrics from sample data, hourly data, or daily data in the resource for which you want performance information. You can also add the time and the interval length to reports. The time is the time at which the performance data was collected. The interval length is the length of the data interval in seconds for sample data, or in minutes for hourly data or daily data.

1. Start the web-based GUI for Tivoli Storage Productivity Center.
2. Depending on the type of report that you want to see, select one of the following items:
   - To create a basic report with limited formatting about the performance of resources, select **Reporting** > **Create performance reports**.
   - To create a report about the performance of resources and apply advanced formatting features to the report, complete the following steps:
     a. Select **Reporting** > **Create performance reports**.
     b. Click the **Return** icon .
     c. Click **Launch** > **Report Studio**.
3. Expand **Tivoli Storage Productivity Center** in the list.
4. Expand **Performance**.
5. Optional: Select a time unit from the **Time** item.
6. Explore the folders in the list to locate the resources, properties, and metrics that you want to include in the report.
7. Depending on your browser, add properties and metrics to the report:
   - In Internet Explorer, drag the items that you want to see information about to the work area.
   - In Firefox, select the items that you want to see information about, and then click **Insert**.
8. Use filters with your performance reports to ensure that your reports do not include too much data. To use filters with your performance reports, do the following steps:
   a. Add a resource or resource type to the report.

b. Select the column heading for the resource or resource type in the work area, and then filter the name of the resource or resource type if necessary.
c. Locate the Sample Data, Hourly Data, or Daily Data folder for the resource or resource type in the list. Add a time stamp from the list to the work area. For example, you can add a day time stamp to the report.
d. Select the column heading for the time stamp in the work area, and then filter the time. If you do not enter a time stamp, the report is run on all the records for this resource or resource type in Tivoli Storage Productivity Center.

9. Click **Save**.

For more information about how to preview and run reports, see the IBM Cognos Business Intelligence 10.2.0 Information Center at pic.dhe.ibm.com/infocenter/cbi/v10r2m0/index.jsp. Search for "Run a Report".

Data and properties in performance reports

You can include capacity data, properties, and other information about storage systems, storage virtualizers, and switches in performance reports.

Data for storage systems in performance reports

You can include general information, capacity data, properties, and other information about storage systems in performance reports.

Information about storage systems

You can create performance reports that include the following information:

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Capacity and usage data

You can create performance reports that include the following information:

Storage System Pool Capacity (GiB)
The amount of storage space in pools that are on the storage system. For an XIV system, this value represents the physical capacity of the pool, not the virtual capacity. For other storage systems, this value might also include overhead space if the pool is unformatted.

Storage System Used Pool Space (GiB)
The amount of space that is in use in all pools on a storage system.

Storage System Available Pool Space (GiB)
The amount of unused space in pools that are on the storage system.

Storage System Volume Capacity (GiB)
The amount of space on all volumes on the storage system.

Storage System Overhead (GiB)
The amount of space that is used for system management. The amount of space also includes space that is reserved for redundancy.

Storage System Assigned Volume Space (GiB)
The amount of space in the pool that is on volumes that are assigned to a server or storage virtualizer.

Storage System Unallocated Disk Space (GiB)
The amount of disk space that can be added to a pool.

Storage System Number of Disks
The number of physical disks on the storage system. For a Storwize V7000 storage system that is configured as a back-end device, the value is the number of managed disks on the storage system.

Storage System Number of Volumes
The number of volumes on a resource.

Storage System Cache (GiB)
The size of the cache on the storage system. This value is not shown for Storwize V7000 storage systems that are configured as back-end storage.

Storage System Real Available Pool Space (GiB)
The amount of unused space in pools that have an associated soft size on an XIV system. The soft size of a pool is the virtual size of a thin-provisioned pool.

Storage System Real Configured Pool Space (GiB)
The amount of storage space that is in pools that have an associated soft size on an XIV system. The soft size of a pool is the virtual size of a thin-provisioned pool.

Storage System Volume Capacity for z/OS (GiB)
The amount of space on all volumes on the storage system that the z/OS operating system can use.

Storage System Volume Capacity Assigned to MDisks (GiB)
The amount of space that is on volumes that are assigned to a storage virtualizer to use as managed disks.

Storage System Disk Capacity (GiB)
The amount of storage space on physical disks in a storage system, excluding spare disks. This value is not shown for Storwize V7000 storage systems that are configured as back-end storage.

Storage System Total Disk Capacity (GiB)
The amount of space on physical disks on a storage system, including spare disks.

Storage System Physical Allocation Percentage
The percentage of physical space in storage system pools that is reserved for volumes. This value is always less than or equal to 100% because you cannot reserve more physical space than is available in the pools.

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

$(\text{allocated pool space} \div \text{pool capacity}) \times 100$

For example, the physical allocation percentage is 25% for a 200 GiB storage pool. Therefore, the space that is reserved for volumes is 50 GiB.

Storage System Virtual Allocation Percentage
The percentage of physical space in storage system pools that is committed to the total virtual capacity of the volumes in the pool. In thin-provisioned environments, this percentage exceeds 100% if a pool is overcommitted (over-provisioned).

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

`(total volume capacity ÷ pool capacity) × 100`

For example, for a total pool size of 15 GiB, the allocation percentage might be 200%. Therefore, the virtual capacity that is committed to the volumes in the pools is 30 GiB. This configuration means that twice as much space is committed than is physically contained in the pools. If the allocation percentage is 100% for the same pools, then the virtual capacity that is committed to the pools is 15 GiB. This configuration means that all the physical capacity of the pools is already allocated to volumes.

An allocation percentage that is higher than 100% is considered aggressive. The pools have insufficient physical capacity to satisfy the maximum allocation for all the thin-provisioned volumes in the pools. In such cases, use the Storage System Shortfall Percentage property to estimate how critical the shortage of space is for storage system pools.

Storage System Shortfall Percentage
The percentage of the remaining unallocated volume space in storage system pools that is not available to be allocated. The higher the percentage, the more critical the shortfall of pool space.

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

`(unallocatable space ÷ (volume space - used volume space)) × 100`

You can use this percentage to determine when the amount of overcommitted space in pools reaches a critically high level. For example, the physical space in pools might be less than the committed virtual space. In this case, the pools do not have enough space to fulfill the commitment to virtual space for a volume.

This value represents the percentage of the committed virtual space that is not available in pools. As more space is used over time by volumes while the pool capacity remains the same, this percentage increases.

For example, the physical capacity of pools is 70 GiB, but 150 GiB of virtual space is committed to thin-provisioned volumes. If the volumes are using 50 GiB, then there is still 100 GiB committed to those volumes (150 GiB - 50 GiB). There is only 20 GiB of available pool space (70 GiB - 50 GiB). Because only 20 GiB of pool space is available, 80 GiB of the committed space cannot be allocated (100 GiB - 20 GiB). In this case, the percentage of committed space that is unavailable is 80% (80 GiB ÷ 100 GiB × 100).

This value is only available for pools with thin-provisioned volumes.

Storage System MDisk Available Space (GiB)
The amount of storage space that is available on a managed disk. This value is only available for Storwize V7000 storage systems that are configured as back-end storage.

Storage System MDisk Capacity (GiB)
The amount of storage space on the managed disk.

Component properties

You can create performance reports that include the following information:

Storage System Access Information
The URL from which you can access the storage system or storage virtualizer.

Storage System Alias
An alternative name for a storage system. The user defines this name.

Storage System Code Level
The Shared Ethernet Adapter level of a DS8000 storage system. For other storage systems, this value is the firmware version.

Storage System Time Zone
The time zone in which a resource is located.

Storage System Custom Tag 1, 2, and 3
User-defined text that is associated with a storage system. You can add or edit the custom tags for a storage system in the **Properties** pane of the storage system in the Tivoli Storage Productivity Center web-based GUI.

Storage System Location
The physical location of a storage system. The location is defined when a storage system is added to Tivoli Storage Productivity Center. You can add or edit the location of the storage system in the **Properties** pane of the storage system in the web-based GUI.

Storage System User Provided Name
The name that was specified for the storage system in the storage environment.

Storage System Is Compression Active
Shows whether the compression feature is enabled on the storage system. If this value is `Yes`, the compression feature is enabled.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Status information

You can create performance reports that include the following information:

Storage System Status
The condition of the resource, for example normal, warning, or error.

Storage System Is Detected
Shows whether the resource was detected the last time that data was collected. If this value is `Yes`, the resource was detected.

Storage System Last Data Collection
The date and time when storage statistics were last collected from the resource.

Storage System Last Data Collection Status
The condition of the last data collection. The status can show if the collection was a success, a failure, or if data was collected from the resource.

Vendor, model, and device information

You can create performance reports that include the following information:

Storage System Type
The type of storage system. For example, the storage system can be an **IBM System Storage DS8800** system, an **IBM System Storage DS8700** system, an **IBM System Storage XIV** system, or another type of storage system.

Storage System Vendor
The vendor who supplied the resource.

Storage System Model
The model name or model number of the storage system.

Storage System Machine Type
The machine type of a storage system. For example, the storage system can be **DS8800**, **DS8700**, **XIV - 2812**, or another type of storage system.

Storage System IP Address
The IP address of the resource.

Storage System Serial Number
The serial number of the resource.

Performance metrics for SAN Volume Controller and Storwize systems:

A storage environment can include SAN Volume Controller systems, Storwize V7000 systems, and a Storwize V7000 Unified systems. You can include performance metrics for ports, port errors, volumes, caches, back-end arrays, and other data for these systems in performance reports.

Port data

You can create performance reports that include the following information:

Port Send I/O Rate (ops/s)
The average number of I/O operations per second for operations in which data is sent from a port.

Port Receive I/O Rate (ops/s)
The average number of I/O operations per second for operations in which the port receives data.

Total Port I/O Rate (ops/s)
The average number of send operations and receive operations per second.

Port to Host Send I/O Rate (ops/s)
The average number of exchanges per second that are sent to host computers.

Port to Host Receive I/O Rate (ops/s)
The average number of exchanges per second that are received from host computers.

Total Port to Host I/O Rate (ops/s)
The average number of exchanges per second that are transmitted between host computers and the component.

Port to Disk Send I/O Rate (ops/s)
The average number of exchanges per second that are sent to back-end storage resources.

Port to Disk Receive I/O Rate (ops/s)
The average number of exchanges per second that are received from back-end storage resources.

Total Port to Disk I/O Rate (ops/s)
The average number of exchanges per second that are transmitted between back-end storage resources and the component. This value includes both send and receive operations.

Port to Local Node Send I/O Rate (ops/s)
The average number of exchanges per second that are sent to other nodes that are in the local SAN Volume Controller cluster.

Port to Local Node Receive I/O Rate (ops/s)
The average number of exchanges per second that are received from other nodes that are in the local SAN Volume Controller cluster.

Total Port to Local Node I/O Rate (ops/s)
The average number of exchanges per second that are transmitted between the component and other nodes that are in the local SAN Volume Controller cluster.

Port to Remote Node Send I/O Rate (ops/s)
The average number of exchanges per second that are sent to nodes that are in the remote SAN Volume Controller cluster.

Port to Remote Node Receive I/O Rate (ops/s)
The average number of exchanges per second that are received from nodes that are in the remote SAN Volume Controller cluster.

Total Port to Remote Node I/O Rate (ops/s)
The average number of exchanges per second that are transmitted between the component and nodes that are in the remote SAN Volume Controller cluster.

Port Send Data Rate (MiB/s)
The average rate at which data is sent through the port. The rate is measured in MiB per second.

Port Receive Data Rate (MiB/s)
The average rate at which data is received by the port. The rate is measured in MiB per second.

Total Port Data Rate (MiB/s)
The average rate at which data is transferred through the port. The rate is measured in MiB per second and includes both send and receive operations.

Port to Host Send Data Rate (MiB/s)
The average rate at which data is sent to host computers. The rate is measured in MiB per second.

Port to Host Receive Data Rate (MiB/s)
The average rate at which data is received from host computers. The rate is measured in MiB per second.

Total Port to Host Data Rate (MiB/s)
The average rate at which data is transmitted between host computers and the component. The rate is measured in MiB per second and includes both send and receive operations.

Port to Disk Send Data Rate (MiB/s)
The average rate at which data is sent to back-end storage resources. The rate is measured in MiB per second.

Port to Disk Receive Data Rate (MiB/s)
The average rate at which data is received from back-end storage resources. The rate is measured in MiB per second.

Total Port to Disk Data Rate (MiB/s)
The average rate at which data is transmitted between back-end storage resources and the component. The rate is measured in MiB per second and includes both send and receive operations.

Port to Local Node Send Data Rate (MiB/s)
The average rate at which data is sent to other nodes that are in the local SAN Volume Controller cluster. The rate is measured in MiB per second.

Port to Local Node Receive Data Rate (MiB/s)
The average rate at which data is received from other nodes that are in the local SAN Volume Controller cluster. The rate is measured in MiB per second.

Total Port to Local Node Data Rate (MiB/s)
The average rate at which data is transmitted between the component and other nodes that are in the local SAN Volume Controller cluster. The rate is measured in MiB per second.

Port to Remote Node Send Data Rate (MiB/s)
The average rate at which data is sent to nodes that are in the remote SAN Volume Controller cluster. The rate is measured in MiB per second.

Port to Remote Node Receive Data Rate (MiB/s)
The average rate at which data is received from nodes that are in the remote SAN Volume Controller cluster. The rate is measured in MiB per second.

Total Port to Remote Node Data Rate (MiB/s)
The average rate at which data is transmitted between the component and nodes that are in the remote SAN Volume Controller cluster. The rate is measured in MiB per second.

Port to Local Node Send Response Time (ms/op)
The average number of milliseconds to complete a send operation to another node that is in the local SAN Volume Controller cluster. This value represents the external response time of the transfers.

Port to Local Node Receive Response Time (ms/op)
The average number of milliseconds to complete a receive operation from another node that is in the local SAN Volume Controller cluster. This value represents the external response time of the transfers.

Overall Port to Local Node Response Time (ms/op)
The average number of milliseconds to complete a send or receive operation with another node that is in the local SAN Volume Controller cluster. This value represents the external response time of the transfers.

Port to Local Node Send Queue Time (ms/op)
The average time in milliseconds that a send operation spends in the queue before the operation is processed. This value represents the queue time for send operations that are issued to other nodes that are in the local SAN Volume Controller cluster.

Port to Local Node Receive Queue Time (ms/op)
The average time in milliseconds that a receive operation spends in the queue before the operation is processed. This value represents the queue time for receive operations that are issued from other nodes that are in the local SAN Volume Controller cluster.

Overall Port to Local Node Queue Time (ms/op)
The average number of milliseconds that a send or receive operation spends in the queue before the operation is processed. This value is for send and receive operations that are issued between the component and other nodes that are in the local SAN Volume Controller cluster.

Port to Remote Node Send Response Time (ms/op)
The average number of milliseconds to complete a send operation to a node that is in the remote SAN Volume Controller cluster. This value represents the external response time of the transfers.

Port to Remote Node Receive Response Time (ms/op)
The average number of milliseconds to complete a receive operation from a node that is in the remote SAN Volume Controller cluster. This value represents the external response time of the transfers.

Overall Port to Remote Node Response Time (ms/op)
The average number of milliseconds to complete a send operation to, or a receive operation from a node in the remote SAN Volume Controller cluster. This value represents the external response time of the transfers.

Port to Remote Node Send Queue Time (ms/op)
The average time in milliseconds that a send operation spends in the queue before the operation is processed. This value represents the queue time for send operations that are issued to a node that is in the remote SAN Volume Controller cluster.

Port to Remote Node Receive Queue Time (ms/op)
The average time in milliseconds that a receive operation spends in the queue before the operation is processed. This value represents the queue time for receive operations that are issued from a node that is in the remote SAN Volume Controller cluster.

Overall Port to Remote Node Queue Time (ms/op)
The average number of milliseconds that a send or receive operation spends in the queue before the operation is processed. This value is for send and receive operations that are issued between the component and a node that is in the remote SAN Volume Controller cluster.

Port error data

You can create performance reports that include the following information:

Link Failure Rate (count/s)
The average number of link errors per second.

Loss of Sync Rate (count/s)
The average number of times per second that synchronization is lost.

Synchronization is assumed lost after a timeout interval expires.

Loss of Signal Rate (count/s)
The average number of times per second that the signal is lost.

CRC Error Rate (count/s)
The average number of frames per second that are received in which a

cyclic redundancy check (CRC) error is detected. A CRC error is detected when the CRC in the transmitted frame does not match the CRC computed by the receiver.

Primitive Sequence Protocol Error Rate (count/s)
The average number of primitive sequence protocol errors per second that are detected.

This error occurs when there is a link failure for a port.

Invalid Transmission Word Rate (count/s)
The average number of bit errors per second that are detected.

Volume data

You can create performance reports that include the following information:

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation.

Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation.

Overall Transfer Size (KiB/op)
The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

Cache data

You can create performance reports that include the following information:

Write Cache Delay I/O Rate (ops/s)
The average number of I/O operations per second that are delayed because there is not enough space in the write cache.

The only operations that can be delayed are write operations, but the value is calculated as an average of all I/O operations.

Write Cache Overflow I/O Rate (ops/s)
The average number of write operations per second that are delayed because there is not enough space in the write cache.

Write Cache Flush Through I/O Rate (ops/s)
The average number of tracks per second that are written to disk in flush-through mode.

Write Cache Write Through I/O Rate (ops/s)
The average number of tracks per second that are written to disk in write-through mode.

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Overall Write Cache Hit Percentage
The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

Total Overall Cache Hit Percentage
The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Disk to Cache Transfer Rate (ops/s)
The average number of tracks that are transferred per second from the disks to the cache.

Cache to Disk Transfer Rate (ops/s)
The average number of tracks per second that are transferred from the cache to the disks.

Write Cache Delay Percentage
The percentage of I/O operations that are delayed because there is not enough space in the write cache.

The only operations that can be delayed are write operations, but the value is calculated as an average of all I/O operations.

Read Ahead Percentage of Cache Hits
The percentage of all read-cache hits that occur on pre-staged data.

Dirty Write Percentage of Cache Hits
The percentage of all cache write operations that occur on data in the cache

that is marked as modified. This value represents how effectively write operations are coalesced before the data is written to disk.

Write Cache Overflow Percentage
The percentage of write operations that are delayed because there is not enough space in the write cache.

Write Cache Flush Through Percentage
The percentage of tracks that is written to disk in flush-through mode.

Write Cache Write Through Percentage
The percentage of tracks that is written to disk in write-through mode.

Back-end array data

You can create performance reports that include the following information:

Back-End Read I/O Rate (ops/s)
The average number of read operations per second that are issued to the back-end storage resources.

Back-End Write I/O Rate (ops/s)
The average number of write operations per second that are issued to the back-end storage resources.

Total Back-End I/O Rate (ops/s)
The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

Back-End Read Data Rate (MiB/s)
The average number of MiB per second that are read from the back-end storage resources.

Back-End Write Data Rate (MiB/s)
The average number of MiB per second that are written to the back-end storage resources.

Total Back-End Data Rate (MiB/s)
The average rate at which data is transmitted between the back-end storage resources and the component. The rate is measured in MiB per second and includes both read and write operations.

Back-End Read Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Back-End Write Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Overall Back-End Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Peak Back-End Read Response Time (ms)
The longest time for a back-end storage resource to respond to a read operation.

Peak Back-End Write Response Time (ms)
The longest time for a back-end storage resource to respond to a write operation.

Back-End Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation from the back-end storage resources.

Back-End Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation to the back-end storage resources.

Overall Back-End Transfer Size (KiB/op)
The average transfer size, in KiB, of a read or a write operation to the back-end storage resources.

Back-End Read Queue Time (ms/op)
The average number of milliseconds that a read operation spends in the queue before the operation is sent to the back-end storage resources.

Back-End Write Queue Time (ms/op)
The average number of milliseconds that a write operation spends in the queue before the operation is sent to the back-end storage resources.

Overall Back-End Queue Time (ms/op)
The average number of milliseconds that a read or a write operation spends in the queue before the operation is sent to the back-end storage resources.

Peak Back-End Read Queue Time (ms)
The longest time that a read operation spends in the queue before the operation is sent to the back-end storage resources.

Peak Back-End Write Queue Time (ms)
The longest time that a write operation spends in the queue before the operation is sent to the back-end storage resources.

Other data

You can create performance reports that include the following information:

Global Mirror Write I/O Rate (op/s)
The average number of write operations per second that are issued to the Global Mirror secondary site.

Global Mirror Overlapping Write I/O Rate (op/s)
The average number of overlapping write operations per second that are issued by the Global Mirror primary site.

For SAN Volume Controller software releases 4.3.1 and later, some overlapping writes are processed in parallel and are excluded from this value. For SAN Volume Controller software releases 4.3.0 and earlier, all overlapping writes are serialized.

Peak Read Response Time (ms)
The longest time to complete a read operation.

Peak Write Response Time (ms)
The longest time to complete a write operation.

Global Mirror Secondary Write Lag (ms/op)
The average number of milliseconds to service a secondary write operation for Global Mirror. This value does not include the time to service the primary write operation.

You monitor the value of Global Mirror Secondary Write Lag to identify delays that occurred during the process of writing data to the secondary site.

Processor Utilization Percentage
The average percentage of time that the processors are busy.

Global Mirror Overlapping Write Percentage
The percentage of overlapping write operations that are issued by the Global Mirror primary site.

For SAN Volume Controller software releases 4.3.1 and later, some overlapping writes are processed in parallel and are excluded from this value. For SAN Volume Controller software releases 4.3.0 and earlier, all overlapping writes are serialized.

Overall Host Attributed Response Time Percentage
The percentage of the average response time that can be attributed to delays from host systems. This value includes both read response times and write response times, and can help you diagnose slow hosts and fabrics that are not working efficiently.

The value is based on the following conditions:

- For read response time, the time that it takes for hosts to respond to transfer-ready notifications from the SAN Volume Controller nodes.
- For write response time, the time that it takes for hosts to send the write data after the node responds to a transfer-ready notification.

Zero Buffer-to-Buffer Credit Timer (microseconds)
The number of microseconds that the port is not able to send frames between ports because there is insufficient buffer-to-buffer credit.

In Fibre Channel technology, buffer-to-buffer credit is used to control the flow of frames between ports. Buffer-to-buffer credit is measured from the last time that the node was reset.

Performance metrics for DS8000 and DS6000 storage systems:

You can include performance metrics for ports, port errors, volumes, caches, back-end arrays, and other data for DS8000 and DS6000 storage systems in performance reports.

Port data

You can create performance reports that include the following information:

Port Send I/O Rate (ops/s)
The average number of I/O operations per second for operations in which data is sent from a port.

Port Receive I/O Rate (ops/s)
The average number of I/O operations per second for operations in which the port receives data.

Total Port I/O Rate (ops/s)
The average number of send operations and receive operations per second.

Port PPRC Send I/O Rate (ops/s)
The average number of operations per second that are sent by using the Peer-to-Peer Remote Copy protocol.

Port PPRC Receive I/O Rate (ops/s)
The average number of operations per second that are received by using the Peer-to-Peer Remote Copy protocol.

Total Port PPRC I/O Rate (ops/s)
The average number of send operations and receive operations per second using the Peer-to-Peer Remote Copy protocol.

Port Send Data Rate (MiB/s)
The average rate at which data is sent through the port. The rate is measured in MiB per second.

Port Receive Data Rate (MiB/s)
The average rate at which data is received by the port. The rate is measured in MiB per second.

Total Port Data Rate (MiB/s)
The average rate at which data is transferred through the port. The rate is measured in MiB per second and includes both send and receive operations.

Port PPRC Send Data Rate (MiB/s)
The average number of MiB per second that are sent by using the Peer-to-Peer Remote Copy protocol.

Port PPRC Receive Data Rate (MiB/s)
The average number of MiB per second that are received by using the Peer-to-Peer Remote Copy protocol.

Total Port PPRC Data Rate (MiB/s)
The average number of MiB per second that are transferred by using the Peer-to-Peer Remote Copy (PPRC) protocol. This value includes both send and receive PPRC operations.

Port Send Response Time (ms/op)
The average number of milliseconds to complete a send operation.

Port Receive Response Time (ms/op)
The average number of milliseconds to complete a receive operation.

Overall Port Response Time (ms/op)
The average number of milliseconds to complete a send or receive operation.

Port PPRC Send Response Time (ms/op)
The average number of milliseconds to complete a send operation by using the Peer-to-Peer Remote Copy protocol.

Port PPRC Receive Response Time (ms/op)
The average number of milliseconds to complete a receive operation by using the Peer-to-Peer Remote Copy protocol.

Overall Port PPRC Response Time (ms/op)
The average number of milliseconds to complete a send or receive operation by using the Peer-to-Peer Remote Copy (PPRC) protocol.

Port Send Transfer Size (KiB/op)
The average number of KiB that are transferred per send operation.

Port Receive Transfer Size (KiB/op)
The average number of KiB that are transferred per receive operation.

Overall Port Transfer Size (KiB/op)
The average number of KiB that are transferred per I/O operation. This value includes both send and receive operations.

Port error data

You can create performance reports that include the following information:

Link Failure Rate (count/s)
The average number of link errors per second.

Loss of Sync Rate (count/s)
The average number of times per second that synchronization is lost.

Synchronization is assumed lost after a timeout interval expires.

Loss of Signal Rate (count/s)
The average number of times per second that the signal is lost.

CRC Error Rate (count/s)
The average number of frames per second that are received in which a cyclic redundancy check (CRC) error is detected. A CRC error is detected when the CRC in the transmitted frame does not match the CRC computed by the receiver.

Primitive Sequence Protocol Error Rate (count/s)
The average number of primitive sequence protocol errors per second that are detected.

This error occurs when there is a link failure for a port.

Invalid Transmission Word Rate (count/s)
The average number of bit errors per second that are detected.

Error Frame Rate (count/s)
The average number of error frames per second that are received. An error frame is a frame that violates the Fibre Channel Protocol.

Link Reset Transmitted Rate (count/s)
The average number of times per second that the port changes from an active (AC) state to a Link Recovery (LR1) state.

Link Reset Received Rate (count/s)
The average number of times per second that the port changes from an active (AC) state to a Link Recovery (LR2) state.

Out of Order Data Rate (count/s)
The average number of times per second that an out-of-order frame is detected.

Out of Order ACK Rate (count/s)
The average number of times per second that an out-of-order acknowledge (ACK) frame is detected.

An ACK frame is used for end-to-end flow control and is sent to verify receipt of a frame.

Duplicate Frame Rate (count/s)
The average number of duplicate frames per second that are received. A duplicate frame is a frame that the system previously processed for the port.

Invalid Relative Offset Rate (count/s)
The average number of times per second that frames are received with an invalid relative offset in the frame header.

Sequence Timeout Rate (count/s)
The average number of times per second that the port detects a timeout condition after the port receives a sequence initiative for a Fibre Channel exchange.

Volume data

You can create performance reports that include the following information:

Normal Read I/O Rate (ops/s)
The average number of nonsequential read operations per second.

Sequential Read I/O Rate (ops/s)
The average number of sequential read operations per second.

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Normal Write I/O Rate (ops/s)
The average number of nonsequential write operations per second.

Sequential Write I/O Rate (ops/s)
The average number of sequential write operations per second.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Normal I/O Rate (ops/s)
The average number of nonsequential I/O operations per second. This value includes both read and write operations.

Total Sequential I/O Rate (ops/s)
The average number of sequential I/O operations per second. This value includes both read and write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Record Mode Read I/O Rate (ops/s)
The average number of I/O operations per second for record-mode read operations.

For record-mode read operations, only the requested data is managed in the cache rather than a full track of data.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation.

Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation.

Overall Transfer Size (KiB/op)
The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

Back-end array data

You can create performance reports that include the following information:

Back-End Read I/O Rate (ops/s)
The average number of read operations per second that are issued to the back-end storage resources.

Back-End Write I/O Rate (ops/s)
The average number of write operations per second that are issued to the back-end storage resources.

Total Back-End I/O Rate (ops/s)
The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

Back-End Read Data Rate (MiB/s)
The average number of MiB per second that are read from the back-end storage resources.

Back-End Write Data Rate (MiB/s)
The average number of MiB per second that are written to the back-end storage resources.

Total Back-End Data Rate (MiB/s)
The average rate at which data is transmitted between the back-end storage resources and the component. The rate is measured in MiB per second and includes both read and write operations.

Back-End Read Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Back-End Write Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Overall Back-End Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Back-End Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation from the back-end storage resources.

Back-End Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation to the back-end storage resources.

Overall Back-End Transfer Size (KiB/op)
The average transfer size, in KiB, of a read or a write operation to the back-end storage resources.

Cache data

You can create performance reports that include the following information:

Write Cache Delay I/O Rate (ops/s)
The average number of I/O operations per second that are delayed because there is not enough space in the write cache.

The only operations that can be delayed are write operations, but the value is calculated as an average of all I/O operations.

Normal Read Cache Hit Percentage
The percentage of nonsequential read operations that find data in the cache.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Sequential Read Cache Hit Percentage
The percentage of sequential read operations that find data in the cache.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Normal Write Cache Hit Percentage
The percentage of nonsequential write operations that are handled in the cache.

Sequential Write Cache Hit Percentage
The percentage of sequential write operations that are handled in the cache.

Overall Write Cache Hit Percentage
The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

Total Normal Cache Hit Percentage
The percentage of nonsequential I/O operations that are handled in the cache. This value includes both read and write operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Total Sequential Cache Hit Percentage
The percentage of sequential I/O operations that are handled in the cache. This value includes both read and write operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Total Overall Cache Hit Percentage
The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Disk to Cache Transfer Rate (ops/s)
The average number of tracks that are transferred per second from the disks to the cache.

Cache to Disk Transfer Rate (ops/s)
The average number of tracks per second that are transferred from the cache to the disks.

Write Cache Delay Percentage
The percentage of I/O operations that are delayed because there is not enough space in the write cache.

The only operations that can be delayed are write operations, but the value is calculated as an average of all I/O operations.

Record Mode Read Cache Hit Percentage
The percentage of cache hits for record-mode read operations.

For record-mode read operations, only the requested data, rather than a full track of data, is managed in the cache.

Other data

You can create performance reports that include the following information:

HPF Read I/O Rate (ops/s)
The average number of read operations per second that are issued by the High Performance FICON® feature of the storage system.

HPF Write I/O Rate (ops/s)
The average number of write operations per second that are issued by the High Performance FICON feature of the storage system.

Total HPF I/O Rate (ops/s)
The average number of I/O operations per second that are issued by the High Performance FICON feature of the storage system. This value includes both read and write operations.

HPF I/O Percentage
The percentage of all I/O operations that are issued by the High Performance FICON feature of the storage system.

Cache Holding Time (s)
The average number of seconds that I/O data for a storage system controller is held in the cache. A short cache-holding time indicates adverse performance.

PPRC Transfer Rate (ops/s)
The average number of tracks per second that are transferred to the secondary device of a Peer-to-Peer Remote Copy (PPRC) pair. This value shows the activity for the source of the PPRC relationship, but shows no activity for the target.

Performance metrics for an XIV system:

You can include performance data for volumes, caches, and other data for an XIV system in performance reports.

Volume data

You can create performance reports that include the following information:

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation.

Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation.

Overall Transfer Size (KiB/op)
The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

Cache data

You can create performance reports that include the following information:

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Overall Write Cache Hit Percentage
The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

Total Overall Cache Hit Percentage
The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Read Data Cache Hit Percentage
The percentage of all read data that is read from the cache.

Write Data Cache Hit Percentage
The percentage of all write data that is written to cache slots that are marked as modified.

Overall Data Cache Hit Percentage
The percentage of all data that is handled in the cache. This value includes read data that is read from the cache and write data that is written to cache slots that are marked as modified.

SSD Read Cache Hit Percentage
The percentage of read operations that find data in the cache on a solid-state drive (SSD). The value for this metric is also included in the value for the Overall Read Cache Hit Percentage metric.

This metric is only available for XIV systems that use solid-state drives as drives for caching.

SSD Read Data Cache Hit Percentage
The percentage of all read data that was read from cache memory on a solid-state drive.

This metric is only available for XIV systems that use solid-state drives as drives for caching.

Read Cache Hit Response Time (ms/op)
The average number of milliseconds to complete a read-cache hit operation.

Write Cache Hit Response Time (ms/op)
The average number of milliseconds to complete a write-cache hit operation.

Overall Cache Hit Response Time (ms/op)
The average number of milliseconds to complete a cache hit operation. This value includes the times for both read-cache hit and write-cache hit operations.

Read Cache Miss Response Time (ms/op)
The average number of milliseconds to complete a read-cache miss operation.

Write Cache Miss Response Time (ms/op)
The average number of milliseconds to complete a write-cache miss operation.

Overall Cache Miss Response Time (ms/op)
The average number of milliseconds to complete a cache miss operation. This value includes the times for both read-cache miss and write-cache miss operations.

SSD Read Cache Hit Response Time (ms/op)
The average number of milliseconds that it takes to complete a hit operation on the read cache on a solid-state drive. The value for this metric is also included in the value for the Read Cache Hit Response Time metric.

This metric is only available for XIV systems that use solid-state drives as drives for caching.

Other data

You can create performance reports that include the following information:

Small Transfers I/O Percentage
The percentage of I/O operations with a small data transfer size. A small data transfer has a size that is less than or equal to 8 KiB.

Medium Transfers I/O Percentage
The percentage of I/O operations with a medium data transfer size. A medium data transfer has a size that is greater than 8 KiB and less than or equal to 64 KiB.

Large Transfers I/O Percentage
The percentage of I/O operations with a large data transfer size. A large data transfer has a size that is greater than 64 KiB and less than or equal to 512 KiB.

Very Large Transfers I/O Percentage
The percentage of I/O operations with a data transfer size that is greater than 512 KiB.

Small Transfers Data Percentage
The percentage of data that is transferred as a result of I/O operations with a small data transfer size. A small data transfer has a size that is less than or equal to 8 KiB.

Medium Transfers Data Percentage
The percentage of data that is transferred as a result of I/O operations with a medium data transfer size. A medium data transfer has a size that is greater than 8 KiB and less than or equal to 64 KiB.

Large Transfers Data Percentage
The percentage of data that is transferred as a result of I/O operations with a large data transfer size. A large data transfer has a size that is greater than 64 KiB and less than or equal to 512 KiB.

Very Large Transfers Data Percentage
The percentage of data that is transferred as a result of I/O operations with a data transfer size that is greater than 512 KiB.

Small Transfers Response Time (ms/op)
The average number of milliseconds to complete an I/O operation that has a small data transfer size. A small data transfer has a size that is less than or equal to 8 KiB.

Medium Transfers Response Time (ms/op)
The average number of milliseconds to complete an I/O operation that has a medium data transfer size. A medium data transfer has a size that is greater than 8 KiB and less than or equal to 64 KiB.

Large Transfers Response Time (ms/op)
The average number of milliseconds to complete an I/O operation that has a large data transfer size. A large data transfer has a size that is greater than 64 KiB and less than or equal to 512 KiB.

Very Large Transfers Response Time (ms/op)
The average number of milliseconds to complete an I/O operation with a data transfer size that is greater than 512 KiB.

Performance metrics for block server systems:

You can include performance metrics for volumes, and cache data for block server storage systems in performance reports.

Volume data

You can create performance reports that include the following information:

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation.

Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation.

Overall Transfer Size (KiB/op)
The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

Cache data

You can create performance reports that include the following information:

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Overall Write Cache Hit Percentage
The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

Total Overall Cache Hit Percentage
The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Data for storage system volumes in performance reports

You can include general information, capacity data, properties, and other information about storage system volumes in performance reports.

Information about storage system volumes

You can create performance reports that include the following information:

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage Controller Name
The name that was assigned to the controller when it was added to the system.

Storage Pool Name
The name that was assigned to the pool when it was added to the system.

Storage RAID Array Name
The name that was assigned to the RAID array when it was added to the system.

Storage I/O Group Name
The name that was assigned to the I/O group when it was added to the system.

Storage Preferred Node Name
The name of the storage node that is used for I/O operations for a volume.

Storage Volume Name
The name that was assigned to the storage volume when it was added to the system.

Storage Volume Assigned Host Connection
The host connection to which the storage volume is assigned. The host connection is a definition in the storage system that contains the WWPN for the server. The storage system uses the WWPN to assign volumes to servers.

Storage Volume Host Connection OS Type
The operating system type of the server or hypervisor that the volume is assigned to.

Storage System Volume Group ID
The unique identifier for a collection of volumes on DS8000 and DS6000 storage systems. The storage system generates this identifier.

Storage Volume Group Name
The user-defined name for a collection of volumes on DS8000 and DS6000 storage systems.

Server Name
The fully qualified domain name of the server. For example, the name of a server might be `server.example.com`.

Hypervisor Name
The fully qualified domain name of the hypervisor. For example, the name of a hypervisor might be `hypervisor.example.com`.

Hypervisor Cluster Name
The name of a cluster that is monitored in your storage environment. A cluster is a group of hypervisors that collaborate for the purposes of workload balancing and failover.

Capacity and usage data

You can create performance reports that include the following information:

Storage Volume Capacity (GiB)
The total amount of storage space that is committed to a volume.

For thin-provisioned volumes, this value represents the virtual capacity of the volume.

For XIV systems, this value represents the physical (hard) capacity of the volume, not the virtual (soft) capacity. For other storage systems, this value might also include overhead space if the pool is unformatted.

Storage Volume Used Space (GiB)
The amount of allocated space that is used by a volume.

For SAN Volume Controller and Storwize V7000, you can preallocate thin-provisioned volume space when the volumes are created. In these cases, the Storage Volume Used Space (GiB) might be different than the Storage Volume Allocated Space (GiB). For volumes that are not thin provisioned, the values for Storage Volume Used Space (GiB) and Storage Volume Allocated Space (GiB) are equal.

This value is accurate as of the most recent time that Tivoli Storage Productivity Center collected data about a volume. The value in this property might not be 100% accurate for the current state of volumes. This inaccuracy might occur because data collection is run on a set schedule and the used space on volumes can change rapidly.

Storage Volume Overhead (GiB)
The amount of space that is used for system management. The amount of space also includes space that is reserved for redundancy.

Storage Volume Allocated Space (GiB)
The amount of space that is reserved for a volume. The space that is allocated for a thin-provisioned volume is less than its virtual capacity, which is shown in the Storage Volume Capacity (GiB) property. This value is equal to the value in the Storage Volume Used Space (GiB) property for the following storage systems:

- Storage systems other than Storwize V7000 systems that are configured as back-end storage
- Storwize V7000 storage systems that are configured as back-end storage, and that are not thin-provisioned

Storage Volume Unallocated Space (GiB)
The amount of space in a pool that is not reserved for a volume.

Tivoli Storage Productivity Center uses the following formula to determine this value:

```
capacity - allocated space
```

Available only for thin provisioned volumes.

Storage Volume Physical Allocation Percentage
The percentage of physical space that is reserved for a volume. This value is always less than or equal to 100% because you cannot reserve more physical space than is available.

Tivoli Storage Productivity Center uses the following formula to determine this value:

```
(allocated space ÷ capacity) × 100
```

For example, the physical allocation percentage is 25% for a volume size of 200 GiB. Therefore, the space that is reserved for volumes is 50 GiB.

Storage Volume Shortfall Percentage
The percentage of the remaining unallocated volume space in a pool that is not available to be allocated to a volume.

The higher the percentage, the more critical the shortfall of space.

Tivoli Storage Productivity Center uses the following formula to determine this value:

```
(unallocatable volume Space ÷ volume unallocated space) × 100
```

You can use this percentage to determine when the amount of overcommitted space in pools reaches a critically high level. For example, the physical space in pools might be less than the committed virtual space. In this case, the pools do not have enough space to fulfill the commitment to virtual space for a volume.

This Storage Volume Shortfall Percentage represents the percentage of the committed virtual space that is not available in a pool. As more space is used over time by a volume while the pool capacity remains the same, this percentage increases.

For example, the remaining physical capacity of a pool is 70 GiB, however, 150 GiB of virtual space is committed to a thin-provisioned volume. If the volume is using 50 GiB, then there is still 100 GiB committed to that volume (150 GiB - 50 GiB). There is a shortfall of 30 GiB (70 GiB remaining pool space - 100 GiB remaining commitment of volume space to the volume). The volume is overcommitted by 30 GiB based on the available space in the pool. The shortfall is 30% when you use the following calculation:

```
100 GiB unallocated volume space - 70 GiB remaining
pool space ÷ 100 GiB unallocated volume space × 100
```

Storage Volume Unallocatable Space (GiB)
The unallocatable storage space in GiB of a thin-provisioned volume. Unallocatable space cannot be supplied by the pool to which the volume belongs.

Storage Volume Used Allocated Space Percentage
The percentage of reserved space for a volume that is being used. This value is always less than or equal to 100% because a volume cannot use more space than is allocated.

Tivoli Storage Productivity Center uses the following formula to determine this value:

```
(volume used space ÷ volume allocated space) × 100
```

Storage Volume Unused Space (GiB)
The amount of space that is allocated to a volume and is not yet used.

Tivoli Storage Productivity Center uses the following formula to determine this value:

```
Allocated Space - Used Space
```

This property is available only for SAN Volume Controller and Storwize V7000 pools.

Storage Volume Uncompressed Capacity (GiB)
The amount of storage space that is used if the compressed volume space is uncompressed. For example, if 100 GiB of uncompressed data is compressed, and the size of the compressed data is 20 GiB, the value is 100.

Component properties

You can create performance reports that include the following information:

Storage Volume RAID Level
The RAID level of the resource, such as RAID 5 or RAID 10. The RAID level affects the performance and fault tolerance of the volumes that are allocated from the resource.

Storage Volume Is Thin Provisioned
Shows whether a pool, volume, or volume copy is thin-provisioned. If this value is `Yes`, the resource is thin-provisioned.

Storage Volume Is Assigned
Shows whether the volume is assigned to a server. If this value is `Yes`, the volume is assigned to a server.

Storage Volume Is Encrypted
Shows whether the resource is encrypted. If this value is `Yes`, the resource is encrypted.

Storage Volume Is Encryptable
Shows whether the resource can be encrypted. If this value is `Yes`, the resource can be encrypted.

Storage Volume Is Volume Control Manager Database
Shows whether a volume is used as the Volume Control Manager Database. If this value is `Yes`, the volume is used as the Volume Control Manager Database.

Storage Volume Format
Shows the format of the volume or pool. The format can be a Count Key Data (CKD) format, or a fixed block format.

Storage Volume Serial Number
The serial number of the resource.

Storage Volume Number
The number of the volume that is assigned by the system.

Storage Volume WWN
The worldwide name of the volume.

Storage Volume FlashCopy Relationship
Shows whether a volume on a storage system is in a FlashCopy relationship. This property can contain the following values:

Source Relationship
The volume is the source of the relationship.

Target Relationship
The volume is the target of the relationship.

Both Source and Target Relationship
The volume is both the source and target of the relationship.

Not in a FlashCopy Relationship
The volume is not in a FlashCopy relationship.

Storage Volume Remote Copy Relationship
Shows whether a volume on a storage system is in a remote copy relationship. This property can contain the following values:

Not in a Copy Relationship
The volume is not in a remote copy relationship.

Source Relationship
The volume is the source of the relationship.

Target Relationship
The volume is the target of the relationship.

Both Source and Target Relationship
The volume is both the source and target of the relationship.

Storage Volume Logical Subsystem
The logical subsystem (LSS) to which a volume or pool belongs.

Storage Volume Type
The type of storage volume. For example, the storage volume can be striped or sequential. This value is only available for SAN Volume Controller and Storwize V7000 storage systems that are configured as back-end storage.

Storage Volume Fast Write State
Shows whether the cache for a volume on a disk that is managed by a storage virtualizer is empty, contains data, or is corrupted.

Storage Volume Grain Size (KiB)
The grain size with which a thin-provisioned volume was created. This value is typically 32, 64, 128, or 256 KiB. Larger grain sizes maximize performance, whereas smaller grain sizes maximize space efficiency. Grain sizes also limit the maximum virtual space of a volume.

This value is only available for SAN Volume Controller and Storwize V7000 storage systems that are configured as back-end storage.

Storage Volume Is Auto Expand Enabled
Shows whether a volume can automatically allocate new extents from a pool. Volumes might allocate new extents to expand the real capacity of the volume. If this value is `Yes`, the volume can automatically allocate new extents from a pool.

This value is only available for SAN Volume Controller and Storwize V7000 storage systems that are configured as back-end storage.

Storage Volume Metro Mirror Name
The name of the Metro Mirror that keeps the synchronous copy of the storage volume. This value is only available for SAN Volume Controller and Storwize V7000 storage systems that are configured as back-end storage.

Storage Volume Mirror Count
The number of mirrors that keep a synchronous copy of the resource. This value is only available for SAN Volume Controller and Storwize V7000 storage systems that are configured as back-end storage.

Storage Volume Throttle
The maximum number of commands that the volume can queue. This value is only available for SAN Volume Controller and Storwize V7000 storage systems that are configured as back-end storage.

Storage Volume Warning Level
The percentage of volume capacity that is used at which a warning is generated. This value is only available for SAN Volume Controller and Storwize V7000 storage systems that are configured as back-end storage.

Storage Volume Is Compressed
Shows whether the volume is compressed. If this value is `Yes`, the volume is compressed.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Status information

You can create performance reports that include the following information:

Storage Volume Status
The condition of the resource, for example normal, warning, or error.

Storage Volume Is Detected
Shows whether the resource was detected the last time that data was collected. If this value is `Yes`, the resource was detected.

Storage Volume Native Status
The condition of the volume. The status can be online, offline, degraded, or excluded.

Performance metrics for volumes on SAN Volume Controller and Storwize systems:

A storage environment can include SAN Volume Controller systems, Storwize V7000 systems, and a Storwize V7000 Unified systems. You can include performance metrics for volumes, caches, and other data for volumes on these systems in performance reports.

Volume data

You can create performance reports that include the following information:

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Maximum Read I/O Rate (ops/s)
The maximum read I/O rate of the volume in operations per second. This metric is only available for daily data for SAN Volume Controller and Storwize V7000 systems.

Maximum Write I/O Rate (ops/s)
The maximum write I/O rate of the volume in operations per second. This metric is only available for daily data for SAN Volume Controller and Storwize V7000 systems.

Maximum Write I/O Size (KiB)
The maximum size of write I/O operations in kibibytes. This metric is only available for daily data for SAN Volume Controller and Storwize V7000 systems.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Maximum Read Response Time (ms/op)
The maximum read response time of the volume in milliseconds per operation. This metric is only available for daily data for SAN Volume Controller and Storwize V7000 systems.

Maximum Write Response Time (ms/op)
The maximum write response time of the volume in milliseconds per operation. This metric is only available for daily data for SAN Volume Controller and Storwize V7000 systems.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation.

Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation.

Overall Transfer Size (KiB/op)
The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

Volume Utilization
The average percentage of time that the volume is busy.

Maximum Volume Utilization Percentage
The maximum period in percentage that the volume is busy. This metric is only available for daily data for SAN Volume Controller and Storwize V7000 systems.

Cache data

You can create performance reports that include the following information:

Write Cache Overflow I/O Rate (ops/s)
The average number of write operations per second that are delayed because there is not enough space in the write cache.

Write Cache Delay I/O Rate (ops/s)
The average number of I/O operations per second that are delayed because there is not enough space in the write cache.

The only operations that can be delayed are write operations, but the value is calculated as an average of all I/O operations.

Write Cache Flush Through I/O Rate (ops/s)
The average number of tracks per second that are written to disk in flush-through mode.

Write Cache Write Through I/O Rate (ops/s)
The average number of tracks per second that are written to disk in write-through mode.

Maximum Write Cache Delay I/O Rate (ops/s)
The maximum number of delayed I/O operations per second for the volume, where the delay occurred because of space constraints or other conditions.

This metric is only available for daily data for SAN Volume Controller and Storwize V7000 systems.

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Overall Write Cache Hit Percentage
The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

Total Overall Cache Hit Percentage
The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Disk to Cache Transfer Rate (ops/s)
The average number of tracks that are transferred per second from the disks to the cache.

Cache to Disk Transfer Rate (ops/s)
The average number of tracks per second that are transferred from the cache to the disks.

Write Cache Delay Percentage
The percentage of I/O operations that are delayed because there is not enough space in the write cache.

The only operations that can be delayed are write operations, but the value is calculated as an average of all I/O operations.

Read Ahead Percentage of Cache Hits
The percentage of all read-cache hits that occur on pre-staged data.

Dirty Write Percentage of Cache Hits
The percentage of all cache write operations that occur on data in the cache that is marked as modified. This value represents how effectively write operations are coalesced before the data is written to disk.

Write Cache Overflow Percentage
The percentage of write operations that are delayed because there is not enough space in the write cache.

Write Cache Flush Through Percentage
The percentage of tracks that is written to disk in flush-through mode.

Write Cache Write Through Percentage
The percentage of tracks that is written to disk in write-through mode.

Maximum Read Cache Hit Percentage
The maximum number of cache hits in percentage for sequential and nonsequential read operations for the volume over a specified interval. This metric is only available for daily data for SAN Volume Controller and Storwize V7000 systems.

Other data

You can create performance reports that include the following information:

Global Mirror Write I/O Rate (op/s)
The average number of write operations per second that are issued to the Global Mirror secondary site.

Global Mirror Overlapping Write Percentage
The percentage of overlapping write operations that are issued by the Global Mirror primary site.

For SAN Volume Controller software releases 4.3.1 and later, some overlapping writes are processed in parallel and are excluded from this value. For SAN Volume Controller software releases 4.3.0 and earlier, all overlapping writes are serialized.

Global Mirror Overlapping Write I/O Rate (op/s)
The average number of overlapping write operations per second that are issued by the Global Mirror primary site.

For SAN Volume Controller software releases 4.3.1 and later, some overlapping writes are processed in parallel and are excluded from this value. For SAN Volume Controller software releases 4.3.0 and earlier, all overlapping writes are serialized.

Peak Read Response Time (ms)
The longest time to complete a read operation.

Peak Write Response Time (ms)
The longest time to complete a write operation.

Global Mirror Secondary Write Lag (ms/op)
The average number of milliseconds to service a secondary write operation for Global Mirror. This value does not include the time to service the primary write operation.

You monitor the value of Global Mirror Secondary Write Lag to identify delays that occurred during the process of writing data to the secondary site.

Overall Host Attributed Response Time Percentage
The percentage of the average response time that can be attributed to delays from host systems. This value includes both read response times and write response times, and can help you diagnose slow hosts and fabrics that are not working efficiently.

The value is based on the following conditions:

- For read response time, the time that it takes for hosts to respond to transfer-ready notifications from the SAN Volume Controller nodes.
- For write response time, the time that it takes for hosts to send the write data after the node responds to a transfer-ready notification.

Nonpreferred Node Usage Percentage
The overall percentage of I/O operations that are completed, or data that is transferred over the non-preferred nodes of the virtual disks.

Performance metrics for volumes on DS8000 and DS6000 storage systems:

You can include performance data for volumes, caches, and other data for storage system volumes on DS8000 and DS6000 storage systems in performance reports.

Volume data

You can create performance reports that include the following information:

Normal Read I/O Rate (ops/s)
The average number of nonsequential read operations per second.

Sequential Read I/O Rate (ops/s)
The average number of sequential read operations per second.

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Normal Write I/O Rate (ops/s)
The average number of nonsequential write operations per second.

Sequential Write I/O Rate (ops/s)
The average number of sequential write operations per second.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Normal I/O Rate (ops/s)
The average number of nonsequential I/O operations per second. This value includes both read and write operations.

Total Sequential I/O Rate (ops/s)
The average number of sequential I/O operations per second. This value includes both read and write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Record Mode Read I/O Rate (ops/s)
The average number of I/O operations per second for record-mode read operations.

For record-mode read operations, only the requested data is managed in the cache rather than a full track of data.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation.

Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation.

Overall Transfer Size (KiB/op)
The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

Volume Utilization
The average percentage of time that the volume is busy.

Cache data

You can create performance reports that include the following information:

Write Cache Delay I/O Rate (ops/s)
The average number of I/O operations per second that are delayed because there is not enough space in the write cache.

The only operations that can be delayed are write operations, but the value is calculated as an average of all I/O operations.

Normal Read Cache Hit Percentage
The percentage of nonsequential read operations that find data in the cache.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Sequential Read Cache Hit Percentage
The percentage of sequential read operations that find data in the cache.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Normal Write Cache Hit Percentage
The percentage of nonsequential write operations that are handled in the cache.

Sequential Write Cache Hit Percentage
The percentage of sequential write operations that are handled in the cache.

Overall Write Cache Hit Percentage
The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

Total Normal Cache Hit Percentage
The percentage of nonsequential I/O operations that are handled in the cache. This value includes both read and write operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Total Sequential Cache Hit Percentage
The percentage of sequential I/O operations that are handled in the cache. This value includes both read and write operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Total Overall Cache Hit Percentage
The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Disk to Cache Transfer Rate (ops/s)
The average number of tracks that are transferred per second from the disks to the cache.

Cache to Disk Transfer Rate (ops/s)
The average number of tracks per second that are transferred from the cache to the disks.

Write Cache Delay Percentage
The percentage of I/O operations that are delayed because there is not enough space in the write cache.

The only operations that can be delayed are write operations, but the value is calculated as an average of all I/O operations.

Record Mode Read Cache Hit Percentage
The percentage of cache hits for record-mode read operations.

For record-mode read operations, only the requested data, rather than a full track of data, is managed in the cache.

Other data

You can create performance reports that include the following information:

HPF Read I/O Rate (ops/s)
The average number of read operations per second that are issued by the High Performance FICON feature of the storage system.

HPF Write I/O Rate (ops/s)
The average number of write operations per second that are issued by the High Performance FICON feature of the storage system.

Total HPF I/O Rate (ops/s)
The average number of I/O operations per second that are issued by the High Performance FICON feature of the storage system. This value includes both read and write operations.

HPF I/O Percentage
The percentage of all I/O operations that are issued by the High Performance FICON feature of the storage system.

PPRC Transfer Rate (ops/s)
The average number of tracks per second that are transferred to the secondary device of a Peer-to-Peer Remote Copy (PPRC) pair. This value shows the activity for the source of the PPRC relationship, but shows no activity for the target.

Performance metrics for storage system volumes on an XIV system:

You can include performance data for volumes, caches, and other data for storage system volumes on an XIV system in performance reports.

Volume data

You can create performance reports that include the following information:

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation.

Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation.

Overall Transfer Size (KiB/op)
The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

Volume Utilization
The average percentage of time that the volume is busy.

Cache data

You can create performance reports that include the following information:

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Overall Write Cache Hit Percentage
The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

Total Overall Cache Hit Percentage
The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Read Data Cache Hit Percentage
The percentage of all read data that is read from the cache.

Write Data Cache Hit Percentage
The percentage of all write data that is written to cache slots that are marked as modified.

Overall Data Cache Hit Percentage
The percentage of all data that is handled in the cache. This value includes read data that is read from the cache and write data that is written to cache slots that are marked as modified.

Read Cache Miss Response Time (ms/op)
The average number of milliseconds to complete a read-cache miss operation.

Write Cache Miss Response Time (ms/op)
The average number of milliseconds to complete a write-cache miss operation.

Overall Cache Miss Response Time (ms/op)
The average number of milliseconds to complete a cache miss operation. This value includes the times for both read-cache miss and write-cache miss operations.

Read Cache Hit Response Time (ms/op)
The average number of milliseconds to complete a read-cache hit operation.

Write Cache Hit Response Time (ms/op)
The average number of milliseconds to complete a write-cache hit operation.

Overall Cache Hit Response Time (ms/op)
The average number of milliseconds to complete a cache hit operation. This value includes the times for both read-cache hit and write-cache hit operations.

SSD Read Cache Hit Percentage
The percentage of read operations that find data in the cache on a solid-state drive (SSD). The value for this metric is also included in the value for the Overall Read Cache Hit Percentage metric.

This metric is only available for XIV systems that use solid-state drives as drives for caching.

SSD Read Data Cache Hit Percentage
The percentage of all read data that was read from cache memory on a solid-state drive.

This metric is only available for XIV systems that use solid-state drives as drives for caching.

SSD Read Cache Hit Response Time (ms/op)
The average number of milliseconds that it takes to complete a hit operation on the read cache on a solid-state drive. The value for this metric is also included in the value for the Read Cache Hit Response Time metric.

This metric is only available for XIV systems that use solid-state drives as drives for caching.

Other data

You can create performance reports that include the following information:

Small Transfers I/O Percentage
The percentage of I/O operations with a small data transfer size. A small data transfer has a size that is less than or equal to 8 KiB.

Medium Transfers I/O Percentage
The percentage of I/O operations with a medium data transfer size. A medium data transfer has a size that is greater than 8 KiB and less than or equal to 64 KiB.

Large Transfers I/O Percentage
The percentage of I/O operations with a large data transfer size. A large data transfer has a size that is greater than 64 KiB and less than or equal to 512 KiB.

Very Large Transfers I/O Percentage
The percentage of I/O operations with a data transfer size that is greater than 512 KiB.

Small Transfers Data Percentage
The percentage of data that is transferred as a result of I/O operations with a small data transfer size. A small data transfer has a size that is less than or equal to 8 KiB.

Medium Transfers Data Percentage
The percentage of data that is transferred as a result of I/O operations with a medium data transfer size. A medium data transfer has a size that is greater than 8 KiB and less than or equal to 64 KiB.

Large Transfers Data Percentage
The percentage of data that is transferred as a result of I/O operations with a large data transfer size. A large data transfer has a size that is greater than 64 KiB and less than or equal to 512 KiB.

Very Large Transfers Data Percentage
The percentage of data that is transferred as a result of I/O operations with a data transfer size that is greater than 512 KiB.

Small Transfers Response Time (ms/op)
The average number of milliseconds to complete an I/O operation that has a small data transfer size. A small data transfer has a size that is less than or equal to 8 KiB.

Medium Transfers Response Time (ms/op)
The average number of milliseconds to complete an I/O operation that has a medium data transfer size. A medium data transfer has a size that is greater than 8 KiB and less than or equal to 64 KiB.

Large Transfers Response Time (ms/op)
The average number of milliseconds to complete an I/O operation that has a large data transfer size. A large data transfer has a size that is greater than 64 KiB and less than or equal to 512 KiB.

Very Large Transfers Response Time (ms/op)
The average number of milliseconds to complete an I/O operation with a data transfer size that is greater than 512 KiB.

Performance metrics for storage system volumes on block servers:

You can include performance data for volumes and caches for storage system volumes on block servers in performance reports.

Volume data

You can create performance reports that include the following information:

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation.

Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation.

Overall Transfer Size (KiB/op)
The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

Volume Utilization
The average percentage of time that the volume is busy.

Cache data

You can create performance reports that include the following information:

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Overall Write Cache Hit Percentage
The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

Total Overall Cache Hit Percentage
The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Data for storage system ports in performance reports

You can include general information, properties, and other information about storage system ports in performance reports.

Information about storage system ports

You can create performance reports that include the following information:

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage Module Name
The name that was assigned to the module when it was added to the system.

Storage Port Name
The name that was assigned to the storage port when the storage system was added to the system.

Component properties

You can create performance reports that include the following information:

Storage System Port Number
The port number on the resource.

Storage System Port Type
The type of port on the storage system, storage virtualizer, or switch. For example, the port type can be N_Port, F_Port, or another type of port.

Storage System Port Speed (GiB/s)
The speed of a port, which is measured in GiB per second.

Storage System Port Location
The physical location of a port on DS8000, DS6000, TotalStorage Enterprise Storage Server storage systems, and on XIV systems. For all other systems, this property shows the WWPN of the port.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Status information

You can create performance reports that include the following information:

Storage System Port Status
The condition of the resource, for example normal, warning, or error.

Storage System Port Enabled State
Shows whether a port is enabled, disabled, or is enabled but offline.

Storage System Port Is Detected
Shows whether the resource was detected the last time that data was collected. If this value is `Yes`, the resource was detected.

Performance metrics for ports on SAN Volume Controller and Storwize systems:

A storage environment can include SAN Volume Controller systems, Storwize V7000 systems, and a Storwize V7000 Unified systems. You can include performance metrics for ports and port errors on these systems in performance reports.

Port data

You can create performance reports that include the following information:

Port Send I/O Rate (ops/s)
The average number of I/O operations per second for operations in which data is sent from a port.

Port Receive I/O Rate (ops/s)
The average number of I/O operations per second for operations in which the port receives data.

Total Port I/O Rate (ops/s)
The average number of send operations and receive operations per second.

Port to Host Send I/O Rate (ops/s)
The average number of exchanges per second that are sent to host computers.

Port to Host Receive I/O Rate (ops/s)
The average number of exchanges per second that are received from host computers.

Total Port to Host I/O Rate (ops/s)
The average number of exchanges per second that are transmitted between host computers and the component.

Port to Disk Send I/O Rate (ops/s)
The average number of exchanges per second that are sent to back-end storage resources.

Port to Disk Receive I/O Rate (ops/s)
The average number of exchanges per second that are received from back-end storage resources.

Total Port to Disk I/O Rate (ops/s)
The average number of exchanges per second that are transmitted between back-end storage resources and the component. This value includes both send and receive operations.

Port to Local Node Send I/O Rate (ops/s)
The average number of exchanges per second that are sent to other nodes that are in the local SAN Volume Controller cluster.

Port to Local Node Receive I/O Rate (ops/s)
The average number of exchanges per second that are received from other nodes that are in the local SAN Volume Controller cluster.

Total Port to Local Node I/O Rate (ops/s)
The average number of exchanges per second that are transmitted between the component and other nodes that are in the local SAN Volume Controller cluster.

Port to Remote Node Send I/O Rate (ops/s)
The average number of exchanges per second that are sent to nodes that are in the remote SAN Volume Controller cluster.

Port to Remote Node Receive I/O Rate (ops/s)
The average number of exchanges per second that are received from nodes that are in the remote SAN Volume Controller cluster.

Total Port to Remote Node I/O Rate (ops/s)
The average number of exchanges per second that are transmitted between the component and nodes that are in the remote SAN Volume Controller cluster.

Port Send Data Rate (MiB/s)
The average rate at which data is sent through the port. The rate is measured in MiB per second.

Port Receive Data Rate (MiB/s)
The average rate at which data is received by the port. The rate is measured in MiB per second.

Total Port Data Rate (MiB/s)
The average rate at which data is transferred through the port. The rate is measured in MiB per second and includes both send and receive operations.

Port to Host Send Data Rate (MiB/s)
The average rate at which data is sent to host computers. The rate is measured in MiB per second.

Port to Host Receive Data Rate (MiB/s)
The average rate at which data is received from host computers. The rate is measured in MiB per second.

Total Port to Host Data Rate (MiB/s)
The average rate at which data is transmitted between host computers and the component. The rate is measured in MiB per second and includes both send and receive operations.

Port to Disk Send Data Rate (MiB/s)
The average rate at which data is sent to back-end storage resources. The rate is measured in MiB per second.

Port to Disk Receive Data Rate (MiB/s)
The average rate at which data is received from back-end storage resources. The rate is measured in MiB per second.

Total Port to Disk Data Rate (MiB/s)
The average rate at which data is transmitted between back-end storage resources and the component. The rate is measured in MiB per second and includes both send and receive operations.

Port to Local Node Send Data Rate (MiB/s)
The average rate at which data is sent to other nodes that are in the local SAN Volume Controller cluster. The rate is measured in MiB per second.

Port to Local Node Receive Data Rate (MiB/s)
The average rate at which data is received from other nodes that are in the local SAN Volume Controller cluster. The rate is measured in MiB per second.

Total Port to Local Node Data Rate (MiB/s)
The average rate at which data is transmitted between the component and other nodes that are in the local SAN Volume Controller cluster. The rate is measured in MiB per second.

Port to Remote Node Send Data Rate (MiB/s)
The average rate at which data is sent to nodes that are in the remote SAN Volume Controller cluster. The rate is measured in MiB per second.

Port to Remote Node Receive Data Rate (MiB/s)
The average rate at which data is received from nodes that are in the remote SAN Volume Controller cluster. The rate is measured in MiB per second.

Total Port to Remote Node Data Rate (MiB/s)
The average rate at which data is transmitted between the component and nodes that are in the remote SAN Volume Controller cluster. The rate is measured in MiB per second.

Port Send Bandwidth Percentage
The percentage of the port bandwidth that is used for send operations. This value is an indicator of port bandwidth usage that is based on the speed of the port.

Port Receive Bandwidth Percentage
The percentage of the port bandwidth that is used for receive operations. This value is an indicator of port bandwidth usage that is based on the speed of the port.

Overall Port Bandwidth Percentage
The percentage of the port bandwidth that is used for send operations and receive operations. This value is an indicator of port bandwidth usage that is based on the speed of the port.

Port error data

You can create performance reports that include the following information:

Link Failure Rate (count/s)
The average number of link errors per second.

Loss of Sync Rate (count/s)
The average number of times per second that synchronization is lost.

Synchronization is assumed lost after a timeout interval expires.

Loss of Signal Rate (count/s)
The average number of times per second that the signal is lost.

CRC Error Rate (count/s)
The average number of frames per second that are received in which a cyclic redundancy check (CRC) error is detected. A CRC error is detected when the CRC in the transmitted frame does not match the CRC computed by the receiver.

Primitive Sequence Protocol Error Rate (count/s)
The average number of primitive sequence protocol errors per second that are detected.

This error occurs when there is a link failure for a port.

Invalid Transmission Word Rate (count/s)
The average number of bit errors per second that are detected.

Zero Buffer-to-Buffer Credit Timer (microseconds)
The number of microseconds that the port is not able to send frames between ports because there is insufficient buffer-to-buffer credit.

In Fibre Channel technology, buffer-to-buffer credit is used to control the flow of frames between ports. Buffer-to-buffer credit is measured from the last time that the node was reset.

Zero Buffer-to-Buffer Credit Percentage
The amount of time, as a percentage, that the port was not able to send frames between ports because of insufficient buffer-to-buffer credit. The amount of time value is measured from the last time that the node was reset. In Fibre Channel technology, buffer-to-buffer credit is used to control the flow of frames between ports.

Performance metrics for ports on DS8000 and DS6000 storage systems:

You can include performance data for storage system port and port errors on DS8000 and DS6000 storage systems in performance reports.

Port data

You can create performance reports that include the following information:

Port Send I/O Rate (ops/s)
The average number of I/O operations per second for operations in which data is sent from a port.

Port Receive I/O Rate (ops/s)
The average number of I/O operations per second for operations in which the port receives data.

Total Port I/O Rate (ops/s)
The average number of send operations and receive operations per second.

Port FICON Send I/O Rate (ops/s)
The average number of send operations per second for Fibre Channel connection (FICON) usage.

Port FICON Receive I/O Rate (ops/s)
The average number of receive operations per second for FICON usage.

Total Port FICON I/O Rate (ops/s)
The average number of send and receive operations per second for FICON usage.

Port FCP Send I/O Rate (ops/s)
The average number of send operations per second for Fibre Channel Protocol (FCP) usage.

Port FCP Receive I/O Rate (ops/s)
The average number of receive operations per second for FCP usage.

Total Port FCP I/O Rate (ops/s)
The average number of send operations and receive operations per second for FCP usage.

Port PPRC Send I/O Rate (ops/s)
The average number of operations per second that are sent by using the Peer-to-Peer Remote Copy protocol.

Port PPRC Receive I/O Rate (ops/s)
The average number of operations per second that are received by using the Peer-to-Peer Remote Copy protocol.

Total Port PPRC I/O Rate (ops/s)
The average number of send operations and receive operations per second using the Peer-to-Peer Remote Copy protocol.

Port Send Data Rate (MiB/s)
The average rate at which data is sent through the port. The rate is measured in MiB per second.

Port Receive Data Rate (MiB/s)
The average rate at which data is received by the port. The rate is measured in MiB per second.

Total Port Data Rate (MiB/s)
The average rate at which data is transferred through the port. The rate is measured in MiB per second and includes both send and receive operations.

Port FICON Send Data Rate (MiB/s)
The average number of MiB per second that is sent for FICON usage.

Port FICON Receive Data Rate (MiB/s)
The average number of MiB per second that is received for FICON usage.

Total Port FICON Data Rate (MiB/s)
The average number of MiB per second that is transferred for FICON usage. This value includes both send and receive FICON operations.

Port FCP Send Data Rate (MiB/s)
The average number of MiB per second that are sent for FCP usage.

Port FCP Receive Data Rate (MiB/s)
The average number of MiB per second that are received for FCP usage.

Total Port FCP Data Rate (MiB/s)
The average number of MiB per second that are transferred for FCP usage. This value includes both send and receive FCP operations.

Port PPRC Send Data Rate (MiB/s)
The average number of MiB per second that are sent by using the Peer-to-Peer Remote Copy protocol.

Port PPRC Receive Data Rate (MiB/s)
The average number of MiB per second that are received by using the Peer-to-Peer Remote Copy protocol.

Total Port PPRC Data Rate (MiB/s)
The average number of MiB per second that are transferred by using the Peer-to-Peer Remote Copy (PPRC) protocol. This value includes both send and receive PPRC operations.

Port Send Response Time (ms/op)
The average number of milliseconds to complete a send operation.

Port Receive Response Time (ms/op)
The average number of milliseconds to complete a receive operation.

Overall Port Response Time (ms/op)
The average number of milliseconds to complete a send or receive operation.

Port FCP Send Response Time (ms/op)
The average number of milliseconds to complete a send operation for FCP usage.

Port FCP Receive Response Time (ms/op)
The average number of milliseconds to complete a receive operation for FCP usage.

Overall Port FCP Response Time (ms/op)
The average number of milliseconds to complete a send or receive operation for FCP usage.

Port FICON Send Response Time (ms/op)
The average number of milliseconds to complete a send operation for FICON usage.

Port FICON Receive Response Time (ms/op)
The average number of milliseconds to complete a receive operation for FICON usage.

Overall Port FICON Response Time (ms/op)
The average number of milliseconds to complete a send or receive operation for FICON usage. This value includes both send and receive FICON operations.

Port PPRC Send Response Time (ms/op)
The average number of milliseconds to complete a send operation by using the Peer-to-Peer Remote Copy protocol.

Port PPRC Receive Response Time (ms/op)
The average number of milliseconds to complete a receive operation by using the Peer-to-Peer Remote Copy protocol.

Overall Port PPRC Response Time (ms/op)
The average number of milliseconds to complete a send or receive operation by using the Peer-to-Peer Remote Copy (PPRC) protocol.

Port Send Transfer Size (KiB/op)
The average number of KiB that are transferred per send operation.

Port Receive Transfer Size (KiB/op)
The average number of KiB that are transferred per receive operation.

Overall Port Transfer Size (KiB/op)
The average number of KiB that are transferred per I/O operation. This value includes both send and receive operations.

Port Send Utilization Percentage
The average percentage of time that the port is busy sending data.

Port Receive Utilization Percentage
The average percentage of time that the port is busy receiving data.

Overall Port Utilization Percentage
The average percentage of time that the port is busy sending or receiving data.

Port Send Bandwidth Percentage
The percentage of the port bandwidth that is used for send operations. This value is an indicator of port bandwidth usage that is based on the speed of the port.

Port Receive Bandwidth Percentage
The percentage of the port bandwidth that is used for receive operations. This value is an indicator of port bandwidth usage that is based on the speed of the port.

Overall Port Bandwidth Percentage
The percentage of the port bandwidth that is used for send operations and receive operations. This value is an indicator of port bandwidth usage that is based on the speed of the port.

Port error data

You can create performance reports that include the following information:

Error Frame Rate (count/s)
The average number of error frames per second that are received. An error frame is a frame that violates the Fibre Channel Protocol.

Link Failure Rate (count/s)
The average number of link errors per second.

Loss of Sync Rate (count/s)
The average number of times per second that synchronization is lost.

Synchronization is assumed lost after a timeout interval expires.

Loss of Signal Rate (count/s)
The average number of times per second that the signal is lost.

CRC Error Rate (count/s)
The average number of frames per second that are received in which a cyclic redundancy check (CRC) error is detected. A CRC error is detected when the CRC in the transmitted frame does not match the CRC computed by the receiver.

Primitive Sequence Protocol Error Rate (count/s)
The average number of primitive sequence protocol errors per second that are detected.

This error occurs when there is a link failure for a port.

Invalid Transmission Word Rate (count/s)
The average number of bit errors per second that are detected.

Out of Order Data Rate (count/s)
The average number of times per second that an out-of-order frame is detected.

Out of Order ACK Rate (count/s)
The average number of times per second that an out-of-order acknowledge (ACK) frame is detected.

An ACK frame is used for end-to-end flow control and is sent to verify receipt of a frame.

Duplicate Frame Rate (count/s)
The average number of duplicate frames per second that are received. A duplicate frame is a frame that the system previously processed for the port.

Invalid Relative Offset Rate (count/s)
The average number of times per second that frames are received with an invalid relative offset in the frame header.

Sequence Timeout Rate (count/s)
The average number of times per second that the port detects a timeout condition after the port receives a sequence initiative for a Fibre Channel exchange.

Link Reset Transmitted Rate (count/s)
The average number of times per second that the port changes from an active (AC) state to a Link Recovery (LR1) state.

Link Reset Received Rate (count/s)
The average number of times per second that the port changes from an active (AC) state to a Link Recovery (LR2) state.

Performance metrics for ports on an XIV system:

You can include performance metrics for storage system ports on an XIV system in performance reports.

Port data

You can create performance reports that include the following information:

Port Send I/O Rate (ops/s)
The average number of I/O operations per second for operations in which data is sent from a port.

Port Receive I/O Rate (ops/s)
The average number of I/O operations per second for operations in which the port receives data.

Total Port I/O Rate (ops/s)
The average number of send operations and receive operations per second.

Port Send Data Rate (MiB/s)
The average rate at which data is sent through the port. The rate is measured in MiB per second.

Port Receive Data Rate (MiB/s)
The average rate at which data is received by the port. The rate is measured in MiB per second.

Total Port Data Rate (MiB/s)
The average rate at which data is transferred through the port. The rate is measured in MiB per second and includes both send and receive operations.

Port Send Response Time (ms/op)
The average number of milliseconds to complete a send operation.

Port Receive Response Time (ms/op)
The average number of milliseconds to complete a receive operation.

Overall Port Response Time (ms/op)
The average number of milliseconds to complete a send or receive operation.

Port Send Bandwidth Percentage
The percentage of the port bandwidth that is used for send operations. This value is an indicator of port bandwidth usage that is based on the speed of the port.

Port Receive Bandwidth Percentage
The percentage of the port bandwidth that is used for receive operations. This value is an indicator of port bandwidth usage that is based on the speed of the port.

Overall Port Bandwidth Percentage
The percentage of the port bandwidth that is used for send operations and receive operations. This value is an indicator of port bandwidth usage that is based on the speed of the port.

Performance metrics for storage system ports on block servers:

You can include performance metrics for storage system ports on block servers in performance reports.

Port data

You can create performance reports that include the following information:

Port Send I/O Rate (ops/s)
The average number of I/O operations per second for operations in which data is sent from a port.

Port Receive I/O Rate (ops/s)
The average number of I/O operations per second for operations in which the port receives data.

Total Port I/O Rate (ops/s)
The average number of send operations and receive operations per second.

Port Send Data Rate (MiB/s)
The average rate at which data is sent through the port. The rate is measured in MiB per second.

Port Receive Data Rate (MiB/s)
The average rate at which data is received by the port. The rate is measured in MiB per second.

Total Port Data Rate (MiB/s)
The average rate at which data is transferred through the port. The rate is measured in MiB per second and includes both send and receive operations.

Port Send Response Time (ms/op)
The average number of milliseconds to complete a send operation.

Port Receive Response Time (ms/op)
The average number of milliseconds to complete a receive operation.

Overall Port Response Time (ms/op)
The average number of milliseconds to complete a send or receive operation.

Port Send Transfer Size (KiB/op)
The average number of KiB that are transferred per send operation.

Port Receive Transfer Size (KiB/op)
The average number of KiB that are transferred per receive operation.

Overall Port Transfer Size (KiB/op)
The average number of KiB that are transferred per I/O operation. This value includes both send and receive operations.

Data for storage system RAID arrays in performance reports

You can include general information, capacity data, and properties of storage system RAID arrays in performance reports.

Information about storage system RAID arrays

You can create performance reports that include the following information:

Storage System Name
A user-defined name of the storage system. If a name was not defined,

Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage Controller Name
The name that was assigned to the controller when it was added to the system.

Storage Pool Name
The name that was assigned to the pool when it was added to the system.

Storage RAID Array Name
The name that was assigned to the RAID array when it was added to the system.

Capacity and usage data

You can create performance reports that include the following information:

Storage RAID Array DDM Capacity (GiB)
The amount of storage space on the disk drive modules in an array.

Component properties

You can create performance reports that include the following information:

Storage RAID Array RAID Level
The RAID level of the resource, such as RAID 5 or RAID 10. The RAID level affects the performance and fault tolerance of the volumes that are allocated from the resource.

Storage RAID Array Width
The number of disks that are in the storage array.

Storage RAID Array DDM Speed (RPM)
The speed of the disk drive module in the array.

Storage RAID Array Description
Shows the array site that the array is associated with.

Storage RAID Array Tag
A number that identifies an array.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Performance metrics for storage system arrays:

You can include front end data, cache data, back-end data, and other data for storage system arrays in performance reports.

Front end data

You can create performance reports that include the following information:

Normal Read I/O Rate (ops/s)
The average number of nonsequential read operations per second.

Sequential Read I/O Rate (ops/s)
The average number of sequential read operations per second.

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Normal Write I/O Rate (ops/s)
The average number of nonsequential write operations per second.

Sequential Write I/O Rate (ops/s)
The average number of sequential write operations per second.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Normal I/O Rate (ops/s)
The average number of nonsequential I/O operations per second. This value includes both read and write operations.

Total Sequential I/O Rate (ops/s)
The average number of sequential I/O operations per second. This value includes both read and write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Record Mode Read I/O Rate (ops/s)
The average number of I/O operations per second for record-mode read operations.

For record-mode read operations, only the requested data is managed in the cache rather than a full track of data.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation.

Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation.

Overall Transfer Size (KiB/op)
The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

Cache data

You can create performance reports that include the following information:

Write Cache Delay I/O Rate (ops/s)
The average number of I/O operations per second that are delayed because there is not enough space in the write cache.

The only operations that can be delayed are write operations, but the value is calculated as an average of all I/O operations.

Normal Read Cache Hit Percentage
The percentage of nonsequential read operations that find data in the cache.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Sequential Read Cache Hit Percentage
The percentage of sequential read operations that find data in the cache.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Normal Write Cache Hit Percentage
The percentage of nonsequential write operations that are handled in the cache.

Sequential Write Cache Hit Percentage
The percentage of sequential write operations that are handled in the cache.

Overall Write Cache Hit Percentage
The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

Total Normal Cache Hit Percentage
The percentage of nonsequential I/O operations that are handled in the cache. This value includes both read and write operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Total Sequential Cache Hit Percentage
The percentage of sequential I/O operations that are handled in the cache. This value includes both read and write operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Total Overall Cache Hit Percentage
The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Record Mode Read Cache Hit Percentage
The percentage of cache hits for record-mode read operations.

For record-mode read operations, only the requested data, rather than a full track of data, is managed in the cache.

Disk to Cache Transfer Rate (ops/s)
The average number of tracks that are transferred per second from the disks to the cache.

Cache to Disk Transfer Rate (ops/s)
The average number of tracks per second that are transferred from the cache to the disks.

Write Cache Delay Percentage
The percentage of I/O operations that are delayed because there is not enough space in the write cache.

The only operations that can be delayed are write operations, but the value is calculated as an average of all I/O operations.

Back-end data

You can create performance reports that include the following information:

Back-End Read I/O Rate (ops/s)
The average number of read operations per second that are issued to the back-end storage resources.

Back-End Write I/O Rate (ops/s)
The average number of write operations per second that are issued to the back-end storage resources.

Total Back-End I/O Rate (ops/s)
The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

Sequential Back-End I/O Percentage
The percentage of all I/O operations that are issued to the back-end storage resources. The operations are for the array and are sequential operations.

Back-End Read Data Rate (MiB/s)
The average number of MiB per second that are read from the back-end storage resources.

Back-End Write Data Rate (MiB/s)
The average number of MiB per second that are written to the back-end storage resources.

Total Back-End Data Rate (MiB/s)
The average rate at which data is transmitted between the back-end storage resources and the component. The rate is measured in MiB per second and includes both read and write operations.

Back-End Read Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Back-End Write Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Overall Back-End Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Back-End Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation from the back-end storage resources.

Back-End Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation to the back-end storage resources.

Overall Back-End Transfer Size (KiB/op)
The average transfer size, in KiB, of a read or a write operation to the back-end storage resources.

Other data

You can create performance reports that include the following information:

HPF Read I/O Rate (ops/s)
The average number of read operations per second that are issued by the High Performance FICON feature of the storage system.

HPF Write I/O Rate (ops/s)
The average number of write operations per second that are issued by the High Performance FICON feature of the storage system.

Total HPF I/O Rate (ops/s)
The average number of I/O operations per second that are issued by the High Performance FICON feature of the storage system. This value includes both read and write operations.

HPF I/O Percentage
The percentage of all I/O operations that are issued by the High Performance FICON feature of the storage system.

PPRC Transfer Rate (ops/s)
The average number of tracks per second that are transferred to the

secondary device of a Peer-to-Peer Remote Copy (PPRC) pair. This value shows the activity for the source of the PPRC relationship, but shows no activity for the target.

Disk Utilization Percentage
The average percentage of time that the disks that are associated with an array are busy.

No value is calculated for this property if there are multiple ranks in the extent pool where the thin-provisioned volumes are allocated. In this case, the value `N/A` is displayed for this property. This limitation applies only to DS8000 storage systems.

If there is only a single rank in the extent pool, the value for this property is calculated regardless of the thin-provisioned volumes.

Data for storage system controllers in performance reports

You can include general information about storage system controllers in performance reports.

Information about storage system controllers

You can create performance reports that include the following information:

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage Controller Name
The name that was assigned to the controller when it was added to the system.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Performance metrics for storage system controllers on DS8000 and DS6000 systems:

You can include front end data, cache data, back-end data, and other data for storage system controllers on DS8000 and DS6000 series systems in performance reports.

Front end data

You can create performance reports that include the following information:

Normal Read I/O Rate (ops/s)
The average number of nonsequential read operations per second.

Sequential Read I/O Rate (ops/s)
The average number of sequential read operations per second.

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Normal Write I/O Rate (ops/s)
The average number of nonsequential write operations per second.

Sequential Write I/O Rate (ops/s)
The average number of sequential write operations per second.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Normal I/O Rate (ops/s)
The average number of nonsequential I/O operations per second. This value includes both read and write operations.

Total Sequential I/O Rate (ops/s)
The average number of sequential I/O operations per second. This value includes both read and write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Record Mode Read I/O Rate (ops/s)
The average number of I/O operations per second for record-mode read operations.

For record-mode read operations, only the requested data is managed in the cache rather than a full track of data.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation.

Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation.

Overall Transfer Size (KiB/op)
The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

Cache data

You can create performance reports that include the following information:

Write Cache Delay I/O Rate (ops/s)
The average number of I/O operations per second that are delayed because there is not enough space in the write cache.

The only operations that can be delayed are write operations, but the value is calculated as an average of all I/O operations.

Normal Read Cache Hit Percentage
The percentage of nonsequential read operations that find data in the cache.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Sequential Read Cache Hit Percentage
The percentage of sequential read operations that find data in the cache.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Normal Write Cache Hit Percentage
The percentage of nonsequential write operations that are handled in the cache.

Sequential Write Cache Hit Percentage
The percentage of sequential write operations that are handled in the cache.

Overall Write Cache Hit Percentage
The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

Total Normal Cache Hit Percentage
The percentage of nonsequential I/O operations that are handled in the cache. This value includes both read and write operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Total Sequential Cache Hit Percentage
The percentage of sequential I/O operations that are handled in the cache. This value includes both read and write operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Total Overall Cache Hit Percentage
The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Record Mode Read Cache Hit Percentage
The percentage of cache hits for record-mode read operations.

For record-mode read operations, only the requested data, rather than a full track of data, is managed in the cache.

Write Cache Delay Percentage
The percentage of I/O operations that are delayed because there is not enough space in the write cache.

The only operations that can be delayed are write operations, but the value is calculated as an average of all I/O operations.

Disk to Cache Transfer Rate (ops/s)
The average number of tracks that are transferred per second from the disks to the cache.

Cache to Disk Transfer Rate (ops/s)
The average number of tracks per second that are transferred from the cache to the disks.

Back-end data

You can create performance reports that include the following information:

Back-End Read I/O Rate (ops/s)
The average number of read operations per second that are issued to the back-end storage resources.

Back-End Write I/O Rate (ops/s)
The average number of write operations per second that are issued to the back-end storage resources.

Total Back-End I/O Rate (ops/s)
The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

Back-End Read Data Rate (MiB/s)
The average number of MiB per second that are read from the back-end storage resources.

Back-End Write Data Rate (MiB/s)
The average number of MiB per second that are written to the back-end storage resources.

Total Back-End Data Rate (MiB/s)
The average rate at which data is transmitted between the back-end storage resources and the component. The rate is measured in MiB per second and includes both read and write operations.

Back-End Read Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Back-End Write Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Overall Back-End Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Back-End Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation from the back-end storage resources.

Back-End Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation to the back-end storage resources.

Overall Back-End Transfer Size (KiB/op)
The average transfer size, in KiB, of a read or a write operation to the back-end storage resources.

Other data

You can create performance reports that include the following information:

HPF Read I/O Rate (ops/s)
The average number of read operations per second that are issued by the High Performance FICON feature of the storage system.

HPF Write I/O Rate (ops/s)
The average number of write operations per second that are issued by the High Performance FICON feature of the storage system.

Total HPF I/O Rate (ops/s)
The average number of I/O operations per second that are issued by the High Performance FICON feature of the storage system. This value includes both read and write operations.

HPF I/O Percentage
The percentage of all I/O operations that are issued by the High Performance FICON feature of the storage system.

PPRC Transfer Rate (ops/s)
The average number of tracks per second that are transferred to the secondary device of a Peer-to-Peer Remote Copy (PPRC) pair. This value shows the activity for the source of the PPRC relationship, but shows no activity for the target.

Cache Holding Time (s)
The average number of seconds that I/O data for a storage system controller is held in the cache. A short cache-holding time indicates adverse performance.

Performance metrics for storage system controllers on block servers:

You can include performance data for volumes and caches for storage system controllers on block servers in performance reports.

Volume data

You can create performance reports that include the following information:

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation.

Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation.

Overall Transfer Size (KiB/op)
The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

Cache data

You can create performance reports that include the following information:

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Overall Write Cache Hit Percentage
The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

Total Overall Cache Hit Percentage
The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Data for storage system modules in performance reports

You can include properties of storage system modules, and other information about storage system modules in performance reports.

Information about storage system modules

You can create performance reports that include the following information:

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage Module Name
The name that was assigned to the module when it was added to the system.

Component properties

You can create performance reports that include the following information:

Storage Module IP Address
The IP address of the resource.

Storage Module WWN
The worldwide name of the module.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Status information

You can create performance reports that include the following information:

Storage Module Status
The condition of the resource, for example normal, warning, or error.

Storage Module Is Detected
Shows whether the resource was detected the last time that data was collected. If this value is `Yes`, the resource was detected.

Performance metrics for storage system modules on an XIV system:

You can include performance metrics for volumes, caches, and other data for storage system modules on an XIV system in performance reports.

Volume data

You can create performance reports that include the following information:

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation.

Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation.

Overall Transfer Size (KiB/op)
The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

Cache data

You can create performance reports that include the following information:

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Overall Write Cache Hit Percentage
The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

Total Overall Cache Hit Percentage
The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Read Data Cache Hit Percentage
The percentage of all read data that is read from the cache.

Write Data Cache Hit Percentage
The percentage of all write data that is written to cache slots that are marked as modified.

Overall Data Cache Hit Percentage
The percentage of all data that is handled in the cache. This value includes read data that is read from the cache and write data that is written to cache slots that are marked as modified.

Read Cache Hit Response Time (ms/op)
The average number of milliseconds to complete a read-cache hit operation.

Write Cache Hit Response Time (ms/op)
The average number of milliseconds to complete a write-cache hit operation.

Overall Cache Hit Response Time (ms/op)
The average number of milliseconds to complete a cache hit operation. This value includes the times for both read-cache hit and write-cache hit operations.

Read Cache Miss Response Time (ms/op)
The average number of milliseconds to complete a read-cache miss operation.

Write Cache Miss Response Time (ms/op)
The average number of milliseconds to complete a write-cache miss operation.

Overall Cache Miss Response Time (ms/op)
The average number of milliseconds to complete a cache miss operation. This value includes the times for both read-cache miss and write-cache miss operations.

SSD Read Cache Hit Percentage
The percentage of read operations that find data in the cache on a solid-state drive (SSD). The value for this metric is also included in the value for the Overall Read Cache Hit Percentage metric.

This metric is only available for XIV systems that use solid-state drives as drives for caching.

SSD Read Data Cache Hit Percentage
The percentage of all read data that was read from cache memory on a solid-state drive.

This metric is only available for XIV systems that use solid-state drives as drives for caching.

SSD Read Cache Hit Response Time (ms/op)
The average number of milliseconds that it takes to complete a hit operation on the read cache on a solid-state drive. The value for this metric is also included in the value for the Read Cache Hit Response Time metric.

This metric is only available for XIV systems that use solid-state drives as drives for caching.

Other data

You can create performance reports that include the following information:

Small Transfers I/O Percentage
The percentage of I/O operations with a small data transfer size. A small data transfer has a size that is less than or equal to 8 KiB.

Medium Transfers I/O Percentage
The percentage of I/O operations with a medium data transfer size. A medium data transfer has a size that is greater than 8 KiB and less than or equal to 64 KiB.

Large Transfers I/O Percentage
The percentage of I/O operations with a large data transfer size. A large data transfer has a size that is greater than 64 KiB and less than or equal to 512 KiB.

Very Large Transfers I/O Percentage
The percentage of I/O operations with a data transfer size that is greater than 512 KiB.

Small Transfers Data Percentage
The percentage of data that is transferred as a result of I/O operations with a small data transfer size. A small data transfer has a size that is less than or equal to 8 KiB.

Medium Transfers Data Percentage
The percentage of data that is transferred as a result of I/O operations with a medium data transfer size. A medium data transfer has a size that is greater than 8 KiB and less than or equal to 64 KiB.

Large Transfers Data Percentage
The percentage of data that is transferred as a result of I/O operations with a large data transfer size. A large data transfer has a size that is greater than 64 KiB and less than or equal to 512 KiB.

Very Large Transfers Data Percentage
The percentage of data that is transferred as a result of I/O operations with a data transfer size that is greater than 512 KiB.

Small Transfers Response Time (ms/op)
The average number of milliseconds to complete an I/O operation that has a small data transfer size. A small data transfer has a size that is less than or equal to 8 KiB.

Medium Transfers Response Time (ms/op)
The average number of milliseconds to complete an I/O operation that has a medium data transfer size. A medium data transfer has a size that is greater than 8 KiB and less than or equal to 64 KiB.

Large Transfers Response Time (ms/op)
The average number of milliseconds to complete an I/O operation that has

a large data transfer size. A large data transfer has a size that is greater than 64 KiB and less than or equal to 512 KiB.

Very Large Transfers Response Time (ms/op)
The average number of milliseconds to complete an I/O operation with a data transfer size that is greater than 512 KiB.

Data for storage system pools in performance reports

You can include general information, capacity data, properties, and other information about storage system pools in performance reports.

Information about storage system pools

You can create performance reports that include the following information:

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage Pool Name
The name that was assigned to the pool when it was added to the system.

Capacity and usage data

You can create performance reports that include the following information:

Storage Pool Capacity (GiB)
The total amount of storage space in a pool.

Storage Pool Available Space (GiB)
The amount of space in a pool that is not reserved for volumes.

Tivoli Storage Productivity Center uses the following formula to determine this value:

```
pool capacity - allocated space
```

For XIV systems, this value represents the unallocated physical space in the pool, not the unallocated virtual space. For some storage systems, this value usually includes only the usable capacity, but might also include overhead space if the pool is unformatted.

Storage Pool Total Volume Capacity (GiB)
The total storage space on all the volumes in a pool, which includes thin-provisioned and standard volumes. For thin-provisioned volumes, this value includes virtual space.

Storage Pool Allocated Space (GiB)
The amount of space that is reserved for all the volumes in a pool, which includes both thin-provisioned and standard volumes. The space that is allocated for thin-provisioned volumes is less than their virtual capacity, which is shown in the Storage Pool Total Volume Capacity (GiB) property. If a pool does not contain thin-provisioned volumes, this value is the same as the value in the Storage Pool Total Volume Capacity (GiB) property. This value is equal to the value in the Storage Pool Used Volume Space (GiB) property for the following storage systems:

- Storage systems other than Storwize V7000 systems that are configured as back-end storage
- Storwize V7000 storage systems that are configured as back-end storage, and that are not thin-provisioned

Storage Pool Used Volume Space (GiB)
The amount of allocated space that is used by the volumes in a pool, which includes thin-provisioned and standard volumes.

For SAN Volume Controller and Storwize V7000, you can preallocate thin-provisioned volume space when volumes are created. For these storage systems, the Storage Pool Used Space might be different than the Storage Pool Allocated Space for pools that contain thin-provisioned volumes. In other cases, the values for Storage Pool Used Space and Storage Pool Allocated Space are equal.

This value is accurate as of the most recent time that Tivoli Storage Productivity Center collected data about a volume. The value in this property might not be 100% accurate for the current state of volumes. This inaccuracy might occur because data collection is run on a set schedule and the used space on volumes can change rapidly.

Storage Pool Extent Size (MiB)
The size of the extent that was specified when a pool was created. Smaller extent sizes limit the maximum size of the volumes that can be created in a pool. Smaller extent sizes minimize the amount of potentially wasted space per volume.

This value is only available for Storwize V7000 storage systems that are configured as back-end storage.

Storage Pool Assigned Volume Space (GiB)
The amount of space in the pool that is on volumes that are assigned to a server or storage virtualizer.

Storage Pool Unassigned Volume Space (GiB)
The amount of volume space in the pool that is not assigned to a server or storage virtualizer.

Storage Pool Number of Storage Volumes
The number of volumes in the storage pool.

Storage Pool Number of MDisks
The number of managed disks in a storage pool.

Storage Pool Physical Allocation Percentage
The percentage of physical space in a pool that is reserved for volumes. This value is always less than or equal to 100% because you cannot reserve more physical space than is available in a pool.

Tivoli Storage Productivity Center uses the following formula to determine the allocation percentage:

`(allocated space ÷ pool capacity) × 100`

For example, the physical allocation percentage is 25% for a total pool size of 200 GiB. Therefore, the space that is reserved for volumes is 50 GiB.

Storage Pool Virtual Allocation Percentage
The percentage of physical space in a pool that is committed to the total virtual capacity of the volumes in the pool. In thin-provisioned environments, this percentage exceeds 100% if a pool is overcommitted (over-provisioned).

Tivoli Storage Productivity Center uses the following formula to determine the allocation percentage:

`(total volume capacity ÷ pool capacity) × 100`

For example, the allocation percentage is 200% for a total pool size of 15 GiB. Therefore, the virtual capacity that is committed to the volumes in the pool is 30 GiB.

This configuration means that twice as much space is committed than is physically contained in the pool. If the allocation percentage is 100% for the same pool, then the virtual capacity that is committed to the pool is 15 GiB. This configuration means that all the physical capacity of the pool is already allocated to volumes.

An allocation percentage that is higher than 100% is considered aggressive. The pool has insufficient physical capacity to satisfy the maximum allocation for all the thin-provisioned volumes in the pool. In such cases, you can use the value for Storage Pool Shortfall Percentage to estimate how critical the shortage of space is for a pool.

This value is only available for pools with thin-provisioned volumes.

Storage Pool Shortfall Percentage
The percentage of the remaining unallocated volume space in a pool that is not available to be allocated.

The higher the percentage, the more critical the shortfall of pool space.

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

`(unallocatable space ÷ (virtual capacity − allocated space)) × 100`

You can use this percentage to determine when the amount of overcommitted space in a pool reaches a critically high level. For example, the physical space in a pool might be less than the committed virtual space. In this case, the pool does not have enough space to fulfill the commitment to virtual space.

This value represents the percentage of the committed virtual space that is not available in a pool. As more space is used over time by volumes while the pool capacity remains the same, this percentage increases.

For example, the physical capacity of a pool is 70 GiB, however, 150 GiB of virtual space is committed to thin-provisioned volumes. If the volumes are using 50 GiB, then there is still 100 GiB committed to those volumes (150 GiB - 50 GiB). There is only 20 GiB of available pool space (70 GiB - 50 GiB). Because only 20 GiB of pool space is available, 80 GiB of the committed space cannot be allocated (100 GiB - 20 GiB). In this case, the percentage of committed space that cannot be allocated is 80% (80 GiB ÷ 100 GiB × 100).

This value is only available for pools with thin-provisioned volumes.

Storage Pool Unallocated Volume Space (GiB)
The amount of the Total Volume Capacity in the pool that is not allocated.

Tivoli Storage Productivity Center uses the following formula to determine this value:

`total volume capacity - allocated space`

The space that is allocated for thin-provisioned volumes is typically less than their virtual capacity. Therefore, the unallocated space represents the difference between the virtual capacity and the allocated space for all the volumes in the pool.

Storage Pool Unused Volume Space (GiB)
The amount of space that is allocated to the volumes in a pool and is not yet used.

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

```
allocated space - used space
```

This property is available only for SAN Volume Controller and Storwize V7000 pools.

Storage Pool Unallocatable Volume Space (GiB)
The amount of space by which the Total Volume Capacity exceeds the physical capacity of a pool.

In thin-provisioned environments, it is possible to over commit (over provision) storage in a pool. If you create volumes with more virtual capacity than can be physically allocated in the pool, you can over commit storage in the pool.

This value represents the amount of volume space that cannot be allocated based on the current capacity of the pool.

Storage Pool Used Space Percentage
The percentage of allocated space that is used by the volumes in a pool, which includes thin-provisioned and standard volumes.

Storage Pool Compressed Virtual Capacity (GiB)
The total virtual capacity of all the volumes that are compressed in a pool.

Storage Pool Compressed Capacity (GiB)
The amount of storage space that is used by compressed volumes in a pool. For example, if 100 GiB of uncompressed data is compressed, and the size of the compressed data is 20 GiB, the value is 20.

Storage Pool Uncompressed Capacity (GiB)
The amount of storage space that is used if the compressed volume space is uncompressed. For example, if 100 GiB of uncompressed data is compressed, and the size of the compressed data is 20 GiB, the value is 100.

Storage Pool Maximum I/O Capability
The projected maximum number of I/O operations per second for a pool. This value is calculated based on the value in the Storage Pool Back-End Storage Disks property, and on the values in following properties:

- Storage Pool Back-End Storage System Type
- Storage Pool Back-End Storage RAID Level
- Storage Pool Back-End Storage Disk Type

This property applies only to SAN Volume Controller, Storwize V7000, and Storwize V7000 Unified pools.

Storage Pool Back-End Storage Disks
The number of physical disks that contribute to the volumes on the back-end storage system. This property applies only to SAN Volume Controller, Storwize V7000, and Storwize V7000 Unified pools.

Component properties

You can create performance reports that include the following information:

Storage Pool Is Encryptable
Shows whether the storage pool can be encrypted. If this value is `Yes`, the storage pool can be encrypted.

Storage Pool Is Encrypted
Shows whether the resource is encrypted. If this value is `Yes`, the resource is encrypted.

Storage Pool Is Solid State
Shows whether there are solid-state drives in the pool. This property can contain the following values:

Mixed The pool contains both hard disk drives and solid-state drives.

Non solid state
The pool contains no solid-state drives.

Solid state
The pool contains a least one solid-state drive.

Storage Pool Is Thin Provisioned
Shows whether a pool, volume, or volume copy is thin-provisioned. If this value is `Yes`, the resource is thin-provisioned.

Storage Pool RAID Level
The RAID level of the resource, such as RAID 5 or RAID 10. The RAID level affects the performance and fault tolerance of the volumes that are allocated from the resource.

Storage Pool Warning Level
The percentage of used capacity of the storage pool at which a warning is generated.

Storage Pool Is Compression Active
Shows whether the compression feature is enabled on the storage pool. If this value is `Yes`, the compression feature is enabled.

Storage Pool Custom Tag 1, 2, and 3
User-defined text that is associated with a storage pool. You can add or edit the custom tags for a storage pool on the **Properties** notebook of the pool in the Tivoli Storage Productivity Center web-based GUI.

Storage Pool Back-End Storage System Type
The type of storage system that provides storage space to a pool. This property applies only to SAN Volume Controller, Storwize V7000, and Storwize V7000 Unified pools.

Storage Pool Back-End Storage RAID Level
The RAID level of the volumes on the back-end storage system that provide storage space to a pool. This property applies only to SAN Volume Controller, Storwize V7000, and Storwize V7000 Unified pools.

Storage Pool Back-End Storage Disk Type
The class and speed of the physical disks that contribute to the volumes on the back-end storage system. This property applies only to SAN Volume Controller, Storwize V7000, and Storwize V7000 Unified pools.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Status information

You can create performance reports that include the following information:

Storage Pool Status
The condition of the resource, for example normal, warning, or error.

Storage Pool Is Detected
Shows whether the resource was detected the last time that data was collected. If this value is `Yes`, the resource was detected.

Performance metrics for pools on SAN Volume Controller and Storwize systems:

A storage environment can include SAN Volume Controller systems, Storwize V7000 systems, and a Storwize V7000 Unified systems. You can include performance metrics for volumes and back-end arrays for pools on these systems in performance reports.

Volume data

You can create performance reports that include the following information:

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Maximum Read I/O Rate (ops/s)
The maximum read I/O rate of the volume in operations per second. This metric is only available for daily data for SAN Volume Controller and Storwize V7000 systems.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation.

Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation.

Overall Transfer Size (KiB/op)
The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

Pool Utilization
The average percentage of time that the volumes in the pool are busy.

Back-end array data

You can create performance reports that include the following information:

Back-End Read I/O Rate (ops/s)
The average number of read operations per second that are issued to the back-end storage resources.

Back-End Write I/O Rate (ops/s)
The average number of write operations per second that are issued to the back-end storage resources.

Total Back-End I/O Rate (ops/s)
The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

Maximum Back-End Read I/O Rate (ops/s)
The maximum number of read operations per second that are issued to the back-end storage resources. This metric is only available for daily data for SAN Volume Controller and Storwize V7000 systems.

Maximum Back-End Write I/O Rate (ops/s)
The maximum number of write operations per second that are issued to the back-end storage resources. This metric is only available for daily data for SAN Volume Controller and Storwize V7000 systems.

Back-End Read Data Rate (MiB/s)
The average number of MiB per second that are read from the back-end storage resources.

Back-End Write Data Rate (MiB/s)
The average number of MiB per second that are written to the back-end storage resources.

Total Back-End Data Rate (MiB/s)
The average rate at which data is transmitted between the back-end storage resources and the component. The rate is measured in MiB per second and includes both read and write operations.

Back-End Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation from the back-end storage resources.

Back-End Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation to the back-end storage resources.

Overall Back-End Transfer Size (KiB/op)
The average transfer size, in KiB, of a read or a write operation to the back-end storage resources.

Back-End Read Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Back-End Write Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Overall Back-End Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Peak Back-End Read Response Time (ms)
The longest time for a back-end storage resource to respond to a read operation.

Peak Back-End Write Response Time (ms)
The longest time for a back-end storage resource to respond to a write operation.

Maximum Back-End Read Response Time (ms/op)
The maximum number of milliseconds for the back-end storage resources to respond to a read operation. This metric is only available for daily data for SAN Volume Controller and Storwize V7000 systems.

Maximum Back-End Write Response Time (ms/op)
The maximum number of milliseconds for the back-end storage resources to respond to a write operation. This metric is only available for daily data for SAN Volume Controller and Storwize V7000 systems.

Back-End Read Queue Time (ms/op)
The average number of milliseconds that a read operation spends in the queue before the operation is sent to the back-end storage resources.

Back-End Write Queue Time (ms/op)
The average number of milliseconds that a write operation spends in the queue before the operation is sent to the back-end storage resources.

Overall Back-End Queue Time (ms/op)
The average number of milliseconds that a read or a write operation spends in the queue before the operation is sent to the back-end storage resources.

Peak Back-End Read Queue Time (ms)
The longest time that a read operation spends in the queue before the operation is sent to the back-end storage resources.

Peak Back-End Write Queue Time (ms)
The longest time that a write operation spends in the queue before the operation is sent to the back-end storage resources.

Performance metrics for pools on DS8000 and DS6000 storage systems:

You can include performance metrics for volumes, caches, back-end arrays, and other data for pools that are on DS8000 and DS6000 storage systems in performance reports.

Volume data

You can create performance reports that include the following information:

Normal Read I/O Rate (ops/s)
The average number of nonsequential read operations per second.

Sequential Read I/O Rate (ops/s)
The average number of sequential read operations per second.

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Normal Write I/O Rate (ops/s)
The average number of nonsequential write operations per second.

Sequential Write I/O Rate (ops/s)
The average number of sequential write operations per second.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Normal I/O Rate (ops/s)
The average number of nonsequential I/O operations per second. This value includes both read and write operations.

Total Sequential I/O Rate (ops/s)
The average number of sequential I/O operations per second. This value includes both read and write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Record Mode Read I/O Rate (ops/s)
The average number of I/O operations per second for record-mode read operations.

For record-mode read operations, only the requested data is managed in the cache rather than a full track of data.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation.

Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation.

Overall Transfer Size (KiB/op)
The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

Back-end array data

You can create performance reports that include the following information:

Back-End Read I/O Rate (ops/s)
The average number of read operations per second that are issued to the back-end storage resources.

Back-End Write I/O Rate (ops/s)
The average number of write operations per second that are issued to the back-end storage resources.

Total Back-End I/O Rate (ops/s)
The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

Back-End Read Data Rate (MiB/s)
The average number of MiB per second that are read from the back-end storage resources.

Back-End Write Data Rate (MiB/s)
The average number of MiB per second that are written to the back-end storage resources.

Total Back-End Data Rate (MiB/s)
The average rate at which data is transmitted between the back-end storage resources and the component. The rate is measured in MiB per second and includes both read and write operations.

Back-End Read Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Back-End Write Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Overall Back-End Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Back-End Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation from the back-end storage resources.

Back-End Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation to the back-end storage resources.

Overall Back-End Transfer Size (KiB/op)
The average transfer size, in KiB, of a read or a write operation to the back-end storage resources.

Cache data

You can create performance reports that include the following information:

Write Cache Delay I/O Rate (ops/s)
The average number of I/O operations per second that are delayed because there is not enough space in the write cache.

The only operations that can be delayed are write operations, but the value is calculated as an average of all I/O operations.

Normal Read Cache Hit Percentage
The percentage of nonsequential read operations that find data in the cache.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Sequential Read Cache Hit Percentage
The percentage of sequential read operations that find data in the cache.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Normal Write Cache Hit Percentage
The percentage of nonsequential write operations that are handled in the cache.

Sequential Write Cache Hit Percentage
The percentage of sequential write operations that are handled in the cache.

Overall Write Cache Hit Percentage
The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

Total Normal Cache Hit Percentage
The percentage of nonsequential I/O operations that are handled in the cache. This value includes both read and write operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Total Sequential Cache Hit Percentage
The percentage of sequential I/O operations that are handled in the cache. This value includes both read and write operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Total Overall Cache Hit Percentage
The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Disk to Cache Transfer Rate (ops/s)
The average number of tracks that are transferred per second from the disks to the cache.

Cache to Disk Transfer Rate (ops/s)
The average number of tracks per second that are transferred from the cache to the disks.

Write Cache Delay Percentage
The percentage of I/O operations that are delayed because there is not enough space in the write cache.

The only operations that can be delayed are write operations, but the value is calculated as an average of all I/O operations.

Record Mode Read Cache Hit Percentage
The percentage of cache hits for record-mode read operations.

For record-mode read operations, only the requested data, rather than a full track of data, is managed in the cache.

Other data

You can create performance reports that include the following information:

HPF Read I/O Rate (ops/s)
The average number of read operations per second that are issued by the High Performance FICON feature of the storage system.

HPF Write I/O Rate (ops/s)
The average number of write operations per second that are issued by the High Performance FICON feature of the storage system.

Total HPF I/O Rate (ops/s)
The average number of I/O operations per second that are issued by the High Performance FICON feature of the storage system. This value includes both read and write operations.

HPF I/O Percentage
The percentage of all I/O operations that are issued by the High Performance FICON feature of the storage system.

PPRC Transfer Rate (ops/s)
The average number of tracks per second that are transferred to the secondary device of a Peer-to-Peer Remote Copy (PPRC) pair. This value shows the activity for the source of the PPRC relationship, but shows no activity for the target.

Performance metrics for pools on an XIV system:

You can include performance data for volumes, caches, and other data for pools on an XIV system in performance reports.

Volume data

You can create performance reports that include the following information:

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation.

Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation.

Overall Transfer Size (KiB/op)
The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

Pool Utilization
The average percentage of time that the volumes in the pool are busy.

Cache data

You can create performance reports that include the following information:

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Overall Write Cache Hit Percentage
The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

Total Overall Cache Hit Percentage
The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Read Data Cache Hit Percentage
The percentage of all read data that is read from the cache.

Write Data Cache Hit Percentage
The percentage of all write data that is written to cache slots that are marked as modified.

Overall Data Cache Hit Percentage
The percentage of all data that is handled in the cache. This value includes read data that is read from the cache and write data that is written to cache slots that are marked as modified.

Read Cache Hit Response Time (ms/op)
The average number of milliseconds to complete a read-cache hit operation.

Write Cache Hit Response Time (ms/op)
The average number of milliseconds to complete a write-cache hit operation.

Overall Cache Hit Response Time (ms/op)
The average number of milliseconds to complete a cache hit operation. This value includes the times for both read-cache hit and write-cache hit operations.

Read Cache Miss Response Time (ms/op)
The average number of milliseconds to complete a read-cache miss operation.

Write Cache Miss Response Time (ms/op)
The average number of milliseconds to complete a write-cache miss operation.

Overall Cache Miss Response Time (ms/op)
The average number of milliseconds to complete a cache miss operation. This value includes the times for both read-cache miss and write-cache miss operations.

Other data

You can create performance reports that include the following information:

Small Transfers I/O Percentage
The percentage of I/O operations with a small data transfer size. A small data transfer has a size that is less than or equal to 8 KiB.

Medium Transfers I/O Percentage
The percentage of I/O operations with a medium data transfer size. A medium data transfer has a size that is greater than 8 KiB and less than or equal to 64 KiB.

Large Transfers I/O Percentage
The percentage of I/O operations with a large data transfer size. A large data transfer has a size that is greater than 64 KiB and less than or equal to 512 KiB.

Very Large Transfers I/O Percentage
The percentage of I/O operations with a data transfer size that is greater than 512 KiB.

Small Transfers Data Percentage
The percentage of data that is transferred as a result of I/O operations with a small data transfer size. A small data transfer has a size that is less than or equal to 8 KiB.

Medium Transfers Data Percentage
The percentage of data that is transferred as a result of I/O operations with a medium data transfer size. A medium data transfer has a size that is greater than 8 KiB and less than or equal to 64 KiB.

Large Transfers Data Percentage
The percentage of data that is transferred as a result of I/O operations with a large data transfer size. A large data transfer has a size that is greater than 64 KiB and less than or equal to 512 KiB.

Very Large Transfers Data Percentage
The percentage of data that is transferred as a result of I/O operations with a data transfer size that is greater than 512 KiB.

Small Transfers Response Time (ms/op)
The average number of milliseconds to complete an I/O operation that has a small data transfer size. A small data transfer has a size that is less than or equal to 8 KiB.

Medium Transfers Response Time (ms/op)
The average number of milliseconds to complete an I/O operation that has a medium data transfer size. A medium data transfer has a size that is greater than 8 KiB and less than or equal to 64 KiB.

Large Transfers Response Time (ms/op)
The average number of milliseconds to complete an I/O operation that has

a large data transfer size. A large data transfer has a size that is greater than 64 KiB and less than or equal to 512 KiB.

Very Large Transfers Response Time (ms/op)
The average number of milliseconds to complete an I/O operation with a data transfer size that is greater than 512 KiB.

Data for managed disks on storage systems in performance reports

You can include general information, capacity data, properties, and other information about managed disks on storage systems in performance reports.

Information about managed disks on storage systems

You can create performance reports that include the following information:

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage Pool Name
The name that was assigned to the pool when it was added to the system.

Storage System MDisk Name
The name that was assigned to the managed disk on a storage system when it was added to the system.

Capacity and usage data

You can create performance reports that include the following information:

Storage System MDisk Capacity (GiB)
The amount of storage space on the managed disk.

Storage MDisk Available Space (GiB)
The amount of unused storage space on the managed disk on a storage system.

Storage System MDisk Strip Size (KB)
The RAID strip size on a managed disk on a storage system.

Component properties

You can create performance reports that include the following information:

Storage MDisk RAID Level
The RAID level of the managed disk, such as RAID 5 or RAID 10. The RAID level affects the performance and fault tolerance of the volumes that are allocated from the managed disk.

Storage MDisk Spare Goal
The number of spare drives that are required to maintain redundancy. Use spare drives to protect the system against drive failures in the array on a managed disk on a storage virtualizer.

Storage System MDisk Type
The type of managed disk on a storage system. For example, the disk on a storage system can be a local managed disk.

Storage System MDisk Mode
The access mode of a managed disk on a storage virtualizer. The access

mode describes how extents are provided for virtual disks. Extents can be provided to virtual disks in the following ways:

Array Extents are provided from local disks.

Managed
Extents are provided from a back-end storage volume.

Unmanaged
The managed disk is not used in the system.

Storage System MDisk Is Balanced
Shows whether LUNs are balanced across storage controllers on the managed disk. If this value is `Yes`, the LUNs are balanced.

Storage System MDisk Fast Write State
Shows whether the cache for a volume on a disk that is managed by a storage system is empty, contains data, or is corrupted.

Storage System MDisk Write Verify
Shows whether all write operations on a managed disk on a storage system are verified by an immediate follow-up read operation. The follow-up read operation verifies that the write operation was successful. If this value is `Yes`, all write operations are verified by a follow-up read operation.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Status information

You can create performance reports that include the following information:

Storage MDisk Status
The condition of the resource, for example normal, warning, or error.

Storage MDisk Native Status
Shows the level of access of nodes in the system to a managed disk or volume on a storage system. The level of access can be online, offline, degraded, or excluded.

Performance metrics for managed disks on SAN Volume Controller and Storwize systems:

A storage environment can include SAN Volume Controller systems, Storwize V7000 systems, and a Storwize V7000 Unified systems. You can include performance metrics for back-end arrays on managed disks on these systems in performance reports.

Back-end array data

You can create performance reports that include the following information:

Back-End Read I/O Rate (ops/s)
The average number of read operations per second that are issued to the back-end storage resources.

Back-End Write I/O Rate (ops/s)
The average number of write operations per second that are issued to the back-end storage resources.

Total Back-End I/O Rate (ops/s)
The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

Back-End Read Data Rate (MiB/s)
The average number of MiB per second that are read from the back-end storage resources.

Back-End Write Data Rate (MiB/s)
The average number of MiB per second that are written to the back-end storage resources.

Total Back-End Data Rate (MiB/s)
The average rate at which data is transmitted between the back-end storage resources and the component. The rate is measured in MiB per second and includes both read and write operations.

Back-End Read Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Back-End Write Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Overall Back-End Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Peak Back-End Read Response Time (ms)
The longest time for a back-end storage resource to respond to a read operation.

Peak Back-End Write Response Time (ms)
The longest time for a back-end storage resource to respond to a write operation.

Back-End Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation from the back-end storage resources.

Back-End Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation to the back-end storage resources.

Overall Back-End Transfer Size (KiB/op)
The average transfer size, in KiB, of a read or a write operation to the back-end storage resources.

Back-End Read Queue Time (ms/op)
The average number of milliseconds that a read operation spends in the queue before the operation is sent to the back-end storage resources.

Back-End Write Queue Time (ms/op)
The average number of milliseconds that a write operation spends in the queue before the operation is sent to the back-end storage resources.

Overall Back-End Queue Time (ms/op)
The average number of milliseconds that a read or a write operation spends in the queue before the operation is sent to the back-end storage resources.

Peak Back-End Read Queue Time (ms)
The longest time that a read operation spends in the queue before the operation is sent to the back-end storage resources.

Peak Back-End Write Queue Time (ms)
The longest time that a write operation spends in the queue before the operation is sent to the back-end storage resources.

Data for storage system nodes in performance reports

You can include general information, capacity data, properties, and other information about storage system nodes in performance reports.

Information about storage system nodes

You can create performance reports that include the following information:

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage Node Name
The name that was assigned to the storage system node when it was added to the system.

Storage I/O Group Name
The name that was assigned to the I/O group when it was added to the system.

Component properties

You can create performance reports that include the following information:

Storage Node IP Address
The IP address of the resource.

Storage Node WWN
The worldwide name of the node.

Storage Node Configuration
The number of the node for the resource. This value can be either `0` or `1`.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Status information

You can create performance reports that include the following information:

Storage Node Status
Shows whether a storage system node is online.

Performance metrics for nodes on SAN Volume Controller and Storwize systems:

A storage environment can include SAN Volume Controller systems, Storwize V7000 systems, and a Storwize V7000 Unified systems. You can include performance metrics for ports, front ends, caches, back-end arrays, and other data for nodes on these systems in performance reports.

Port data

You can create performance reports that include the following information:

Port Send I/O Rate (ops/s)
The average number of I/O operations per second for operations in which data is sent from a port.

Port Receive I/O Rate (ops/s)
The average number of I/O operations per second for operations in which the port receives data.

Total Port I/O Rate (ops/s)
The average number of send operations and receive operations per second.

Port to Host Send I/O Rate (ops/s)
The average number of exchanges per second that are sent to host computers.

Port to Host Receive I/O Rate (ops/s)
The average number of exchanges per second that are received from host computers.

Total Port to Host I/O Rate (ops/s)
The average number of exchanges per second that are transmitted between host computers and the component.

Port to Disk Send I/O Rate (ops/s)
The average number of exchanges per second that are sent to back-end storage resources.

Port to Disk Receive I/O Rate (ops/s)
The average number of exchanges per second that are received from back-end storage resources.

Total Port to Disk I/O Rate (ops/s)
The average number of exchanges per second that are transmitted between back-end storage resources and the component. This value includes both send and receive operations.

Port to Local Node Send I/O Rate (ops/s)
The average number of exchanges per second that are sent to other nodes that are in the local SAN Volume Controller cluster.

Port to Local Node Receive I/O Rate (ops/s)
The average number of exchanges per second that are received from other nodes that are in the local SAN Volume Controller cluster.

Total Port to Local Node I/O Rate (ops/s)
The average number of exchanges per second that are transmitted between the component and other nodes that are in the local SAN Volume Controller cluster.

Port to Remote Node Send I/O Rate (ops/s)
The average number of exchanges per second that are sent to nodes that are in the remote SAN Volume Controller cluster.

Port to Remote Node Receive I/O Rate (ops/s)
The average number of exchanges per second that are received from nodes that are in the remote SAN Volume Controller cluster.

Total Port to Remote Node I/O Rate (ops/s)
The average number of exchanges per second that are transmitted between the component and nodes that are in the remote SAN Volume Controller cluster.

Port Send Data Rate (MiB/s)
The average rate at which data is sent through the port. The rate is measured in MiB per second.

Port Receive Data Rate (MiB/s)
The average rate at which data is received by the port. The rate is measured in MiB per second.

Total Port Data Rate (MiB/s)
The average rate at which data is transferred through the port. The rate is measured in MiB per second and includes both send and receive operations.

Port to Host Send Data Rate (MiB/s)
The average rate at which data is sent to host computers. The rate is measured in MiB per second.

Port to Host Receive Data Rate (MiB/s)
The average rate at which data is received from host computers. The rate is measured in MiB per second.

Total Port to Host Data Rate (MiB/s)
The average rate at which data is transmitted between host computers and the component. The rate is measured in MiB per second and includes both send and receive operations.

Port to Disk Send Data Rate (MiB/s)
The average rate at which data is sent to back-end storage resources. The rate is measured in MiB per second.

Port to Disk Receive Data Rate (MiB/s)
The average rate at which data is received from back-end storage resources. The rate is measured in MiB per second.

Total Port to Disk Data Rate (MiB/s)
The average rate at which data is transmitted between back-end storage resources and the component. The rate is measured in MiB per second and includes both send and receive operations.

Port to Local Node Send Data Rate (MiB/s)
The average rate at which data is sent to other nodes that are in the local SAN Volume Controller cluster. The rate is measured in MiB per second.

Port to Local Node Receive Data Rate (MiB/s)
The average rate at which data is received from other nodes that are in the local SAN Volume Controller cluster. The rate is measured in MiB per second.

Total Port to Local Node Data Rate (MiB/s)
The average rate at which data is transmitted between the component and other nodes that are in the local SAN Volume Controller cluster. The rate is measured in MiB per second.

Port to Remote Node Send Data Rate (MiB/s)
The average rate at which data is sent to nodes that are in the remote SAN Volume Controller cluster. The rate is measured in MiB per second.

Port to Remote Node Receive Data Rate (MiB/s)
The average rate at which data is received from nodes that are in the remote SAN Volume Controller cluster. The rate is measured in MiB per second.

Total Port to Remote Node Data Rate (MiB/s)
The average rate at which data is transmitted between the component and nodes that are in the remote SAN Volume Controller cluster. The rate is measured in MiB per second.

Port to Local Node Send Response Time (ms/op)
The average number of milliseconds to complete a send operation to another node that is in the local SAN Volume Controller cluster. This value represents the external response time of the transfers.

Port to Local Node Receive Response Time (ms/op)
The average number of milliseconds to complete a receive operation from another node that is in the local SAN Volume Controller cluster. This value represents the external response time of the transfers.

Overall Port to Local Node Response Time (ms/op)
The average number of milliseconds to complete a send or receive operation with another node that is in the local SAN Volume Controller cluster. This value represents the external response time of the transfers.

Port to Remote Node Send Response Time (ms/op)
The average number of milliseconds to complete a send operation to a node that is in the remote SAN Volume Controller cluster. This value represents the external response time of the transfers.

Port to Remote Node Receive Response Time (ms/op)
The average number of milliseconds to complete a receive operation from a node that is in the remote SAN Volume Controller cluster. This value represents the external response time of the transfers.

Overall Port to Remote Node Response Time (ms/op)
The average number of milliseconds to complete a send operation to, or a receive operation from a node in the remote SAN Volume Controller cluster. This value represents the external response time of the transfers.

Port to Local Node Send Queue Time (ms/op)
The average time in milliseconds that a send operation spends in the queue before the operation is processed. This value represents the queue time for send operations that are issued to other nodes that are in the local SAN Volume Controller cluster.

Port to Local Node Receive Queue Time (ms/op)
The average time in milliseconds that a receive operation spends in the

queue before the operation is processed. This value represents the queue time for receive operations that are issued from other nodes that are in the local SAN Volume Controller cluster.

Overall Port to Local Node Queue Time (ms/op)
The average number of milliseconds that a send or receive operation spends in the queue before the operation is processed. This value is for send and receive operations that are issued between the component and other nodes that are in the local SAN Volume Controller cluster.

Port to Remote Node Send Queue Time (ms/op)
The average time in milliseconds that a send operation spends in the queue before the operation is processed. This value represents the queue time for send operations that are issued to a node that is in the remote SAN Volume Controller cluster.

Port to Remote Node Receive Queue Time (ms/op)
The average time in milliseconds that a receive operation spends in the queue before the operation is processed. This value represents the queue time for receive operations that are issued from a node that is in the remote SAN Volume Controller cluster.

Overall Port to Remote Node Queue Time (ms/op)
The average number of milliseconds that a send or receive operation spends in the queue before the operation is processed. This value is for send and receive operations that are issued between the component and a node that is in the remote SAN Volume Controller cluster.

Front end data

You can create performance reports that include the following information:

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation.

Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation.

Overall Transfer Size (KiB/op)
The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

Cache data

You can create performance reports that include the following information:

Write Cache Delay I/O Rate (ops/s)
The average number of I/O operations per second that are delayed because there is not enough space in the write cache.

The only operations that can be delayed are write operations, but the value is calculated as an average of all I/O operations.

Write Cache Overflow I/O Rate (ops/s)
The average number of write operations per second that are delayed because there is not enough space in the write cache.

Write Cache Flush Through I/O Rate (ops/s)
The average number of tracks per second that are written to disk in flush-through mode.

Write Cache Write Through I/O Rate (ops/s)
The average number of tracks per second that are written to disk in write-through mode.

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Overall Write Cache Hit Percentage
The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

Total Overall Cache Hit Percentage
The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Write Cache Delay Percentage
The percentage of I/O operations that are delayed because there is not enough space in the write cache.

The only operations that can be delayed are write operations, but the value is calculated as an average of all I/O operations.

Read Ahead Percentage of Cache Hits
The percentage of all read-cache hits that occur on pre-staged data.

Dirty Write Percentage of Cache Hits
The percentage of all cache write operations that occur on data in the cache that is marked as modified. This value represents how effectively write operations are coalesced before the data is written to disk.

Write Cache Overflow Percentage
The percentage of write operations that are delayed because there is not enough space in the write cache.

Write Cache Flush Through Percentage
The percentage of tracks that is written to disk in flush-through mode.

Write Cache Write Through Percentage
The percentage of tracks that is written to disk in write-through mode.

Disk to Cache Transfer Rate (ops/s)
The average number of tracks that are transferred per second from the disks to the cache.

Cache to Disk Transfer Rate (ops/s)
The average number of tracks per second that are transferred from the cache to the disks.

Back-end data

You can create performance reports that include the following information:

Back-End Read I/O Rate (ops/s)
The average number of read operations per second that are issued to the back-end storage resources.

Back-End Write I/O Rate (ops/s)
The average number of write operations per second that are issued to the back-end storage resources.

Total Back-End I/O Rate (ops/s)
The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

Back-End Read Data Rate (MiB/s)
The average number of MiB per second that are read from the back-end storage resources.

Back-End Write Data Rate (MiB/s)
The average number of MiB per second that are written to the back-end storage resources.

Total Back-End Data Rate (MiB/s)
The average rate at which data is transmitted between the back-end storage resources and the component. The rate is measured in MiB per second and includes both read and write operations.

Back-End Read Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Back-End Write Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Overall Back-End Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Peak Back-End Read Response Time (ms)
The longest time for a back-end storage resource to respond to a read operation.

Peak Back-End Write Response Time (ms)
The longest time for a back-end storage resource to respond to a write operation.

Back-End Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation from the back-end storage resources.

Back-End Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation to the back-end storage resources.

Overall Back-End Transfer Size (KiB/op)
The average transfer size, in KiB, of a read or a write operation to the back-end storage resources.

Back-End Read Queue Time (ms/op)
The average number of milliseconds that a read operation spends in the queue before the operation is sent to the back-end storage resources.

Back-End Write Queue Time (ms/op)
The average number of milliseconds that a write operation spends in the queue before the operation is sent to the back-end storage resources.

Overall Back-End Queue Time (ms/op)
The average number of milliseconds that a read or a write operation spends in the queue before the operation is sent to the back-end storage resources.

Peak Back-End Read Queue Time (ms)
The longest time that a read operation spends in the queue before the operation is sent to the back-end storage resources.

Peak Back-End Write Queue Time (ms)
The longest time that a write operation spends in the queue before the operation is sent to the back-end storage resources.

Other data

You can create performance reports that include the following information:

Global Mirror Write I/O Rate (op/s)
The average number of write operations per second that are issued to the Global Mirror secondary site.

Global Mirror Overlapping Write Percentage
The percentage of overlapping write operations that are issued by the Global Mirror primary site.

For SAN Volume Controller software releases 4.3.1 and later, some overlapping writes are processed in parallel and are excluded from this value. For SAN Volume Controller software releases 4.3.0 and earlier, all overlapping writes are serialized.

Global Mirror Overlapping Write I/O Rate (op/s)
The average number of overlapping write operations per second that are issued by the Global Mirror primary site.

For SAN Volume Controller software releases 4.3.1 and later, some overlapping writes are processed in parallel and are excluded from this value. For SAN Volume Controller software releases 4.3.0 and earlier, all overlapping writes are serialized.

Global Mirror Secondary Write Lag (ms/op)
The average number of milliseconds to service a secondary write operation for Global Mirror. This value does not include the time to service the primary write operation.

You monitor the value of Global Mirror Secondary Write Lag to identify delays that occurred during the process of writing data to the secondary site.

Peak Read Response Time (ms)
The longest time to complete a read operation.

Peak Write Response Time (ms)
The longest time to complete a write operation.

Link Failure Rate (count/s)
The average number of link errors per second.

Loss of Sync Rate (count/s)
The average number of times per second that synchronization is lost.

Synchronization is assumed lost after a timeout interval expires.

Loss of Signal Rate (count/s)
The average number of times per second that the signal is lost.

CRC Error Rate (count/s)
The average number of frames per second that are received in which a cyclic redundancy check (CRC) error is detected. A CRC error is detected when the CRC in the transmitted frame does not match the CRC computed by the receiver.

Primitive Sequence Protocol Error Rate (count/s)
The average number of primitive sequence protocol errors per second that are detected.

This error occurs when there is a link failure for a port.

Invalid Transmission Word Rate (count/s)
The average number of bit errors per second that are detected.

Processor Utilization Percentage
The average percentage of time that the processors are busy.

Overall Host Attributed Response Time Percentage
The percentage of the average response time that can be attributed to delays from host systems. This value includes both read response times and write response times, and can help you diagnose slow hosts and fabrics that are not working efficiently.

The value is based on the following conditions:

- For read response time, the time that it takes for hosts to respond to transfer-ready notifications from the SAN Volume Controller nodes.
- For write response time, the time that it takes for hosts to send the write data after the node responds to a transfer-ready notification.

Zero Buffer-to-Buffer Credit Timer (microseconds)
The number of microseconds that the port is not able to send frames between ports because there is insufficient buffer-to-buffer credit.

In Fibre Channel technology, buffer-to-buffer credit is used to control the flow of frames between ports. Buffer-to-buffer credit is measured from the last time that the node was reset.

Data for storage system I/O groups in performance reports

You can include general information, capacity data, properties, and other information about storage system I/O groups in performance reports.

Information about storage system I/O groups

You can create performance reports that include the following information:

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage I/O Group Name
The name that was assigned to the I/O group when it was added to the system.

Component properties

You can create performance reports that include the following information:

Storage I/O Group Mirroring Total Memory (MiB)
The total amount of memory that is allocated on the nodes in an I/O group to provide volume mirroring functions.

Storage I/O Group Mirroring Free Memory (MiB)
The amount of available memory on the nodes in an I/O group to provide volume mirroring functions.

Storage I/O Group FlashCopy Total Memory (MiB)
The total amount of memory that is allocated on the nodes in an I/O group to provide FlashCopy mirroring functions.

Storage I/O Group FlashCopy Free Memory (MiB)
The amount of available memory on the nodes in an I/O group to provide FlashCopy mirroring functions.

Storage I/O Group Remote Copy Total Memory (MiB)
The total amount of memory that is allocated on the nodes in an I/O group to provide mirroring functions by using a remote copy.

Storage I/O Group Remote Copy Free Memory (MiB)
The amount of available memory on the nodes in an I/O group to provide mirroring functions by using a remote copy.

Storage I/O Group RAID Total Memory (MiB)
The total amount of memory that is allocated on the nodes in an I/O group to provide RAID mirroring functions.

Storage I/O Group RAID Free Memory (MiB)
The amount of available memory on the nodes in an I/O group to provide RAID mirroring functions.

Status information

You can create performance reports that include the following information:

Storage I/O Group Maintenance
Shows whether the I/O group is in maintenance mode. If this value is `Yes`, the I/O group is in maintenance mode.

Storage I/O Group Is Compression Active
Shows whether the compression feature is enabled on the volumes in the storage I/O group. If this value is `Yes`, the compression feature is enabled.

Storage I/O Group Is Compression Supported
Shows whether the compression feature is available for volumes in the storage I/O group. If this value is `Yes`, the compression feature is available.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Performance metrics for I/O groups on SAN Volume Controller and Storwize systems:

A storage environment can include SAN Volume Controller systems, Storwize V7000 systems, and a Storwize V7000 Unified systems. You can include performance metrics for ports, volumes, caches, back-end arrays, and other data for I/O groups on these systems in performance reports.

Port data

You can create performance reports that include the following information:

Port Send I/O Rate (ops/s)
The average number of I/O operations per second for operations in which data is sent from a port.

Port Receive I/O Rate (ops/s)
The average number of I/O operations per second for operations in which the port receives data.

Total Port I/O Rate (ops/s)
The average number of send operations and receive operations per second.

Port to Host Send I/O Rate (ops/s)
The average number of exchanges per second that are sent to host computers.

Port to Host Receive I/O Rate (ops/s)
The average number of exchanges per second that are received from host computers.

Total Port to Host I/O Rate (ops/s)
The average number of exchanges per second that are transmitted between host computers and the component.

Port to Disk Send I/O Rate (ops/s)
The average number of exchanges per second that are sent to back-end storage resources.

Port to Disk Receive I/O Rate (ops/s)
The average number of exchanges per second that are received from back-end storage resources.

Total Port to Disk I/O Rate (ops/s)
The average number of exchanges per second that are transmitted between back-end storage resources and the component. This value includes both send and receive operations.

Port to Local Node Send I/O Rate (ops/s)
The average number of exchanges per second that are sent to other nodes that are in the local SAN Volume Controller cluster.

Port to Local Node Receive I/O Rate (ops/s)
The average number of exchanges per second that are received from other nodes that are in the local SAN Volume Controller cluster.

Total Port to Local Node I/O Rate (ops/s)
The average number of exchanges per second that are transmitted between the component and other nodes that are in the local SAN Volume Controller cluster.

Port to Remote Node Send I/O Rate (ops/s)
The average number of exchanges per second that are sent to nodes that are in the remote SAN Volume Controller cluster.

Port to Remote Node Receive I/O Rate (ops/s)
The average number of exchanges per second that are received from nodes that are in the remote SAN Volume Controller cluster.

Total Port to Remote Node I/O Rate (ops/s)
The average number of exchanges per second that are transmitted between the component and nodes that are in the remote SAN Volume Controller cluster.

Port Send Data Rate (MiB/s)
The average rate at which data is sent through the port. The rate is measured in MiB per second.

Port Receive Data Rate (MiB/s)
The average rate at which data is received by the port. The rate is measured in MiB per second.

Total Port Data Rate (MiB/s)
The average rate at which data is transferred through the port. The rate is measured in MiB per second and includes both send and receive operations.

Port to Host Send Data Rate (MiB/s)
The average rate at which data is sent to host computers. The rate is measured in MiB per second.

Port to Host Receive Data Rate (MiB/s)
The average rate at which data is received from host computers. The rate is measured in MiB per second.

Total Port to Host Data Rate (MiB/s)
The average rate at which data is transmitted between host computers and the component. The rate is measured in MiB per second and includes both send and receive operations.

Port to Disk Send Data Rate (MiB/s)
The average rate at which data is sent to back-end storage resources. The rate is measured in MiB per second.

Port to Disk Receive Data Rate (MiB/s)
The average rate at which data is received from back-end storage resources. The rate is measured in MiB per second.

Total Port to Disk Data Rate (MiB/s)
The average rate at which data is transmitted between back-end storage resources and the component. The rate is measured in MiB per second and includes both send and receive operations.

Port to Local Node Send Data Rate (MiB/s)
The average rate at which data is sent to other nodes that are in the local SAN Volume Controller cluster. The rate is measured in MiB per second.

Port to Local Node Receive Data Rate (MiB/s)
The average rate at which data is received from other nodes that are in the local SAN Volume Controller cluster. The rate is measured in MiB per second.

Total Port to Local Node Data Rate (MiB/s)
The average rate at which data is transmitted between the component and other nodes that are in the local SAN Volume Controller cluster. The rate is measured in MiB per second.

Port to Remote Node Send Data Rate (MiB/s)
The average rate at which data is sent to nodes that are in the remote SAN Volume Controller cluster. The rate is measured in MiB per second.

Port to Remote Node Receive Data Rate (MiB/s)
The average rate at which data is received from nodes that are in the remote SAN Volume Controller cluster. The rate is measured in MiB per second.

Total Port to Remote Node Data Rate (MiB/s)
The average rate at which data is transmitted between the component and nodes that are in the remote SAN Volume Controller cluster. The rate is measured in MiB per second.

Port to Local Node Send Response Time (ms/op)
The average number of milliseconds to complete a send operation to another node that is in the local SAN Volume Controller cluster. This value represents the external response time of the transfers.

Port to Local Node Receive Response Time (ms/op)
The average number of milliseconds to complete a receive operation from

another node that is in the local SAN Volume Controller cluster. This value represents the external response time of the transfers.

Overall Port to Local Node Response Time (ms/op)
The average number of milliseconds to complete a send or receive operation with another node that is in the local SAN Volume Controller cluster. This value represents the external response time of the transfers.

Port to Remote Node Send Response Time (ms/op)
The average number of milliseconds to complete a send operation to a node that is in the remote SAN Volume Controller cluster. This value represents the external response time of the transfers.

Port to Remote Node Receive Response Time (ms/op)
The average number of milliseconds to complete a receive operation from a node that is in the remote SAN Volume Controller cluster. This value represents the external response time of the transfers.

Overall Port to Remote Node Response Time (ms/op)
The average number of milliseconds to complete a send operation to, or a receive operation from a node in the remote SAN Volume Controller cluster. This value represents the external response time of the transfers.

Port to Local Node Send Queue Time (ms/op)
The average time in milliseconds that a send operation spends in the queue before the operation is processed. This value represents the queue time for send operations that are issued to other nodes that are in the local SAN Volume Controller cluster.

Port to Local Node Receive Queue Time (ms/op)
The average time in milliseconds that a receive operation spends in the queue before the operation is processed. This value represents the queue time for receive operations that are issued from other nodes that are in the local SAN Volume Controller cluster.

Overall Port to Local Node Queue Time (ms/op)
The average number of milliseconds that a send or receive operation spends in the queue before the operation is processed. This value is for send and receive operations that are issued between the component and other nodes that are in the local SAN Volume Controller cluster.

Port to Remote Node Send Queue Time (ms/op)
The average time in milliseconds that a send operation spends in the queue before the operation is processed. This value represents the queue time for send operations that are issued to a node that is in the remote SAN Volume Controller cluster.

Port to Remote Node Receive Queue Time (ms/op)
The average time in milliseconds that a receive operation spends in the queue before the operation is processed. This value represents the queue time for receive operations that are issued from a node that is in the remote SAN Volume Controller cluster.

Overall Port to Remote Node Queue Time (ms/op)
The average number of milliseconds that a send or receive operation spends in the queue before the operation is processed. This value is for send and receive operations that are issued between the component and a node that is in the remote SAN Volume Controller cluster.

Volume data

You can create performance reports that include the following information:

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation.

Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation.

Overall Transfer Size (KiB/op)
The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

Back-end array data

You can create performance reports that include the following information:

Back-End Read I/O Rate (ops/s)
The average number of read operations per second that are issued to the back-end storage resources.

Back-End Write I/O Rate (ops/s)
The average number of write operations per second that are issued to the back-end storage resources.

Total Back-End I/O Rate (ops/s)
The average number of I/O operations per second that are transmitted

between the back-end storage resources and the component. This value includes both read and write operations.

Back-End Read Data Rate (MiB/s)
The average number of MiB per second that are read from the back-end storage resources.

Back-End Write Data Rate (MiB/s)
The average number of MiB per second that are written to the back-end storage resources.

Total Back-End Data Rate (MiB/s)
The average rate at which data is transmitted between the back-end storage resources and the component. The rate is measured in MiB per second and includes both read and write operations.

Back-End Read Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Back-End Write Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Overall Back-End Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Peak Back-End Read Response Time (ms)
The longest time for a back-end storage resource to respond to a read operation.

Peak Back-End Write Response Time (ms)
The longest time for a back-end storage resource to respond to a write operation.

Back-End Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation from the back-end storage resources.

Back-End Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation to the back-end storage resources.

Overall Back-End Transfer Size (KiB/op)
The average transfer size, in KiB, of a read or a write operation to the back-end storage resources.

Back-End Read Queue Time (ms/op)
The average number of milliseconds that a read operation spends in the queue before the operation is sent to the back-end storage resources.

Back-End Write Queue Time (ms/op)
The average number of milliseconds that a write operation spends in the queue before the operation is sent to the back-end storage resources.

Overall Back-End Queue Time (ms/op)
The average number of milliseconds that a read or a write operation spends in the queue before the operation is sent to the back-end storage resources.

Peak Back-End Read Queue Time (ms)
The longest time that a read operation spends in the queue before the operation is sent to the back-end storage resources.

Peak Back-End Write Queue Time (ms)
The longest time that a write operation spends in the queue before the operation is sent to the back-end storage resources.

Cache data

You can create performance reports that include the following information:

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Overall Write Cache Hit Percentage
The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

Total Overall Cache Hit Percentage
The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Write Cache Delay Percentage
The percentage of I/O operations that are delayed because there is not enough space in the write cache.

The only operations that can be delayed are write operations, but the value is calculated as an average of all I/O operations.

Write Cache Flush Through I/O Rate (ops/s)
The average number of tracks per second that are written to disk in flush-through mode.

Write Cache Write Through I/O Rate (ops/s)
The average number of tracks per second that are written to disk in write-through mode.

Write Cache Overflow I/O Rate (ops/s)
The average number of write operations per second that are delayed because there is not enough space in the write cache.

Write Cache Delay I/O Rate (ops/s)
The average number of I/O operations per second that are delayed because there is not enough space in the write cache.

The only operations that can be delayed are write operations, but the value is calculated as an average of all I/O operations.

Disk to Cache Transfer Rate (ops/s)
The average number of tracks that are transferred per second from the disks to the cache.

Cache to Disk Transfer Rate (ops/s)
The average number of tracks per second that are transferred from the cache to the disks.

Read Ahead Percentage of Cache Hits
The percentage of all read-cache hits that occur on pre-staged data.

Dirty Write Percentage of Cache Hits
The percentage of all cache write operations that occur on data in the cache that is marked as modified. This value represents how effectively write operations are coalesced before the data is written to disk.

Write Cache Flush Through Percentage
The percentage of tracks that is written to disk in flush-through mode.

Write Cache Write Through Percentage
The percentage of tracks that is written to disk in write-through mode.

Write Cache Overflow Percentage
The percentage of write operations that are delayed because there is not enough space in the write cache.

Other data

You can create performance reports that include the following information:

Global Mirror Write I/O Rate (op/s)
The average number of write operations per second that are issued to the Global Mirror secondary site.

Global Mirror Overlapping Write Percentage
The percentage of overlapping write operations that are issued by the Global Mirror primary site.

For SAN Volume Controller software releases 4.3.1 and later, some overlapping writes are processed in parallel and are excluded from this value. For SAN Volume Controller software releases 4.3.0 and earlier, all overlapping writes are serialized.

Global Mirror Overlapping Write I/O Rate (op/s)
The average number of overlapping write operations per second that are issued by the Global Mirror primary site.

For SAN Volume Controller software releases 4.3.1 and later, some overlapping writes are processed in parallel and are excluded from this value. For SAN Volume Controller software releases 4.3.0 and earlier, all overlapping writes are serialized.

Peak Read Response Time (ms)
The longest time to complete a read operation.

Peak Write Response Time (ms)
The longest time to complete a write operation.

Global Mirror Secondary Write Lag (ms/op)
The average number of milliseconds to service a secondary write operation for Global Mirror. This value does not include the time to service the primary write operation.

You monitor the value of Global Mirror Secondary Write Lag to identify delays that occurred during the process of writing data to the secondary site.

Link Failure Rate (count/s)
The average number of link errors per second.

Loss of Sync Rate (count/s)
The average number of times per second that synchronization is lost.

Synchronization is assumed lost after a timeout interval expires.

Loss of Signal Rate (count/s)
The average number of times per second that the signal is lost.

CRC Error Rate (count/s)
The average number of frames per second that are received in which a cyclic redundancy check (CRC) error is detected. A CRC error is detected when the CRC in the transmitted frame does not match the CRC computed by the receiver.

Processor Utilization Percentage
The average percentage of time that the processors are busy.

Overall Host Attributed Response Time Percentage
The percentage of the average response time that can be attributed to delays from host systems. This value includes both read response times and write response times, and can help you diagnose slow hosts and fabrics that are not working efficiently.

The value is based on the following conditions:

- For read response time, the time that it takes for hosts to respond to transfer-ready notifications from the SAN Volume Controller nodes.
- For write response time, the time that it takes for hosts to send the write data after the node responds to a transfer-ready notification.

Nonpreferred Node Usage Percentage
The overall percentage of I/O operations that are completed, or data that is transferred over the non-preferred nodes of the virtual disks.

Primitive Sequence Protocol Error Rate (count/s)
The average number of primitive sequence protocol errors per second that are detected.

This error occurs when there is a link failure for a port.

Invalid Transmission Word Rate (count/s)
The average number of bit errors per second that are detected.

Zero Buffer-to-Buffer Credit Timer (microseconds)
The number of microseconds that the port is not able to send frames between ports because there is insufficient buffer-to-buffer credit.

In Fibre Channel technology, buffer-to-buffer credit is used to control the flow of frames between ports. Buffer-to-buffer credit is measured from the last time that the node was reset.

Data for local disks on storage systems in performance reports

You can include general information, capacity data, properties, and other information about local disks that are on storage systems in performance reports.

Information about local disks on storage systems

You can create performance reports that include the following information:

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage MDisk Name
The name that was assigned to the managed disk when it was added to the system.

Storage Local Disk Name
The name that was assigned to the local disk on the storage system when the local disk was created on the system.

Capacity and usage data

You can create performance reports that include the following information:

Storage Local Disk Capacity (GiB)
The amount of storage space on the local disk.

Component properties

You can create performance reports that include the following information:

Storage Local Disk Is Encryptable
Shows whether the resource can be encrypted. If this value is `Yes`, the resource can be encrypted.

Storage Local Disk Is Encrypted
Shows whether the resource is encrypted. If this value is `Yes`, the resource is encrypted.

Storage Local Disk Storage Class
The storage technology of the local disk on a storage system. For example, the storage class can be a serial-attached SCSI (SAS) or solid-state drive (SSD).

Storage Local Disk Is Solid State
Shows whether the disk is a solid-state drive.

Storage Local Disk Speed (RPM)
The speed of the local disk on a storage system.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Status information

You can create performance reports that include the following information:

Storage Local Disk Status
The condition of the resource, for example normal, warning, or error.

Vendor, model, and device information

You can create performance reports that include the following information:

Storage System Local Disk Firmware Version
The version number of the firmware that is running on the disk.

Storage System Local Disk Model
The model name or model number of the resource.

Storage System Local Disk Serial Number
The serial number of the resource.

Storage System Local Disk Vendor
The vendor who supplied the resource.

Performance metrics for local disks on storage systems:

You can include performance data for back-end arrays on local disks that are on storage systems in performance reports.

Back-end array data

You can create performance reports that include the following information:

Back-End Read I/O Rate (ops/s)
The average number of read operations per second that are issued to the back-end storage resources.

Back-End Write I/O Rate (ops/s)
The average number of write operations per second that are issued to the back-end storage resources.

Total Back-End I/O Rate (ops/s)
The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

Back-End Read Data Rate (MiB/s)
The average number of MiB per second that are read from the back-end storage resources.

Back-End Write Data Rate (MiB/s)
The average number of MiB per second that are written to the back-end storage resources.

Total Back-End Data Rate (MiB/s)
The average rate at which data is transmitted between the back-end storage resources and the component. The rate is measured in MiB per second and includes both read and write operations.

Back-End Read Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Back-End Write Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Overall Back-End Response Time (ms/op)
The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

Peak Back-End Read Response Time (ms)
The longest time for a back-end storage resource to respond to a read operation.

Peak Back-End Write Response Time (ms)
The longest time for a back-end storage resource to respond to a write operation.

Back-End Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation from the back-end storage resources.

Back-End Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation to the back-end storage resources.

Overall Back-End Transfer Size (KiB/op)
The average transfer size, in KiB, of a read or a write operation to the back-end storage resources.

Back-End Read Queue Time (ms/op)
The average number of milliseconds that a read operation spends in the queue before the operation is sent to the back-end storage resources.

Back-End Write Queue Time (ms/op)
The average number of milliseconds that a write operation spends in the queue before the operation is sent to the back-end storage resources.

Overall Back-End Queue Time (ms/op)
The average number of milliseconds that a read or a write operation spends in the queue before the operation is sent to the back-end storage resources.

Peak Back-End Read Queue Time (ms)
The longest time that a read operation spends in the queue before the operation is sent to the back-end storage resources.

Peak Back-End Write Queue Time (ms)
The longest time that a write operation spends in the queue before the operation is sent to the back-end storage resources.

Data for storage host connections in performance reports

You can include general information, capacity data, properties, and other information about storage host connections in performance reports.

Information about storage host connections

You can create performance reports that include the following information:

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Storage Host Connection Name
The user-defined name that describes the server or storage device that is assigned to a volume.

XIV Cluster
The name of the cluster, if any, as defined on the XIV system. If no cluster is defined for the host connection, this field is blank.

Performance metrics for host connections on SAN Volume Controller, Storwize V7000, or Storwize V7000 Unified systems:

You can include performance metrics for volumes, caches, and for other data for host connections in performance reports.

Volume data

You can create performance reports that include the following information:

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation.

Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation.

Overall Transfer Size (KiB/op)
The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

Cache data

You can create performance reports that include the following information:

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Overall Write Cache Hit Percentage
The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

Total Overall Cache Hit Percentage
The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Disk to Cache Transfer Rate (ops/s)
The average number of tracks that are transferred per second from the disks to the cache.

Cache to Disk Transfer Rate (ops/s)
The average number of tracks per second that are transferred from the cache to the disks.

Write Cache Delay Percentage
The percentage of I/O operations that are delayed because there is not enough space in the write cache.

The only operations that can be delayed are write operations, but the value is calculated as an average of all I/O operations.

Write Cache Flush Through I/O Rate (ops/s)
The average number of tracks per second that are written to disk in flush-through mode.

Write Cache Write Through I/O Rate (ops/s)
The average number of tracks per second that are written to disk in write-through mode.

Write Cache Overflow I/O Rate (ops/s)
The average number of write operations per second that are delayed because there is not enough space in the write cache.

Write Cache Delay I/O Rate (ops/s)
The average number of I/O operations per second that are delayed because there is not enough space in the write cache.

The only operations that can be delayed are write operations, but the value is calculated as an average of all I/O operations.

Read Ahead Percentage of Cache Hits
The percentage of all read-cache hits that occur on pre-staged data.

Dirty Write Percentage of Cache Hits
The percentage of all cache write operations that occur on data in the cache

that is marked as modified. This value represents how effectively write operations are coalesced before the data is written to disk.

Write Cache Flush Through Percentage
The percentage of tracks that is written to disk in flush-through mode.

Write Cache Write Through Percentage
The percentage of tracks that is written to disk in write-through mode.

Write Cache Overflow Percentage
The percentage of write operations that are delayed because there is not enough space in the write cache.

Other data

You can create performance reports that include the following information:

Global Mirror Write I/O Rate (op/s)
The average number of write operations per second that are issued to the Global Mirror secondary site.

Global Mirror Overlapping Write I/O Rate (op/s)
The average number of overlapping write operations per second that are issued by the Global Mirror primary site.

For SAN Volume Controller software releases 4.3.1 and later, some overlapping writes are processed in parallel and are excluded from this value. For SAN Volume Controller software releases 4.3.0 and earlier, all overlapping writes are serialized.

Peak Read Response Time (ms)
The longest time to complete a read operation.

Peak Write Response Time (ms)
The longest time to complete a write operation.

Global Mirror Secondary Write Lag (ms/op)
The average number of milliseconds to service a secondary write operation for Global Mirror. This value does not include the time to service the primary write operation.

You monitor the value of Global Mirror Secondary Write Lag to identify delays that occurred during the process of writing data to the secondary site.

Overall Host Attributed Response Time Percentage
The percentage of the average response time that can be attributed to delays from host systems. This value includes both read response times and write response times, and can help you diagnose slow hosts and fabrics that are not working efficiently.

The value is based on the following conditions:

- For read response time, the time that it takes for hosts to respond to transfer-ready notifications from the SAN Volume Controller nodes.
- For write response time, the time that it takes for hosts to send the write data after the node responds to a transfer-ready notification.

Global Mirror Overlapping Write Percentage
The percentage of overlapping write operations that are issued by the Global Mirror primary site.

For SAN Volume Controller software releases 4.3.1 and later, some overlapping writes are processed in parallel and are excluded from this value. For SAN Volume Controller software releases 4.3.0 and earlier, all overlapping writes are serialized.

Nonpreferred Node Usage Percentage
The overall percentage of I/O operations that are completed, or data that is transferred over the non-preferred nodes of the virtual disks.

Performance metrics for host connections on DS8000 and DS6000 storage systems:

You can include performance metrics for volumes, caches, and for other data for storage host connections on DS8000 and DS6000 storage systems in performance reports.

Volume data

You can create performance reports that include the following information:

Normal Read I/O Rate (ops/s)
The average number of nonsequential read operations per second.

Sequential Read I/O Rate (ops/s)
The average number of sequential read operations per second.

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Normal Write I/O Rate (ops/s)
The average number of nonsequential write operations per second.

Sequential Write I/O Rate (ops/s)
The average number of sequential write operations per second.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Normal I/O Rate (ops/s)
The average number of nonsequential I/O operations per second. This value includes both read and write operations.

Total Sequential I/O Rate (ops/s)
The average number of sequential I/O operations per second. This value includes both read and write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Record Mode Read I/O Rate (ops/s)
The average number of I/O operations per second for record-mode read operations.

For record-mode read operations, only the requested data is managed in the cache rather than a full track of data.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation.

Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation.

Overall Transfer Size (KiB/op)
The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

Cache data

You can create performance reports that include the following information:

Write Cache Delay I/O Rate (ops/s)
The average number of I/O operations per second that are delayed because there is not enough space in the write cache.

The only operations that can be delayed are write operations, but the value is calculated as an average of all I/O operations.

Normal Read Cache Hit Percentage
The percentage of nonsequential read operations that find data in the cache.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Sequential Read Cache Hit Percentage
The percentage of sequential read operations that find data in the cache.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Normal Write Cache Hit Percentage
The percentage of nonsequential write operations that are handled in the cache.

Sequential Write Cache Hit Percentage
The percentage of sequential write operations that are handled in the cache.

Overall Write Cache Hit Percentage
The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

Total Normal Cache Hit Percentage
The percentage of nonsequential I/O operations that are handled in the cache. This value includes both read and write operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Total Sequential Cache Hit Percentage
The percentage of sequential I/O operations that are handled in the cache. This value includes both read and write operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Total Overall Cache Hit Percentage
The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Record Mode Read Cache Hit Percentage
The percentage of cache hits for record-mode read operations.

For record-mode read operations, only the requested data, rather than a full track of data, is managed in the cache.

Disk to Cache Transfer Rate (ops/s)
The average number of tracks that are transferred per second from the disks to the cache.

Cache to Disk Transfer Rate (ops/s)
The average number of tracks per second that are transferred from the cache to the disks.

Write Cache Delay Percentage
The percentage of I/O operations that are delayed because there is not enough space in the write cache.

The only operations that can be delayed are write operations, but the value is calculated as an average of all I/O operations.

Other data

You can create performance reports that include the following information:

HPF Read I/O Rate (ops/s)
The average number of read operations per second that are issued by the High Performance FICON feature of the storage system.

HPF Write I/O Rate (ops/s)
The average number of write operations per second that are issued by the High Performance FICON feature of the storage system.

Total HPF I/O Rate (ops/s)
The average number of I/O operations per second that are issued by the High Performance FICON feature of the storage system. This value includes both read and write operations.

HPF I/O Percentage
The percentage of all I/O operations that are issued by the High Performance FICON feature of the storage system.

PPRC Transfer Rate (ops/s)
The average number of tracks per second that are transferred to the secondary device of a Peer-to-Peer Remote Copy (PPRC) pair. This value shows the activity for the source of the PPRC relationship, but shows no activity for the target.

Performance metrics for storage host connections on an XIV system:

You can include performance metrics for volumes, caches, and for other data for storage host connections on an XIV system in performance reports.

Volume data

You can create performance reports that include the following information:

Overall Read I/O Rate (ops/s)
The average number of read operations per second. This value includes both sequential and nonsequential read operations.

Overall Write I/O Rate (ops/s)
The average number of write operations per second. This value includes both sequential and nonsequential write operations.

Total Overall I/O Rate (ops/s)
The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

Read Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations.

Write Data Rate (MiB/s)
The average number of MiB per second that are transferred for write operations.

Total Data Rate (MiB/s)
The average number of MiB per second that are transferred for read operations and write operations.

Read Response Time (ms/op)
The average number of milliseconds to complete a read operation.

Write Response Time (ms/op)
The average number of milliseconds to complete a write operation.

Overall Response Time (ms/op)
The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

Read Transfer Size (KiB/op)
The average number of KiB that are transferred per read operation.

Write Transfer Size (KiB/op)
The average number of KiB that are transferred per write operation.

Overall Transfer Size (KiB/op)
The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

Cache data

You can create performance reports that include the following information:

Overall Read Cache Hit Percentage
The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Overall Write Cache Hit Percentage
The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

Total Overall Cache Hit Percentage
The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

Read Data Cache Hit Percentage
The percentage of all read data that is read from the cache.

Write Data Cache Hit Percentage
The percentage of all write data that is written to cache slots that are marked as modified.

Overall Data Cache Hit Percentage
The percentage of all data that is handled in the cache. This value includes read data that is read from the cache and write data that is written to cache slots that are marked as modified.

Read Cache Hit Response Time (ms/op)
The average number of milliseconds to complete a read-cache hit operation.

Write Cache Hit Response Time (ms/op)
The average number of milliseconds to complete a write-cache hit operation.

Overall Cache Hit Response Time (ms/op)
The average number of milliseconds to complete a cache hit operation. This value includes the times for both read-cache hit and write-cache hit operations.

Read Cache Miss Response Time (ms/op)
The average number of milliseconds to complete a read-cache miss operation.

Write Cache Miss Response Time (ms/op)
The average number of milliseconds to complete a write-cache miss operation.

Overall Cache Miss Response Time (ms/op)
The average number of milliseconds to complete a cache miss operation. This value includes the times for both read-cache miss and write-cache miss operations.

Other data

You can create performance reports that include the following information:

Small Transfers I/O Percentage
The percentage of I/O operations with a small data transfer size. A small data transfer has a size that is less than or equal to 8 KiB.

Medium Transfers I/O Percentage
The percentage of I/O operations with a medium data transfer size. A medium data transfer has a size that is greater than 8 KiB and less than or equal to 64 KiB.

Large Transfers I/O Percentage
The percentage of I/O operations with a large data transfer size. A large data transfer has a size that is greater than 64 KiB and less than or equal to 512 KiB.

Very Large Transfers I/O Percentage
The percentage of I/O operations with a data transfer size that is greater than 512 KiB.

Small Transfers Data Percentage
The percentage of data that is transferred as a result of I/O operations with a small data transfer size. A small data transfer has a size that is less than or equal to 8 KiB.

Medium Transfers Data Percentage
The percentage of data that is transferred as a result of I/O operations with a medium data transfer size. A medium data transfer has a size that is greater than 8 KiB and less than or equal to 64 KiB.

Large Transfers Data Percentage
The percentage of data that is transferred as a result of I/O operations with a large data transfer size. A large data transfer has a size that is greater than 64 KiB and less than or equal to 512 KiB.

Very Large Transfers Data Percentage
The percentage of data that is transferred as a result of I/O operations with a data transfer size that is greater than 512 KiB.

Small Transfers Response Time (ms/op)
The average number of milliseconds to complete an I/O operation that has a small data transfer size. A small data transfer has a size that is less than or equal to 8 KiB.

Medium Transfers Response Time (ms/op)
The average number of milliseconds to complete an I/O operation that has

a medium data transfer size. A medium data transfer has a size that is greater than 8 KiB and less than or equal to 64 KiB.

Large Transfers Response Time (ms/op)
The average number of milliseconds to complete an I/O operation that has a large data transfer size. A large data transfer has a size that is greater than 64 KiB and less than or equal to 512 KiB.

Very Large Transfers Response Time (ms/op)
The average number of milliseconds to complete an I/O operation with a data transfer size that is greater than 512 KiB.

Data for switches in performance reports

You can include properties and other information about switches in performance reports.

Information about switches

You can create performance reports that include the following information:

Switch Logical Name
The logical name of a switch or switch port.

Component properties

You can create performance reports that include the following information:

Switch WWN
The worldwide name of the switch.

Parent Switch WWN
The worldwide name of the parent switch.

Switch Management Telnet Address
The Telnet address that you access to manage the switch.

Switch Management SNMP Address
The Simple Network Management Protocol (SNMP) address that you access to manage the switch.

Switch Management URL Address
The URL that you access to manage the switch.

Switch Domain
The domain of the switch.

Switch Version
The version number of the operating system that is running on the switch.

Switch Location
The physical location of a switch. The location is defined when a switch is added to Tivoli Storage Productivity Center. You can add or edit the location of the switch in the **Properties** pane of the switch in the web-based GUI.

Switch Custom Tag 1, 2, and 3
User-defined text that is associated with a switch. You can add or edit the custom tags for a switch in the **Properties** pane of the switch in the Tivoli Storage Productivity Center web-based GUI.

Status information

You can create performance reports that include the following information:

Switch Status
The condition of the resource, for example normal, warning, or error.

Switch Is Detected
Shows whether the resource was detected the last time that data was collected. If this value is `Yes`, the resource was detected.

Vendor, model, and device information

You can create performance reports that include the following information:

Switch IP Address
The IP address of the resource.

Switch Serial Number
The serial number of the resource.

Switch Vendor
The vendor who supplied the resource.

Switch Model
The model name or model number of the resource.

Performance metrics for switches:

You can include performance data for switches, including switch error data, in performance reports.

Switch data

You can create performance reports that include the following information:

Port Send Frame Rate (frames/s)
The average number of frames per second that are sent through the port.

Port Receive Frame Rate (frames/s)
The average number of frames per second that are received by the port.

Total Port Frame Rate (frames/s)
The average number of frames per second that are transferred. This value includes frames that are sent and frames that are received by the port.

Port Send Data Rate (MiB/s)
The average rate at which data is sent through the port. The rate is measured in MiB per second.

Port Receive Data Rate (MiB/s)
The average rate at which data is received by the port. The rate is measured in MiB per second.

Total Port Data Rate (MiB/s)
The average rate at which data is transferred through the port. The rate is measured in MiB per second and includes both send and receive operations.

Port Send Frame Size (KiB/op)
The average size of a frame, in KiB, that is sent through the port.

Port Receive Frame Size (KiB/op)
The average size of a frame, in KiB, that is received by the port.

Overall Port Frame Size (KiB/op)
The average frame transfer size. This value is measured in KiB and includes frames that are sent and frames that are received by the port.

Port Send Bandwidth Percentage
The percentage of the port bandwidth that is used for send operations. This value is an indicator of port bandwidth usage that is based on the speed of the port.

Port Receive Bandwidth Percentage
The percentage of the port bandwidth that is used for receive operations. This value is an indicator of port bandwidth usage that is based on the speed of the port.

Overall Port Bandwidth Percentage
The percentage of the port bandwidth that is used for send operations and receive operations. This value is an indicator of port bandwidth usage that is based on the speed of the port.

Switch error data

You can create performance reports that include the following information:

Error Frame Rate (count/s)
The average number of error frames per second that are received. An error frame is a frame that violates the Fibre Channel Protocol.

Discarded Frame Rate (count/s)
The average number of frames per second that are discarded because host buffers are unavailable for the port.

Link Failure Rate (count/s)
The average number of link errors per second.

Loss of Sync Rate (count/s)
The average number of times per second that synchronization is lost.

Synchronization is assumed lost after a timeout interval expires.

Loss of Signal Rate (count/s)
The average number of times per second that the signal is lost.

CRC Error Rate (count/s)
The average number of frames per second that are received in which a cyclic redundancy check (CRC) error is detected. A CRC error is detected when the CRC in the transmitted frame does not match the CRC computed by the receiver.

Encoding Disparity Error Rate (count/s)
The average number of disparity errors per second that are received.

Discarded Class 3 Frame Rate (count/s)
The average number of class 3 frames per second that are discarded.

Primitive Sequence Protocol Error Rate (count/s)
The average number of primitive sequence protocol errors per second that are detected.

This error occurs when there is a link failure for a port.

Invalid Transmission Word Rate (count/s)
The average number of bit errors per second that are detected.

Link Reset Transmitted Rate (count/s)
The average number of times per second that the port changes from an active (AC) state to a Link Recovery (LR1) state.

Link Reset Received Rate (count/s)
The average number of times per second that the port changes from an active (AC) state to a Link Recovery (LR2) state.

Short Frame Rate (count/s)
The average number of frames that are received per second that are shorter than 28 octets. This number excludes start-of-frame bytes and end-of-frame bytes.

The 28 octet limit is calculated based on the assumption that a frame has 24 header bytes, and 4 CRC bytes.

Long Frame Rate (count/s)
The average number of frames that are received per second that are longer than 2140 octets. This number excludes start-of-frame bytes and end-of-frame bytes.

The 2140 octet limit is calculated based on the assumption that a frame has 24 header bytes, 4 CRC bytes, and 2112 data bytes.

F-BSY Frame Rate (count/s)
The average number of F-BSY frames per second that are generated.

An F-BSY frame is issued by the fabric to indicate that a frame cannot be delivered because the fabric or destination N_port is busy.

F-RJT Frame Rate (count/s)
The average number of F-RJT frames per second that are generated.

An F-RJT frame is issued by the fabric to indicate that delivery of a frame was denied.

Data for switch ports in performance reports

You can include properties and other information about switch ports in performance reports.

Information about switch ports

You can create performance reports that include the following information:

Switch Logical Name
The logical name of a switch or switch port.

Switch Port WWPN
The worldwide port name of the port on the switch.

Component properties

You can create performance reports that include the following information:

Switch Port Number
The port number on the resource.

Switch Port Type
The type of port on the storage system, storage virtualizer, or switch. For example, the port type can be N_Port, F_Port, or another type of port.

Switch Port Speed (GiB/s)
The speed of a port, which is measured in GiB per second.

Switch Blade Slot Number
The number of the slot on the switch to which the blade is attached. This property applies to ports on blades.

Status information

You can create performance reports that include the following information:

Switch Port Status
The condition of the resource, for example normal, warning, or error.

Switch Port Is Detected
Shows whether the resource was detected the last time that data was collected. If this value is `Yes`, the resource was detected.

Switch Port Enabled State
Shows whether a port is enabled, disabled, or is enabled but offline.

Switch Port Operational Status
The current operational state of the switch port. For example, this value can be `Error` or `OK`.

Performance metrics for switch ports:

You can include performance data for switch ports, including port error data, in performance reports.

Switch port data

You can create performance reports that include the following information:

Port Send Frame Rate (frames/s)
The average number of frames per second that are sent through the port.

Port Receive Frame Rate (frames/s)
The average number of frames per second that are received by the port.

Total Port Frame Rate (frames/s)
The average number of frames per second that are transferred. This value includes frames that are sent and frames that are received by the port.

Port Send Data Rate (MiB/s)
The average rate at which data is sent through the port. The rate is measured in MiB per second.

Port Receive Data Rate (MiB/s)
The average rate at which data is received by the port. The rate is measured in MiB per second.

Total Port Data Rate (MiB/s)
The average rate at which data is transferred through the port. The rate is measured in MiB per second and includes both send and receive operations.

Port Peak Send Data Rate (MiB/s)
The fastest rate at which data is sent through this switch port.

Port Peak Receive Data Rate (MiB/s)
The fastest rate at which data is received through this switch port.

Port Send Frame Size (KiB/op)
The average size of a frame, in KiB, that is sent through the port.

Port Receive Frame Size (KiB/op)
The average size of a frame, in KiB, that is received by the port.

Overall Port Frame Size (KiB/op)
The average frame transfer size. This value is measured in KiB and includes frames that are sent and frames that are received by the port.

Port Send Bandwidth Percentage
The percentage of the port bandwidth that is used for send operations. This value is an indicator of port bandwidth usage that is based on the speed of the port.

Port Receive Bandwidth Percentage
The percentage of the port bandwidth that is used for receive operations. This value is an indicator of port bandwidth usage that is based on the speed of the port.

Overall Port Bandwidth Percentage
The percentage of the port bandwidth that is used for send operations and receive operations. This value is an indicator of port bandwidth usage that is based on the speed of the port.

Data for errors on switch ports

You can create performance reports that include the following information:

Error Frame Rate (count/s)
The average number of error frames per second that are received. An error frame is a frame that violates the Fibre Channel Protocol.

Discarded Frame Rate (count/s)
The average number of frames per second that are discarded because host buffers are unavailable for the port.

Link Failure Rate (count/s)
The average number of link errors per second.

Loss of Sync Rate (count/s)
The average number of times per second that synchronization is lost.

Synchronization is assumed lost after a timeout interval expires.

Loss of Signal Rate (count/s)
The average number of times per second that the signal is lost.

CRC Error Rate (count/s)
The average number of frames per second that are received in which a cyclic redundancy check (CRC) error is detected. A CRC error is detected when the CRC in the transmitted frame does not match the CRC computed by the receiver.

Encoding Disparity Error Rate (count/s)
The average number of disparity errors per second that are received.

Discarded Class 3 Frame Rate (count/s)
The average number of class 3 frames per second that are discarded.

Primitive Sequence Protocol Error Rate (count/s)
The average number of primitive sequence protocol errors per second that are detected.

This error occurs when there is a link failure for a port.

Invalid Transmission Word Rate (count/s)
The average number of bit errors per second that are detected.

Link Reset Transmitted Rate (count/s)
The average number of times per second that the port changes from an active (AC) state to a Link Recovery (LR1) state.

Link Reset Received Rate (count/s)
The average number of times per second that the port changes from an active (AC) state to a Link Recovery (LR2) state.

Short Frame Rate (count/s)
The average number of frames that are received per second that are shorter than 28 octets. This number excludes start-of-frame bytes and end-of-frame bytes.

The 28 octet limit is calculated based on the assumption that a frame has 24 header bytes, and 4 CRC bytes.

Long Frame Rate (count/s)
The average number of frames that are received per second that are longer than 2140 octets. This number excludes start-of-frame bytes and end-of-frame bytes.

The 2140 octet limit is calculated based on the assumption that a frame has 24 header bytes, 4 CRC bytes, and 2112 data bytes.

F-BSY Frame Rate (count/s)
The average number of F-BSY frames per second that are generated.

An F-BSY frame is issued by the fabric to indicate that a frame cannot be delivered because the fabric or destination N_port is busy.

F-RJT Frame Rate (count/s)
The average number of F-RJT frames per second that are generated.

An F-RJT frame is issued by the fabric to indicate that delivery of a frame was denied.

Custom reports about capacity and relationships

You can use Tivoli Common Reporting to create custom reports about capacity and relationships. Capacity and relationship reports can contain detailed information about the properties of monitored resources, and the available space and capacity of those resources.

Capacity and relationship reports can contain information about the following resources and their components:

- Servers
- Hypervisors
- Network-attached storage servers
- Storage virtualizers
- Storage systems
- Storage resource groups

Creating custom capacity and relationship reports

You can create custom reports that show capacity and relationship information for resources. Capacity and relationship reports can contain detailed information about the properties of monitored resources, and the available space and capacity of those resources. You access custom capacity and relationship reports from the Tivoli Storage Productivity Centerweb-based GUI, and you create the reports in Tivoli Common Reporting.

Before you can create a custom report about capacity and relationships, ensure that data was collected from the resources. The following table shows where the data must be collected from for each resource:

Resource	Prerequisite
Server	Data must be collected from the server by the Storage Resource agent, or by an agentless server.
Hypervisor	Data must be collected from the VMware ESX server.
NAS	Data must be collected from any NetApp or IBM Scale Out Network Attached Storage resources that are in your storage environment.
Storage virtualizer	Data must be collected from the any of the following storage virtualizers that are in your storage environment: • Storwize V7000 • Storwize V7000 Unified • SAN Volume Controller • Hitachi Universal Storage Platform V
Storage system	Data must be collected from the storage system, or any of the following systems that are configured as back-end storage: • Storwize V7000 • Storwize V7000 Unified • SAN Volume Controller • Hitachi Universal Storage Platform V

Tip: Before you run a report, you can preview the report with no data.

1. Start the web-based GUI for Tivoli Storage Productivity Center.
2. Depending on the type of report that you want to see, complete one of the following steps:
   - To create a basic report with limited formatting about the capacity and relationships of resources, select **Reporting** > **Create capacity reports**.
   - To create a report about the performance of resources and apply advanced formatting features to the report, complete the following steps:
     a. Select **Reporting** > **Create capacity reports**.
     b. Click the **Return** icon .
     c. Click **Launch** > **Report Studio**.
3. Expand **Tivoli Storage Productivity Center** in the list.
4. Expand **Servers to Storage Systems** in the list.

5. Explore the folders in the list to locate the resources, properties, and statistics that you want to include in the report.
6. Depending on your browser, do one of the following steps to add properties and statistics to the report:
   - In Internet Explorer, drag the items that you want to see information about to the work area.
   - In Firefox, select the items that you want to see information about, and then click **Insert**.
7. Click **Save**.

Related tasks:

"Adding filters to reports"
You can use filters with capacity and relationship reports. Filters allow you to show only certain data that complies with your criteria. You add filters to your capacity and relationship reports when you create the reports.

Related information:

IBM Cognos Business Intelligence 10.2.0 Information Center
For more information about how to preview and run reports, see the IBM Cognos Business Intelligence 10.2.0 Information Center at pic.dhe.ibm.com/infocenter/cbi/v10r2m0/index.jsp. Search for "Run a Report".

Adding filters to reports

You can use filters with capacity and relationship reports. Filters allow you to show only certain data that complies with your criteria. You add filters to your capacity and relationship reports when you create the reports.

Filters for resources are in the same list as the resources, in the appropriate resource folder. For example, to view the filters for servers, select **Server Resources** > **Server Resource Filters** > **Server Filters**.

Filters are available for all resources, except network-attached storage resources.

1. To apply a filter to the data in the work area, locate the filter that you want to include in the folders in the list.
2. Depending on your browser, do one of the following steps to add a filter to the report:
   - In Internet Explorer, drag the filter that you want to use to the work area.
   - In Firefox, select the filter that you want to use, and then click **Insert**.

   The filter is applied to the report. If you did not add properties and statistics to the report, the filter is applied when you add the properties and statistics.
3. Optional: To delete the filter, right-click the filter in the work area, and then select **Delete**.

Related information:

IBM Cognos Business Intelligence 10.2.0 Information Center
For more information about how to use filters with reports, see the IBM Cognos Business Intelligence 10.2.0 Information Center at pic.dhe.ibm.com/infocenter/cbi/v10r2m0/index.jsp. Search for "Create a Simple Filter".

Filters for servers in capacity and relationship reports

You can filter capacity and relationship reports to include only the servers, server file systems, and server logical volumes that meet specific criteria.

Filters for servers

You can create capacity and relationship reports that include the following filters:

Servers Connected to Virtualizers or Storage Systems
Shows servers that are connected to storage virtualizers or storage systems. You can use this filter to identify servers that are connected directly to storage virtualizers, or connected directly or indirectly to storage systems. This filter excludes local disks from the report.

Servers Directly Connected to Storage Systems
Shows servers that are directly connected to a back-end storage system. You can use this filter to identify servers or server disks that are connected to a storage system, but are not connected through a storage virtualizer.

For example, you might want to migrate data from one storage system to another. In this case, you can use this filter to identify file systems or server disks that are not virtualized. These file systems or server disks might be affected if a storage system is removed.

Servers Directly Connected to Virtualizers
Shows servers that are directly connected to a storage virtualizer. You can use this filter to identify servers that are connected to a storage virtualizer, but are not connected directly to a back-end storage system.

For example, you can use this filter to identify only server disks that are on a SAN Volume Controller.

Filters for server file systems

You can create capacity and relationship reports that include the following filters:

Rows with File System Mount Points
Shows the file systems that have a mount point on the server.

Rows without File System Mount Points
Shows resources that do not have a mount point on the server. You can use this filter to identify disks that do not have file systems, that is, disks that are not in use.

For example, to identify unused space include the Server Name property and the Server Disk Path property in a report, and then include the Rows without File System Mount Points filter.

Filters for server logical volumes

You can create capacity and relationship reports that include the following filters:

Rows with Logical Volume Path
Shows the logical volumes that have a path to the server.

Rows without Logical Volume Path
Shows resources that do not have a logical volume path to the server. You can use this filter to identify volumes that do not have paths, that is, volumes that are not in use.

For example, to identify unused space include the Server Name property and the Server Disk Path property in a report, and then include the Rows without Logical Volume Path filter.

Filters for hypervisors in capacity and relationship reports

You can filter capacity and relationship reports to include only the hypervisors, hypervisor file systems, and hypervisor logical volumes that meet specific criteria.

Filters for hypervisors

You can create capacity and relationship reports that include the following filters:

Hypervisor with Probed Servers
Shows hypervisors that are connected to servers. You can use this filter to include only hypervisors and their associated servers from which data was collected. For example, you might collect data only from your critical production servers on a hypervisor, but not your test servers. In this case, you can use this filter to exclude information for the test servers from the report.

Hypervisors Connected to Virtualizers or Storage Systems
Shows hypervisors that are connected to storage virtualizers or storage systems. You can use this filter to identify hypervisors that are connected directly to storage virtualizers, or connected directly or indirectly to storage systems. This filter excludes local disks from the report.

Hypervisors Directly Connected to Storage Systems
Shows hypervisors that are directly connected to a back-end storage system. You can use this filter to identify hypervisors or hypervisor disks that are connected to a storage system, but are not connected through a storage virtualizer.

For example, you might want to migrate data from one storage system to another. In this case, you can use this filter to identify file systems or hypervisor disks that are not virtualized. These file systems or hypervisor disks might be affected if a storage system is removed.

Hypervisors Directly Connected to Virtualizers
Shows hypervisors that are directly connected to a storage virtualizer. You can use this filter to identify hypervisors that are connected to a storage virtualizer, but are not connected directly to a back-end storage system.

For example, you can use this filter to identify only hypervisor disks that are on a SAN Volume Controller.

Filters for hypervisor file systems

You can create capacity and relationship reports that include the following filters:

Hypervisors with File System Mount Points
Shows the file systems that have a mount point on the hypervisor.

Hypervisors without File System Mount Points
Shows resources that do not have a mount point on the hypervisor. You can use this filter to identify disks that do not have file systems, that is, disks that are not in use.

For example, to identify unused space include the Hypervisor Name property and the Hypervisor Disk Path property in a report, and then include the Hypervisors without File System Mount Points filter.

Filters for hypervisor logical volumes

You can create capacity and relationship reports that include the following filters:

Hypervisors with Logical Volume Path
Shows the logical volumes that have a path to the hypervisor.

Hypervisors without Logical Volume Path
Shows resources that do not have a logical volume path to the hypervisor. You can use this filter to identify volumes that do not have paths, that is, volumes that are not in use.

For example, to identify unused space include the Hypervisor Name property and the Hypervisor Disk Path property in a report, and then include the Hypervisors without Logical Volume Path filter.

Filters for storage virtualizers in capacity and relationship reports

You can filter capacity and relationship reports to include only the storage virtualizers and storage virtualizer volumes that meet specific criteria.

Storage virtualizer filters

You can create capacity and relationship reports that include the following filters:

Virtualizers Not Connected to Servers
Shows storage virtualizers that are not connected to servers.

Filters for storage virtualizer volumes

You can create capacity and relationship reports that include the following filters:

Rows with Virtualizer Volumes
Shows storage virtualizer disks that are connected to the storage virtualizer that have an associated volume.

Rows without Virtualizer Volumes
Shows storage virtualizer disks that are connected to the storage virtualizer that do not have an associated volume.

Virtualizer Primary Volume Information
Shows primary volumes that are connected to the storage virtualizer. You can use this filter if you want to get a total of the used space on primary volumes in your storage environment.

Virtualizer Volume Copy Information
Shows copy volumes that are connected to the storage virtualizer. You can use this filter if you want to get a total of the used space on volume copies in your storage environment.

Filters for storage systems in capacity and relationship reports

You can filter capacity and relationship reports to include only the storage systems or storage volumes that meet specific criteria.

Filters for storage systems

You can create capacity and relationship reports that include the following filters:

Storage Systems Directly Connected to Servers
Shows back-end storage systems that are directly connected to a server. You can use this filter to identify storage systems that are connected to a server, but are not connected through a storage virtualizer.

For example, you might want to migrate data from one storage system to another. In this case, you can use this filter to identify file systems or

server disks that are not virtualized. These file systems or server disks might be affected if a storage system is removed.

Storage Systems Connected to Servers through Virtualizers
Shows storage systems that are indirectly connected to a server through a storage virtualizer. You can use this filter to identify storage systems that are connected to a storage virtualizer, but are not connected directly to a server.

For example, you can use this filter to identify only server disks that are on a SAN Volume Controller.

Storage Systems not Connected to Servers
Shows storage systems that are not connected to a server either directly, or indirectly through a storage virtualizer.

Rows with Storage Volumes
Shows storage resources that have an associated storage volume.

Rows without Storage Volumes
Shows storage resources that do not have an associated storage volume.

Filters for storage resource groups in capacity and relationship reports

You can filter capacity and relationship reports to include only the storage resource groups that meet specific criteria.

Filters for storage resource groups

You can create capacity and relationship reports that include the following filters:

Storage Resource Group for Volumes
Shows only the volumes that are in a storage resource group.

Storage Resource Group for Pools
Shows only the pools that are in a storage resource group.

Data and properties in capacity and relationship reports

You can include capacity data, properties, relationship information, and other information about resources in your storage environment in capacity and relationship reports.

Data for clusters in capacity and relationship reports

You can include general information about clusters in capacity and relationship reports.

Information about clusters

You can create capacity and relationship reports that include the following information:

Cluster Name
The name that was assigned to the cluster when it was created.

Cluster Type
The type of the cluster. The cluster can be a Microsoft Cluster Server or a High-Availability Cluster Multiprocessing (HACMP) server.

Cluster IP Address
The IP address of the resource.

Cluster Domain Name
The domain name of the cluster.

Data for servers in capacity and relationship reports

You can include general information, capacity data, properties of components, and other information about servers in capacity and relationship reports.

Information about servers

You can create capacity and relationship reports that include the following information:

Server Name
The fully qualified domain name of the server. For example, the name of a server might be `server.example.com`.

Server Domain Name
The domain name of the server.

Server Short Name
The host name from the fully qualified domain name of the server. For example, if the fully qualified domain name of the server is `mycomputer.example.com`, the host name is `mycomputer`.

Capacity and usage data

You can create capacity and relationship reports that include the following information:

Server Swap Space (GiB)
The amount of disk space on a resource that is available to store some of the contents of the RAM when the RAM is full.

Server Total Disk Capacity (GiB)
The amount of storage space that is on a server.

Server Total Disk Available Space (GiB)
The amount of unused storage space on all disks on a server.

Server Total File System Available Space (GiB)
The amount of unused storage space that is available on the file systems on a server.

Component properties

You can create capacity and relationship reports that include the following information:

Server Cluster Current Hosting Node
The name of the server that is hosting the cluster resource group.

Server Cluster Resource Type
Shows whether the cluster is a node or a cluster resource group.

Server IP Address
The IP address of the resource.

Server Is Virtual Machine
Shows whether a resource is a virtual machine. If this value is `Yes`, the resource is a virtual machine.

Server OS Type
The operating system that is running on the server.

Server OS Version
The version number of the operating system that is running on the resource.

Server Processor Architecture
The architecture of the processor on the server or hypervisor. For example, the architecture of a processor might be Intel 64 bit (IA64) or Intel 32 bit (IA32).

Server Processor Count
The number of processors on the server or hypervisor.

Server Processor Speed (MHz)
The speed of the processor on the server or hypervisor.

Server Processor Type
Shows information about the processor, such as the family and model of the processor.

Server RAM (GiB)
The amount of RAM on the server or hypervisor.

Server Time Zone
The time zone in which a resource is located.

Server Location
The physical location of a server. The location is defined when a server is added to Tivoli Storage Productivity Center. You can add or edit the location of the server in the **Properties** pane of the server in the web-based GUI.

Server Custom Tag 1, 2, and 3
User-defined text that is associated with a server. You can add or edit the custom tags for a server in the **Properties** pane of the server in Tivoli Storage Productivity Center web-based GUI.

Vendor, model, and device information

You can create capacity and relationship reports that include the following information:

Server Model
The model name or model number of the resource.

Server Serial Number
The serial number of the resource.

Server Vendor
The vendor who supplied the resource.

Status information

You can create capacity and relationship reports that include the following information:

Server Status
The status of a server, such as `Normal`, `Warning`, `Error`, `Unreachable`,

Unknown, or Agentless. Use the status to determine the condition of the server, and if any actions must be taken. If this value is Agentless, the server is an unmanaged server.

Server Is Detected
Shows whether the resource was detected the last time that data was collected. If this value is Yes, the resource was detected.

Server Last Data Collection
The date and time when storage statistics were last collected from the resource.

Server Last Start Time
The last time that the resource was started.

Data for file systems on servers in capacity and relationship reports

You can include general information, capacity data, and status information about file systems on servers in capacity and relationship reports.

Information about file systems on servers

You can create capacity and relationship reports that include the following information:

File System Mount Point
The name or mount point of the file system for the resource. For example, on Microsoft Windows systems, the value in this property might be c:\ or d:\. On operating systems such as AIX, Linux, Solaris, or HP-UX, the mount point might be /opt or /export/home.

File System Export Name
The name of the exported file system.

File System Type
The type of file system that the resource uses.

Capacity and usage data

You can create capacity and relationship reports that include the following information:

File System Capacity (GiB)
The amount of storage space on the file system of the resource.

File System Directory Count
The number of directories in the file systems that are on a server.

File System File Count
The number of files in the file system.

File System Available Space (GiB)
The amount of unused storage space in the file system of the resource.

File System Available Inodes
The number of unused inodes in file systems on the operating system.

File System Used Inodes
The number of used inodes in file systems on the operating system.

Tip: For Microsoft Windows systems, this property is blank.

File System Maximum Files
The maximum number of files that the file system on the resource can contain.

File System Physical Size (GiB)
The amount of physical storage space on the file systems on a resource. The physical size is the size of all the clusters that the file system uses.

File System Used Space (GiB)
The amount of used storage space in the file system of the resource.

Component properties

You can create capacity and relationship reports that include the following information:

File System Is Remote Mount
Shows whether the file system is remotely mounted on another server. If this value is `Yes`, the file system is remotely mounted.

Status information

You can create capacity and relationship reports that include the following information:

File System Is Detected
Shows whether the resource was detected the last time that data was collected. If this value is `Yes`, the resource was detected.

File System Last Scan
The date and time when file statistics were last collected from the resource.

Data for logical volumes on servers in capacity and relationship reports

You can include general information, capacity data, and status information about logical volumes on servers in capacity and relationship reports.

Information about logical volumes on servers

You can create capacity and relationship reports that include the following information:

Logical Volume Path
The path to a logical volume on a resource, for example `/dev/hd1`.

Logical Volume Is Swap Space
Shows whether a logical volume is used to store some of the contents of the RAM when the RAM is full. If this value is `Yes`, the logical volume is used to store some of the contents of the RAM.

Logical Volume Mirror Count
The number of mirrors that keep a synchronous copy of the resource.

Logical Volume Type
The type of server logical volume. For example, the logical volume type can be concatenation or stripe set.

Capacity and usage data

You can create capacity and relationship reports that include the following information:

Logical Volume Allocation on Server Disk (GiB)
The amount of disk storage space that is allocated to the logical volume.

Logical Volume Capacity (GiB)
The amount of storage space that is on a logical volume.

Logical Volume Overhead (GiB)
The amount of space that is used for system management. The amount of space also includes space that is reserved for redundancy.

Status information

You can create capacity and relationship reports that include the following information:

Logical Volume Is Detected
Shows whether the resource was detected the last time that data was collected. If this value is `Yes`, the resource was detected.

Data for volume groups on servers in capacity and relationship reports

You can include general information and capacity data about volume groups on servers in capacity and relationship reports.

Information about volume groups on servers

You can create capacity and relationship reports that include the following information:

Volume Group Name
The name that was assigned to the volume group when it was added to the system.

Volume Group Type
The type of the volume manager that manages the volume group. The volume manager can be a logical volume manager (LVM) or a Veritas volume manager.

Capacity and usage data

You can create capacity and relationship reports that include the following information:

Volume Group Capacity (GiB)
The amount of storage space that is on a volume group.

Volume Group Available Space (GiB)
The amount of unused storage space on a server volume group.

Volume Group Number of Logical Volumes
The number of logical volumes on a resource.

Volume Group Number of Server Disks
The number of server disks in a volume group.

Data for server disks in capacity and relationship reports

You can include general information, capacity data, properties of components, and other information about server disks in capacity and relationship reports.

Information about server disks

You can create capacity and relationship reports that include the following information:

Server Disk Path
The identifier that specifies a path to a server disk, for example `/dev/hdisk0`.

A server disk might have one or more disk paths. To identify unique server disks, add the Server Disk Serial Number property to the report, and group the server disks by the serial number.

Capacity and usage data

You can create capacity and relationship reports that include the following information:

Server Disk Capacity (GiB)
The amount of storage space that is on a server disk.

Server Disk Available Space (GiB)
The amount of unused storage space that is on a server disk.

Component properties

You can create capacity and relationship reports that include the following information:

Server Disk Is Removable
Shows whether the disk can be removed from the server. If this value is `Yes`, the disk can be removed from the server.

Status information

You can create capacity and relationship reports that include the following information:

Server Disk Status
The condition of the resource, for example normal, warning, or error.

Server Disk Is Detected
Shows whether the resource was detected the last time that data was collected. If this value is `Yes`, the resource was detected.

Vendor, model, and device information

You can create capacity and relationship reports that include the following information:

Server Disk Firmware Version
The version number of the firmware that is running on the disk.

Server Disk Model
The model name or model number of the resource.

Server Disk Serial Number
The serial number of the resource.

Server Disk Vendor
The vendor who supplied the resource.

Path information

You can create capacity and relationship reports that include the following information:

Server Disk LUN
The logical unit within a small computer system interface target on a disk.

Server Disk SCSI Target
The bus address for the small computer system interface of the target on a disk.

Server Disk Target WWPN
The worldwide port name of the storage port that the volume is mapped to.

Data for server groups in capacity and relationship reports

You can include general information and properties of server groups in capacity and relationship reports.

Information about server groups

You can create capacity and relationship reports that include the following information:

Server Group Name
The name that was assigned to the server group when it was added to the system.

Component properties

You can create capacity and relationship reports that include the following information:

Server Group Creator
The user name of the user who created the group.

Server Group Last Modified
The date and time that the resource was last modified.

Server Group Last Modified by User
The user name of the user who last modified the resource.

Data for file system groups on servers in capacity and relationship reports

You can include general information about file system groups on servers, and properties of file system groups in capacity and relationship reports.

Information about file system groups on servers

You can create capacity and relationship reports that include the following information:

File System Group Name
The name that was assigned to the file system group when it was added to the system.

Component properties

You can create capacity and relationship reports that include the following information:

File System Group Creator
The user name of the user who created the group.

File System Group Last Modified
The date and time that the resource was last modified.

File System Group Last Modified by User
The user name of the user who last modified the resource.

Data for hypervisors in capacity and relationship reports

You can include general information, capacity data, properties, and other information about hypervisors in capacity and relationship reports.

Information about hypervisors

You can create capacity and relationship reports that include the following information:

Hypervisor Name
The fully qualified domain name of the hypervisor. For example, the name of a hypervisor might be `hypervisor.example.com`.

Hypervisor Short Name
The host name from the fully qualified domain name of the hypervisor. For example, if the fully qualified domain name of the hypervisor is `mycomputer.example.com`, the host name is `mycomputer`.

Capacity and usage data

You can create capacity and relationship reports that include the following information:

Hypervisor Kernel Memory (GiB)
The amount of memory on a hypervisor that is used for kernel memory. Kernel memory is used to perform internal operating system processes.

Hypervisor Service Console Memory (GiB)
The amount of memory on a hypervisor that is used for the VMware ESX Service Console. Service Console is the operating system that is used to interact with ESX and the virtual machines that run on the hypervisor.

Hypervisor Swap Space (GiB)
The amount of disk space on a resource that is available to store some of the contents of the RAM when the RAM is full.

Hypervisor Total Disk Capacity (GiB)
The amount of storage space on disks on a hypervisor.

Hypervisor Total Disk Available Space (GiB)
The amount of unused storage space on disks on the hypervisor.

Hypervisor Total File System Available Space (GiB)
The amount of unused storage space that is available on the file systems on a hypervisor.

Component properties

You can create capacity and relationship reports that include the following information:

Hypervisor IP Address
The IP address of the resource.

Hypervisor OS Type
The software that runs the hypervisor, that is, VMware ESX.

Hypervisor OS Version
The version number of the operating system that is running on the resource.

Hypervisor Processor Architecture
The architecture of the processor on the server or hypervisor. For example, the architecture of a processor might be Intel 64 bit (IA64) or Intel 32 bit (IA32).

Hypervisor Processor Count
The number of processors on the server or hypervisor.

Hypervisor Processor Speed (MHz)
The speed of the processor on the server or hypervisor.

Hypervisor Processor Type
Shows information about the processor, such as the family and model of the processor.

Hypervisor RAM (GiB)
The amount of RAM on the server or hypervisor.

Hypervisor Software API Version
The version number of the software API that runs on the hypervisor.

Hypervisor Software Full Name
The name, version number, and build number of the software that runs the hypervisor.

Hypervisor Time Zone
The time zone in which a resource is located.

Hypervisor Location
The physical location of a hypervisor. The location is defined when a hypervisor is added to Tivoli Storage Productivity Center. You can add or edit the location of the hypervisor in the **Properties** pane of the hypervisor in the web-based GUI.

Hypervisor Custom Tag 1, 2, and 3
User-defined text that is associated with a hypervisor. You can add or edit the custom tags for a hypervisor in the **Properties** pane of the hypervisor in the Tivoli Storage Productivity Center web-based GUI.

Vendor, model, and device information

You can create capacity and relationship reports that include the following information:

Hypervisor Model
The model name or model number of the resource.

Hypervisor Serial Number
The serial number of the resource.

Hypervisor Vendor
The vendor who supplied the resource.

Status information

You can create capacity and relationship reports that include the following information:

Hypervisor Status
The condition of the resource, for example normal, warning, or error.

Hypervisor Is Detected
Shows whether the resource was detected the last time that data was collected. If this value is `Yes`, the resource was detected.

Hypervisor Last Data Collection
The date and time when storage statistics were last collected from the resource.

Hypervisor Last Start Time
The last time that the resource was started.

Data for clusters on hypervisors in capacity and relationship reports

You can include general information about clusters on hypervisors in capacity and relationship reports.

Information about clusters on hypervisors

You can create capacity and relationship reports that include the following information:

Hypervisor Cluster Name
The name of a cluster that is monitored in your storage environment. A cluster is a group of hypervisors that collaborate for the purposes of workload balancing and failover.

Hypervisor Cluster Type
The type of a cluster that is monitored in your storage environment. For example, the type might be VMware Cluster.

Data for file systems on hypervisors in capacity and relationship reports

You can include general information, capacity data, and other information about file systems on hypervisors in capacity and relationship reports.

Information about file systems on hypervisors

You can create capacity and relationship reports that include the following information:

Hypervisor File System Mount Point
The name or mount point of the file system for the resource. For example, on Microsoft Windows systems, the value in this property might be `c:\` or `d:\`. On operating systems such as AIX, Linux, Solaris, or HP-UX, the mount point might be `/opt` or `/export/home`.

Hypervisor File System Export Name
The name of the exported file system.

Hypervisor File System Type
The type of file system that the hypervisor uses.

Capacity and usage data

You can create capacity and relationship reports that include the following information:

Hypervisor File System Capacity (GiB)
The amount of storage space on the file system of the resource.

Hypervisor File System Directory Count
The number of directories in the file systems that are on a server.

Hypervisor File System File Count
The number of files in the file system.

Hypervisor File System Available Space (GiB)
The amount of unused storage space in the file system of the resource.

Hypervisor File System Available Inodes
The number of unused inodes in file systems on the operating system.

Hypervisor File System Used Inodes
The number of used inodes in file systems on the operating system.

Tip: For Microsoft Windows systems, this property is blank.

Hypervisor File System Maximum Files
The maximum number of files that the file system on the resource can contain.

Hypervisor File System Physical Size (GiB)
The amount of physical storage space on the file systems on a resource. The physical size is the size of all the clusters that the file system uses.

Hypervisor File System Used Space (GiB)
The amount of used storage space in the file system of the resource.

Status information

You can create capacity and relationship reports that include the following information:

Hypervisor File System Is Detected
Shows whether the resource was detected the last time that data was collected. If this value is `Yes`, the resource was detected.

Hypervisor File System Last Scan
The date and time when file statistics were last collected from the resource.

Data for data stores on hypervisors in capacity and relationship reports

You can include general information, capacity data, and other information about data stores on hypervisors in capacity and relationship reports.

Information about data stores on hypervisors

You can create capacity and relationship reports that include the following information:

Hypervisor Data Store
The path to the VMware ESX data store on the hypervisor, for example `datastore_svc3c`.

Hypervisor Data Store Cluster Name
The name of the cluster, if the data store is a member of a data store cluster. If the data store is not a member of a data store cluster, no information is displayed.

Hypervisor Data Store Type
The type of file system that the hypervisor data store uses. For example, the type can be NFS or VMFS.

Hypervisor NAS Name
The name of the network-attached storage that the data store is obtained from.

Hypervisor NAS Path Name
The path name on the network-attached storage of the data store.

Capacity and usage data

You can create capacity and relationship reports that include the following information:

Hypervisor Data Store Capacity (GiB)
The amount of storage space that is on the hypervisor data store.

Hypervisor Data Store Available Space (GiB)
The amount of unused storage space on a hypervisor data store.

Hypervisor Data Store Allocation on Hypervisor Disk (GiB)
The amount of storage space that is allocated to the hypervisor data store on hypervisor server disks.

Hypervisor Data Store VM File System Version
The version number of the virtual machine file system on the hypervisor data store.

Status information

You can create capacity and relationship reports that include the following information:

Hypervisor Data Store Is Detected
Shows whether the resource was detected the last time that data was collected. If this value is `Yes`, the resource was detected.

Data for server disks on hypervisors in capacity and relationship reports

You can include general information, capacity data, path information, and other information about server disks on hypervisors in capacity and relationship reports.

Information about server disks

You can create capacity and relationship reports that include the following information:

Hypervisor Disk Path
The identifier that specifies a path to a hypervisor server disk, for example `vmhba1:0:0`.

Capacity and usage data

You can create capacity and relationship reports that include the following information:

Hypervisor Disk Capacity (GiB)
The amount of storage space that is on the hypervisor disk.

Hypervisor Disk Available Space (GiB)
The amount of unused storage space on a hypervisor server disk.

Status information

You can create capacity and relationship reports that include the following information:

Hypervisor Disk Status
The condition of the resource, for example normal, warning, or error.

Hypervisor Disk Is Detected
Shows whether the resource was detected the last time that data was collected. If this value is `Yes`, the resource was detected.

Vendor, model, and device information

You can create capacity and relationship reports that include the following information:

Hypervisor Disk Firmware Version
The version number of the firmware that is running on the disk.

Hypervisor Disk Model
The model name or model number of the resource.

Hypervisor Disk Serial Number
The serial number of the resource.

Hypervisor Disk Vendor
The vendor who supplied the resource.

Path information

You can create capacity and relationship reports that include the following information:

Hypervisor Disk LUN
The logical unit within a small computer system interface target on a disk.

Hypervisor Disk SCSI Target
The bus address for the small computer system interface of the target on a disk.

Hypervisor Disk Target WWPN
The worldwide port name of the storage port that the volume is mapped to.

Data for virtual machines managed by hypervisors in capacity and relationship reports

You can include general information, and file and disk information for virtual machines in capacity and relationship reports.

Information about virtual machines

You can create capacity and relationship reports that include the following information:

Virtual Machine Name
The name that was assigned to the virtual machine when it was added to the system.

Virtual Machine Configuration File
The path to the virtual machine configuration file for a hypervisor virtual machine, for example `[datastore1] example/example.vmx`.

Virtual Machine Is Detected
Shows whether the resource was detected the last time that data was collected. If this value is `Yes`, the resource was detected.

Virtual Machine Number of CPU
The number of processors on the virtual machine.

Virtual Machine Status
The condition of the resource, for example normal, warning, or error.

Virtual Machine Total Memory (GiB)
The amount of memory on a hypervisor virtual machine.

Virtual machine file information

You can create capacity and relationship reports that include the following information:

Virtual Machine File Path
The path to the virtual machine configuration file, or to the virtual machine disk file for the virtual machine. The virtual machine configuration file is a `.vmx` file, and the virtual machine disk file is a `.vmdk` file.

Virtual Machine File Logical Size (GiB)
The logical size of a virtual machine disk file for a hypervisor virtual machine.

Virtual Machine File Type
The type of the file for the virtual machine. For example, the file can be a virtual machine configuration file, a virtual machine disk file, an ISO image file, or other types of virtual machine file.

Virtual machine disk information

You can create capacity and relationship reports that include the following information:

Virtual Machine Disk Name
The name that was assigned to the virtual machine disk when it was added to the system.

Virtual Machine Disk SCSI Target
The bus address for the small computer system interface of the target on a disk.

Virtual Machine Disk Type
The type of virtual machine disk, for example, collection mirroring or logical disk mirroring.

Data for network-attached storage systems in capacity and relationship reports

You can include general information, capacity data, properties, and other information about network-attached storage (NAS) systems in capacity and relationship reports.

Information about NAS systems

You can create capacity and relationship reports that include the following information:

NAS Name
The fully qualified domain name of the NAS device. For example, the name of a NAS device might be `nas.example.com`.

NAS Domain Name
The domain name of the cluster, server, or NAS server.

NAS Short Name
The host name from the fully qualified domain name of the NAS device. For example, if the fully qualified domain name of the NAS device is `mycomputer.example.com`, the host name is `mycomputer`.

Capacity and usage data

You can create capacity and relationship reports that include the following information:

NAS Total Disk Capacity (GiB)
The amount of storage space on all disks on a NAS resource.

NAS Total Disk Available Space (GiB)
The amount of unused storage space on all disks on a NAS resource.

NAS Total File System Available Space (GiB)
The amount of unused storage space on the file systems on a NAS resource.

Component properties

You can create capacity and relationship reports that include the following information:

NAS OS Type
The operating system that is running on the server.

NAS OS Version
The version number of the operating system that is running on the resource.

NAS Location
The physical location of a NAS system that is probed as a filer. You can add or edit the location of the NAS system on the **File Storage** tab in the **Storage Systems** pane in the web-based GUI.

NAS Custom Tag 1, 2, and 3
User-defined text that is associated with a NAS system that is probed as a filer. You can add or edit the custom tags for a NAS system on the **File Storage** tab in the **Storage Systems** pane in the Tivoli Storage Productivity Center web-based GUI.

Vendor, model, and device information

You can create capacity and relationship reports that include the following information:

NAS Model
The model name or model number of the resource.

NAS Vendor
The vendor who supplied the resource.

NAS Serial Number
The serial number of the resource.

Status information

You can create capacity and relationship reports that include the following information:

NAS Is Detected
Shows whether the resource was detected the last time that data was collected. If this value is `Yes`, the resource was detected.

NAS Last Data Collection
The date and time when storage statistics were last collected from the resource.

NAS Last Start Time
The last time that the resource was started.

NAS system components information

You can create capacity and relationship reports that include the following information:

NAS System Name
The name that was assigned to the NAS system when it was added to the system.

NAS System IP Address
The IP address of the resource.

NAS System Location
The physical location of a NAS system that is probed as a storage system. The location is defined when a NAS system is added to Tivoli Storage Productivity Center. You can add or edit the location of the NAS system on the **File Storage** tab in the **Storage Systems** pane in the web-based GUI.

NAS System Custom Tag 1, 2, and 3
User-defined text that is associated with a NAS system that is probed as a

storage system. You can add or edit the custom tags for a NAS system on the **File Storage** tab in the **Storage Systems** pane in the Tivoli Storage Productivity Center web-based GUI.

Data for file systems on network-attached storage systems in capacity and relationship reports

You can include general information, capacity data, and other information about file systems on network-attached storage (NAS) systems in capacity and relationship reports.

Information about file systems on NAS systems

You can create capacity and relationship reports that include the following information:

NAS File System Mount Point
The name or mount point of the file system for the resource. For example, on Microsoft Windows systems, the value in this property might be `c:\` or `d:\`. On operating systems such as AIX, Linux, Solaris, or HP-UX, the mount point might be `/opt` or `/export/home`.

NAS File System Export Name
The name of the exported file system.

NAS File System Type
The type of file system that the resource uses.

Capacity and usage data

You can create capacity and relationship reports that include the following information:

NAS File System Capacity (GiB)
The amount of storage space on the file system of the resource.

NAS File System Directory Count
The number of directories in the file systems that are on a server.

NAS File System File Count
The number of files in the file system.

NAS File System Available Space (GiB)
The amount of unused storage space in the file system of the resource.

NAS File System Available Inodes
The number of unused inodes on the file system on a NAS server.

NAS File System Used Inodes
The number of used inodes on the file system on a NAS server.

NAS File System Maximum Files
The maximum number of files that the file system on the resource can contain.

NAS File System Physical Size (GiB)
The amount of physical storage space on the file systems on a resource. The physical size is the size of all the clusters that the file system uses.

NAS File System Used Space (GiB)
The amount of used storage space in the file system of the resource.

Component properties

You can create capacity and relationship reports that include the following information:

NAS File System Custom Tag 1, 2, and 3
User-defined text that is associated with a NAS file system. You can add or edit the custom tags for a NAS file system in the **Properties** pane of the resource in the Tivoli Storage Productivity Center web-based GUI.

Status information

You can create capacity and relationship reports that include the following information:

NAS File System Is Detected
Shows whether the resource was detected the last time that data was collected. If this value is `Yes`, the resource was detected.

NAS File System Last Scan
The date and time when file statistics were last collected from the resource.

Data for network-attached storage exports in capacity and relationship reports

You can include general information and status information about network-attached storage (NAS) exports in capacity and relationship reports.

Information about network-attached storage exports

You can create capacity and relationship reports that include the following information:

NAS Export Name
The name of the network-attached storage export. Use this name to mount the network-attached storage export on a server.

NAS Export Path
The path to a logical volume on a resource, for example `/dev/hd1`.

NAS Export State
Shows whether the network-attached storage export is active.

Status information

You can create capacity and relationship reports that include the following information:

NAS Export Is Detected
Shows whether the resource was detected the last time that data was collected. If this value is `Yes`, the resource was detected.

Data for logical volumes on network-attached storage systems in capacity and relationship reports

You can include general information, capacity data, and other information about logical volumes on network-attached storage (NAS) systems in capacity and relationship reports.

Information about logical volumes on NAS systems

You can create capacity and relationship reports that include the following information:

NAS Logical Volume Name
The name that was assigned to the NAS logical volume when it was added to the system.

NAS Logical Volume Type
The type of NAS logical volume. The logical volume type can be a NetApp traditional volume or a NetApp flexible volume.

Capacity and usage data

You can create capacity and relationship reports that include the following information:

NAS Logical Volume Capacity (GiB)
The amount of storage space on the NAS logical volume.

NAS Logical Volume Overhead (GiB)
The amount of space that is used for system management. The amount of space also includes space that is reserved for redundancy.

Status information

You can create capacity and relationship reports that include the following information:

NAS Logical Volume Is Detected
Shows whether the resource was detected the last time that data was collected. If this value is `Yes`, the resource was detected.

NAS Logical Volume Last Scan
The date and time when file statistics were last collected from the resource.

Data for network-attached storage disks in capacity and relationship reports

You can include general information, capacity data, properties, and other information about network-attached storage (NAS) disks in capacity and relationship reports.

Information about NAS disks

You can create capacity and relationship reports that include the following information:

NAS Disk Name
The name that was assigned to the NAS disk when it was added to the system.

Capacity and usage data

You can create capacity and relationship reports that include the following information:

NAS Disk Total Capacity (GiB)
The amount of storage space that is on the NAS disk.

NAS Disk Available Space (GiB)
The amount of unused storage space on a NAS disk.

Status information

You can create capacity and relationship reports that include the following information:

NAS Disk Status
The condition of the resource, for example normal, warning, or error.

NAS Disk Is Detected
Shows whether the resource was detected the last time that data was collected. If this value is `Yes`, the resource was detected.

IBM Scale Out Network Attached Storage and Storwize V7000 Unified information

You can create capacity and relationship reports that include the following information:

NSD Available Fragments
The number of fragments of disk space that are unused on the Network Shared Disk (NSD).

NSD Failover Group
The failover group that the NSD belongs to. A failover group is a group of resources that are grouped together to ensure that some of those resources are available if one or more of the resources fail.

NSD Type
The type of the NSD. For example, the type can be:

- Data and metadata
- Metadata only
- Data only

NSD Last Data Collection
The date and time when storage statistics were last collected from the resource.

NSD Custom Tag 1, 2, and 3
User-defined text that is associated with a Network Shared Disk (NSD). You can add or edit the custom tags for an NSD in the **Properties** pane of the resource in the Tivoli Storage Productivity Center web-based GUI.

NetApp information

You can create capacity and relationship reports that include the following information:

NAS Disk Flag
Shows whether the NAS disk is a spare device. If this value is `Spare device`, the NAS disk is a spare device.

NAS Disk Is Encrypted
Shows whether the resource is encrypted. If this value is `Yes`, the resource is encrypted.

NAS Disk Is Removable
Shows whether the disk can be removed from the server. If this value is `Yes`, the disk can be removed from the server.

NAS Disk Is Solid State
Shows whether the disk is a solid-state drive.

NetApp paths information

You can create capacity and relationship reports that include the following information:

NAS Disk LUN
The logical unit within a small computer system interface target on a disk.

NAS Disk SCSI Target
The bus address for the small computer system interface of the target on a disk.

NAS Disk Target WWPN
The worldwide port name of the storage port that the volume is mapped to.

NetApp vendor, model, and device information

You can create capacity and relationship reports that include the following information:

NAS Disk Firmware Version
The version number of the firmware that is running on the disk.

NAS Disk Model
The model name or model number of the resource.

NAS Disk Serial Number
The serial number of the resource.

NAS Disk Vendor
The vendor who supplied the resource.

Data for pools on IBM SONAS and Storwize V7000 Unified systems in capacity and relationship reports

You can include general information and capacity data about pools on IBM Scale Out Network Attached Storage and Storwize V7000 Unified systems in capacity and relationship reports.

Information about pools on network-attached storage systems

You can create capacity and relationship reports that include the following information:

NAS Pool Name
The name that was assigned to the NAS pool when it was added to the system.

Capacity and usage data

You can create capacity and relationship reports that include the following information:

NAS Pool Capacity (GiB)
The amount of storage space that is in a NAS pool.

NAS Pool Available Space (GiB)
The amount of unused storage space in a NAS pool.

NAS Pool Number of Logical Volumes
The number of logical volumes on a resource.

Data for IBM SONAS and Storwize V7000 Unified file sets in capacity and relationship reports

You can include general information, capacity data, and other information about IBM Scale Out Network Attached Storage and Storwize V7000 Unified file sets in capacity and relationship reports.

Information about network-attached storage file sets

You can create capacity and relationship reports that include the following information:

NAS File Set Name
The name that was assigned to the network-attached storage (NAS) file set when it was added to the system.

NAS File Set Comment
A comment that is associated with the NAS file set.

NAS File Set Path
The path to a logical volume on a resource, for example `/dev/hd1`.

Capacity and usage data

You can create capacity and relationship reports that include the following information:

NAS File Set Used Space (GiB)
The amount of used storage space in the file set of the NAS resource.

NAS File Set Used Inodes
The number of used inodes in file systems on operating systems such as AIX, Linux, Solaris, or HP-UX.

Status information

You can create capacity and relationship reports that include the following information:

NAS File Set Status
Shows whether the network-attached storage file set is linked or unlinked.

NAS File Set Is Detected
Shows whether the resource was detected the last time that data was collected. If this value is `Yes`, the resource was detected.

Data for storage virtualizers in capacity and relationship reports

You can include general information, capacity data, properties, and other information about storage virtualizers in capacity and relationship reports.

Information about storage virtualizers

You can create capacity and relationship reports that include the following information:

Storage Virtualizer Name
A user-defined name of the storage virtualizer. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage virtualizer was added for monitoring.

Capacity and usage data

You can create capacity and relationship reports that include the following information:

Storage Virtualizer Total Pool Capacity (GiB)
The total amount of storage space in pools on the storage virtualizer.

Storage Virtualizer Pool Used Space (GiB)
The amount of allocated space that is used by the volumes in a pool, which includes thin-provisioned and standard volumes.

For SAN Volume Controller and Storwize V7000, you can pre-allocate thin-provisioned volume space when the volumes are created. For these storage systems, the Storage Virtualizer Pool Used Space might be different than the Storage Virtualizer Pool Allocated Space for pools that contain thin-provisioned volumes. For pools with compressed volumes on SAN Volume Controller and Storwize V7000, the Storage Virtualizer Pool Used Space reflects the size of compressed data written to disk. As the data changes the Storage Virtualizer Pool Used Space may at times be less than the Storage Virtualizer Pool Allocated Space.

For pools with volumes that are not thin provisioned or compressed in SAN Volume Controller, Storwize V7000, and other storage systems, the values for Storage Virtualizer Pool Used Space and Storage Virtualizer Pool Allocated Space are equal.

This value is accurate as of the most recent time that Tivoli Storage Productivity Center collected data about a pool. Because data collection is run on a set schedule and the used space on volumes can change rapidly, the value in this column might not be 100% accurate for the current state of volumes.

Storage Virtualizer Pool Available Space (GiB)
The amount of space in a pool that is not reserved for volumes.

Storage Virtualizer Total Volume Capacity (GiB)
The amount of virtual volume space on all volumes on the storage virtualizer.

Storage Virtualizer Volume Allocated Space (GiB)
The amount of space that is reserved for a volume.

The space that is allocated for a thin-provisioned volume is less than its virtual capacity, which is shown in Storage Virtualizer Capacity.

This value is equal to Storage Virtualizer Volume Used Space for the following storage systems:

- Storage systems other than SAN Volume Controller and Storwize V7000
- SAN Volume Controller and Storwize V7000 storage systems that are not thin-provisioned

Storage Virtualizer Volume Assigned Space (GiB)
The amount of virtual volume space that is assigned to the server or storage virtualizer.

Storage Virtualizer MDisk Available Space (GiB)
The amount of space on managed disks that is available in a pool, or is available to be added to a pool.

Storage Virtualizer MDisk Capacity (GiB)
The amount of storage space on the managed disk.

Storage Virtualizer Disk Capacity (GiB)
The amount of local disk storage on the storage virtualizer. The local disks are the internal disk drives.

Storage Virtualizer Number of MDisks
The number of managed disks on a resource.

Storage Virtualizer Number of Volumes
The number of volumes on a resource.

Storage Virtualizer Overhead (GiB)
The amount of space that is used for system management. The amount of space also includes space that is reserved for redundancy.

Storage Virtualizer Tier Available Space (GiB)
The amount of unused tier storage of a particular type. The type is identified in the Storage Virtualizer Tier Type property.

This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Tier Capacity (GiB)
The amount of tier storage of a particular type. The type is identified in the Storage Virtualizer Tier Type property.

This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Physical Allocation Percentage
The percentage of physical space in storage virtualizer pools that is reserved for volumes. This value is always less than or equal to 100% because you cannot reserve more physical space than is available in the pools.

Tivoli Storage Productivity Center uses the following formula to determine the allocation percentage:

`(allocated space ÷ pool capacity) × 100`

For example, the physical allocation percentage is 25% for a total storage virtualizer pool size of 200 GiB. Therefore, the space that is reserved for volumes is 50 GiB.

Storage Virtualizer Virtual Allocation Percentage
The percentage of physical space in storage virtualizer pools that is committed to the total virtual capacity of the volumes in the pool. In thin-provisioned environments, this percentage exceeds 100% if a pool is overcommitted (over-provisioned).

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

`(total volume capacity ÷ pool capacity) × 100`

For example, the allocation percentage is 200% for a total pool size of 15 GiB. Therefore, the virtual capacity that is committed to the volumes in the pools is 30 GiB.

This configuration means that twice as much space is committed than is physically contained in the pools. If the allocation percentage is 100% for the same pools, then the virtual capacity that is committed to the pools is 15 GiB. This configuration means that all the physical capacity of the pools is already allocated to volumes.

An allocation percentage that is higher than 100% is considered aggressive. The pools have insufficient physical capacity to satisfy the maximum allocation for all the thin-provisioned volumes in the pools. In such cases, use the Storage Virtualizer Shortfall Percentage property to estimate how critical the shortage of space is for storage virtualizer pools.

This value is only available for pools with thin-provisioned volumes.

This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Shortfall Percentage
The percentage of the remaining unallocated volume space in storage virtualizer pools that is not available to be allocated. The higher the percentage, the more critical the shortfall of pool space.

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

```
(unallocatable space ÷ (volume space - used volume space)) × 100
```

You can use this percentage to determine when the amount of overcommitted space in pools reaches a critically high level. For example, the physical space in pools might be less than the committed virtual space. In this case, the pools do not have enough space to fulfill the commitment to virtual space.

This Storage Virtualizer Shortfall Percentage represents the percentage of the committed virtual space that is not available in pools. As more space is used over time by volumes while the pool capacity remains the same, this percentage increases.

For example, the physical capacity of pools is 70 GiB, but 150 GiB of virtual space is committed to thin-provisioned volumes. If the volumes are using 50 GiB, then there is still 100 GiB committed to those volumes (150 GiB - 50 GiB). There is only 20 GiB of available pool space (70 GiB - 50 GiB). Because only 20 GiB of pool space is available, 80 GiB of the committed space cannot be allocated (100 GiB - 20 GiB). In this case, the percentage of committed space that is unavailable is 80% (80 GiB ÷ 100 GiB × 100).

This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

This property is available only for storage virtualizer pools with thin-provisioned volumes.

Component properties

You can create capacity and relationship reports that include the following information:

Storage Virtualizer Access Information
The URL from which you can access the storage system or storage virtualizer.

Storage Virtualizer Alias
Shows an alternative name for a storage virtualizer.

Storage Virtualizer Code Level
The microcode or firmware level of the storage virtualizer.

Storage Virtualizer Time Zone
The time zone in which a resource is located.

Storage Virtualizer Location
The physical location of a storage virtualizer. The location is defined when a storage virtualizer is added to Tivoli Storage Productivity Center. You can add or edit the location of the storage virtualizer in the **Properties** pane for the storage system in the web-based GUI.

Storage Virtualizer Custom Tag 1, 2, and 3
User-defined text that is associated with a storage virtualizer. You can add or edit the custom tags for a storage virtualizer on the **Properties** page of the storage system in the Tivoli Storage Productivity Center web-based GUI.

Storage Virtualizer User Provided Name
The name that was specified for the storage virtualizer in the storage environment.

Storage Virtualizer Tier Type
The type of tier that is used on the storage virtualizer. For example, the tier type can be hard disk drive (HDD) or solid-state drive (SSD).

This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Is Compression Active
Shows whether the compression feature is enabled on the storage virtualizer. If this value is `Yes`, the compression feature is enabled.

Storage Virtualizer Configuration
Shows that a storage virtualizer is configured to virtualize back-end storage. This value is always **Storage Virtualizer**.

Status information

You can create capacity and relationship reports that include the following information:

Storage Virtualizer Status
The condition of the resource, for example normal, warning, or error.

Storage Virtualizer Is Detected
Shows whether the resource was detected the last time that data was collected. If this value is `Yes`, the resource was detected.

Storage Virtualizer Last Data Collection
The date and time when storage statistics were last collected from the resource.

Storage Virtualizer Last Data Collection Status
The condition of the last data collection. The status can show if the collection was a success, a failure, or if data was collected from the resource.

Vendor, model, and device information

You can create capacity and relationship reports that include the following information:

Storage Virtualizer Type
The type of storage virtualizer. For example, the storage virtualizer can be an **IBM Storwize V7000** system, an **IBM SAN Volume Controller** system, or another type of storage virtualizer.

Storage Virtualizer Vendor
The vendor who supplied the resource.

Storage Virtualizer Model
The model name or model number of the storage virtualizer.

Storage Virtualizer Machine Type
The machine type of a storage virtualizer. For example, the storage virtualizer can be **Storwize V7000 - 2076**, **SAN Volume Controller - 2145**, or another type of storage virtualizer.

Storage Virtualizer IP Address
The IP address of the resource.

Storage Virtualizer Serial Number
The serial number of the resource.

Data for storage virtualizer pools in capacity and relationship reports

You can include general information, capacity data, properties, and other information about storage virtualizer pools in capacity and relationship reports.

Information about storage virtualizer pools

You can create capacity and relationship reports that include the following information:

Storage Virtualizer Pool Name
The name that was assigned to the pool when it was added to the system.

Capacity and usage data

You can create capacity and relationship reports that include the following information:

Storage Virtualizer Pool Capacity (GiB)
The total amount of storage space in a pool.

Storage Virtualizer Pool Available Space (GiB)
The amount of unused storage space in a storage virtualizer pool.

Storage Virtualizer Pool Total Volume Capacity (GiB)
The total storage space on all the volumes in a pool, which includes thin-provisioned and standard volumes. For thin-provisioned volumes, this value includes virtual space.

Storage Virtualizer Pool Allocated Space (GiB)
The amount of space that is reserved for all the volumes in a pool, which includes both thin-provisioned and standard volumes.

The space that is allocated for thin-provisioned volumes is less than their virtual capacity. The Storage Virtualizer Pool Total Volume Capacity (GiB) property shows the virtual capacity of the volumes. If a pool does not contain thin-provisioned volumes, this value is the same as the value of the Storage Virtualizer Pool Total Volume Capacity (GiB) property.

This value is equal to Storage Virtualizer Used Space (GiB) for volumes that are not thin provisioned.

Storage Virtualizer Pool Used Volume Space (GiB)
The amount of allocated space that is used by the volumes in a pool, which includes thin-provisioned and standard volumes.

For SAN Volume Controller and Storwize V7000, you can preallocate thin-provisioned volume space when volumes are created. For these storage systems, the Storage Virtualizer Pool Used Space might be different than the Storage Virtualizer Pool Allocated Space for pools that contain thin-provisioned volumes. In other cases, the values for Storage Virtualizer Pool Used Space and Storage Virtualizer Pool Allocated Space are equal.

This value is accurate as of the most recent time that Tivoli Storage Productivity Center collected data about a volume. The value in this property might not be 100% accurate for the current state of volumes. This inaccuracy might occur because data collection is run on a set schedule and the used space on volumes can change rapidly.

Storage Virtualizer Pool Extent Size (MiB)
The size of the extents that were specified when a pool was created. This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Pool Assigned Volume Space (GiB)
The amount of space in the pool that is on volumes that are assigned to a server or storage virtualizer.

Storage Virtualizer Pool Unassigned Volume Space (GiB)
The amount of volume space in the pool that is not assigned to a server or storage virtualizer.

Storage Virtualizer Pool Tier Capacity (GiB)
The amount of pool tier storage of a particular type. The type is identified in the Storage Virtualizer Pool Tier Type property.

This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Pool Tier Available Space (GiB)
The amount of pool tier storage of a particular type that is unused. The type is identified in the Storage Virtualizer Tier Type property.

This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Pool Tier Number of MDisks
The number of managed disks on a storage virtualizer pool. This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Pool Number of Storage Volumes
The number of volumes in the storage virtualizer pool.

Storage Virtualizer Pool Number of MDisks
The number of managed disks on a resource.

Storage Virtualizer Pool Maximum I/O Capability
The projected maximum number of I/O operations per second for a pool. This value is calculated based on the value in the Storage Virtualizer Pool Back-End Storage Disks property, and on the values in following properties:

- Storage Virtualizer Pool Back-End Storage System Type
- Storage Virtualizer Pool Back-End Storage RAID Level
- Storage Virtualizer Pool Back-End Storage Disk Type

This property applies only to SAN Volume Controller, Storwize V7000, and Storwize V7000 Unified pools.

Storage Virtualizer Pool Back-End Storage Disks
The number of physical disks that contribute to the volumes on the back-end storage system. This property applies only to SAN Volume Controller, Storwize V7000, and Storwize V7000 Unified pools.

Storage Virtualizer Pool Physical Allocation Percentage
The percentage of physical space in a pool that is reserved for volumes. This value is always less than or equal to 100% because you cannot reserve more physical space than is available in a pool.

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

```
(allocated space ÷ pool capacity) × 100
```

For example, the physical allocation percentage is 25% for a total pool size of 200 GiB. Therefore, the space that is reserved for volumes is 50 GiB.

Storage Virtualizer Pool Virtual Allocation Percentage
The percentage of physical space in a pool that is committed to the total virtual capacity of the volumes in the pool. In thin-provisioned environments, this percentage exceeds 100% if a pool is overcommitted (over-provisioned).

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

```
(total volume capacity ÷ pool capacity) × 100
```

For example, for a total pool size of 15 GiB, the allocation percentage might be 200%. In this case, the virtual capacity that is committed to the volumes in the pool is 30 GiB. This configuration means that twice as much space is committed than is physically contained in the pool. If the allocation percentage is 100% for the same pool, then the virtual capacity that is committed to the pool is 15 GiB. This configuration means that all the physical capacity of the pool is already allocated to volumes.

An allocation percentage that is higher than 100% is considered aggressive. The pool has insufficient physical capacity to satisfy the maximum allocation for all the thin-provisioned volumes in the pool. In such cases, use the Storage Virtualizer Pool Shortfall Percentage property to estimate how critical the shortage of space is for storage system pools.

This value is only available for pools with thin-provisioned volumes.

Storage Virtualizer Pool Shortfall Percentage
The percentage of the remaining unallocated volume space in a pool that is not available to be allocated. The higher the percentage, the more critical the shortfall of pool space.

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

```
(unallocatable space ÷ (total volume capacity − allocated space)) × 100
```

You can use this percentage to determine when the amount of overcommitted space in a pool reaches a critically high level. For example, the physical space in a pool might be less than the committed virtual space. In this case, the pool does not have enough space to fulfill the commitment to virtual space.

This value represents the percentage of the committed virtual space that is not available in a pool. As more space is used over time by volumes while the pool capacity remains the same, this percentage increases.

For example, the physical capacity of a pool is 70 GiB, but 150 GiB of virtual space is committed to thin-provisioned volumes. If the volumes are using 50 GiB, then there is still 100 GiB committed to those volumes (150 GiB - 50 GiB). There is only 20 GiB of available pool space (70 GiB - 50 GiB). Because only 20 GiB of pool space is available, 80 GiB of the committed space cannot be allocated (100 GiB - 20 GiB). In this case, the percentage of committed space that cannot be allocated is 80% (80 GiB ÷ 100 GiB × 100).

This value is only available for pools with thin-provisioned volumes.

This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Pool Unallocated Volume Space (GiB)
The amount of the Total Volume Capacity in the pool that is not allocated.

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

```
total volume capacity − allocated space
```

The space that is allocated for thin-provisioned volumes is typically less than their virtual capacity. Therefore, the unallocated space represents the difference between the virtual capacity and the allocated space for all the volumes in the pool.

Storage Virtualizer Pool Unused Volume Space (GiB)
The amount of space that is allocated to the volumes in a pool and is not yet used.

Tivoli Storage Productivity Center uses the following formula to determine this value:

```
allocated space − used pool space
```

This property is available only for SAN Volume Controller and Storwize V7000 pools.

Storage Virtualizer Pool Unallocatable Volume Space (GiB)
The amount of space by which the Total Volume Capacity exceeds the physical capacity of a pool.

In thin-provisioned environments, it is possible to over commit (over provision) storage in a pool. If you create volumes with more virtual capacity than can be physically allocated in the pool, you can over commit storage in the pool.

This value represents the amount of volume space that cannot be allocated based on the current capacity of the pool.

Storage Virtualizer Pool Used Space Percentage
The percentage of allocated space that is used by the volumes in a pool, which includes thin-provisioned and standard volumes.

Storage Virtualizer Pool Compressed Virtual Capacity (GiB)
The total virtual capacity of all the volumes that are compressed in a storage virtualizer pool.

Storage Virtualizer Pool Compressed Capacity (GiB)
The amount of storage space that is used by compressed volumes in a storage virtualizer pool. For example, if 100 GiB of uncompressed data is compressed, and the size of the compressed data is 20 GiB, the value is 20.

Storage Virtualizer Pool Uncompressed Capacity (GiB)
The amount of storage space that is used if the compressed volume space is uncompressed. For example, if 100 GiB of uncompressed data is compressed, and the size of the compressed data is 20 GiB, the value is 100.

Component properties

You can create capacity and relationship reports that include the following information:

Storage Virtualizer Pool Is Encryptable
Shows whether the storage virtualizer pool can be encrypted. If this value is `Yes`, the storage virtualizer pool can be encrypted.

This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Pool Is Encrypted
Shows whether the storage virtualizer pool is encrypted. If this value is `Yes`, the storage virtualizer pool is encrypted.

This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Pool Is Solid State
Shows whether there are solid-state drives in the pool. This property can contain the following values:

Mixed The pool contains both hard disk drives and solid-state drives.

Non solid state
The pool contains no solid-state drives.

Solid state
The pool contains a least one solid-state drive.

Storage Virtualizer Pool Is Thin Provisioned
Shows whether a pool, volume, or volume copy is thin-provisioned. If this value is `Yes`, the resource is thin-provisioned.

Storage Virtualizer Pool RAID Level
The RAID level of the resource, such as RAID 5 or RAID 10. The RAID level affects the performance and fault tolerance of the volumes that are allocated from the resource.

Storage Virtualizer Pool Warning Level
The percentage of used capacity of the resource at which a warning is generated. This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Pool Tier
The tier that a managed disk is assigned to by the internal cluster automatic detection for internal disks or by the user for external disks. This classification is used by the storage virtualizer to determine when to activate the Easy Tier function for certain pools.

Storage Virtualizer Pool Tier Type
The type of tier that is used on the storage virtualizer pool. For example, the tier type can be hard disk drive (HDD) or solid-state drive (SSD).

This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Pool Is Easy Tier
Shows whether the IBM System Storage Easy Tier feature is enabled. The IBM System Storage Easy Tier feature can be set to `auto`, `on`, or `off`.

The IBM System Storage Easy Tier feature automatically helps optimize solid-state storage deployments in multitier systems.

Storage Virtualizer Pool Back-End Storage System Type
The type of storage system that is providing storage space to a pool. This property applies only to SAN Volume Controller, Storwize V7000, and Storwize V7000 Unified pools.

Storage Virtualizer Pool Back-End Storage RAID Level
The RAID level of the volumes on the back-end storage system that are providing storage space to a pool. This property applies only to SAN Volume Controller, Storwize V7000, and Storwize V7000 Unified pools.

Storage Virtualizer Pool Back-End Storage Disk Type
The class and speed of the physical disks that contribute to the volumes on the back-end storage system. This property applies only to SAN Volume Controller, Storwize V7000, and Storwize V7000 Unified pools.

Storage Virtualizer Pool Custom Tag 1, 2, and 3
User-defined text that is associated with a storage virtualizer pool. You can add or edit the custom tags for a storage virtualizer pool on the **Properties** notebook of the pool in the Tivoli Storage Productivity Center web-based GUI.

Storage Virtualizer Pool Is Compression Active
Shows whether the compression feature is enabled on the storage virtualizer pool. If this value is `Yes`, the compression feature is enabled.

Status information

You can create capacity and relationship reports that include the following information:

Storage Virtualizer Pool Status
The condition of the resource, for example normal, warning, or error.

Storage Virtualizer Pool Is Detected
Shows whether the resource was detected the last time that data was collected. If this value is `Yes`, the resource was detected.

Storage Virtualizer Pool Easy Tier Status
Shows whether the Easy Tier feature is active or inactive. This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Data for storage virtualizer volumes in capacity and relationship reports

You can include general information, capacity data, properties, information about copies of volumes, and other information about storage virtualizer volumes in capacity and relationship reports.

Information about storage virtualizer volumes

You can create capacity and relationship reports that include the following information:

Storage Virtualizer Volume Name
The name that was assigned to the storage virtualizer volume when it was added to the system.

Storage Virtualizer Volume Assigned Host Connection
The host connection to which the storage virtualizer volume is assigned. The host connection is a definition in the storage virtualizer that contains the WWPN for the server. The storage virtualizer uses the WWPN to assign volumes to servers.

Storage Virtualizer Volume Host Connection OS Type
The operating system type of the server or hypervisor that the virtualizer volume is assigned to.

Storage Virtualizer Volume Preferred Node Name
The number of the storage virtualizer node that is used for I/O operations for the storage virtualizer volume.

Capacity and usage data

You can create capacity and relationship reports that include the following information:

Storage Virtualizer Volume Capacity (GiB)
The total amount of storage space that is committed to a volume.

For thin-provisioned volumes, this value represents the virtual capacity of the volume.

Storage Virtualizer Volume Allocated Space (GiB)
The amount of space that is reserved for a volume.

The space that is allocated for a thin-provisioned volume is less than its virtual capacity, which is shown in Storage Virtualizer Capacity.

This value is equal to Storage Virtualizer Volume Used Space for the following storage systems:

- Storage systems other than SAN Volume Controller and Storwize V7000

- SAN Volume Controller and Storwize V7000 storage systems that are not thin-provisioned

Storage Virtualizer Volume Used Space (GiB)
The amount of allocated space that is used by a volume.

For SAN Volume Controller and Storwize V7000, you can preallocate thin-provisioned volume space when the volumes are created. In these cases, the Storage Virtualizer Volume Used Space (GiB) might be different than the Storage Virtualizer Volume Allocated Space (GiB). For volumes that are not thin provisioned, the values for Storage Virtualizer Volume Used Space (GiB) and Storage Virtualizer Volume Allocated Space (GiB) are equal.

This value is accurate as of the most recent time that Tivoli Storage Productivity Center collected data about a volume. The value in this property might not be 100% accurate for the current state of volumes. This inaccuracy might occur because data collection is run on a set schedule and the used space on volumes can change rapidly.

Storage Virtualizer Volume Overhead (GiB)
The amount of space that is used for system management. The amount of space also includes space that is reserved for redundancy.

Storage Virtualizer Volume Used Allocated Space Percentage
The percentage of reserved space for a volume that is being used. This value is always less than or equal to 100% because a volume cannot use more space than is allocated.

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

```
(used space ÷ allocated space) × 100
```

This property is available only for SAN Volume Controller and Storwize V7000 volumes.

Storage Virtualizer Volume Unallocated Space (GiB)
The amount of space in a pool that is not reserved for a volume.

Tivoli Storage Productivity Center uses the following formula to determine the value:

```
capacity - allocated space
```

Storage Virtualizer Volume Physical Allocation Percentage
The percentage of physical space that is reserved for a volume. This value is always less than or equal to 100% because you cannot reserve more physical space than is available.

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

```
(allocated space ÷ capacity) × 100
```

For example, the physical allocation percentage is 25% for a volume size of 200 GiB. Therefore the space that is reserved for volumes is 50 GiB.

Storage Virtualizer Volume Unused Space (GiB)
The amount of space that is allocated to a volume and is not yet used.

Tivoli Storage Productivity Center uses the following formula to determine this value:

```
allocated space - used Space
```

This property is available only for SAN Volume Controller and Storwize V7000 pools.

Storage Virtualizer Volume Shortfall Percentage
The percentage of the remaining unallocated volume space in a pool that is not available to be allocated to a volume. The higher the percentage, the more critical the shortfall of space.

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

`(unallocatable volume space ÷ unallocated volume space) × 100`

You can use this percentage to determine when the amount of overcommitted space in a pool reaches a critically high level for the volume. For example, the physical space in a pool might be less than the committed virtual space. In this case, the pool does not have enough space to fulfill the commitment to virtual space for a volume.

This value represents the percentage of the committed virtual space that is not available in a pool. As more space is used over time by a volume while the pool capacity remains the same, this percentage increases.

For example, the remaining physical capacity of a pool is 70 GiB, however, 150 GiB of virtual space is committed to a thin-provisioned volume. If the volume is using 50 GiB, then there is still 100 GiB committed to that volume (150 GiB - 50 GiB). There is a shortfall of 30 GiB (70 GiB remaining pool space - 100 GiB remaining commitment of volume space to the volume). The volume is overcommitted by 30 GiB based on the available space in the pool. The shortfall is 30% when you use the following calculation:

`(100 GiB unallocated volume space - 70 GiB remaining pool space) ÷ 100 GiB unallocated volume space × 100`

This value is only available for pools with thin-provisioned volumes.

Storage Virtualizer Volume Unallocatable Space (GiB)
The unallocatable storage space in GiB of a thin-provisioned volume. Unallocatable space cannot be supplied by the pool to which the volume belongs.

Storage Virtualizer Volume Uncompressed Capacity (GiB)
The amount of storage space that is used if the compressed volume space is uncompressed. For example, if 100 GiB of uncompressed data is compressed, and the size of the compressed data is 20 GiB, the value is 100.

Component properties

You can create capacity and relationship reports that include the following information:

Storage Virtualizer Volume Type
The type of storage virtualizer volume. For example, the storage virtualizer volume can be striped, sequential, or another type of storage virtualizer volume. This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Volume WWN
The worldwide name of the volume.

Storage Virtualizer Volume Fast Write State
Shows whether the cache for a volume on a disk that is managed by a storage virtualizer is empty, contains data, or is corrupted.

Storage Virtualizer Volume Grain Size (KiB)
The grain size with which a thin-provisioned volume was created. This value is typically 32, 64, 128, or 256 KiB. Larger grain sizes maximize performance, whereas smaller grain sizes maximize space efficiency. Grain sizes also limit the maximum virtual space of a volume.

This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Volume Is Assigned
Shows whether the volume is assigned to a server. If this value is `Yes`, the volume is assigned to a server.

Storage Virtualizer Volume Is Auto Expand Enabled
Shows whether a volume or volume copy can allocate new extents from a pool automatically. Volumes or volume copies might allocate new extents to expand the real capacity of the storage virtualizer volume or volume copy. If this value is `Yes`, the volume or volume copy can allocate new extents from a pool automatically.

Storage Virtualizer Volume Is Encryptable
Shows whether the resource can be encrypted. If this value is `Yes`, the resource can be encrypted.

Storage Virtualizer Volume Is Encrypted
Shows whether the resource is encrypted. If this value is `Yes`, the resource is encrypted.

Storage Virtualizer Volume Is Formatted
Shows whether a storage virtualizer volume is formatted. If this value is `Yes`, the storage virtualizer volume is formatted.

Storage Virtualizer Volume Is Thin Provisioned
Shows whether a pool, volume, or volume copy is thin-provisioned. If this value is `Yes`, the resource is thin-provisioned.

Storage Virtualizer Volume Metro Mirror Name
The name of the Metro Mirror that keeps the synchronous copy of the storage virtualizer volume.

Storage Virtualizer Volume Mirror Count
The number of mirrors that keep a synchronous copy of the resource.

Storage Virtualizer Volume Throttle
The maximum number of commands that the storage virtualizer volume can queue.

Storage Virtualizer Volume Warning Level
The percentage of used capacity of the resource at which a warning is generated.

Storage Virtualizer Volume FlashCopy Relationship
Shows whether a volume on a storage virtualizer is in a FlashCopy relationship. This property can contain the following values:

Source Relationship
The volume is the source of the relationship.

Target Relationship
The volume is the target of the relationship.

Both Source and Target Relationship
The volume is both the source and target of the relationship.

Not in a FlashCopy Relationship
The volume is not in a FlashCopy relationship.

Storage Virtualizer Volume Remote Copy Relationship
Shows whether a volume on a storage virtualizer is in a remote copy relationship. This property can contain the following values:

Not in a Copy Relationship
The volume is not in a remote copy relationship.

Source Relationship
The volume is the source of the relationship.

Target Relationship
The volume is the target of the relationship.

Both Source and Target Relationship
The volume is both the source and target of the relationship.

Storage Virtualizer Volume RAID Level
The RAID level of a storage virtualizer volume, such as RAID 5 or RAID 10. The RAID level affects the performance and fault tolerance of the volumes that are allocated from the resource.

Storage Virtualizer Volume Is Compressed
Shows whether the storage virtualizer volume is compressed. If this value is `Yes`, the volume is compressed.

Status information

You can create capacity and relationship reports that include the following information:

Storage Virtualizer Volume Status
The condition of the resource, for example normal, warning, or error.

Storage Virtualizer Volume Is Detected
Shows whether the resource was detected the last time that data was collected. If this value is `Yes`, the resource was detected.

Storage Virtualizer Volume Native Status
Shows the level of access of nodes in the system to the storage virtualizer managed disk or volume. The level of access can be online, offline, degraded, or excluded.

Volume copy information

You can create capacity and relationship reports that include the following information:

Storage Virtualizer Volume Copy ID
The identifier of a volume copy. This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Volume Copy Grain Size (KiB)
The grain size with which a thin-provisioned volume was created. This

value is typically 32, 64, 128, or 256 KiB. Larger grain sizes maximize performance, whereas smaller grain sizes maximize space efficiency. Grain sizes also limit the maximum virtual space of a volume.

Storage Virtualizer Volume Copy Is Auto Expand Enabled
Shows whether a volume or volume copy can allocate new extents from a pool automatically. Volumes or volume copies might allocate new extents to expand the real capacity of the storage virtualizer volume or volume copy. If this value is `Yes`, the volume or volume copy can allocate new extents from a pool automatically.

Storage Virtualizer Volume Copy Is Detected
Shows whether the resource was detected the last time that data was collected. If this value is `Yes`, the resource was detected.

Storage Virtualizer Volume Copy Is Primary
Shows whether the volume copy is the primary volume copy. This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Volume Copy Is Thin Provisioned
Shows whether a pool, volume, or volume copy is thin-provisioned. If this value is `Yes`, the resource is thin-provisioned.

Storage Virtualizer Volume Copy Total Number of Extents
The number of extents that are used by the storage virtualizer volume copy.

Storage Virtualizer Volume Copy Type
The type of copy of the storage virtualizer volume. For example, the copy of the storage virtualizer volume can be sequential, a mirror copy, or another type of copy.

Storage Virtualizer Volume Copy Warning Level
The percentage of used capacity of the resource at which a warning is generated.

Storage Virtualizer Volume Copy Used Allocated Space Percentage
The percentage of reserved space for a volume copy that is being used. This value is always less than or equal to 100% because a volume copy cannot use more space than is allocated.

Tivoli Storage Productivity Center uses the following formula to determine this value:

`(used space ÷ allocated space) × 100`

This property is available only for SAN Volume Controller and Storwize V7000 pools.

Storage Virtualizer Volume Copy Used Space (GiB)
The amount of allocated space that is used by a volume copy.

Storage Virtualizer Volume Copy Allocated Space (GiB)
The amount of space that is reserved for a volume copy.

The space that is allocated for a thin-provisioned volume copy is less than its virtual capacity, which is shown in Storage Virtualizer Capacity (GiB).

This value is equal to Storage Virtualizer Volume Copy Used Space (GiB) for volume copies that are not thin provisioned.

Storage Virtualizer Volume Copy Unallocated Space (GiB)
The amount of space in a pool that is not reserved for a volume copy.

Tivoli Storage Productivity Center uses the following formula to determine this value:

```
capacity - allocated space
```

Storage Virtualizer Volume Copy Physical Allocation Percentage
The percentage of physical space that is reserved for a volume copy. This value is always less than or equal to 100% because you cannot reserve more physical space than is available.

Tivoli Storage Productivity Center uses the following formula to determine this value:

```
(allocated Space ÷ capacity) × 100
```

For example, the physical allocation percentage is 25% for a total pool size of 200 GiB. Therefore, the space that is reserved for volume copies is 50 GiB.

Storage Virtualizer Volume Copy Unused Space (GiB)
The amount of space that is allocated to a volume copy and is not yet used.

Tivoli Storage Productivity Center uses the following formula to determine this value:

```
allocated Space - used space
```

This property is available only for SAN Volume Controller and Storwize V7000 pools.

Storage Virtualizer Volume Copy Shortfall Percentage
The percentage of the remaining unallocated volume copy space in a pool that is not available to be allocated to a volume copy.

The higher the percentage, the more critical the shortfall of space.

Tivoli Storage Productivity Center uses the following formula to determine this value:

```
(unallocatable space ÷ (capacity – real capacity)) × 100
```

You can use this percentage to determine when the amount of overcommitted space in a pool reaches a critically high level for the volume. For example, the physical space in a pool might be less than the committed virtual space. In this case, the pool does not have enough space to fulfill the commitment to virtual space for a volume.

This value represents the percentage of the committed virtual space that is not available in a pool. As more space is used over time by a volume while the pool capacity remains the same, this percentage increases.

For example, the remaining physical capacity of a pool is 70 GiB, however, 150 GiB of virtual space is committed to a thin-provisioned volume. If the volume is using 50 GiB, then there is still 100 GiB committed to that volume (150 GiB - 50 GiB). There is a shortfall of 30 GiB (70 GiB remaining pool space - 100 GiB remaining commitment of volume space to the volume). The volume is overcommitted by 30 GiB based on the available space in the pool. The shortfall is 30% when you use the following calculation:

```
(100 GiB unallocatable volume copy space - 70 GiB
remaining pool space) ÷ 100 GiB unallocated volume space × 100
```

Available only for thin-provisioned volume copies.

Storage Virtualizer Volume Copy Unallocatable Space (GiB)
The unallocatable storage space in GiB of a thin-provisioned volume copy. Unallocatable space cannot be supplied by the pool to which the volume copy belongs.

Storage Virtualizer Volume Copy Is Compressed
Shows whether the volume copy is compressed. If this value is `Yes`, the volume copy is compressed.

Storage Virtualizer Volume Copy Uncompressed Capacity (GiB)
The amount of storage space that is used if the compressed space on the volume copy is uncompressed. For example, if 100 GiB of data is compressed, the value is 100.

Data for managed disks on storage virtualizers in capacity and relationship reports

You can include general information, capacity data, properties, and other information about managed disks on storage virtualizers in capacity and relationship reports.

Information about managed disks on storage virtualizers

You can create capacity and relationship reports that include the following information:

Storage Virtualizer MDisk Name
The name that was assigned to the managed disk on a storage virtualizer when it was added to the system.

Capacity and usage data

You can create capacity and relationship reports that include the following information:

Storage Virtualizer MDisk Capacity (GiB)
The amount of storage space on the managed disk.

Storage Virtualizer MDisk Available Space (GiB)
The amount of space on managed disks that is available in a pool, or is available to be added to a pool.

Storage Virtualizer MDisk Strip Size (KB)
The RAID strip size on a managed disk on a storage virtualizer. This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Component properties

You can create capacity and relationship reports that include the following information:

Storage Virtualizer MDisk RAID Level
The RAID level of the managed disk, such as RAID 5 or RAID 10. The RAID level affects the performance and fault tolerance of the volumes that are allocated from the managed disk.

This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer MDisk Spare Goal
The number of spare drives that are required to maintain redundancy. Use spare drives to protect against drive failures in the array on a managed disk on a storage virtualizer.

This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer MDisk Type
The type of managed disk on a storage virtualizer. For example, the storage virtualizer can be a local or virtual managed disk.

Storage Virtualizer MDisk Mode
The access mode of a managed disk on a storage virtualizer. The access mode describes how extents are provided for virtual disks. Extents can be provided to virtual disks in the following ways:

Array Extents are provided from local disks.

Managed
Extents are provided from a back-end storage volume.

Unmanaged
The managed disk is not used in the system.

This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer MDisk Is Balanced
Shows whether LUNs are balanced across storage controllers on the managed disk. If this value is `Yes`, the LUNs are balanced.

This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer MDisk Fast Write State
Shows whether the cache for a volume on a disk that is managed by a storage virtualizer is empty, contains data, or is corrupted. This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer MDisk Write Verify
Shows whether all write operations on a managed disk on a storage virtualizer are verified by an immediate follow-up read operation. The follow-up read operation verifies that the write operation was successful. If this value is `Yes`, all write operations are verified by a follow-up read operation.

This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Status information

You can create capacity and relationship reports that include the following information:

Storage Virtualizer MDisk Status
The condition of the resource, for example normal, warning, or error.

Storage Virtualizer MDisk Native Status
Shows the level of access of nodes in the system to a managed disk or volume on a storage virtualizer. The level of access can be online, offline, degraded, or excluded.

This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Data for local disks on storage virtualizers in capacity and relationship reports

You can include general information, capacity data, properties, and other information about local disks on storage virtualizers in capacity and relationship reports.

Information about local disks on storage virtualizers

You can create capacity and relationship reports that include the following information:

Storage Virtualizer Local Disk Name
The name that was assigned to the local disk on the storage virtualizer when it was added to the system.

Capacity and usage data

You can create capacity and relationship reports that include the following information:

Storage Virtualizer Local Disk Capacity (GiB)
The amount of storage space on the local disk.

Component properties

You can create capacity and relationship reports that include the following information:

Storage Virtualizer Local Disk Is Encryptable
Shows whether the local disk can be encrypted. If this value is `Yes`, the local disk can be encrypted.

This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Local Disk Is Encrypted
Shows whether the local disk is encrypted. If this value is `Yes`, the local disk is encrypted.

This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Local Disk Storage Class
The storage technology of the local disk on a storage virtualizer. For example, the storage class can be a serial-attached SCSI (SAS) or solid-state drive (SSD). This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Local Disk Is Solid State
Shows whether the disk is a solid-state drive. This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Local Disk Speed (RPM)
The speed of the local disk on a storage virtualizer. This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Local Disk Tag
A number that identifies the array to which a local disk belongs.

Status information

You can create capacity and relationship reports that include the following information:

Storage Virtualizer Local Disk Status
The condition of the resource, for example normal, warning, or error.

Vendor, model, and device information

You can create capacity and relationship reports that include the following information:

Storage Virtualizer Local Disk Firmware Version
The version number of the firmware that is running on the local disk. This value is not shown for Hitachi Universal Storage Platform V storage systems that are configured to virtualize back-end storage.

Storage Virtualizer Local Disk Model
The model name or model number of the resource.

Storage Virtualizer Local Disk Serial Number
The serial number of the resource.

Storage Virtualizer Local Disk Vendor
The vendor who supplied the resource.

Data for storage virtualizer groups in capacity and relationship reports

You can include the name of storage virtualizer groups and properties for storage virtualizer groups in capacity and relationship reports.

Information about storage virtualizer groups

You can create capacity and relationship reports that include the following information:

Storage Virtualizer Group Name
A user-defined name of the storage virtualizer group.

Component properties

You can create capacity and relationship reports that include the following information:

Storage Virtualizer Group Creator
The user name of the user who created the storage virtualizer group.

Storage Virtualizer Group Last Modified
The date and time that the storage virtualizer group was last modified.

Storage Virtualizer Group Last Modified by User
The user name of the user who last modified the storage virtualizer group.

Data for storage systems in capacity and relationship reports

You can include general information, capacity data, properties of components, and other information about storage systems in capacity and relationship reports.

Information about storage systems

You can create capacity and relationship reports that include the following information:

Storage System Name
A user-defined name of the storage system. If a name was not defined, Tivoli Storage Productivity Center shows the name that was defined when the storage system was added for monitoring.

Capacity and usage data

You can create capacity and relationship reports that include the following information:

Storage System Pool Capacity (GiB)
The amount of storage space in pools that are on the storage system. For an XIV system, this value represents the physical capacity of the pool, not the virtual capacity. For other storage systems, this value might also include overhead space if the pool is unformatted.

Storage System Used Pool Space (GiB)
The amount of space that is in use in all pools on a storage system.

Storage System Pool Available Space (GiB)
The amount of space in a pool that is not reserved for volumes.

For XIV systems, this value represents the unallocated physical space in the pool, not the unallocated virtual space. For some storage systems, this value usually includes only the usable capacity, but might also include overhead space if the pool is unformatted.

Storage System Volume Capacity (GiB)
The amount of space on all volumes on the storage system.

Storage System Overhead (GiB)
The amount of space that is used for system management. The amount of space also includes space that is reserved for redundancy.

Storage System Assigned Volume Space (GiB)
The amount of space on the storage system that is on volumes that are assigned to a server or storage virtualizer.

Storage System Unallocated Disk Space (GiB)
The amount of disk space that can be added to a pool.

Storage System Number of Disks
The number of disks on the storage system.

Storage System Number of Volumes
The number of volumes on a resource.

Storage System Cache (GiB)
The size of the cache on the storage system. This value is not shown for Storwize V7000 storage systems that are configured as back-end storage.

Storage System Real Available Pool Space (GiB)
The amount of unused space in pools that have an associated soft size on an XIV system. The soft size of a pool is the virtual size of a thin-provisioned pool.

Storage System Real Configured Pool Space (GiB)
The amount of storage space that is in pools that have an associated soft size on an XIV system. The soft size of a pool is the virtual size of a thin-provisioned pool.

Storage System Volume Capacity for z/OS (GiB)
The amount of space on all volumes on the storage system that the z/OS operating system can use.

Storage System Volume Capacity Assigned to MDisks (GiB)
The amount of space that is on volumes that are assigned to a storage virtualizer to use as managed disks.

Storage System Disk Capacity (GiB)
The amount of storage space on physical disks in a storage system, excluding spare disks. This value is not shown for Storwize V7000 storage systems that are configured as back-end storage.

Storage System Total Disk Capacity (GiB)
The amount of space on physical disks on a storage system, including spare disks.

Storage System Physical Allocation Percentage
The percentage of physical space in storage system pools that is reserved for volumes. This value is always less than or equal to 100% because you cannot reserve more physical space than is available in the pools.

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

`(allocated pool space ÷ pool capacity) × 100`

For example, the physical allocation percentage is 25% for a 200 GiB storage pool. Therefore, the space that is reserved for volumes is 50 GiB.

Storage System Virtual Allocation Percentage
The percentage of physical space in storage system pools that is committed to the total virtual capacity of the volumes in the pool. In thin-provisioned environments, this percentage exceeds 100% if a pool is overcommitted (over-provisioned).

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

`(total volume capacity ÷ pool capacity) × 100`

For example, for a total pool size of 15 GiB, the allocation percentage might be 200%. Therefore, the virtual capacity that is committed to the volumes in the pools is 30 GiB. This configuration means that twice as much space is committed than is physically contained in the pools. If the allocation percentage is 100% for the same pools, then the virtual capacity that is committed to the pools is 15 GiB. This configuration means that all the physical capacity of the pools is already allocated to volumes.

An allocation percentage that is higher than 100% is considered aggressive. The pools have insufficient physical capacity to satisfy the maximum allocation for all the thin-provisioned volumes in the pools. In such cases, use the Storage System Shortfall Percentage property to estimate how critical the shortage of space is for storage system pools.

Storage System Shortfall Percentage
The percentage of the remaining unallocated volume space in storage system pools that is not available to be allocated. The higher the percentage, the more critical the shortfall of pool space.

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

`(unallocatable space ÷ (volume space - used volume space)) × 100`

You can use this percentage to determine when the amount of overcommitted space in pools reaches a critically high level. For example, the physical space in pools might be less than the committed virtual space. In this case, the pools do not have enough space to fulfill the commitment to virtual space for a volume.

This value represents the percentage of the committed virtual space that is not available in pools. As more space is used over time by volumes while the pool capacity remains the same, this percentage increases.

For example, the physical capacity of pools is 70 GiB, but 150 GiB of virtual space is committed to thin-provisioned volumes. If the volumes are using 50 GiB, then there is still 100 GiB committed to those volumes (150 GiB - 50 GiB). There is only 20 GiB of available pool space (70 GiB - 50 GiB). Because only 20 GiB of pool space is available, 80 GiB of the committed space cannot be allocated (100 GiB - 20 GiB). In this case, the percentage of committed space that is unavailable is 80% (80 GiB ÷ 100 GiB × 100).

This value is only available for pools with thin-provisioned volumes.

Storage System MDisk Available Space (GiB)
The amount of storage space that is available on a managed disk. This value is only available for Storwize V7000 storage systems that are configured as back-end storage.

Storage System Tier Available Space (GiB)
The amount of unused space in a tier. This value is only available for Storwize V7000 storage systems that are configured as back-end storage.

Storage System Tier Capacity (GiB)
The total amount of storage space in a tier.This value is only available for Storwize V7000 storage systems that are configured as back-end storage.

Component properties

You can create capacity and relationship reports that include the following information:

Storage System Access Information
The URL from which you can access the storage system or storage virtualizer.

Storage System Code Level
The Shared Ethernet Adapter level of a DS8000 storage system. For other storage systems, this value is the firmware version.

Storage System Location
The physical location of a storage system. The location is defined when a storage system is added to Tivoli Storage Productivity Center. You can add or edit the location of the storage system in the **Properties** pane of the storage system in the web-based GUI.

Storage System Custom Tag 1, 2, and 3
User-defined text that is associated with a storage system. You can add or edit the custom tags for a storage system in the **Properties** pane of the storage system in the Tivoli Storage Productivity Center web-based GUI.

Storage System User Provided Name
The name that was specified for the storage system in the storage environment.

Storage System Tier Type
The type of tier that is used on a storage system. For example, the tier type can be hard disk drive (HDD) or solid-state drive (SSD).

This value is only available for Storwize V7000 storage systems that are configured as back-end storage.

Storage System Configuration
Shows whether a storage system is configured as back-end storage or configured to virtualize back-end storage. If this value is `Storage System`, the storage system is configured as back-end storage. If this value is `Storage Virtualizer`, the storage system is configured to virtualize back-end storage.

Storage System Is Compression Active
Shows whether the compression feature is enabled on the storage system. If this value is `Yes`, the compression feature is enabled.

Status information

You can create capacity and relationship reports that include the following information:

Storage System Status
The condition of the resource, for example normal, warning, or error.

Storage System Is Detected
Shows whether the resource was detected the last time that data was collected. If this value is `Yes`, the resource was detected.

Storage System Last Data Collection
The date and time when storage statistics were last collected from the resource.

Storage System Last Data Collection Status
The condition of the last data collection. The status can show if the collection was a success, a failure, or if data was collected from the resource.

Vendor, model, and device information

You can create capacity and relationship reports that include the following information:

Storage System Type
The type of storage system. For example, the storage system can be an **IBM System Storage DS8800** system, an **IBM System Storage DS8700** system, an **IBM System Storage XIV** system, or another type of storage system.

Storage System Vendor
The vendor who supplied the resource.

Storage System Model
The model name or model number of the storage system.

Storage System Machine Type
The machine type of a storage system. For example, the storage system can be **DS8800**, **DS8700**, **XIV - 2812**, or another type of storage system.

Storage System IP Address
The IP address of the resource.

Storage System Serial Number
The serial number of the resource.

Data for storage system pools in capacity and relationship reports

You can include general information, capacity data, properties of components, and other information about storage system pools in capacity and relationship reports.

Information about storage systems pools

You can create capacity and relationship reports that include the following information:

Storage Pool Name
The name that was assigned to the pool when it was added to the system.

Capacity and usage data

You can create capacity and relationship reports that include the following information:

Storage Pool Capacity (GiB)
The total amount of storage space in a pool.

Storage Pool Available Space (GiB)
The amount of space in a pool that is not reserved for volumes.

Tivoli Storage Productivity Center uses the following formula to determine this value:

```
pool capacity - allocated space
```

For XIV systems, this value represents the unallocated physical space in the pool, not the unallocated virtual space. For some storage systems, this value usually includes only the usable capacity, but might also include overhead space if the pool is unformatted.

Storage Pool Assigned Volume Space (GiB)
The amount of space in the pool that is on volumes that are assigned to a server or storage virtualizer.

Storage Pool Unassigned Volume Space (GiB)
The amount of volume space in the pool that is not assigned to a server or storage virtualizer.

Storage Pool Total Volume Capacity (GiB)
The total storage space on all the volumes in a pool, which includes thin-provisioned and standard volumes. For thin-provisioned volumes, this value includes virtual space.

Storage Pool Real Configured Space (GiB)
The amount of storage space that is in an XIV system pool that has an associated soft size. The soft size of a pool is the virtual size of a thin-provisioned pool.

Storage Pool Used Volume Space (GiB)
The amount of allocated space that is used by the volumes in a pool, which includes thin-provisioned and standard volumes.

For SAN Volume Controller and Storwize V7000, you can preallocate thin-provisioned volume space when volumes are created. For these storage systems, the Storage Pool Used Space might be different than the Storage Pool Allocated Space for pools that contain thin-provisioned volumes. In other cases, the values for Storage Pool Used Space and Storage Pool Allocated Space are equal.

This value is accurate as of the most recent time that Tivoli Storage Productivity Center collected data about a volume. The value in this property might not be 100% accurate for the current state of volumes. This inaccuracy might occur because data collection is run on a set schedule and the used space on volumes can change rapidly.

Storage Pool Real Available Space (GiB)
The amount of unused space that is in an XIV system pool that has an associated soft size. The soft size of a pool is the virtual size of a thin-provisioned pool.

Storage Pool Repository Capacity (GiB)
The amount of space on all extents in the repository of a pool. This space can be used to allocate track space-efficient volumes. This attribute applies only to DS8000 storage systems.

Storage Pool Used Repository Space (GiB)
The amount of space on all extents in the repository of a pool that are allocated. This space can be used to allocate track space-efficient volumes. This attribute applies only to the DS8000 storage systems.

Storage Pool Physical Allocation Percentage
The percentage of physical space in a pool that is reserved for volumes. This value is always less than or equal to 100% because you cannot reserve more physical space than is available in a pool.

Tivoli Storage Productivity Center uses the following formula to determine the allocation percentage:

`(allocated space ÷ pool capacity) × 100`

For example, the physical allocation percentage is 25% for a total pool size of 200 GiB. Therefore, the space that is reserved for volumes is 50 GiB.

Storage Pool Virtual Allocation Percentage
The percentage of physical space in a pool that is committed to the total virtual capacity of the volumes in the pool. In thin-provisioned environments, this percentage exceeds 100% if a pool is overcommitted (over-provisioned).

Tivoli Storage Productivity Center uses the following formula to determine the allocation percentage:

`(total volume capacity ÷ pool capacity) × 100`

For example, the allocation percentage is 200% for a total pool size of 15 GiB. Therefore, the virtual capacity that is committed to the volumes in the pool is 30 GiB.

This configuration means that twice as much space is committed than is physically contained in the pool. If the allocation percentage is 100% for

the same pool, then the virtual capacity that is committed to the pool is 15 GiB. This configuration means that all the physical capacity of the pool is already allocated to volumes.

An allocation percentage that is higher than 100% is considered aggressive. The pool has insufficient physical capacity to satisfy the maximum allocation for all the thin-provisioned volumes in the pool. In such cases, you can use the value for Storage Pool Shortfall Percentage to estimate how critical the shortage of space is for a pool.

This value is only available for pools with thin-provisioned volumes.

Storage Pool Shortfall Percentage
The percentage of the remaining unallocated volume space in a pool that is not available to be allocated.

The higher the percentage, the more critical the shortfall of pool space.

Tivoli Storage Productivity Center uses the following formula to determine this percentage:

`(unallocatable space ÷ (virtual capacity − allocated space)) × 100`

You can use this percentage to determine when the amount of overcommitted space in a pool reaches a critically high level. For example, the physical space in a pool might be less than the committed virtual space. In this case, the pool does not have enough space to fulfill the commitment to virtual space.

This value represents the percentage of the committed virtual space that is not available in a pool. As more space is used over time by volumes while the pool capacity remains the same, this percentage increases.

For example, the physical capacity of a pool is 70 GiB, however, 150 GiB of virtual space is committed to thin-provisioned volumes. If the volumes are using 50 GiB, then there is still 100 GiB committed to those volumes (150 GiB - 50 GiB). There is only 20 GiB of available pool space (70 GiB - 50 GiB). Because only 20 GiB of pool space is available, 80 GiB of the committed space cannot be allocated (100 GiB - 20 GiB). In this case, the percentage of committed space that cannot be allocated is 80% (80 GiB ÷ 100 GiB × 100).

This value is only available for pools with thin-provisioned volumes.

Storage Pool Allocated Space (GiB)
The amount of space that is reserved for all the volumes in a pool, which includes both thin-provisioned and standard volumes. The space that is allocated for thin-provisioned volumes is less than their virtual capacity, which is shown in the Storage Pool Total Volume Capacity (GiB) property. If a pool does not contain thin-provisioned volumes, this value is the same as the value in the Storage Pool Total Volume Capacity (GiB) property. This value is equal to the value in the Storage Pool Used Volume Space (GiB) property for the following storage systems:

- Storage systems other than Storwize V7000 systems that are configured as back-end storage
- Storwize V7000 storage systems that are configured as back-end storage, and that are not thin-provisioned

Storage Pool Extent Size (MiB)
The size of the extent that was specified when a pool was created. Smaller

extent sizes limit the maximum size of the volumes that can be created in a pool. Smaller extent sizes minimize the amount of potentially wasted space per volume.

This value is only available for Storwize V7000 storage systems that are configured as back-end storage.

Storage Pool Tier Capacity (GiB)
The information that this property shows depends on whether the report includes the Storage Pool Tier Type property:

- Report includes Storage Pool Tier Type: Shows the amount of space on solid-state drives and hard disk drives in a pool. The report shows the storage space on solid-state drives and on hard disk drives on different rows.
- Report does not include Storage Pool Tier Type: Shows the total storage space on all of the solid-state drives and hard disk drives in a pool.

This value is only available for Storwize V7000 storage systems that are configured as back-end storage.

Storage Pool Tier Available Space (GiB)
The information that this property shows depends on whether the report includes the Storage Pool Tier Type property:

- Report includes Storage Pool Tier Type: Shows the amount of unused space on solid-state drives and hard disk drives in a pool. The report shows the unused space on solid-state drives and on hard disk drives on different rows.
- Report does not include Storage Pool Tier Type: Shows the total unused space on all of the solid-state drives and hard disk drives in a pool.

This value is only available for Storwize V7000 storage systems that are configured as back-end storage.

Storage Pool Tier Number of MDisks
The information that this property shows depends on whether the report includes the Storage Pool Tier Type property:

- Report includes Storage Pool Tier Type: Shows the number of managed disks on the tier that are solid-state drives or hard disk drives. The report shows the number of managed disks that are solid-state drives and the number that are hard disk drives on different rows.
- Report does not include Storage Pool Tier Type: Shows the total number of managed disks on all of the solid-state drives and hard disk drives in a tier.

This value is only available for Storwize V7000 storage systems that are configured as back-end storage.

Storage Pool Unallocated Volume Space (GiB)
The amount of the Total Volume Capacity in the pool that is not allocated.

Tivoli Storage Productivity Center uses the following formula to determine this value:

```
total volume capacity - allocated space
```

The space that is allocated for thin-provisioned volumes is typically less than their virtual capacity. Therefore, the unallocated space represents the difference between the virtual capacity and the allocated space for all the volumes in the pool.

Storage Pool Unallocatable Volume Space (GiB)
The amount of space by which the Total Volume Capacity exceeds the physical capacity of a pool.

In thin-provisioned environments, it is possible to over commit (over provision) storage in a pool. If you create volumes with more virtual capacity than can be physically allocated in the pool, you can over commit storage in the pool.

This value represents the amount of volume space that cannot be allocated based on the current capacity of the pool.

Storage Pool Number of MDisks
The number of managed disks in a storage pool.

Storage Pool Compressed Virtual Capacity (GiB)
The total virtual capacity of all the volumes that are compressed in a pool.

Storage Pool Compressed Capacity (GiB)
The amount of storage space that is used by compressed volumes in a pool. For example, if 100 GiB of uncompressed data is compressed, and the size of the compressed data is 20 GiB, the value is 20.

Storage Pool Uncompressed Capacity (GiB)
The amount of storage space that is used if the compressed volume space is uncompressed. For example, if 100 GiB of uncompressed data is compressed, and the size of the compressed data is 20 GiB, the value is 100.

Storage Pool Maximum I/O Capability
The projected maximum number of I/O operations per second for a pool. This value is calculated based on the value in the Storage Pool Back-End Storage Disks property, and on the values in following properties:

- Storage Pool Back-End Storage System Type
- Storage Pool Back-End Storage RAID Level
- Storage Pool Back-End Storage Disk Type

This property applies only to SAN Volume Controller, Storwize V7000, and Storwize V7000 Unified pools.

Storage Pool Back-End Storage Disks
The number of physical disks that contribute to the volumes on the back-end storage system. This property applies only to SAN Volume Controller, Storwize V7000, and Storwize V7000 Unified pools.

Component properties

You can create capacity and relationship reports that include the following information:

Storage Pool RAID Level
The RAID level of the resource, such as RAID 5 or RAID 10. The RAID level affects the performance and fault tolerance of the volumes that are allocated from the resource.

Storage Pool Is Solid State
Shows whether there are solid-state drives in the pool. This property can contain the following values:

Mixed The pool contains both hard disk drives and solid-state drives.

Non solid state
The pool contains no solid-state drives.

Solid state
The pool contains a least one solid-state drive.

Storage Pool Is Encrypted
Shows whether the resource is encrypted. If this value is `Yes`, the resource is encrypted.

Storage Pool Format
Shows the format of the volume or pool. The format can be a Count Key Data (CKD) format, or a fixed block format.

Storage Pool Is Thin Provisioned
Shows whether a pool, volume, or volume copy is thin-provisioned. If this value is `Yes`, the resource is thin-provisioned.

Storage Pool Logical Subsystem
The logical subsystem (LSS) to which a volume or pool belongs.

Storage Pool Rank Group
The rank group to which a pool is assigned, that is, 0 or 1. This property applies only to the DS8000 and DS6000 storage systems.

Storage Pool Lock Behavior
Shows whether the pool is locked for write operations, or is disabled for both read and write operations when storage space is limited. This property applies only to an XIV system.

Storage Pool Tier
The tier that a managed disk is assigned to by the internal cluster automatic detection for internal disks or by the user for external disks. This classification is used by the storage system to determine when to activate the Easy Tier function for certain pools.

Storage Pool Custom Tag 1, 2, and 3
User-defined text that is associated with a storage pool. You can add or edit the custom tags for a storage pool on the **Properties** notebook of the pool in the Tivoli Storage Productivity Center web-based GUI.

Storage Pool Is Compression Active
Shows whether the compression feature is enabled on the storage pool. If this value is `Yes`, the compression feature is enabled.

Storage Pool Back-End Storage System Type
The type of storage system that provides storage space to a pool. This property applies only to SAN Volume Controller, Storwize V7000, and Storwize V7000 Unified pools.

Storage Pool Back-End Storage Disk Type
The class and speed of the physical disks that contribute to the volumes on the back-end storage system. This property applies only to SAN Volume Controller, Storwize V7000, and Storwize V7000 Unified pools.

Storage Pool Back-End Storage RAID Level
The RAID level of the volumes on the back-end storage system that provide storage space to a pool. This property applies only to SAN Volume Controller, Storwize V7000, and Storwize V7000 Unified pools.

Status information

You can create capacity and relationship reports that include the following information:

Storage Pool Status
The condition of the resource, for example normal, warning, or error.

Storage Pool Is Detected
Shows whether the resource was detected the last time that data was collected. If this value is `Yes`, the resource was detected.

Storage Pool Tier Type
The type of tier that is used on a storage pool. For example, the tier type can be hard disk drive (HDD) or solid-state drive (SSD).

This value is only available for Storwize V7000 storage systems that have internal storage.

Data for storage system volumes in capacity and relationship reports

You can include general information, capacity data, properties, information about copies of volumes, and other information about storage system volumes in capacity and relationship reports.

Information about storage system volumes

You can create capacity and relationship reports that include the following information:

Storage Volume Name
The name that was assigned to the storage volume when it was added to the system.

Storage Volume Assigned Host Connection
The host connection to which the storage volume is assigned. The host connection is a definition in the storage system that contains the WWPN for the server. The storage system uses the WWPN to assign volumes to servers.

Storage Volume Host Connection OS Type
The operating system type of the server or hypervisor that the volume is assigned to.

Storage System Volume Group ID
The unique identifier for a collection of volumes on DS8000 and DS6000 storage systems. The storage system generates this identifier.

Storage System Volume Group Name
The user-defined name for a collection of volumes on DS8000 and DS6000 storage systems.

Storage System Volume Preferred Node Name
The name of the node that is used for I/O operations for the storage system volume.

Capacity and usage data

You can create capacity and relationship reports that include the following information:

Storage Volume Capacity (GiB)
The total amount of storage space that is committed to a volume.

For thin-provisioned volumes, this value represents the virtual capacity of the volume.

For XIV systems, this value represents the physical (hard) capacity of the volume, not the virtual (soft) capacity. For other storage systems, this value might also include overhead space if the pool is unformatted.

Storage Volume Overhead (GiB)
The amount of space that is used for system management. The amount of space also includes space that is reserved for redundancy.

Storage Volume Allocated Space (GiB)
The amount of space that is reserved for a volume. The space that is allocated for a thin-provisioned volume is less than its virtual capacity, which is shown in the Storage Volume Capacity (GiB) property. This value is equal to the value in the Storage Volume Used Space (GiB) property for the following storage systems:

- Storage systems other than Storwize V7000 systems that are configured as back-end storage
- Storwize V7000 storage systems that are configured as back-end storage, and that are not thin-provisioned

Storage Volume Used Space (GiB)
The amount of allocated space that is used by a volume.

For SAN Volume Controller and Storwize V7000, you can preallocate thin-provisioned volume space when the volumes are created. In these cases, the Storage Volume Used Space (GiB) might be different than the Storage Volume Allocated Space (GiB). For volumes that are not thin provisioned, the values for Storage Volume Used Space (GiB) and Storage Volume Allocated Space (GiB) are equal.

This value is accurate as of the most recent time that Tivoli Storage Productivity Center collected data about a volume. The value in this property might not be 100% accurate for the current state of volumes. This inaccuracy might occur because data collection is run on a set schedule and the used space on volumes can change rapidly.

Storage Volume Used Allocated Space Percentage
The percentage of reserved space for a volume that is being used. This value is always less than or equal to 100% because a volume cannot use more space than is allocated.

Tivoli Storage Productivity Center uses the following formula to determine this value:

```
(volume used space ÷ volume allocated space) × 100
```

Storage Volume Unallocated Space (GiB)
The amount of space in a pool that is not reserved for a volume.

Tivoli Storage Productivity Center uses the following formula to determine this value:

```
capacity - allocated space
```

Available only for thin provisioned volumes.

Storage Volume Physical Allocation Percentage
The percentage of physical space that is reserved for a volume. This value is always less than or equal to 100% because you cannot reserve more physical space than is available.

Tivoli Storage Productivity Center uses the following formula to determine this value:

```
(allocated space ÷ capacity) × 100
```

For example, the physical allocation percentage is 25% for a volume size of 200 GiB. Therefore, the space that is reserved for volumes is 50 GiB.

Storage Volume Unused Space (GiB)
The amount of space that is allocated to a volume and is not yet used.

Tivoli Storage Productivity Center uses the following formula to determine this value:

```
Allocated Space - Used Space
```

This property is available only for SAN Volume Controller and Storwize V7000 pools.

Storage Volume Shortfall Percentage
The percentage of the remaining unallocated volume space in a pool that is not available to be allocated to a volume.

The higher the percentage, the more critical the shortfall of space.

Tivoli Storage Productivity Center uses the following formula to determine this value:

```
(unallocatable volume Space ÷ volume unallocated space) × 100
```

You can use this percentage to determine when the amount of overcommitted space in pools reaches a critically high level. For example, the physical space in pools might be less than the committed virtual space. In this case, the pools do not have enough space to fulfill the commitment to virtual space for a volume.

This Storage Volume Shortfall Percentage represents the percentage of the committed virtual space that is not available in a pool. As more space is used over time by a volume while the pool capacity remains the same, this percentage increases.

For example, the remaining physical capacity of a pool is 70 GiB, however, 150 GiB of virtual space is committed to a thin-provisioned volume. If the volume is using 50 GiB, then there is still 100 GiB committed to that volume (150 GiB - 50 GiB). There is a shortfall of 30 GiB (70 GiB remaining pool space - 100 GiB remaining commitment of volume space to the volume). The volume is overcommitted by 30 GiB based on the available space in the pool. The shortfall is 30% when you use the following calculation:

```
100 GiB unallocated volume space - 70 GiB remaining
pool space ÷ 100 GiB unallocated volume space × 100
```

Storage Volume Unallocatable Space (GiB)
The unallocatable storage space in GiB of a thin-provisioned volume. Unallocatable space cannot be supplied by the pool to which the volume belongs.

Storage Volume Uncompressed Capacity (GiB)
The amount of storage space that is used if the compressed volume space

is uncompressed. For example, if 100 GiB of uncompressed data is compressed, and the size of the compressed data is 20 GiB, the value is 100.

Component properties

You can create capacity and relationship reports that include the following information:

Storage Volume Type
The type of storage volume. For example, the storage volume can be striped or sequential. This value is only available for SAN Volume Controller and Storwize V7000 storage systems that are configured as back-end storage.

Storage Volume WWN
The worldwide name of the volume.

Storage Volume Fast Write State
Shows whether the cache for a volume on a disk that is managed by a storage virtualizer is empty, contains data, or is corrupted.

Storage Volume Grain Size (KiB)
The grain size with which a thin-provisioned volume was created. This value is typically 32, 64, 128, or 256 KiB. Larger grain sizes maximize performance, whereas smaller grain sizes maximize space efficiency. Grain sizes also limit the maximum virtual space of a volume.

This value is only available for SAN Volume Controller and Storwize V7000 storage systems that are configured as back-end storage.

Storage Volume Is Assigned
Shows whether the volume is assigned to a server. If this value is `Yes`, the volume is assigned to a server.

Storage Volume Is Auto Expand Enabled
Shows whether a volume or volume copy can allocate new extents from a pool automatically. Volumes or volume copies might allocate new extents to expand the real capacity of the storage virtualizer volume or volume copy. If this value is `Yes`, the volume or volume copy can allocate new extents from a pool automatically.

Storage Volume Is Encryptable
Shows whether the resource can be encrypted. If this value is `Yes`, the resource can be encrypted.

Storage Volume Is Encrypted
Shows whether the resource is encrypted. If this value is `Yes`, the resource is encrypted.

Storage Volume Is Formatted
Shows whether a storage volume is formatted. If this value is `Yes`, the volume is formatted. This value is only available for SAN Volume Controller and Storwize V7000 storage systems that are configured as back-end storage.

Storage Volume Is Thin Provisioned
Shows whether a pool, volume, or volume copy is thin-provisioned. If this value is `Yes`, the resource is thin-provisioned.

Storage Volume Metro Mirror Name
The name of the Metro Mirror that keeps the synchronous copy of the storage virtualizer volume.

Storage Volume Mirror Count
The number of mirrors that keep a synchronous copy of the resource.

Storage Volume Throttle
The maximum number of commands that the storage volume can queue.

Storage Volume Warning Level
The percentage of used capacity of the resource at which a warning is generated.

Storage Volume FlashCopy Relationship
Shows whether a volume on a storage system is in a FlashCopy relationship. This property can contain the following values:

Source Relationship
The volume is the source of the relationship.

Target Relationship
The volume is the target of the relationship.

Both Source and Target Relationship
The volume is both the source and target of the relationship.

Not in a FlashCopy Relationship
The volume is not in a FlashCopy relationship.

Storage Volume Remote Copy Relationship
Shows whether a volume on a storage system is in a remote copy relationship. This property can contain the following values:

Not in a Copy Relationship
The volume is not in a remote copy relationship.

Source Relationship
The volume is the source of the relationship.

Target Relationship
The volume is the target of the relationship.

Both Source and Target Relationship
The volume is both the source and target of the relationship.

Storage Volume RAID Level
The RAID level of a storage volume, such as RAID 5 or RAID 10. The RAID level affects the performance and fault tolerance of the volumes that are allocated from the resource.

Storage Volume Is Compressed
Shows whether the volume is compressed. If this value is `Yes`, the volume is compressed.

Storage Volume Is Volume Control Manager Database
Shows whether a volume is used as the Volume Control Manager Database. If this value is `Yes`, the volume is used as the Volume Control Manager Database.

Storage Volume Format
Shows the format of the volume or pool. The format can be a Count Key Data (CKD) format, or a fixed block format.

Storage Volume Serial Number
The serial number of the resource.

Storage Volume Number
The number of the volume that is assigned by the system.

Storage Volume Logical Subsystem
The logical subsystem (LSS) to which a volume or pool belongs.

Status information

You can create capacity and relationship reports that include the following information:

Storage Volume Status
The condition of the resource, for example normal, warning, or error.

Storage Volume Is Detected
Shows whether the resource was detected the last time that data was collected. If this value is `Yes`, the resource was detected.

Volume copy information

You can create capacity and relationship reports that include the following information:

Storage Volume Copy ID
The identifier of a volume copy.

Storage Volume Copy Grain Size (KiB)
The grain size with which a thin-provisioned volume was created. This value is typically 32, 64, 128, or 256 KiB. Larger grain sizes maximize performance, whereas smaller grain sizes maximize space efficiency. Grain sizes also limit the maximum virtual space of a volume.

Storage Volume Copy Is Auto Expand Enabled
Shows whether a volume or volume copy can allocate new extents from a pool automatically. Volumes or volume copies might allocate new extents to expand the real capacity of the storage virtualizer volume or volume copy. If this value is `Yes`, the volume or volume copy can allocate new extents from a pool automatically.

Storage Volume Copy Is Detected
Shows whether the resource was detected the last time that data was collected. If this value is `Yes`, the resource was detected.

Storage Volume Copy Is Primary
Shows whether the volume copy is the primary volume copy.

Storage Volume Copy Is Thin Provisioned
Shows whether a pool, volume, or volume copy is thin-provisioned. If this value is `Yes`, the resource is thin-provisioned.

Storage Volume Copy Total Number of Extents
The number of extents that are used by the storage volume copy.

Storage Volume Copy Type
The type of copy of the storage volume. For example, the copy of the storage volume can be sequential, a mirror copy, or another type of copy.

Storage Volume Copy Warning Level
The percentage of used capacity of the resource at which a warning is generated.

Storage Volume Copy Used Allocated Space Percentage
The percentage of reserved space for a volume copy that is being used. This value is always less than or equal to 100% because a volume copy cannot use more space than is allocated.

Tivoli Storage Productivity Center uses the following formula to determine this value:

```
(used space ÷ allocated space) × 100
```

This property is available only for SAN Volume Controller and Storwize V7000 pools.

Storage Volume Copy Used Space (GiB)
The amount of allocated space that is used by a volume copy.

Storage Volume Copy Allocated Space (GiB)
The amount of space that is reserved for a volume copy.

The space that is allocated for a thin-provisioned volume copy is less than its virtual capacity, which is shown in the Storage Virtualizer Capacity (GiB) property.

For volume copies that are not thin provisioned, this value is equal to the value of the Storage Volume Copy Used Space (GiB) property.

Storage Volume Copy Unallocated Space (GiB)
The amount of space in a pool that is not reserved for a volume copy.

Tivoli Storage Productivity Center uses the following formula to determine this value:

```
capacity - allocated space
```

Storage Volume Copy Physical Allocation Percentage
The percentage of physical space that is reserved for a volume copy. This value is always less than or equal to 100% because you cannot reserve more physical space than is available.

Tivoli Storage Productivity Center uses the following formula to determine this value:

```
(allocated space ÷ capacity) × 100
```

For example, the physical allocation percentage is 25% for a total pool size of 200 GiB. Therefore, the space that is reserved for volume copies is 50 GiB.

Storage Volume Copy Unused Space (GiB)
The amount of space that is allocated to a volume copy and that is not yet used.

Tivoli Storage Productivity Center uses the following formula to determine this value:

```
allocated space - used space
```

This property is available only for SAN Volume Controller and Storwize V7000 pools.

Storage Volume Copy Shortfall Percentage
The percentage of the remaining unallocated volume copy space in a pool that is not available to be allocated to a volume copy.

This value represents the percentage of the committed virtual space that is not available in a pool. As more space is used over time by a volume while the pool capacity remains the same, this percentage increases.

The higher the percentage value is, the more critical the shortfall of space is.

Tivoli Storage Productivity Center uses the following formula to determine this value:

```
(unallocatable space ÷ (capacity – real capacity)) × 100
```

You can use this percentage to determine when the amount of overcommitted space in a pool reaches a critically high level for the volume. For example, the physical space in a pool might be less than the committed virtual space. In this case, the pool does not have enough space to fulfill the commitment to virtual space for a volume.

For example, the remaining physical capacity of a pool is 70 GiB, however, 150 GiB of virtual space is committed to a thin-provisioned volume. If the volume uses 50 GiB, 100 GiB is, nevertheless, committed to that volume (150 GiB minus 50 GiB). There is a shortfall of 30 GiB when you use the following calculation:

```
(100 GiB remaining commitment of volume space to
the volume - 70 GiB remaining pool space)
```

The volume is overcommitted by 30 GiB based on the available space in the pool. The shortfall is 30% when you use the following calculation:

```
(100 GiB unallocatable volume copy space - 70 GiB
remaining pool space) ÷ 100 GiB unallocated volume space × 100
```

This property is available only for volume copies that are thin provisioned.

Storage Volume Copy Unallocatable Space (GiB)
The unallocatable storage space in GiB of a thin-provisioned volume copy. Unallocatable space cannot be supplied by the pool to which the volume copy belongs.

Storage Volume Copy Is Compressed
Shows whether the volume copy is compressed. If this value is `Yes`, the volume copy is compressed.

Storage Volume Copy Uncompressed Capacity (GiB)
The amount of storage space that is used if the compressed space on the volume copy is uncompressed. For example, if 100 GiB of data is compressed, the value is 100.

Data for storage system disks in capacity and relationship reports

You can include properties, and other data about storage system disks in capacity and relationship reports.

Information about storage system disks

You can create capacity and relationship reports that include the following information:

Storage Disk Name
The name that was assigned to the storage disk when it was added to the system.

Capacity and usage data

You can create capacity and relationship reports that include the following information:

Storage Disk Capacity (GiB)
The amount of storage space that is on a physical disk on the storage system.

Component properties

You can create capacity and relationship reports that include the following information:

Storage Disk Flags
Shows whether a device is a spare device. This property applies only to DS8000 storage systems.

Storage Disk Is Encryptable
Shows whether the resource can be encrypted. If this value is `Yes`, the resource can be encrypted.

Storage Disk Is Encrypted
Shows whether the resource is encrypted. If this value is `Yes`, the resource is encrypted.

Storage Disk Is Solid State
Shows whether the disk is a solid-state drive.

Storage Disk Speed (RPM)
The speed of the disk.

Storage Disk Tag
A number that identifies the array to which a disk belongs. This property applies only to DS8000, DS6000, and TotalStorage Enterprise Storage Server storage systems.

Storage Disk Class
The storage technology of the disk. This property applies only to DS8000, DS5000, and DS4000 storage systems. This property can contain the following values:

FC The disk is a Fibre Channel disk.

Nearline ATA
The disk is a nearline Advanced Technology Attachment disk.

Nearline SAS
The disk is a nearline serial-attached SCSI disk.

SAS The disk is a serial-attached SCSI disk.

SATA The disk is a Serial Advanced Technology Attachment disk.

SSD The disk is a solid-state drive.

Unavailable
The disk is on a DS5000 or DS4000 series system, and is not a solid-state drive.

Unsupported
The disk is on a system that is not a DS8000, DS5000, or DS4000 series system.

Status information

You can create capacity and relationship reports that include the following information:

Storage Disk Status
The condition of the resource, for example normal, warning, or error.

Storage Disk Is Detected
Shows whether the resource was detected the last time that data was collected. If this value is `Yes`, the resource was detected.

Vendor, model, and device information

You can create capacity and relationship reports that include the following information:

Storage Disk Firmware Version
The version number of the firmware that is running on the disk.

Storage Disk Model
The model name or model number of the resource.

Storage Disk Serial Number
The serial number of the resource.

Storage Disk Vendor
The vendor who supplied the resource.

Data for storage system groups in capacity and relationship reports

You can include general information about, and properties of, storage system groups in capacity and relationship reports.

Information about storage system groups

You can create capacity and relationship reports that include the following information:

Storage System Group Name
The name that was assigned to the storage system group when it was added to the system.

Component properties

You can create capacity and relationship reports that include the following information:

Storage System Group Creator
The user name of the user who created the group.

Storage System Group Last Modified
The date and time that the resource was last modified.

Storage System Group Last Modified by User
The user name of the user who last modified the resource.

Data for managed disks on storage systems in capacity and relationship reports

You can include general information, capacity data, properties, and other information about managed disks on storage systems in capacity and relationship reports.

Information about managed disks on storage systems

You can create capacity and relationship reports that include the following information:

Storage System MDisk Name
The name that was assigned to the managed disk on a storage system when it was added to the system.

Capacity and usage data

You can create capacity and relationship reports that include the following information:

Storage System MDisk Capacity (GiB)
The amount of storage space on the managed disk.

Storage System MDisk Available Space (GiB)
The amount of storage space that is available on a managed disk. This value is only available for Storwize V7000 storage systems that are configured as back-end storage.

Storage System MDisk Strip Size (KB)
The RAID strip size on a managed disk on a storage system.

Component properties

You can create capacity and relationship reports that include the following information:

Storage MDisk RAID Level
The RAID level of the managed disk, such as RAID 5 or RAID 10. The RAID level affects the performance and fault tolerance of the volumes that are allocated from the managed disk.

Storage MDisk Spare Goal
The number of spare drives that are required to maintain redundancy. Use spare drives to protect the system against drive failures in the array on a managed disk on a storage virtualizer.

Storage System MDisk Type
The type of managed disk on a storage system. For example, the disk on a storage system can be a local managed disk.

Storage System MDisk Mode
The access mode of a managed disk on a storage virtualizer. The access mode describes how extents are provided for virtual disks. Extents can be provided to virtual disks in the following ways:

Array Extents are provided from local disks.

Managed
Extents are provided from a back-end storage volume.

Unmanaged
The managed disk is not used in the system.

Storage System MDisk Is Balanced
Shows whether LUNs are balanced across storage controllers on the managed disk. If this value is `Yes`, the LUNs are balanced.

Storage System MDisk Fast Write State
Shows whether the cache for a volume on a disk that is managed by a storage system is empty, contains data, or is corrupted.

Storage System MDisk Write Verify
Shows whether all write operations on a managed disk on a storage system are verified by an immediate follow-up read operation. The follow-up read operation verifies that the write operation was successful. If this value is `Yes`, all write operations are verified by a follow-up read operation.

Status information

You can create capacity and relationship reports that include the following information:

Storage System MDisk Status
The condition of the resource, for example normal, warning, or error.

Storage MDisk Native Status
Shows the level of access of nodes in the system to a managed disk or volume on a storage system. The level of access can be online, offline, degraded, or excluded.

Data for storage resource groups in capacity and relationship reports

You can include general information about storage resource groups in capacity and relationship reports.

Information about storage resource groups

You can create capacity and relationship reports that include the following information:

Storage Resource Group Name
The name that was assigned to the storage resource group when it was created.

Storage Resource Group Last Modified by User
The user name of the user who last modified the resource.

Storage Resource Group Custom Tag 1, 2, and 3
User-defined text that is associated with a storage resource group.

Troubleshooting reports

Find answers to questions about resolving issues with reports in Tivoli Common Reporting.

Problem
When you run reports, Tivoli Common Reporting times out.

Solution

Based on your operating system, complete the following steps to change the timeout:

Windows

1. Open a command-line interface.
2. Stop Tivoli Common Reporting:

   ```
   c:\program files\IBM\JazzSM\profiles\bin\stopServer.bat
   server_name -username JazzSM_username -password JazzSM_password
   ```

3. Open the `configuration` directory:

   ```
   c:\program files\IBM\JazzSM\reporting\cognos\configuration
   ```

4. Copy the `cogstartup.xml` file and, then change the name of the copied file to `cogstartup.orig`.
5. Open the `cogstartup.xml` file:

   ```
   c:\program files\IBM\JazzSM\reporting\cognos\
   configuration\cogstartup.xml
   ```

6. In the `cogstartup.xml` file, enter the new timeout value in seconds for the *inactivityTimeout* setting.
7. In the `cogstartup.xml` file, enter new timeout value in minutes for the *mdmSessionTimeout* setting.
8. Save the `cogstartup.xml` file.
9. Start Tivoli Common Reporting:

   ```
   c:\program files\IBM\JazzSM\profiles\bin\startServer.bat
   server_name
   ```

AIX or Linux

1. Open a command-line interface.
2. Stop Tivoli Common Reporting:

   ```
   /opt/IBM/JazzSM/profile/bin/stopServer.sh server_name
    -username JazzSM_username -password JazzSM_password
   ```

3. Open the `configuration` directory:

   ```
   /opt/IBM/JazzSM/reporting/cognos/configuration
   ```

4. Copy the `cogstartup.xml` file and, then change the name of the copied file to `cogstartup.orig`.
5. Open the `cogstartup.xml` file:

   ```
   /opt/IBM/JazzSM/reporting/cognos/configuration/cogstartup.xml
   ```

6. In the `cogstartup.xml` file, enter the new timeout value in seconds for the *inactivityTimeout* setting.
7. In the `cogstartup.xml` file, enter new timeout value in minutes for the *mdmSessionTimeout* setting.
8. Save the `cogstartup.xml` file.
9. Start Tivoli Common Reporting:

   ```
   /opt/IBM/JazzSM/profile/bin/startServer.sh server_name
   ```

Problem

You can set output format options for reports either when you schedule a report or run a report. If you choose PDF format for your report and the report contains many columns, all of the columns might not fit on one page. For example, if a report contains 20 columns, then the row for a specific resource might be shown on more than one page: 10 columns on the first page and 10 columns on the second page.

Solution

To fit the maximum number of columns on one page, set the PDF options in one of the following ways:

When you schedule a report

1. Navigate to a report in Tivoli Common Reporting.
2. Click the **Schedule** icon .
3. Select **Override the default values**.
4. Select **PDF**, and then click **Set**.
5. From the **Orientation** list, select **Landscape**.
6. From the **Paper size** list, select **11 × 17**.

When you run a report

1. Navigate to a report in Tivoli Common Reporting.
2. Click the **Run with options** icon .
3. Click the **advanced options** link in the tip.
4. Click **Run in the background**.
5. Select **PDF**, and then click **Set**.
6. From the **Orientation** list, select **Landscape**.
7. From the **Paper size** list, select **11 × 17**.

Problem

When you create a custom report, you cannot find online help that describes the columns that you can include in your reports.

Solution

To view the online help, follow these steps:

1. Go to the dashboard of the Tivoli Storage Productivity Center web-based GUI.
2. Select **Reporting** > **View predefined reports**.
3. Click any predefined report.
4. Click the **Help** link at the upper right of the page.
5. Go to the custom reports help content.

To view the custom reports help content in the information center, go to the Tivoli Storage Productivity Center Information Center at publib.boulder.ibm.com/infocenter/tivihelp/v59r1/index.jsp. Search for "Custom reports".

Problem

If the Tivoli Storage Productivity Center database (TPCDB) is not accessible, you are prompted to reenter your user ID and password although you previously entered the correct user ID and password.

Solution

Check that the server that hosts TPCDB is available. Check that the firewall settings on the server are not preventing you from accessing TPCDB.

Problem

If the password to access the Tivoli Storage Productivity Center database (TPCDB) is changed, you must also change the password in Tivoli Common Reporting.

Solution

In Tivoli Common Reporting, complete the following steps:

1. In the **Public Folders** tab, click **Launch** > **Administration**.
2. Click the **Configuration** tab.
3. Click **TPCDB**, and then click **TPCDB** again.
4. In the Actions column, click the **Set properties** icon, and then click the **Signon** tab.
5. Click **Edit the signon**.
6. Make your changes, and then click **OK**.

Problem

When you use particular combinations of properties from the Storage Volume section in the Performance package in a custom report, a `No data available` message might be displayed. This occurs when you use the following combinations of properties in a custom report:

- Server Name, Hypervisor Name, and any other property from the Storage Volume section
- Server Name, Hypervisor Name, Hypervisor Cluster Name, and any other property from the Storage Volume section
- Server Name, Hypervisor Cluster Name, and any other property from the Storage Volume section

Solution

Do not use these combinations of properties in custom reports.

Problem

When you try to log in to Tivoli Common Reporting, the following error message is displayed:

```
DPR-ERR-2109 The dispatcher cannot service the request at this time. The
dispatcher is still initializing. Contact your administrator if this
problem persists.
```

The Jazz for Service Management server starts Tivoli Common Reporting. This problem occurs if Tivoli Common Reporting starts when DB2 is not running.

Solution

Stop the Jazz for Service Management server, restart DB2, and restart the Jazz for Service Management server. To do this, complete the following steps:

1. Open a command-line interface.
2. Stop the Jazz for Service Management server:

   Windows

   JazzSM_install_directory\profile\bin\stopServer.bat *server_name* -username *JazzSM_username* -password *JazzSM_user_password*

   AIX or Linux

   JazzSM_install_directory/profile/bin/stopServer.sh *server_name* -username *JazzSM_username* -password *JazzSM_user_password*
3. Restart DB2.
4. Start the Jazz for Service Management server:

   Windows

   JazzSM_install_directory\profile\bin\startServer.bat *server_name*

   AIX or Linux

   JazzSM_install_directory/profile/bin/startServer.sh *server_name*

Problem

In Internet Explorer 8, 9, or 10 when you open a report in Report Studio for the first time, a CM-REQ-4158 error might be displayed.

Solution

For information about how to resolve this problem, see the IBM Tivoli Systems Management Information Center at publib.boulder.ibm.com/infocenter/tivihelp/v3r1/index.jsp. Search for "CM-REQ-4158 Jazz".

Problem

When you add a filter to a property in Query Studio, not all of the resources are listed in the **Filter (Pick values from a list)** area. For example, when you add a filter to the Storage Volume Name property, not all of the volumes are listed.

This problem occurs because the maximum number of items in a list in Query Studio is 5000. If there are more than 5000 items in the list, only the first 5000 values are displayed, in alphabetical order.

Solution

Click **Search for values** in the **Filter (Pick values from a list)** area. Type a keyword, and then click **Search** to search for volumes on a resource. For example, type `a%` to find volume names that begin with 'a' or 'A'.

Problem

When you run a report, it takes a long time for the report output to display. It might take a long time to run a report for some combinations of the interval and reporting period. For example, the report might take a long time if you select the Sample interval or Hourly interval with one of the following periods:

- Last 30 days
- Last 90 days
- All

Solution

When you run a report, use shorter reporting periods with the Sample interval or Hourly interval.

Problem

When you run a report, the output that is displayed contains no data. If you select the Daily interval and a recent reporting period, then no data might be available. For example, if you select Last 24 hours or Today, the data for those reporting periods is unlikely to be collected yet.

Solution

When you run a report with a Daily interval, use a reporting period other than Last 24 hours or Today.

Problem

If you log off from a remote connection, you must manually restart Jazz for Service Management and Tivoli Common Reporting.

Solution

To restart Jazz for Service Management and Tivoli Common Reporting, complete the following steps for your operating system:

Windows

JazzSM_install_directory\profile\bin\startServer.bat *server_name*

AIX or Linux

JazzSM_install_directory/profile/bin/startServer.sh *server_name*

Problem

You set the default language of your operating system or your browser to Portuguese (Brazilian). However, you see English text in the report prompt pages or in the report output. This problem is a known problem with Cognos 10.2 and Tivoli Common Reporting Version 3.1.0.1.

Solution

To set the language of the report prompt pages and report output to Portuguese (Brazilian), complete the following steps:

1. In Tivoli Common Reporting, click the **My Area Options** icon .
2. Click **My Preferences**.
3. In the **Regional options** area, under **Content language**, select **Use the following language**.
4. Select **Portuguese (Brazil)**.
5. Click **OK**.

Problem

If you create a custom performance report in Query Studio, in particular circumstances, the report takes a long time to complete. This problem might occur in the following circumstances:

- The report is for more than 10,000 volumes.
- The interval for the report is Hourly, and the data for the report was collected for more than 15 days.
- The interval for the report is Sample, and the data for the report was collected for more than 7 days.

Solution

When this problem occurs, complete the following steps for the report in Query Studio:

1. Click **Run Report** in the menu pane.
2. Click **Advanced Options**.
3. Clear each of the following check boxes:
   - **Automatically generate footer summaries for measures**
   - **Automatically summarize detail values, suppressing duplicates**
   - **Enable drill up and drill down in the report output**
   - **Enable drill through from a package in the report output**
4. Click **OK**.

Showing the package version number and build ID

Access information about the packages for custom reports and predefined reports, such as the version number and the build ID.

You can identify the version number and build ID for each of the following packages:

- Capacity and Relationships
- Performance

1. Start the web-based GUI for Tivoli Storage Productivity Center.
2. Depending on the package whose version number and build ID you want to see, complete one of the following steps:

- To identify the version number and build ID of the Capacity and Relationships package, select **Reporting** > **Create capacity reports**.
- To identify the version number and build ID of the Performance package, select **Reporting** > **Create performance reports**.

3. In the navigation tree, position the cursor over the item under the name of the package.

The version number and the build ID for the package is shown.

Reporting in the stand-alone GUI

Use Tivoli Storage Productivity Center reports to view detailed information about the storage resources in your environment. These reports are organized into different types and categories and provide both summary and detailed information depending on your needs.

Data in reports is based on statistical information accumulated by data collection schedules and stored in the database repository. You can select the specific systems, storage subsystems, switches, fabrics, NAS filers, clusters, disks, file systems, and even users upon which you want to report.

Reports are organized into report types and categories that you can expand to reveal additional subcategories of reporting. Many reports are also accessible through the topology viewer.

- **Reporting types:** system reports, batch reports, user ID reports, user-defined online reports
- **Report categories:** asset, availability, capacity, usage, usage violation, backup, storage subsystem performance, switch performance

Consider the following steps when determining how to best use Tivoli Storage Productivity Center reports:

1. Determine how you want to generate and view reports. See "Choosing a reporting type" for more information.
2. Identify which reports contain the most important information about your storage environment. See "Choosing a report category" on page 1297 for more information.

Choosing a reporting type

Use pre-defined (system reports), saved reports, batch reports, rollup reports, and user-defined reports, tables, and charts to view the information collected by monitoring and quota jobs. Tivoli Storage Productivity Center includes these different reporting types to provide you with the flexibility to view data about your storage resources according to the needs of your environment.

The following table describes the reporting types available in Tivoli Storage Productivity Center. Use this table to help determine how to best deliver and view reports about your storage resources.

Reporting type	Description	Location in the navigation tree
User-defined online reports	These reports can be generated at any time during a product session and are only available for that session. Each manager within Tivoli Storage Productivity Center has a set of reports specific to that manager. For example, to view detailed reports about storage subsystems, access the reporting function within Disk Manager. See the following topics for more information about online reports: • "Working with user-defined online reports" on page 1320 • "Data Manager reports" on page 1331 • "Using Data Manager for Databases reports" on page 1462 • "Disk Manager reports" on page 1490 • "Fabric Manager reports" on page 1502	Data Manager > Reporting Data Manager for Databases > Reporting Disk Manager > Reporting Fabric Manager > Reporting
System reports	System reports are automatically generated by Tivoli Storage Productivity Center and contain some of the most common information about your monitored storage resources. These pre-defined reports enable you to view your storage enterprise data quickly and efficiently with one click. Data for these system reports are gathered every time that monitoring jobs are run against your storage resources. See the following topics for more information about online reports: • "System reports - Data" on page 1510 • "System reports - Data Manager for Databases" on page 1525 • "System Reports - Disk Manager" on page 1537 • "System reports - Fabric Manager" on page 1554	IBM Tivoli Storage Productivity Center > Reporting > System Reports
User ID (saved) reports	Create saved reports when you want specific reports generated for you whenever you log in to a product session. This enables you to save reports that you can generate at any time without having to define your report criteria again. Saved reports are only visible to the user ID that created them. See "User ID (saved) reports" on page 1574 for more information.	IBM Tivoli Storage Productivity Center > Reporting > My Reports > *user ID* Reports where *user ID* represents the IBM Tivoli Storage Productivity Center ID of the user that saved the report

Reporting type	Description	Location in the navigation tree
Batch reports	A batch report represents any Tivoli Storage Productivity Center report that you want to run on a regular basis and save its data to a file. You can view the information in a generated batch report file directly or import it into an application of your choice. To create a batch report, you must determine which Tivoli Storage Productivity Center report you want to generate, the schedule on which to generate the report, and the file to which to save its data. You can save the data generated for a batch report to any of the following file formats: CSV, HTML, formatted text, PDF chart, and HTML chart. See "Batch reports" on page 1562 for more information.	IBM Tivoli Storage Productivity Center > Reporting > My Reports > Batch Reports
Rollup Reports	Use rollup reports to view the storage information collected by the master Tivoli Storage Productivity Center server from its associated subordinate servers. Rollup reports enable you to have a network-wide perspective of storage usage in an environment where multiple Tivoli Storage Productivity Center servers are deployed and collecting storage metrics. See the following topics for more information about online reports: • "Rollup reports" on page 1575 • "Tivoli Storage Productivity Center servers" on page 246 • "Collect storage statistics from Tivoli Storage Productivity Center servers" on page 331	IBM Tivoli Storage Productivity Center > Reporting > Rollup Reports
Data Source reports	Use these reports to view detailed information about the agents from which Tivoli Storage Productivity Center collects information about storage resources. Data sources include CIMOM agents, Storage Resource agents, Fabric agents, VMWare, and subordinate Tivoli Storage Productivity Center servers. See Data Source reports for more information.	IBM Tivoli Storage Productivity Center > Reporting > Data Source Reports

Choosing a report category

IBM Tivoli Storage Productivity Center provides a number of categories for reports that help you identify which reports contain the information you want to view about your storage environment. Each category of report contains information gathered by different data collection and quota jobs.

The following table describes the reporting categories. Use this table to help determine which reports are most useful to you and which data collection jobs to run for those reports.

Report Category	Description	What data collection job should I run for this report?
Asset reports	View itemized statistics about your storage resources in a hierarchical view that enables you to drill down to view those resources in greater detail. **Location:** These reports are available in the following locations on the navigation tree: • Data Manager > Reporting > Asset • Data Manager for Databases > Reporting > Asset • IBM Tivoli Storage Productivity Center > Reporting > My Reports (if you save the definition of an online report it appears in this location) • Data Manager for Databases > My Reports **Example:** View information about a storage subsystem and drill down into its related storage pools, disks, volumes, and disk groups. See "Asset reports" on page 1334 for more information about Asset reports.	Probes, Discovery Data for System-wide Users and Monitored Directory reports are gathered by Scans.
Availability reports	View availability statistics about your storage resources, both from a network point of view and from a computer uptime perspective. **Location:** These reports are available in the following locations on the navigation tree: • Data Manager > Reporting > Availability • IBM Tivoli Storage Productivity Center > Reporting > My Reports (if you save the definition of an online report it appears in this location) **Example:** Use a Computer Uptime report to determine the percentage of time that a computer was up, the number of times it was rebooted, and the total time it was down within a user-defined period of time. See "Availability Reports" on page 1358 for more information about Availability reports.	Ping data: Pings Computer Uptime: Probes

Report Category	Description	What data collection job should I run for this report?
TPC-wide Storage Space	Examine storage capacities of storage resources at a file system, computer, or network level. **Location:** These reports are available in the following locations on the navigation tree: • Data Manager > Reporting > TPC-wide Storage Space • Data Manager for Databases> Reporting > Capacity • IBM Tivoli Storage Productivity Center > Reporting > My Reports (if you save the definition of an online report it appears in this location) • Data Manager for Databases > My Reports **Example:** Identify how much storage space is being used on the file systems within your environment, and how much unused storage space is available. See "TPC-wide Storage Space Reports" on page 1360 for more information about Capacity reports.	Probes
Usage reports	View information about the usage and growth of consumption of your storage resources, as well as select files against which to run an Tivoli Storage Productivity Center archive/backup job. **Location:** These reports are available in the following locations on the navigation tree: • Data Manager > Reporting > Usage • Data Manager for Databases > Reporting > Usage • IBM Tivoli Storage Productivity Center > Reporting > My Reports (if you save the definition of an online report it appears in this location) • Data Manager for Databases > My Reports (if you save the definition of an online report it appears in this location) **Example:** Determine how much of the storage being used in your environment can be considered wasted space (orphaned, obsolete, or forbidden files). See "Usage Reports" on page 1420 for more information about Usage reports.	Scans

Report Category	Description	What data collection job should I run for this report?
Usage Violation reports	View quota and constraint violations as well as select files for archive/backup jobs. **Location:** These reports are available in the following locations on the navigation tree: • Data Manager > Reporting > Usage Violations • Data Manager for Databases > Reporting > Usage Violations • IBM Tivoli Storage Productivity Center > Reporting > My Reports (if you save the definition of an online report it appears in this location) • Data Manager for Databases > My Reports (if you save the definition of an online report it appears in this location) **Example:** Identify the users or groups of users that are using storage space on machines where they should not. See "Usage Violation reports" on page 1427 for more information about Usage Violation reports.	Scans, Quotas, Constraints
Backup reports	Investigate the sizes of data that would be required to backup to achieve full backups, determine the amount of space required to perform an incremental backup of any or all of your data at any given point in time, and select files for archive/backup jobs. **Location:** These reports are available in the following locations on the navigation tree: • Data Manager > Reporting > Backup • IBM Tivoli Storage Productivity Center > Reporting > My Reports (if you save the definition of an online report it appears in this location) • Data Manager for Databases > My Reports (if you save the definition of an online report it appears in this location) **Example:** Determine if you have enough storage space to perform a backup of your data (incremental or full). See "Backup reports" on page 1429 for more information about Usage Violation reports.	Scans

Report Category	Description	What data collection job should I run for this report?
Monitored Computer Storage Space	Use these host-based reports to view the data that is collected by probes for computers, Network Attached Storage, and hypervisors. These reports contain detailed information about the consumption of file system space and enable you to relate that space back to external or internal storage without counting shared space multiple times. **Location:** These reports are available in the following locations on the navigation tree: • Data Manager > Reporting > Monitored Computer Storage Space • IBM Tivoli Storage Productivity Center > Reporting > My Reports (if you save the definition of an online report it appears in this location) See "Monitored Computer Storage Space reports" on page 1431 for more information about Monitored Computer Storage Space reports.	Probes
Storage subsystem reports	View storage capacity for a computer, file system, storage subsystem, volumes, array sites, ranks, and disks. These reports also enable you to view the relationships among the components of a storage subsystem. **Location:** Disk Manager > Reporting > Storage Subsystems **Example:** Determine if you have enough storage space to perform a backup of your data (incremental or full). See "Disk Manager reports" on page 1490 for more information about Storage Subsystem reports.	Probes
Storage Subsystem Performance reports	View performance data for storage subsystems. **Location:** Disk Manager > Reporting > Storage Subsystem Performance **Example:** Check the performance rate for storage subsystem activities, such as read I/O rate, read data rate, total port I/O rate, etc. See "Disk Manager reports" on page 1490 for more information about Storage Subsystem Performance Monitor reports.	Subsystem Performance Monitors

Report Category	Description	What data collection job should I run for this report?
Switch Performance reports	View performance data for fabric switches. **Location:** Fabric Manager > Reporting > Switch Performance **Example:** Check the performance rate for switch activities, such as port send packet rate, port send data rate, total port data rate, etc. See "Fabric Manager reports" on page 1502 for more information about Switch Performance Monitor reports.	Switch Performance Monitors
Rollup reports: Asset, Capacity, Database Asset, Database Capacity	View the storage information that has been collected by IBM Tivoli Storage Productivity Center servers through a single interface. These rollup reports enable you to have a consolidated perspective of storage usage in an environment where multiple IBM Tivoli Storage Productivity Center servers are deployed and collecting storage metrics. **Location:** IBM Tivoli Storage Productivity Center > Reporting > Rollup Reports **Example:** Check the disk capacity of all the computers monitored by different servers in your environment. See "Rollup reports" on page 1575 for more information about rollup reports.	IBM Tivoli Storage Productivity Center Server Probes
Data Source reports	Use data source reports to view detailed information about the agents from which Tivoli Storage Productivity Center collects information about storage resources. Data sources include CIMOM agents, Storage Resource agents, Fabric agents, VMWare, and subordinate Tivoli Storage Productivity Center servers. **Location:** IBM Tivoli Storage Productivity Center > Reporting > Data Source Reports **Example:** View detailed information about the CIMOM Agents that have been added to Tivoli Storage Productivity Center as data sources. See "Data source reports - overview" on page 1633 for more information about data source reports.	These reports are available for data sources that have been associated with Tivoli Storage Productivity Center.

What can I find out using reports?

Learn about some of the key storage questions that you can answer by generating Tivoli Storage Productivity Center reports.

Use the following table to view a list of reports that can be generated to answer key questions about storage resources that are monitored by Tivoli Storage Productivity Center.

What do you want to know?	Which report answers this question?	Which schedule can I run to generate this report?
What hardware is currently being used within the enterprise?	Data Manager > Reporting > Asset > By <storage_resource_type>	Probes
How much storage space is being used?	Data Manager > Reporting > TPC-wide Storage Space > Consumed File System Space	Probes
Of the space that is being used, how much is wasted space? (orphaned, obsolete, or duplicate files)	Data Manager > Reporting > Usage > Files Data Manager > Reporting > Usage Violations > Constraint Violations	Scans
How much unused or unallocated storage space is available?	Data Manager > Reporting > TPC-wide Storage Space > Available File System Space	Probes
Is there enough space to do a backup of our data? (incremental or full)	Data Manager > Reporting > Backup > Backup Storage Requirements	Scans
Which files in the environment are at risk if a disaster hits?	Data Manager > Reporting > Backup > Most at Risk Files	Scans
What "forbidden files" are taking up storage space on the network?	Data Manager > Reporting > Usage Violations > Constraint Violations	Scans
Which user or group of users is consuming space on computers that they should not?	Data Manager > Reporting > Usage Violations > Quota Violations	Scans
How fast are storage resources being consumed?	Data Manager > Reporting > TPC-wide Storage Space > Consumed File System Space	Probes
Which user or business unit is consuming the most storage resources?	Data Manager > Reporting > Usage > Users Data Manager > Reporting > Usage > OS User Groups	Scans
Where is disk space reaching a critical shortage?	Data Manager > Reporting > TPC-wide Storage Space > Disk Space	Probes
Which devices have been experiencing the most use/traffic? Which devices have been experiencing the least use/traffic?	Data Manager > Reporting > Usage > Access Load	Scans
Based on historical consumption, how much storage space should be added and when should it be added?	Data Manager > Reporting > TPC-wide Storage Space > Available File System Space	Probes
What files have not been used within a certain time period?	Data Manager > Reporting > Usage > Files > Most Obsolete Files	Scans
What are the largest files or directories within the environment?	Data Manager > Reporting > Usage > Files > Largest Files	Scans

What do you want to know?	Which report answers this question?	Which schedule can I run to generate this report?
What are the most modified files within the environment?	Data Manager > Reporting > Usage > Access Load > Modification Time	Scans
Which computers are "up" or "down" within the environment?	Data Manager > Reporting > Availability > Ping	Pings
What hardware is most prone to error? (for example, disk defects)	Data Manager > Reporting > Asset > System-wide > Disks	Probes
Which file owners no longer exist in the environment?	Data Manager > Reporting > Usage > Files > Orphan files	Scans
How much storage space is an instance consuming?	• **Oracle:** Data Manager for Databases > Reporting > Capacity > Oracle > Total Instance Storage • **SQL/Server:** Data Manager for Databases > Reporting > Capacity > SQL/Server > Total Instance Storage • **Sybase:** Data Manager for Databases > Reporting > Capacity > Sybase > Total Instance Storage • **UDB:** Data Manager for Databases > Reporting > Capacity > UDB > Total Instance Storage	Probes

What do you want to know?	Which report answers this question?	Which schedule can I run to generate this report?
Which user or business unit is consuming the most storage resources and on which instances are they consuming those resources?	**Oracle:** • Data Manager for Databases > Reporting > Usage > Oracle > Users > Group by User Name, *or* • Data Manager for Databases > My Reports > System Reports > Oracle - User Database Space Usage **SQL/Server:** • Data Manager for Databases > Reporting > Usage > SQL/Server > Users > Group by User Name, *or* • Data Manager for Databases > My Reports > System Reports > SqlServer - User Database Space Usage **Sybase:** • Data Manager for Databases > Reporting > Usage > Sybase > Users > Group by User Name, *or* • Data Manager for Databases > My Reports > System Reports > Sybase - User Database Space Usage **UDB:** • Data Manager for Databases > Reporting > Usage > UDB > Users > Group By User Name, *or* • Data Manager for Databases > My Reports > System Reports > UDB - User Database Space Usage	Scans
Which tablespaces are reaching a critical shortage of free space?	• **Oracle:** Data Manager for Databases > Reporting > Capacity > Oracle > Data File Free Space > By Tablespace • **UDB:** Data Manager for Databases > Reporting > Capacity > UDB > Container Free Space > By Tablespace	Probes
Which tablespaces contain the most free space?	• **Oracle:** Data Manager for Databases > Reporting > Capacity > Oracle > Data File Used Space > By Tablespace • **UDB:** Data Manager for Databases > Reporting > Capacity > UDB > Container Used Space > By Tablespace	Probes

What do you want to know?	Which report answers this question?	Which schedule can I run to generate this report?
Which databases are reaching a critical shortage of free space?	• **SQL/Server:** Data Manager for Databases > Reporting > Capacity > SQL/Server > Data File Free Space > By Database • **Sybase:** Data Manager for Databases > Reporting > Capacity > Sybase > Fragment Free Space > By Database	Probes
Which databases contain the most used space?	• **SQL/Server:** Data Manager for Databases > Reporting > Capacity > SQL/Server > Data File Used Space > By Database • **Sybase:** Data Manager for Databases > Reporting > Capacity > Sybase > Fragment Used Space > By Database	Probes
Based on historical consumption of storage space for an RDBMS, how much storage space should be added and when should it be added?	• **Oracle:** Data Manager for Databases > Reporting > Capacity > Oracle > Data File Free Space > By Database > History Chart:Free Space % for selected • **SQL/Server:** Data Manager for Databases > Reporting > Capacity > SQL/Server > Data File Free Space > By Instance > History Chart:Free Space % for selected • **Sybase:** Data Manager for Databases > Reporting > Capacity > Sybase > Device Free Space > By Device > History Chart:Free Space % for selected • **UDB:** Data Manager for Databases > Reporting > Capacity > UDB > Container Free Space > By Instance > History Chart:Free Space % for selected	Probes
What are the largest tables within the environment?	• **Oracle:** Data Manager for Databases > Reporting > Usage > Oracle > Tables > Largest Tables • **SQL/Server:** Data Manager for Databases > Reporting > Usage > SQL/Server > Tables > Largest Tables • **Sybase:** Data Manager for Databases > Reporting > Usage > Sybase > Tables > Largest Tables • **UDB:** Data Manager for Databases > Reporting > Usage > UDB > Tables > Largest Tables	Scans
Which segments in an instance contain the most extents?	• **Oracle:** Data Manager for Databases > Reporting > Usage > Oracle > Segments > Most Extents	Scans
How much allocated space for an object is being wasted?	• **Oracle:** Data Manager for Databases > My Reports > System Reports > Oracle - Segments with Wasted Space	Scans

What do you want to know?	Which report answers this question?	Which schedule can I run to generate this report?
How many free extents does a tablespace have?	• **Oracle:** Data Manager for Databases > Reporting > Asset > By DBMS Type > Oracle > instance_name > By Tablespace	Probes
How many tables, indexes, and datafiles/containers are associated with a tablespace?	• **Oracle:** Data Manager for Databases > Reporting > Asset > System-wide > Oracle > Tablespaces • **UDB:** Data Manager for Databases > Reporting > Asset > System-wide > UDB > Tablespaces	Scans
How many tables, indexes, and datafiles/fragments are associated with a database?	• **SQL/Server:** Data Manager for Databases > Reporting > Asset > System-wide > SQL/Server > Databases • **Sybase:** Data Manager for Databases > Reporting > Asset > System-wide > Sybase > Databases	Scans
How can I determine which users have violated a quota on a specific instance?	• **All DBMSs:** Data Manager for Databases> Reporting > Usage Violations > Quota Violations > Instance Quotas > By Instance	Scans
What are the sizes and locations of Control Files and log files for an instance within the environment?	• **Oracle:** Data Manager for Databases > Reporting > Asset > By DBMS Type > Oracle > instance_name • **SQL/Server:** Data Manager for Databases > Reporting > Asset > By DBMS Type > SQL/Server > instance_name > Databases	Probes
How can I determine how close a user is to exceeding a quota?	• **All DBMSs:** Data Manager for Databases > Usage Violations > Quota Violations > All Quotas > By User	Scans

Report considerations and limitations

Keep in mind these considerations and limitations when viewing reports in Tivoli Storage Productivity Center.

Data collection for reports

Some columns within reports might not be populated with data for the storage resources that you are monitoring. Columns are empty if you did not configure Tivoli Storage Productivity Center to discover or collect the information intended for that column. Use discovery, probe, ping, or scan schedules to ensure that you collect information for all the columns that appear in reports.

When you specify a start time for using performance monitor data in a report, the start time might not coincide with the start of a performance monitor data collection interval. If the requested start time is after the start of a data collection interval and the duration of the data collection interval is long enough so that it ends at or after the requested start time, Tivoli Storage Productivity Center includes all data from the collection interval that began before the requested start time. This data might include data collected before the start time that you specified. This processing ensures

that the maximum amount of available performance data is used. For example, if a performance monitor collects data every 20 minutes starting at 01:00, but you request performance data that starts at 1:15, Tivoli Storage Productivity Center still analyzes performance data that starts at 01:00 that has a duration of 20 minutes.

Report charts that contain long path names
If you generate charts for reports and these charts contain long path names or many segments, the text on the charts might overlap and make them difficult to read.

Information about directories
Before information about directories is displayed in reports, you must complete the following tasks:

1. Include directories that were discovered by Tivoli Storage Productivity Center in a directory group.
2. Include the directory group in a data collection scan.

After a scan schedule collects data about the directories in a directory group, information about the directories is displayed in By Directory reports

Storage totals for Network-wide reports
Tivoli Storage Productivity Center provides a number of network-wide reports that display storage totals based on the data collected from the monitored computers and storage subsystems in your network. Click the magnifying glass icon next to a row in a network-wide report to view the details about the computers that are included in those storage totals. However, the reports that you drill down into display information about computers only. Storage information about storage subsystems is not included in the values for reports that are shown when you drill down from a network-wide report.

For example, the Data Manager > Reporting > Capacity > Disk Capacity > Network-wide report displays disk capacity totals for the computers and storage subsystems in your network that are monitored by Tivoli Storage Productivity Center. However, when you click the magnifying glass icon next to a row in that report, the resulting report displays disk totals for computers only. This action might cause the totals displayed in the network-wide report to be larger than the totals reflected in the report that you drill down in to (if you have disks that are part of both computers and storage subsystems within your network).

Report values for General Parallel File Systems (GPFS) file systems
For reports that display information collected by scans, Tivoli Storage Productivity Center does not include statistics for GPFS snapshot directories and the files in those directories. Because of this issue, the values in these columns might be smaller than the actual numbers for the file systems.

For example, when viewing data collected by scans of GPFS file systems in the Data Manager > TPC-wide Storage Space > File System Space report, the values for the File Count, Directory Count, and File System Space columns might be smaller than the actual numbers for the file systems.

IBM XIV Storage System reporting limitation for disk drives
Tivoli Storage Productivity Center does not collect physical serial number information about the disk drives that are associated with the XIV system

devices. Therefore, any reports that display information about the XIV system do not include the physical serial numbers of the disk drives.

Hitachi Data Systems storage subsystems limitations

- There is a limitation within reports when Tivoli Storage Productivity Center collects information about Hitachi Data Systems (HDS) storage subsystems that are configured as storage virtualizers. Specifically, any reports that display a value for the Disk Unallocated Space column do not count the storage used by volumes that exist on external disks when the HDS is used as a virtualizer.
- Tivoli Storage Productivity Center does not support Logical Unit Size Expansion (LUSE) with Hitachi storage subsystems. Because of this limitation, Tivoli Storage Productivity Center might report a different number of volumes for a subsystem than is reflected in the HiCommand Device Manager (HDvM) when LUSE is used.

Time zones for servers that are monitored by Storage Resource agents

The time zones of servers that are monitored by Storage Resource agents are shown as Greenwich mean time (GMT) offsets in Tivoli Storage Productivity Center reports. For example, a server in Los Angeles shows the following time zones in the By Computer report in Asset reporting:

```
(GMT-8:00) GMT-8:00
```

SQL access to data collected by Tivoli Storage Productivity Center for use in external reports and applications

You can use the data collected by data collection jobs to create custom reports in external tools. Tivoli Storage Productivity Center provides a set of DB2® views that represent key data that was stored in the database repository. Use Structured Query Language (SQL) commands to retrieve the data in these views. Use this data in external tools such as Business Intelligence and Reporting Tools (BIRT), Microsoft Excel, and Tivoli Common Reporting. See *Planning to retrieve information from views in the database repository* topic in the *IBM Tivoli Storage Productivity Center and IBM Tivoli Storage Productivity Center for Replication Installation and Configuration Guide* for more information about how to use SQL to retrieve data for use in custom reports and tools.

Storage Pools in EMC storage subsystems

The data that Tivoli Storage Productivity Center collects about EMC storage subsystems is based on SMI-S standards. Within SMI-S model, different types of storage pools are defined and several subsystem attributes can be modeled as special pool types. Beside the pools that are available for volume creation, additional storage space from the EMC storage subsystem might be represented as a pool within the SMI-S model. Because of this representation, Tivoli Storage Productivity Center reports and CLI commands might display more pools for EMC storage subsystems than what is reported through the EMC Navisphere agent.

Computers in a Windows domain

Once computers are discovered in a domain, they remain in the database until three discoveries do not report them. If you remove the computer that is doing the discovery in a domain, no further discovery results are processed by the server. Therefore, any remaining domain computers that were previously discovered continue to show their unreachable value in Unmanaged Computers reports.

UDB reports

For UDB reports, the "User Name" and "Creator" columns represent the

schema (not the operating system user) which is using the storage space. Each schema is associated with one operating system user. The reports show usage at the schema level.

Reports display incorrect number of folders for Windows computers

On monitored computers that run Windows, the number of folders that is reported by Tivoli Storage Productivity Center might be different from the number of folders that is indicated by Windows Explorer. This situation occurs when settings on the computer indicate that files, folders, and drives are hidden. For example, the Data Manager > Reporting > Usage > files > File Summary > by Computer report might display a number of folders for a Windows computer that is less than the number of folders provided by Windows Explorer on that computer.

To ensure that the number of folders reported by Tivoli Storage Productivity Center more closely matches the number reported by Windows Explorer, complete the following steps:

1. On each of the Windows computers that you are monitoring, start Windows Explorer.
2. Navigate to the file system whose settings that you want to change.
3. Select **Folder and search options...** or **Folder options...** from the **Organize** or **View** menus.
4. Click the **View** tab.
5. In the **Advanced Settings** section, make the following changes:
   - Select **Show hidden files, folders, and drives**.
   - Clear **Hide protected operating system files**.
6. Run probe and scan data collection schedules on the computers.
7. View the reports that display the number of folders for Windows computers.

Information about space efficient volumes

Keep in mind the following information about space-efficient volumes:

- A volume name or virtual disk in a report that is marked with an asterisk (*) indicates that the volume or virtual disk is a space-efficient volume. The * is not part of the actual volume or virtual disk name.
- Tivoli Storage Productivity Center does not include space efficient volumes when calculating the values for consumed and available space on DS8000 storage systems. Therefore, the values for these columns in Tivoli Storage Productivity Center reports might be different from the space that is available on DS8000 storage systems with space efficient volumes.
- Tivoli Storage Productivity Center does not display information about space-efficient volumes for IBM DS8000 storage systems in the following reports:
  - Disk Manager > Reporting > Storage Subsystems > Computer Views > By Filesystem/Logical Volume
  - Disk Manager > Reporting > Storage Subsystems > Storage Subsystem Views > Disks

The mapping of volumes to an ESX hypervisor might not display correctly

When assigning and unassigning volumes to an ESX hypervisor, the mapping of the volumes might not display correctly in Tivoli Storage Productivity Center reports. For example, if you assign a volume to a hypervisor, unassign it, and then assign a different volume to the

hypervisor, information about the original volume might still be displayed in the Correlated Storage Subsystem volume report that is available under Data Manager > Reporting > Asset > By Hypervisor.

To ensure that Tivoli Storage Productivity Center reports display the correct volume information, complete the following tasks before generating the reports:

- After unassigning a storage system volume from a hypervisor, use VMware vSphere Client to rescan the HBA.
- After assigning a new storage system volume to the hypervisor, use VMware vSphere Client to rescan the HBA.
- In Tivoli Storage Productivity Center, rerun probes for the computer, hypervisor, and storage system.

IBM Storwize V7000 Unified/IBM SONAS cluster names in reports

In reports that display file level information for IBM Storwize V7000 Unified/IBM SONAS clusters, the storage system name is included with the cluster name in the Computer or Device column. The format of the column is `storagesystem_name: cluster_name`, where storagesystem_name is the name of the IBM Storwize V7000 Unified/IBM SONAS device that the cluster belongs to. For example, tpcserver1.tpc.example.com: kq98n5d.acct displays storage system tpcserver1.tpc.example.com that cluster kq98n5d.acct belongs to.

Pool space for NetApp filers

For NetApp filers that are configured with block data, the values for pool space that are shown in reports are different from the values shown in a storage management tool for NetApp filers, such as FilerView. The values that are different include total pool space (capacity) and available pool space.

This discrepancy occurs because the pool space information that is collected by SMI-S agents for Tivoli Storage Productivity Center includes Write Anywhere File Layout (WAFL) and Snapshot reserve space, whereas tools like FilerView do not include this additional space.

Working with reports

Learn how to drill down through reports, navigate report tabs, view historical trends in reports, and view reports as tables of data or as graphical charts. The ability to customize your view of reports provides you with the flexibility to get a very detailed look at your information or a very high level overview.

Generating and viewing reports

Learn how to generate and view reports.

Each of the report types available in IBM Tivoli Storage Productivity Center are generated in different ways to provide you with the flexibility to meet your environment's changing needs. Click the following links to learn more about how to generate the different report types and determine what works best for your organization.

Report type	How to generate
User-defined online reports	"Generating reports" on page 1320
System reports	"Generating and viewing system reports" on page 1510
User ID (saved) reports	"Creating a user-defined report" on page 1574

Report type	How to generate
Batch reports	"Creating batch reports" on page 1562
Rollup reports	"Generating rollup reports" on page 1576

Sorting report columns

Learn how to sort the columns in reports.

Reports appear in a tabular format and are comprised of rows and columns. You can scroll the report to view the entire report. Use the **View** menu to hide/show the navigation tree to increase the viewable area of the report. You can also drag the divider bar in the middle of the screen back and forth to reallocate the amount of space that is given each pane.

To sort the columns or change the order of the columns in a report:

- **Re-sorting columns.** To resort a column, click on the column header. The column will resort in ascending or descending order.
- **Moving columns.** To change a column order, press <Alt>, and then click and drag the column you want to move.

Printing reports or charts

Learn how to print reports to a printer, a PDF, an HTML file, a CSV file, or a formatted text file.

You can print any IBM Tivoli Storage Productivity Center report or chart displayed in the content pane.

To print a report or chart, complete the following steps:

1. Generate the report you want.
2. Click **File > Print** or click on the tool bar. A print window opens.
3. Select the output that you want:
   - Select **Printer** to send the output directly to a printer
   - Select **PDF file** to save the output as a PDF file
   - Select **HTML file** to save the output as an HTML file
   - Select **CSV file** to save the output as a comma delimited file. Select **Include Headers** to include column headers in the report output file. Select **Include Totals** to include the totals column in the report output file.
   - Select **Formatted file** to save the output as a formatted text file
4. Click **Continue**.
   - If you selected **Printer**, the Page Setup window opens. Specify any custom settings for the print job on the Page Setup window and click **OK**. The report or chart is printed to your default printer.
   - If you selected **PDF file, HTML file, CSV file** or **Formatted file**, the Save As window opens. Select the location where you want to store the file and enter a name for the file in the **File Name** field. Click **Save**. Depending on the file type you selected, the report or chart is saved as a PDF or HTML file.

Including charts in reports

Learn how to create charts from the reports that you generate.

There are a large number of charts and chart types that can be generated from reports. All reports that support charting will have a button at the start of the report. Any row in a report that supports charting on that row will also have a .

Many charts can be generated simultaneously from the same report. After generating a chart, return to the **Report** tab and choose another chart or another set of objects to generate a chart upon. Another **Chart** tab will be generated in addition to the existing tabs and you will be positioned to the new chart tab.

See "Generating charts" for information on how to generate charts from reports.

You can also customize the appearance of charts to determine how you want to present data. For example, you can create pie chart, bar chart, stacked bar chart, determine how many charts appear per page, specify time increments, and so on. See "Customizing charts" on page 1314 for information on how to customize charts.

Generating charts:

Learn how to generate charts.

To view a chart of all of the rows in the table:

1. Click , which is at the start of the report. All reports that support charting will have this multi-colored pie chart icon at the start of the report.
2. Select the type of chart you would like to generate. The types of charts available will vary depending on the report. After you select the chart type, a new tab for that chart will appear in the content pane.

To generate a chart for just the element in that row:

- Click the chart icon for that report row.

To generate a chart for multiple, non-consecutive rows in a report:

1. Select rows in the report by holding down the control key (Ctrl key) on the keyboard while clicking on the required rows.
2. Click a button for any of the selected rows and select the type of chart you would like to generate. After you select the chart type, a new tab for that chart will appear in the content pane.

To generate a chart for a range of rows in a report:

1. Click on the first row in the range and then hold down the Shift and Ctrl while clicking on the end row in the range.
2. Click a button for any of the selected rows and select the type of chart you would like to generate. After you select the chart type, a new tab for that chart will appear in the content pane.

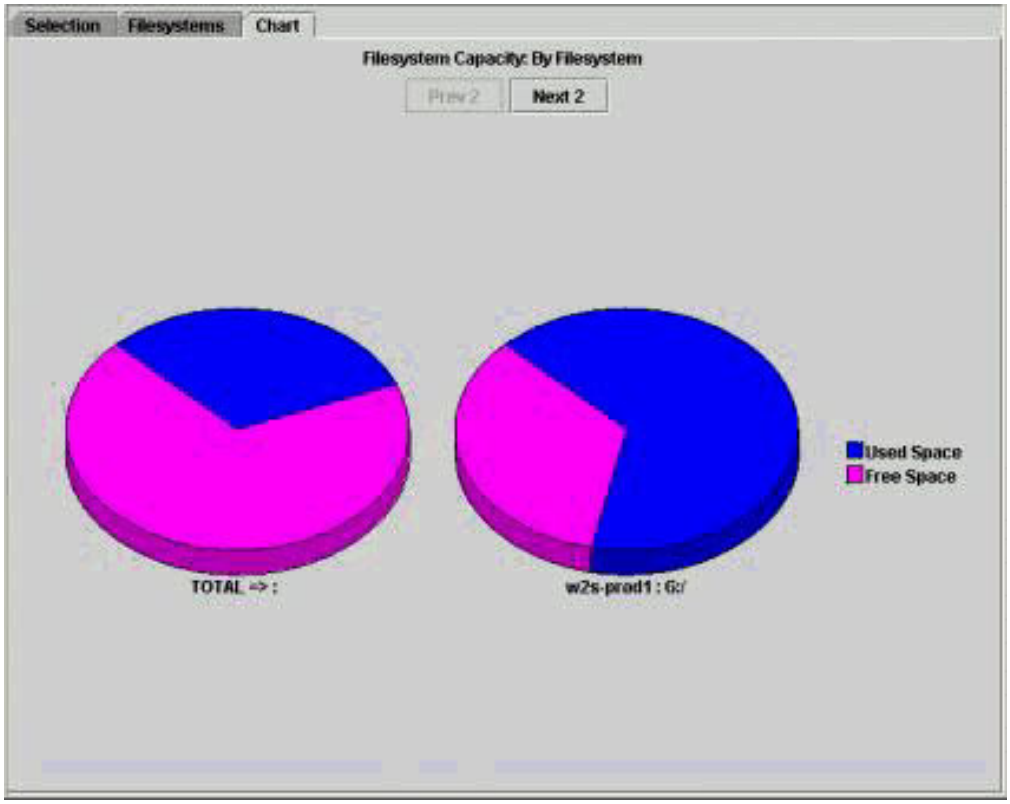

Figure 34. Chart Generation

Customizing charts:

Learn how to customize the appearance of charts.

While viewing a chart, you can customize its appearance using the Chart Customization window. This includes:

- Entering the title of a chart
- Determining the maximum number of charts or series that appear per screen
- Specifying how to show values for data points or areas
- Selecting a type for a chart such as a pie, bar, stacked bar, and 100% stacked bar
- Determining the orientation (vertical or horizontal) of a chart
- Specifying history chart settings such as trends and time increment values

To access this window from a chart, right-click on the chart and select **Customize this chart** from the pop-up menu. The Chart Customization window appears.

Use this window to customize the chart generated from a report, a report created in the Reporting facility, a batch report, user reports, and dashboard reports. You can use the settings on this window to:

- Customize the display of the current chart.
- Customize the display of the current chart and save those changes. If you save the customization settings for a report chart, that chart will use those settings whenever it is generated.

If a field on this window does not apply to a selected report it will appear as grayed out and cannot be edited. The following list describes the fields:

Chart title
Enter the name you want to give to the generated chart.

Maximum number of charts or series per screen
Select the maximum number of charts or series per page that should appear in the generated report from this list. For example, how many pie charts will appear on one page. When the number of charts that appear on one page exceeds the number in this field, the additional charts will be shown on a separate page. The most charts or series you can define to appear on a page is 30.

Show values for data points or areas
Determine how to display the data points/areas on a chart. You can choose to display the data points areas:

- Only when hovering - display values for data points on an online chart when the mouse hovers over an appropriate place on that chart
- Always - always display and print values for data points

Graph charts
Use the fields in this section to customize the appearance of graphs and charts.

Chart type
Select a type for the generated chart including:

- Pie Chart
- Bar Chart
- Stacked Bar
- 100% Stacked Bar

Chart orientation
Determine whether the chart graphic will appear vertically or horizontally on a page. You can set the orientation for the following chart types only: Bar Chart, Stacked Bar, and 100% Stacked Bar.

Maximum number of series per graph
Select the maximum number of series that should appear in one graph or chart. For example, how many slices will appear in one pie chart. When the number of series that appear in one graph exceeds the number in this field, the additional charts will be shown on a separate page. The default maximum is 12. The most series that can appear in one chart is 30.

Note: Disk Capacity batch reports always display one series per chart, and one chart per page.

History Charts
Use the fields in this section to customize the appearance of history charts.

Show Trends
Check this box if you want IBM Tivoli Storage Productivity Center to show a trend for the data in a history chart. The trend attempts to show future storage usage in a chart based on earlier usage.

Time increment for x-axis
Select which value to use for the time increment that appears on the x-axis of a history chart. You can select By Scan, Weekly, Monthly. For example, if you choose Monthly, the x-axis will measure storage usage in monthly increments.

Restore Defaults
Reset the values in the fields on this window to their original default settings.

Apply Apply the settings defined in this window to the current chart.

Save Apply the settings defined in this window to the current chart and save those settings. When the chart is generated in the future, it will automatically use the saved settings.

Cancel
Exit the window without applying or saving the settings in the window.

Drilling down a report row

Learn how to drill down into report rows to view more detailed information about your storage resources.

Many of the rows that are presented in the generated reports allow you to drill down and get more reports of more detailed information. For example, if you are looking at a report on computers, you might be able to drill down on a row for a specific computer and generate a report for the file systems contained on that computer.

When detailed drill down is allowed within a report, there is a icon for that row. To drill down, simply click on and a new tab with the drill down report will be generated and added to the tab dialog. You will then be positioned on that tab viewing the new detail report that you have generated.

Navigating tabs

Learn how to navigate report tabs to view detailed sub reports.

As you generate reports and drill down on rows to generate detailed sub reports, the number of tabs in the Reporting window will grow. You can move about from tab to tab simply by clicking on the tab name.

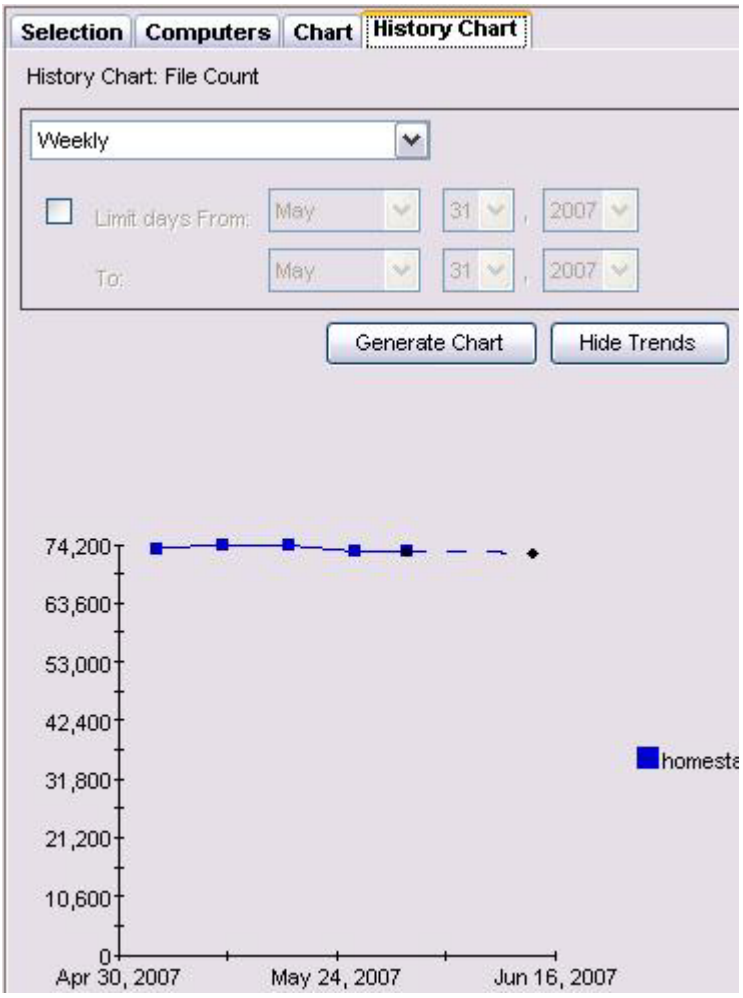

Figure 35. Tabs

You can also return to the **Selection** tab and change your selection criteria to start all over again with a newly generated report at any time. If you change your selection criteria and generate a new report, all subsequent or dependent tabs (for example, drill down and chart tabs) are closed.

To close a tab, right-click on the tab name and select **Close** from the pop-up menu.

Trending with historical data

Learn how to view trends related to the capacity and usage of your storage resources.

Use the trending of historical data to view patterns of your data across your entire network. For example, if you set up a graph that shows the disk capacity of a computer between January 1 and December 31, you can view "trended" data that will predict the disk capacity for that computer over the next 6 months. The trended data appears as a dashed line that is appended to the last probed or scanned data point.

The length of time for how far in the future that trended data will show is determined by 50% of the length of time displayed in the graph. For example, if the data in the non-trended portion of the graph displays data between January 1 and December 31, the predicted trend for that data will be shown for the next 6

months (January 1 to December 31 = 12 months, 50% of 12 months = 6 months trended). You can change the amount of time trended by changing the length of time of the graphed data using the **Limit days from** and **To** fields.

Before viewing trends in the data collected by IBM Tivoli Storage Productivity Center, use the history aggregator function to define and run jobs to sum data in the database repository for historical reporting purposes. For example, after running the history aggregator, you can view the sum of usage across multiple resources, by database.

To view a historical data, generate a report, right-click on the row or rows for which you want to view the data, and select an option from the menu.

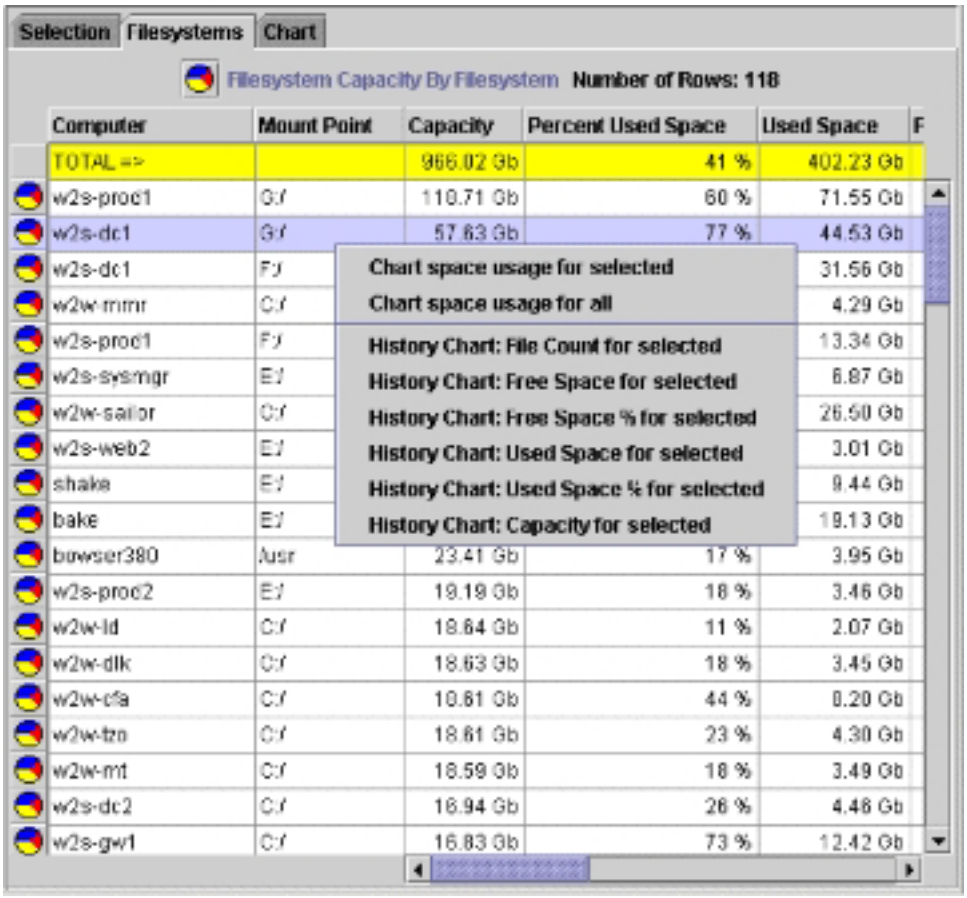

Figure 36. Trending with Historical Data

Depending on the type of report you generated, you can create the following history charts for the storage resources that you select:

History chart	Description
Free Space for Selected	Shows the free space available over a specified period of time.[1]
Free Space % for Selected	Shows the percentage of free space available over a specified period of time.[1]
Used Space for Selected	Shows used space over a specified period of time.[1]
Used Space % for Selected	Shows percentage of used space over a specified period of time.[1]

History chart	Description
Capacity for Selected	Shows capacity for selected over a specified period of time.[1]
Unallocated Space for Selected	Shows the unallocated space available for the selected resources over a specified period of time.[1]
Unallocated Space for All	Shows the unallocated space available for all the storage resources in the report over a specified period of time.[1]
File Count	Shows the number of files accessed or modified over a period of: • 1 day • 1 day - 1 week • 1 week - 1 month • 1 month - 1 year • > year
File Count %	Shows the percentage of files accessed or modified over a period of: • 1 day • 1 day - 1 week • 1 week - 1 month • 1 month - 1 year • > year
Size	Shows the size of files accessed or modified over a period of: • 1 day • 1 day - 1 week • 1 week - 1 month • 1 month - 1 year • > year
Size %	Shows the percentage of file size accessed or modified over a period of: • 1 day • 1 day - 1 week • 1 week - 1 month • 1 month - 1 year • > year

[1] The time options for data points in a chart are **By Aggregator**, **Weekly**, and **Monthly**. You can select one of these options from the list menu on the **History Chart** page for the report. (See Figure 37 on page 1320.)

- Select **By Aggregator** to generate a chart in which its data points correspond to each time a history aggregator job is run. By default, the history aggregator runs daily at 3:30 a.m., so when you generate a history chart with this default setting there is a point in the chart for every day in the selected time range. If you change the schedule of the history aggregator, the points in the history chart that you generate change accordingly.
- Select **Weekly** to generate a chart that includes one data point for each week in the selected time range.
- Select **Monthly** to generate a chart that includes one data point for each month in the selected time range.

Figure 37 on page 1320 shows a history chart for used space for a file system:

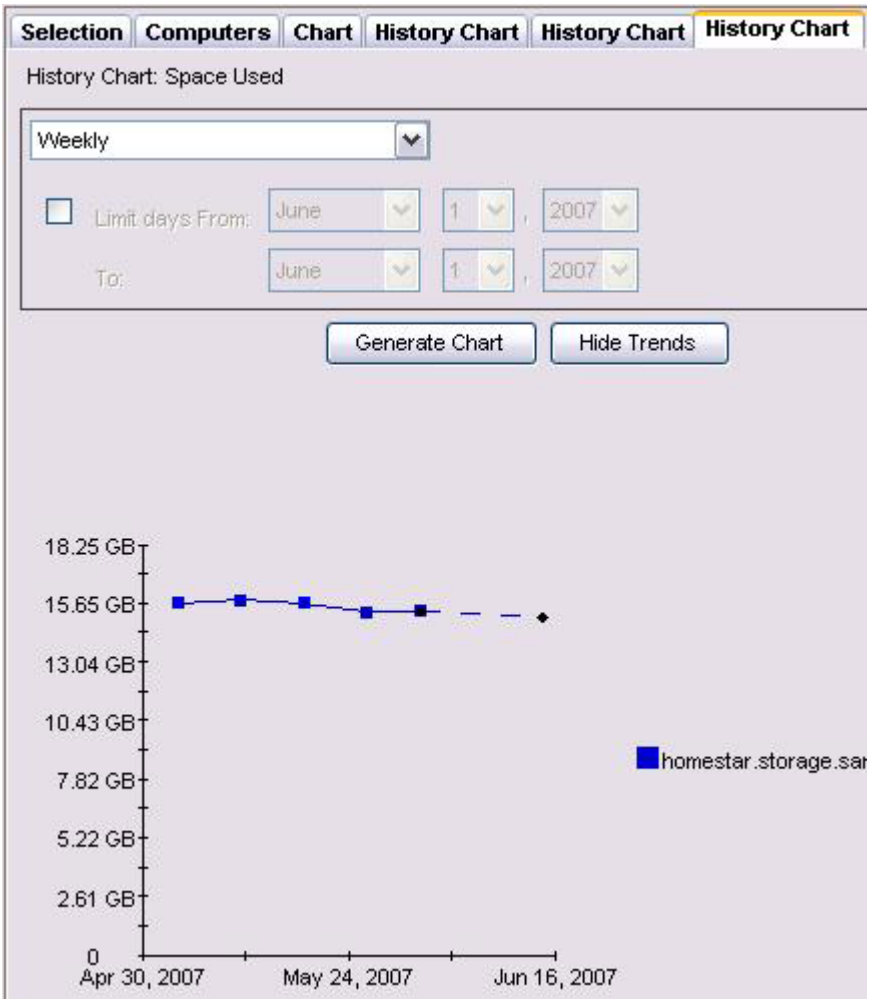

Figure 37. History Chart for File System Used Space

Select **File → Export data** to export history data to a comma delimited file (.csv). You can include or not include headers in the comma delimited file that you create. The column headings within the header reflect the type of report from which you are exporting history data.

Working with user-defined online reports

Use the information in this section to learn how to generate and view online reports. These reports are available in the **Reporting** nodes under Data Manager, Data Manager for Databases, Disk Manager, and Fabric Manager.

Generating reports

Learn how to generate and view online reports in Data Manager, Data Manager for Databases, Disk Manager, and Fabric Manager.

1. Expand the navigation tree to display the type of report you want to generate. For example, if you want to generate a disk capacity report, expand **Data Manager** > **Reporting** > **Capacity** > **Disk Capacity**.
2. Highlight a By Clause to determine how you want to view a report. For example, to view capacity information according to computer group, click **Reporting** > **Capacity** > **Disk Capacity** > **By Computer Group**. The **Selection** page is displayed.

3. Use the **Selection** page to select the profile to use when generating a report and determine what columns appear within a report. See "Selecting resources to display on a report" on page 1324 for information.
4. Click **Selection...** to select the objects that you want to report upon from the Select Resources window.
5. Click **Filter...** to further filter the objects that appear in a report. Filters enable you to apply general rules to the report based on the rows in that report. See "Filtering the resources that appear on a report" on page 1326 for more information on filtering.
6. Use the **Available Columns** and **Included Columns** list boxes to determine what columns are displayed in a generated report.
7. Click **Generate Report**. A new tab will be added to the tab dialog representing the report that you generated.
8. Click the new tab to view the report. Reports are tabular in format and composed of rows and columns. You can scroll the report to view the entire report. Use the **View** menu to hide/show the navigation tree to increase the viewable area of the report or drag the divider bar in the middle of the screen back and forth to reallocate the amount of space that is given each pane.

Defining options for a report:

Learn how to customize a report before you generate it.

Depending on the report that you want to generate and the level upon which you choose to report (by computer, by file system, network wide, and so on), you are typically presented with a **Selection** page. For example, if you want to generate the Most Obsolete Files report, expand **Data Manager** > **Reporting** > **Usage** > **Files** > **Most Obsolete Files** > **By Computer**. Choose items in the **Selection** page.

- Select the profile to use when you generate a report
- Select the resources (computers, computer groups, storage subsystems, and so on) to display in a generated report
- Apply filters to the columns within a report to determine what resources are displayed within the rows of a report. For example, show only the systems that contain over 80% used space.
- Determine what columns display within a report.

The following table describes the interface elements that might be displayed on the **Selection** page (depending on the report that you want to generate):

Interface element	Description
Profile (Data Manager only)	This field indicates the profile to use when the report is generated. If you want to use the supplied default profile, then leave the field as is and generate the report. However, if you want to use a customized profile that you set up for this reporting, choose that profile from the list. Keep in mind that profiles control what statistics are gathered and also what files are included in that statistical analysis.

Interface element	Description
Return maximum of __ rows per *storage_resource*	This field controls how many rows are displayed in a generated report. The value that displays as the *storage_resource* in this field depends on the selected By clause. For example, if you select **Data Manager** > **Reporting** > **Usage** > **Files** > **Most Obsolete Files** > **By Computer**, you can enter 10 in the **Return maximum of __ rows per computer** field and to limit the number of rows in the report to only 10 obsolete files per computer. If you set up scans to collect many more rows than that per computer, this selection is an effective and efficient way to control the size of the generated report. With this field, you can control the size of the report that is generated for different By clauses.
Limit to this time range:	The fields determine the date range from which to gather availability information for the objects that you select.
Relate Computers to: (Disk Manager - Storage Subsystem reports only)	This field generates a report that shows the relationship between the computer and one of these options: storage subsystems, volumes, or disks. • Storage Subsystem. Choose this option to view the Storage Subsystems that the logical volumes within a computer are using. • • Volumes. Choose this option to show the volumes within a storage subsystem that the logical volumes within a computer are using. • Disks. Choose this option to show the disks within a disk array that the logical volumes within a computer are using.
Relate File systems/Logical Volumes to: (Disk Manager - Storage Subsystem reports only)	This field generates a report that shows the relationship between the file systems/logical volumes and one of these options: storage subsystems, volumes, or disks. • Storage Subsystem. Choose this option to view the storage subsystems on which a file system/logical volume is allocated. • Volumes. Choose this option to view the volumes on which the file system/logical volume is allocated. • Disks. Choose this option to show the disks on which a file system/logical volume is allocated.
Relate Storage Subsystems to: (Disk Manager - Storage Subsystem reports only)	This field generates a report that shows the relationship between a storage subsystem and one of these options: computer or file system/logical volume. • Computer. Choose this option to view the computers that are using a storage subsystem. • File system/Logical Volume. Choose this option to view the file systems/logical volumes that are using a storage subsystem.
Relate Volumes to: (Disk Manager - Storage Subsystem reports only)	This field generates a report that shows the relationship between a volume and one of these options: computer or file system/logical volume. • Computer. Choose this option to view the computers that are using a volume. • File system/Logical Volume. Choose this option to view the file systems/logical volumes that are using a volume.

Interface element	Description
Relate Disks to: (Disk Manager - Storage Subsystem reports only)	This field generates a report that shows the relationship between a disk and one of these options: computer and file system/logical volume. • Computer. Choose this option to view the computers that are using a disk. • File system/Logical Volume. Choose this option to view the file systems/logical volumes that are using a disk.
Selection...	This button is used to determine the storage resources (computers, file systems, logical volumes, storage subsystems, and so on) upon which you want to report. When you click **Selection...**, the Select Resources window opens. If you clear the check box for a resource on the Select Resources window, a push-pin icon displays on the **Selection...** button. If you are generating a Network-wide report, the **Selection...** button is disabled because you chose to generate the report network-wide, for all objects.
Filter...	Use this button to further select or restrict the values within the columns you want to include on a report. You can apply general rules to the selected columns. When you click **Filter...**, the Edit Filter window opens. For example, select all computers with the name beginning with `w2s-*`, or select all file systems with percent used space >= to a specific value. If a filter is defined for this report, a pushpin icon displays on the **Filter...** button. **Note:** For storage entities that contain an asterisk (*) within their names, the * is used as a wildcard character if you select `LIKE` from the **Operator** menu on the **Edit Filter** panel. For more information, see "Filtering the resources that appear on a report" on page 1326.
Available Columns / Included Columns	These panels display the columns that can be included or are already included in the generated report. • The **Available Columns** list displays the columns that you can include in the generated report that is not already included. • The **Included Columns** list displays the columns in the generated report. By default, all the columns for a report are listed in this list box and are displayed in the generated report. You can highlight the columns and use the up and down arrows to rearrange columns in the report. The order of the items in this list determines the order in which the columns display in the generated report. The columns with shaded-color names are unavailable columns. They cannot be selected, removed, or reordered. To include a column in a report: 1. In the **Available Columns** list, click the name of the column. To select more columns, press **Shift** and click the columns that you want to add. To select a range of columns, press **Ctrl** and click the first and last column. 2. Click the right-arrow button (>>) to add the columns to the **Included Columns** list. To remove a column in a report: 1. In the **Included Columns** list, click the name of the column. To select more columns, press **Shift** and click the columns that you want to add. To select a range of columns, press **Ctrl** and click the first and last column. 2. Click the left-arrow button (<<) to add the columns to the **Available Columns** list.

Selecting resources to display on a report:

Learn how to select the storage resources that displays in a report.

Use the Select Resource window to determine the objects (computers, file systems, logical volumes, storage subsystems, and so on) upon which you want to report. To select the resources on which you want to report:

1. Select the type of report you want to generate. For example, **Data Manager** > **Reporting** > **Capacity** > **Disk Capacity** > **By Disk**.
2. Click **Selection**. The Select Resources window opens.

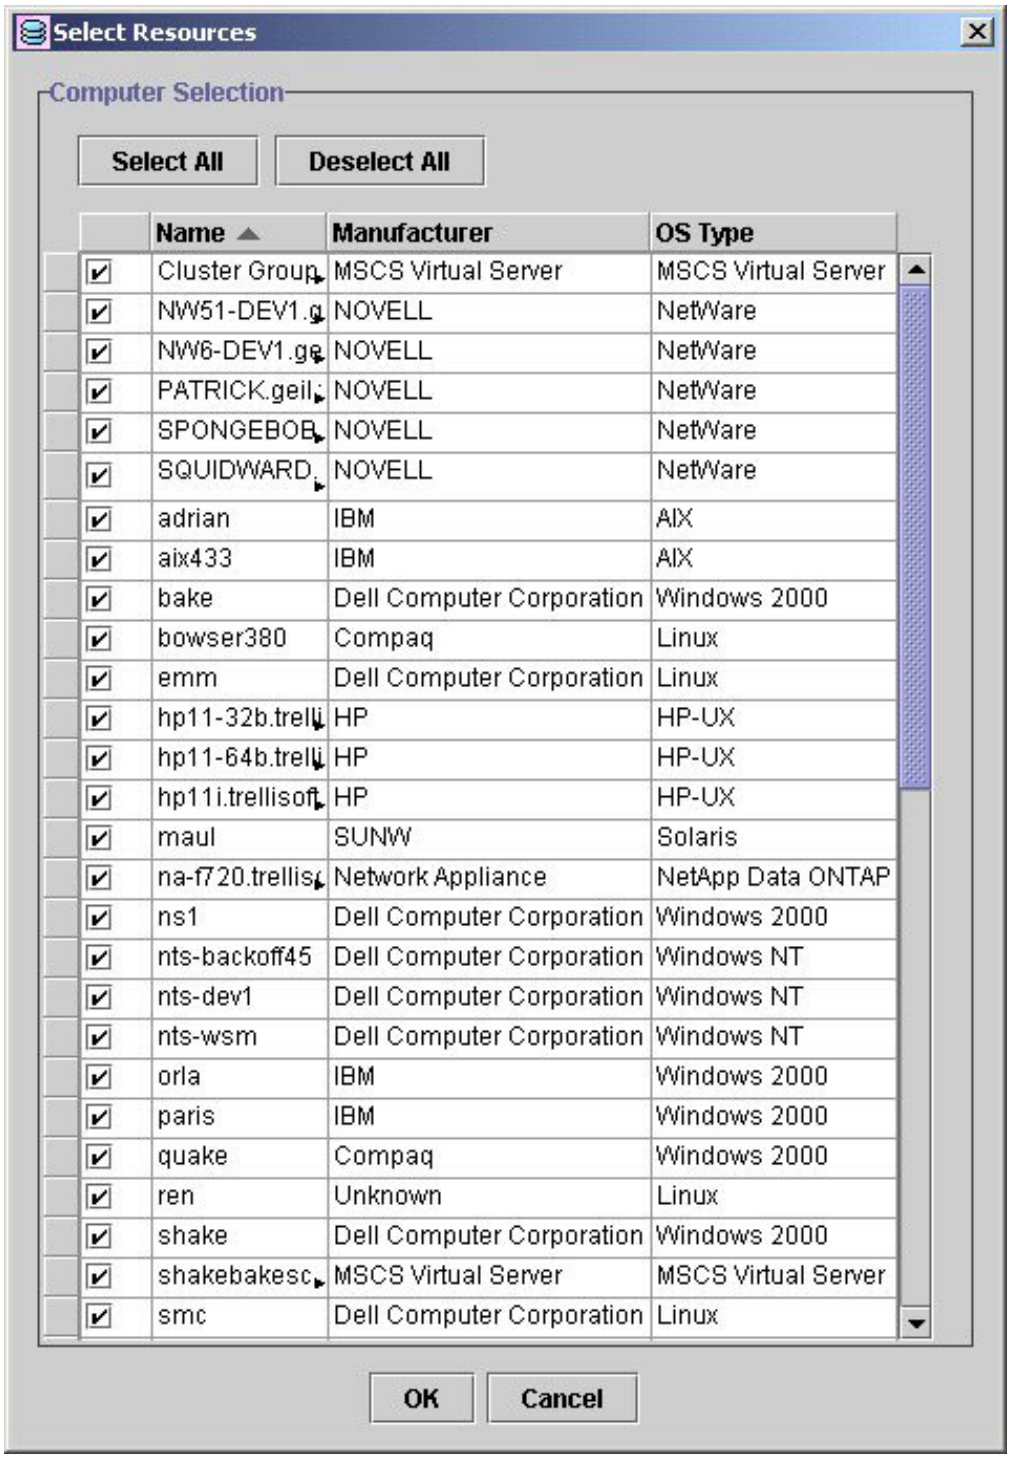

Figure 38. Selection Resources window

The objects that display in this window are determined by the report you are generating and the By-Clause you selected. For example, if you choose to generate the report **Data Manager** > **Reporting** > **Capacity** > **Disk Capacity** > **By Disk**, the Select Resources window displays a list of computers and subsystems that you can include in the report.

When the Select Resource window is initially opened, all objects in the list are selected.

- If you would like to generate the report for all the objects that are selected, click **OK**.
- To select/deselect individual objects in the selection list, select the check box for the object. When there is a check mark in the check box, then the object is selected for inclusion in the report.

You can use **Select All** or **Deselect All** to quickly select or deselect all of the objects in the list.

Note: If you generate a Network-wide report, the **Selection** button is disabled on the **Selection** tab because you chose to generate the report network-wide, for all objects.

Filtering the resources that appear on a report:

Learn how to apply conditions to the columns in a report to further filter the resources that appear in a report.

Use the Edit Filter window to apply conditions to the columns within a report to further select or restrict objects on which you want to report. Filters enable you to apply general rules to the report. For example, you can show only the file systems that contain over 80% used space, or show computers that match "w2s-*", or select all disks with percent used space >= to a specific value. To filter the objects that appear in a report:

1. Select the type of report you want to generate. For example, **Data Manager** > **Reporting** > **TPC-wide Storage Space** > **Disk Space** > **By Disk**.
2. Click **Filter...**. The Edit Filter window opens.

Note: For storage entities that contain an asterisk (*) within their names, the * is used as a wildcard character if you select **LIKE** from the **Operator** menu on this panel. For example, if you enter ***XYZ** in the **Value 1** field and select **LIKE** from the **Operator** menu, the resulting report includes any entities named "*XYZ", and also all entities whose names end with the letters "XYZ". To create a filter that includes only the storage entity named "*XYZ" in the resulting report, enter ***XYZ** in the **Value 1** field and select **IN** from the **Operator** menu.

The following table describes the interface elements that appear on the **Edit Filter** window:

Interface element	Description
Add	This button is used to specify multiple conditions for the filter. When you click **Add**, report columns will be displayed enabling you to define conditions for those columns.
Delete All	This button is used to delete all the conditions displayed on the table.
Case-sensitive string comparisons	This check box indicates that case-sensitive string comparisons should be done. Select this check box to ensure that values appearing in the generated report match the case of the values entered in the Value 1 and Value 2 fields.

Interface element	Description
Records must meet	This field specifies how the conditions in the filter are grouped together. • **All conditions**. All of the entered conditions (rows on the dialog box), must be true in order for the record to show up as a row in the report. • **At least one condition**. At least one of the entered condition must be true in order for the record to show up as a row in the report.
Column	This field is used to select specific columns on which you want to define conditions. The list on this field shows the columns available for the report. As you select a column from the list, it is displayed on the table, and the column name is removed from all other lists. Click to delete the column.
Operator	This field is used to select the condition's operator. Not all operators apply to all the column data-types.
Value 1/ Value 2	This field is used to specify fixed value(s) to be compared against the record's column value. Depending on the operator and data type, this field may be absent or display-only. If the field is display-only, an **Edit...** button will be enabled. If both this field and the **Edit...** button are enabled, this field allows shorthand value entry. If you click **Edit** , a window opens to provide more assistance in editing the value. A **Value 2** field will be present only for (NOT) BETWEEN. For certain columns that contain string text, you can: • put the string in quotes for the **LIKE** operator, or • use the **=** operator without quotes instead of LIKE (the default) For example, if you want to filter the Device Path (computer) column on the **Reporting → Storage Subsystems → Computer Views → By Filesystem/Logical Volume** report, you can search/filter on a name such as **"Disk 1"** or **"Disk 2"** with the **LIKE** operator. For the **=** operator, you can enter **Disk 1** or **Disk 2** with no quotes. **Note:** An asterisk is prepended to the names of space-efficient VDisks in the IBM Tivoli Storage Productivity Center database repository. When you use a filter to determine which volume names appear in a report, you must include the "*" as the first character in the filter value to ensure that those VDisks are included. For example, if you want to include VDisks whose name begins with "*vdisk1", you must enter ***vdisk1** in the **Value 1** field and select **LIKE** or **IN** from the **Operator** menu. If you select the **LIKE** operator, the *vdisk1 VDisk is included in the report, as well as other VDisks whose names end in "vdisk1".

Interface element	Description
Edit	This button is used to edit values pertaining to size, date, and for specific values used for IN, LIKE, etc. operators. Depending on the condition you are creating, a dialog box displays to help you to enter values that correspond to the condition.
Selection...	This button is used to determine the objects (computers, file systems, logical volumes, storage subsystems, etc.) upon which you want to report. The Select Resources window opens. If you clear the check box for a resource on the Select Resource window, a pushpin icon displays on the **Selection...** button. If you are generating a Network-wide report, the **Selection...** button will be disabled because you have chosen to generate the report network wide, for all objects.
OK	This button is used to save the filter. You are returned to the **Selection** tab. The **Filter** button will display a pushpin to indicate that a filter has been defined for the report.
Cancel	This button is used to return to the **Selection** tab without saving the filter.

Reporting groups

A reporting group is a user-defined set of storage assets, monitoring groups, and reporting groups upon which you want to report.

Use reporting groups to view storage information about:

- Resources that display in different monitoring groups. Because a resource can display in only one monitoring group at a time, you can use reporting groups to include resources from different monitoring groups and view reports on them.
- A subset of resources within a monitoring group. For example, you can create a reporting group for a specific subset of computers with the Payroll monitoring group and generate a report that contains information about those computers.
- Resources that display in other reporting groups.
- A subset of resources within other reporting groups.

Note: Unlike monitoring groups, a resource can be displayed in one or more reporting groups.

You can create the following types of reporting groups:

- Data Manager: **Computer**, **File system**. Within a computer-reporting group, you can include computer monitoring groups, specific computers, and other reporting groups. Within a file system reporting group, you can include file system monitoring groups, specific file systems, and other reporting groups.
- Data Manager for Databases: **Computer**, **Databases-Tablespaces**. Within a computer reporting group, you can include computer monitoring groups, specific computers, and other computer reporting groups. Within a databases-tablespaces reporting group, you can include databases-tablespace monitoring groups, specific databases or table spaces, and other databases-tablespaces reporting groups.

- Disk Manager: **Storage Subsystems**. Within a storage subsystem reporting group, you can include storage subsystem monitoring groups, specific storage subsystems, and other storage subsystem reporting groups.

When you generate a report, storage statistics about a reporting group displays in the corresponding "By Group" clause for that report. The following lists the reports that reflect reporting group information.

Computer reporting groups (Data Manager and Data Manager for Databases)
The following reports display computer reporting group information:

- **Data Manager** > **Reporting** > **Capacity reports**, **Data Manager for Databases** > **Reporting** > **Capacity reports**
- **Data Manager** > **Reporting** > **Usage reports**, **Data Manager for Databases** > **Reporting** > **Usage reports**
- **Data Manager** > **Reporting** > **Usage Violation reports**, **Data Manager for Databases** > **Reporting** > **Usage Violation reports**
- **Data Manager** > **Reporting** > **Backup reports**
- **IBM Tivoli Storage Productivity Center** > **Rollup Reports** > **Capacity**
- **IBM Tivoli Storage Productivity Center** > **My Reports** > **Batch Reports** > **Create Batch Report** > **Report page**, select one of the following items:
  - **Capacity** > **capacity_report_type** > **By Computer Group**
  - **Usage** > **usage_reporting_type** > **By Computer Group**
  - **Usage Violations** > **usage_violation_reporting_type** > **By Computer Group**
  - **Backup** > **backup_reporting_type** > **By Computer Group**
  - **Rollup Reports** > **Capacity** > **capacity_report_type** > **By Computer Group**
  - **Rollup Reports** > **Database Capacity** > **rdbms_type** > **By Computer Group**

File system reporting groups (Data Manager)
The following reports display file system reporting group information:

- **Data Manager** > **Reporting** > **Capacity reports**
- **Data Manager** > **Reporting** > **Usage reports**
- **Data Manager** > **Reporting** > **Usage Violation** > **Constraint Violations reports**
- **Data Manager** > **Reporting** > **Backup reports**
- **IBM Tivoli Storage Productivity Center** > **My Reports** > **Batch Reports** > **Create Batch Report** > **Report page**, select one of the following items:
  - **Capacity** > **capacity_report_type** > **By File System Group**
  - **Usage** > **usage_reporting_type** > **By File System Group**
  - **Usage Violations** > **Constraint Violations** > **By File System Group**
  - **Backup** > **backup_reporting_type** > **By File System Group**

Databases-Table spaces reporting groups (Data Manager for Databases)
The following reports display databases reporting group and table spaces reporting group information:

- **Data Manager for Databases** > **Reporting** > **Capacity reports**
- **Data Manager for Databases** > **Reporting** > **Usage reports**

- **Data Manager for Databases** > **Reporting** > **Usage Violations** > **Database-Table Space Quotas reports**Data Manager for Databases > Reporting > Usage Violations > Database-Tablespace Quotas reports

Storage subsystem reporting groups

The following reports display storage subsystem reporting group information:

- **Data Manager** > **Reporting** > **Storage Subsystems** > **Storage Subsystem Views** > **By Storage System Group**
- **Data Manager** > **Reporting** > **Capacity** > **Disk Capacity** > **By Storage Subsystem Group**
- **IBM Tivoli Storage Productivity Center** > **My Reports** > **Batch Reports** > **Create Batch Report** > **Report page**, select one of the following items:
  - **Storage Subsystems** > **Storage Subsystem Views** > **By Storage Subsystem Group**
  - **Capacity** > **Disk Capacity** > **By Storage Subsystem Group**

Creating a reporting group:

To create a reporting group:

1. Expand **Reporting** > **Groups** under:
   - Data Manager to create computer and file system reporting groups.
   - Data Manager for Databases to create computer and databases-tablespaces reporting groups
   - Disk Manager to create storage subsystem reporting groups
2. Right-click the type of group you want to create. A pop-up menu opens.
3. Select **Create <group type>** from the pop-up menu. The topic pane displays a window for defining the group.
4. Define information about the group. See the IBM Tivoli Storage Productivity Center online Help for detailed information about the windows for creating a group.
5. Click **File** > **Save** to save the group definition. The group is saved to the database repository. You can generate and view reports that are based on these groups.

Note: You can define filters to select specific computers, file systems, storage subsystems, table spaces, and databases for a reporting group. Tivoli Storage Productivity Center uses these filters to dynamically include resources to the group as they are discovered within your environment. When you define dynamic filters for reporting groups, the filters you enter might or might not be case-sensitive. The sensitivity depends on the database under which the Tivoli Storage Productivity Center database repository is stored. For example:

- The dynamic filters that you enter for reporting groups are case-sensitive when the database repository is stored on Oracle, Sybase, and UDB/DB2.
- The dynamic filters that you enter for reporting groups are not case-sensitive when the database repository is stored on Microsoft SQL Server.

Keep in mind these case-sensitive issues when you define filters for reporting groups. Prevent inaccurate reporting that is caused by unintended resources that are being included in reports.

Editing a reporting group:

To edit an existing reporting group:

1. Expand **Reporting** > **Groups** under:

- **Data Manager** to edit computer and file system reporting groups.
- **Data Manager for Databases** to edit computer and databases-tablespaces reporting groups
- **Disk Manager** to edit storage subsystem reporting groups

2. Expand the type of the reporting group that you want to edit. For example, expand **Disk Manager** > **Reporting** > **Groups** > **Storage Subsystem** to edit a storage subsystem reporting group.
3. Click the reporting group that you want to edit. The topic pane displays a window for editing the group.
4. Edit information about the group. See the IBM Tivoli Storage Productivity Center online Help for detailed information about the windows for creating a group.
5. Click **File** > **Save** to save the updated group definition.

Note: You can define filters to select specific computers, file systems, storage subsystems, table spaces, and databases for a reporting group. Tivoli Storage Productivity Center uses these filters to dynamically include resources to the group as they are discovered within your environment. When you define dynamic filters for reporting groups, the filters you enter might or might not be case-sensitive. This sensitivity depends on the database under which the Tivoli Storage Productivity Center database repository is stored. For example:

- The dynamic filters that you enter for reporting groups are case-sensitive when the database repository is stored on Oracle, Sybase, and UDB/DB2.
- The dynamic filters that you enter for reporting groups are not case-sensitive when the database repository is stored on Microsoft SQL Server.

Keep in mind these case-sensitive issues when you define filters for reporting groups. Prevent inaccurate reporting that is caused by unintended resources that are included in reports.

Data Manager reports

Use Data Manager reports to view both overview and detailed information about your storage resources, including computers, disks, file systems, storage subsystems, clusters, and users. These reports are constructed from the statistical information that is gathered by data collection jobs and accumulated in the database repository.

Note: You must run appropriate data collection jobs on the storage resources before you generate reports. If you do not run the data collection jobs before you generate reports, you might see inconsistent or inaccurate results.

Data Manager - Report categories:

Use the report categories within Data Manager to collect information about storage assets, availability, backup requirements, capacity, usage, usage violations, and monitored computer storage space.

The following table describes the categories of reports available in Data Manager.

Report Category	Use these reports to do the following	What job collects information for these reports?
Asset reports	View information about the agents, computers, disk controllers, hard disks, clusters, fabrics, storage subsystems, volumes, file systems, and general hardware inventory of storage assets within your environment. See "Asset reports" on page 1334 for more information about Asset reports.	Probes, discovery Data for System-wide Users and Monitored Directory reports are gathered by scans.
Availability reports	View information about the availability of your storage, both from a network point of view and from a computer up-time perspective. This allows you to see what percentage of the time the storage in your enterprise (or on particular server or group of servers), is off-network due to network problems or perhaps is unavailable due to system downtime. See "Availability Reports" on page 1358 for more information about Availability reports.	Ping data: pings Computer uptime — probes
TPC-wide Storage Space reports	View storage capacity at a file system, computer, or entire network level. For a specific computer, group of computers, or all the computers in your enterprise, you can view the following: • How much storage you have • How much storage is being used • What percentage of storage is free for expansion See "TPC-wide Storage Space Reports" on page 1360 for more information about Capacity reports.	Probes
Usage reports	View information about the usage and growth of the consumption of your storage. Use these reports to do the following: • View which servers and file systems are experiencing the heaviest (or lightest) load of data and storage access. • Identify wasted space by pinpointing files that are no longer needed or have not been accessed for the longest time. • Associate users with the amount of storage they are consuming on specific file systems, groups of file systems, specific computers, groups of computers, and throughout the entire network. • Select the files against which to run an IBM Tivoli Storage Manager archive/backup job. Tivoli Storage Manager protects your organization's data from hardware failures and other errors by storing backup and archive copies of data on offline storage. See "Usage Reports" on page 1420 for more information about Usage reports.	Scans

Report Category	Use these reports to do the following	What job collects information for these reports?
Usage Violation reports	View information about the storage usage violations committed by users and user groups within your environment. Use these reports to do the following: • Create and enforce corporate storage usage policies. You can report on violations of quotas and constraints. • Select files in Constraint Violation reports against which to run an Tivoli Storage Manager archive or backup job. • Add files from Constraint Violation reports to an existing Tivoli Storage Manager archive or backup job. See "Usage Violation reports" on page 1427 for more information about Usage Violation reports.	Scans, Quotas, Constraints
Backup reports	Investigate the sizes of data that would be required to backup to achieve full backups, determine the amount of space required to perform an incremental backup of any or all of your data at any given point in time, and select files for archive/backup jobs. See "Backup reports" on page 1429 for more information about Usage Violation reports.	Scans
Monitored Computer Storage Space reports	Use these host-based reports to view the data that is collected by probes for computers, Network Attached Storage, and hypervisors. These reports contain detailed information about the consumption of file system space and enable you to relate that space back to external or internal storage without counting shared space multiple times. See "Monitored Computer Storage Space reports" on page 1431 for more information about Monitored Computer Storage Space reports.	Probes

Use By clauses:

Use the By clauses that are associated with Data Manager reports as a method for viewing the data in those reports from different perspectives.

As you drill down through Data Manager reports, the options repeat for each report type. Use the *By Clauses* options to generate variations of the reports with different perspectives and groupings of data.

The available By Clauses are described in the following table:

By Clause	Description
`By Directory`	Use this clause to select the directories that you want to include in a report.
`By Directory Group`	Use this clause to select the directory groups that you want to include in a report.

By Clause	Description
By Disk	Use this clause to select the disks that you want to include in a report.
By File system	Use this clause to select the file systems that you want to include in a report.
By File system Group	Use this clause to select the file system groups that you want to include in a report.
By Cluster	Use this clause to select the clusters or cluster resource groups that you want to include in a report. Cluster resource groups in a PowerHA SystemMirror for AIX or MSCS-clustered environment are listed as computers.
By Computer	Use this clause to select the computers that you want to include in a report.
By Computer Group	Use this clause to select the computer groups that you want to include in a report.
By Storage Subsystem	Use this clause to select the storage subsystems that you want to include in a report.
By Domain	Use this clause to select the Window Domains that you want to include in a report.
Network Wide	The reports and charts that you see are on all data, network wide. Use this view to generate a global view of the storage and storage usage for your whole enterprise.

Asset reports:

Use asset reports to view itemized statistics for your storage resources. Tivoli Storage Productivity Center provides a hierarchical view of your storage resources so that you can navigate to view your resources in greater detail.

The following section is a description of each of the report types that are under **Data Manager** > **Reporting** > **Asset**.

Asset Reporting Type	Description
By Cluster	View storage assets based on PowerHA SystemMirror for AIX or MSCS cluster membership. You can navigate to a cluster and view its nodes and cluster resource groups. For each cluster resource group, you can navigate to show its controllers, disks, file systems, logical volumes, and exports or shares. For a cluster node, you can view local resources.
By Computer	Navigate through storage assets in a hierarchical manner. You can navigate to a computer and show its controllers, disks, file systems, logical volumes, and directories. You can then navigate further to view more detailed information such as the disks that are under a specific controller or file systems that are under a disk.
By Hypervisor	Navigate through hypervisors in a hierarchical manner. You can use this report to navigate to and view details about the virtual machines, controllers, disks and file systems, or logical volumes.
By IBM Storwize V7000 Unified/IBM SONAS	Navigate through Storwize V7000 Unified or IBM SONAS clusters and directories in a hierarchical manner. You can use this report to navigate to and view details about the nodes, pools, Network Shared Disks, file systems, monitored directories, and exports that are associated with the clusters.

Asset Reporting Type	Description
By OS Type	View storage assets based upon the operating systems that are running on those storage servers. This report type provides a way to see what your operating system dependencies are throughout your organization. By navigating to any or each of these different supported operating system types, you can see how many of each server type you have and you can navigate to investigate the underlying storage.
By Storage Subsystem	View storage capacity at a computer, file system, storage system, volume, and disk level. These reports also show the relationships between the components of a storage system.
System Wide	View storage assets as a whole, across the entire system. Use these reports to view lists of all of your disks, computers, file systems, Storage Resource agents and Data agents that are installed in your environment.

By Cluster:
Use the "By Cluster" reports to navigate to a cluster to view its nodes and cluster resource groups.

- For a node, you can view its local resources, including controllers, disks, file systems, logical volumes, exports, shares, and directories.
- For a cluster resource group, you can view controllers, disks, file systems, logical volumes, exports, and shares.
- For a node, the number of processors that are reported are the logical processors. The amount of RAM that is reported is the available RAM.

1. Expand **Asset → By Cluster** node to display the nodes for each cluster that has been discovered and monitored by Data Manager.
2. Click a node to view cluster information, or further expand the cluster node to navigate to greater detail.

Cluster Information
Click the name of a cluster that appears under **Asset → By Cluster** to view information about that cluster such as:

- Name
- Domain
- IP address
- Discovered Time

Controller Information
As you navigate to Asset Reporting By Cluster for a cluster node or cluster resource group, you can expand the assets under a controller, or you can select a controller to view its detailed information.

The name of the controller's computer is shown, as well as the driver name, instance number, bus number, address, and type of driver (for example, SCSI, IDE, etc).

Note: Host Bus Adapter (HBA) controllers must be connected to the SAN and see volumes in order to be displayed under the Controllers node.

Disk Information
As you navigate to Asset Reporting By Cluster for a cluster node or cluster resource group, you can expand the assets under a disk, or you can select a disk to view its detailed information.

The disk detail information is shown in a tab dialog that is made of up three pages: **General**, **Paths**, and **Latest Probe**.

General page

Use the General page to view the computer name, the path name, SCSI Target ID, logical unit number, and the number of access paths. The disk information shown includes the hardware manufacturer of the disk, the model number of the disk, the firmware revision, the disk serial number, and the manufacture date along with the time when Data Manager discovered the disk. The page also includes a breakdown of how the disk is allocated, including the disk allocation point and the length of the allocation.

Latest Probe page

Use the Latest Probe page to view the information that was obtained by Data Manager about this disk during the most recent probe of that disk. This information on this page includes:

- Sector size and sector information
- the number of heads
- the number of cylinders
- the logical block size
- the capacity of the disk
- the RPM or revolutions per minute that the disk spins at
- the elapsed time the disk has been powered on
- spare blocks
- the current write protection setting
- the cache enabled setting
- whether failure is predicted for this disk
- the time and date of the last Probe
- the unallocated space
- the number of primary defects
- the number of grown defects
- the NonMedium errors
- the recorded operating temperature

Some of these values are manufacturer specific, so if they are unavailable, then you will see **N/A** for a value. Additional information about the breakdown of recovered errors, unrecovered errors, and the number of bytes broken down by Write, Read, and Verify is shown in this report. Also included are three SCSI disk bit settings that you can turn on/off and the change will actually be made to the disk settings the next time a probe is run on that disk. These include on/off settings for:

- Automatic read reallocation
- Automatic write reallocation
- Read continuous (no error correction)

Probe History page

Use the Probe History page to view the history of probes that have been run on the disk you are reporting on. Each row on this report represents one time that a probe has been run against the disk. Each row shows what time the probe ran, the type of record (which could be daily, weekly or monthly), bytes written, bytes read, number of grown defects.

Filesystem and Logical Volume Information

The Asset Reporting By Cluster Filesystem or Logical Volume information report contains two pages: **Filesystem** and **Logical Volume**.

Filesystem page

Use this page to view a pie chart that depicts used space and free space on the file system and includes the following information:

- Computer name
- File system type
- Use count
- Mount point
- Physical size of the file system
- Capacity of the file system
- The time and date of the last probe and scan
- When the file system was discovered on the system by Data Manager
- If the file system has been removed then a removed date/time will be shown

Logical Volume page

Use this page to view:

- The path name of the logical volume
- The capacity of the logical volume
- The use count
- The type of logical volume
- Whether it is a swap volume and mirrored
- A tree displaying the mapping of the logical volume on the disk area(s) that make up the logical volume

Exports or Shares Information

The Asset Reporting By Computer Exports or Shares information report includes the following information:

- the name of the computer the share is on
- the export name that it will be known by
- the path on the computer the share resides upon
- the protocol being used and the date and time that Data Manager discovered the export or share

Monitored Directory Information

To view a report on a directory that you are monitoring, expand the **Monitored Directories** node on the navigation tree and select the directory on which you want to report. This information is available for clustered nodes, but not cluster resource groups.

The Asset Reporting By Cluster Monitored Directory report includes the following information:

- computer name the directory resides on
- name of the directory
- owner
- OS Group
- total size of the directory
- number of files in the directory
- count of subdirectories in the directory
- average file size
- access time
- modification time and creation time of the directory
- last scan time and the time that Data Manager discovered the directory
- file attributes that are set
- list of the Directory Groups that the directory is a part of

By Computer:
Use the "By Computer" reports to navigate to a computer and view detailed information about its controllers, disks, file systems, logical volumes, and directories.

Computer Information

As you navigate to Asset Reporting By Computer, you can expand the assets under a computer, or you can select a computer to view the details for that computer. The detailed report shows the following information:

- Computer
- Host ID: the identifier of the host computer in hexadecimal format. Currently, IBM Tivoli Storage Productivity Center collects Host ID information for Oracle Solaris computers only. All other platforms display GUID information in the Host ID column.
- Group and Domain
- Network Address, IP address
- Time zone
- Hardware manufacturer and model numbers
- Processor type
- Count and speed
- Amount of RAM
- Operating System (OS) information such as:
  - Type of OS and version
  - The storage attributes of the server
  - The computer disk capacity, unallocated space, and free space

Controller Information

As you navigate to Asset Reporting By Computer, you can expand the assets under a controller, or you can select a controller to view the details for that controller. The name of the computer controller is shown, as well as the driver name, instance number, bus number, address, and type of driver (for example, SCSI, IDE, and so on).

Note: Host Bus Adapter (HBA) controllers must be connected to the SAN and see volumes in order to be displayed under the Controllers subnode.

Disk Information

As you navigate to Asset Reporting By Computer, you can expand the assets under a disk, or you can select a disk to view the details for that disk. The disk detail information is shown in a tab dialog that is made of up four tabs: **General**, **Paths**, **Latest Probe**, and **Probe History**.

General page

The General page includes the computer name, the path name, SCSI Target ID, logical unit number, the number of access paths.

The disk information shown includes:

- The hardware manufacturer of the disk
- The model number of the disk
- The disk firmware revision
- The disk serial number
- The disk manufacture date
- Indicators that specify whether the disk is encrypted or encryptable

- The time when Data Manager discovered the disk

The tab also includes a breakdown of how the disk is allocated, including the disk allocation point and the length of the allocation.

Paths The **Paths** page shows the following information:

- Host
- OS type
- Path
- Controller
- Instance
- Bus number
- SCSI target id
- Logical unit number

Latest Probe page

The **Latest Probe** page shows the information that was obtained by Data Manager about this disk during the most recent probe of that disk. This information on this tab includes:

- Sector size and sector information
- The number of heads
- The number of cylinders
- The logical block size
- The capacity of the disk
- The RPM or revolutions per minute that the disk spins at
- The elapsed time the disk has been powered on
- Spare blocks
- The current write protection setting
- The cache enabled setting
- Whether failure is predicted for this disk
- The time and date of the last Probe
- The unallocated space
- The number of primary defects
- The number of grown defects
- The NonMedium errors
- The recorded operating temperature

Some of these values are manufacturer-specific. If the values are unavailable, **N/A** is displayed.

Additional information about the breakdown of recovered errors, unrecovered errors, and the number of bytes broken down by Write, Read, and Verify is shown in this report.

Also included are three SCSI disk bit settings that you can turn on/off and the change will actually be made to the disk settings the next time a probe is run on that disk. These include on/off settings for:

- Automatic read reallocation
- Automatic write reallocation
- Read continuous (no error correction)

Probe History page

The **Probe History** page shows the history of probes that have been run on the disk you are reporting on. Each row on this report represents one time that a probe has been run against the disk. Each row shows what time the probe ran, the type of record (which could be daily, weekly, or monthly), bytes written, bytes read, number of grown defects.

Volume Group Information

Data Manager provides support for the following volume managers:

- Veritas Volume Manager (Oracle Solaris)
- Logical Volume Manager (AIX)

These volume managers allow you to group logical volumes and disks. As you navigate to Asset Reporting By Computer for an AIX or Oracle Solaris computer, you can expand the assets under a volume group to see the group disks and file systems or logical volumes.

You can also select a volume group to view detailed information about it. The group name is shown, as well as the type (LVM or Veritas), capacity, free space, number of volumes, number of disks, discovered time, and probe time.

File System / Logical Volume Information

The Asset Reporting By Computer File System / Logical Volume information report contains two pages: **File System** and **Logical Volume**.

File System page

This page shows a pie chart depicting used space and free space on the file system and includes the following information:

- Computer name
- File system type
- Use count
- Mount point
- Physical size of the file system
- Capacity of the file system
- The time and date of the last probe and scan
- When the file system was discovered on the system by Data Manager
- If the file system has been removed, then a removed date/time is shown

Also shown for UNIX-based systems are:

- The maximum file count
- Used inodes
- Free inodes. Inodes are areas reserved for index entries within the UNIX file systems. For Windows computers, these values are zero.
- The amount of used space and free space is shown

Logical Volume page

The information on this page includes:

- The path name of the logical volume
- The capacity of the logical volume
- The use count
- The type of logical volume
- Whether it is a swap volume and mirrored
- A tree displaying the mapping of the logical volume on the disk areas that make up the logical volume

Exports/Shares Information

The Asset Reporting By Computer Exports/Shares information report includes the following information:

- The name of the computer the share is on
- The export name that it will be known by

- The path on the computer the share resides upon
- The protocol being used and the date/time that Data Manager discovered the export/share

Monitored Directory Information

To view a report on a directory that you are monitoring, expand the **Monitored Directories** node on the navigation tree and select the directory on which you want to report.

Note: This information is not shown for cluster resource groups.
The Asset Reporting By Computer Monitored Directory report includes the following information:

- Computer name the directory resides on
- Name of the directory
- Owner
- OS Group
- Total size of the directory
- Number of files in the directory
- Count of subdirectories in the directory
- Average file size
- Access time
- Modification time and creation time of the directory
- Last scan time and the time that Data Manager discovered the directory
- File attributes that are set
- List of the Directory Groups that the directory is a part of

The Asset Reporting By Computer Monitored Directory report includes the following information:

- Computer name the directory resides on
- Name of the directory
- Owner
- OS Group
- Totalsize of the directory
- Number of files in the directory
- Count of subdirectories in the directory
- Average file size
- Access time
- Modification time and creation time of the directory
- Last scan time and the time that Data Manager discovered the directory
- File attributes that are set
- List of the Directory Groups that the directory is a part of

By IBM Storwize V7000 Unified/IBM SONAS:

Use "By IBM Storwize V7000 Unified/IBM SONAS" reports to navigate to the components of a Storwize V7000 Unified storage system or an IBM SONAS system. These components include the clusters, nodes, pools, Network Shared Disks, file systems, and exports that are associated with the storage system.

To view Storwize V7000 Unified or IBM SONAS asset reports, follow these steps:

1. Expand **Data Manager** > **Reporting** > **Asset** > **By IBM Storwize V7000 Unified/IBM SONAS**. The Storwize V7000 Unified storage systems or IBM SONAS systems that were discovered by Tivoli Storage Productivity Center are displayed.
2. Expand a storage system to view detailed information. The following tabbed pages are displayed:

Storage Subsystem Details
Use this page to view detailed information about the Storwize V7000 Unified storage system or the IBM SONAS system. The information available for the storage system includes the status, vendor, type and model, and the available and used space. You can also use this page to modify some information about the Storwize V7000 Unified storage system or the IBM SONAS system.

File Module Details
Use this page to view information about Storwize V7000 Unified.

You can view information about the components of the Storwize V7000 Unified storage system or the IBM SONAS system. When you click a component, report pages for that component are displayed.

Storwize V7000 Unified or IBM SONAS - Cluster Information:

This page shows general information about a selected cluster that is associated with a Storwize V7000 Unified storage system or an IBM SONAS system.

The following information is displayed on this page.

Table 115. Information about clusters associated with a Storwize V7000 Unified storage system or an IBM SONAS system

Field Name	Description
Cluster	The name of the cluster. For Storwize V7000 Unified or IBM SONAS clusters, the storage system name is included with the cluster name in the Computer or Device column. The format of the column is `storagesystem_name: cluster_name`, where storagesystem_name is the name of the Storwize V7000 Unified or IBM SONAS device that the cluster belongs to. For example, `tpcserver1.tpc.example.com: kq98n5d.acct` displays storage system tpcserver1.tpc.example.com that cluster kq98n5d.acct belongs to.
Cluster ID	The identifier of the cluster.
Type	The cluster can be one or more of the following types: **Interface** An interface cluster contains nodes that connect a system to an IP network for file-serving capabilities by using service protocols. **Management** A management cluster contains nodes that are used to configure, administer, and monitor a system. **Storage** A storage cluster contains nodes that provide the storage and file system for the data in a system.

Storwize V7000 Unified or IBM SONAS - Node Information:

This page shows general information about a selected node that is associated with a Storwize V7000 Unified storage system or an IBM SONAS system.

The following information is displayed on this page.

Table 116. Information about nodes associated with a Storwize V7000 Unified storage system or an IBM SONAS system

Field Name	Description
Node	The name of the node.
Description	The description of the node.
IP Address	The IP address for the node.
Role	The role of the node. The node can serve one or more of the following roles: **Interface** An interface node connects a system to an IP network for file-serving capabilities by using service protocols. **Management** A management node is used to configure, administer, and monitor a system. **Storage** A storage node provides the storage and file system for the data in a system.
Status	The status of the node. The status can be one of the following values: **Normal** The node is operating normally. **Critical** The node is either not operating or an error occurred. **Warning** At least one component of the node is not operating or an error occurred. **Unreachable** Tivoli Storage Productivity Center cannot reach the node.

Storwize V7000 Unified or IBM SONAS - Pool Information:

This page shows general information about a selected pool that is associated with a Storwize V7000 Unified storage system or an IBM SONAS system.

The following information is displayed on this page.

Table 117. Information about pools associated with a Storwize V7000 Unified storage system or an IBM SONAS system

Field Name	Description
Pool	The name of the pool.
Capacity	The capacity of the pool.
Available Space	The amount of unused space that is in the pool.

Storwize V7000 Unified or IBM SONAS - NSD Information:

This page shows general information about a selected Network Shared Disk (NSD) that is associated with a Storwize V7000 Unified storage system or an IBM SONAS system.

The following information is displayed on this page.

Table 118. Information about a selected NSD associated with a Storwize V7000 Unified storage system or an IBM SONAS system

Field Name	Description
NSD	The name of the NSD.
NSD ID	The identifier of the NSD.
Failover Group	The failure group that the NSD belongs to.
Type	The NSD type. The possible values are: • Metadata and Data • Metadata Only • Data Only
Pool	The pool that the NSD belongs to.
Status	The status of the NSD. The possible values are: **Normal** The NSD is operating normally. **Critical** The NSD is either not operating or an error occurred. **Warning** At least one component of the NSD is not operating or an error occurred. **Unreachable** Tivoli Storage Productivity Center cannot reach the NSD.
Disk Space	The total disk space for the NSD.
Available Space	The amount of unused disk space for the NSD.

Storwize V7000 Unified - NSD Probe History:

This page shows the probe history for a selected Network Shared Disk (NSD) that is associated with a Storwize V7000 Unified storage system.

The following information is displayed on this page.

Table 119. Information about a selected NSD associated with a Storwize V7000 Unified storage system

Field Name	Description
Time of Probe	The time that the probe ran.
Record Type	The record type that is shown in the report. Valid values are: • Daily • Weekly • Monthly
Bytes Written	The total number of bytes that were written since the NSD was formatted or manufactured.
Bytes Read	The total number of bytes that were read since the NSD was formatted or manufactured.
Grown Defects	The number of defects that were detected on the NSD after the NSD was used.
Recovered Write Errors	The number of write errors that were successful on a subsequent attempt.
Unrecovered Write Errors	The number of write errors that were not successful on a subsequent attempt.
Recovered Read Errors	The number of read errors that were successful on a subsequent attempt.
Unrecovered Read Errors	The number of read errors that were not successful on a subsequent attempt.
Recovered Verify Errors	The number of verify errors that were successful on a subsequent attempt.
Unrecovered Verify Errors	The number of verify errors that were not successful on a subsequent attempt.
Non-Medium Errors	The number of errors that are not related to the physical disk platter, such as a mechanical problem in the head movement or communication errors.
Available Disk Space	The amount of unused space on the NSD.
Primary Defects	The number of defects on the NSD when the NSD was new.
Temperature	The temperature of the NSD in degrees Celsius.

Storwize V7000 Unified - Correlated Storage Subsystem Volume:

This page shows information about the relationship between a selected Network Shared Disk (NSD) and the associated virtual disk or volume that is on the Storwize V7000 Unified storage system.

The following information is displayed on this page.

Table 120. Information about the relationship between a selected NSD and an associated virtual disk or volume on a Storwize V7000 Unified storage system

Field Name	Description
Virtual Disk Name	The name of the virtual disk.
Virtual Disk Space	The total storage capacity of a virtual disk.
Unavailable Virtual Disk Space	The amount of storage space for Redundant Array of Independent Disks (RAID) or mirror redundancy.
Type	The organization of the virtual disk. Values are: • Sequential • Striped
RAID Level	The RAID level of the virtual disk. For example, 0, 1, 5, and so on.
Is Encryptable	Indicates whether the virtual disk is encryptable. If the virtual disk is encryptable, the virtual disk uses full disk encryption, but does not belong to a defined System Storage DS8000 or System Storage DS5000 encryption group. Values are: • True (the virtual disk is encryptable) • False (the virtual disk is not encryptable)
Is Encrypted	Indicates whether the virtual disk is encrypted. If the virtual disk is encrypted, the volume uses full disk encryption and belongs to a defined DS8000 or DS5000 encryption group. Values are: • True (the virtual disk is encrypted) • False (the virtual disk is not encrypted)
Easy Tier	Indicates whether Easy Tier is on or off for the virtual disk.
Easy Tier Status	Indicates the Easy Tier functions that are active for the virtual disk copy. Values are: • Active (can move extents of this virtual disk copy for performance [automatic data placement]) • Inactive (no Easy Tier function is active) • Measured (statistics are being gathered for the virtual disk copy, but no extents are moved)
Tiers	The tier levels that are used by the virtual disk. Each tier is displayed as a row in a table.
Flash Copy	Indicates whether the virtual disk or copy is in a FlashCopy relationship and whether it is a FlashCopy source or a FlashCopy target. A virtual disk or copy that is not in a FlashCopy relationship is displayed with a None value, regardless of whether the virtual disk is on a system that supports FlashCopy.

Table 120. Information about the relationship between a selected NSD and an associated virtual disk or volume on a Storwize V7000 Unified storage system (continued)

Field Name	Description
Attributes	Indicates whether the disk is surfaced or not surfaced.

Storwize V7000 Unified or IBM SONAS - File System Information:

This page shows general information about a selected file system that is associated with a Storwize V7000 Unified storage system or an IBM SONAS system.

The following information is displayed on this page.

Table 121. Information about a selected file system associated with a Storwize V7000 Unified storage system or an IBM SONAS system

Field Name	Description
Computer	The name of the computer that contains the file system.
File System Type	The file system type, which is General Parallel File System (GPFS).
Mount Point	The name or mount point of the file system (for example, `/ibm/gpfs0`, or `/ibm/testfs`).
Physical Space	The physical size of the file system.
File System Space	The capacity of the file system.
Probe Last Run	The date and time that the last probe ran for the file system.
Scan Last Run	The time that the last scan ran for the file system.
Discovered Time	The date and time that the file system was discovered.
Removed Time	The date and time that the file system was removed, if applicable.
Maximum File Count	The maximum number of files allowed on the file system.
Used I-Nodes	The number of used i-nodes in the file system.
Free I-Nodes	The number of free i-nodes within a file system.
Used Space	The amount of used storage space within a file system. The amount of used and free space is also shown in a chart on the page.
Free Space	The amount of unused storage space in the file system.

Storwize V7000 Unified or IBM SONAS - File Set Information:

This page shows general information about a selected file set that is associated with a Storwize V7000 Unified storage system or an IBM SONAS system.

The following information is displayed on this page.

Table 122. Information about a selected file set associated with a Storwize V7000 Unified storage system or an IBM SONAS system

Field Name	Description
File Set	The name of the file set.
Path	The path for the file set. The path is displayed only if Linked is displayed in the **Status** field.
File System	The name of the file system that is associated with the file set.
Status	The status of the file system. Valid values are: **Linked** The file set is linked to the file system that is displayed in the **File System** field. **Unlinked** The file set is not linked to the file system that is displayed in the **File System** field.
Used Space	The amount of space that is used by the file set.
Used I-Nodes	The number of i-nodes that are used by the file set.

Storwize V7000 Unified or IBM SONAS - Export Information:

This page shows general information about a selected export that is associated with a Storwize V7000 Unified storage system or an IBM SONAS system.

The following information is displayed on this page.

Table 123. Information about a selected export associated with a Storwize V7000 Unified storage system or an IBM SONAS system

Field Name	Description
Export or Share	The name of the export.
Cluster	The name of the cluster that the export is associated with.
Path	The name of the path for the export.
Discovered	The date and time that the export was discovered.
Active	Indicates whether the export is active or inactive within the cluster. Valid values are: **Yes** The export is active. **No** The export is inactive. If an export is inactive, it is included in the list of exports, but the data that is associated with the export cannot be accessed.

Storwize V7000 Unified or IBM SONAS - Configured Protocol Information:

This page shows the protocols for a selected export that is associated with a Storwize V7000 Unified storage system or an IBM SONAS system.

Protocols are specified for an export when the export is created. The following protocols can be specified for an export:

- HTTP
- FTP
- Secure Copy Protocol (SCP)
- Network File System (NFS)
- Common Internet File System (CIFS)

For each protocol that is listed on this page, **Configured** or **Not Configured** is shown to designate whether the protocol as been specified for the export. In addition, the information in the following tables is provided for the NFS and the CIFS protocols when they are specified for the export.

Protocol Type NFS

Table 124. NFS protocols for a selected export associated with a Storwize V7000 Unified storage system or an IBM SONAS system

Field Name	Description
Client Name	The name of the client that can access the NFS protocol. If an asterisk (*) is shown, the settings apply to multiple clients.
Read Only	Specifies whether the export is read only. If the export is read only, files cannot be modified or created on this export. Values are: **Yes** Files cannot be modified or created. **No** Files can be modified or created.
Root Squash	Specifies whether root users on clients should be prevented from having privileged access to exported files. Values are: **Yes** Root squash is enabled. **No** Root squash is not enabled.
Secure	Specifies whether NFS access to the export is secure. Values are: **Yes** NFS is secure. **No** NFS is not secure.

Protocol Type CIFS

Table 125. CIFS protocols for a selected export associated with a Storwize V7000 Unified storage system or an IBM SONAS system

Field Name	Description
Read Only	Specifies whether the export is read only. If the export is read only, files cannot be modified or created on this export. Values are: **Yes** Files cannot be modified or created. **No** Files can be modified or created.
Browsable by Client	Specifies whether the export is hidden from the client. The export is not shown in the list of available exports. Values are: **Yes** The export is not hidden from the client. **No** The export is hidden from the client.
Hide Objects with No Read Access	Specifies whether the export is excluded from lists of files and directories when the user does not have permission to those files and directories. Values are: **Yes** The export is excluded. **No** The export is included.
Client/Group/SID	The client, group, or security identifier that can access the CIFS protocol.
Access	Specifies whether the client, group, or security identifier has access to the export. • Allowed • Denied
Value	Specifies the level of access that is granted to the client, group, or security identifier. Values are: • Full • Read • Write
Comment	A user-defined comment for the CIFS export. If a comment is not available, this field is blank.

Storwize V7000 Unified or IBM SONAS - Monitored Directory Information:

This page shows general information about a directory that is associated with a Storwize V7000 Unified storage system or an IBM SONAS system.

The following information is displayed on this page.

Table 126. Information about a directory associated with a Storwize V7000 Unified storage system or an IBM SONAS system

Field Name	Description
Computer	The name of the computer that contains the directory.

Table 126. Information about a directory associated with a Storwize V7000 Unified storage system or an IBM SONAS system (continued)

Field Name	Description
Directory	The name of the directory.
Owner	The owner of the directory.
OS Group	The operating system group that the directory belongs to.
Total Size	The total size of the directory.
File Count	The number of files in the directory.
Directory Count	The number of subdirectories in the directory.
Average File Size	The average size of the files in the directory.
Access Time	The date and time that the directory was last accessed.
Modification Time	The date and time that the directory was last modified.
Creation Time	The date and time that the directory was created.
Scan Time	The date and time that the directory was last scanned.
Discovered Time	The date and time that the directory was discovered.
Removed Time	The date and time that the directory was removed.
File attributes that are set	If any attributes were set for the files in the directory (for example, read only), the attributes are displayed. If no attributes were set, `No File Attributes Are Set` is displayed.
This Directory belongs to the following Directory Groups	A list of the directory groups that the directory belongs to.

By OS Type:
Use the "By OS Type Asset" report to view your storage assets based upon the operating systems under which they are running. This provides you with a an easy way to see what your OS dependencies are throughout your organization. You can navigate to any of the storage resources that appear under an operating system node to access all of the same sub-reports that as described for other asset reports.

By Storage Subsystem:

Browse your storage subsystem assets in a hierarchical manner. Data Manager provides reports for individual storage subsystems and any disk array subsystems whose SMI-S Providers are CTP certified by SNIA for SMI-S 1.0.2 or later.

For disk array systems, you can view information about:

- Disk groups
- Array sites
- Ranks
- Storage pools

- Disks
- Volumes

For virtualization systems, you can view information about:

- SAN Volume Controller clusters
- Storwize V7000
- Storwize V7000 Unified
- Managed disk groups
- Managed disks
- Virtual disks
- Virtual disk copies

Keep in mind the following considerations:

- A volume name in a report that is marked with an asterisk (*) indicates that the volume is a space-efficient volume. The * is not part of the actual volume name.
- The total capacity value for storage pools in TotalStorage Enterprise Storage Server subsystems includes only the formatted (usable) capacity for storage pools.
- For the following storage systems, you can navigate from storage subsystems and show managed disks, managed disk groups, and virtual disks:
  - SAN Volume Controller
  - Storwize V7000
  - Storwize V7000 Unified

  For Storwize V7000 and Storwize V7000 Unified, you can also navigate from the internal disks node to view the internal storage on the system.
  - Information that is displayed for managed disks and internal disks is the same as for storage subsystem disks. See "By Storage Subsystem" on page 1351 for a description of the available views.
  - Information that is displayed for virtual disks is the same as for storage subsystem volumes. See "By Storage Subsystem" on page 1351 for a description of the available views.
- For IBM FAStT, HP StorageWorks, and the XIV system, you can navigate to storage subsystems and show storage pools, disks, and volumes.

  Note: The total capacity value for storage pools in these storage subsystems includes raw (unconfigured) capacity—it does not include formatted/usable capacity.
- For Hitachi Data Systems TagmaStore subsystem, the relationship between a disk or volume is not displayed if the volume is using imported extents (virtual disks).

  Note: The total capacity value for storage pools in HDS subsystems includes the formatted/usable capacity for storage pools only.
- Some of the columns in the totals row for these reports can count storage multiple times if the report includes the following:
  - A storage virtualizer like a SAN Volume Controller
  - The disk arrays that host the backend storage to a storage virtualizer like a SAN Volume Controller

  In this situation, disks and logical unit numbers (LUNs) appear to belong to both a storage virtualizer like SAN Volume Controller and the disk arrays, and

are counted multiple times in some of the columns in the totals row. To avoid this situation, filter the report to display only the storage virtualizer or the disk arrays. If this situation is unavoidable, then some of the columns in the totals row can be adjusted as follows:

1. Use the **Physical Disk Space** column to determine the actual physical disk space on all arrays. This disk space is not counted multiple times.
2. Sum the **Disk Space** column for the disk arrays and subtract this result from the totals row to determine the total backend storage for a virtualizer.
3. To prevents counting the backend volumes multiple times, subtract the **Backend Volume Space** column from the **Volume Space** column in the totals row to determine the amount of volume space.

See "Report considerations and limitations" on page 1307 for additional information about reports.

Disk Groups

When you expand the **Disk Group** node, the navigation tree shows a list of disk groups for the storage subsystem. You can expand the name of a disk group to view the disks and volume spaces within that disk group. Navigate through both Volume Spaces and Disks subnodes to view:

- Disks and volumes associated with a volume space
- Volumes with segments on a disk
- Disks containing segments from a volume
- Detailed information about a disk

Array Sites

(IBM Tivoli Storage DS8000 only) When you expand the **Array Site** node, the navigation tree shows a list of array sites for the storage subsystem. Click **Array Site** to view a description of the information displayed about array sites. You can expand the name of an array site to view the ranks, storage pools, and disks associated with that array site.

Storage Pools

When you expand the **Storage Pool** node, the navigation tree shows a list of storage pools for the storage subsystem. You can expand the name of a storage pool to view the disks and volumes within that storage pool, including:

- Volumes with segments on a disk
- Disks containing segments from a volume
- Detailed information about a disk

Disks When you expand the **Disks** node, the navigation tree shows a list of disks for the storage subsystem. You can expand the name of disk to view the volumes associated with that disk. Click the name of a volume associated with a disk to view detailed information about that volume.

Volume Spaces

When you expand the **Volume Spaces** node, the navigation tree shows a list of volume spaces for the storage subsystem. You can expand the name of a volume space to view the disks and volumes within that volume space. Navigate through both the Disks and volumes subnodes to view:

- Volumes with segments on a disk
- Disks containing segments from a volume
- Detailed information about a disk
- Detailed information about a volume

Volumes

When you expand the volumes node, the navigation tree shows a list of volumes for the storage subsystem. Click the name of a volume to view detailed information about that volume.

Note:

- Volume Reporting is not available for IBM FAStT FlashCopy logical drive and repository logical drive.
- After creating a volume on a storage subsystem, you must run a probe on that storage subsystem to collect accurate information about disk allocation.

Managed Disk Groups

When you expand the Managed Disk Group node, the navigation tree shows a list of disk groups that are managed by the following storage systems:

- SAN Volume Controller
- Storwize V7000
- Storwize V7000 Unified

You can expand the name of a disk group to view the physical disks and virtual disks that are associated with it.

Managed Disks

When you expand the Managed Disk node, the navigation tree shows a list of disks that are managed by the following storage systems:

- SAN Volume Controller
- Storwize V7000
- Storwize V7000 Unified

You can expand the name of a disk to view the virtual disks and any available internal disks that are associated with it.

Virtual Disks and Virtual Disk Copies

There are three nodes in the navigation tree that are related to virtual disks (VDisks). These nodes might be included under the nodes for the SAN Volume Controllers in your environment:

- **Virtual Disks** (at the same level as **Managed Disk** and **Managed Disk Groups**): Expand this node to view a list of the logical disks that a cluster provides to the SAN. You can further expand each virtual disk (VDisk) to view its mirror copies (primary copies and additional copies).
- **Virtual Disks** (under **Managed Disk** and **Managed Disk Groups**): Expand this node to view the VDisks for which the primary copies are on the selected Managed Disk.
- **Virtual Disk Copies** (under **Managed Disk** and **Managed Disk Groups**): Expand this node to view all the virtual disk copies that are on the selected Managed Disk. The primary copies are not listed under this node because they are displayed under the **Virtual Disks** node.

  Tip:

  – The **Virtual Disk Copies** node is displayed in the navigation tree only if a monitored SAN Volume Controller supports virtual disk mirrors. If it supports virtual disk mirrors, all virtual disks will have a related primary virtual disk copy regardless of whether the virtual disk is mirrored. This is because all virtual disks on a SAN Volume

Controller that supports virtual disk mirrors are primary copies that can be updated to have mirrored disks or virtual disk copies.

– The icons for all virtual disk copies are shown as folders in the navigation tree because they represent logical extensions of a virtual disk.

- If the virtual disk is a virtual disk copy, the primary virtual disk copy is noted by -0 in the name of the logical volume, and all secondary copies are noted by a hyphen and a value larger than zero. If the virtual disk is not a virtual disk copy, only one logical volume is created and is noted by -0. The logical disk representation of a virtual disk should always exist, but if a probe is started for SAN Volume Controller 4.3.1 or later, the logical disk representation of the virtual disk expands to one or more logical volumes where virtual disk copies are represented by multiple logical volumes, and non-virtual disk copies are represented by a single logical volume.

Internal Disks

Internal storage information about the Storwize V7000 or Storwize V7000 Unified systems in your environment is displayed in the **Internal Disks** nodes in the navigation tree:

Internal Disks (at the same level as Virtual Disks, Managed Disk, and Managed Disk Groups)

Expand this node to view a list of the internal disks that a Storwize V7000 or Storwize V7000 Unified system provides to the SAN.

Internal Disks (under Managed Disk Groups > Managed Disk)

The internal disks for this node are only displayed if there are internal disks that are available on the managed disk.

Internal Disks (under Managed Disk)

The internal disks for this node are only displayed if there are internal disks available.

System-wide:

Use "System-wide" reports to do the following tasks.

- View your storage assets as a whole across the entire system. You can view lists of all of your disks, computers, storage subsystems, disk/volume groups, disks, file systems, logical volumes, storage subsystem volumes, exports or shares, monitored directories, users, and OS users. Additionally, you can view aggregated reports that are based on certain filters, such as grown defects per disk.
- View detailed information about Storage Resource agents and Data agents. Use these reports to monitor your agents and track their status.
- The **Selection** button is disabled for system-wide reports because all the monitored storage entities are automatically displayed for each report type. For example, all the computers that are monitored by IBM Tivoli Storage Productivity Center are displayed in the **System-wide** > **Computers** report.

Note: A volume name in a report that is marked with an asterisk (*) indicates that the volume is a space-efficient volume. The * is not part of the actual volume name. For more information about reports, see "Report considerations and limitations" on page 1307.

System-wide reports include options to go to storage resources for more detail, view charts of current statistics, and generate historical charts to show storage trends. The following icons are available on some system-wide reports.

Chart icon
Click to generate charts for the selected rows in the table. You can generate a chart that is based on the statistics that are currently displayed in the report. You can also generate a history chart that provides trending data for the selected storage subsystems. For more information about history charts, see Viewing historical trends.

Magnifying glass icon
Click to view detailed information about a specific file system or logical volume in a row.

Agents reports
Use these reports to track and monitor the Storage Resource agents and Data agents that are deployed in your environment. With this report, you can export a comma-separated file that contains the name and status of an agent. Specifically, use this report to run the following tasks.

- View information about the agents that are deployed in your environment
- Perform actions against one or more agents that are shown in the report

Each agent that is shown in the report has a magnifying glass icon next to it. Click this icon to display detailed information about an agent (which is identical to the information on the **Administrative Services** > **Data Sources** > **Data/Storage Resource agents** node in the navigation tree).

You can also select one or more rows on the report and right-click to display a menu. Use the options in this menu to run an action against multiple agents at the same time. The menu contains all the other operations available from the **Administrative Services** > **Data Sources** > **Data/Storage Resource agents** node in the navigation tree.

Computers reports

Use these reports to view all the computers in the system, which are sorted in order of the time they were last started, probed, or discovered. This information is valuable in environments where computers become more unreliable after they are up and running for long periods of time.

Storage Subsystem reports
Use these reports to view all your monitored storage subsystems and SAN Volume Controllers, sorted by their total capacity (By Disk Space) or alias (By Storage Subsystem).

Unmanaged Virtual Machines reports
Use these reports to view detailed information about the unmanaged virtual machines in your environment. Each row in the report gives you information for each unmanaged virtual machine.

Virtual Machines With No VMware reports
Use these reports to view detailed information about the virtual machines that have Storage Resource agents or Data agents that are installed but are not discovered through the VMWare data sources. Each row in the report gives you information for each virtual machine.

Disk/Volume Groups reports
Data Manager provides support for the following volume managers.

- Veritas Volume Manager (Oracle Solaris)
- Logical Volume Manager (AIX)

Through these volume managers, you can create groups of logical volumes and disks. Use these reports to view all your disk and volume groups, which are sorted by their computer (By Computer), storage capacity (By Disk/Volume Group Space) total free space (By Available Disk/Volume Group Space), time when they were last probed (By Probe Time), and time when they were discovered (By Discovered Time).

Disks reports

Use these reports to view all the disks in the system, which are sorted in order of how many recovered (By Recovered Errors) and unrecovered errors (By Unrecovered Errors) they have, time when they were probed (By Probe Time), and time when they were discovered (By Discovered Time).

Use the **Asset Reporting** > **System-wide** > **Disks** > **By Grown Defects** report to view the following information.

- All the disks in the system that are sorted in order of the number of grown defects that they have on them
- What disks in your system are experiencing problems and might be in danger of an imminent failure

The **Asset Reporting** > **System-wide** > **Disks** > **By Primary Defects** report returns no data if disk defects are not detected. Use this report to view the following information.

- All the disks in the system that are sorted in order of the number of primary defects they have on them
- What disks in your system are in good condition and which ones are more or less defective

File systems / Logical Volumes reports

Use these reports to view detailed information about file systems and logical volumes on your monitored computers. A logical volume is a partition on a disk that does not have a file system (raw partition). Use these reports to view the following information.

- Available file system space on monitored computers.
- All the file systems in the system that are sorted in order of the amount of free space they have on them.
- Which file systems have less free space and might be in danger of running out of free space.
- Which file systems have too much free space and where space consolidation might be necessary.
- A list of virtual disk files, which are not assigned to any of the virtual machines. This situation represents wasted storage capacity.
- The path from the file system on a virtual machine to the back-end storage volumes on a hypervisor or mapped to the hypervisor.
- The path from the file system on a virtual machine to the back-end storage volumes on an IBM SONAS or Storwize V7000 Unified system, or mapped to the IBM SONAS or Storwize V7000 Unified system.

Note: The values in the By Available File System Space report are based on data that is collected by probes. Probes collect space information as measured in blocks (1 block = 512 bytes). Tivoli Storage Productivity Center calculates file system space, including used space and free space,

which is based on the number of blocks it retrieves from a probe. It multiplies the number of blocks by 512 and displays the resulting value in the report.

Volumes reports

Use these reports to view the following information.

- Information about the storage subsystems that host volumes
- Storage capacity of the volumes hosted by storage subsystems
- Information about the storage subsystems that host volumes sorted by the date/time when they were probed

Exports or Shares report

Use this report to view all the Exports or Shares in your environment, which are sorted in the order that they were discovered.

Monitored Directories reports

Use these reports to view all the monitored directories in the system, which are sorted in order of the amount of storage space they are taking up (By Space Used), the time when they were last scanned (By Scan Time), the time when they were discovered (By Discovered Time), and when they were removed (Removed Directories).

Unmanaged Computers report

Use this report to view all of the new computers that are introduced into your system and that do not have Storage Resource agents or Data agents that are installed on them. It also lists other computers that you do not put under Data Manager control.

Users report

Use this report to view all the users in your environment that are sorted in the order that they were discovered.

OS User Groups report

Use this report to view all the OS User Groups in your environment that are sorted in the order when they were discovered.

Availability Reports:

Use Availability reports to monitor and report on the availability of your storage, both from a network point of view and from a computer uptime perspective.

Use these reports to view the percentage of time that the storage in your enterprise is off-network due to network problems or is unavailable due to system downtime. In a fast-paced business environment, 24x7 application availability is critical. These reports help you monitor the availability of the storage and data that back up your applications.

Reporting Type	Description
Ping	Use the ping report to monitor how available your storage is on the network. To do this monitor, regularly scheduled pings are sent out from the Data server to all of the monitored computers in your environment. The Tivoli Storage Productivity Center server checks not only for whether a Storage Resource agent is available on the network, but records the amount of time that the request was in transit. This information indicates the responsiveness of the various storage servers on the network as well. Use the **Report Filter Specification** section on the **Selection** panel to limit the time range of the information in a report. Check the **Limit To This Time Range** option and use the date selection fields to limit the time range for a report. A ping report shows the following information: • the name of a computer • percentage of time the computer is available on the network • number of pings that have been transmitted and the number that have been received • number of damaged requests and the average transit time for the request to go between the Tivoli Storage Productivity Center server and the computer that is being monitored • maximum transit time • minimum transit time • report start time and report end time for each computer in the report **Note:** You can sort on any of these columns by clicking on the column name. You can also generate charts and drill down on each computer for more detail.

Reporting Type	Description
Computer Uptime	Use the computer uptime report to track the availability of the storage based upon the percentage of the time the computer that hosts that storage is down or not running. The Storage Resource agent on the computer tracks this information and sends it to the server. A computer uptime report shows the following information: • name of a computer • percentage of time the computer is up and running • number of reboots that have been recorded • total amount of time the computer has been down and unavailable • average downtime that has been recorded • report start time and report end time for each computer in the report **Note:** Computer Uptime reports are not available for Storage Resource agents that are invoked using the non-daemon protocol for data collection. These reports do not contain data for computers on which non-daemon based Storage Resource agents are deployed. To collect computer uptime information using a Storage Resource agent, that agent must use a daemon service for runtime operation. You can sort on any of these columns by clicking on the column name. You can also generate charts and drill down on each computer for more detail.

TPC-wide Storage Space Reports:

Use these reports to view storage capacity of your resources at a file system, computer, or entire network level.

For a specific computer, group of computers, or all the computers in your enterprise, you can view the following information:

- How much storage you have
- How much storage is being used
- What percentage of storage is free for expansion

Reporting Type	Description
Disk Space	Use these reports to view and chart disk capacity, per disk, per computer, per computer group, per domain, and for the whole network. These reports include one row for each computer that shows the total amount of storage capacity on that computer and the associated computer and disk storage information. For detail on any computer in the report, click the magnifying glass next to the report row. You can also click the chart button within a report to view an easy-to-interpret bar chart, showing the total storage capacity of each computer that you chose to report on and chart. To get the exact amount of storage for a computer, position the cursor over the associated bar and a box displays the total amount for the selected computer. **Note:** To ensure the accuracy and consistency of the data that is displayed in Disk Capacity reports, run regularly scheduled probes against the hosts that import volumes and the storage subsystems upon which you want to report. Run probes against storage subsystems after you run them against any hosts. You can use the following By clauses to view disk space for the following storage entities: By Disk, By Storage Subsystem, By Cluster, By Computer, By Computer Group, By Domain, and Network-wide.
File System Space	Use these reports to view information for monitored file systems, including the total amount of storage capacity on those file systems and statistics for used space, free space, and total number of files. You can use the following By clauses to view file system space for the following storage entities: By File System, By File System Group, By Cluster, By Computer, By Computer Group, By Domain, Network-wide.
Consumed File System Space	Use these reports to view information about the amount of space that is consumed on a file system. You can use the following By clauses to view consumed file system space for the following storage entities: By File System, By File System Group, By Cluster, By Computer, By Computer Group, By Domain, Network-wide.
Available File System Space	Use File System Used Space reports to view information about the amount of free space on a file system. You can use the following By clauses to view available file system space for the following storage entities: By File System, By File System Group, By Cluster, By Computer, By Computer Group, By Domain, Network-wide.

TPC-Wide Storage Space - Disk Space report:

Use this report to view and chart disk storage capacity at the following levels: by disk, by computer, by cluster, by storage system, by computer monitoring or reporting group, by storage system monitoring or reporting group, by domain, and for the whole network.

Note: The names of some columns are changed. For your reference, the original names of those columns display within parentheses ( ) next to their new names.

By Disk

Chart icon
Click to generate charts about the capacity of disks that are displayed in the report.

Magnifying glass icon
Click to view a more detailed report about the capacity of a disk.

Device

Name of the device on which a disk is in. The following disks are displayed in this report.

- Computer disks that are internal to the computers monitored by IBM Tivoli Storage Productivity Center.
- Computer disks on virtual machines that are monitored by Tivoli Storage Productivity Center.
- Storage system disks on storage subsystems that are monitored by Tivoli Storage Productivity Center.
- Storage system disks that no longer exist after a probe of a storage system because information about that system was removed based on settings in the Removed Resource Retention panel.
- Back-end storage volumes that are not identified by Tivoli Storage Productivity Center as being assigned to a monitored storage system virtualizer.
- Computer disks that are not identified by Tivoli Storage Productivity Center as being assigned to a monitored storage system.

The following disks are not displayed in this report.

- Computer disks that are assigned to storage subsystems monitored by Tivoli Storage Productivity Center.
- Back-end storage volumes that are assigned to storage system virtualizers monitored by Tivoli Storage Productivity Center.

Path Name of a disk.

Disk Space (Capacity)

Total storage capacity for a disk. Keep in mind the following information about the TOTAL row for this column.

- The value that displays in TOTAL row for this column includes the disk space of spare disks within a storage subsystem.
- The value that displays in the TOTAL row for this column does not include computer disk space that is on virtual machines that are monitored by Tivoli Storage Productivity Center.

Note: When you use the stand-alone GUI, the Disk Space entries for Storwize V7000 virtualizers report the sum of backend capacity. Local disk space is not included. When you use the web-based GUI, local disk space is included in the calculation of the total device disk space of Storwize V7000 virtualizers.

Available Disk Space (Not Allocated Space)

Amount of space on the disk that is not allocated to any logical volume (or volumes for disks within storage subsystems). This value does not include RAID disk usage on storage subsystems that are identified by Tivoli Storage Productivity Center. The value that displays in the TOTAL row for this column includes the capacity of all disks within the storage system that is not allocated. The capacity of spare disks is included.

In Storage Subsystem

Indicates `Yes` when a disk is either of the following.

- An actual physical disk within a storage system that is monitored by Tivoli Storage Productivity Center.
- A back-end storage volume within a storage system virtualizer that is monitored by Tivoli Storage Productivity Center.

Manufacturer
Name of the manufacturer of a disk.

Note: The value `Unknown` is displayed in this column for IBM ESS storage subsystems.

Model
Model number of a disk.

Note: The value `Unknown` is displayed in this column for IBM ESS storage subsystems.

Serial Number
Serial number of a disk.

Primary Defects
Number of defects on the disk when it was new.

Note: Defect data is not collected for IBM TotalStorage Enterprise Storage Server, IBM FAStT, HP StorageWorks, Hitachi Data Systems storage subsystems.

Grown Defects
Number of defects that are detected on the disk since it was new.

Note: Defect data is not collected for TotalStorage Enterprise Storage Server, FAStT, HP StorageWorks, Hitachi Data Systems storage subsystems.

Fibre Attached
Indicates `Yes` when a disk is attached to a port that Tivoli Storage Productivity Center identifies as fibre.

Mapped to Storage Subsystem
Indicates `Yes` when a computer disk or a back-end storage volume can be mapped to a storage system.

Detectable
Indicates `Yes` when a disk is identified as being available to the server or the storage system after a successful probe.

Is Virtual
Indicates `Yes` when a disk is on a computer that Tivoli Storage Productivity Center identifies as a virtual machine.

Is Solid State
Indicates `Yes` when a disk is on a solid-state drive.

Is Encryptable
Indicates `Yes` when a disk can be encrypted.

Is Encrypted
Indicates `Yes` when a disk is encrypted.

Tier Indicates the tier level of a disk. Disks can have only one tier. For example, this column displays either the value `generic_ssd` or `generic_hdd`.

By Storage Subsystem

Chart icon
Click to generate charts about the disk capacity of storage subsystems that are displayed in the report.

Magnifying glass icon

Click to view a more detailed report about the capacity of disks that are associated with a storage system.

Name

Name or alias of a storage system that contains the disks or the name or alias of a storage system virtualizer (for example, SAN Volume Controller) that manages the disks. This report does not display storage subsystems that are discovered but not probed.

Disk Space (Disk Capacity)

Total raw (unformatted) disk capacity of a storage system. Tivoli Storage Productivity Center does not include the following capacity information in its calculation of the value for this column.

- Capacity of spare disks that are identified on TotalStorage Enterprise Storage Server, DS8000, and IBM System Storage DS6000 storage subsystems.
- Capacity of storage system disks that become missing after a Tivoli Storage Productivity Center storage system probe.
- The value that displays in the TOTAL row for this column does not include spare disks in its calculation.

Available Disk Space (Disk Space Not Allocated)

Total unformatted disk free space of a storage system. Tivoli Storage Productivity Center does not include the following storage space in its calculation of the value for this column.

- Storage system disks that become missing after a storage system probe.
- RAID storage usage on storage subsystems that are identified by Tivoli Storage Productivity Center.
- External back-end storage for TagmaStore subsystems.
- Storage space that is used by volumes that are on external disks when Hitachi Data Systems (HDS) storage subsystems are configured as storage virtualizers.
- The value that displays in the TOTAL row for this column does not include spare disks in its calculation.

Number of Disks

Total number of disks in a storage system. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column.

- Storage system disks that become missing after a storage system probe.
- External back-end storage for TagmaStore subsystems.
- Disks in partner storage pools for NetApp storage devices.

Note: If you click the magnifying glass icon next to storage system, the resulting drill-down report generates a list of detectable storage system disks or back-end storage volumes only. Therefore, the total number of disks for each storage system drill-down report equals this value.

Number of Volumes (LUNs)

Total number of storage volumes in a storage system or the total number of virtual volumes that are virtual storage. This value does not include storage system volumes or virtual storage volumes that become missing after a storage system probe.

Volume Space (LUN Capacity)
Total capacity of all storage system volumes or virtual storage volumes within a storage system. This value does not include capacity information for storage system volumes or virtual storage volumes that become missing after a storage system probe.

Note: For space-efficient FlashCopy volumes, the volume capacity is the amount of storage space that is requested for these volumes, not the actual allocated amount. This condition can result in discrepancies in the overall storage capacity reported for a storage system that uses space-efficient FlashCopy volumes. This situation also applies to the Total Usable Volume Space and Total FlashCopy Target Capacity calculations.

Consumable Volume Space (Usable LUN Capacity)
Total amount of unique storage system volume space and virtual storage volume space on monitored storage system arrays. You can assign this space to servers within the network or they are already assigned to servers within the network.

Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column.

- Storage system volumes or virtual storage volumes that become missing after a probe.
- Storage system volumes or virtual storage volumes that are used as FlashCopy targets.
- Storage system volumes or virtual storage volumes that are identified as Business Continuance Volume extended (BCVx).
- Storage system volumes or virtual storage volumes that are used as a Volume Configuration Management (VCM) database.
- Storage system volumes or virtual storage volumes that Tivoli Storage Productivity Center identifies as back-end storage volumes on monitored storage system virtualizers. For example, SAN Volume Controller.

Note: For FAStT, the XIV system, HP StorageWorks, and Hitachi Data Systems storage subsystems, the value in this column is the same as the value in the Volume Capacity column.

FlashCopy Target Volume Space (Capacity)
Total amount of unique storage system volume space and virtual storage volume space on monitored storage system arrays that is identified as FlashCopy target space. Tivoli Storage Productivity Center does not include the following storage space in its calculation of the value for this column.

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Storage system volumes or virtual storage volumes that are not used as FlashCopy targets.

Correlated Volume Space (LUN Capacity Visible to Data Manager)
Total amount of storage system volume space or virtual storage volume space on systems where the systems disks are identified by Tivoli Storage Productivity Center within a monitored storage system. The volumes include storage system volumes or virtual storage volumes that are identified as back-end storage volumes on monitored storage system

virtualizers. Tivoli Storage Productivity Center does not include the following capacity information in its calculation of the value for this column.

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Disks that are assigned to a monitored storage system but are not identified by Tivoli Storage Productivity Center as a disk within the storage system. Some reasons why these disks are not identified as being in the storage system are included.
  - Tivoli Storage Productivity Center does not support the identification of disks for some storage system types.
  - The connection of the disk to the storage system is lost and is no longer detectable during a probe.
- Storage system volumes or virtual storage volumes that are identified as Business Continuance Volume extended (BCVx).
- Storage system volumes or virtual storage volumes that are used as a Volume Configuration Management (VCM) database.

Volume Space Not Correlated (LUN Capacity not Visible to Data Manager)
Total amount of unique storage system volume space and virtual storage volume space that is discovered on monitored storage system arrays that can be assigned or are assigned to systems within the network. Tivoli Storage Productivity Center does not include the following capacity information in its calculation of the value for this column.

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Disks that are within a monitored storage system.
- Storage system volumes or virtual storage volumes that Tivoli Storage Productivity Center identifies as back-end storage volumes on monitored storage system virtualizers.

Unavailable Disk Space (Disk Usage)
Amount of storage system volume or virtual storage volume space that is dedicated to redundancy. This value is dependent on the storage system SMI-S provider that returns a valid RAID value that is used to determine the disk usage. If the value is zero for a storage system, the disk usage cannot be calculated.

This amount does not include storage space information from storage system volumes or virtual storage volumes that become missing after a storage system probe.

Formatted Space (Capacity)
Total amount of formatted storage space that is associated with the storage system that is used or can be used for system storage volumes or virtual storage volumes. This value is dependent on the storage system SMI-S provider that returns a formatted value.

For some storage subsystems, this space is the total managed space, which includes space that cannot be used for storage volumes or virtual storage volumes. This situation can occur because of a number of reasons, such as space not being formatted until storage volumes are created.

For SAN Volume Controller, this value represents the total size of the managed disk groups that are created on the SAN Volume Controller. This value does not include managed disk space that is not defined to a managed disk group.

Formatted Space with No Volumes
Total amount of formatted storage space that is associated with the storage system that can be used for system storage volumes or virtual storage volumes. This value is dependent on the storage system SMI-S provider that returns a formatted value.

For some subsystems, this value represents the remaining managed space that includes space that cannot be used for storage volumes or virtual storage volumes. This situation can occur because of a number of reasons, such as space not being formatted until storage volumes are created.

For SAN Volume Controller, this value represents the space within the managed disk groups that does not include the size of the virtual disks that are created and the corresponding virtual disk extent usage.

Overall Unavailable Disk Space (Total Disk Usage)
(TotalStorage Enterprise Storage Server, DS6000, and DS8000 storage systems only) Total amount of unformatted space within disk groups or array sites.

Unformatted Disk Space
This value does not apply to all storage subsystems. For FAStT, TotalStorage Enterprise Storage Server, DS6000, and DS8000 storage systems, this value is the total raw disk space of any unformatted disk groups or array sites. This column displays `N/A` for the storage systems where this value is not applicable. For the XIV system, this value shows the physical (hard) space of the XIV system available for pool creation or expansion.

Cache
Amount of cache memory that is internal to the storage system.

Note: This column is blank for SAN Volume Controllers.

Manufacturer
Name of the manufacturer of a disk.

Model
Model number of a disk.

Serial Number
Serial number of a disk. This information is displayed for physical disks only. For MDisks, the value `Unknown` is displayed.

Firmware Revision
Microcode (OS) version.

Assigned Volume Space (Subsystem Assigned LUN Capacity)
Total storage system volume space within the storage system that is mapped or assigned to host systems. Tivoli Storage Productivity Center does not include the following capacity information in its calculation of the value for this column.

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Storage system volumes that are not mapped or are not assigned to host systems.

Unassigned Volume Space (Subsystem Unassigned LUN Capacity)
Total storage system volume space within a storage system that is not

mapped or not assigned to host systems. Tivoli Storage Productivity Center does not include the following capacity information in its calculation of the value for this column.

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Storage system volumes that are mapped or assigned to host systems.

Unassigned and Available Formatted Disk Space (Subsystem Total Formatted Free Space)

Total storage system space that is not mapped or not assigned to host systems and the total amount of formatted storage space that is associated with the storage system that can be used for system storage volumes.

This total amount of formatted storage space is dependent on the storage system SMI-S provider that returns a formatted value. For some subsystems, this value represents the remaining managed space that might include space that cannot be used for storage volumes or virtual storage volumes. This situation can occur because of a number of reasons, such as space not being formatted until storage volumes are created.

Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column.

- Storage system volumes that become missing after a storage system probe.
- Storage system volumes that are mapped or assigned to host systems.

zOS Volume Space (zOS LUN Capacity)

Total storage system space that is reserved for use on mainframe storage such as used by z/OS. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column.

- Storage system volumes that become missing after a storage system probe.
- Storage system volumes that are reserved for use on open system server or non-mainframe storage.

Open System Volume Space (Open System LUN Capacity)

Total storage system space that is reserved for use on open system storage such as used by operating systems like Linux, AIX, HP/UX, Oracle Solaris, and Windows. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column.

- Storage system volumes that become missing after a storage system probe.
- Storage system volumes that are reserved for use on mainframe storage.

Physical Disk Space (Capacity)

Total amount of physical disk space that is discovered on the monitored storage system arrays. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column.

- Storage system disks that become missing after a storage system probe.
- Back-end storage volumes on monitored storage system virtualizers (for example, SAN Volume Controller) that are attached from a storage system.

Backend Volume Space (Backend LUN Capacity)

Total amount of storage system volume space or virtual storage space that Tivoli Storage Productivity Center identifies as the back-end disk space on a monitored storage system virtualizer (for example, SAN Volume

Controller). Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column.

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Storage system volumes or virtual storage volumes that are back-end disks on a storage system virtualizer that is not monitored.

Configured Real Space (GB)
Total amount of real available and formatted storage space in the storage pools that are associated with a storage subsystem.

Available Real Space (GB)
Amount of real storage space available to allocate to volumes in the storage pools that are associated with a storage subsystem.

Tiers Indicates the tiers that are used by the storage system. Each tier is delimited by a semi-colon (;). Possible values are: generic_hdd, generic_ssd

Information about tiers is available for SAN Volume Controller 6.1 and Storwize V7000 only. The value `N/A` is displayed in tier-related columns for other storage systems.

Tier Capacities
Total storage capacity for each tier that is used by the storage system. The capacity for each tier is delimited by a semi-colon (;).

Tier Free Capacities
Free storage capacity (available space) for each tier that is used by the storage system. The free capacity for each tier is delimited by a semi-colon (;).

By Storage Subsystem Group

Chart icon
Click to generate charts about the disk capacity of storage subsystems in the groups that are displayed in the report.

Magnifying glass icon
Click to view a more detailed report about the disk capacity of storage subsystems in a group.

Creator
ID of the user who created the storage system monitoring group or storage system reporting group.

Group Name of a group.

Disk Space (Disk Capacity)
Total raw (unformatted) disk capacity of the storage subsystems that are in a group. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column.

- Capacity of spare disks that are identified on TotalStorage Enterprise Storage Server, DS8000, and DS6000 storage systems.
- Capacity of storage system disks that become missing after a Tivoli Storage Productivity Center storage system probe.

Available Disk Space (Not Allocated Disk Space)
Total unformatted disk free space of the storage subsystems that are in a group. Tivoli Storage Productivity Center does not include the following storage space in its calculation of the value for this column.

- Storage system disks that become missing after a storage system probe.
- RAID disk usage on storage subsystems that are identified by Tivoli Storage Productivity Center.
- External back-end storage for TagmaStore subsystems.
- Storage space that is consumed by volumes that are on external disks when Hitachi Data Systems (HDS) storage subsystems are configured as storage virtualizers.

Number of Disks

Total number of disks in the storage subsystems that are in a group. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column.

- Storage system disks that become missing after a storage system probe.
- External back-end storage for TagmaStore subsystems.
- Disks in partner storage pools for NetApp storage devices.

Note: If you click the magnifying glass icon next to storage system, the resulting drill-down report generates a list of detectable storage system disks or back-end storage volumes only. Therefore, the total number of disks for each storage system drill-down report equals this value.

Number of Volumes (LUNs)

Total number of storage volumes in a storage system or the total number of virtual volumes that are virtual storage. This value does not include storage system volumes or virtual storage volumes that become missing after a storage system probe.

Volume Space (LUN Capacity)

Total capacity of all storage system volumes or virtual storage volumes within the storage system. This value does not include capacity information of storage system volumes or virtual storage volumes that become missing after a storage system probe.

Note: For space-efficient FlashCopy volumes, the volume capacity is the amount of storage space that is requested for these volumes, not the actual allocated amount. This situation can result in discrepancies in the overall storage capacity reported for a storage system that uses space-efficient FlashCopy volumes. This situation also applies to the Total Usable Volume Space and Total FlashCopy Target Capacity calculations.

Consumable Volume Space (Usable LUN Capacity)

Total amount of unique storage system volume space and virtual storage volume space on monitored storage system arrays in a group that you can assign to servers within the network or are already assigned to servers within the network.

Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column.

- Storage system volumes or virtual storage volumes that become missing after a probe.
- Storage system volumes or virtual storage volumes that are used as FlashCopy targets.
- Storage system volumes or virtual storage volumes that are identified as Business Continuance Volume extended (BCVx).
- Storage system volumes or virtual storage volumes that are used as a Volume Configuration Management (VCM) database.

- Storage system volumes or virtual storage volumes that Tivoli Storage Productivity Center identifies as back-end storage volumes on monitored storage system virtualizers. For example, SAN Volume Controller.

Note: For FAStT, the XIV system, HP StorageWorks, and Hitachi Data Systems storage subsystems, the value in this column is the same as the value in the Volume Space column.

FlashCopy Target Volume Space (Capacity)
Total amount of unique storage system volume space and virtual storage volume space on monitored storage system arrays in a group that is identified as FlashCopy target space. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column.

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Storage system volumes or virtual storage volumes that are not used as FlashCopy targets

Correlated Volume Space (LUN Capacity Visible to Data Manager)
Total amount of storage system volume space or virtual storage volume space on systems where the systems disks are identified by Tivoli Storage Productivity Center as being in the monitored storage subsystems in a group. The volumes include storage system volumes or virtual storage volumes that are identified as back-end storage volumes on monitored storage system virtualizers.Tivoli Storage Productivity Center does not include the following scenarios in its calculation of the value for this column.

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Disks that are assigned to a monitored storage system but are not identified by Tivoli Storage Productivity Center as a disk in the storage system. Some reasons why these disks are not identified as being in the storage system include.
  - Tivoli Storage Productivity Center does not support the identification of disks for some storage system types.
  - The connection of the disk to the storage system is lost and is no longer detectable during a probe.
- Storage system volumes or virtual storage volumes that are identified as Business Continuance Volume extended (BCVx).
- Storage system volumes or virtual storage volumes that are used as a Volume Configuration Management (VCM) database.

Volume Space Not Correlated (LUN Capacity not Visible to Data Manager)
Total amount of unique storage system volume space and virtual storage volume space that is discovered on monitored storage system arrays in a group that can be assigned or are assigned to systems within the network. Tivoli Storage Productivity Center does not include the following in its calculation of the value for this column.

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Disks that are within a monitored storage system.
- Storage system volumes or virtual storage volumes that Tivoli Storage Productivity Center identifies as back-end storage volumes on monitored storage system virtualizers.

Unavailable Disk Space
Amount of volume or virtual storage volume space of storage subsystems in a group that is dedicated to redundancy. This value is dependent on the storage system SMI-S provider that returns a valid RAID value that is used to determine the disk usage. If the value is zero for a storage system, the disk usage cannot be calculated.

This amount does not include storage space information from storage system volumes or virtual storage volumes that become missing after a storage system probe.

Formatted Space
Total amount of formatted storage space that is associated with the storage subsystems in a group that is used or can be used for system storage volumes or virtual storage volumes. This value is dependent on the storage system SMI-S provider that returns a formatted value.

For some storage subsystems, this space is the total managed space, which includes space that cannot be used for storage volumes or virtual storage volumes. This situation can occur because of a number of reasons, such as space not being formatted until storage volumes are created.

For SAN Volume Controller, this value represents the total size of the managed disk groups that are created on the SAN Volume Controller. This value does not include managed disk space that is not defined to a managed disk group.

Formatted Space with No Volumes
Total amount of formatted storage space that is associated with the storage subsystems in a group that can be used for system storage volumes or virtual storage volumes. This value is dependent on the storage system SMI-S provider that returns a formatted value.

For some subsystems, this value represents the remaining managed space that includes space that cannot be used for storage volumes or virtual storage volumes. This situation can occur because of a number of reasons, such as space not being formatted until storage volumes are created.

For SAN Volume Controller, this value represents the space within the managed disk groups that does not include the size of the virtual disks that are created and the corresponding virtual disk extent usage.

Unformatted Disk Space
This value does not apply to all storage subsystems. For FAStT, TotalStorage Enterprise Storage Server, DS6000, and DS8000 storage systems, this space is the total raw disk space of any unformatted disk groups or array sites. For the XIV system, the total physical (hard) space that is available for pool creation. This column displays `N/A` for the storage subsystems where this value is not applicable.

Cache
Amount of cache memory that is internal to the storage subsystems in the group.

Note: This column does not include values for SAN Volume Controllers.

Assigned Volume Space (Subsystem Assigned LUN Capacity)
Total volume space of the storage subsystems within a group that is mapped or assigned to host systems. Tivoli Storage Productivity Center does not include the following capacity information in its calculation of the value for this column.

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Storage system volumes that are not mapped or are not assigned to host systems.

Unassigned Volume Space (Subsystem Unassigned LUN Capacity)
Total volume space of the storage subsystems in a group that is not mapped or not assigned to host systems. Tivoli Storage Productivity Center does not include the following capacity information in its calculation of the value for this column.

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Storage system volumes that are mapped or assigned to host systems.

zOS Volume Space (zOS LUN Capacity)
Total space of storage subsystems in a group that is reserved for use on mainframe storage such as used by z/OS. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column.

- Storage system volumes that become missing after a storage system probe.
- Storage system volumes that are reserved for use on open system server or non-mainframe storage.

Open System Volume Space (Open System LUN Capacity)
Total space of the storage subsystems in a group that is reserved for use on open system storage such as used by operating systems such as Linux, AIX, HP/UX, Oracle Solaris, and Windows. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column.

- Storage system volumes that become missing after a storage system probe.
- Storage system volumes that are reserved for use on mainframe storage.

Physical Disk Space (Capacity)
Total amount of physical disk space on the storage system arrays that are in a group. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column.

- Storage system disks that become missing after a storage system probe.
- Back-end storage volumes on monitored storage system virtualizers (for example, SAN Volume Controller) that are attached from a storage system.

Backend Volume Space (Backend LUN Capacity)
Total amount of storage system volume space or virtual storage space that Tivoli Storage Productivity Center identifies as the back-end disk space on the monitored storage system virtualizers (for example, SAN Volume Controller) that are in a group. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column.

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Storage system volumes or virtual storage volumes that are back-end disks on a storage system virtualizer that is not monitored.

By Cluster

Chart icon
Click to generate charts about the disk capacity of the clusters that are displayed in the report.

Magnifying glass icon
Click to view a more detailed report about the capacity of disks in a cluster.

Cluster
Name of a cluster.

Note: For Storwize V7000 Unified or IBM SONAS clusters, the storage system name is included with the cluster name in the Computer or Device column. The format of the column is `storagesystem_name: cluster_name`, where storagesystem_name is the name of the Storwize V7000 Unified or IBM SONAS device that the cluster belongs to. For example, `tpcserver1.tpc.example.com: kq98n5d.acct` displays storage system tpcserver1.tpc.example.com that cluster kq98n5d.acct belongs to.

Disk Space (Total Capacity)
Total amount of unique disk storage space for the computers in a cluster. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value in this column.

- Computer disks on a computer that is not yet probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from the computer.

Note:

- If the computer is a SAN File System client, this value includes the capacity of storage system volumes that are visible to the computers in the cluster and are owned by the SAN File System.
- The drill-down reports for each computer generate a list of detectable computer disks only. Therefore, the total capacity of disks for each computer drill-down report equals this value.

Available Disk Space (Total Not Allocated Space)
Total amount of unique disk storage space for a computer that is not allocated to any logical volume on the computer. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column.

- Computer disks on computers that are not yet probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from the computer.

Note: If the computer is a SAN File System client, then this value does not include the space not allocated on any storage system volumes visible to it that are owned by the SAN File System.

Owned Disk Space (Capacity)
Total amount of unique disk storage space for computers in a cluster that is owned by those computers. If Data Manager determines that a disk is configured for a different host, that disk's capacity is not counted in this

column. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column.

- Computer disks on computers that are not yet probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from the computer.

Note:

- If the computer is a SAN File System client, this value does not include the capacity of any volumes that are visible to it that are owned by the SAN File System.
- If the host is Solaris and Veritas Volume Manager (VxVM) is in use, the product examines the Veritas disk-label and reads from the host ID. If this examination does not agree with the local host ID, the disk is classified as belonging to a different (Solaris) host.

Owned Available Disk Space (Owned Not Allocated Space)
Total amount of unique disk storage space for computers in a cluster that is not allocated to any logical volume within the computers and is owned by the computers. If Data Manager determines that a disk is configured for a different computer, the space that is not allocated for that disk is not counted in this column. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column.

- Computer disks on computers that are not yet probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from the computer.

If the computer is a SAN File System client, then this value excludes the space not allocated on any storage system volumes visible to it that are owned by the SAN File System.

If the host is Solaris and Veritas Volume Manager (VxVM) is in use, the product examines the Veritas disk-label and read off the host-ID. If this examination does not agree with the local host-ID, the disk is classified as belonging to a different (Solaris) host.

Non-Fibre Channel Attached Disk Space (Total Other Attached Capacity)
Total amount of unique disk space on the computers in a cluster that is not attached through a fibre channel port. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column.

- Computer disks that are behind a fibre channel port.
- Computer disks on a computer that is not yet probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

Non-Fibre Channel Attached Available Disk Space (Total Other Attached Not Allocated Space)
Total amount of disk storage space on the computers in a cluster that is not allocated to any logical volume within the computers and is not attached through a fibre channel port. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column.

- Computer disks that are behind a fibre channel port.
- Computer disks on a computer that is not yet probed.

- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

Fibre Channel Attached Disk Space (Total Fibre Channel Attached Capacity)
Total amount of unique disk space on the computers in a cluster that is attached through a fibre channel port. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column.

- Computer disks that are not behind a fibre channel port.
- Computer disks that are behind a fibre channel port that is not identified by a Storage Resource agent.
- Computer disks on a computer that is not yet probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

Fibre Channel Attached Available Disk Space (Total Fibre Channel Attached Not Allocated Space)
Total amount of disk storage space on the computers in a cluster that is not allocated to any logical volume within the computers and is attached through a fibre channel port. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column.

- Computer disks that are not behind a fibre channel port.
- Computer disks that are behind a fibre channel port that is not identified by a Storage Resource agent.
- Computer disks on a computer that is not yet probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

By Computer

Chart icon

Magnifying glass icon
Click to view a more detailed report about the disks on a computer.

Computer
Name of a computer.

Disk Space (Total Capacity)
Total amount of unique disk storage space for a computer. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column.

- Computer disks on a computer that is not yet probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from the computer.

Note:

- The value that displays in the TOTAL row for this column does not include disks on virtual machines where the Storage Resource agent is installed.
- If the computer is a SAN File System client, then this value also includes the capacity of any storage system volumes visible to this computer that are owned by the SAN File System.
- The drill-down reports for each computer generate a list of detectable computer disks only. Therefore, the total capacity of disks for each computer drill-down report equals this value.

Available Disk Space (Total Not Allocated Space)
Total amount of unique disk storage space for a computer that is not allocated to any logical volume on the computer. Tivoli Storage Productivity Center does not include the following disks from in its calculation of the value in this column.

- Computer disks on computers that are not yet probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from the computer.

Note: If the computer is a SAN File System client, then this value does not include the space not allocated on any storage system volumes visible to it that are owned by the SAN File System.

Owned Disk Space (Capacity)
Total amount of unique disk storage space for a computer that is owned by that computer. If Data Manager determines that a disk is configured for a different host, that disk's capacity is not counted in this column. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column.

- Computer disks on computers that are not yet probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from the computer.

If the computer is a SAN File System client, this value does not include the capacity of any volumes that are visible to it that are owned by the SAN File System.

If the host is Solaris and Veritas Volume Manager (VxVM) is in use, the product examines the Veritas disk-label and reads from the host ID. If this examination does not agree with the local host ID, the disk is classified as belonging to a different (Solaris) host.

Owned Available Disk Space (Not Allocated Owned Space)
Total amount of unique disk storage space for a computer that is not allocated to any logical volume within the computer and is owned by the computer. If Data Manager determines that a disk is configured for a different computer, that disk space that is not allocated is not counted in this column. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column.

- Computer disks on computers that are not yet probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from the computer.

Note:

- If the computer is a SAN File System client, then this value excludes the space not allocated on any storage system volumes visible to it that are owned by the SAN File System.
- If the host is Solaris and Veritas Volume Manager (VxVM) is in use, the product examines the Veritas disk-label and read off the host-ID. If this examination does not agree with the local host-ID, the disk is classified as belonging to a different (Solaris) host.

Non-Fibre Channel Attached Disk Space (Total Other Attached Capacity)
Total amount of unique disk space on a computer that is not attached through a fibre channel port. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column.

- Computer disks that are behind a fibre channel port.
- Computer disks on a computer that is not yet probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

Non-Fibre Channel Attached Available Disk Space (Total Other Attached Not Allocated Space)
Total amount of disk storage space for a computer that is not allocated to any logical volume within the computer and is not attached through a fibre channel port. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column.

- Computer disks that are behind a fibre channel port.
- Computer disks on a computer that is not yet probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

Fibre Channel Attached Disk Space (Total Fibre Channel Attached Capacity)
Total amount of unique disk space on a computer that is attached through a fibre channel port. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column.

- Computer disks that are not behind a fibre channel port.
- Computer disks that are behind a fibre channel port that is not identified by a Storage Resource agent.
- Computer disks on a computer that is not yet probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

Fibre Channel Attached Available Disk Space (Total Fibre Channel Attached Not Allocated Space)
Total amount of disk storage space on a computer that is not allocated to any logical volume within the computer and is attached through a fibre channel port. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column.

- Computer disks that are not behind a fibre channel port.
- Computer disks that are behind a fibre channel port that is not identified by a Storage Resource agent.
- Computer disks on a computer that is not yet probed.

- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

OS Type
Operating system that runs on a computer.

Network Address
Network address of a computer.

IP Address
IP address of a computer.

Time Zone
Time zone in which a computer is running.

CPU Architecture
Architecture of the processor (for example, IA32).

By Computer Group

Chart icon

Magnifying glass icon
Click to view a more detailed report about the disk capacity of computers in a group.

Creator
Creator of a computer monitoring group or computer reporting group.

Group
Name of a group.

Disk Space (Total Capacity)
Total amount of unique disk storage space for the computers in a group. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column.

- Computer disks that are on a virtual machine that is monitored by Tivoli Storage Productivity Center.
- Computer disks on a computer that is not yet probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from the computer.

Available Disk Space (Total Not Allocated Space)
Total amount of unique disk storage space for computers in a group that is not allocated to any logical volume on the computers. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column.

- Computer disks on computers that are not yet probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from the computer.

Note: If the computer is a SAN File System client, then this value does not include the space not allocated on any storage system volumes visible to it that are owned by the SAN File System.

Owned Disk Space (Capacity)

Total amount of unique disk storage space for computers in a group that is owned by those computers. If Data Manager determines that a disk is configured for a different host, that disk's capacity is not counted in this column. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column.

- Computer disks on a cluster of virtual machines that is monitored by Tivoli Storage Productivity Center.
- Computer disks on computers that are not yet probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from the computer.

Note:

- If the computer is a SAN File System client, this value does not include the capacity of any volumes that are visible to it that are owned by the SAN File System.
- If the host is Solaris and Veritas Volume Manager (VxVM) is in use, the product examines the Veritas disk-label and reads from the host ID. If this examination does not agree with the local host ID, the disk is classified as belonging to a different (Solaris) host.

Owned Available Disk Space (Owned Not Allocated Space)

Total amount of unique disk storage space for the computers in a group that is not allocated to any logical volume within the computer group and is owned by a computer within the group. If Data Manager determines that a disk is configured for a different computer, the disk space that is not allocated is not counted in this column. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column.

- Computer disks on computers that are not yet probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from the computer.

Note:

- If the computer is a SAN File System client, then this value excludes the not allocated space on any storage system volumes visible to it that are owned by the SAN File System.
- If the host is Solaris and Veritas Volume Manager (VxVM) is in use, the product examines the Veritas disk-label and read off the host-ID. If this examination does not agree with the local host-ID, the disk is classified as belonging to a different (Solaris) host.

Non-Fibre Channel Attached Disk Space (Total Other Attached Capacity)

Total amount of unique disk space on the computers in a group and is not attached through a fibre channel port. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column.

- Computer disks that are behind a fibre channel port.
- Computer disks that are discovered on virtual machine servers where the Storage Resource agent is installed.
- Computer disks on a computer that is not yet probed.

- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

Non-Fibre Channel Attached Available Disk Space (Total Other Attached Not Allocated Space)

Total amount of disk storage space on the computers in a group that is not allocated to any logical volume within the computers and is not attached through a fibre channel port. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column.

- Computer disks that are behind a fibre channel port.
- Computer disks on a computer that is not yet probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

Fibre Channel Attached Disk Space (Total Fibre Channel Attached Capacity)

Total amount of unique disk space on the computers in a group that is attached through a fibre channel port. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column.

- Computer disks that are not behind a fibre channel port.
- Computer disks that are behind a fibre channel port that is not identified by a Storage Resource agent.
- Computer disks that are discovered on virtual machine servers where the Storage Resource agent is installed.
- Computer disks on a computer that is not yet probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

Fibre Channel Attached Available Disk Space (Total Fibre Channel Attached Not Allocated Space)

Total amount of disk storage space on the computers in a group that is not allocated to any logical volume within the computers and is attached through a fibre channel port. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column.

- Computer disks that are not behind a fibre channel port.
- Computer disks that are behind a fibre channel port that is not identified by a Storage Resource agent.
- Computer disks on a computer that is not yet probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

By Domain

Chart icon

Click to generate charts about the disk capacity of the computers in a domain.

Magnifying glass icon

Click to view a more detailed report about the disk capacity of computers in a domain.

Domain
Name of a domain.

Disk Space (Capacity)
Total amount of unique disk storage space for the computers in a domain. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column.

- Computer disks on a computer that is not yet probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from the computer.

Available Disk Space (Not Allocated Space)
Total amount of unique disk storage space for computers in a domain that is not allocated to any logical volume on the computers. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column.

- Computer disks on computers that are not yet probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from the computer.

Network-wide

Chart icon
Click to generate charts about the disk capacity across a network.

Magnifying glass icon
Click to view a more detailed report about the disk capacity of computers in a network.

Disk Space (Capacity)
Total amount of internal physical disk space on monitored storage system arrays and disk space on monitored systems that are not storage system volumes. Tivoli Storage Productivity Center does not include the following capacity information in its calculation of the value for this column.

- Storage system disks or computer disks that become missing after a probe.
- Back-end storage volumes that are not identified by Tivoli Storage Productivity Center as being assigned to a monitored storage system virtualizer.
- Computer disks that are identified by Tivoli Storage Productivity Center as being assigned to a monitored storage system.
- Computer disks that are within a virtual machine server where the Storage Resource agent is installed.

Consumed File System Space (File System Used Space)
Total amount of unique file system storage space that is used or consumed by the systems where the Storage Resource agent is installed. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems that become missing after a probe.
- File systems on discovered hypervisors that are assigned to discovered virtual machines where the Storage Resource agent is installed.

- File systems on discovered virtual machines where the Storage Resource agent is installed. The hypervisor for the virtual machine is not yet discovered and the total used space exceeds the capacity of the total file system capacity.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

Available File System Space (File System Free Space)
Total amount of unique file system storage space that is not used or available to the systems where the Storage Resource agent is installed. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

Raw Volume Space
Total amount of storage system volume space that is the following.

- Assigned or mapped to hosts.
- Storage system volume space on a system that it is monitored by Tivoli Storage Productivity Center.
- Logical volume space on hosts that are not within a storage system that is monitored by Tivoli Storage Productivity Center.

Unavailable Disk Space (Disk Usage)
Total amount of storage system volume space that is identified as the following.

- For RAID or mirror redundancy on a storage system.
- As storage system volume space used for replication targets.
- As logical volume space on hosts that is for RAID or mirror redundancy on those hosts.

Available Disk Space (Not Allocated Space)
Total amount of disk space that does not include the following from the network capacity.

- Network Raw Volume Space
- Network Disk Usage
- Network Unknown Volume Space

Unknown Storage Subsystem Volume Space (Unknown LUN Capacity)
Total amount of storage system volume space that is not mapped or assigned to a host and is not identified on a host that is probed by a Storage Resource agent.

TPC-Wide Storage Space - File System Space report:

Use these reports to view detailed information about the storage capacity of file systems on systems in your environment. You can view this information in different ways by using the following By-Clauses: by file system, by file system group, by cluster, by computer, by computer group, by domain, and for the entire network.

Note: The names of some columns are changed. For your reference, the original names of those columns are within parentheses ( ) next to their new names.

By File system

Chart icon
Click this button to generate charts about the storage space for a file system.

Computer
Name of the computer on which a file system is in.

Mount Point
Name or mount point (UNIX/Linux) of the file system (for example, `c:\`, `d:\`, `/opt`, `/export/home`, and so on). The file systems that are displayed in this report include the following information.

- File systems on virtual machines that are monitored by IBM Tivoli Storage Productivity Center.
- File systems on hypervisors that are monitored by Tivoli Storage Productivity Center.
- File systems that become missing after a probe.

File System Space (Capacity)
Amount of file system storage space for a file system.

Note:

- The value that is displayed in the TOTAL row for this column does not include file systems on virtual machines where the Storage Resource agent is installed.
- The value in this column might be greater than **Used Space** + **Free Space** on some UNIX systems. This difference occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents and by the **df** command) does not include some space that is reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space** + **Free Space**. The difference represents the space that is wasted because of the system overhead.

Detectable
Indicates "Yes" when a file system is identified as being available to the server after a successful probe.

Percent Used Space
Percentage of file system storage space that is used within a file system.

Consumed File System Space (Used Space)
Amount of used storage space within a file system. On some UNIX file systems, this value does not include storage space that is reserved by the operating system (overhead). Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

The value in the TOTAL row for this column represents the difference between the TOTAL values in the **File System Space** and **Available File System Space** columns. If the calculated value for the TOTAL row is negative, the column displays 0.

The TOTAL row does not add the used space from VMWare computers. See the *VMWare capacity reports* topic in the *Planning* chapter of the *Tivoli Storage Productivity Center Installation and Configuration Guide* for information about how file system and disk capacity are calculated in this report for VMWare computers. This information is also available in the *Planning* section of the *Tivoli Storage Productivity Center Information Center*.

The value in the TOTAL row for this column does not include the following file systems.

- File systems on discovered hypervisors that are assigned to virtual machine servers where the Storage Resource agent is installed.
- File systems on discovered virtual machine servers where the Storage Resource agent is installed, but the hypervisor for the virtual machine servers is not discovered and the total used space exceeds the capacity of the total file system capacity.

Available File System Space (Free Space)
Amount of unused storage space within a file system.

File Count
Total number of files within a file system. This value does not include files on file systems that are not scanned.

Note: On Windows computers, AIX systems, and systems that use IBM General Parallel File System (GPFS™) for file management, Tivoli Storage Productivity Center calculates both the number of files and the number of directories for the value in this column. For example, if a Windows computer contains 150 files and 50 directories, the number in the File Count column is 200.

Directory Count
Total number of directories within a file system. This value does not include directories on file systems that are not scanned.

Percent Used Inodes
Percentage of used Inodes within a file system.

Used Inodes
Number of used Inodes within a file system.

Free Inodes
Number of free Inodes within a file system.

Volume Group
Volume group to which a logical volume belongs. If the volume is not part of a volume group this column displays “N/A”.

Logical Volume Space (Logical Volume Allocation)
Logical volume space that is used by the logical volume that contains the file system.

Disk Detectable
Indicates “Yes” when a file system's logical volume is identified as having an underlying host disk.

By File System Group

Chart icon

Magnifying glass icon
Click this button to view more detailed information about the capacity of file systems in a file system monitoring group or file system reporting group.

Creator
ID of the user who created a group.

Group Name of a file system monitoring group or file system reporting group.

File System Space (Capacity)
Amount of file system storage space for the file systems in a group. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems on virtual machines where the Storage Resource agent is installed.
- File systems that become missing after a probe.
- File systems that are not mounted.

Note: The value in this column might be greater than **Used Space** + **Free Space** on some UNIX systems. This difference occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents and by the **df** command) does not include some space that is reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space** + **Free Space**, the difference that represents the space that is wasted because of the system overhead.

Percent Used Space
Percentage of total file system storage space that is used within a group.

Consumed File System Space (Used Space)
Total amount of used file system storage space within a group. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems on hypervisors that are assigned to virtual machine servers where the Storage Resource agent is installed if both the virtual machine file systems and hypervisor file systems are within the group.
- File systems on virtual machine servers where the Storage Resource agents are deployed. However, the hypervisor for the virtual machine servers is not discovered and the total used space exceeds the capacity of the total file system capacity.
- File systems on virtual machine servers that are in a group without the underlying hypervisor file systems, and the total used space exceeds the capacity of the total file system capacity.
- File systems that become missing after a probe.
- File systems that are not mounted.

Note: On some UNIX file systems, this value does not include storage space that is reserved by the operating system (overhead).

Available File System Space (Free Space)
Total amount of unique file system storage space that is not used or is available within a group. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems that become missing after a probe.
- File systems that are not mounted.

File Count
Total number of files within a group. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this column.

- Files on file systems that become missing after a probe.
- Files on file systems that are not mounted.
- Files on file systems that are not scanned by a Storage Resource agent.

Note: On Windows computers, AIX systems, and systems that use IBM General Parallel File System (GPFS) for file management, Tivoli Storage Productivity Center calculates both the number of files and the number of directories for the value in this column. For example, if a Windows computer contains 150 files and 50 directories, the number in the File Count column is 200.

Directory Count
Total number of directories within a group. Tivoli Storage Productivity Center does not include the following directories in its calculation of the value for this column.

- Directories on file systems that become missing after a probe.
- Directories on file systems that are not mounted.
- Directories on file systems that are not scanned by a Storage Resource agent.

Percent Used Inodes
Percentage of used Inodes within a group.

Used Inodes
Number of used Inodes within a group.

Free Inodes
Number of free Inodes within a group.

By Cluster

Chart icon
Click this button to generate charts about the used file system space for a cluster.

Magnifying glass icon
Click this button to view more detailed information about the used storage space on file systems that are in a cluster.

Cluster
Name of cluster.

File System Space (Capacity)
Total amount of unique file system storage space in a cluster. Tivoli Storage

Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

Note: The value in this column might be greater than **Used Space** + **Free Space** on some UNIX systems. This difference occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents and by the **df** command) does not include some space that is reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space** + **Free Space**, the difference that represents the space that is wasted because of the system overhead.

Percent Used Space
Percentage of total file system storage space that is used within a cluster.

Consumed File System Space (Used Space)
Total amount of unique file system storage space that is used or consumed by the file systems in a cluster. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

Note: On some UNIX file systems, this value does not include storage space that is reserved by the operating system (overhead).

Available File System Space (Free Space)
Total amount of unique file system storage space that is not used or is available in a cluster. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

File Count
Total number of files within a cluster. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this column.

- Files on file systems that become missing after a probe.
- Files on file systems that are not mounted.
- Files on file systems that are not scanned by an agent.

When computers are monitored where the Windows operating system is installed, the number of files that are indicated in this column might be less than the number of files that are reported by the operating system.

Directory Count
Total number of directories within a cluster. Tivoli Storage Productivity Center does not include the following directories in its calculation of the value for this column.

- Directories on file systems that become missing after a probe.
- Directories on file systems that are not mounted.
- Directories on file systems that are not scanned by an agent.

When computers are monitored where the Windows operating system is installed, the number of folders that is indicated in this column might be higher than the number of folders that is reported by the operating system.

Percent Used Inodes
Percentage of used Inodes within a cluster.

Used Inodes
Number of used Inodes within a cluster.

Free Inodes
Number of free Inodes within a cluster.

By Computer

Chart icon
Click this button to generate a chart about the used file system storage space of the computers that are displayed in the report.

Magnifying glass icon
Click this button to view a more detailed report about the used file system storage space on a computer.

File System Space (Capacity)
Total amount of unique file system storage space that was discovered on the computer where the Storage Resource agent is installed. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

Note:

- The value in this column might be greater than **Used Space** + **Free Space** on some UNIX systems. This difference occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents and by the **df** command) does not include some space that is reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space** + **Free Space**, the difference that represents the space that is wasted because of the system overhead.
- The value that displays in the TOTAL row for this column does not include file systems on virtual machines where the Storage Resource agent is installed.
- The drill-down reports for each computer generate a list of detectable file systems only. Therefore, the total capacity of file systems for each computer drill-down report equals this value.

Percent Used Space
Percentage of total file system storage space that is used within a computer.

Consumed File System Space (Used Space)
Amount of unique file system storage space that is used or consumed by the computer where the Storage Resource agent is installed. On some UNIX file systems, this value does not include storage space that is reserved by the operating system (overhead). Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

The value that displays in the TOTAL row for this column represents the difference between the TOTAL values in the **File System Space** and **Available File System Space** columns. If the calculated value for the TOTAL row is negative, the column displays 0.

The TOTAL row does not add the used space from VMWare computers. See the *VMWare capacity reports* topic in the *Planning* chapter of the *Tivoli Storage Productivity Center Installation and Configuration Guide* for information about how file system and disk capacity are calculated in this report for VMWare computers. This topic is also available in the *Planning* section of the *Tivoli Storage Productivity Center Information Center*.

The value that displays in the TOTAL row for this column does not include the following file systems.

- File systems on discovered hypervisors that are assigned to virtual machine servers where the Storage Resource agent is installed.
- File systems on discovered virtual machine servers where the Storage Resource agent is installed. However, the hypervisor for the virtual machine servers is not discovered and the total used space exceeds the capacity of the total file system capacity.

Available File System Space (Free Space)
Total amount of unique file system storage space that is not used or is available to a computer. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

File Count
Total number of files within a computer. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this column.

- Files on file systems that become missing after a probe.
- Files on file systems that are not mounted.
- Files on file systems that are not scanned by a Storage Resource agent.

Note: On Windows computers, AIX systems, and systems that use IBM General Parallel File System (GPFS) for file management, Tivoli Storage Productivity Center calculates both the number of files and the number of directories for the value in this column. For example, if a Windows computer contains 150 files and 50 directories, the number in the **File Count** column is 200.

Directory Count
Total number of directories within a computer. Tivoli Storage Productivity Center does not include the following directories in its calculation of the value for this column.

- Directories on file systems that become missing after a probe.
- Directories on file systems that are not mounted.
- Directories on file systems that are not scanned by a Storage Resource agent.

Percent Used Inodes
Percentage of used Inodes within a computer.

Used Inodes
Number of used Inodes within a computer.

Free Inodes
Number of free Inodes within a computer.

By Computer Group

Chart icon

Magnifying glass icon
Click this button to view more detailed information about the file systems in a computer monitoring group or computer reporting group.

Creator
ID of the user who created a group.

Group Name of a computer monitoring group or computer reporting group.

File System Space (Capacity)
Amount of file system storage space for the computers in a group. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems on virtual machines where the Storage Resource agent is installed.
- File systems that become missing after a probe.
- File systems that are not mounted.

Note: The value in this column might be greater than **Used Space** + **Free Space** on some UNIX systems. This difference occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents and by the **df** command) does not include some space that is reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space** + **Free Space**, the difference that represents the space wasted because of the system overhead.

Percent Used Space
Percentage of total file system storage space that is used within a group.

Consumed File System Space (Used Space)
Total amount of used file system storage space within a group. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems on hypervisors that are assigned to virtual machine servers where the Storage Resource agent is installed if both the virtual machine file systems and hypervisor file systems are within the group.
- File systems on virtual machine servers where the Storage Resource agent is installed. However, the hypervisor for the virtual machine servers is not discovered and the total used space exceeds the capacity of the total file system capacity.
- File systems on virtual machine servers that are in a group without the underlying hypervisor file systems, and the total used space exceeds the capacity of the total file system capacity.
- File systems that become missing after a probe.
- File systems that are not mounted.

Note: On some UNIX file systems, this value does not include storage space that is reserved by the operating system (overhead).

Available File System Space (Free Space)
Total amount of unique file system storage space that is not used or is available within a group. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems that become missing after a probe.
- File systems that are not mounted.

File Count
Total number of files within a group. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this column.

- Files on file systems that become missing after a probe.
- Files on file systems that are not mounted.
- Files on file systems that are not scanned by a Storage Resource agent.

Note: For groups that contain Windows computers, AIX systems, and systems that use IBM General Parallel File System (GPFS) for file management, Tivoli Storage Productivity Center calculates both the number of files and the number of directories for the value in this column. For example, if a Windows computer contains 150 files and 50 directories, the number in the **File Count** column is 200.

Directory Count
Total number of directories within a group. Tivoli Storage Productivity Center does not include the following directories in its calculation of the value for this column.

- Directories on file systems that become missing after a probe.
- Directories on file systems that are not mounted.
- Directories on file systems that are not scanned by a Storage Resource agent.

Percent Used Inodes
Percentage of used Inodes within a group.

Used Inodes
Number of used Inodes within a group.

Free Inodes
Number of free Inodes within a group.

By Domain

Domain
Name of a domain.

File System Space (Capacity)
Total amount of unique file system storage space that was discovered on the computers within a domain. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

Note: The value in this column might be greater than **Used Space** + **Free Space** on some UNIX systems. This difference occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents and by the **df** command) does not include some space that is reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space** + **Free Space**, the difference that represents the space wasted because of the system overhead.

Percent Used Space
Percentage of total file system storage space that is used within a domain.

Consumed File System Space (Used Space)
Total amount of unique file system storage space that is used or consumed by the computers within a domain. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

Note: On some UNIX file systems, this value does not include storage space that is reserved by the operating system (overhead).

Available File System Space (Free Space)
Total amount of unique file system storage space that is not used or is available to the computers within a domain. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server
- File systems that are not mounted.

File Count
Total number of files within a domain. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this column.

- Files on file systems that become missing after a probe.
- Files on file systems that are not mounted.
- Files on file systems that are not scanned by a Storage Resource agent.

Note: On Windows computers, AIX systems, and systems that use IBM General Parallel File System (GPFS) for file management, Tivoli Storage Productivity Center calculates both the number of files and the number of directories for the value in this column. For example, if a Windows computer contains 150 files and 50 directories, the number in the File Count column is 200.

Directory Count
Total number of directories within a domain. Tivoli Storage Productivity Center does not include the following directories in its calculation of the value for this column.

- Directories on file systems that become missing after a probe.
- Directories on file systems that are not mounted.
- Directories on file systems that are not scanned by a Storage Resource agent.

Percent Used Inodes
Percentage of used Inodes within a domain.

Used Inodes
Number of used Inodes within a domain.

Free Inodes
Number of free Inodes within a domain.

File System Space (Capacity)
Total amount of unique file system storage space that was discovered on

the computers within a network. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

Note: The value in this column might be greater than **Used Space** + **Free Space** on some UNIX systems. This difference occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents and by the **df** command) does not include some space that is reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space** + **Free Space**, the difference that represents the space wasted because of the system overhead.

Percent Used Space
Percentage of total file system storage space that is used within a network.

Consumed File System Space (Used Space)
Total amount of unique file system storage space that is used or consumed by the computers within a network. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

Note: On some UNIX file systems, this value does not include storage space that is reserved by the operating system (overhead).

Available File System Space (Free Space)
Total amount of unique file system storage space that is not used or is available to the computers within a network. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server
- File systems that are not mounted.

File Count
Total number of files within a network. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this column.

- Files on file systems that become missing after a probe.
- Files on file systems that are not mounted.
- Files on file systems that are not scanned by a Storage Resource agent.

Note: On Windows computers, AIX systems, and systems that use IBM General Parallel File System (GPFS) for file management, Tivoli Storage Productivity Center calculates both the number of files and the number of

directories for the value in this column. For example, if a Windows computer contains 150 files and 50 directories, the number in the File Count column is 200.

Directory Count
Total number of directories within a network. Tivoli Storage Productivity Center does not include the following directories in its calculation of the value for this column.

- Directories on file systems that become missing after a probe.
- Directories on file systems that are not mounted.
- Directories on file systems that are not scanned by a Storage Resource agent.

Percent Used Inodes
Percentage of used Inodes within a network.

Used Inodes
Number of used Inodes within a network.

Free Inodes
Number of free Inodes within a network.

TPC-Wide Storage Space - Consumed File System Space report:

Use these reports to view detailed information about the used storage space in file systems on computers in your environment. You can view this information in different ways by using the following By clauses: by file system, by file system group, by cluster, by computer, by computer group, by domain, and for the entire network.

Note: The names of some columns are changed. For your reference, the original names of those columns are within parentheses ( ) next to their new names.

By File System

Chart icon
Click this button to generate charts about the used space information for a file system.

Computer
Name of the computer on which a file system is in.

Mount Point
Name or mount point (UNIX/Linux) of the file system (for example, `c:\`, `d:\`, `/opt`, `/export/home`, and so on). The file systems that are displayed in this report include the following information.

- File systems on virtual machines that are monitored by IBM Tivoli Storage Productivity Center.
- File systems on hypervisors that are monitored by Tivoli Storage Productivity Center.
- File systems that become missing after a probe.

Consumed File System Space (Used Space)
Amount of used storage space within a file system. On some UNIX file systems, this value does not include storage space that is reserved by the operating system (overhead).

The value in the TOTAL row for this column does not include the following file systems.

- File systems on discovered hypervisors that are assigned to virtual machine servers where the Storage Resource agent is installed.
- File systems on discovered virtual machine servers where the Storage Resource agent is installed. However, the hypervisor for the virtual machine servers is not discovered and the total used space exceeds the capacity of the total file system capacity.

Detectable
Indicates "Yes" when a file system is identified as being available to the server after a successful probe.

Percent Used Space
Percentage of file system storage space that is used within a file system.

Available File System Space (Free Space)
Amount of unused storage space within a file system.

File System Space (Capacity)
Amount of file system storage space for a file system.

Note:

- The value in the TOTAL row for this column does not include file systems on virtual machines where the Storage Resource agent is installed.
- The value in this column might be greater than **Used Space** + **Free Space** on some UNIX systems. This difference occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents and by the **df** command) does not include some space that is reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space** + **Free Space**. The difference represents the space that is wasted because of the system overhead.

File Count
Total number of files within a file system. This value does not include files on file systems that are not scanned.

Note: On Windows computers, AIX systems, and systems that use IBM General Parallel File System (GPFS) for file management, Tivoli Storage Productivity Center calculates both the number of files and the number of directories for the value in this column. For example, if a Windows computer contains 150 files and 50 directories, the number in the File Count column is 200.

Directory Count
Total number of directories within a file system. This value does not include directories on file systems that are not scanned.

Percent Used Inodes
Percentage of used Inodes within a file system.

Used Inodes
Number of used Inodes within a file system.

Free Inodes
Number of free Inodes within a file system.

Volume Group
Volume group to which a logical volume belongs. If the volume is not part of a volume group this column displays “N/A”.

Logical Volume Space (Allocation)
Logical volume space that is used by the logical volume that contains the file system.

Disk Detectable
Indicates “Yes” when a file system's logical volume is identified as having an underlying host disk.

By File System Group

Magnifying glass icon
Click this button to view more detailed information about the used file system storage space in a file system monitoring group or file system reporting group.

Creator
ID of the user who created a group.

Group Name of a file system monitoring group or file system reporting group.

Consumed File System Space (Used Space)
Total amount of used file system storage space within a group. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems on hypervisors that are assigned to virtual machine servers where the Storage Resource agent is installed if both the virtual machine file systems and hypervisor file systems are within the group.
- File systems on virtual machine servers where the Storage Resource agent is installed. However, the hypervisor for the virtual machine servers is not discovered and the total used space exceeds the capacity of the total file system capacity.
- File systems on virtual machine servers that are in a group without the underlying hypervisor file systems, and the total used space exceeds the capacity of the total file system capacity.
- File systems that become missing after a probe.
- File systems that are not mounted.

Note: On some UNIX file systems, this value does not include storage space that is reserved by the operating system (overhead).

Percent Used Space
Percentage of total file system storage space that is used within a group.

Available File System Space (Free Space)
Total amount of unique file system storage space that is not used or is available within a group. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems that become missing after a probe.

- File systems that are not mounted.

File System Space (Capacity)
Amount of file system storage space for the file systems in a group. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems on virtual machines where the Storage Resource agent is installed.
- File systems that become missing after a probe.
- File systems that are not mounted.

Note: The value in this column might be greater than **Used Space** + **Free Space** on some UNIX systems. This difference occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents and by the **df** command) does not include some space that is reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space** + **Free Space**. The difference represents the space that is wasted because of the system overhead.

File Count
Total number of files within a group. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this column.

- Files on file systems that become missing after a probe.
- Files on file systems that are not mounted.
- Files on file systems that are not scanned by a Storage Resource agent.

Note: On Windows computers, AIX systems, and systems that use IBM General Parallel File System (GPFS) for file management, Tivoli Storage Productivity Center calculates both the number of files and the number of directories for the value in this column. For example, if a Windows computer contains 150 files and 50 directories, the number in the File Count column is 200.

Directory Count
Total number of directories within a group. Tivoli Storage Productivity Center does not include the following directories in its calculation of the value for this column.

- Directories on file systems that become missing after a probe.
- Directories on file systems that are not mounted.
- Directories on file systems that are not scanned by a Storage Resource agent.

Percent Used Inodes
Percentage of used Inodes within a group.

Used Inodes
Number of used Inodes within a group.

Free Inodes
Number of free Inodes within a group.

By Cluster

Chart icon
Click this button to generate charts about the used file system space for a cluster.

Magnifying glass icon
Click this button to view more detailed information about the used storage space on file systems that are in a cluster.

Cluster
Name of cluster.

Consumed File System Space (Used Space)
Total amount of unique file system storage space that is used or consumed by the file systems in a cluster. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

Note: On some UNIX file systems, this value does not include storage space that is reserved by the operating system (overhead).

Percent Used Space
Percentage of total file system storage space that is used within a cluster.

Available File System Space (Free Space)
Total amount of unique file system storage space that is not used or is available in a cluster. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

File System Space (Capacity)
Total amount of unique file system storage space in a cluster. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

Note: The value in this column might be greater than **Used Space** + **Free Space** on some UNIX systems. This difference occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents and by the **df** command) does not include some space that is reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space** + **Free Space**. The difference represents the space that is wasted because of the system overhead.

File Count
Total number of files within a cluster. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this column.

- Files on file systems that become missing after a probe.
- Files on file systems that are not mounted.
- Files on file systems that are not scanned by a Storage Resource agent.

When computers are monitored where the Windows operating system is installed, the number of files that are indicated in this column might be less than the number of files that are reported by the operating system.

Directory Count
Total number of directories within a cluster. Tivoli Storage Productivity Center does not include the following directories in its calculation of the value for this column.

- Directories on file systems that become missing after a probe.
- Directories on file systems that are not mounted.
- Directories on file systems that are not scanned by a Storage Resource agent.

When computers are monitored where the Windows operating system is installed, the number of folders that are indicated in this column might be higher than the number of folders that is reported by the operating system.

Percent Used Inodes
Percentage of used Inodes within a cluster.

Used Inodes
Number of used Inodes within a cluster.

Free Inodes
Number of free Inodes within a cluster.

By Computer

Chart icon
Click this button to generate charts about the used file system storage space of the computers that are displayed in the report.

Magnifying glass icon
Click this button to view a more detailed report about the used file system storage space on a computer.

Computer
Name of the computer on which a file system is in.

Consumed File System Space (Used Space)
Total amount of unique file system storage space that is used or consumed by the computer where the Storage Resource agent is installed. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

Note: On some UNIX file systems, this value does not include storage space that is reserved by the operating system (overhead).

Percent Used Space
Percentage of total file system storage space that is used within a computer.

Available File System Space (Free Space)
Total amount of unique file system storage space that is not used or is available to a computer. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

File System Space (Capacity)
Total amount of unique file system storage space that was discovered on the computer where the Storage Resource agent is installed. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

Note:

- The value in this column might be greater than **Used Space** + **Free Space** on some UNIX systems. This difference occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents and by the **df** command) does not include some space that is reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space** + **Free Space**. The difference represents the space that is wasted because of the system overhead.
- The value in the TOTAL row for this column does not include file systems on virtual machines where the Storage Resource agent is installed.
- The drill-down reports for each computer generate a list of detectable file systems only. Therefore, the total capacity of file systems for each computer drill-down report equals this value.

File Count
Total number of files within a computer. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this column.

- Files on file systems that become missing after a probe.
- Files on file systems that are not mounted.
- Files on file systems that are not scanned by a Storage Resource agent.

Note: On Windows computers, AIX systems, and systems that use IBM General Parallel File System (GPFS) for file management, Tivoli Storage Productivity Center calculates both the number of files and the number of

directories for the value in this column. For example, if a Windows computer contains 150 files and 50 directories, the number in the File Count column is 200.

Directory Count
Total number of directories within a computer. Tivoli Storage Productivity Center does not include the following directories in its calculation of the value for this column.

- Directories on file systems that become missing after a probe.
- Directories on file systems that are not mounted.
- Directories on file systems that are not scanned by a Storage Resource agent.

Percent Used Inodes
Percentage of used Inodes within a computer.

Used Inodes
Number of used Inodes within a computer.

Free Inodes
Number of free Inodes within a computer.

Click this button to view more detailed information about the file systems in a computer monitoring group or computer reporting group.

Creator
ID of the user who created a group.

Group Name of a computer monitoring group or computer reporting group.

Consumed File System Space (Used Space)
Total amount of used file system storage space within a group. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems on hypervisors that are assigned to virtual machine servers where the Storage Resource agent is installed if both the virtual machine file systems and hypervisor file systems are within the group.
- File systems on virtual machine servers where the Storage Resource agent is installed. However, the hypervisor for the virtual machine servers is not discovered and the total used space exceeds the capacity of the total file system capacity.
- File systems on virtual machine servers that are in a group without the underlying hypervisor file systems, and the total used space exceeds the capacity of the total file system capacity.
- File systems that become missing after a probe.
- File systems that are not mounted.

Note: On some UNIX file systems, this value does not include storage space that is reserved by the operating system (overhead).

Percent Used Space
Percentage of total file system storage space that is used within a group.

Available File System Space (Free Space)
Total amount of unique file system storage space that is not used or is available within a group. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems that become missing after a probe.
- File systems that are not mounted.

File System Space (Capacity)
Amount of file system storage space for the computers in a group. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems on virtual machines where the Storage Resource agent is installed.
- File systems that become missing after a probe.
- File systems that are not mounted.

Note: The value in this column might be greater than **Used Space** + **Free Space** on some UNIX systems. This difference occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents and by the **df** command) does not include some space that is reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space** + **Free Space**. The difference represents the space that is wasted because of the system overhead.

File Count
Total number of files within a group. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this column.

- Files on file systems that become missing after a probe.
- Files on file systems that are not mounted.
- Files on file systems that are not scanned by a Storage Resource agent.

Note: For groups that contain Windows computers, AIX systems, and systems that use IBM General Parallel File System (GPFS) for file management, Tivoli Storage Productivity Center calculates both the number of files and the number of directories for the value in this column. For example, if a Windows computer contains 150 files and 50 directories, the number in the File Count column is 200.

Directory Count
Total number of directories within a group. Tivoli Storage Productivity Center does not include the following directories in its calculation of the value for this column.

- Directories on file systems that become missing after a probe.
- Directories on file systems that are not mounted.
- Directories on file systems that are not scanned by a Storage Resource agent.

Percent Used Inodes
Percentage of used Inodes within a group.

Used Inodes
Number of used Inodes within a group.

Free Inodes
Number of free Inodes within a group.

By Domain

Chart icon

Magnifying glass icon
Click this button to view more detailed information about the file system used space of computers that are in a domain.

Consumed File System Space (Domain)
Name of a domain.

Used Space
Total amount of unique file system storage space that is used or consumed by the computers within a domain. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

Note: On some UNIX file systems, this value does not include storage space that is reserved by the operating system (overhead).

Percent Used Space
Percentage of total file system storage space that is used within a domain.

Available File System Space (Free Space)
Total amount of unique file system storage space that is not used or is available to the computers within a domain. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server
- File systems that are not mounted.

File System Space (Capacity)
Total amount of unique file system storage space that was discovered on the computers within a domain. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

Note: The value in this column might be greater than **Used Space** + **Free Space** on some UNIX systems. This difference occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents and by the **df** command) does not include some space that is reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space** + **Free Space**. The difference represents the space that is wasted because of the system overhead.

File Count
Total number of files within a domain. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this column.

- Files on file systems that become missing after a probe.
- Files on file systems that are not mounted.
- Files on file systems that are not scanned by a Storage Resource agent.

Note: On Windows computers, AIX systems, and systems that use IBM General Parallel File System (GPFS) for file management, Tivoli Storage Productivity Center calculates both the number of files and the number of directories for the value in this column. For example, if a Windows computer contains 150 files and 50 directories, the number in the File Count column is 200.

Directory Count

Magnifying glass icon
Click this button to view more detailed information about the file system used space in a network.

Consumed File System Space (Used Space)
Total amount of unique file system storage space that is used or consumed by the computers within a network. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

Note: On some UNIX file systems, this value does not include storage space that is reserved by the operating system (overhead).

Percent Used Space
Percentage of total file system storage space that is used within a network.

Available File System Space (Free Space)
Total amount of unique file system storage space that is not used or is available to the computers within a network. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server
- File systems that are not mounted.

File System Space (Capacity)
Total amount of unique file system storage space that was discovered on the computers within a network. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

Note: The value in this column might be greater than **Used Space** + **Free Space** on some UNIX systems. This difference occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents and by the **df** command) does not include some space that is reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space** + **Free Space**. The difference represents the space that is wasted because of the system overhead.

File Count
Total number of files within a network. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this column.

- Files on file systems that become missing after a probe.
- Files on file systems that are not mounted.
- Files on file systems that are not scanned by a Storage Resource agent.

Note: On Windows computers, AIX systems, and systems that use IBM General Parallel File System (GPFS) for file management, Tivoli Storage Productivity Center calculates both the number of files and the number of directories for the value in this column. For example, if a Windows computer contains 150 files and 50 directories, the number in the File Count column is 200.

Directory Count
Total number of directories within a network. Tivoli Storage Productivity Center does not include the following directories in its calculation of the value for this column.

- Directories on file systems that become missing after a probe.
- Directories on file systems that are not mounted.
- Directories on file systems that are not scanned by a Storage Resource agent.

Percent Used Inodes
Percentage of used Inodes within a network.

Used Inodes
Number of used Inodes within a network.

Free Inodes
Number of free Inodes within a network.

TPC-Wide Storage Space - Available File System Space report:

Use these reports to view detailed information about the available storage space in file systems on systems in your environment. You can view this information in different ways by using the following By clauses: by file system, by file system group, by cluster, by computer, by computer group, by domain, and for the entire network.

Note: The names of some columns are changed. For your reference, the original names of those columns are within parentheses ( ) next to their new names.

By File System

Chart icon
Click this button to generate a chart about the used space information for a file system.

Computer
Name of the computer on which a file system is in.

Mount Point
Name or mount point (UNIX/Linux) of a file system (for example, `c:\`, `d:\`, `/opt`, `/export/home`, and so on). The file systems that are displayed in this report include the following information.

- File systems on virtual machines that are monitored by IBM Tivoli Storage Productivity Center.
- File systems on hypervisors that are monitored by Tivoli Storage Productivity Center.
- File systems that become missing after a probe.

Available File System Space (Free Space)
Amount of unused storage space within a file system.

Detectable
Indicates “Yes” when a file system is identified as being available to the server after a successful probe.

Percent Available File System Space (Percent Free Space)
Percentage of file system storage space that is unused within a file system.

Consumed File System Space (Used Space)
Amount of used storage space within a file system. On some UNIX file systems, this value does not include storage space that is reserved by the operating system (overhead).

The value in the TOTAL row for this column does not include the following file systems:

- File systems on discovered hypervisors that are assigned to virtual machine servers where the Storage Resource agent is installed.
- File systems on discovered virtual machine servers where the Storage Resource agent is installed. However, the hypervisor for the virtual machine servers is not discovered yet and the total used space exceeds the capacity of the total file system capacity.

File System Space (Capacity)
Amount of file system storage space for a file system.

Note:

- The value in the TOTAL row for this column does not include file systems on virtual machines where the Storage Resource agent is installed.
- The value in this column might be greater than **Used Space** + **Free Space** on some UNIX systems. This difference occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents and by the **df** command) does not include some space that is reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space** + **Free Space**. The difference represents the space that is wasted because of the system overhead.

File Count
Total number of files within a file system. This value does not include files on file systems that are not scanned.

Note: On Windows computers, AIX systems, and systems that use IBM General Parallel File System (GPFS) for file management, Tivoli Storage Productivity Center calculates both the number of files and the number of directories for the value in this column. For example, if a Windows computer contains 150 files and 50 directories, the number in the File Count column is 200.

Directory Count
Total number of directories within a file system. This value does not include directories on file systems that are not scanned.

Percent Used Inodes
Percentage of used Inodes within a file system.

Used Inodes
Number of used Inodes within a file system.

Free Inodes
Number of free Inodes within a file system.

Volume Group
Volume group to which a logical volume belongs. If the volume is not part of a volume group this column displays “N/A”.

Logical Volume Space (Allocation)
Logical volume space that is used by the logical volume that contains the file system.

Disk Detectable
Indicates "Yes" when a file system's logical volume is identified as having an underlying host disk.

By File System Group

Chart icon
Click this button to generate charts about the used file system storage space in a file system monitoring group or file system reporting group.

Magnifying glass icon
Click this button to view more detailed information about the used file system storage space in a file system monitoring group or file system reporting group.

Creator
ID of the user who created a group.

Group Name of a file system monitoring group or file system reporting group.

Available File System Space (Free Space)
Total amount of unique file system storage space that is not used or is available within a group. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are not mounted.

Percent Available File System Space (Percent Free Space)
Percentage of total file system storage space that is not used or available within a group.

Consumed File System Space (Used Space)
Total amount of used file system storage space within a group. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems on hypervisors that are assigned to virtual machine servers where the Storage Resource agent is installed if both the virtual machine file systems and hypervisor file systems are within the group.
- File systems on virtual machine servers that are in a group without the underlying hypervisor file systems. The total used space exceeds the capacity of the total file system capacity.
- File systems that become missing after a probe.
- File systems that are not mounted.

Note: On some UNIX file systems, this value does not include storage space that is reserved by the operating system (overhead).

File System Space (Capacity)
Amount of file system storage space for the file systems in a group. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems on virtual machines where the Storage Resource agent is installed.
- File systems that become missing after a probe.
- File systems that are not mounted.

Note: The value in this column might be greater than **Used Space** + **Free Space** on some UNIX systems. This difference occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents and by the **df** command) does not include some space that is reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space** + **Free Space**. The difference represents the space that is wasted because of the system overhead.

File Count
Total number of files within a group. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this column:

- Files on file systems that become missing after a probe.
- Files on file systems that are not mounted.
- Files on file systems that are not scanned by a Storage Resource agent.

Note: On Windows computers, AIX systems, and systems that use IBM General Parallel File System (GPFS) for file management, Tivoli Storage Productivity Center calculates both the number of files and the number of directories for the value in this column. For example, if a Windows computer contains 150 files and 50 directories, the number in the File Count column is 200.

Directory Count
Total number of directories within a group. Tivoli Storage Productivity Center does not include the following directories in its calculation of the value for this column:

- Directories on file systems that become missing after a probe.
- Directories on file systems that are not mounted.
- Directories on file systems that are not scanned by a Storage Resource agent.

Percent Used Inodes
Percentage of used Inodes within a group.

Used Inodes
Number of used Inodes within a group.

Free Inodes
Number of free Inodes within a group.

By Cluster

Chart icon
Click this button to generate a chart about the used file system space for a cluster.

Magnifying glass icon
Click this button to view more detailed information about the used storage space on file systems that are in a cluster.

Cluster
Name of cluster.

Available File System Space (Free Space)
Total amount of unique file system storage space that is not used or is available in a cluster. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

Percent Available File System Space (Percent Free Space)
Percentage of total file system storage space that is available within a cluster.

Consumed File System Space (Used Space)
Total amount of unique file system storage space that is used or consumed by the file systems in a cluster. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

Note: On some UNIX file systems, this value does not include storage space that is reserved by the operating system (overhead).

File System Space (Capacity)
Total amount of unique file system storage space in a cluster. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

Note: The value in this column might be greater than **Used Space** + **Free Space** on some UNIX systems. This difference occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents and by the **df** command) does not include some space that is reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space** + **Free Space**. The difference represents the space that is wasted because of the system overhead.

File Count
Total number of files within a cluster. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this column:

- Files on file systems that become missing after a probe.
- Files on file systems that are not mounted.
- Files on file systems that are not scanned by an agent.

When computers are monitored where the Windows operating system is installed, the number of files that are indicated in this column might be less than the number of files that are reported by the operating system.

Directory Count
Total number of directories within a cluster. Tivoli Storage Productivity Center does not include the following directories in its calculation of the value for this column:

- Directories on file systems that become missing after a probe.
- Directories on file systems that are not mounted.
- Directories on file systems that are not scanned by an agent.

When computers are monitored where the Windows operating system is installed, the number of folders that is indicated in this column might be higher than the number of folders that is reported by the operating system.

Percent Used Inodes
Percentage of used Inodes within a cluster.

Used Inodes
Number of used Inodes within a cluster.

Free Inodes
Number of free Inodes within a cluster.

By Computer

Chart icon
Click this button to generate a chart about the used file system storage space of the computers that are displayed in the report.

Magnifying glass icon
Click this button to view a more detailed report about the used file system storage space on a computer.

Computer
Name of the computer on which a file system is in.

Available File System Space (Free Space)
Total amount of unique file system storage space that is not used or is available to a computer. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

Percent Available File System Space (Percent Free Space)
Percentage of total file system storage space that is available within a computer.

Consumed File System Space (Used Space)
Total amount of unique file system storage space that is used or consumed by the computer where the Storage Resource agent is installed. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.

- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

Note: On some UNIX file systems, this value does not include storage space that is reserved by the operating system (overhead).

File System Space (Capacity)
Total amount of unique file system storage space that was discovered on the computer where the Storage Resource agent is installed. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

Note:

- The value in this column might be greater than **Used Space** + **Free Space** on some UNIX systems. This difference occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents and by the **df** command) does not include some space that is reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space** + **Free Space**, the difference represents the space that is wasted because of the system overhead.
- The value in the TOTAL row for this column does not include file systems on virtual machines where the Storage Resource agent is installed.
- The drill-down reports for each computer generate a list of detectable file systems only. Therefore, the total capacity of file systems for each computer drill-down report equals this value.

File Count
Total number of files within a computer. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this column:

- Files on file systems that become missing after a probe.
- Files on file systems that are not mounted.
- Files on file systems that are not scanned by a Storage Resource agent.

Note: On Windows computers, AIX systems, and systems that use IBM General Parallel File System (GPFS) for file management, Tivoli Storage Productivity Center calculates both the number of files and the number of directories for the value in this column. For example, if a Windows computer contains 150 files and 50 directories, the number in the File Count column is 200.

Directory Count
Total number of directories within a computer. Tivoli Storage Productivity Center does not include the following directories in its calculation of the value for this column:

- Directories on file systems that become missing after a probe.
- Directories on file systems that are not mounted.

- Directories on file systems that are not scanned by a Storage Resource agent.

Percent Used Inodes
Percentage of used Inodes within a computer.

Used Inodes
Number of used Inodes within a computer.

Free Inodes
Number of free Inodes within a computer.

By Computer Group

Chart icon
Click this button to generate charts about the used file system storage space for a computer monitoring group or computer reporting group.

Magnifying glass icon
Click this button to view more detailed information about the file systems in a computer monitoring group or computer reporting group.

Creator
ID of the user who created a group.

Group Name of a computer monitoring group or computer reporting group.

Available File System Space (Free Space)
Total amount of unique file system storage space that is not used or is available within a group. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are not mounted.

Percent Available File System Space (Percent Free Space)
Percentage of total file system storage space that is available within a group.

Consumed File System Space (Used Space)
Total amount of used file system storage space within a group. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems on hypervisors that are assigned to virtual machine servers where the Storage Resource agent is installed if both the virtual machine file systems and hypervisor file systems are within the group.
- File systems on virtual machine servers where the Storage Resource agent is installed. However, the hypervisor for the virtual machine servers is not discovered and the total used space exceeds the capacity of the total file system capacity.
- File systems on virtual machine servers that are in a group without the underlying hypervisor file systems, and the total used space exceeds the capacity of the total file system capacity.
- File systems that become missing after a probe.
- File systems that are not mounted.

Note: On some UNIX file systems, this value does not include storage space that is reserved by the operating system (overhead).

File System Space (Capacity)
Amount of file system storage space for the computers in a group. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems on virtual machines where the Storage Resource agent is installed.
- File systems that become missing after a probe.
- File systems that are not mounted.

Note: The value in this column might be greater than **Used Space** + **Free Space** on some UNIX systems. This difference occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents and by the **df** command) does not include some space that is reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space** + **Free Space**, the difference represents the space that is wasted because of the system overhead.

File Count
Total number of files within a group. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this column:

- Files on file systems that become missing after a probe.
- Files on file systems that are not mounted.
- Files on file systems that are not scanned by a Storage Resource agent.

Note: For groups that contain Windows computers, AIX systems, and systems that use IBM General Parallel File System (GPFS) for file management, Tivoli Storage Productivity Center calculates both the number of files and the number of directories for the value in this column. For example, if a Windows computer contains 150 files and 50 directories, the number in the File Count column is 200.

Directory Count
Total number of directories within a group. Tivoli Storage Productivity Center does not include the following directories in its calculation of the value for this column:

- Directories on file systems that become missing after a probe.
- Directories on file systems that are not mounted.
- Directories on file systems that are not scanned by a Storage Resource agent.

Percent Used Inodes
Percentage of used Inodes within a group.

Used Inodes
Number of used Inodes within a group.

Free Inodes
Number of free Inodes within a group.

By Domain

Chart icon
Click this button to generate charts about the file system used space for a domain.

Magnifying glass icon
Click this button to view more detailed information about the file system used space of computers that are in a domain.

Domain
Name of a domain.

Available File System Space (Free Space)
Total amount of unique file system storage space that is not used or is available to the computers within a domain. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server
- File systems that are not mounted.

Percent Available File System Space (Percent Free Space)
Percentage of total file system storage space that is available within a domain.

Consumed File System Space (Used Space)
Total amount of unique file system storage space that is used or consumed by the computers within a domain. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

Note: On some UNIX file systems, this value does not include storage space that is reserved by the operating system (overhead).

File System Space (Capacity)
Total amount of unique file system storage space that was discovered on the computers within a domain. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

Note: The value in this column might be greater than **Used Space** + **Free Space** on some UNIX systems. This difference occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents and by the **df** command) does not include some space that is reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space** + **Free Space**, the difference represents the space that is wasted because of the system overhead.

File Count
Total number of files within a domain. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this column:

- Files on file systems that become missing after a probe.
- Files on file systems that are not mounted.
- Files on file systems that are not scanned by a Storage Resource agent.

Note: On Windows computers, AIX systems, and systems that use IBM General Parallel File System (GPFS) for file management, Tivoli Storage Productivity Center calculates both the number of files and the number of directories for the value in this column. For example, if a Windows computer contains 150 files and 50 directories, the number in the File Count column is 200.

Directory Count
Total number of directories within a domain. Tivoli Storage Productivity Center does not include the following directories in its calculation of the value for this column:

- Directories on file systems that become missing after a probe.
- Directories on file systems that are not mounted.
- Directories on file systems that are not scanned by a Storage Resource agent.

Percent Used Inodes
Percentage of used Inodes within a domain.

Used Inodes
Number of used Inodes within a domain.

Free Inodes
Number of free Inodes within a domain.

Network-wide

Magnifying glass icon
Click this button to view more detailed information about the file system used space in a network.

Available File System Space (Free Space)
Total amount of unique file system storage space that is not used or is available to the computers within a network. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server
- File systems that are not mounted.

Percent Available File System Space (Percent Free Space)
Percentage of total file system storage space that is available within a network.

Consumed File System Space (Used Space)
Total amount of unique file system storage space that is used or consumed by the computers within a network. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

Note: On some UNIX file systems, this value does not include storage space that is reserved by the operating system (overhead).

File System Space (Capacity)
Total amount of unique file system storage space that was discovered on the computers within a network. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

Note: The value in this column might be greater than **Used Space** + **Free Space** on some UNIX systems. This difference occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents and by the **df** command) does not include some space that is reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space** + **Free Space**, the difference represents the space that is wasted because of the system overhead.

File Count
Total number of files within a network. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this column:

- Files on file systems that become missing after a probe.
- Files on file systems that are not mounted.
- Files on file systems that are not scanned by a Storage Resource agent.

Note: On Windows computers, AIX systems, and systems that use IBM General Parallel File System (GPFS) for file management, Tivoli Storage Productivity Center calculates both the number of files and the number of directories for the value in this column. For example, if a Windows computer contains 150 files and 50 directories, the number in the File Count column is 200.

Directory Count
Total number of directories within a network. Tivoli Storage Productivity Center does not include the following directories in its calculation of the value for this column:

- Directories on file systems that become missing after a probe.
- Directories on file systems that are not mounted.

- Directories on file systems that are not scanned by a Storage Resource agent.

Percent Used Inodes
Percentage of used Inodes within a network.

Used Inodes
Number of used Inodes within a network.

Free Inodes
Number of free Inodes within a network.

Usage Reports:

Use Usage reports to view the usage and growth of the consumption of your storage. You can view these reports that are based on specific file systems and computers, groups of file systems and computers, or throughout your entire enterprise. These reports help you project storage consumption for the future and maximize the current storage assets that you have in place. This result is achieved by eliminating wasted space and making the most of the space you have.

Use these reports to do the following actions.

- View which servers and file systems are experiencing the heaviest (or lightest) load of data and storage access.
- Identify wasted space by pinpointing files that are no longer needed or not accessed in a long time.
- Associate users with the amount of storage they are using on specific file systems, groups of file systems, specific computers, groups of computers, and throughout the entire network.
- Select the files against which to run an IBM Tivoli Storage Manager archive/backup job. Tivoli Storage Manager protects your organization's data from hardware failures and other errors by storing backup and archive copies of data on auxiliary storage.

Access Load reports: Use Access Load reports to view which machines and file systems within your environment are experiencing the heaviest (or lightest) load of data and storage access.

Access Time reports
Use Access Time reports to view and chart the amount of data and the number of files that have been accessed during the last day, the last week, the last month, the last year, and over. You can view this information at the directory level, the file system level, the computer level, at the domain level, and for the entire network.

The following report shows a single pie chart that depicts all of the data across the entire enterprise, giving you an easy way to see how much of your corporate data is accessed every day, every week, and even data that has not been accessed in over a year.

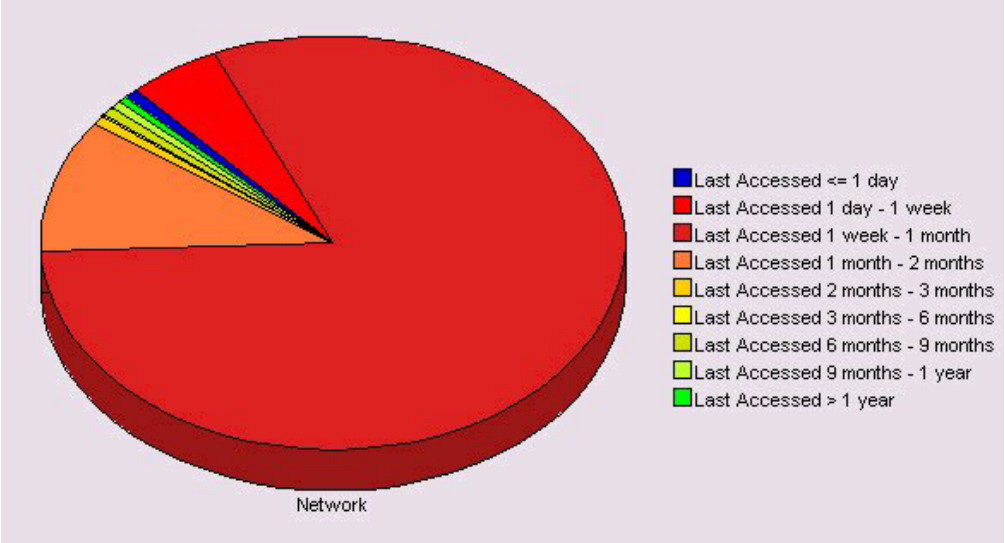

Figure 39. Usage Reporting—Access Load—Access Time—Chart Network Wide

Modification Time reports

Use Modification Time reports to view and chart the amount of data and the number of files that have been modified during the last day, the last week, the last month, the last year, and over. You can view this information at the directory level, the file system level, the computer level, at the domain level, and for the entire network.

The following report shows a single pie chart that depicts all of the data across the entire enterprise, allowing you to see how much of your corporate data is modified every day, every week, and even data that has not been modified in over a year.

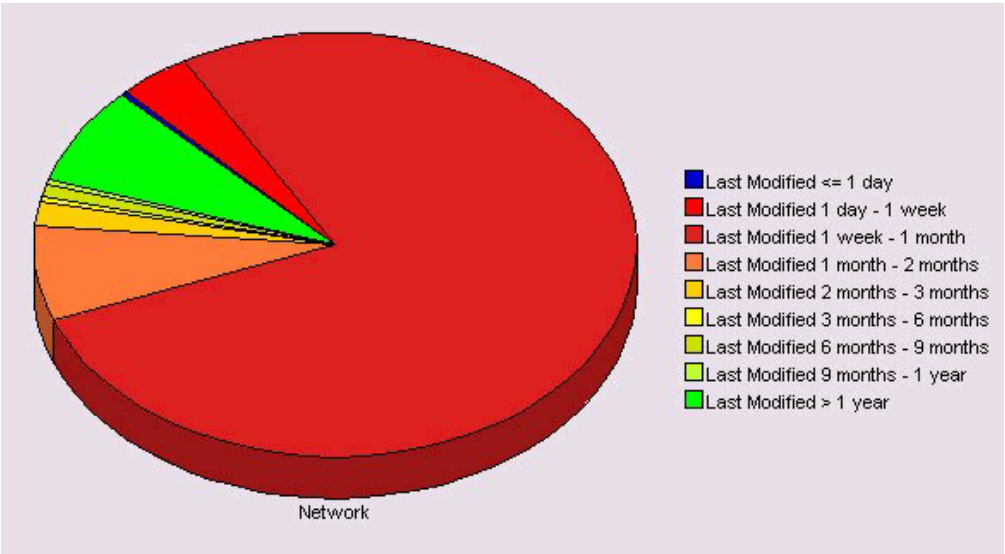

Figure 40. Usage Reporting—Access Load—Modification Time—Chart Network Wide

Creation Time reports

Use Creation Time reports to view and chart the amount of data and the number of files that have been created during the last day, the last week,

the last month, the last year, and over. You can view this information at the directory level, the file system level, the computer level, at the domain level, and for the entire network.

Note: Because scans do not collect creation time information for the files stored on UNIX machines, creation time reports do not contain any data for the non-Windows machines in your environment.

Files reports: Use Files Reports to report on the files found on the storage in your environment during theData Manager scan process. During the scan process, Data Manager gathers statistics on your files and attributes about the files. Select the files against which to run an IBM Tivoli Storage Manager archive or backup job. See "Archive and backup functions" on page 547 for information on how to create archive and backup jobs from the files shown in a Files report. The information gathered can be reported on in a variety of ways using this facility:

Largest Files reports

Use these reports to view information about the largest files in your environment. Largest Files reports enable you to do the following:

- Generate reports that contain detailed information about the largest files found in your environment. You can view reports on the largest files in the following ways: by directory, by directory group, by file system, by file system group, by cluster, by computer, by computer group, by domain, and for the entire network.

  Note: The number of files that are gathered and stored in the repository is dependent upon the number that you specify in the profile that you use during scanning. The default profile gathers information on the 20 largest files. You can select a profile for the report by clicking the **Profile** list box.
- Select files against which to run anTivoli Storage Manager archive or backup job. See "Archive and backup functions" on page 547 for information on how to create archive/backup jobs from the files shown in a Files report.
- Add files to an existing Tivoli Storage Manager archive/backup job. See "Archive and backup functions" on page 547 for information on how to add files from reports to an archive/backup job.

Duplicate Files reports

Use these reports to view information about the files found in your environment during a scan that contain duplicate file names. Duplicate Files reports enable you to do the following:

- Generate reports on the files found in your environment during a scan that contain duplicate file names. Use this report to view a list of files that might no longer be needed and could be wasting storage space. You can use the data generated in a duplicate files report to view a list of files that might no longer be needed and could be wasting storage space. You can view reports on duplicate files in the following ways: by directory, by directory group, by file system, by file system group, by cluster, by computer, by computer group, by domain, and for the entire network.

  Note: The number of files that are gathered and stored in the repository is dependent upon the number that you specify in the profile that you

use during scanning. The default profile gathers information on the 20 largest files. You can select a profile for the report by clicking the **Profile** list box.

- Select files against which to run an Tivoli Storage Manager archive or backup job. See "Archive and backup functions" on page 547 for information on how to create archive and backup jobs from the files shown in a Files report.
- Add files to an existing Tivoli Storage Manager archive or backup job. See "Archive and backup functions" on page 547 for information on how to add files from reports to an archive or backup job.

Before generating a Duplicate Files report for environments that contain a large amount of files (i.e., environments that might contain over 100,000 duplicate files), we recommend you tune theData Manager repository. To do this, run the appropriate RDBMS utility to collect statistics on the repository tables. Run the following utilities depending on the RDBMS where the repository is stored:

- UDB: runstats
- Oracle: analyze
- Microsoft SQL Server: update stats
- Sybase: update stats

Run the appropriate utility against all the tables in the repository schema you specified during the installation process.

To generate the data for a duplicate files report, you can either create a constraint that will save filenames for *n* number of violation files, or run a scan that includes one or all of the following existing profiles:

- TPCUser.Largest Files
- TPCUser.Largest Orphans
- TPCUser.Most at Risk
- TPCUser.Most Obsolete

There is not a specific Duplicate Files profile that collects information on all duplicate files in a file system. The filenames that are triggered by the previously listed profiles or constraints will be saved to the repository and the duplicate files report is generated from the data gathered from the scan or constraint.

For example, create a scan using the Largest Files profile to collect information on the 100 largest files. The 100 largest files are saved in the t_stat_file table in the repository. If five duplicate files were saved as a result of being flagged by the Largest File Profile, then those files will be reported as duplicates in the Duplicate file Report.

Most Obsolete Files reports

Use these reports to view information about the files found in your environment that have not been accessed in the longest period of time. Most Obsolete Files reports enable you to do the following:

- Generate reports on the files found in your environment that have not been accessed in the longest period of time. It is very likely that many of these files are no longer needed, at least online, and could be wasting space. You can view reports on the largest files in the following ways: by directory, by directory group, by file system, by file system group, by cluster, by computer, by computer group, by domain, and for the entire network.

Note: The number of files that are gathered and stored in the repository is dependent upon the number that you specify in the profile that you use during scanning. The default profile gathers information on the 20 largest files. You can select a profile for the report by clicking the **Profile** list box.

- Select files against which to run an Tivoli Storage Manager archive or backup job. See "Archive and backup functions" on page 547 for information on how to create archive/backup jobs from the files shown in a Files report.
- Add files to an existing Tivoli Storage Manager archive or backup job. See "Archive and backup functions" on page 547 for information on how to add files from reports to an archive or backup job.

Orphan Files reports

Use these reports to view information about files that are owned by users that are no longer active in the environment. Orphan files reporting enables you to do the following:

- Generate reports on files that are owned by users that are no longer active in the environment. It is very likely that many of these files are no longer needed and could be wasting space. You can view reports on orphan files in the following ways: by directory, by directory group, by file system, by file system group, by cluster, by computer, by computer group, by domain, and for the entire network.

  You can also generate reports on the oldest orphan files that have not been accessed for the longest periods of time, as well as largest orphan files.

  Note: The number of files that are gathered and stored in the repository is dependent upon the number that you specify in the profile that you use during scanning. The default profile gathers information on the 20 largest files. You can select a profile for the report by clicking the **Profile** list box.
- Select files against which to run an Tivoli Storage Manager archive or backup job. See "Archive and backup functions" on page 547 for information on how to create archive and backup jobs from the files shown in a Files report.
- Add files to an existing Tivoli Storage Manager archive or backup job. See "Archive and backup functions" on page 547 for information on how to add files from reports to an archive or backup job.

File Size Distribution reports

Use these reports to view information about the distribution of file sizes across storage resources. Use File Size Distribution reports to generate reports that show the distribution of file sizes on a specific directory, a file system, a computer, the domain, or across your entire network.

The following report shows a single pie chart for each computer in the report.

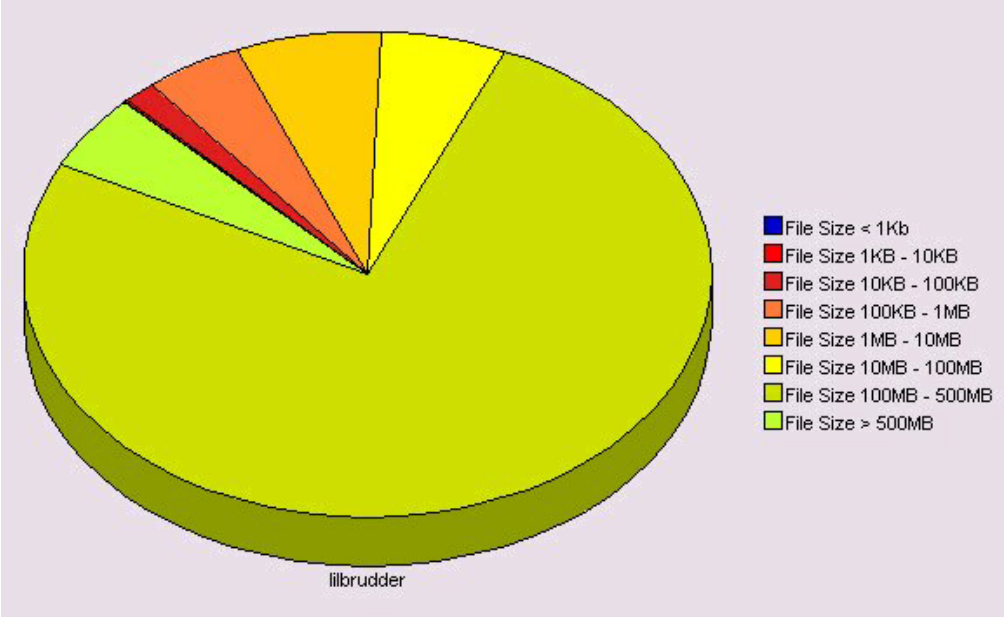

Figure 41. Usage Reporting—Files—File Size Distribution—File Count Chart Tab

Each pie chart depicts the number of files that fall into each file size bucket that are described in the legend. For example, the blue portion of the pie represents the number of files on each computer that are smaller than 1024 bytes long. This gives you an easy way to get a quick grasp of what are the size distribution of your data files.

File Summary reports

Use these reports to view general information about the files in your environment. Use File Summary reports generate overview information for files, also at the directory level, the file system level, the computer level, the domain level or for the whole network.

This report shows you the following (for each entity at the level you are reporting by):

- The total size of the files
- The number of files
- The number of directories
- The average file size

File Types reports

Use these reports to view information about the storage usage of different file types in your environment. File Types reports enable you to generate reports on the file types found in your environment during a scan. The scan that collects data for these reports must use the TPCUser.Summary By File Type profile. For example, when you run a scan using the TPCUser.Summary By File Type profile,Data Manager will collect storage usage information about such file types as .exe, .zip, .sys, .pdf, .doc, .dll, .wav, .mp3, .avi, etc. Each of these file types is represented by its own row in the generated reports.

Use these reports to do the following:

- Relate the space used by applications to the total capacity and used space. For example, you can use these reports to view the total amount of storage consumed by Adobe Acrobat files and Lotus Notes mail databases.
- View which applications are consuming the most space across a given set of storage resources

You can view these reports in the following ways:

- **Group by Resource**. These reports organize data by storage resource (for example, file system, computer, cluster, etc.) and space used.
- **Group by File Type**. These reports organizes data by file type and space used. They show where the most spaced used by each type of file resides.

Archive/Backup jobs from reports:

Use the Archive/Backup function from Reporting to define an archive or backup job to run against the files that you select from specified reports.

Tivoli Storage Manager protects your organization's data from hardware failures and other let you back up specified files. These files are not excluded in the include-exclude list and meet the requirement for serialization in the backup copy group of the management class assigned to each file. An incremental backup enables you to back up new or changed files or directories from a client domain or from specified directories or files. These directories or files are not excluded in the include-exclude list and meet the requirements for frequency, mode, and serialization as defined by a backup copy group of the management class assigned to each file. See *IBM Tivoli Storage Manager Client User's Guide* for more information about Tivoli Storage Manager archives and backups.

This function enables you to select a specific file or group of files fromData Manager reports that you want to archive or back up using the Tivoli Storage Manager tool.

Archive/backup is run from**Data Manager -> Reporting**. You cannot create archive and backup jobs from the Archive/Backup node - rather you create these jobs by selecting files from the previously listed reports or the reports that you create. Each archive and backup that you create from reports appears as a node under the Archive/Backup node. The reports that contain files against which you can run an archive or backup job include:

- **Data Manager -> Reporting -> Usage -> Files -> Largest Files**
- **Data Manager -> Reporting -> Usage -> Files -> Most Obsolete Files**
- **Data Manager -> Reporting -> Usage -> Files -> Orphan Files**
- **Data Manager -> Reporting -> Usage -> Files -> Duplicate Files**
- **Data Manager -> Reporting -> Backup -> Most at Risk Files ->**
- **Data Manager -> Reporting -> Usage Violations -> Constraint Violations**

You can also run an archive or backup job from a report you create.

Note:

See *Creating Archive/Backup jobs* in *Reporting* for information about how to create an archive or backup job from the files shown in reports.

Directories reports:
Use Directories reports to report upon the directories found on the storage in your environment during the scan process. During the scan process, Data Manager gathers a vast number of statistics on your directories and a number of attributes about the directories. Before you can view information about directories in these reports, you must do the following:

1. Use the **Monitoring → Groups → Directory** function to create directory groups that contain the directories upon which you want to report.
2. Include the directory groups you created in scans.
3. Schedule and run the scans that contain the directory groups (and directories) upon which you want to report.

Largest Directories reports

Use Largest Directories reports to view reports on the *n* largest directories found in your environment:

- for specific directories
- on specific computers or groups of computers
- on specific file systems or groups of file systems
- in specific domains
- on the entire network

The number of largest (or the value of *n* in finding the *n* largest directories), is determined by the profile that you use for doing the reporting. When you define a profile in the **Monitoring → Profiles** node, you specify the number of largest directories upon which to collect information. When you generate a Largest Directories report, you can select what profile to use.

Monitored Directory Space reports

Use Monitored Directory reports to report on the monitored directories that you have included in a group via the **Monitoring → Groups → Directory** facility and included in a scan. During the scan process, Data Manager gathers a number of statistics on your directories and a number of attributes about the directories.

Users reports: Use Users Reports to view information about the users that are found as file owners in your environment. These reports provide an easy and convenient way to view and aggregate storage resource consumption by owner across directories, file systems, computers, domains, and across your entire network.

OS User Groups reports: OS User Groups reports give you the exact same capabilities as the reports under Users reports. The only difference is that you are doing your analysis of OS User Groups as opposed to actual single users.

Usage Violation reports:

Use Usage Violation reports to view information about quota and constraint violations.

With Usage Violation reports, you can do these actions:

- Create and enforce corporate storage usage policies that are based on reports that show quota and constraint violations.

  Use quotas to control how much storage a user, or a group of users, can use on a file system or group of file systems, a computer or group of computers, and

throughout the entire network. Use Constraints to set policies about which types of files, owners, and file sizes are allowed on a file system or group of file systems, a computer or group of computers, and throughout the entire network.

- Select files in Constraint Violation reports against which to run an IBM Tivoli Storage Manager archive/backup job. See "Archive and backup functions" on page 547 for information on how to create archive/backup jobs from the files that are shown in a Files report.
- Add files from Constraint Violation reports to an existing Tivoli Storage Manager archive or backup job. See "Create an archive/backup job" on page 548 for information on how to add files from reports to an archive/backup job.

Constraint Violations reports: Constraint Violations reporting enables you to do the following:

- View the files that have violated a constraint. The report shows one row for each Constraint. The row shows the detail of the constraint and the violating space totals for the files that violate the constraint. You can view reports on the files that violate constraints in the following ways: by file system, by file system group, by computer, by computer group, by domain, and by constraint.
- Select files against which to run an Tivoli Storage Manager archive or backup job. See the "Archive and backup functions" on page 547 section for information on how to create archive and backup jobs from the files shown in a Files report.
- Add files to an existing Tivoli Storage Manager archive or backup job. See the "Archive and backup functions" on page 547 section for information on how to add files from reports to an archive or backup job.

Quota Violations reports: Quota Violations reports display information on the quotas that you define. Monitor the space that is being used by the various entities that have quotas that are defined upon them.

Quotas can be defined on either of two categories of users: on a specific user or group of users that you define within either Users or on OS User Groups. The two categories are described in the following list:

User You can define a quota on a user or group of users. The users are the owners of the files that Data Manager finds as it scans your systems.

OS User Group
You can define a quota on an OS user group or group of OS user groups. OS user groups are defined outside the tool and are found by Data Manager as it scans your systems.

Within each of those categories, you can define quotas at any one of following three levels:

Network
You can define quotas on users or groups of users at the entire network level. You can control how much storage any single user or group of users is using throughout your enterprise.

Computer
You can define quotas on users or groups of users at the computer level. You can control how much a single or group of users is using on a single computer or on any group of computers.

File system
You can define quotas on users or groups of users at the file system level.

You can control how much a single or group of users is using on a single file system, or on any group of file systems.

All Quotas reports

Use All Quotas reports to report on all quotas that are violated, including the quotas at the network level, computer level, and file system level. With the **Selection** tab, you can select which users are to do the quota reporting.

The **Objects** tab displays information for each user and computer and file system:

- How much space is being used
- There
- What the Quota threshold is
- What the percentage of the Quota that is being used

This report gives you a simple way to analyze how much space is being used relative to the Quotas that you defined on your systems and users.

Network-wide Quotas reports

Use Network-wide Quota reports to view all the network-wide quotas that are violated by users and OS user groups in your environment. Quota information that is displayed in these reports includes the amount of space that is being used, the threshold value, and the percentage over the threshold value. You can view these reports that are sorted by user, by OS user group, and by the creator of the quota.

Computer Quotas reports

Use Computer Quota reports to view all the computer quotas that are violated by users and OS user groups in your environment. Quota information that is displayed in these reports includes the amount of space that is being used, the threshold value, and the percentage over the threshold value. You can view these reports that are sorted by user, by OS user group, and by the creator of the quota.

File System Quotas reports

Use File System Quota reports to view all the computer quotas that are violated by users and OS user groups in your environment. Quota information that is displayed in these reports includes the amount of space that is being used, the threshold value, and the percentage over the threshold value. You can view these reports that are sorted by user, by OS user group, and by the creator of the quota.

Backup reports:

Use Backup reports to identify the most at risk files in your enterprise that are not backed up properly. Critical data that is not backed up might expose you to costly losses of information.

Backup reports also enable you to:

- Investigate the sizes of data that would be required to backup to achieve full backups of any subset of your enterprise (including the whole enterprise).
- Determine the amount of space required to perform an incremental backup of any or all of your data at any given point in time.

- Select files in Most at Risk Files reports against which to run an IBM Tivoli Storage Manager archive/backup job.
- Add files from Most at Risk Files reports to an existing Tivoli Storage Manager archive/backup job.

Most At Risk Files reports: Most At Risk Files reporting enables you to do the following:

- View the files that have the earliest modification time, but have not been backed up since they were modified. This can alert you to a dangerous situation where you may have vulnerable data that could be lost and not recovered due to lack of backups.
- Select files against which to run an IBM Tivoli Storage Manager archive or backup job. See the "Archive and backup functions" on page 547 section for information on how to create archive or backup jobs from the files shown in a Files report.
- Add files to an existingTivoli Storage Manager archive or backup job. See the "Archive and backup functions" on page 547 section for information on how to add files from reports to an archive or backup job.

Modified Files not Backed Up reports: Use Modified Files not Backed Up reports to view the numbers of files that have the earliest modification time, but have not been backed up since they were modified. This can alert you to a dangerous situation where you may have vulnerable data that could be lost and not recovered due to lack of backups.

Backup Storage Requirements reports: Use Backup Storage Requirements reports to determine, at a network, domain computer, file system, or directory level, how much storage will be required to do backups. You can determine how much storage will be required to do both full backups and to do incremental backups.

Reporting Type	Description
Full Backup Size	Use Full Backup Size reports to view how much space it will take to do full backups of specific computers, file systems, directories, groups of those entities, domains, and the entire network.
Incremental Backup Size	(Windows only) Use this report to view the total size of all the files that have not been backed up since the last scan. You can generate this report by Directory, by Directory Group, by File System, by File System Group, by Computer, by Computer Group, by Domain and Network Wide. This allows you to see for any of these levels, how much data would need to be backed up for any of these desired time intervals. This is useful for backup sizing and can be used to determine appropriate backup groups and sets for timing your backups.

Reporting Type	Description
Incremental Range Sizes	Use this report to determine how much storage space you would need to back up data that has been modified in the last day, week, month, two months, three months, six months, nine months, or year. For example, if you want to back up the files that have been modified in the last 3 months only, generate this report and view the values in the "Last Modified <= 3 months" column to determine 1) how many files changed and 2) how much storage those changed files are consuming. You can generate this report by Directory, by Directory Group, by File System, by File System Group, by Cluster, by Computer, by Computer Group, by Domain and Network Wide. This allows you to see for any of these levels, how much data would need to be backed up for any of these desired time intervals. This is useful for backup sizing and can be used to determine appropriate backup groups and sets for timing your backups.

Monitored Computer Storage Space reports:

Use these host-based reports to view the data that is collected by probes for computers, network attached storage, and hypervisors. These reports contain detailed information about the consumption of file system space and enable you to relate that space back to external or internal storage without counting shared space multiple times.

Monitored computer storage space reports are organized into the following categories:

Disk Storage
Use these reports to view information about disks that reside on computers monitored by IBM Tivoli Storage Productivity Center. This includes information about storage subsystem disks, known disks with serial numbers, or unknown disks without serial numbers.

Non-Disk Storage
Use these reports to view information about storage space that does not reside on computer disks that are monitored by Tivoli Storage Productivity Center. This type of storage includes the following:

- Storage that resides on a remote mount or a network attached server.
- Storage that is temporarily allocated to processor memory.

You must perform the following actions before viewing these reports:

- Run a probe against the storage entities upon which you want to report.
- If you want to generate By Computer Group, By Filesystem Group, and By Storage Subsystem Group reports, perform the following tasks:
  - Create computer monitoring group and file system monitoring groups using the **Data Manager** > **Monitoring** > **Groups** node and then probe them.
  - Create storage subsystem monitoring group using the **Disk Manager** > **Monitoring** > **Groups** node and probe them.
  - Create a computer reporting group or file system reporting group using the **Data Manager** > **Reporting** > **Groups** and **Disk Manager** > **Reporting** > **Groups** node. Probe the entities in the group.

– Create a subsystem reporting group using the **Disk Manager** > **Reporting** > **Groups** node. Probe the storage subsystems in the group.

Related Topics

Monitored Computer Storage Space reports - Storage entities:

Monitored Computer Storage Space reports display information about storage entities that you probe. Use this topic to view descriptions of those entities.

You can use Monitored Computer Storage Space reports to view information about the following storage entities:

Computer
Computer that is monitored by a Storage Resource agent. This computer can be a single host, a virtual machine, or a hypervisor. A hypervisor is a machine that hosts one or more virtual machines.

Disk on a storage subsystem
Computer disk that originates from a storage subsystem. If the disk's storage subsystem is not monitored by IBM Tivoli Storage Productivity Center, that storage subsystem is represented by a portion of the serial number of the disk. If the storage subsystem is monitored by Tivoli Storage Productivity Center, that storage subsystem is represented by the name collected by a probe.

Disk not on a storage subsystem with a serial number
Computer disk that Tivoli Storage Productivity Center is unable to determine if it originates from a storage subsystem. Tivoli Storage Productivity Center is able to extract the serial number of that disk.

Disk not on a storage subsystem without a serial number
A valid computer disk for which Tivoli Storage Productivity Center is unable to do the following:

- Determine if the disk originates from a storage subsystem.
- Extract the serial number of the disk.

Disk Group
A collection of disk drives on a computer.

File System
Storage entity that creates, removes, and modifies files on a computer. File systems can be shared among monitored computers and span portions of different disks. If a file system spans disk entities, then there will be a single logical volume beneath it that describes how the file system is spanned.

(Parent) Logical Volume
Logical representation of a volume that spans many logical volumes. If there is no file system created on this logical volume, information about the parent logical volume is displayed in the reports.

(Child) Logical Volume
Logical representation of a volume that spans one or more portions of a single or multiple disks. This entity helps determine how the parent logical

volumes and file systems are allocated on the disks. If there is no file system created on this logical volume, or there is no parent logical volume for this logical volume, the child logical volume is displayed in the reports.

Non-Disk Storage
Storage space that does not reside on a computer disk. This includes storage residing on a remote mount or a network attached server and storage that is temporarily allocated to processor memory.

Volume Group
A collection of logical volumes on a computer.

Virtual Machine (VM) Disk File
Storage entity that represents a computer disk on a computer that is a virtual machine.

Virtual Machine File System (VMFS)
Storage entity that creates, removes, and modifies VM Disk files on a computer that is a hypervisor hosting one or more virtual machines.

Monitored Computer Storage Space reports - Common storage space values:

Monitored Computer Storage Space reports provide detailed storage space information about the computers probed by IBM Tivoli Storage Productivity Center. Use this topic to view descriptions of the common storage values that appear in these reports.

You can view the following storage space information in Monitored Computer Storage Space reports:

Space Total amount of storage space for the entity that a row represents:

- For file system rows, this is the total logical volume space where a file system resides.
- For logical volume rows, this is the total logical volume space.
- For computer disk rows, this is the total disk space of a computer disk.
- For computer space rows, this is the total storage subsystem volume space on a computer.
- For storage subsystem space rows, this is the total storage subsystem volume space on all monitored computers.

Consumed Space
Amount of consumed storage space for the entity that a row represents:

- For file system rows, this is the space that is consumed by data that can be accessed by the end user of a computer.
- For logical volume rows, this is the space that can be consumed by a file system, but is not yet consumed by a file system.
- For computer disk rows, this is the space that is consumed by the file systems and logical volumes on a disk.
- For computer space rows, this is the storage subsystem volume space that is consumed on a monitored computer.
- For storage subsystem space rows, this is the storage subsystem volume space that is consumed on all monitored computers.

Available Space
Amount of available storage space for the entity that a row represents:

- For file system rows, this is the space that is available for consumption.

- For logical volume rows, this value is zero (0) because no file system has been created on the logical volume that would help determine the amount of available space.
- For computer disk rows, this is the space that is available on the file systems on a computer disk and the space on a computer disk not yet allocated to a logical volume.
- For computer space rows, this is the storage subsystem volume space that is available for consumption on a computer.
- For storage subsystem space rows, this is the storage subsystem volume space that is available for consumption on all monitored computers.

Unavailable Space

Amount of unavailable storage space for the entity that a row represents:

- For file system rows, this space is unavailable for consumption because it is reserved by the software RAID level on the underlying logical volume and is required for data that is used by the operating system to maintain a file system.
- For logical volume rows, this space is unavailable because it is reserved for the software RAID level of a logical volume.
- For computer disk rows, this is the space that is unavailable on the file systems and the logical volumes on a computer disk.
- For computer space rows, this is the storage subsystem volume space that is unavailable on a computer.
- For storage subsystem space rows, this is the storage subsystem volume space that is unavailable on all monitored computers.

Monitored Computer Storage Space - Disk Storage reports:

Use these reports to view information about disks residing within computers that are monitored by IBM Tivoli Storage Productivity Center. This includes information about storage subsystem disks, known disks with serial numbers, and unknown disks without serial numbers.

Disk Storage reports are organized into the following categories:

All Disk Storage

Use these reports to view information about all the disks residing on computers that are monitored by Tivoli Storage Productivity Center.

Disk Storage On Storage Subsystems

Use these reports to view information about disks that Tivoli Storage Productivity Center has identified as storage subsystem volumes.

Disk Storage Not On Storage Subsystems

Use these reports to view information about disks that Tivoli Storage Productivity Center has not identified as storage subsystem volumes.

Related Topics

- See Common storage space values to view descriptions of the common storage space values that appear in these reports.

Disk Storage - All Disk Storage reports:

Use these reports to view information about all the disks residing on computers that are monitored by IBM Tivoli Storage Productivity Center.

See All Disk Storage reports - Column Descriptions for descriptions of all the columns that appear in All Disk Storage reports.

Use By clauses to filter the entities that appear in a report. For example, if you want to view an All Disk Storage report that displays specific computers, select **By Computer** and use the **Selection** and **Filter** options to determine which computers appear in that report.

You can customize the information in each report by relating the monitored entities to other storage. The following options for relating entities to storage in these reports includes the following:

- Use the **Relate To:** options in the By Computer, By Computer Group, and By Disk/Volume Group reports to relate storage entities to the following storage:
  - File System or Logical Volume Space
  - Distributed File System or Logical Volume Space
  - Computer Disk Space
  - Distributed Computer Disk Space
- Use the **Relate To:** options in the By File System/Logical Volume and By File System Groups reports to relate storage entities to the following storage:
  - File System or Logical Volume Space
  - Distributed File System or Logical Volume Space

All Disk Storage reports - Column Descriptions:

Use these reports to view information about all the disks residing on computers that are monitored by IBM Tivoli Storage Productivity Center. Use this topic to view descriptions of the columns that appear in these reports.

The following buttons and columns appear in the By clauses of All Disk Storage reports:

Note: Not all of the following columns appear in each By clause.

Selection...
Click this button to select the specific entities that you want to include in the report. For example, in the **By Filesystem/Logical Volume** report, click this button to select the specific file systems or logical volumes upon which you want to report.

Filter Click this button to apply conditions to the columns within a report to further select or restrict the entities that you want to include in the report.

Relate <entity> To:
Select how you want to relate monitored storage entities in the report to other storage.

Magnifying glass icon
This button appears on all **By <entity> Group** reports. Click this button to view a more detailed report about the entities in a group.

Available Disk Space
Amount of space on a disk that is available for use. For computer groups, this is the amount of space on disks that is available for use by the computers in a group. For disk and volume groups, this is the external disk space available for use within those groups.

This space includes the file system space that is available on the disk and the space that is not allocated to a logical volume. For example, unpartitioned space.

The XIV system GUI and the XIV system command-line interface (CLI) report sizes in GB of disks, volumes, pools, and so on, based on 10^9. Tivoli Storage Productivity Center reports sizes in GB based on 2^30. For example, a volume showing a size of 17 GB in the XIV system GUI is reported as 16 GB (XIV GB size * 1000 * 1000 * 1000 / 1024 /1024 / 1024 rounded to the nearest GB) in Tivoli Storage Productivity Center.

Available Disk/Volume Group Space
Amount of available space in a disk group or volume group.

Available File System/Logical Volume Space
Amount of space on the file system or logical volume that is available for use. For computers groups, this is the amount of space on file systems or logical volumes that is available for use by the computers within those groups. For file system groups, this is the amount of space on file systems or logical volumes within those groups that can be consumed. For disk groups and volume groups, this is the external logical volume or file system space available for use within those groups.

Computer
Name of a computer where a disk, file system, logical volume, or disk group is located.

Computer OS Type
The operating system running on a computer.

Consumed Disk Space
Amount of space on a disk that is consumed. For computer groups, this is the amount of disk consumed by the computers within those groups. For disk and volume groups, this is the external disk space consumed within those groups.

This space includes the file system space that is consumed on a disk. If a logical volume on this disk space has no file system, then this space includes the consumed portion of the logical volume that has been allocated to the disk.

Consumed Disk/Volume Group Space
Amount of consumed disk or volume group space.

Consumed File System or Logical Volume Space
Amount of space on the file system or logical volume consumed by the computer on a disk. For computer groups, this is the amount of space on

file systems or logical volumes that is consumed by the computers within those groups. For file system groups, this is the amount of space on file systems or logical volumes within those groups that is consumed. For disk groups and volume groups, this is the external logical volume or file system space consumed within those groups.

Correlated
Indicates **Yes** if Tivoli Storage Productivity Center is able to relate the host storage directly to a storage subsystem. You can relate this correlated storage back to the actual storage subsystem storage for a more detailed view of how the host storage is allocated.

If a computer disk, file system, or logical volume appears in the Disk Storage On Storage Subsystem reports but is not correlated, it might be the result of the following reasons:

- The storage subsystem was not probed. Run a probe to collect data about the storage subsystem then generate this report.
- The storage subsystem storage was unassigned from the host storage, but the host has not been probed. Run a probe to collect data about the host then generate this report.
- The storage subsystem storage was not correctly identified by a probe of the host. If this is the problem, check the probe log of the host for messages relating to SCSI command errors and the probe results of the storage subsystem.

Creator
ID of the user who created a group.

Disk Path
Path name of a disk as seen by the computer.

Disk Space
Total amount of space allocated to a computer disk. For computer groups, this is the total amount of space allocated to the disks on the computers within those groups. For disk and volume groups, this is the external disk space within the disk group or volume group.

Note:

- This space is distributed across the hypervisor disk space from where the virtual machine disk's file resides. The portion of space identified to a particular external hypervisor disk is reported only. This is true for all space values in this report.
- The XIV system GUI and the XIV system command-line interface (CLI) report sizes in GB of disks, volumes, pools, and so on, based on 10^9. Tivoli Storage Productivity Center reports sizes in GB based on 2^30. For example, a volume showing a size of 17 GB in the XIV system GUI is reported as 16 GB (XIV GB size * 1000 * 1000 * 1000 / 1024 /1024 / 1024 rounded to the nearest GB) in Tivoli Storage Productivity Center.

Disk/Volume Group Name
Name of a disk group or volume group where a logical volume or file system was created. This column displays **N/A** if a disk group or volume group does not exist on a disk.

Disk/Volume Group Space
Total amount of disk group or volume group space. This is space inclusive of all storage space and applies to all space values related to disk groups or volume groups.

Disk/Volume Group Type
Type of a disk group.

Fibre Attached
Indicates **Yes** when Tivoli Storage Productivity Center determines that a disk is behind a fibre channel adapter port.

File System Type
Type of a file system, such as NTFS.

File System/Logical Volume Path
Name of a file system or logical volume path.

Group Name of a group.

Grown Defects
Number of defects detected on the disk since it was new.

Hypervisor Name
Name of the hypervisor where a virtual machine was created. This column displays **N/A** if not applicable to a disk.

Logical Volume Space
Total amount of space allocated to the logical volume on a disk. For computer groups, this is the total amount of space allocated to the logical volumes on disks within those groups. For file system groups, this is the total amount of space allocated to the logical volumes within those groups. For disk groups and volume groups, this is the external logical volume space within those groups.

This space includes the file system space on the disk reported if the entity displayed is a file system. The actual size of the file system on the disk reported is in addition to the consumed and available space.

Note: When relating a monitored entity to distributed file system/logical volume space, the space is distributed across the disks where a logical volume or file system resides. The portion identified to a disk is reported only.

(Disk) Manufacturer
The manufacturer of a disk.

Mapped to Storage Subsystem
Indicates **Yes** if Tivoli Storage Productivity Center has identified a disk as being located on a storage volume from a storage subsystem. The storage subsystem might no be monitored by Tivoli Storage Productivity Center.

(Disk) Model
Model number of a disk.

Number of Disks
Number of disks in a computer group. For disk groups and volume groups, this is the number of external disks within those groups.

Number of File Systems/Logical Volumes
Number of logical file systems or logical volumes within a group. For disk groups and volume groups, this is the number of external logical file systems or logical volumes within those groups.

The logical volumes underlying the file systems are not counted for the value in the column.

Overallocated
Indicates **Yes** if Tivoli Storage Productivity Center is unable to uniquely identify disk storage across more than one host. Check the probe log of the host for messages relating to SCSI command errors.

Path Type
Path type of the entity being reported: file system or a logical volume.

Primary Defects
Number of defects on the disk when it was new.

Shared
Indicates **Yes** if a file system or logical volume is shared by more than one computer.

Serial Number
Serial number of a disk.

Unavailable Disk Space
Amount of space on the disk not available to be consumed. For the computer groups, this is the amount of space on disks that is not available to be consumed by the computers in a group. For disk and volume groups, this is the external disk space that is not available for use within those groups.

This space is used for logical volume overhead and is reserved by the operating system to manage a file system.

Unavailable Logical Volume Space
Amount of space on a logical volume that is not available for use by a computer. For computer groups, this is the amount of space on logical volumes that is not available for use by the computers within those groups. For file system groups, this is the amount of space on the logical volumes within those groups that is not available for use. For disk groups and volume groups, this is the external logical volume space that is not available for use within those groups.

This space is used for logical volume overhead and is reserved by the operating system to manage a file system.

VM Disk File
Virtual machine disk's file on a monitored hypervisor that represents the disk on the virtual machine. This column displays **N/A** if not applicable to a disk.

VMFS Disk
Hypervisor disk where the virtual machine disk resides. This column displays **N/A** if not applicable to a disk.

Note: If a virtual machine disk's file spans multiple hypervisor disks, duplicate entries for the virtual machine disk are generated. If the report is distributed, the space is distributed across the hypervisor disks that are not external.

VFMS Mount Point
Hypervisor file system's mount point where the virtual machine disk's file resides. This column displays **N/A** if not applicable to a disk.

Related Topics

- See Common storage space values to view descriptions of the common storage space values that appear in these reports.

Disk Storage - Disk Storage on Storage Subsystems reports:

Use these reports to view information about computer disks that IBM Tivoli Storage Productivity Center has identified as storage subsystem volumes.

See Disks On Storage Subsystems - Column Descriptions for descriptions of all the columns that appear in Disk Storage on Storage Subsystem reports.

Use By clauses to filter the entities that appear in a report. For example, if you want to view a report that displays specific computers, select **By Storage Subsystem** and use the **Selection** and **Filter** options to determine which storage subsystems appear in the generated report.

You can customize the information in each By clause by relating the monitored entities to other storage. The following options for relating storage entities (storage subsystems, computers, groups, file systems, logical volumes, disk groups, volume groups) to other storage in these reports includes the following:

- Use the **Relate Storage Subsystems To:** options in the By Storage Subsystem and By Storage Subsystem Group reports to relate storage subsystems to the following storage:
  - Computer Space
  - File System or Logical Volume Space
  - Distributed File System or Logical Volume Space
  - Computer Disk Space
  - Distributed Computer Disk Space
- Use the **Relate Computers To:** and **Relate Disk/Volume Group To:** options in the By Computer, By Computer Group, and By Disk/Volume Group reports to relate storage computers, computer groups, disk groups, or volume groups to the following storage:
  - File System or Logical Volume Space
  - Distributed File System or Logical Volume Space
  - Computer Disk Space
  - Distributed Computer Disk Space
  - Storage Subsystem Space (not available for disk groups and volume groups)
- Use the **Relate FileSystems/Logical Volumes To:** options in the By File System/Logical Volume and By Filesystem Group reports to relate file systems or logical volumes to the following storage:
  - File System or Logical Volume Space
  - Distributed File System or Logical Volume Space

Considerations

Keep in mind the following considerations when generating Disk Storage on Storage Subsystems reports:

By Storage Subsystem (Relate Storage Subsystems To: File System/Logical Volume Space, Distributed File System/Logical Volume Space)

Duplicate entries appear in By Storage Subsystem reports for file systems

or logical volumes that span multiple storage subsystems. The storage space shown in the report is adjusted in the totals. The storage space values include space that is not storage subsystem storage if a file system or logical volume spans disks that are both storage subsystem disks and other storage disks.

When relating storage subsystems or computers to distributed file system/logical volume space, the reports displays duplicate entries for file systems or logical volumes that span multiple disks, but the displayed storage space unique. The values for storage space exclude space that is not storage subsystem storage if a file system or logical volume spans disks that are both storage subsystem disks and other storage disks.

By Storage Subsystem (Relate Storage Subsystems To: Computer Disk Space, Distributed Computer Disk Space)

Duplicate entries appear in these reports for virtual machines whose disks spans multiple hypervisor disks. The storage space shown in the report is adjusted in the totals. The storage space values include space that is not storage subsystem storage if the file system on a virtual machine spans hypervisor disks that are external or if the file system spans other storage disks.

When relating storage subsystems or computers to distributed computer disk space, this report displays duplicate entries for virtual machines whose disks spans multiple hypervisor disks, but the storage space shown in the report is unique. The storage space values exclude space that is not storage subsystem storage if the virtual machine disk's file system spans hypervisor disks that are external or the virtual machine disk's file system spans other storage disks.

By XIV system

The XIV system GUI and the XIV system command-line interface (CLI) report sizes in GB of disks, volumes, pools, and so on, based on 10^9. Tivoli Storage Productivity Center reports sizes in GB based on 2^30. For example, a volume showing a size of 17 GB in the XIV system GUI is reported as 16 GB (XIV GB size * 1000 * 1000 * 1000 / 1024 /1024 / 1024 rounded to the nearest GB) in Tivoli Storage Productivity Center.

Disks On Storage Subsystems - Column Descriptions:

Use these reports to view information about disks on monitored computers that IBM Tivoli Storage Productivity Center has identified as storage subsystem volumes.

The following buttons and columns appear in the By clauses of Disks On Storage Subsystems reports:

Note: Not all of the following columns appear in each By clause.

Selection...
Click this button to select the specific entities that you want to include in the report. For example, in the **By Storage Subsystem** report, click this button to select the specific storage subsystems upon which you want to report.

Filter Click this button to apply conditions to the columns within a report to further select or restrict the entities that you want to include in the report.

Relate <entity> To:
Select how you want to relate monitored storage entities in the report to other storage. See Disk Storage - Disk Storage Not On Storage Subsystems reports for more information.

Magnifying glass icon
This button appears on all **By <entity> Group** reports. Click this button to view a more detailed report about the entities in a group.

Available Disk Space
Amount of disk space on a storage subsystem that is available for a computer to consume. For computer groups, this is the amount of space on disks that is available for use by the computers within those groups. For storage subsystem groups, this is the amount of space on disks that is available for use by the storage subsystems within those groups. For disk and volume groups, this is the external disk space available for use within those groups.

This space includes the file system space that is available on the disk and the space that has not been allocated to a logical volume.

Available Disk/Volume Group Space
Amount of available space in a disk group or volume group.

Available File System/Logical Volume Space
Amount of space on the file system or logical volume that is available for use by the computer on a storage subsystem. For computers groups and storage subsystem groups, this is the amount of space on file systems or logical volumes that is available for use on storage subsystems by the entities within those groups. For file system groups, this is the amount of space on file systems or logical volumes within those groups that can be consumed. For disk groups and volume groups, this is the external logical volume or file system space available for use within those groups.

Computer
Name of a computer where a disk, file system, logical volume, or disk group is located.

Computer OS Type
The operating system running on a computer.

Consumed Disk Space
Amount of disk space on a storage subsystem that is consumed by a computer. For storage subsystem groups, this is the amount of consumed disk space within those groups. For computer groups, this is the amount of disk space consumed by the computers those groups. For disk and volume groups, this is the external disk space consumed within those groups.

This space includes the file system space that is consumed on a disk. If a logical volume on this disk space has no file system, then this space includes the consumed portion of the logical volume that has been allocated to the disk.

Consumed Disk/Volume Group Space
Amount of consumed disk or volume group space.

Consumed File System/Logical Volume Space
Amount of space on the file system or logical volume that is consumed by the computer on a storage subsystem. For computer groups and storage subsystem groups, this is the amount of space on file systems or logical volumes that is consumed by the entities within those groups. For file system groups, this is the amount of storage subsystem space on file systems or logical volumes within those groups that is consumed. For disk groups and volume groups, this is the external logical volume or file system space consumed within those groups.

Correlated
Indicates **Yes** if Tivoli Storage Productivity Center is able to relate the host storage directly to a storage subsystem. You can relate this correlated storage back to the actual storage subsystem storage for a more detailed view of how the host storage is allocated.

If a computer disk, file system, or logical volume appears in the Disk Storage On Storage Subsystem reports but is not correlated, it might be the result of the following reasons:

- The storage subsystem was not probed. Run a probe to collect data about the storage subsystem then generate this report.
- The storage subsystem storage was unassigned from the host storage, but the host has not been probed. Run a probe to collect data about the host then generate this report.
- The storage subsystem storage was not correctly identified by a probe of the host. If this is the problem, check the probe log of the host for messages relating to SCSI command errors and the probe results of the storage subsystem.

Creator
ID of the user who created a group.

Disk Path
Path name of a disk as seen by the computer.

Disk Space
Total disk space on a storage subsystem seen by a computer. For computer groups, this is the total disk space within those groups that is associated with storage subsystems. For storage subsystem groups, this is the total disk space on the storage subsystems within those groups. For disk and volume groups, this is the external disk space within the disk group or volume group.

Note: This space is distributed across the hypervisor disk space from where the virtual machine disk's file resides. The portion of space identified to a particular external hypervisor disk is reported only. This is true for all space values in this report.

Disk/Volume Group Name
Name of a disk group or volume group where a logical volume or file system was created. This column displays **N/A** if a disk group or volume group does not exist on a disk.

Disk/Volume Group Space
Total amount of disk group or volume group space. This is space inclusive of all storage space and applies to all space values related to disk groups or volume groups.

Disk/Volume Group Type
Type of a disk group. For example, a volume group might be LVM or Veritas. This column displays **N/A** if a disk group or volume group does not exist on a disk.

Fibre Attached
Indicates **Yes** when Tivoli Storage Productivity Center determines that a disk is behind a fibre channel adapter port.

File System Type
Type of a file system, such as NTFS.

File System/Logical Volume Path
Name of a file system or logical volume path.

Group Name of a group.

Grown Defects
Number of defects detected on the disk since it was new.

Hypervisor Name
Name of the hypervisor where a virtual machine was created. This column displays **N/A** if not applicable to a disk.

Logical Volume Space
Total amount of space allocated to the logical volume on a disk. For computer groups, this is the total logical volume space in computer groups that is associated with storage subsystems. For storage subsystem groups, this is the total logical volume space on the storage subsystems within those groups. For file system groups, this is the total amount of space allocated to the logical volumes within those groups. For disk groups and volume groups, this is the external logical volume space within those groups.

This space includes the file system space on the disk reported if the entity displayed is a file system. The actual size of the file system on the disk reported is in addition to the consumed and available space.

Note: When relating a monitored entity to distributed file system/logical volume space, the space is distributed across the disks where a logical volume or file system resides. The portion identified to a disk is reported only.

(Disk) Manufacturer
The manufacturer of a disk.

Mapped to Storage Subsystem
Indicates **Yes** if Tivoli Storage Productivity Center has identified a disk as being located on a storage volume from a storage subsystem. The storage subsystem might not be monitored by Tivoli Storage Productivity Center.

(Disk) Model
Model number of a disk.

Number of Disks
Number of disks assigned to a storage subsystem or group. For disk groups and volume groups, this is the number of external disks within those groups. For NetApp storage devices, this number does not include disks in partner storage pools.

Number of File Systems/Logical Volumes
Number of logical file systems or logical volumes within a group. For disk groups and volume groups, this is the number of external logical file systems or logical volumes within those groups.

The logical volumes underlying the file systems are not counted for the value in the column.

Overallocated
Indicates **Yes** if Tivoli Storage Productivity Center is unable to uniquely identify disk storage across more than one host. Check the probe log of the host for messages relating to SCSI command errors.

Path Type
Path type of the entity being reported: file system or a logical volume.

Primary Defects
Number of defects on the disk when it was new.

Shared
Indicates **Yes** if a file system or logical volume is shared by more than one computer.

Serial Number
Serial number of a disk.

Storage Subsystem Manufacturer
The manufacturer of a storage subsystem.

Storage Subsystem Type
The type of storage subsystem.

Unavailable Disk Space
Amount of disk space on the storage subsystem that is not available for a computer to consume. For the computer groups, this is the amount of space on disks that is not available to be consumed by the computers within those groups. For the storage subsystem groups, this is the amount of space on disks that is not available to be consumed within those groups. For disk and volume groups, this is the external disk space that is not available for use within those groups.

This space is used for logical volume overhead and is reserved by the operating system to manage a file system.

Unavailable Logical Volume Space
Amount of space on the logical volume that is not available for use by the computer on a storage subsystem. For computer groups and storage subsystem groups, this is the amount of space on logical volumes that is not available for use by the entities within those groups. For file system groups, this is the amount of space on the logical volumes within those groups that is not available for use. For disk groups and volume groups, this is the external logical volume space that is not available for use within those groups.

This space is used for logical volume overhead and is reserved by the operating system to manage a file system.

VM Disk File
Virtual machine disk's file on a monitored hypervisor that represents the disk on the virtual machine. This column displays **N/A** if not applicable to a disk.

VMFS Disk
Hypervisor disk where the virtual machine disk resides. This column displays **N/A** if not applicable to a disk.

Note: If a virtual machine disk's file spans multiple hypervisor disks, duplicate entries for the virtual machine disk are generated. If the report is distributed, the space is distributed across the hypervisor disks that are not external.

VFMS Mount Point
Hypervisor file system's mount point where the virtual machine disk's file resides. This column displays **N/A** if not applicable to a disk.

Disk Storage - Disk Storage Not On Storage Subsystems reports:

Use these reports to view information about computer disks that IBM Tivoli Storage Productivity Center has not identified as storage subsystem volumes.

These reports are organized into the following categories:

Disks With Serial Numbers
These reports display information about non-storage subsystem disks that Tivoli Storage Productivity Center has identified with a valid serial number.

Disks Without Serial Numbers
These reports display information about non-storage subsystem disks that Tivoli Storage Productivity Center has not identified with serial numbers that uniquely identify those disks. This might occur on internal disks within a hypervisor and virtual machines that have storage created from internal disks within a hypervisor. If this problem occurs for other types of storage, check the probe log of the host for messages relating to SCSI command errors.

See Disks Not On Storage Subsystems - Column Descriptions for descriptions of all the columns that appear in Disk Storage Not On Storage Subsystems reports.

Use By clauses to filter the entities that appear in a report. For example, if you want to view a Disk Storage Not On Storage Subsystems report that displays specific computers, select **By Computer** and use the **Selection** and **Filter** options to determine which computers appear in that report.

You can customize the information in each By clause by relating the monitored entities to other storage. The following options for relating storage entities (computers, computer groups, file systems, file system groups, logical volumes, disk groups, volume groups) to other storage in these reports includes the following:

- Use the **Relate Computers To:** and **Relate Disk/Volume Group To:** options in the By Computer, By Computer Group, and By Disk/Volume Group reports to relate computers, computer groups, disk groups, and volume groups to the following storage:
  - File System or Logical Volume Space
  - Distributed File System or Logical Volume Space
  - Computer Disk Space
  - Distributed Computer Disk Space
- Use the **Relate FileSystems/Logical Volumes To:** options in the By File System/Logical Volume and By Filesystem Group reports to relate file systems or logical volumes to the following storage:
  - File System or Logical Volume Space
  - Distributed File System or Logical Volume Space

Available Disk Space

Amount of space on a disk that is available for use by a computer. For computer groups, this is the amount of space on disks that is available for use by the computers in a group. For disk and volume groups, this is the external disk space available for use within those groups.

This space includes the file system space that is available on the disk and the space that has not been allocated to a logical volume.

Available Disk/Volume Group Space

Amount of available space in a disk group or volume group.

Available File System/Logical Volume Space

Amount of space on the file system or logical volume that is available for use on a disk. For computers groups, this is the amount of space on file systems or logical volumes that is available for use by the computers within those groups. For file system groups, this is the amount of space on file systems or logical volumes within those groups that can be consumed. For disk groups and volume groups, this is the external logical volume or file system space available for use within those groups.

Computer

Name of a computer where a disk, file system, logical volume, or disk group is located.

Computer OS Type

The operating system running on a computer.

Consumed Disk Space

Amount of space on a disk that is consumed. For computer groups, this is the amount of disk consumed by the computers in those groups. For disk and volume groups, this is the external disk space consumed within those groups.

This space includes the file system space that is consumed on a disk. If a logical volume on this disk space has no file system, then this space includes the consumed portion of the logical volume that has been allocated to the disk.

Consumed Disk/Volume Group Space

Amount of consumed disk or volume group space.

Consumed File System/Logical Volume Space

Amount of space on the file system or logical volume consumed by the computer on a disk. For computer groups, this is the amount of space on file systems or logical volumes that is consumed by the computers within those groups. For file system groups, this is the amount of space on file systems or logical volumes within those groups that is consumed. For disk groups and volume groups, this is the external logical volume or file system space consumed within those groups.

Creator

ID of the user who created a group.

Disk Path

Path name of a disk as seen by the computer.

Disk Space
Total amount of space allocated to a computer disk. For computer groups, this is the total amount of space allocated to the disks on the computers within those groups. For disk and volume groups, this is the external disk space within the disk group or volume group.

Note: This space is distributed across the hypervisor disk space from where the virtual machine disk's file resides. The portion of space identified to a particular external hypervisor disk is reported only. This is true for all space values in this report.

Disk/Volume Group Name
Name of a disk group or volume group where a logical volume or file system was created. This column displays **N/A** if a disk group or volume group does not exist on a disk.

Disk/Volume Group Space
Total amount of disk group or volume group space. This is space inclusive of all storage space and applies to all space values related to disk groups or volume groups.

Disk/Volume Group Type
Type of a disk group. For example, a volume group might be LVM or Veritas. This column displays **N/A** if a disk group or volume group does not exist on a disk.

Fibre Attached
Indicates **Yes** when Tivoli Storage Productivity Center determines that a disk is behind a fibre channel adapter port.

File System Type
Type of a file system, such as NTFS.

File System/Logical Volume Path
Name of a file system or logical volume path.

Group Name of a group.

Grown Defects
Number of defects detected on the disk since it was new.

Hypervisor Name
Name of the hypervisor where a virtual machine was created. This column displays **N/A** if not applicable to a disk.

Logical Volume Space
Total amount of space allocated to the logical volume on a disk. For computer groups, this is the total amount of space allocated to the logical volumes on disks within those groups. For file system groups, this is the total amount of space allocated to the logical volumes within those groups. For disk groups and volume groups, this is the external logical volume space within those groups.

This space includes the file system space on the disk reported if the entity displayed is a file system. The actual size of the file system on the disk reported is in addition to the consumed and available space.

Note: When relating a monitored entity to distributed file system/logical volume space, the space is distributed across the disks where a logical volume or file system resides. The portion identified to a disk is reported only.

(Disk) Manufacturer
The manufacturer of a disk.

(Disk) Model
Model number of a disk.

Number of Disks
Number of disks in a computer group. For disk groups and volume groups, this is the number of external disks within those groups.

Number of File Systems/Logical Volumes
Number of logical file systems or logical volumes within a group. For disk groups and volume groups, this is the number of external logical file systems or logical volumes within those groups.

The logical volumes underlying the file systems are not counted for the value in the column.

Overallocated
Indicates **Yes** if Tivoli Storage Productivity Center is unable to uniquely identify disk storage across more than one host. Check the probe log of the host for messages relating to SCSI command errors.

Path Type
Path type of the entity being reported: file system or a logical volume.

Primary Defects
Number of defects on the disk when it was new.

Shared
Indicates **Yes** if a file system or logical volume is shared by more than one computer.

Serial Number
Serial number of a disk.

Unavailable Disk Space
Amount of space on the disk not available to be consumed. For the computer groups, this is the amount of space on disks that is not available to be consumed by the computers in a group. For disk and volume groups, this is the external disk space that is not available for use within those groups.

This space is used for logical volume overhead and is reserved by the operating system to manage a file system.

Unavailable Logical Volume Space
Amount of space on a logical volume that is not available for use by a computer. For computer groups, this is the amount of space on logical volumes that is not available for use by the computers within those groups. For file system groups, this is the amount of space on the logical volumes within those groups that is not available for use. For disk groups and volume groups, this is the external logical volume space that is not available for use within those groups.

This space is used for logical volume overhead and is reserved by the operating system to manage a file system.

VM Disk File
Virtual machine disk's file on a monitored hypervisor that represents the disk on the virtual machine. This column displays **N/A** if not applicable to a disk.

VMFS Disk
Hypervisor disk where the virtual machine disk resides. This column displays **N/A** if not applicable to a disk.

Note: If a virtual machine disk's file spans multiple hypervisor disks, duplicate entries for the virtual machine disk are generated. If the report is distributed, the space is distributed across the hypervisor disks that are not external.

VFMS Mount Point
Hypervisor file system's mount point where the virtual machine disk's file resides. This column displays **N/A** if not applicable to a disk.

Disk Storage - Non-Disk Storage reports:

Use these reports to view information about storage space that does not reside on disks that are monitored by IBM Tivoli Storage Productivity Center. This includes storage that resides on a remote mount or a network attached server and storage that is temporarily allocated to processor memory.

Use By clauses to filter the entities that appear in a report. For example, if you want to view a report that displays specific computers, select **By Computer** and use the **Selection** and **Filter** options to determine which computers appear in the generated report.

The following By clauses are available for Non-Disk Storage reports:

- By Computer
- By Computer Group
- By Filesystem/Logical Volume
- By Filesystem Group
- By Disk/Volume Group

You can customize the information in each By clause by relating the monitored entities to other storage. The following options for relating storage entities (computers, computer groups, file systems, file system groups, logical volumes, disk groups, volume groups) to other storage in these reports includes the following:

- File System or Logical Volume Space
- Distributed File System or Logical Volume Space

Related Topics

Non-Disk Storage - By Computer report, By Filesystem/Logical Volume report:

Use these reports to view information about non-disk storage. This includes storage that resides on a remote mount or a network attached server and storage that is temporarily allocated to processor memory. Select **By Computer** if you want to determine which computers are displayed in the report. Select **By Filesystem/Logical Volume** if you want to determine which file systems or logical volumes appear in the report.

Selection...
For the **By Computer** reports, click this button to select the specific computers upon which you want to report. For the **By Filesystem/Logical Volume** reports, click this button to select the specific file systems or logical volumes upon which you want to report.

Filter Click this button to apply conditions to the columns within a report to further select or restrict computers or file system/logical volumes upon which you want to report.

Relate <entity> To:
Select how you want to relate computers or file systems in the report to other storage entities. See]Disk Storage - Non-Disk Storage reports for more information.

Computer
Name of a computer.

File System/Logical Volume Path
Name of a file system or logical volume path.

Note: Each monitored file system or logical volume path is displayed only once in this report because if the storage space is not distributed (there are no underlying disks), then there is no need to report distribution.

Logical Volume Space
Total amount of space allocated to the logical volume on a disk. This space includes the file system space if the entity displayed is a file system. The actual size of the file system is in addition to the consumed and available space.

Note: When relating computers to distributed file system/logical volume space, the space is distributed across the logical volumes where the file system or parent logical volume resides. The portion identified to a particular file system or parent logical volume is reported only. If a file system does not have an underlying logical volume, the logical volume space is the size of that file system.

Consumed File System/Logical Volume Space
Amount of space on a file system or logical volume that is consumed by a computer.

Available File System/Logical Volume Space
Amount of space on a file system or logical volume that is available for use by a computer.

Unavailable Logical Volume Space
Amount of space on the logical volume that is not available for use by a computer. This space is used for logical volume overhead and is reserved by the operating system to manage a file system.

Computer OS Type
Operating system running on a computer.

Disk/Volume Group Name
Name of a disk or volume group where the logical volume or file system was created. This column displays **N/A** if a disk group or volume group does not exist on a disk.

Disk/Volume Group Type
Type of a disk or volume group where the logical volume or file system was created. This column displays **N/A** if a disk group or volume group does not exist on a disk.

File System Type
Type of a file system, such as NTFS.

Path Type
Path type of an entity: file system or a logical volume.

Shared
Indicates **Yes** if a file system or logical volume is shared by more than one computer.

Non-Disk Storage - By Computer Group report, By Filesystem Group report:

Use these reports to view information about non-disk storage. This includes storage that resides on a remote mount or a network attached server and storage that is temporarily allocated to processor memory. Select **By Computer Group** if you want to determine which computer groups are displayed in the report. Select **By Filesystem Group** if you want to determine which file system groups appear in the report.

Selection...
For the **By Computer Group** reports, click this button to select the specific computer groups upon which you want to report. For the **By Filesystem Group** reports, click this button to select the specific file system group upon which you want to report.

Filter Click this button to apply conditions to the columns within a report to further select or restrict groups upon which you want to report.

Relate <entity> To:
Select how you want to relate groups in the report to other storage entities. See Disk Storage - Non-Disk Storage reports for more information.

A unique row appears for each group in this report.

Magnifying glass icon
Click this button to view a more detailed report about the computers or file systems in a group.

Creator
ID of the user who created the group.

Group Name of a group.

Logical Volume Space
Total amount of space allocated to the computers or file systems in a group. This space includes the file system space if the entity displayed is a file system. The actual size of the file system is in addition to the consumed and available space.

Note: When relating groups to distributed file system/logical volume space, this space is distributed across the disks from where the logical volume or file system reside. This is true for all space values in the Distributed File System/Logical Volume Space report.

Consumed File System/Logical Volume Space
Amount of space on file systems or logical volumes within a group that is consumed.

Available File System/Logical Volume Space
Amount of space on file systems or logical volumes within a group that can be consumed.

Unavailable Logical Volume Space
Amount of space on the logical volumes in a group that is not available for use. This space is used for logical volume overhead and is reserved by the operating system to manage a file system.

Number of File Systems/Logical Volumes
Number of file systems or logical volumes in a group.

Non-Disk Storage - By Computer report, By Filesystem/Logical Volume report:

Use these reports to view information about non-disk storage. This includes storage that resides on a remote mount or a network attached server and storage that is temporarily allocated to processor memory. Select **By Computer** if you want to determine which computers are displayed in the report. Select **By Filesystem/Logical Volume** if you want to determine which file systems or logical volumes appear in the report.

Selection...
For the **By Computer** reports, click this button to select the specific computers upon which you want to report. For the **By Filesystem/Logical Volume** reports, click this button to select the specific file systems or logical volumes upon which you want to report.

Filter Click this button to apply conditions to the columns within a report to further select or restrict computers or file system/logical volumes upon which you want to report.

Relate <entity> To:
Select how you want to relate computers or file systems in the report to other storage entities. See]Disk Storage - Non-Disk Storage reports for more information.

Computer
Name of a computer.

File System/Logical Volume Path
Name of a file system or logical volume path.

Note: Each monitored file system or logical volume path is displayed only once in this report because if the storage space is not distributed (there are no underlying disks), then there is no need to report distribution.

Logical Volume Space
Total amount of space allocated to the logical volume on a disk. This space includes the file system space if the entity displayed is a file system. The actual size of the file system is in addition to the consumed and available space.

Note: When relating computers to distributed file system/logical volume space, the space is distributed across the logical volumes where the file system or parent logical volume resides. The portion identified to a particular file system or parent logical volume is reported only. If a file system does not have an underlying logical volume, the logical volume space is the size of that file system.

Consumed File System/Logical Volume Space
Amount of space on a file system or logical volume that is consumed by a computer.

Available File System/Logical Volume Space
Amount of space on a file system or logical volume that is available for use by a computer.

Unavailable Logical Volume Space
Amount of space on the logical volume that is not available for use by a computer. This space is used for logical volume overhead and is reserved by the operating system to manage a file system.

Computer OS Type
Operating system running on a computer.

Disk/Volume Group Name
Name of a disk or volume group where the logical volume or file system was created. This column displays **N/A** if a disk group or volume group does not exist on a disk.

Disk/Volume Group Type
Type of a disk or volume group where the logical volume or file system was created. This column displays **N/A** if a disk group or volume group does not exist on a disk.

File System Type
Type of a file system, such as NTFS.

Path Type
Path type of an entity: file system or a logical volume.

Shared
Indicates **Yes** if a file system or logical volume is shared by more than one computer.

Non-Disk Storage - By Computer Group report, By Filesystem Group report:

Use these reports to view information about non-disk storage. This includes storage that resides on a remote mount or a network attached server and storage that is temporarily allocated to processor memory. Select **By Computer Group** if you want to determine which computer groups are displayed in the report. Select **By Filesystem Group** if you want to determine which file system groups appear in the report.

Selection...
For the **By Computer Group** reports, click this button to select the specific computer groups upon which you want to report. For the **By Filesystem Group** reports, click this button to select the specific file system group upon which you want to report.

Filter Click this button to apply conditions to the columns within a report to further select or restrict groups upon which you want to report.

Relate <entity> To:
Select how you want to relate groups in the report to other storage entities. See Disk Storage - Non-Disk Storage reports for more information.

A unique row appears for each group in this report.

Magnifying glass icon
Click this button to view a more detailed report about the computers or file systems in a group.

Creator
ID of the user who created the group.

Group Name of a group.

Logical Volume Space
Total amount of space allocated to the computers or file systems in a group. This space includes the file system space if the entity displayed is a file system. The actual size of the file system is in addition to the consumed and available space.

Note: When relating groups to distributed file system/logical volume space, this space is distributed across the disks from where the logical volume or file system reside. This is true for all space values in the Distributed File System/Logical Volume Space report.

Consumed File System/Logical Volume Space
Amount of space on file systems or logical volumes within a group that is consumed.

Available File System/Logical Volume Space
Amount of space on file systems or logical volumes within a group that can be consumed.

Unavailable Logical Volume Space
Amount of space on the logical volumes in a group that is not available for use. This space is used for logical volume overhead and is reserved by the operating system to manage a file system.

Number of File Systems/Logical Volumes
Number of file systems or logical volumes in a group.

Disk Storage on Storage Subsystems reports - By Disk/Volume Group:

Use this report to view information about non-disk storage. This includes storage that resides on a remote mount or a network attached server and storage that is temporarily allocated to processor memory. This report enables you to determine which disk groups or volume groups are displayed.

Selection...
Click this button to select the specific disk groups or volume groups upon which you want to report.

Filter Click this button to apply conditions to the columns within a report to further select or restrict disk groups or volume groups upon which you want to report.

Relate Disk/Volume Group To:
Select how you want to relate the non-disk storage in disk groups or volume groups to other storage entities. See Disk Storage - Non-Disk Storage reports for more information.

A unique row appears for each disk group or volume group.

Magnifying glass icon
Click this button to view a more detailed report about the disk or file system within the disk group or volume group.

Disk/Volume Group Name
Name of a group.

Disk/Volume Group Type
Type of a group. For example, a volume group might be LVM or Veritas.

Computer
Name of the computer where a disk group or volume group resides.

Computer OS Type
Operating system running on a computer.

Disk/Volume Group Space
Total amount of disk group or volume group space. This is space inclusive of all storage space and applies to all space values related to disk groups or volume groups.

Consumed Disk/Volume Group Space
Amount of consumed disk group or volume group space.

Available Disk/Volume Group Space
Amount of available disk group or volume group space.

Logical Volume Space
External logical volume space within a disk group or volume group.

Consumed File System/Logical Volume Space
External logical volume or file system space that is consumed within a disk group or volume group.

Available File System/Logical Volume Space
External logical volume or file system space that is available for use within a disk group or volume group.

Unavailable Logical Volume Space
External logical volume space that is not available for use within a disk group or volume group. This space is used for logical volume overhead and is reserved by the operating system to manage a file system.

Number of File Systems/Logical Volumes
Number of external logical file systems or logical volumes within a disk or volume group. The logical volumes underlying the file systems are not counted.

Additional reporting support and information:

Learn about the additional storage devices upon which you can report within Data Manager.

IBM FAStT Subsystem support: The IBM FAStT subsystem reporting feature further extends the subsystem reporting capabilities of Data Manager. You can use the Reporting facility to view information about the capacity, allocation, and volumes of an IBM FAStT subsystem. You can view IBM FAStT subsystem information by using the following menu options to generate reports:

- **Reporting → Asset → By Storage Subsystem →** <IBM FAStT subsystem name>

- **Reporting → Asset → System-wide → Storage Subsystems**
- **Reporting → Asset → System-wide → Volumes**
- **Reporting → Asset → System-wide → Disks**

Note: Data Manager shows an incorrect value for the **Storage Pool Free Space** column in IBM FAStT subsystem reports (for example, **Asset → By Storage Subsystem → <FAStT_subsystem_name>**, and **Asset → System-wide → Storage Subsystems**). The value for **Storage Pool Free Space** in these reports reflects the space from one Free Capacity node rather than all the free space within the defined arrays on a FAStT subsystem.

Hitachi Data Systems Subsystem support: Use the Reporting facility to report on Hitachi Data Systems (HDS) storage subsystems. You can view reports that contain information about the capacity, allocation, and volumes of an HDS subsystem.

Any storage pools or volumes created using the HDS **HiCommand** software will not be reported through the HDS CIMOM provider. **HiCommand** is the native interface for HDS subsystems. If you configure an HDS subsystem through **HiCommand** , IBM Tivoli Storage Productivity Center will not be able to gather information about storage pools and volumes from that subsystem. The HDS CIM agent provider will return all storage pools created through the **HiCommand** interface as a single pool containing all of the **HiCommand** created pools. This single pool is always reported as Raid 5.

Note: Data Manager does not report on the raw capacity of disks internal to the HDS subsystem. Information on the internal disks of the HDS subsystem is not available through the CIMOM interface provided by the Hitachi HiCommand Device Manager.

You can view HDS storage subsystem information by using the following menu options to generate reports:

- **Reporting → Asset → By Storage Subsystem →** <HDS subsystem name>
- **Reporting → Asset → System-wide → Storage Subsystems**
- **Reporting → Asset → System-wide → Volumes**
- **Reporting → Asset → System-wide → Disks**
- **Reporting → TPC-wide Storage Space → Disk Space**

HP StorageWorks Subsystem support: Use the Reporting facility to report on HP StorageWorks storage subsystems. You can view reports that contain information about the capacity, allocation, and volumes of an HP StorageWorks subsystem.

You can view HP StorageWorks storage subsystem information by using the following menu options to generate reports:

- **Reporting → Asset → By Storage Subsystem →** <HP StorageWorks subsystem name>
- **Reporting → Asset → System-wide → Storage Subsystems**
- **Reporting → Asset → System-wide → Volumes**
- **Reporting → Asset → System-wide → Disks**

IBM Tivoli Storage SAN File Systems support: You can also perform scans and probes to gather information about IBM Tivoli Storage SAN File Systems and generate reports based on that information using the Reporting facility. You can

view information gathered by probes of the SAN File System by using the following menu options to generate reports:

- **Reporting → Asset → By OS Type → IBM SAN File System**
- **Reporting → Asset → By Computer**
- **Reporting → TPC-wide Storage Space → File System Space**
- **Reporting → TPC-wide Storage Space → Consumed File System Space**
- **Reporting → TPC-wide Storage Space → Available File System Space**

Note: Due to the complexity of the SAN File System, the values displayed for total capacity, used space and free space in the Capacity and Asset reports might not be accurate. The values displayed are the values returned by the probe or scane and they may not represent actual values for your SAN File System. Use the SAN File System admin console to obtain the actual values.
You can view information gathered by scans of the SAN File System by using the following menu options to generate reports:

- **Reporting → Usage**
- **Reporting → Usage Violations**
- **Reporting → Backup**

Refer to the *Creating Directory Groups* section in the *Monitoring* chapter for more information about how to configure SAN File System support within the Reporting facility.

Report Array, Loop, and Adapter Pair for IBM TotalStorage Enterprise Storage Server Disk Groups support: Disk Manager provides report information on Array, Loop, and Adapter Pairs for TotalStorage Enterprise Storage Server Disk Groups. This information is available when managing an TotalStorage Enterprise Storage Server through IBM CIM Agent (ICAT) for TotalStorage Enterprise Storage Server version 1.2.0.13. Contact IBM Customer Support to obtain IBM CIM Agent for TotalStorage Enterprise Storage Server version 1.2.0.13.

You can view Array, Loop, and Adapter Pair information by using the menu option **Reporting → Asset Reporting → By Storage Subsystem** to generate reports.

Conversion of volume sizes by IBM Tivoli Storage Productivity Center:

Tivoli Storage Productivity Center uses 1024 bytes to represent a kilobyte. However, some element managers use 1000 bytes to represent a kilobyte. When reporting volume sizes, Tivoli Storage Productivity Center converts base-1000 values to base-1024 values.

The following table shows the byte values that are associated with base-1024 and base-1000 systems:

Unit	Abbreviation	Bytes in base-1024	Bytes in base-1000
Kilobyte	KB in base-1024 kB in base-1000 see note	2^{10} or 1024	10^3 or 1000
Megabyte	MB	1024^2 or 1,048,576	10^6 or 1,000,000
Gigabyte	GB	1024^3 or 1,073,741,824	10^9 or 1,000,000,000
Terabyte	TB	1024^4 or 1,099,511,627,716	10^{12}or 1,000,000,000,000

Unit	Abbreviation	Bytes in base-1024	Bytes in base-1000
Note: In SI Metric Style, the abbreviation of the prefix kilo is lowercase k. IBM distinguishes between lowercase k (meaning 1000 or 10^3) and uppercase K (meaning 1024 or 2^{10}). Therefore, KB means 1024 bytes, and kB means 1000 bytes.			

You can verify the volume size reported by Tivoli Storage Productivity Center against the size reported by element managers that use a base-1000 system. For example, suppose an element manager reports the size of a volume as 62,000 MB. Use the following calculations to verify the total number of base-1024 GB as reported by Tivoli Storage Productivity Center:

1. Multiply the volume size reported by the element manager by the number of bytes in a base-1000 MB:

   `62,000 MB × 1,000,000 bytes per MB = 62,000,000,000 bytes`
2. Divide the result by the number of bytes in a base-1024 MB:

   `62,000,000,000 bytes / 1,048,576 bytes per MB = 59,127.81 MB`
3. Divide the quotient by the number of MB in a base-1024 GB:

   `59,127.81 MB / 1024 MB per GB = 57.74 GB`

Tivoli Storage Productivity Center reports the volume size as 57.74 GB.

VMware capacity reports:

You must probe both the ESX Server and the Storage Resource agent on the virtual machines before you can generate accurate reports for disk and file system capacity.

The TOTAL row in the capacity report shows the capacity for the file system or the disk capacity. The total includes virtualized disks, virtual machines, non-virtualized disks, and non-virtualized machines.

For example, you have an ESX Server that has a capacity of 100 GB and 60 GB is allocated to the virtual machine. The virtual machine uses 5 GB of space. Both the ESX Server (H1) and the virtual machine (VC1) are probed. You also have a physical machine (PC1) that is probed. The capacity is shown in the report, as follows:

Column heading	Capacity	Used space (calculated as Capacity minus Free Space)	Free space
TOTAL	130 GB	25 GB	105 GB
H1	100 GB	60 GB	40 GB
VC1	60 GB	5 GB	55 GB
PC1	30 GB	20 GB	10 GB

If you probed the physical machine (PC1) and the virtual machine (VC1) but did not probe the ESX Server (hypervisor), the capacity is shown as follows:

Column heading	Capacity	Used Space (calculated as Capacity minus Free Space; negative values are shown as 0)	Free Space
TOTAL	30 GB	0 GB	65 GB
PC1	30 GB	20 GB	10 GB
VC1	60 GB	5 GB	55 GB

If you probed the hypervisor (H1) and the physical machine (PC1) but did not probe the virtual machine (VC1), the capacity is shown as follows:

Column heading	Capacity	Used Space (calculated as Capacity minus Free Space)	Free Space
TOTAL	130 GB	80 GB	50 GB
H1	100 GB	60 GB	40 GB
PC1	30 GB	20 GB	10 GB

If you have an ESX Server that has devices that are directly attached to the virtual machine, the file system capacity created on the virtual machine is not added in the TOTAL row.

For example, the file system capacity shown in the table is based on the following factors:

- The file system (FS1) created on the hypervisor has a capacity of 100 GB and uses 60 GB of space.
- The file system (FS1) created from internal storage on the hypervisor (H1) has a capacity of 60 GB and uses 5 GB of space.
- The file system (FS2) on the device that is directly attached to the virtual machine (VC1) has a capacity of 5 GB and uses 4 GB of space.
- The file system created on the physical machine (PC1) has a capacity of 30 GB and uses 20 GB of space.

Column heading	Capacity	Used Space (calculated as Capacity minus Free Space)	Free Space
TOTAL	130 GB	24 GB	106 GB
H1 FS1	100 GB	60 GB	40 GB
VC1 FS1	60 GB	5 GB	55 GB
VC1 FS2	5 GB	4 GB	1 GB
PC1 FS1	30 GB	20 GB	10 GB

Data Manager for Databases reports

Use Data Manager for Databases for reports to view both overview and detailed information about your RDBMS storage resources, including instances, tablespaces, databases, devices, containers, data files, fragments, tables, control files, redo logs,

archive log directories, users. These reports are constructed from the statistical information gathered by data collection jobs and accumulated in the database repository.

Using Data Manager for Databases reports:

Learn how to use Data Manager for Databases reports to view information about the instances, tablespaces, databases, devices, containers, data files, fragments, tables, control files, redo logs, archive log directories, and users within your environment.

Before you begin:

Learn about information you should know before generating and viewing Data Manager for Databases reports.

Before you can use reports to view detailed information about tables in an RDBMS, you must have 1) defined a table group that contains the tables about which you want to view storage information and 2) scheduled and run a scan against that table group. See "Working with groups of resources" on page 337 for information about using groups. See "Collecting storage usage and trending information" on page 306 for information about scans and how to create them.

Data Manager for Databases - Report Categories:

Use the report categories within Data Manager for Databases reports to collect information about RDBMS storage assets, capacity, usage, and usage violations.

The following table describes the categories of reports available in Data Manager for Databases.

Report Category	Use these reports to do the following tasks	What job collects information for these reports?
Asset Reports	View the information gathered by probes. While running probes, Data Manager for Databases itemizes the information for each type of database. • Oracle: instances, table spaces, tables, data files, control files, redo logs, and archive log directories • SQL Server: instances, databases, tables, and data files • Sybase: instances, devices, databases, tables, and fragments. • UDB: instances, databases, table spaces, tables, containers, and users	Probes

Report Category	Use these reports to do the following tasks	What job collects information for these reports?
Capacity Reports	View the storage capacity of different entities within an RDBMS. Specifically, use Capacity reports to view: • **Instance storage capacity within all DBMSs.** If you are monitoring the instances for different DBMSs, you can use the **All DBMSs** node to view a summary of the storage capacity for all those instances in a single view. • **Oracle databases** – How much storage you have for instances – How much storage is being used for data files – What percentage of storage for a data file is free for expansion • **SQL Server databases** – How much storage you have for instances – How much storage is being used for data files – What percentage of storage for a data file is free for expansion • **Sybase databases** – How much storage you have for instances – How much storage is being used for devices – What percentage of storage for a device is free for expansion – How much storage is being used for fragments – What percentage of storage for a fragment is free for expansion • **UDB databases** – How much allocated storage you have for a UDB Instance and the objects it contains – How much storage is being used for a UDB Instance and the objects it contains – What percentage of UDB storage is free for expansion The Capacity reporting function provides you with the ability to view the storage capacity, used space, and free space for your RDBMS objects in a single view.	Probes

Report Category	Use these reports to do the following tasks	What job collects information for these reports?
Usage Reports	Monitor and report on the usage and growth of the consumption of your DBMS storage: • **Storage usage within all DBMSs.** If you are monitoring the multiple DBMSs, use this node to view common storage usage information for databases, table spaces, tables, and users across all monitored DBMSs. • **Oracle databases** – View detailed information for table spaces including their total size, used space, empty used space, # of tables and indexes, and so on. – Identify the tables consuming the most space within your environment. – Identify the segments with the most extents and most empty used space. – Associate users with the amount of storage they are consuming on specific databases, table spaces, groups of table spaces, specific computers, groups of computers, and throughout the entire network. • **SQL Server databases** – View detailed information for databases including their total size, used space, empty used space, # of tables and indexes, and so on. – Identify the tables consuming the most space within your environment. – Associate users with the amount of storage they are consuming on specific databases, groups of databases, specific computers, groups of computers, and throughout the entire network. • **Sybase databases** – View detailed information for databases including their total size, used space, empty used space, # of tables and indexes, and so on. – Identify the tables consuming the most space within your environment. – Associate users with the amount of storage they are consuming on specific databases, groups of databases, specific computers, groups of computers, and throughout the entire network. • **UDB databases** – View detailed information for table spaces including their total size, used space, empty used space, # of tables and indexes, and so on. – Identify the tables consuming the most space within your environment. You can view this information at the table space, database, and computer level, as well as at a network-wide level. – Associate users with the amount of storage they are consuming on specific databases, table spaces, groups of table spaces, specific computers, groups of computers, and throughout the entire network.	Scans
Usage Violation Reports	Create and enforce corporate storage usage policies. You can report on violations of quotas that are set at the network-wide, instance, table space, and database levels.	Scans, Quotas

Reporting on RDBMS Objects:

Learn about the RDBMS objects upon which you can report using Data Manager for Databases reports.

The following table lists the RDBMS objects whose storage usage is monitored by Data Manager for Databases.

Oracle	SQL Server	Sybase	DB2/UDB
Instances	**Instances**	**Instances**	**Instances**
Databases	**Databases**	**Devices**	**Databases**
Tablespaces	**Datafiles**	**Databases**	**Tablespaces**
Datafiles	**Tables**	**Fragments**	**Containers**
Tables	**Indexes**	**Tables**	**Tables**
Indexes	**Log Files**	**Indexes**	**Indexes**
Extents			
Segments			
Redo Log files			
Control Files			
Archive Log Directories			

Note:

1. Each of the major reporting categories in the Reporting facility can be expanded in the navigation tree to reveal additional sub-categories of reporting. Some of the nodes within the reporting tree will appear only if you set up access for the RDBMS to which that node applies. For example, if you set up for monitoring Oracle and SQL Server instances only, nodes representing the other RDBMSs supported by Data Manager for Databases (such as Sybase and UDB) will not appear within the navigation tree. If you have set up access for only one RDBMS, the **All DBMSs** node will also not be available in some nodes.
2. Data Manager for Databases does not currently support the monitoring of clustered database applications.

Using By clauses:

Use the By clauses associated with Data Manager for Databases reports as a method for viewing the data in those reports from different perspectives.

As you drill down through Data Manager for Databases's reports, you will notice a set of options that repeats for each report type. These *By Clauses* allow you to generate variations of the reports with different perspectives and groupings of the data. Some of the available By Clauses are described in the following table:

By Clause	Description
By DBMS Type	Use this clause to select the DBMS that you want to report upon.
By Instance	Use this clause to select the instances that you want to report upon and the report that will be generated based upon those instances.
By Device (Sybase only)	Use this clause to select the devices that you want to report upon and the report that will be generated based upon those devices.
By Database	Use this clause to select the database that you want to report upon and the report that will be generated based upon those databases.
By Tablespace	Use this clause to select the tablespaces that you want to report upon and the report that will be generated based upon those tablespaces.
By Tablespace Group	Use this clause to select the tablespace groups that you want to report upon and the report that will be generated based upon those tablespace groups.

By Clause	Description
By Fragments (Sybase only)	Use this clause to select the fragments that you want to report upon and the report that will be generated based upon those fragments.
By Container (UDB only)	Use this clause to select the containers that you want to report upon and the report that will be generated based upon those containers.
By Computer	Use this clause to select the computers that you want to report upon and the report that will be generated based upon those computers.
By Computer Group	Use this clause to select the computer groups that you want to report upon and the report that will be generated based upon those computer groups.
By User	Use this clause to select the users that you want to report upon and the report that will be generated based upon those users.
Network Wide	The reports and charts that you see will be generated on all data, network wide. This allows you to get a global view of the storage and storage usage for your whole enterprise.

Asset reports:

Use Asset reports to view information about the instances, devices, databases, tablespaces, tables, containers, data files, fragments, control files, redo logs, and archive log directories, and general hardware inventory of RDBMS storage assets within your environment.

While running probes and scans, Data Manager for Databases itemizes your RDBMS storage assets and provides a hierarchical view of that information so you can drill down to view your those assets in greater detail. You can view information about RDBMS storage resources through the following views:

Asset Reporting View	Use these reports to...
Asset > By Computer	View the instances and their related objects based upon the computers on which they reside.
Asset > By DBMS Type	This node appears if you are using Data Manager for Databases to monitor more than one RDBMS. Expand this node to view asset information about instances organized according to their DBMS.
Asset > System-wide	Investigate all of your instances, databases, tablespaces, tables, container, data files, users and other assets for your *entire* system. **Note:** (UDB only) For the **All DBMSs** reports available under the **Asset > System-wide** reporting nodes, the Database-Tablespaces view shows information about UDB tablespaces only.

By Computer, By DBMS Type:

Learn about the reports available within the **By Computer** and **By DBMS Type** nodes within Asset reporting.

Asset Report Type	Use these reports to...	What's in these reports?
By Computer By Computer > *machine_name* > *instance/database_name* **By DBMS Type** By DBMS Type > *dbms_type* > *instance/database_name*	Drill down through your DBMS storage assets in a hierarchical manner according to the computers on which they reside or the DBMS to which they belong.	Depending on the DBMS of the Instance you want to view, you can drill down and expose its: • Tablespaces • Databases • Devices • Monitored tables • Containers • Data files • Fragments • Control files • Redo logs • Archive log directories

Asset Report Type	Use these reports to...	What's in these reports?
Instance Information **By Computer** By Computer > *machine_name* > *instance_name* **By DBMS Type** By DBMS Type > *dbms_type* > *instance_name*	View information about all of your monitored instances. Specifically, you can view information about the following information based upon DBMS type: **SQL Server** • Databases • Monitored Tables • Data Files **Oracle** • Tablespaces • Monitored Tables • Data Files • Control Files • Redo Logs • Archive Log Directories **Sybase** • Devices • Databases • Monitored Tables • Fragments **UDB** • Instances • Databases • Tablespaces • Tables • Containers • Users	**SQL Server** • RDBMS Type, Name, Version, Loginid • Number of Databases, Number of Datafiles, Number of Log Files • Total Size of all Storage, Capacity of Data Files, Free Space of Data Files, Capacity of Log Files, Free Space of Log Files • Probe Status, Last Probe Time **Oracle** *Database Information tab* • Name, Owner, Block Size, Log Mode, Status • Maximum Number of Instances, Number of Tablespaces, Maximum Number of Data Files, Number of Data Files, Maximum Number of Log Files, Number of Log Files • Total Size of all Storage, Capacity Of Data Files, Free Space of Data Files • Create Time, Discovered Time, Dropped Time *Instance Information tab* • RDBMS Type, Name, Version, Home Directory, Loginid, Port, Probe Status • Last Probe Time, Last Start Time, Discovered Time **Sybase** • RDBMS Type, Name, Version, Home Directory, Loginid, Port • Number of Databases, Number of Devices, Number of Fragments, Number of Log Fragments • Total Size of all Storage, Mirror Overhead, Capacity of Data Fragments, Free Space in Data Fragments, Capacity of Log Fragments, Free Space in Log Fragments • Probe Status, Last Probe Time **UDB** • RDBMS Type, Name, Version, Home Directory, Loginid, Port • Number of Tablespaces, Number of Containers, Number of Log Files • Total Size of all Storage, Container Capacity, DMS Container Free Space, Total Size of all Log Files • Probe Status, Last Probe Time

Asset Report Type	Use these reports to...	What's in these reports?
Oracle Detailed Instance Information **By Computer** By Computer > *machine_name* > *instance_name*	View information about the objects associated with a selected Oracle Instance.	• **Tablespaces**: When you expand the **Tablespaces** node, click the name of a tablespace to view information about that tablespace and its related data file. • **Monitored Tables**: When you expand the **Monitored Tables** node, click on the name of a table to view its information. Only the tables that belong to Table Groups included in scans will be available to view through this node. • **Data Files**: Click the **Data Files** node, click the name of a data file to view information about the data files associated with the Instance, including: Data File Path, Used Space, Percent Used, Free Space, Total Size, Coalesced Extents, Minimum Free Extent Size, Maximum Free Extent Size, and Create Time. • **Control Files**: Click this node to view information on the control files associated with the Instance, including the File Name (full path) and File Size. • **Redo Logs**: Click this node to view information on the redo logs associated with the Instance. – for Log Group: Sequence Number, Status, Archived, Total Size – for Log File: File Name (full path) • **Archive Log Directories**: Click this node to view information on the archive log directory associated with the Instance, including Directory Name, Size of Files, File Count, Status, Last Failure Time.
SQL Server Detailed Instance Information **By Computer** By Computer > *machine_name* > *server_name* **By DBMS Type** By DBMS Type > SQL/Server > *server_name*	View information about the objects associated with a selected SQL Server Instance.	• **Databases**: When you expand the **Databases** node, click the name of a Database to view information about that database, its related data file, and its related log file. • **Monitored Tables**: When you expand the **Monitored Tables** node, click on the name of a table to view its information including the computer, instances, and database on which is resides, as well as its creator, total size, empty used space, index size, number of indexes, row count, etc. Only the tables that belong to table groups included in scans will be available to view through this node. • **Data Files**: Click the **Data Files** node, click the name of a data file to view information about the data files associated with the Instance, including: Data File Path, Used Space, Percent Used, Free Space, Total Size, Coalesced Extents, Minimum Free Extent Size, Maximum Free Extent Size, and Create Time.

Asset Report Type	Use these reports to...	What's in these reports?
Sybase Detailed Instance Information **By Computer** By Computer > *machine_name* > *instance_name* **By DBMS Type** By DBMS Type > Sybase > *instance_name*	view information about the objects associated with a selected Sybase Instance.	• **Devices**: Click this node to view information about the Device associated with the Instance, including its name, computer on which it resides, path, free space, percent free, used space, total size, fragments, mirror path, etc. • **Databases**: When you expand the **Databases** node, click the name of a Database to view information about that database, its device information, and its related fragment information. • **Monitored Tables**: When you expand the **Monitored Tables** node, click on the name of a table to view its information including the computer, instances, and database on which is resides, as well as its creator, total size, empty used space, index size, number of indexes, row count, etc. Only the tables that belong to table groups included in scans will be available to view through this node. • **Fragments**: Click this node to view about the Fragments associated with the Instance including the computer, instances, and database on which they resides as well as their path, used space, percent used, free space, total size, data type, etc.
UDB Detailed Instance Information **By Computer** By Computer > *machine_name* > *instance_name* **By DBMS Type** >	view information about the objects associated with a selected UDB Instance.	• **Databases**: When you expand the **Databases** node, click the name of a databases to view information about that database. • **Monitored Tables**: When you expand the **Monitored Tables** node, click on the name of a table to view its information. Only the tables that belong to Table Groups included in scans will be available to view through this node. • **Containers**: Click the **Containers** node, click the name of a container to view information about the containers associated with the Instance, including: Database, Tablespace, Container Node, Container Name, Used Space, Percent Used, Free Space, Total Size, Container Type, Status, Discovered Time.

System-wide:

Use System-wide reports to view your RDBMS storage assets as a whole, across the storage environment

Asset Report Type	Use these reports to...	What's in these reports?
System-Wide **Asset** > **System-wide**	drill down through your DBMS storage assets in a hierarchical manner.	Depending on the DBMS of the Instance you want to view, you can drill down and display the following items. • Table spaces • Databases • Devices • Monitored tables • Containers • Data files • Fragments • Control files • Redo logs • Archive log directories
All DBMSs **Asset** > **System-wide** > **All DBMSs**	View information about all the DBMSs within your environment that is based on the objects that are related to those instances.	• **Instances**: Expand the **Instances** node and click the sorting method by which you want to view instances. • **Databases-Table spaces**: Expand **Databases-Table spaces** node and click the sorting method by which you want to view information about the databases and/or table spaces within your environment. • **Tables**: Expand the **Tables** node and click the sorting method by which you want to view tables. Only the tables that belong to table groups included in scans display within the reports that are viewed through this node. • **Files**: Expand the **Files** node and click the sorting method by which you want to view information about data files/containers. The viewable information includes File Path, Free Space, Percent Free, Used Space, Total Size, Create Time, and Discovered Time. • **Users**: Expand the **Users** node and click the sorting method by which you want to view the users who are consuming space on the monitored DBMS within your environment.

Asset Report Type	What's in these reports?
All DBMSs (continued)	• **Instances**: Expand the **Instances** node and click the sorting method by which you want to view instances. – By Instance: sort that is based on Instance name – By Version: sort that is based on the version of the DBMS under which an Instance is running – By Start Time: sort that is based on when an Instance was last started – By Probe Time: sort that is based on when an Instance was last probed – By RDBMS Type: sort that is based on the DBMS of an Instance • **Databases-Table spaces**: Expand the **Databases-Table spaces** node and click the sorting method by which you want to view information about the databases or table spaces within your environment. – By Database-Table space: sort that is based on DB/TB name – By Free space: sort that is based on the amount of free space on a DB/TB – By Total Size: sort that is based on the total size of a DB/TB – By Table Count: sort that is based on the number of tables on a DB/TB – By Scan Time: sort that is based on when a DB/TB was last scanned – By Discovered Time: sort that is based on when a DB/TB was discovered – Dropped Table spaces: sort that is based on dropped DBs or TBs. – By RDBMS Type: sort that is based on the DBMS of a DB/TB • **Tables**: Expand the **Tables** node and click the sorting method by which you want to view tables. Only the tables that belong to Table Groups included in scans display within the reports that are viewed through this node. – By Table: sort that is based on table name – By Number of Indexes: sort that is based on the number of indexes that are associated with a table – By Total Size: sort that is based on the total size of a table – By Row Count: sort that is based on the number of rows in a table – By Chained Row Count: sort that is based on the number of chained rows in a table – By Discovered Time: sort that is based on when a table was discovered – Dropped Tables: sort that is based on dropped tables – By RDBMS Type: sort that is based on the DBMS of a table • **Files**: Expand the **Files** node and click the sorting method by which you want to view information about DBMS files. – By File: sort that is based on file name – By Free Space: sort that is based on file free space – By Total Size: sort that is based on the total size of a file – By Discovered Time: sort that is based on when a file was discovered – By RDBMS Type: sort that is based on the DBMS of a file • **Users**: Expand the **Users** node and click the sorting method by which you want to view the users who are consuming space on the monitored DBMS within your environment.

Asset Report Type	What's in these reports?
Oracle **Asset > System-wide > Oracle**	• **Instances**: Expand the **Instances** node and click the sorting method by which you want to view instances. – By Instance: sort that is based on Instance name – By Version: sort that is based on the version of the DBMS under which an Instance is running – By Start Time: sort that is based on when an Instance was last started – By Probe Time: sort that is based on when an Instance was last probed • **Table spaces**: Expand this node and click the sorting method by which you want to view information about table spaces within your environment. – By Table space: sort that is based on table space name – By Max Free Extent: sort that is based on the maximum free extent size – By Free space: sort that is based on the amount of free space on a table space – By Total Size: sort that is based on the total size of a table space – By Coalesced Extents: sort that is based on the number of coalesced extents – By Table Count: sort that is based on the number of tables – By Scan Time: sort that is based on when a table space was last scanned – By Discovered Time: sort that is based on when a table space was discovered – Dropped Table spaces: sort that is based on dropped table spaces • **Tables**: Expand the **Tables** node and click the sorting method by which you want to view tables. Only the tables that belong to Table Groups included in scans display within the reports that are viewed through this node. – By Table: sort that is based on table name – By Number of Indexes: sort that is based on the number of indexes that are associated with a table – By Total Size: sort that is based on the total size of a table – By Row Count: sort that is based on the number of rows in a table – By Chained Row Count: sort that is based on the number of chained rows in a table – By Discovered Time: sort that is based on when a table was discovered – Dropped Tables: sort that is based on dropped tables • **Data Files**: Expand the **Data Files** node and click the sorting method by which you want to view information about DBMS files. – By Data File: sort that is based on file name – By Max Free Extent: sort data files that are sorted by their maximum free extent sizes – By Free Space: sort that is based on file free space – By Total Size: sort that is based on the total size of a file – With Auto-extend: sort data files that have auto-extend specified – Without Auto-extend: sort data files that do not have auto-extend specified – By Discovered Time: sort that is based on when a file was discovered • **Users**: Expand the **Users** node and click the sorting method by which you want to view the users who are consuming space on the monitored Oracle instances within your environment.

Asset Report Type	What's in these reports?
SQL Server **Asset** > **System-wide** > **SQL/Server**	• **Instances**: Expand the **Instances** node and click the sorting method by which you want to view instances. – By Instance: sort that is based on Instance name – By Version: sort that is based on the version of the DBMS under which an Instance is running – By Probe Time: sort that is based on when an Instance was last probed • **Databases**: Expand this node and click the sorting method by which you want to view information about databases within your environment. – By Database: sort that is based on database name – By Free space: sort that is based on the amount of free space on a database – By Total Size: sort that is based on the total size of a database – By Table Count: sort that is based on the number of tables in the database – By Scan Time: sort that is based on when a database was last scanned – By Discovered Time: sort that is based on when a database was discovered – Dropped Databases: sort that is based on dropped databases • **Tables**: Expand the **Tables** node and click the sorting method by which you want to view tables. Only the tables that belong to Table Groups included in scans display within the reports that are viewed through this node. – By Table: sort that is based on table name – By Number of Indexes: sort that is based on the number of indexes that are associated with a table – By Total Size: sort that is based on the total size of a table – By Row Count: sort that is based on the number of rows in a table – By Discovered Time: sort that is based on when a table was discovered – Dropped Tables: sort that is based on dropped tables • **Data Files**: Expand the **Data Files** node and click the sorting method by which you want to view information about data files. – By Data File: sort that is based on file name – By Free Space: sort that is based on file free space – By Total Size: sort that is based on the total size of a file – With Auto-extend: sort data files that have auto-extend specified – Without Auto-extend: sort data files that do not have auto-extend specified – By Discovered Time: sort that is based on when a file was discovered • **Users**: Expand the **Users** node and click the sorting method by which you want to view the users who are consuming space on the monitored SQL Server instances. – By Users: sort that is based on user names – By Discovered Time: sort that is based when a user was discovered

Asset Report Type	What's in these reports?
Sybase **Asset > System-wide > Sybase**	• **Instances**: Expand the **Instances** node and click the sorting method by which you want to view instances. – By Instance: sort that is based on Instance name – By Version: sort that is based on the version of the DBMS under which an Instance is running – By Probe Time: sort that is based on when an Instance was last probed • **Devices**: Expand this node and click the sorting method by which you want to view information about devices within your environment. – By Device: sort that is based on device name – By Free space: sort that is based on the amount of free space on a device – By Total Size: sort that is based on the total size of a device – By Fragments: sort that is based on the number of fragments for a device – By Discovered Time: sort that is based on when a device was discovered – Dropped Devices: sort that is based on dropped devices • **Databases**: Expand this node and click the sorting method by which you want to view information about databases within your environment. – By Database: sort that is based on database name – By Free space: sort that is based on the amount of free space on a database – By Total Size: sort that is based on the total size of a database – By Table Count: sort that is based on the number of tables in the database – By Scan Time: sort that is based on when a database was last scanned – By Discovered Time: sort that is based on when a database was discovered – By Last Dump Time: sort that is based on the date/time when devices were last dumped – Dropped Databases: sort that is based on dropped databases • **Fragments**: Expand this node and click the sorting method by which you want to view information about fragments. – By Fragments: sort that is based on fragment name – By Free Space: sort that is based on the free space in fragments – By Total Size: sort that is based on the total size of fragments – By Discovered Time: sort that is based on when fragments were discovered • **Tables**: Expand the **Tables** node and click the sorting method by which you want to view tables. Only the tables that belong to Table Groups included in scans display within the reports that are viewed through this node. – By Table: sort that is based on table name – By Number of Indexes: sort that is based on the number of indexes that are associated with a table – By Total Size: sort that is based on the total size of a table – By Row Count: sort that is based on the number of rows in a table – By Chained Row Count: sort that is based on the number of chained rows in a table – By Discovered Time: sort that is based on when a table was discovered – Dropped Tables: sort that is based on dropped tables • **Users**: Expand the **Users** node and click the sorting method by which you want to view the users who are consuming space on the monitored Sybase instances.

Asset Report Type	What's in these reports?
UDB **Asset** > **System-wide** > **UDB**	• **Instances**: Expand the **Instances** node and click the sorting method by which you want to view instances. – By Instance: sort that is based on Instance name – By Version: sort that is based on the version of the DBMS under which an Instance is running – By Probe Time: sort that is based on when an Instance was last probed • **Databases**: Expand this node and click the sorting method by which you want to view information about databases within your environment. – By Database: sort that is based on database name – By Free space: sort that is based on the amount of free space on a database – By Total Size: sort that is based on the total size of a database – By Table Count: sort that is based on the number of tables in the database – By Scan Time: sort that is based on when a database was last scanned – By Discovered Time: sort that is based on when a database was discovered – Dropped Databases: sort that is based on dropped databases • **Table spaces**: Expand this node and click the sorting method by which you want to view information about table spaces. – By Table space: sort that is based on table space name – By Free space: sort that is based on the free space in table spaces – By Total Size: sort that is based on the total size of table spaces – By Table Count: sort that is based on the number of tables that are associated with table spaces – By Scan Time: sort that is based on the date/time when table spaces were scanned – By Discovered Time: sort that is based on the date/time when table spaces were discovered – Dropped Table spaces: sort that is based on the names of dropped table spaces • **Tables**: Expand the **Tables** node and click the sorting method by which you want to view tables. Only the tables that belong to Table Groups included in scans display within the reports that are viewed through this node. – By Table: sort that is based on table name – By Number of Indexes: sort that is based on the number of indexes that are associated with a table – By Total Size: sort that is based on the total size of a table – By Row Count: sort that is based on the number of rows in a table – By Chained Row Count: sort that is based on the number of chained rows in a table – By Discovered Time: sort that is based on the date/time when a table was discovered – Dropped Tables: sort that is based on the names of dropped tables

Asset Report Type	What's in these reports?
	• **Containers**: Expand the **Containers** node and click the sorting method by which you want to view containers. – By Container: sort that is based on container name – By Free space: sort that is based on the free space in containers – By Total Size: sort that is based on the total size of containers – With Auto–extend: sort that is based on whether containers with Auto-extend on – Without Auto–extend: sort that is based on whether containers with Auto-extend off – By Discovered Time: sort that is based on the date/time when container were discovered • **Users**: Expand the **Users** node and click the sorting method by which you want to view the users who are consuming space on the monitored UDB instances.

Capacity reports:

Use Capacity reports to view the storage capacity, used space, and free space for your RDBMS objects.

Capacity enable you to view storage capacity at the computer, instance, database, device, fragment, container, and data file level. For a specific Instance, computer, group of computers, database, group of databases, tablespace, group of tablespaces, datafiles, containers, fragments, or all the computers in your enterprise, you can view the following:

- How much storage you have for a DBMS and the objects it contains
- How much storage is being used for a DBMS and the objects it contains
- What percentage of DBMS storage is free for expansion

All DBMSs Capacity reports:

Use these reports to view storage capacity information about the different RDBMS instances that you are monitoring within your environment.

Capacity Reporting View	Use these reports to...
Capacity > All DBMSs > Total Instance Storage	If you have multiple RDBMSs that you monitor using Data Manager, use this node to view detailed storage information about the different RDBMS instances within your environment. Depending on the RDBMS of the instance you want to view, use this report to view information about its: • RDBMS instance • RDBMS type • total size • file capacity • file free space • DB-TS count • file count • log file count

Oracle Capacity reports:

Use these reports to view storage capacity information about the Oracle instances that you are monitoring within your environment.

Capacity Reporting View	Use these reports to...
Oracle Capacity > Oracle **By Clauses** for these reports: • By Instance: sort based on Instance name • By Database: sort a report by database name • By Tablespace: sort a report by tablespace name • By Tablespace Group: view the desired storage information organized by tablespace group • By Datafile: sort based on file name • By Computer: sort based on the computer where the object's Instance resides • By Computer Group: view the desired storage information organized by computer group • Network-wide: view the desired storage information for your entire network	This node appears if you are using Data Manager for Databases to monitor Oracle instances. Expand this node to view the following information: • **Total Instance Storage.** Generate a report under this node to view detailed information about Oracle instances, including: – total size – file capacity – file free space – DB-TS count – file count – log file count • **Data File Used Space.** Generate a report under this node to view detailed information about the storage usage of datafiles associated with the tablespaces in an Instance, including: – tablespace – data file path – used space – percent used – free space – total size – free extents – coalesced extents – maximum free extent size • **Data File Free Space**. Generate a report under this node to view detailed information about the storage free space of datafiles associated with the tablespaces in an Instance, including: – tablespace – data free space – percent free – data used space – data size – free extents – coalesced extents – maximum free extent size

SQL Server Capacity reports:

Use these reports to view storage capacity information about the SQL Server instances that you are monitoring within your environment.

Capacity Reporting View	Use these reports to...
SQL Server Capacity > SQL/Server **By Clauses** for these reports: • By Instance: sort based on Instance name • By Database: sort a report by database name • By Database Group: view the desired storage information organized by database group • By Datafile: sort based on file name • By Computer: sort based on the computer where the object's Instance resides • By Computer Group: view the desired storage information organized by computer group • Network-wide: view the desired storage information for your entire network	This node appears if you are using Data Manager for Databases to monitor SQL Server instances. Expand this node to view the following information: • **Total Instance Storage.** Generate a report under this node to view detailed information about SQL Server instances, including: – total size – data file capacity – data file free space – log file capacity – log file free space – database count – data file count – log file count • **Data File Used Space.** Generate a report under this node to view detailed information about the storage usage of datafiles associated with the databases in an Instance, including: – database – data used space – percent used – data free space – data size – log used space – log percent used – log free space – log size – number data files • **Data File Free Space**. Generate a report under this node to view detailed information about the storage free space of datafiles associated with the databases in an Instance, including: – database – data free space – percent free – data used space – data size – log free space – log percent used – log used space – log size – number data files

Sybase Capacity reports:

Use these reports to view storage capacity information about the Sybase instances that you are monitoring within your environment.

Capacity Reporting View	Use these reports to...
Sybase Capacity > Sybase **By Clauses** for these reports: • By Device: sort based on Device name • By Instance: sort based on Instance name • By Fragments: sort based upon fragments • By Database: sort a report by database name • By Database Group: view the desired storage information organized by database group • By Datafile: sort based on file name • By Computer: sort based on the computer where the object's Instance resides • By Computer Group: view the desired storage information organized by computer group • Network-wide: view the desired storage information for your entire network	This node appears if you are using Data Manager for Databases to monitor Sybase instances. Expand this node to view the following information: • **Total Instance Storage.** Generate a report under this node to view detailed information about Sybase instances, including: – total device size – mirrored device size – device free space – data fragment capacity – data fragment free space – log fragment capacity – log fragment free space – device count – database count – fragment count – log fragment count • **Device Used Space.** Generate a report under this node to view detailed information about the storage usage of devices associated with instances, including: – Instance – device path – used space – percent used – free space – total size – number fragments – mirror path – number devices • **Device Free Space**. Generate a report under this node to view detailed information about the storage free space of devices associated instances, including: – Instance – device path – free space – percent free – used space – total size – number fragments – low, high – mirror path – number devices

Capacity Reporting View	Use these reports to...
Sybase (continued)	• **Fragment Used Space.** Generate a report under this node to view detailed information about the storage usage of fragments associated with databases, including: – Instance – fragment path – database – data used space – percent used – data free space – data size – data type – log used space – log percent used – log free space – log size – number fragments • **Fragment Free Space**. Generate a report under this node to view detailed information about the storage free space of fragments associated databases, including: – Instance – fragment path – database – data free space – percent free – data used space – data size – log free space – log used space – log percent used – log used space – log size – number fragments

UDB Capacity reports:

Use these reports to view storage capacity information about the UDB instances that you are monitoring within your environment.

Capacity Reporting View	Use these reports to...
UDB Capacity > UDB **By Clauses** for these reports: • By Container: sort based on Container name • By Tablespace: sort based on Tablespace name • By Database: sort a report by database name • By Database Group: view the desired storage information organized by database group • By Instance: sort based on Instance name • By Computer: sort based on the computer where the object's Instance resides • By Computer Group: view the desired storage information organized by computer group • Network-wide: view the desired storage information for your entire network	This node appears if you are using Data Manager for Databases to monitor UDB instances. Expand this node to view the following information: • **Total Instance Storage.** Generate a report under this node to view detailed information about UDB instances, including: – total size – container capacity – container free space – log file capacity – tablespace count – container count – log file count – log mode • **Container Used Space.** Generate a report under this node to view detailed information about the storage usage of containers associated with a tablespace, including: – Instance – database – tablespace – container node – container name – used space – percent used – free space – total size – container type – status – discovered time • **Container Free Space**. Generate a report under this node to view detailed information about the storage free space of containers associated with a tablespace, including: – Instance – database – tablespace – container node – container name – free space – percent free – used space – total size – container type – status – discovered time

Usage reports:

Use Usage reports to monitor and report on the usage and growth of the storage consumption for your databases, tablespaces, tables, segments, and users.

Use these reports to do the following:

- View detailed information for tablespaces and databases including their total size, used space, empty used space, # of tables and indexes, etc.
- Identify the tables consuming the most space within your environment. You can view this information at the tablespace, database, and computer level, as well as at a network-wide level.
- (Oracle) Identify the segments with the most extents and most empty used space. You can view this information at the tablespace, database, and computer level, as well as at a network-wide level.
- Associate users with the amount of storage they are consuming on specific databases, groups of databases, tablespaces, groups of tablespaces, specific computers, groups of computers, and throughout the entire network.

All DBMS Usage reports:

Use these reports to view storage usage information about the different RDBMS instances that you are monitoring within your environment.

Usage Reporting View	**Use these reports to...**
Usage > All DBMSs	If you have multiple RDBMSs that you monitor using Data Manager, use this node to view detailed storage information about the different RDBMS instances within your environment.
Usage > All DBMSs > Databases-Tablespaces	view storage usage statistics about the databases and tablespaces with your monitored DBMSs. Some of the information you can view through these reports includes: • database name, tablespace name • computer • Instance • Instance type • total size • used space • empty used space • table count • index count • other count
Usage > All DBMSs > Tables	view storage usage statistics about the tables with your monitored DBMSs. Some of the information you can view through these reports includes the following: • Largest tables • Total size • Creator • Table name • Empty used space • Index size • Row count • Chained row count

Usage Reporting View	Use these reports to...
Usage > All DBMSs > Users	associate users with the amount of storage they are consuming on specific DBMS objects, specific computers, groups of computers, and throughout the entire network. • **Group by User Name**: select the users and then the resources on which you want to report storage consumption. For example, when setting up a report to view user storage consumption on an Oracle or UDB tablespace, you must do the following: – Select the users upon which you want to report – Select the tablespaces whose storage consumption by the selected users you want to view • **Group by Resource**: select the resources and then the users on which you want to report storage consumption. For example, when setting up a report to view storage consumption on Oracle or UDB tablespaces for users, you must do the following: – Select the tablespaces upon which you want to report – Select the users whose storage consumption on the selected tablespaces you want to view

Oracle Usage reports:

Use these reports to view storage usage information about the Oracle tablespaces, tables, segments, and users that you are monitoring within your environment.

Usage Reporting View	Use these reports to...
Oracle Usage > Oracle **By Clauses** for these reports: • By Database—sort a report by database name • By Tablespace—sort a report by tablespace name • By Tablespace Group—view the desired storage information organized by tablespace group • By Table—sort a report by table name • By Table Group—view the desired storage information organized by table group • By Computer—sort based on the computer where the object's Instance resides • By Computer Group—view the desired storage information organized by computer group • Network-wide—view the desired storage information for your entire network	This node appears if you are using Data Manager for Databases to monitor Oracle instances. Expand this node to view the following information: • **Tablespaces.** View detailed information for tablespaces including the following: – Instance – Database – Total size – Used space – Empty used space – Freelist blocks – Table count – Index count • **Tables.** Identify the tables consuming the most space within your environment. You can view this information at the tablespace, database, and computer level, as well as at a network-wide level. Some of the information in these reports includes the following: – Table name – Total size – Empty used space – Index size – Freelist blocks – Number partitions – Number indexes – Number segments – Number extents – Percent free, used

Usage Reporting View	Use these reports to...
Oracle Usage → Oracle **By Clauses** for these reports: • By Database—sort a report by database name • By Tablespace—sort a report by tablespace name • By Tablespace Group—view the desired storage information organized by tablespace group • By Table—sort a report by table name • By Table Group—view the desired storage information organized by table group • By Computer—sort based on the computer where the object's Instance resides • By Computer Group—view the desired storage information organized by computer group • Network-wide—view the desired storage information for your entire network	This node appears if you are using Data Manager for Databases to monitor Oracle instances. Expand this node to view the following information: • **Segments**. Identify the segments with the most extents and most empty used space. Some of the information in these reports includes the following: – Number extents – Segment name, creator – Tablespace – Parent name, creator – Total size – Empty used space – Number extents – Freelist blocks, groups • **Users**. Associate users with the amount of storage they are consuming on specific databases, tablespaces, groups of tablespaces, specific computers, groups of computers, throughout the entire network, and applied Quotas. Some of the information included in these reports includes the following: – Computer, instance, database, tablespace – Total size – Empty used space – Table count – Index count – Largest segment, 2nd largest segment – Segment sizes: <50Kb, 500Kb-100Mb, 1Mb-10Mb, 10Mb-100Mb, 100Mb-500MB, 500Mb-1Gb, >1Gb – Quota name – Percent of Quota – Quota threshold

SQL Server Usage reports:

Use these reports to view storage usage information about the SQL Server databases, tables, and users that you are monitoring within your environment.

Usage Reporting View	Use these reports to...
SQL Server Usage > SQL/Server **By Clauses** for these reports: • By Instance: sort based on Instance name • By Database: sort a report by database name • By Database Group: view the desired storage information organized by database group • By Computer: sort based on the computer where the object's Instance resides • By Computer Group: view the desired storage information organized by computer group • Network-wide: view the desired storage information for your entire network • By User Quota: sort based upon the users to which Quotas are applied. A user who has not violated a quota will not appear in this report.	This node appears if you are using Data Manager for Databases to monitor storage usage on SQL Server instances. Expand this node to view the following information: • **Databases.** Generate a report under this node to view detailed information about the storage on SQL Server databases, including the following: – Total size – Used space – Empty used space – Table count – Index count • **Tables.** Identify the tables consuming the most space within your environment. You can view this information at the table, database, and computer level, as well as at a network-wide level. Some of the information in these reports includes the following: – Table name – Total size – Empty used space – Index count – Row count • **Users**. Associate users with the amount of storage they are consuming on specific databases, groups of databases, specific computers, groups of computers, throughout the entire network, and applied Quotas . Some of the information in these reports includes the following: – Computer, instance, database – Total size – Empty used space – Table count – Index count – Largest object, 2nd largest object – Object sizes: <50Kb, 500Kb-100Mb, 1Mb-10Mb, 10Mb-100Mb, 100Mb-500MB, 500Mb-1Gb, >1Gb – Quota name – Percent of Quota – Quota threshold

Sybase Usage reports:

Use these reports to view storage usage information about the Sybase databases, tables, and users that you are monitoring within your environment.

Usage Reporting View	Use these reports to...
Sybase Usage > Sybase • By Database: sort a report by database name • By Database Group: view the desired storage information organized by database group • By Computer: sort based on the computer where the object's Instance resides • By Computer Group: view the desired storage information organized by computer group • Network-wide: view the desired storage information for your entire network • By User Quota: sort based upon the users to which Quotas are applied. A user who has not violated a quota will not appear in this report.	This node appears if you are using Data Manager for Databases to monitor storage usage on Sybase instances. Expand this node to view the following information: • **Databases.** Generate a report under this node to view detailed information about the storage on Sybase databases, including the following: – Database name, computer, instance – Total size – Used space – Empty used space – Table count – Index count • **Tables.** Identify the tables consuming the most space within your environment. You can view this information at the table, database, and computer level, as well as at a network-wide level. Some of the information in these reports includes the following: – Table name, database, computer, Instance, creator – Total size – Empty used space – Index size – Maximum rows per page – Expected row size – Fill factor – Page gap – Average row length – Row count • **Users**. Associate users with the amount of storage they are consuming on specific databases, groups of databases, specific computers, groups of computers, throughout the entire network, and applied Quotas. Some of the information included in these reports includes the following: – Computer, instance, database – Total size – Empty used space – Table, index count – Largest object, 2nd largest object – Object sizes: <50Kb, 500Kb-100Mb, 1Mb-10Mb, 10Mb-100Mb, 100Mb-500MB, 500Mb-1Gb, >1Gb – Quota name – Percent of Quota – Quota threshold

UDB reports:

Use these reports to view storage usage information about the UDB tablespaces, tables, and users that you are monitoring within your environment.

Usage Reporting View	Use these reports to...
UDB Usage > UDB • By Tablespace: sort a report by tablespace name • By Tablespace Group: view the desired storage information organized by tablespace group • By Database: sort a report by database name • By Instance: sort a report by Instance name • By Computer: sort based on the computer where the object's Instance resides • By Computer Group: view the desired storage information organized by computer group • Network-wide: view the desired storage information for your entire network	This node appears if you are using Data Manager for Databases to monitor storage usage on UDB instances. Expand this node to view the following information: • **Tablespaces.** Generate a report under this node to view detailed information about the storage on UDB tablespaces, including the following: – Database name, computer, instance – Total size – Used space – Empty used space – Table count – Index count • **Tables.** Identify the tables consuming the most space within your environment. You can view this information at the table, database, and computer level, as well as at a network-wide level. Some of the information in these reports includes the following: – Table name, database, computer, Instance, creator – Total size – Empty used space – Index size – Maximum rows per page – Expected row size – Fill factor – Page gap – Average row length – Row count **Note:** When viewing reports under the **Monitored Tables** node, keep in mind that a table will appear in this report if: 1) it is included in the definition of a table group and 2) the table group in which it is included is defined as part of a scan. • **Users**. Associate users with the amount of storage they are consuming on specific UDB instances, tablespaces, groups of tablespaces, computers, groups of computers, and throughout the entire network. Some of the information included in these reports includes the following: – Computer, instance – Total size – Empty used space – Table, index count – Largest object, 2nd largest object – Object sizes: <50Kb, 500Kb-100Mb, 1Mb-10Mb, 10Mb-100Mb, 100Mb-500MB, 500Mb-1Gb, >1Gb – Quota name – Percent of Quota – Quota threshold

Usage Violation reports:

Use Usage Violation reports to view information about quota violations and help enforce corporate storage usage policies.

With quotas, you can control how much storage a user, or a group of users, can consume on the following:

- Database or group of databases
- Tablespace or group of tablespaces

- Instance
- Throughout the entire network

The following table contains information about Usage Violation reports:

Usage Violation Reporting Type	Use these reports to...	What's in these reports?
Quota Violations Usage Violations > Quota Violations	identify the quota violations within the environment	
All Quotas Usage Violations > Quota Violations > All Quotas	view all the quotas and quota violations in the environment • **By User**. View information about the users who have violated quotas. • **By User Quota**. View information about the quotas that have been violated.	• User name • RDBMS type • Instance • Database-tablespace • Space used • Threshold • % of threshold • Number of violations • Quota creator • Quota name • Quota type
Network Wide Quotas Usage Violations > Quota Violations > Network-wide Quotas	view quota violations at the network-wide level • **By User**. View information about the users who have violated quotas. • **By User Quota**. View information about the quotas that have been violated and which users have violated them.	• User name • Space used • Threshold • % of threshold • Number of violations • Quota creator • Quota name • Quota type
Instance Quotas Usage Violations > Quota Violations > Instance Quotas	view quota violations at the Instance level • **By Instance**. View Instance quota violations sorted by Instance • **By Computer**. View Instance quota violations sorted by computer • **By Computer Group**. View Instance quota violations sorted by computer group • **By User**. View Instance quota violations sorted by users • **By User Quota**. View Instance quota violations sorted by quota	• Computer • RDBMS type • Group creator (by group clauses only) • Group name (by group clauses only) • Instance • Database-tablespace • User name • Space used • Threshold • % of threshold • Number of violations • Quota creator • Quota name • Quota type

Usage Violation Reporting Type	Use these reports to...	What's in these reports?
Database-Tablespace Quotas Usage Violations > Quota Violations > Database-Tablespace Quotas	view quota violations at the tablespace level • **By Database-Tablespace**. View quota violations sorted by the database or tablespace name on which the violation occurred • **By Database-Tablespace Group**. View quota violations sorted by the database or tablespace group in which the violation occurred • **By Instance**. View database or tablespace quota violations sorted by Instance • **By Computer**. View database or tablespace quota violations sorted by computer • **By Computer Group**. View database or tablespace quota violations sorted by computer group • **By User**. View database or tablespace quota violations sorted by users • **By User Quota**. View database or tablespace quota violations sorted by quota	• Computer • Group creator (by group clauses only) • Group name (by group clauses only) • Instance • Database-tablespace • User name • Space used • Threshold • % of threshold • Number of violations • Quota creator • Quota name • Quota type

Data Manager for Chargeback reports

Use invoices generated by Data Manager for Chargeback to charge users or groups of users for storage usage within a storage environment.

See "Working with invoices" on page 620 for information about how to use Data Manager for Chargeback to generate invoices.

Disk Manager reports

Use Disk Manager reports to view the relationships among the components of a storage subsystem and the storage capacity. The capacity can be for a computer, file system, storage subsystem, volume, Array Sites, Ranks, and disk.

Reporting on storage subsystems:

Learn how to use Disk Manager to report on storage subsystems.

Through these reports, you can view the relationships among the components of a storage subsystem. Storage subsystems reports use data that is gathered by probes.

To ensure the accuracy and consistency of the data that is displayed in storage subsystem reports, run regularly scheduled probes against the hosts that use or import volumes, and the storage subsystems upon which you want to report. Run probes against storage subsystems after you run them against any host.

- A disk must be partitioned before it is considered a logical volume by Disk Manager. If a disk is not partitioned, it is not included in a file system or logical volumes report.
- Before you begin, you might want to refer to Generating and viewing reports. That section provides information on reports that applies all IBM Tivoli Storage

Productivity Center reports. It describes the types of reports: system, user-defined, and batch. It also describes how to save reports and how to customize reports, such as filtering information and displaying the information in chart form.

You can view storage subsystem reports in the following ways:

Disks Use these reports to view and chart the storage capacity of storage subsystem disks. Use By clauses to filter the storage entities that are displayed in a report. For example, if you want to view a report that displays specific disks, select **By Disk**; if you want to view the disks of specific storage subsystems, select **By Storage Subsystem**.

Volumes
Use these reports to view and chart the storage capacity of storage subsystem volumes. Use the **By Storage Subsystems** and **By Storage Subsystem Group** clauses to filter the storage entities that display in a report. Use the **By Volume Space** and **By Probe Time** clauses to sort the volumes that display in a report according to when a volume was probed or the capacity of a volume.

Storage Pools
Use these reports to view and chart the storage capacity of storage pools. Use By clauses to filter the storage entities that display in a report. For example, if you want to view a report that displays information about the storage pools for specific storage systems, select **By Storage Subsystem**.

Array Sites
Use these reports to view information about the array sites that are on storage subsystems. Use By clauses to filter the storage entities that display in a report. For example, if you want to view a report that displays about the array sites for specific groups of storage subsystems, select **By Storage Subsystem Group**.

Disk Groups
Use these reports to view information about the disk groups that are on storage subsystems. Use the By clauses to filter the storage entities that display in a report. For example, if you want to view a report that displays about the disk groups for specific storage subsystems, select **By Storage Subsystem**.

Ranks Use these reports to view information about the ranks that are on storage subsystems. Use the By clauses to filter the storage entities that display in a report. For example, if you want to view a report that displays about the ranks for specific groups of storage subsystems, select **By Storage Subsystem Group**.

Computer Views
Use these reports to view the relationships between the computer and the storage subsystems, volumes, and disks in your environment. The information is gathered from the viewpoint of the computer. For reporting purposes, *computer* is defined as a system that is running Tivoli Storage Productivity Center.

Restriction: These reports are available only if the following steps are done.

- A Storage Resource agent is installed on a system where a volume is surfaced
- A probe is run against the system where the volume is located

- A probe is run against the storage subsystem or IBM SAN Volume Controller cluster

By Computer

These reports view relationships between the computer and the storage subsystems, volumes, or disks in your environment. To generate a report by computer, select the **By Computer** node and choose an item from the **Relate Computers to:** field.

For example, to retrieve information on computers in your environment and their volumes, select the **By Computer** node and then choose **By volumes**. These settings generate a report that details all computers with agents on them, which use volumes from the monitored storage subsystems.

By Computer Group

These reports view relationships between the computer groups (both monitoring and reporting groups) and the storage subsystems, volumes, or disks in your environment. To generate a report by computer group, select the **By Computer group** node and choose an item from the **Relate Computers to:** field.

For example, to retrieve information on computers in a group that use storage from monitored storage subsystems, select the **By Computer Group** node and then choose **Storage Subsystems** from the **Relate Computers to:** field. These settings generate a report that details all computers in groups with agents on them, which use volumes from the monitored storage subsystems.

By File System/Logical Volume

These reports view the relationships between the file systems or logical volumes and the storage subsystems, volumes, and disks in your environment. To generate a report for the relationship you want to view, select the **By File System/Logical Volume** node and choose an item from the **Relate File System/Logical Volume to:** field.

For example, to retrieve information on file systems or logical volumes that use storage from monitored storage subsystems, select the **By File System/Logical Volume** node and choose **By Storage Subsystems**. These settings generate a report that details all file systems or logical volumes that use storage from monitored storage subsystems.

By File System Group

Use this report to view the relationships between the file system groups (both monitoring and reporting) and the storage subsystems, volumes, and disks in your environment. To generate a report for the relationship you want to view, select the **By File System Group** node and choose an item from the **Relate File System/Logical Volume to:** field.

For example, to retrieve information on file systems in a group that use storage from monitored storage subsystems, select the **By File System Group** node and choose **Storage Subsystems** from the **Relate File System/Logical Volume to:** field. These settings generate a report that details all file systems in a group that use storage from monitored storage subsystems.

Storage Subsystem Views

Use these reports to view the relationships among the storage subsystem components (storage subsystems, volumes, and disks) to the computers and file systems or logical volumes in your environment.

Note: These reports are available only if the following steps are performed.

- A Storage Resource agent is installed on a system where a volume is surfaced
- A probe is run against the system where the volume is located
- A probe is run against the storage subsystem or IBM SAN Volume Controller cluster
- For IBM XIV Storage System, there is no relationship between storage disks, pools, and volumes because of the unique storage disk distribution and architecture.

By Storage Subsystem

These reports view the relationships between the storage subsystems and the computers and file systems or logical volumes in your environment. To generate a report for the relationship you want to view, select the **By Storage Subsystem** node and choose an item from the **Relate Storage Subsystem to:** field.

For example, to view all storage subsystems that have storage that is being used by computers in the environment, select **By Storage Subsystem** and choose **Computers**. These settings generate a report that details all storage subsystems that have storage that is being used by computers in the environment.

By Storage Subsystem Group

These reports view the relationships between storage subsystem groups (both monitoring and reporting) and the computers and file systems or logical volumes in your environment. To generate a report for the relationship you want to view, select the **By Storage Subsystem Group** node and choose an item from the **Relate Storage Subsystem to:** field.

For example, to view all storage subsystem groups that have storage that is used by computers in the environment, select **By Storage Subsystem Group** and choose **Computers** from the **Relate Storage Subsystem to:** field. These settings generate a report that details all storage subsystem groups that have storage that is used by computers in the environment.

By Volume

Use this report to view the relationships between the volumes and the computers and file systems or logical volumes in your environment. To generate a report for the relationship you want to view, select the **By Volume** node and then choose an item from the **Relate Volumes to:** field.

For example, to get a listing of all volumes in the environment on which file systems or logical volumes are created, select **By Volume** and select **File Systems/Logical Volumes** from the **Relate Volumes to:** field. These settings generate a report that details all volumes in the environment on which file systems or logical volumes are created.

To get a listing of all volumes in the environment that are being used by computers in the environment, select **By Volume** and choose **Computers**. These settings generate a report that details all volumes in the environment that are being used by computers in the environment.

Disks Use this report to view the relationships between disks and the computers and file systems or logical volumes in your environment. To generate a report for the relationship you want to view, select the **Disks** node and then choose an item from the **Relate Disks to:** field.

For example, to get a listing of all storage subsystem disks in the environment on which file systems or logical volumes are created, select **Disks** and select **File Systems/Logical Volumes**. These settings generate a report that details all storage subsystem disks in the environment on which file systems or logical volumes are created.

Volume to HBA Assignment

Use these reports to view all the logical unit numbers (volumes) of each probed storage subsystem that is assigned to at least one host bus adapter (HBA) port worldwide name (WWN). These reports retrieve data only from systems that have HBAs.

The HBA is a Fibre Channel and volumes are physically attached to the storage subsystem.

By Storage Subsystem

This report shows all the volumes of each probed storage subsystem that is assigned to at least one HBA Port WWN. This report is sorted by storage subsystem name.

By Volume Space

This report views all the volumes of each probed storage subsystem that is assigned to at least one HBA Port WWN. This report is sorted by volume space.

Not on Monitored Computers

This report shows only volumes that are assigned to HBA Port WWNs on hosts with no Storage Resource agent installed on them.

Not Visible to Monitored Server

Use this report to find volumes that are assigned to hosts with Storage Resource agents, but not configured. This report can be used to generate a list of all volumes that must be configured before they are used.

Volume to Backend Volume Assignment By Volume

Use this report to view the relationships between the virtual disks (including mirror copies) and managed disks that are associated with a virtualizer storage subsystem, such as the SAN Volume Controller, and the back-end storage volumes that are associated with those managed disks.

Note: A virtual disk with one mirror copy is displayed as one row in the table. A virtual disk with multiple mirror copies is displayed in multiple rows in the table. Each row represents one of the copies.

Important: Some of the columns in the totals row for these reports can count storage multiple times if the report includes information.

- A storage virtualizer like a SAN Volume Controller
- The disk arrays that host the backend storage to a storage virtualizer like a SAN Volume Controller

In this situation, disks and logical unit numbers (LUNs) seem to belong to both a storage virtualizer like SAN Volume Controller and the disk arrays. LUNs are counted multiple times in some of the columns in the totals row. To avoid this situation, filter the report to display only the storage virtualizer or the disk arrays. If this situation is unavoidable, then some of the columns in the totals row can be adjusted as follows:

1. Use the **Physical Disk Space** column to determine the actual physical disk space on all arrays. This disk space is not counted multiple times.
2. Sum the **Disk Space** column for the disk arrays and subtract this result from the totals row to determine the total backend storage for a virtualizer.
3. To prevent counting the back-end volumes multiple times, subtract the **Backend Volume Space** column from the **Volume Space** column in the totals row to determine the amount of volume space.

In the topology of a subsystem, the **Backend Volume Space** column displays the total amount of back-end space available to the subsystem. This space is the total capacity of the managed disks on the SAN Volume Controller, not the internal disk storage space. In other reports, Backend Volume Space refers to the space that a storage subsystem makes available to a storage virtualizer. These reports include:

- Reports that are generated through Data Manager.
- Reports that are generated through Disk Manager.
- Rollup reports.
- **Data Manager** > **Reporting** > **Asset** > **By Storage Subsystem** reports.

Generating storage-subsystem reports:

Learn how to generate a storage subsystem report.

These reports are available only if the following steps have been performed:

1. An agent is installed on a machine where a volume is surfaced.
2. A probe has been run against the machine where the volume is located.
3. A probe has been run against the storage subsystem or SAN Volume Controller cluster.

To generate a storage-subsystems report, do the following:

1. In the navigation tree, expand **Disk Manager** > **Reporting** > **Storage Subsystems**.
2. Do one of the following:
   a. In the navigation tree, expand **Computer Views** and click one of the following:
      - By Computer
      - By Computer Group
      - By Filesystem/Logical Volume
      - By Filesystem Group
   b. In the navigation tree, expand **Storage Subsystems Views** and click one of the following:
      - By Storage Subsystem

- By Storage Subsystem Group
- By Volume
- Disks

c. In the navigation tree, expand **Volume to HBA Assignment** and click one of the following:
   - By Storage System
   - By Volume Space
   - Not On Monitored Computers
   - Not Visible to Monitored Computers

d. In the navigation tree, expand **Volume to Backend Volume Assignment** and click the following:
   - By Volume

3. The **Storage Subsystem Performance** pane for your selected storage subsystem opens the Select Resources pane. All valid available resources are listed in Included Columns. In Available Columns and Included Columns, use and to select the columns you want to include in your report.
4. Filters can be applied to the selected columns. In the **Report Filter Specification** area, the **Filter** button opens the **Edit Filter** window.
   a. Click **Add** to add a column to the filter list. The columns will be added in the order they appear on your report.
   b. Click **Delete** to delete all columns. Click the X for an individual column to delete it.
   c. In the **Records Must Meet** area, select **All Conditions** or **At Least One Condition**.
   d. Type the condition value in the **Value 1** text field.
      - If the text field is greyed-out, click **Edit**.
      - If you wish to add additional values for the same column using the same operator, click **Edit**.
   e. Select the Operator.
      - If you select the BETWEEN or NOT BETWEEN operators, two value text fields will open for a lower-limit value and an upper-limit value. Click **Edit** to enter the upper-limit value and lower-limit value. You must input values in both **Value 1** and **Value 2** fields, if shown.
      - For numeric columns, such as Free Space, a pull-down menu at the end of the each field assists you with numerical units.
   f. Once your selections have been made, click **OK**.
5. Click **Generate Report**. The report appears under a new tab window. If there is no data, as in if a probe has not been run, the window will say "No Data To Display."
6. Click **File** > **Save**. The report is saved under **IBM Tivoli Storage Productivity Center** > **My Reports**. Reports can be regenerated from that node.

To change the parameters for your report, or create a new report of the same type, do the following:

1. Click the **Selection** tab before closing the Storage Subsystem Performance window. Make the necessary changes.
2. Click **Generate Report**.
3. Click **File** > **Save** and enter the name of the new report.

4. Click **OK**.

Creating a storage subsystem performance report:

Learn how to create a storage-subsystem performance report.

Before you can view a performance report on a storage subsystem, that subsystem must have been discovered and had performance data successfully collected.

For a complete list of metrics available for performance reports, see "Performance metrics" on page 1701.

1. In the navigation tree pane, expand **Disk Manager** > **Reporting** > **Storage Subsystem Performance**.
2. Click the type of performance report that you want to view. You can choose from the following performance reports:

   By Storage Subsystem
   This report contains performance information for storage subsystems.

   By Controller
   This report contains performance information for controllers.

   By I/O Group
   This report contains performance information for I/O groups.

   By Node
   This report contains historical performance data for SAN Volume Controller (SVC) nodes.

   By Array
   This report contains performance information for arrays.

   By Managed Disk Group
   This report contains performance information for managed-disk groups.

   By Volume
   This report contains performance information for volumes.

   By Managed Disk
   This report contains performance information for managed disks.

   By Port
   This report contains performance information for ports.

   In the content pane, the Selection page opens.
3. Select from the following options to customize the report:

   Selection button
   Click this button to determine the resources upon which you want to report, such as the storage subsystems, the fibre-channel ports, and so forth. The Select Resources window displays. The type of resources displayed for selection depends on the type of report you selected. For example, if you selected a By Storage Subsystem report, all displayed resources will be storage subsystems. If you clear the box for a resource on the Select Resources window, a pushpin icon displays on the Selection button.

   Filter button
   Click this button to further defines the data that you want to include in the report. Filters enable you to apply general rules to the report. When you click this button, the Edit Filter window displays.

For example, to select only data associated with subsystems that have a name ending with "123–IBM", select the "Subsystem" column, the "LIKE" operator, and type "*123–IBM" (without the quotation marks) in the Value 1 field. To select only data which has a Read I/O Rate greater than 0, select the "Read I/O Rate (overall)" column, the ">" operator, and type "0" (without the quotation marks) in the Value 1 field.

If a filter is defined for this report, a pushpin icon displays on the **Filter** button.

Time range selectors

All performance reports display historical performance data. Use the time range selectors to specify the exact time range that you want the report to cover. Click one of the following radio buttons to select the type of historical report you want:

Display latest performance data

This report contains only the latest available performance data for the selected resources. Note that even the latest data available might still be somewhat old, depending on whether data was recently collected for the resources. Including the time column in the report will help you determine how old the latest available data actually is. Regardless of the age of the data, clicking this button ensures that only a single row (representing a single point in time) for each selected resource is included in the report. If no data has ever been collected for a particular resource, then that resource is not included in the report. If no data has ever been collected for any resource, then the resulting report will be empty.

Display historic performance data using absolute time

This report contains only data that falls within a specific time range. Select the time range using the **From** and **To** selectors. The specified from and to values are interpreted as inclusive. The resulting report contains all the performance data that is available within the specified time range, for each selected resource. This means that the data can consist of potentially many rows per resource, each with a unique timestamp. If no data has been collected for a particular resource during the specified time range, that resource is not included in the report. If no data has been collected for any resource during the specified time range, then the resulting report will be empty.

To determine which historical performance records fall within the specified time range, the **beginning timestamp** of the collection intervals is used for comparison. If an historical record contains performance data for an interval of time from 1:00 PM to 1:05 PM, that record would be included in the report for a time range of 1:00 PM to 8:00 PM. However, that same record would not be included if a time range of 1:02 PM to 8:02 PM was specified, because it is the beginning of the time period (for example, 1:00 PM in this example) that is used to determine inclusion in the specified time interval.

Display historic performance data using relative time

This report contains only data that falls within a specific time range extending backward from the current date and time. Specify the number of days in the desired time range, using the **days ago until now** field. The report will be exactly the same

as a report using absolute time, with the **To** selector set to the current date and time, and the **From** selector set to the current date and time minus the number of **days ago until now**.

Note that the same criteria applies as if determining which historical performance records fall within the specified time range. Only the beginning timestamp of the collection intervals is used for comparison. This means that data for the current hour or the current day is not included in the report when selecting hourly or daily summation data, because data for the current hour or current day is only saved in the database when the hour or day is complete. As an alternative, consider using the first radio button, **Display latest performance data**, to see a report showing the most recent daily summation data.

Summation Level

Use this selector to select which type of performance data records to include in the report. The Tivoli Storage Productivity Center Performance Manager collects and stores three different types of performance data:

By sample

Represents the most detailed data. There is usually one sample record per resource for every **n** minutes, where **n** is the performance monitor interval length that was specified when the monitor was defined. Each sample represents the average performance of the resource over those **n** minutes. A sample record with a timestamp of **t** will be saved at time **t+n**. In other words, the beginning of each **n** minute time interval is used for display and for time range matching.

Hourly

Represents an hourly average of the performance of the specified resources. There will be one hourly record written every hour, per resource. Each such record will be written at or shortly after each hour mark on the (device) clock. For example, a record with a timestamp of 12:00 PM and interval length of 1 hour will be written at 1:00 PM.

Daily Represents a daily average of the performance of the resources. There will be one daily record written every day, per resource. Each daily record will be written at or shortly after midnight, according to the device clock. For example, a record with a timestamp of April 21, 12:00 AM and interval length of 24 hours will be written on April 22, 12:00 AM.

Note that hourly and daily records are usually retained in the database for longer periods of time, compared to By Sample records. As a result, if a generated report indicates that sample data is no longer available for a particular time range in the past, it is possible that the sample data has already been purged, in which case you can try generating the report using hourly or daily summation levels.

Be aware that when selecting a time range using the **Display historic performance data using relative time** radio button, it is necessary to select the length of the range in days. This can lead to unexpected results when also selecting the daily summation level. Remember that a daily record is not written until the day is complete, which means that at any given time during the day, the current day's data does not yet

exist in the database. Therefore, selecting the daily summation level as well as a relative time range of n **days ago until now**, will usually result in n-1 records being returned per resource, assuming that at least n-1 days worth of data has been previously collected for those resources. Specifying a relative time range of 1 **days ago until now** will result in an empty report.

Note: The user interface displays the date and time of data in the Tivoli Storage Productivity Center server time zone, but the daily and hourly aggregations are calculated based on the device time zones. Hourly records are written at the end of each hour according to the devices' clocks and the daily records are written at midnight according the the devices' clocks, but both are displayed according to the Tivoli Storage Productivity Center server's clock. For example, if a subsystem clock is one hour ahead of the Tivoli Storage Productivity Center server clock, the hourly data for 5:00 PM according to the device's clock is displayed as 4:00 PM in the user interface and the daily data for 12:00 AM according to the device's clock is displayed as 11:00 PM of the previous day.

Available Columns, Included Columns

Use these items to specify which columns to include and which columns to exclude from the generated report.

Available Columns

Displays the columns that you can include in the generated report that are not already included. If a column appears in the **Included Columns** list box, it will not appear in the **Available Columns** list box.

Included Columns

Displays the columns that will appear in the generated report. By default, all columns for a report are listed in this list box and will be displayed in the generated report. You can highlight the columns and use the up and down arrows to rearrange the order of the columns in the report. The order of the items in this list box determines the order in which the columns will appear in the generated report. The columns with grayed-out names are the frozen columns, which cannot be selected, removed, or reordered for this type of report.

If a column appears in the **Available Columns** list box, it will not appear in the **Included Columns** list box.

To exclude a column from a report, click the name of the column in the **Included Columns** list box. Click **Shift+click** and **Ctrl+click** to select multiple columns, if so desired. Then click the left-arrow button (<<). The selected columns are removed from the **Included Columns** list box, and will appear in the **Available Columns** list box.

To include a column in a report, click the name of the column in the Available Columns list box. Click **Shift+click** and **Ctrl+click** to select multiple columns, if so desired. Then click the right-arrow button (>>). The selected columns will be removed from the **Available Columns** list box, and will appear in the **Included Columns** list box.

To rearrange the order of columns that will appear in the generated report, click the name of a column in the **Available Columns** list box.

Click **Shift+click** and **Ctrl+click** to select multiple columns, if so desired. Then click the up-arrow button (^) or the down-arrow button (v) to move the selected columns up or down in the list, relative to the other columns.

4. Click **Generate Report**. A new tab opens and displays the report.
5. Optional: To view the report in chart format, click , specify charting options, and then click **OK**. Right-click on the chart and select **Customize this Chart** to further customize how the chart is displayed.
6. Optional: To save the report settings to generate later, click and enter a name for the report. The report is saved under theIBM Tivoli Storage Productivity Center node. See "Filtering the resources that appear on a report" on page 1326 for instructions on modifying saved report settings.

If the report is greater than 2500 rows, a dialog box will appear which will allow you to retrieve additional rows by clicking **Display More Rows**. An additional 2500 rows will be retrieved from the server and displayed on the panel for each click of the button. Do not try to display too much data or there is the possibility of running out of memory.

Generating constraint violation reports:

Learn how to generate a storage subsystem performance report.

Creating constraint violation reports:

Learn how to how to create constraint violation reports.

1. In the navigation tree pane, expand **Disk Manager** > **Reporting** > **Storage Subsystem Performance**.
2. Click **Constraint Violations**. The constraint violation report selection page appears in the content pane.
3. If you want to limit the report to a particular time period, select **Limit to this time range** and specify the time period.
4. Click **Selection** to choose which storage subsystems to include in the report.
5. Click **Filter** to modify the filter used in generating the report.
6. Customize the performance report. By default, all supported metrics are included. Click to move the selected metric up in the list and to move the selected metric down in the list.
   a. In the **Included Columns** list, select a metric and click to remove it from the report.
   b. To change the order in which the columns appear in the report, select a metric and click either or .
7. Click **Generate Report**. The **Constraint Violations** tab opens and displays the report.

The report might show information about DS6000, DS8000, TotalStorage Enterprise Storage Server, SAN Volume Controller, and other subsystems all on the same report. By default, the report displays one subsystem per row. Results are aggregated for the current day.

Viewing detailed constraint violation information:

Learn how to view detailed information about constraint violations.

Before you can view detailed information about constraint violations, you must generate a constraint violation report (see "Creating constraint violation reports" on page 1501).

1. Click on the **Constraint Violations** tab to view the report. The report might show information about DS6000, DS8000, TotalStorage Enterprise Storage Server,SAN Volume Controller, and other subsystems all on the same report. By default, the report displays one subsystem per row. Results are aggregated for the current day.
2. Click to view a detailed report of that subsystem.
3. Click , specify charting options, and then click **OK** to view the report in chart form. Right-click on the chart and select **Customize this Chart** to further customize how the chart is displayed.

Viewing affected volumes and affected hosts:

Learn how to view information on volumes and related hosts affected by constraint violations.

Before you can view affected volumes and hosts information, you must generate a constraint violation report (see "Creating constraint violation reports" on page 1501) and view detailed information on a subsystem (see "Viewing detailed constraint violation information").

1. Click for a constraint violation to display the Affected Volumes Selection page.
2. Under Volumes, select whether you want the report to show all volumes or only the most active volumes associated with the subsystem and component and type in the maximum number of volumes to display in the report.
3. Under Performance Data, select whether you do not want the report to display performance data for the volumes or you do want the report to display historic performance data for volumes.
4. Customize the performance report. By default, all supported metrics are included. Click to move the selected metric up in the list and to move the selected metric down in the list.
   a. In the **Included Columns** list, select a metric and click to remove it from the report.
   b. To change the order in which the columns appear in the report, select a metric and click either or .
5. Click **Generate Report**.

Fabric Manager reports

Fabric reports provide you with both overview and detailed information about your fabrics, switches, and ports. The reports are based on information collected by probes and performance monitors. You can view reports as tables of data or as

graphical charts. You can use pre-defined Fabric system reports or define your own switch performance reports for information by port or by constraint violations.

Before you can generate a report you need to gather information about your fabrics. You can do this through monitoring jobs, and discoveries.

Creating switch performance reports:

After performance monitors are in operation, you can generate switch performance reports. The procedure is similar for each report.

"Creating performance monitors" on page 300 describes how to create performance monitors for fabric switches.

For both reports, use the **Selection** tab to specify switches to report, report columns to include, and filters to apply. When you click **Generate Report**, the **Ports** page or **Constraint Violations** page is created and displays the report.

1. Expand **Fabric Manager → Reporting → Switch Performance**.
2. Click **By Switch**, **By Port** or **By Constraint Violations**. In the content pane, the Selection page opens.
3. Select from the following options to customize the report:

   Selection button
   Click this button to determine the resources upon which you want to report. The Select Resources window displays. The type of resources displayed for selection depends on the type of report you selected. If you clear the box for a resource on the Select Resources window, a pushpin icon displays on the Selection button.

   Filter button
   Click this button to further defines the data that you want to include in the report. Filters enable you to apply general rules to the report. When you click this button, the Edit Filter window displays.

   For example, to select only data associated with switches that have a name ending with "123–IBM", select the "Switch" column, the "LIKE" operator, and type "*123–IBM" (without the quotation marks) in the **Value 1** field.

   If a filter is defined for this report, a pushpin icon displays on the **Filter** button.

   Time range selectors
   All performance reports display historical performance data. Use the time range selectors to specify the exact time range that you want the report to cover. Click one of the following radio buttons to select the type of historical report you want:

   Display latest performance data
   This report contains only the latest available performance data for the selected resources. Note that even the latest data available might still be somewhat old, depending on whether data was recently collected for the resources. Including the time column in the report will help you determine how old the latest available data actually is. Regardless of the age of the data, clicking this button ensures that only a single row (representing a single point in time) for each selected resource is included in the report. If no data has ever been collected for

a particular resource, then that resource is not included in the report. If no data has ever been collected for any resource, then the resulting report will be empty.

Display historic performance data using absolute time
This report contains only data that falls within a specific time range. Select the time range using the **From** and **To** selectors. The specified from and to values are interpreted as inclusive. The resulting report contains all the performance data that is available within the specified time range, for each selected resource. This means that the data can consist of potentially many rows per resource, each with a unique timestamp. If no data has been collected for a particular resource during the specified time range, that resource is not included in the report. If no data has been collected for any resource during the specified time range, then the resulting report will be empty.

To determine which historical performance records fall within the specified time range, the **beginning timestamp** of the collection intervals is used for comparison. If an historical record contains performance data for an interval of time from 1:00 PM to 1:05 PM, that record would be included in the report for a time range of 1:00 PM to 8:00 PM. However, that same record would not be included if a time range of 1:02 PM to 8:02 PM was specified, because it is the beginning of the time period (for example, 1:00 PM in this example) that is used to determine inclusion in the specified time interval.

Display historic performance data using relative time
This report contains only data that falls within a specific time range extending backward from the current date and time. Specify the number of days in the desired time range, using the **days ago until now** field. The report will be exactly the same as a report using absolute time, with the **To** selector set to the current date and time, and the **From** selector set to the current date and time minus the number of **days ago until now**.

Note that the same criteria applies as if determining which historical performance records fall within the specified time range. Only the beginning timestamp of the collection intervals is used for comparison. This means that data for the current hour or the current day is not included in the report when selecting hourly or daily summation data, because data for the current hour or current day is only saved in the database when the hour or day is complete. As an alternative, consider using the first radio button, **Display latest performance data**, to see a report showing the most recent daily summation data.

Summation Level
Use this selector to select which type of performance data records to include in the report. The Tivoli Storage Productivity Center Performance Manager collects and stores three different types of performance data:

By sample
Represents the most detailed data. There is usually one sample record per resource for every **n** minutes, where **n** is the performance monitor interval length that was specified when the monitor was defined. Each sample represents the average

performance of the resource over those **n** minutes. A sample record with a timestamp of **t** will be saved at time **t+n**. In other words, the beginning of each **n** minute time interval is used for display and for time range matching.

Hourly
Represents an hourly average of the performance of the specified resources. There will be one hourly record written every hour, per resource. Each such record will be written at or shortly after each hour mark on the (device) clock. For example, a record with a timestamp of 12:00 PM and interval length of 1 hour will be written at 1:00 PM.

Daily Represents a daily average of the performance of the resources. There will be one daily record written every day, per resource. Each daily record will be written at or shortly after midnight, according to the device clock. For example, a record with a timestamp of April 21, 12:00 AM and interval length of 24 hours will be written on April 22, 12:00 AM.

Note that hourly and daily records are usually retained in the database for longer periods of time, compared to By Sample records. As a result, if a generated report indicates that sample data is no longer available for a particular time range in the past, it is possible that the sample data has already been purged, in which case you can try generating the report using hourly or daily summation levels.

Be aware that when selecting a time range using the **Display historic performance data using relative time** radio button, it is necessary to select the length of the range in days. This can lead to unexpected results when also selecting the daily summation level. Remember that a daily record is not written until the day is complete, which means that at any given time during the day, the current day's data does not yet exist in the database. Therefore, selecting the daily summation level as well as a relative time range of n **days ago until now**, will usually result in n-1 records being returned per resource, assuming that at least n-1 days worth of data has been previously collected for those resources. Specifying a relative time range of 1 **days ago until now** will result in an empty report.

Note: The user interface displays the date and time of data in the Tivoli Storage Productivity Center server time zone, but the daily and hourly aggregations are calculated based on the device time zones. Hourly records are written at the end of each hour according to the devices' clocks and the daily records are written at midnight according the the devices' clocks, but both are displayed according to the Tivoli Storage Productivity Center server's clock. For example, if a subsystem clock is one hour ahead of the Tivoli Storage Productivity Center server clock, the hourly data for 5:00 PM according to the device's clock is displayed as 4:00 PM in the user interface and the daily data for 12:00 AM according to the device's clock is displayed as 11:00 PM of the previous day.

Available Columns, Included Columns
Use these items to specify which columns to include and which columns to exclude from the generated report.

Available Columns
Displays the columns that you can include in the generated

report that are not already included. If a column appears in the **Included Columns** list box, it will not appear in the **Available Columns** list box.

Included Columns
Displays the columns that will appear in the generated report. By default, all columns for a report are listed in this list box and will be displayed in the generated report. You can highlight the columns and use the up and down arrows to rearrange the order of the columns in the report. The order of the items in this list box determines the order in which the columns will appear in the generated report. The columns with grayed-out names are the frozen columns, which cannot be selected, removed, or reordered for this type of report.

If a column appears in the **Available Columns** list box, it will not appear in the **Included Columns** list box.

To exclude a column from a report, click the name of the column in the **Included Columns** list box. Click **Shift+click** and **Ctrl+click** to select multiple columns, if so desired. Then click the left-arrow button (<<). The selected columns are removed from the **Included Columns** list box, and will appear in the **Available Columns** list box.

To include a column in a report, click the name of the column in the Available Columns list box. Click **Shift+click** and **Ctrl+click** to select multiple columns, if so desired. Then click the right-arrow button (>>). The selected columns will be removed from the **Available Columns** list box, and will appear in the **Included Columns** list box.

To rearrange the order of columns that will appear in the generated report, click the name of a column in the **Available Columns** list box. Click **Shift+click** and **Ctrl+click** to select multiple columns, if so desired. Then click the up-arrow button (^) or the down-arrow button (v) to move the selected columns up or down in the list, relative to the other columns.

4. Click **Generate** to run the report.
   The report is displayed in the **Ports** tab. You can display the information in chart form by clicking .
5. Click **File → Save as** to save the report in the **<user–id> Reports** node.

Switch Performance:

Use the Switch Performance report to generate and view reports that provide information about the free and occupied ports on the switches in your SAN. These reports provide information about the port connections and status, as well as the port and switch IDs, data and packet transfer rates, and other details. This report can be generated only for switches that have had performance monitors run on them.

The following list describes the columns that are on the Switch Performance report. All of the columns in the report are for display only.

Switch
The ID of the switch.

Time The date and time of the data collection.

Interval
The size of the sample interval, in seconds.

Port Send Packet Rate
The rate at which packets are sent through this port.

Port Receive Packet Rate
The rate at which packets are received through this port.

Total Port Packet Rate
The total rate at which packet operations are performed through this port.

Port Send Data Rate
The rate at which data is sent through this port.

Port Receive Data Rate
The rate at which data is received through this port.

Total Port Data Rate
The total rate at which data is processed through this port.

Port Peak Send Data Rate
The peak rate at which data is sent through this switch.

Port Peak Receive Data Rate
The peak rate at which data is received through this switch.

Port Send Packet Size
The size of the data block that is sent out through this switch.

Port Receive Packet Size
The size of the data block that is received in through this switch.

Overall Port Packet Size
The total size of the data block that is transferred by the switch.

Error Frame Rate
The rate at which error frames are generated by the switch.

Dumped Frame Rate
The rate at which frames are dumped by the switch.

Link Failure Rate
The rate at which failed links are generated by the switch.

Fabric Performance Report - By Port:

Click to display detailed information per computer in a **Network** tab. The **Network** tab displays a file summary by computer.

The following list describes the columns that are on the Fabric Performance Report - By Port report, and are for display only.

Port The ID of the port.

WWPN
The World Wide Port Name (WWPN) of the selected port.

Slot The number for the blade that the port is on.

Index The unique number for the port across the whole switch.

Time The date and time of the data collection.

Interval
The size of the sample interval, in seconds.

Port Send Packet Rate
The average number of packets sent per second, by a particular port over a particular time interval. A send operation is a read operation processed, or a write operation initiated by the particular port.

Port Receive Packet Rate
The average number of packets received per second, by a particular port over a particular time interval. A receive operation is a write operation processed, or a read operation initiated by the particular port.

Total Port Packet Rate
The average number of packets sent and received per second, by a particular port over a particular time interval.

Port Send Data Rate
The average number of megabytes sent per second, by a particular port over a particular time interval.

Port Receive Data Rate
The average number of megabytes received per second, by a particular port over a particular time interval.

Total Port Data Rate
The average number of megabytes transferred per second, by a particular port over a particular time interval.

Port Peak Send Data Rate
The peak number of megabytes sent per second, by a particular port over a particular time interval.

Port Peak Receive Data Rate
The peak number of megabytes received per second, by a particular port over a particular time interval.

Port Send Packet Size
The size of the data block that is sent out through this switch.

Port Receive Packet Size
The size of the data block that is received in through this switch.

Overall Port Packet Size
The total size of the data block that is transferred by the switch.

Error Frame Rate
The rate at which error frames are generated by the switch.

Dumped Frame Rate
The rate at which frames are dumped by the switch.

Link Failure Rate
The rate at which failed links are generated by the switch.

Loss of Sync Rate
The average number of times per second that synchronization was lost after the last reset of the device, for a particular component over a particular time interval.

Loss of Signal Rate
The average number of times per second that the signal was lost after the last reset of the device, for a particular component over a particular time interval.

CRC Error Rate
The average number of frames received per second in which the CRC in the frame did not match the CRC computed by the receiver, for a particular component over a particular time interval.

Short Frame Rate
The average number of frames received per second that were shorter than 28 octets (24 header + 4 CRC), not including any start of frame/end of frame bytes, for a particular component over a particular time interval.

Long Frame Rate
The average number of frames received per second that were longer than 2140 octets (24 header + 4 CRC + 2112 data), not including any start of frame/end of frame bytes, for a particular component over a particular time interval.

Encoding Disparity Error Rate
The average number of disparity errors received per second, for a particular component over a particular time interval.

Discarded Class3 Frame Rate
The average number of class-3 frames per second that were discarded by a particular component over a particular time interval.

F-BSY Frame Rate
The average number of F-BSY frames per second that were generated by a particular component over a particular time interval.

F-RJT Frame Rate
The average number of F-RJT frames per second that were generated by a particular component over a particular time interval.

Constraint Violations:

If you have defined switch performance alerts you can also generate the Constraint Violations report.

Click to display detailed information per computer in a **Network** tab. The **Network** tab displays a file summary by computer.

The following list describes the columns that are on the Top Switch Ports Packet Rate Performance report. The columns are for display only and are not editable.

Switch
The ID of the switch.

Total Port Data Rate Threshold
The total rate at which data is processed through this port.

Link Failure Rate Threshold
The rate at which failed links are generated by the switch.

Error Frame Rate Threshold
The rate at which error frames are generated by the switch.

Total Port Packet Rate Threshold
The total rate at which the packet operations are performed through this port.

System reports

Use the information in this section to learn how to generate and view system reports. These reports are available in the **IBM Tivoli Storage Productivity Center** > **Reporting** > **System Reports** and **Data Manager for Databases** > **My Reports** > **System Reports** nodes in the navigation tree. Data for system reports are gathered every time that monitoring jobs are run against your storage resources.

Generating and viewing system reports

Learn how to generate system reports, drill down through and filter their data, and generate charts.

To display a report, complete the following steps:

1. Expand **IBM Tivoli Storage Productivity Center** > **My Reports** > **System Reports** > **<manager>**.
2. Click the name of the report you want to view. The report will appear in the content pane. To regenerate a report, select the report name, right-click, and select **Regenerate Report**.

Many of the rows that are presented in the generated system reports enable you to:

- drill down into a row to get more detailed information
- view report information in a chart format

To drill down for more detailed report information:

- Click on the desired row. The drill down report is displayed and a new tab representing that report is added to the tabs on the report.

To view report information in a chart format:

- Click on the desired row. The chart is displayed and a new tab representing that chart is added to the tabs on the report.

  You can customize the charts that you generate from system reports by using the Chart Customization window. You can access this window by right-clicking on a system report chart and selecting **Customize this chart** from the pop-up menu. See “Customizing charts” on page 1314 for information on how to customize a system report chart.

To filter the data displayed on a report:

Click the **Filter** button, which displays an Edit Filter window. In this window, specify criteria for records (for example, Capacity in Data Reports), operators (for example, =) and values for each "column" (whatever you want to type). For example, in the Disk Space Summary report, you can specify only disks with a capacity greater than 70 GB.

If you change any element of a report definition (for example, the maximum number of rows in the report), you can save the new report definition (and regenerate it later) by clicking **File** → **Save** and then typing a name for the report. The report is saved with the name you specify under the ***user_id's Reports*** node.

System reports - Data

Use these predefined reports to view statistics about your storage resources.

Access Time Summary:

This report provides a summary of the number of files in your environment and when they were last accessed (for example, created or modified) during the last day, the last week, the last month, the last two months, the last three months, the last six months, the last nine months, the last year, and over a year.

The following list describes the columns that are on the Access Time Summary report. All of the fields on the report are for display only and are not editable.

Last Accessed <= 1 day
The number and total size of the files that were accessed within the last day.

Last Accessed 1 day — 1 week
The number and total size of the files that were accessed between 1 day and 1 week ago.

Last Accessed 1 week — 1 month
The number and total size of the files that were accessed between 1 week and 1 month ago.

Last Accessed 1 month — 2 months
The number and total size the files that were accessed between 1 month and 2 months ago.

Last Accessed 2 months — 3 months
The number and total size of the files that were accessed between 2 – 3 months ago.

Last Accessed 3 months — 6 months
The number and total size of the files that were accessed between 3 – 6 months ago.

Last Accessed 6 months — 9 months
The number and total size of the files that were accessed between 6 – 9 months ago.

Last Accessed 9 months — 1 year
The number and total size of the files that were accessed between 9 months and 1 year ago.

Overall File Count
Total number of files across a network.

Overall File Size
Total size of the space consumed by the files on a network.

Average Age
Average age of files on a network measured by days, hours, minutes, seconds.

- To view any of the following charts, click above the report and select the corresponding option from the pop-up menu:
  - pie chart of storage space distribution for a selected row
  - pie chart of file counts for a selected row
  - pie chart of storage space distribution for all the rows on the report
  - pie chart of file counts for all the rows on a report
  - history chart of file counts

- history chart of file count by percent
- history chart of file sizes
- history chart of files size by percent

- To view a pie chart of file access times, click to left of a report row.

- To view detailed file access times for the computers on the network, click to the left of a report row.

Disk Space Summary:

This report shows storage capacity for the whole network. You can drill down through this report to view storage capacity for each of the following levels: per disk, per computer, per cluster, per computer group, and per domain.

The following list describes the columns that are on the Disk Space Summary report. All of the fields on the report are for display only and are not editable.

Disk Space
Total storage capacity of the disks on the computers within a network.

Consumed File System Space
Amount of used storage space on the file systems within a network.

Available File System Space
Amount of unused storage space on the file systems within a network.

Raw Volume Space
Space on host-side logical volumes that is not occupied by file systems.

Unavailable Disk Space
Amount of storage subsystem volume or virtual storage volume space that is dedicated to redundancy. This value is dependent on the storage subsystem SMI-S provider returning a valid RAID value that is used to determine the overhead. If the value is zero for a storage subsystem, the overhead cannot be calculated. This amount does not include storage space information from storage subsystem volumes or virtual storage volumes that become missing after a storage subsystem probe.

Available Disk Space
Space that is assigned to a (monitored) host that is not part of any logical volume.

Unknown Storage Subsystem Volume Space
Volume space of unknown usage.

- To view any of the following charts click at the top of the report and select the corresponding option from the pop-up menu:
  - pie chart of network space distribution
  - pie chart of network row
  - history chart of the free space for a network
  - history chart of the percentage of free space for a network
  - history chart of the storage capacity on a network

- To view a pie chart of disk capacity, click to the left of a report row.

- To view detailed disk capacity for the computers on a network, click the to the left of a report row.

Access File Summary:

This report provides overview information for files in your storage environment.

The Access File Summary report provides overview information for files by directory, directory group, file system, file system group, cluster, computer, computer group, domain, and for the entire network. Through this report you can view historically the number of files for each resource in the report. The historical chart can be generated to show daily, weekly, or monthly history.

The following list describes the columns that are on the Access File Summary report. All of the fields on the report are for display only.

File Size
Total size of the storage space consumed by the files on a network.

File Count
Total number of files on a network.

Directory Count
Total number of directories on a network.

Average File Size
Average storage space consumed by each of the files on a network.

File System Space
Total storage capacity of the files on a network.

- To view any of the following charts click at the top of the report and select the corresponding option from the pop-up menu:
  - History chart of storage space usage for a selected row
  - History chart of file counts for a selected row
- To view a history chart of the storage space consumed by files on a network, click to the left of a report row.
- To view detailed file storage usage for the computers on the network, click to the left of a report row.

Storage Access Times:

This report shows when files were last accessed.

The following list describes the columns that are on the Storage Access Times report. All of the fields on the report are for display only.

Computer
Name of a computer against which the report was run.

Last Accessed <= 1 day
Number of files that were accessed within the last 24 hours and the total physical size of those files (measured in kilobytes, megabytes, or gigabytes).

Last Accessed 1 day - 1 week
Number of files that were accessed between 1 day to 1 week previous and the total physical size of those files (measured in kilobytes, megabytes, or gigabytes).

Last Accessed 1 week - 1 month
Number of files that were accessed between 1 week to 1 month previous and the total physical size of those files (measured in kilobytes, megabytes, or gigabytes).

Last Accessed 1 month - 2 months
Number of files that were accessed between 1 month to 2 months previous and the total physical size of those files (measured in kilobytes, megabytes, or gigabytes).

Last Accessed 2 months - 3 months
Number of files that were accessed between 2 months to 3 months previous and the total physical size of those files (measured in kilobytes, megabytes, or gigabytes).

Last Accessed 3 months - 6 months
Number of files that were accessed between 3 months to 6 months previous and the total physical size of those files (measured in kilobytes, megabytes, or gigabytes).

Last Accessed 6 months - 9 months
Number of files that were accessed between 6 months to 9 months previous and the total physical size of those files (measured in kilobytes, megabytes, or gigabytes).

Last Accessed 9 months - 1 year
Number of files that were accessed between 9 months to 1 year previous and the total physical size of those files (measured in kilobytes, megabytes, or gigabytes).

Last Accessed > 1 year
Number of files that were accessed over one year previous and the total physical size of those files (measured in kilobytes, megabytes, or gigabytes).

Overall File Count
Total of all the counts.

Overall File Size
Total of all the sizes.

Average Age
Average time since the file was last accessed.

To view graphical information about specific computers' access times, click . A new tab displaying a chart for each selected computer is displayed.

Disk Defects:

This report shows any disk defects that are on the monitored computers.

The following list describes the columns that are on the Disk Defects report. All of the fields on the report are for display only and are not editable.

Device
Name of the computer containing a disk defect.

Path Full path to the location of a disk defect.

Primary Defects
Number of defects on the disk when it was new.

Manufacturer
Name of the manufacturer of the disk drive containing the disk defect.

Model Model number of the disk drive containing a disk defect.

In Storage Subsystem
Indicates Yes when a disk is an actual physical disk within the storage subsystem.

RPM Speed that the disk turns (revolutions per minute).

Read Cache
Hardware caching turned on/off for reads.

Write Cache
Hardware caching turned on/off for writes.

Failure Predicted
Disk predicts a failure.

Probe Last Run
Date and time when the last probe was run.

Discovered Time
Date and time when a disk defect was discovered.

Disk Space
Storage capacity of the disk drive containing a defect.

Available Disk Space
Amount of unused storage space on the disk drive containing a defect.

Grown Defects
Number of defects detected by the disk since new.

Recovered Errors
Number of errors (read, write, verify) from which the disk was able to recover.

Unrecovered Errors
Number of errors (read, write, verify) from which the disk was not able to recover.

Bytes Written
Number of bytes written to the disk.

Bytes Read
Number of bytes read from the disk.

Automatic Write Reallocation
Disk attempts to move the data sector on the disk in the event of a write error.

Desired Automatic Write Reallocation
Change automatic write allocation on the next probe.

Automatic Read Reallocation
Disk attempts to move the data sector on the disk in the event of a read error.

Desired Automatic Read Reallocation
Change automatic read allocation on the next probe.

Read Continuous (no error correction)
No error correction (setting is ON=no error correction).

Desired Read Continuous (no error correction)
Change automatic read continuous on the next probe.

Detectable
Indicates Yes when a storage volume is identified as being available to the storage subsystem following a successful probe.

Is Virtual
Indicates Yes when a disk is identified as being available to the server or the storage subsystem.

Mapped to Storage Subsystem
Indicates Yes when a computer disk or a backend storage volume can be mapped to a storage subsystem.

To view more information for a specific computer:

- Click . Detailed information regarding the computer will be available in three tabs:
  - **General tab.** This tab displays general information about the computer, such as computer information, discovered date and time, disk allocation information, and so on.
  - **Latest Probe tab.** This tab displays information about the latest probe, and provides information such as sector size, probe last run, primary and grown defects, and so on.
  - **Probe History tab.** This tab displays probe history for the selected machine, and provides information such as probe times, record type, bytes written, and so on.

Storage Modification Times:

This report shows information about files within the network that were modified with certain time frames.

The Storage Modification Times report provides information about files within the network that were modified:

- within the last 24 hours
- between 24 hours and one week previous
- between one week to one month previous
- between one month to two months previous
- between two months to three months previous
- between three months to six months previous
- between six months to nine months previous
- between nine months to one year previous
- more than one year previous

The following list describes the columns that are on the Storage Modification Times report. All of the fields on the report are for display only.

Last Modified <= 1 day
Number of files that were modified in the last 24 hours and the total physical size of those files (measured in kilobytes, megabytes, or gigabytes)

Last Modified 1 day - 1 week
Number of files that were modified between 1 day to 1 week previous and the total physical size of those files (measured in kilobytes, megabytes, or gigabytes)

Last Modified 1 week - 1 month
Number of files that were modified between 1 week to 1 month previous and the total physical size of those files (measured in kilobytes, megabytes, or gigabytes)

Last Modified 1 month - 2 months
Number of files that were modified between 1 month to 2 months previous and the total physical size of those files (measured in kilobytes, megabytes, or gigabytes)

Last Modified 2 months - 3 months
Number of files that were modified between 2 months to 3 months previous and the total physical size of those files (measured in kilobytes, megabytes, or gigabytes)

Last Modified 3 months - 6 months
Number of files that were modified between 3 months to 6 months previous and the total physical size of those files (measured in kilobytes, megabytes, or gigabytes)

Last Modified 6 months - 9 months
Number of files that were modified between 6 months to 9 months previous and the total physical size of those files (measured in kilobytes, megabytes, or gigabytes)

Last Modified 9 months - 1 year
Number of files that were modified between 9 months to 1 year previous and the total physical size of those files (measured in kilobytes, megabytes, or gigabytes)

Last Modified > 1 year
Number of files that were modified over a year previous and the total physical size of those files (measured in kilobytes, megabytes, or gigabytes)

Overall File Count
Sum of the files

Overall File Size
Sum of the size of the files

Average Age
Average age since files were modified

To view graphical information about storage modification times, click . A new tab displaying a chart for the network is displayed.

Most At Risk Files:

This report provides information on files that were modified the longest time ago and were not backed-up or archived since they were modified.

The following list describes the columns that are on the Most At Risk Files report. All of the fields on the report are for display only and are not editable.

Modification Time
Date and time when an at risk file was last modified

Computer
Name of the computer where an at risk file is stored

Filesystem
Filesystem where an at risk file is stored

Path Full path to the location of an at risk file

Filename
The name of the at risk file

Owner
ID of the user who owns an at risk file

OS User Group
OS User group of the user who owns an at risk file

Logical Size
Logical size of an at risk file

Physical Size
Physical size of an at risk file (measured in kilobytes, megabytes, or gigabytes)

Access Time
Date and time when an at risk file was last accessed

Create Time
Date and time when an at risk file was created

To view more information about a specific file:

- Click . Detailed information regarding the file is displayed in a **File Detail** tab. The **File Detail** tab displays more information for the specific file and provides information such as file ownership, modification and creation time, and any file attributes that were set.

Most Obsolete Files:

This report provides information about files that have not been accessed or modified for the longest period of time.

The following list describes the columns that are on the Most Obsolete Files report. All of the fields on the report are for display only and are not editable.

Access Time
Date and time when an obsolete file was last accessed

Computer
Name of the computer where an obsolete file is stored

Filesystem
Filesystem where an obsolete file is stored

Path Full path to the location of an obsolete file

Filename
File name of an obsolete file

Owner
ID of the user who owns an obsolete file

OS User Group
OS User Group to which the owner of the obsolete file belongs

Logical Size
Logical size of an obsolete file

Physical Size
Physical size of an obsolete file (measured in kilobytes, megabytes, or gigabytes)

Modification Time
Date and time when an obsolete file was last modified

Create Time
Date and time when an obsolete file was created

Viewing more information about a specific file

Click . Detailed information regarding the file is displayed in a **File Detail** tab. The **File Detail** tab displays more information for the specific file and provides information such as file ownership, modification and creation time, and any file attributes that are set.

Oldest Orphaned Files:

This report provides information about files that have the oldest creation date and no longer have owners who are registered as users on the computer or network.

The following list describes the columns that are on the Oldest Orphaned Files report. All of the fields on the report are for display only.

Access Time
Date and time when an orphaned file was last accessed

Computer
Name of the computer where an orphaned file is stored

Filesystem
Filesystem where an orphaned file is stored

Path Full path to the location of an orphaned file

Filename
File name of an orphaned file

Owner
Operating system internal ID of the user who owned the orphaned file. This is the internal ID that the operating system uses to identify the user, and *not* the user ID

OS User Group
OS User group to which the owner of an orphaned file belongs

Logical Size
Logical size of an orphaned file

Physical Size
Physical size of an orphaned file (measured in kilobytes, megabytes, or gigabytes)

Modification Time
Date and time when an orphaned file was last modified

Create Time
Data and time when an orphaned file was created

To view more information for a specific file:

- Click . Detailed information regarding the file is displayed in a **File Detail** tab. The **File Detail** tab displays information about a specific file such as file ownership, modification and creation time, and any file attributes that are set.

User Quota Violations:

This report shows which users have violated a Data Manager storage usage quota.

The following list describes the columns on the User Quota Violations report. All the fields on the report are for display only.

Quota Creator
Creator of a quota

Quota Name
Name of a quota

Computer
Computer that violated a quota

Filesystem
File system that violated a quota

User Name
ID of the user that violated a quota

Space Used
Total amount of space used

Threshold
Threshold defined by a quota

% of Threshold
Percentage of quota; always > 100

Number of Violations
Number of violations by a user

Quota Type
Type of quota: Network Wide, Filesystem, or Computer

Computer Storage Availability:

This report provides information about the availability of computers within your environment.

If the computer is not available (determined by a ping), the storage is likely not available for use. The following list describes the fields that are on the Storage Availability report. All of the fields on the report are for display only.

Computer
Name of the computer

% Available
Percentage of successful pings

Transmitted
Number of pings transmitted

Received
Number of responses from the ping

Damaged
Number of responses with errors

Avg Transit Time
Average time to send and receive a response from a ping

Max Transit Time
Maximum time it took to send and receive response from a ping

Min Transit Time
Minimum time it took to send and receive response from a ping

Report Start Time
Start time of information in this row

Report End Time
End time of information

To view the ping history for a specific computer, click . A new tab displaying ping history information for the selected computer is displayed.

Computer Disk Space:

This report provides storage capacity information about each computer within your environment.

The following list describes the columns that are on the Computer Disk Space report. All of the fields on the report are for display only.

Computer
Name of a computer against which the report was run

Disk Space
Total storage capacity for a computer

Available Disk Space
Amount of unused storage space on a computer (not in file systems seen by this operating system)

Owned Disk Space
Total amount of unique disk storage space for computers in a cluster that is owned by those computers. If Tivoli Storage Productivity Center determines that a disk is configured for a different host, that disk's capacity is not counted in this column. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks on computers that have not been probed.

- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from the computer.

Note:

- If the computer is an IBM SAN File System client, this value does not include the capacity of any volumes that are visible to it that are owned by the SAN File System.
- If the host is Solaris and Veritas Volume Manager (VxVM) is in use, the product examines the Veritas disk-label and reads from the host ID. If this does not agree with the local host ID, the disk is classified as belonging to a different (Solaris) host.

Owned Available Disk Space

Total amount of unique disk storage space for computers in a cluster that is not allocated to any logical volume within the computers and is owned by the computers. If Data Manager determines that a disk is configured for a different computer, that disk's unallocated space is not counted in this column. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks on computers that have not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from the computer.

If the computer is an IBM SAN File System client, then this value excludes the unallocated space on any storage subsystem volumes visible to it that are owned by the SAN File System.

If the host is Solaris and Veritas Volume Manager (VxVM) is in use, the product will examine the Veritas disk-label and read off the host-ID. If this does not agree with the local host-ID, the disk is classified as belonging to a different (Solaris) host.

Non-Fibre Channel Attached Disk Space

Total amount of unique disk space on the computers in a cluster that is not attached through a fibre channel port. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks that reside behind a fibre channel port.
- Computer disks on a computer that has not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

Non-Fibre Channel Attached Available Disk Space

Total amount of disk storage space on the computers in a cluster that is not allocated to any logical volume within the computers and is not attached through a fibre channel port. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks that reside behind a fibre channel port.
- Computer disks on a computer that has not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

Fibre Channel Attached Disk Space
Total amount of unique disk space on the computers in a cluster that is attached through a fibre channel port. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks that do not reside behind a fibre channel port.
- Computer disks that reside behind a fibre channel port that is not identified by a Storage Resource agent.
- Computer disks on a computer that has not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

Fibre Channel Attached Available Disk Space
Total amount of disk storage space on the computers in a cluster that is not allocated to any logical volume within the computers and is attached through a fibre channel port. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks that do not reside behind a fibre channel port.
- Computer disks that reside behind a fibre channel port that is not identified by a Storage Resource agent.
- Computer disks on a computer that has not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

OS Type
Operating system running on a computer

Network Address
Network address of a computer

IP Address
IP address of a computer

Time Zone
Time zone in which a computer is running

CPU Architecture
Instruction set architecture on the machine where an agent is running

Available File System Space:

This report shows the total amount of unused storage across a network.

The following list describes the columns on the Total Free Space report. All the fields on the report are for display only.

Available File System Space
Total amount of available storage space available on a network.

Percent Available File System Space
Percentage of total space that is unused on a network.

Consumed File System Space
Amount of used storage space on a network.

File System Space
Total amount (capacity) of storage space on a network.

File Count
Total number of files on a network.

Directory Count
Total number of directories on a network.

Percent Free Inodes
Percentage of free Inodes on a network.

Used Inodes
Number of used Inodes on a network.

Free Inodes
Number of free Inodes on a network.

User Space Usage:

This report provides information about storage statistics related to users within your environment.

The following list describes the columns on the User Space Usage report. All the fields on the report are for display only.

User Name
ID of a user

File Size
Total amount of space used by a user

File Count
Number of files owned or created by a user

Directory Count
Number of directories owned or created by a user

Largest File
Largest file owned by a user

2nd Largest File
Second-largest file owned by a user

Files < 1KB
Number and total space usage of files under 1KB in size

Files 1KB - 10KB
Number and total space usage of files between 1KB and 10KB in size

Files 10KB - 100KB
Number and total space usage of files between 10KB and 100KB in size

Files 100KB - 1MB
Number and total space usage of files between 100KB and 1MB in size

Files 1MB - 10MB
Number and total space usage of files between 1MB and 10MB in size

Files 10MB - 100MB
Number and total space usage of files between 10MB and 100MB in size

Files 100MB - 500MB
Number and total space usage of files between 100MB and 500MB in size

Files > 500MB
Number and total space usage of files over 500MB in size

Wasted Space:

This report provides information about storage statistics on non-OS files not accessed in the first year and orphan files.

The following list describes the columns on the Wasted Space-File Summary by Computer report. All the fields on the report are for display only.

File Size
Total amount of space used by the obsolete and orphan files

File Count
Total number of obsolete and orphan files

Directory Count
Total number of orphan directories

Average File Size
Average size of obsolete and orphan files

File System Space
Amount of storage space available on a storage subsystem.

To view more information for a specific file, click . Detailed information per computer will be displayed in a **Network** tab. The **Network** tab displays file summary by computer.

System reports - Data Manager for Databases

Use these predefined reports to view statistics about your RDBMS storage resources. These reports are available in the **Data Manager for Databases** > **My Reports** > **System Reports** node of the navigation tree.

All DBMS - Database Storage By Computer:

This report shows storage information about the databases in your environment sorted by the computers on which they are stored.

The following list describes the columns that are displayed in the All DBMS Database Storage By Computer report.

Computer
Name of the computer where the databases are located.

Total Size
Amount of space that is consumed by the databases on the computers.

File Capacity
Storage capacity of the data files within the databases.

File Free Space
Amount of free space that is available on the data files within the databases.

DB-TS Count
Number tablespaces that are associated with the databases.

File Count
Number of data files that are associated with the tablespaces in the databases.

Log File Count
Number of log files that are associated with the databases.

All DBMS - User Database Space Usage:

This report shows information about the RDBMS storage space consumed by users across the network.

The following list describes the columns that appear on the All DBMS - User Database Space Usage report:

User Name
Name of a user upon whose storage usage information was collected.

Total Size
Amount of space consumed by the objects that are owned by the user.

Empty Used Space
Amount of empty used space that resides on the objects that are owned by the user.

Table Count
Number of tables that are owned by the user.

Index Count
Number of indexes that are owned by the user.

Other Count
Number of other objects owned by the user.

Largest Object
Size of the largest object owned by the user.

2nd Largest Object
Size of the second largest object owned by the user.

Segment Size < 50KB
Number and total space usage of objects owned by the user that are under 50KB in size.

Segment Size 50KB - 500KB
Number and total space usage of objects owned by the user that are between 50KB and 500KB in size.

Segment Size 500KB - 1Mb
Number and total space usage of objects owned by the user that are between 500KB and 1MB in size.

Segment Size 1Mb - 10Mb
Number and total space usage of objects owned by the user that are between 1MB and 10MB in size.

Segment Size 10Mb - 100Mb
Number and total space usage of objects owned by the user that are between 10MB and 100MB in size.

Segment Size 100Mb - 500Mb
Number and total space usage of objects owned by the user that are between 100MB and 500MB in size.

Segment Size 500Mb - 1GB
Number and total space usage of objects owned by the user that are between 500MB and 1GB in size.

Segment Size > 1Gb
Number and total space usage of objects owned by the user that are over 1GB in size.

All DBMS - User Database Quota Violations:

This report provides information on the users who violated any storage usage thresholds defined in quotas.

The following list describes the columns that are on the All DBMS - User Database Quota Violations report.

Quota Creator
ID of the user who created the quota

Quota Name
Name of the quota

Computer
Name of the computer where the quota violation occurred

RDBMS type
RDBMS to which an instance belongs, for example, Oracle, SQL Server, Sybase, or UDB

Instance
Name/SID of the Oracle Instance, SQL Server server, Sybase server, or UDB Instance where the quota violation occurred

Database-Tablespace
Name of the database where the tablespace resides and name of the tablespace whose quota was violated

User Name
ID of the user who violated the quota

Space Used
Amount of space consumed by the user

Threshold
Threshold of used space defined within the quota

% of Threshold
Percentage of space by which the user violated the quota

Number of Violations
Number of violations for the user

Quota Type
The type of quota: Database-Tablespace, Instance, or Network-wide

Oracle - Database Storage By Computer:

This report shows storage information about the databases in your environment sorted by the computers on which they are stored.

The following list describes the columns that are in the Oracle - Database Storage By Computer report.

Computer
Name of the computer where the databases are located.

Total Size
Amount of space consumed by the databases on the computers.

Data File Capacity
Storage capacity of the data files within the databases.

Data File Free space
Amount of free space available on the data files within the databases.

Tablespace Count
Number tablespaces associated with the databases.

Data File Count
Number of data files associated with the tablespaces in the databases.

Log File Count
Number of log files associated with the databases.

Oracle - Total Database Free Space:

This report provides information on the total free space for data files at a network-wide level, the percentage of free space, the total used space, number of free extents, and number of data files on a network. This report is available for Oracle and Microsoft SQL Server.

Free Space
Amount of free space on all data files in the network.

Percent Free
Percent of free space available on the data files in the network.

Used Space
Amount of used space on the data files in the network.

Total Size
Total size of data files in the network.

Free Extents
Number of free extents on the data files in the network.

Coalesced Extents
Number of coalesced extents on the databases in the network.

Minimum Free Extent Size
Minimum size of a free extent in a database.

Maximum Free Extent Size
Maximum size of a free extent in a database.

Number Data Files
Number of data files on the databases in the network.

Oracle - User Database Space Usage:

This report shows information about the RDBMS storage space consumed by users across the network.

The following list describes the columns that appear on the Oracle - User Database Space Usage report:

User Name
Name of a user upon whose storage usage information was collected.

Total Size
Amount of space consumed by the objects that are owned by the user.

Empty Used Space
Amount of empty used space that resides on the objects that are owned by the user.

Table Count
Number of tables that are owned by the user.

Index Count
Number of indexes that are owned by the user.

Other Count
Number of other objects owned by the user.

Largest Segment
Size of the largest segment owned by the user.

2nd Largest Segment
Size of the second largest segment owned by the user.

Segment Size < 50KB
Number and total space usage of objects owned by the user that are under 50KB in size.

Segment Size 50KB - 500KB
Number and total space usage of objects owned by the user that are between 50KB and 500KB in size.

Segment Size 500KB - 1Mb
Number and total space usage of objects owned by the user that are between 500KB and 1MB in size.

Segment Size 1Mb - 10Mb
Number and total space usage of objects owned by the user that are between 1MB and 10MB in size.

Segment Size 10Mb - 100Mb
Number and total space usage of objects owned by the user that are between 10MB and 100MB in size.

Segment Size 100Mb - 500Mb
Number and total space usage of objects owned by the user that are between 100MB and 500MB in size.

Segment Size 500Mb - 1GB
Number and total space usage of objects owned by the user that are between 500MB and 1GB in size.

Segment Size > 1Gb
Number and total space usage of objects owned by the user that are over 1GB in size.

Oracle - Segments With Wasted Space:

This report provides information on the segments containing allocated space that is currently empty/not being used. Use this information to gather information that can help you discover space that can be reclaimed and allocated to other objects.

Empty Used Space
The amount of empty used space within a segment (table, index, etc.)

Segment Creator
The owner of a segment

Segment Name
The name of a segment

Computer
The name of the computer on which the Instance of a segment Instance resides

Instance
The SID of an Oracle Instance

Database
The name of the database to which the segment belongs

Tablespace
The name of the tablespace to which the segment belongs

Partition
The partition on which the segment is stored

Segment Type
Type of the segment, including:
- TABLE
- TABLE PARTITION
- TABLE SUBPARTITION
- NESTED TABLE
- CLUSTER
- INDEX
- INDEX PARTITION
- INDEX SUBPARTITION
- LOBINDEX
- LOBSEGMENT
- LOB PARTITION
- LOB SUBPARTITION

Parent Type
Subset of the segment type

Parent Creator
The owner of a segment

Parent Name
The name of a segment

Total Size
The amount of space that is allocated to a segment

Number of Extents
The number of extents that is allocated to a segment

Freelist Blocks
The number of blocks that are on the freelist chain

Initial Extent
The size of the first extent that is allocated to a segment

Next Extent
The amount of space that Oracle will retrieve when allocating another extent

Maximum Extents
The maximum number of extents that Oracle can allocate to an object

Percent Increase
The size that Oracle allocates for the next extent

SqlServer - Database Storage By Computer:

This report shows storage information about the databases in your environment sorted by the computers on which they are stored.

The following list describes the columns that are displayed in the SqlServer Database Storage By Computer report.

Computer
Name of the computer on which SQL Server is running.

Total Size
Total amount of storage space allocated to SQL Server on a computer.

Data File Capacity
Amount of allocated storage space for data files that is unused on a computer where SQL Server is running.

Data File Free space
Amount of free space available on the data files associated with SQL Server on a computer.

Log File Capacity
Amount of allocated storage space for log files that is unused on a computer where SQL Server is running.

Log File Free space
Amount of free space available on the log files associated with SQL Server on a computer.

Database Count
Number of databases associated with SQL Server on a computer.

Data File Count
Number of data files associated with SQL Server on a computer.

Log File Count
Number of log files associated with SQL Server on a computer.

SqlServer - Total Database Free Space:

This report provides information on the total free space for data files at a network-wide level, the percentage of free space, the total used space, number of free extents, and number of data files on a network. This report is available for Oracle and Microsoft SQL Server.

Data Free Space
Amount of free space on all data files in the network.

Percent Free
Percent of free space available on the data files in the network.

Data Used Space
Amount of used space on the data files in the network.

Data Size
Total size of data files in the network.

Log Free Space
Amount of free space.

Log Percent Used
Percent of used space.

Log Used Space
Amount of space that is used by the log.

Log Size
Size of the log.

Number Data Files
Number of data files on the databases in the network.

SqlServer - User Database Space Usage:

This report shows information about the RDBMS storage space consumed by users across the network.

The following list describes the columns that appear on the SqlServer - User Database Space Usage report:

User Name
Name of a user upon whose storage usage information was collected.

Total Size
Amount of space consumed by the objects that are owned by the user.

Empty Used Space
Amount of empty used space that resides on the objects that are owned by the user.

Table Count
Number of tables that are owned by the user.

Index Count
Number of indexes that are owned by the user.

Other Count
Number of other objects owned by the user.

Largest Object
Size of the largest object owned by the user.

2nd Largest Object
Size of the second largest object owned by the user.

Object Size < 50KB
Number and total space usage of objects owned by the user that are under 50KB in size.

Object Size 50KB - 500KB
Number and total space usage of objects owned by the user that are between 50KB and 500KB in size.

Object Size 500KB - 1Mb
Number and total space usage of objects owned by the user that are between 500KB and 1MB in size.

Object Size 1Mb - 10Mb
Number and total space usage of objects owned by the user that are between 1MB and 10MB in size.

Object Size 10Mb - 100Mb
Number and total space usage of objects owned by the user that are between 10MB and 100MB in size.

Segment Size 100Mb - 500Mb
Number and total space usage of objects owned by the user that are between 100MB and 500MB in size.

Object Size 500Mb - 1GB
Number and total space usage of objects owned by the user that are between 500MB and 1GB in size.

Object Size > 1Gb
Number and total space usage of objects owned by the user that are over 1GB in size.

Sybase - Database Storage By Computer:

This report shows storage information about the databases in your environment sorted by the computers on which they are stored.

The following list describes the columns on the Sybase - Database Storage By Computer report.

Computer
Name of the computer on which Sybase is running.

Total Device Size
Total amount of storage space that is allocated to Sybase on a computer.

Mirrored Device Size
Total storage capacity of the mirrored device for an instance.

Device Free Space
Amount of free space available on the data files that are associated with Sybase on a computer.

Data Fragment Capacity
Amount of allocated storage space for log files that is unused on a computer where Sybase is running.

Data Fragment Free space
Amount of free space available on the data fragments that are associated with Sybase on a computer.

Log Fragment Capacity
Amount of allocated storage space for log fragments that is unused on a computer where Sybase is running.

Log Fragment Free space
Amount of free space available on the log files that are associated with Sybase on a computer.

Device Count
Number of devices associated with Sybase on a computer.

Database Count
Number of databases associated with Sybase on a computer.

Fragment Count
Number of fragments associated with Sybase on a computer.

Log File Count
Number of log files associated with Sybase on a computer.

Sybase - Total Device Free Space:

This report provides information on the total free space for Sybase devices at a network-wide level, the percentage of free space, the total used space, number of fragments, and number of devices.

Free Space
Amount of free space on all the devices in the network.

Percent Free
Percent of free space available on the devices in the network.

Used Space
Amount of used space on the devices in the network.

Total Size
Total size of devices in the network.

Number Fragments
Number of fragments that are associated with the devices in the network.

Number Devices
Number of devices in the network.

Sybase - Total Database Free Space:

This report provides information on the total free space for data files at a network-wide level, the percentage of free space, the total used space, number of free extents, and number of data files on a network. This report is available for Oracle and Microsoft SQL Server.

Data Free Space
Amount of free space on all data files in the network.

Percent Free
Percent of free space available on the data files in the network.

Data Used Space
Amount of used space on the data files in the network.

Data Size
Total size of data files in the network.

Log Free Space
Amount of free space available to a database log.

Log Percent Used
Percentage of allocated space that a database log is consuming.

Log Used Space
Amount of storage space that is consumed by a database log.

Log Size
Total amount of space that is allocated to a database log.

Number Fragments
Number of fragments that are associated with a database.

Sybase - User Database Space Usage:

This report shows information about the RDBMS storage space consumed by users across the network.

The following list describes the columns that appear on the Sybase- User Database Space Usage report:

User Name
Name of a user upon whose storage usage information was collected.

Total Size
Amount of space consumed by the objects that are owned by the user.

Empty Used Space
Amount of empty used space that resides on the objects that are owned by the user.

Table Count
Number of tables that are owned by the user.

Index Count
Number of indexes that are owned by the user.

Other Count
Number of other objects owned by the user.

Largest Object
Size of the largest object owned by the user.

2nd Largest Object
Size of the second largest object owned by the user.

Object Size < 50KB
Number and total space usage of objects owned by the user that are under 50KB in size.

Object Size 50KB - 500KB
Number and total space usage of objects owned by the user that are between 50KB and 500KB in size.

Object Size 500KB - 1Mb
Number and total space usage of objects owned by the user that are between 500KB and 1MB in size.

Object Size 1Mb - 10Mb
Number and total space usage of objects owned by the user that are between 1MB and 10MB in size.

Object Size 10Mb - 100Mb
Number and total space usage of objects owned by the user that are between 10MB and 100MB in size.

Object Size 100Mb - 500Mb
Number and total space usage of objects owned by the user that are between 100MB and 500MB in size.

Object Size 500Mb - 1GB
Number and total space usage of objects owned by the user that are between 500MB and 1GB in size.

Object Size > 1Gb
Number and total space usage of objects owned by the user that are over 1GB in size.

UDB - Instance Storage By Computer:

This report shows information about the UDB instances in your environment sorted by the computers on which they are stored.

The following list describes the columns that are displayed on the UDB - Instance Storage By Computer report.

Computer
Name of the computer on which a UDB Instance(s) resides

Total Size
Total amount of storage space allocated to UDB on a computer

Container Capacity
Amount of storage space allocated to the containers that reside on a computer

Container Free Space
Amount of free space available on the containers that reside on a computer

Log File Capacity
Amount of storage space allocated to the log files that reside on a computer

Tablespace Count
Number of tablespaces that reside on a computer

Container Count
Number of containers that reside on a computer

Log File Count
Number of log files that reside on a computer

UDB - Total DMS Container Free Space:

This report shows the total free space for the containers that are associated with DMS table spaces on UDB instances within your environment.

The following columns are displayed on the UDB - Total DMS Container Free Space report:

Free Space
Amount of free space available on the DMS containers within a network.

Percent Space
Percentage of free space available on the DMS containers within a network.

Used Space
Amount of storage space that is consumed on the DMS containers within a network.

Total Size
Total amount of space on the DMS containers within a network.

Number Containers
Number of DMS containers within a network.

UDB - User Database Space Usage:

This report shows information about the RDBMS storage space consumed by users across the network.

The following list describes the columns that appear on the UDB - User Database Space Usage report:

User Name
Name of a user upon whose storage usage information was collected.

Total Size
Amount of space consumed by the objects that are owned by the user.

Empty Used Space
Amount of empty used space that resides on the objects that are owned by the user.

Table Count
Number of tables that are owned by the user.

Index Count
Number of indexes that are owned by the user.

Other Count
Number of other objects owned by the user.

Largest Object
Size of the largest object owned by the user.

2nd Largest Object
Size of the second largest object owned by the user.

Object Size < 50KB
Number and total space usage of objects owned by the user that are under 50KB in size.

Object Size 50KB - 500KB
Number and total space usage of objects owned by the user that are between 50KB and 500KB in size.

Object Size 500KB - 1Mb
Number and total space usage of objects owned by the user that are between 500KB and 1MB in size.

Object Size 1Mb - 10Mb
Number and total space usage of objects owned by the user that are between 1MB and 10MB in size.

Object Size 10Mb - 100Mb
Number and total space usage of objects owned by the user that are between 10MB and 100MB in size.

Object Size 100Mb - 500Mb
Number and total space usage of objects owned by the user that are between 100MB and 500MB in size.

Object Size 500Mb - 1GB
Number and total space usage of objects owned by the user that are between 500MB and 1GB in size.

Object Size > 1Gb
Number and total space usage of objects owned by the user that are over 1GB in size.

System Reports - Disk Manager

Use these predefined reports to view performance information about storage subsystems.

The following system reports are available for Disk Manager .

Array Performance:

This report shows performance data for arrays. This report supports IBM System Storage DS8000, DS6000, and IBM TotalStorage Enterprise Storage Server systems only.

Column	Description
Subsystem	ID of the storage system
Array	The ID of the specified array.
Time	Date and time that the data was collected.
Interval	The actual duration of the sample interval (in seconds) for the performance data that was collected.
Disk Utilization Percentage	The approximate utilization percentage of a rank over a specified time interval (the average percent of time that the disks associated with the array were busy).
Sequential I/O Percentage	Percentage of all I/O operations that are performed for an array over a specified time interval that were sequential operations.
Backend Read I/O Rate	Average number of I/O operations per second for read operations.
Backend Write I/O Rate	Average number of I/O operations per second for write operations.
Total Backend I/O Rate	Average number of I/O operations per second for read and write operations.
Backend Read Data Rate	Average number of megabytes (2^20 bytes) that were transferred for read operations.
Backend Write Data Rate	Average number of megabytes (2^20 bytes) that were transferred for write operations.
Total Backend Data Rate	Average number of megabytes (2^20 bytes) that were transferred for read and write operations.
Backend Read Response Time	Average number of milliseconds that it took to respond to each read operation. For SAN Volume Controller models, this time is the external response time of the managed disks (MDisks).
Backend Write Response Time	Average number of milliseconds that it took to respond to each write operation. For SAN Volume Controller models, this time is the external response time of the managed disks (MDisks).
Overall Backend Response Time	Average number of milliseconds that it took to respond to each I/O operation (read and write). For SAN Volume Controller models, this time is the external response time of the managed disks (MDisks).
Write-cache Delay Percentage	Percentage of I/O operations that were delayed because of write-cache space constraints or other conditions. Write-cache Delay Percentage is the ratio of delayed I/O operations to total I/O operations.

Column	Description
Write-cache Delay I/O Rate	Average number of I/O operations per second that were delayed because of write-cache space constraints or other conditions, for a particular component over an interval.

Controller Cache Performance:

This report shows performance data for storage system controller caches. This report supports IBM System Storage DS8000, DS6000, DS5000, DS4000, and IBM TotalStorage Enterprise Storage Server systems only.

Column	Description
Subsystem	ID of the storage system.
Controller	The ID of the controller.
Time	Date and time that the data was collected.
Interval	The actual duration of the sample interval (in seconds) for the performance data that was collected.
Read I/O Rate (normal)	Average number of I/O operations per second for non-sequential read operations for a component over a specified time interval.
Read I/O Rate (sequential)	Average number of I/O operations per second for sequential read operations for a component over a specified time interval.
Read I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential read operations for a component over a specified time interval.
Write I/O Rate (normal)	Average number of I/O operations per second for non-sequential write operations for a component over a specified time interval.
Write I/O Rate (sequential)	Average number of I/O operations per second for sequential write operations for a component over a specified time interval.
Write I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential write operations for a component over a specified time interval.
Total I/O Rate (normal)	Average number of I/O operations per second for non-sequential read and write operations for a component over a specified time interval.
Total I/O Rate (sequential)	Average number of I/O operations per second for sequential read and write operations for a component over a specified time interval.

Column	Description
Total I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential read and write operations for a component over a specified time interval.
Cache Holding Time	Average cache holding time, in seconds, for I/O data in this subsystem controller (cluster). Shorter time periods indicate adverse performance.
Read Cache Hits Percentage (overall)	Percentage of cache hits for both sequential and non-sequential read operations for a component over a specified time interval.
Write Cache Hits Percentage (overall)	Percentage of cache hits for both sequential and non-sequential write operations for a component over a specified time interval.
Total Cache Hits Percentage (overall)	Percentage of cache hits for both sequential and non-sequential read and write operations for a component over a specified time interval.
Read Cache Hits Percentage (normal)	Percentage of cache hits for non-sequential read operations for a component over a specified time interval.
Write Cache Hits Percentage (normal)	Percentage of cache hits for non-sequential write operations for a component over a specified time interval.
Total Cache Hits Percentage (normal)	Percentage of cache hits for non-sequential read and write operations for a component over a specified time interval.
Read Cache Hits Performance (sequential)	The sequential read cache allocated for the controller.
Write Cache Hits Performance (sequential)	The sequential write cache allocated for the controller.
Total Cache Hits Performance (sequential)	The total sequential cache percentage (read and write) allocated for the controller.
Record Mode Read I/O Rate	Average number of I/O operations per second for record mode read operations for a component over a specified time interval.
Record Mode Read Cache Hits Percentage	Percentage of cache hits for record mode read operations for a component over a specified time interval.
Disk to Cache I/O Rate	Average number of I/O operations (track transfers) per second for disk to cache transfers for a component over a specified time interval.
Cache to Disk I/O Rate	Average number of I/O operations (track transfers) per second for cache to disk transfers for a component over a specified time interval.
Write-cache Delay Percentage	Percentage of I/O operations that were delayed because of write-cache space constraints or other conditions. Write-cache Delay Percentage is the ratio of delayed I/O operations to total I/O operations.

Column	Description
Write-cache Delay I/O Rate	Average number of I/O operations per second that were delayed due to write-cache space constraints or other conditions for a component over a specified time interval.

Controller Performance:

This report shows performance data for storage system controllers. This report supports IBM System Storage DS8000, DS6000, DS5000, DS4000, and IBM TotalStorage Enterprise Storage Server systems only.

Column	Description
Subsystem	ID of the storage system.
Controller	The ID of the controller.
Time	Date and time that the data was collected.
Interval	The actual duration of the sample interval (in seconds) for the performance data that was collected.
Read I/O Rate (overall)	Average number of megabytes (2^20 bytes) per second that were transferred for read operations for a component over a specified time interval.
Write I/O Rate (overall)	Average number of megabytes (2^20 bytes) per second that were transferred for write operations for a component over a specified time interval.
Total I/O Rate (overall)	Average number of megabytes (2^20 bytes) per second that were transferred for read and write operations for a component over a specified time interval.
Read Data Rate	Average number of I/O operations per second for both sequential and non-sequential read operations for a component over a specified time interval.
Write Data Rate	Average number of I/O operations per second for both sequential and non-sequential write operations for a component over a specified time interval.
Total Data Rate	Average number of I/O operations per second for both sequential and nonsequential read and write operations.
Read Response Time	Average number of milliseconds that it took to service each read operation for a component over a specified time interval.
Write Response Time	Average number of milliseconds that it took to service each write operation for a component over a specified time interval.
Overall Response Time	Average number of milliseconds that it took to service each I/O operation (read and write) for a component over a specified time interval.

I/O Group Performance:

This report shows performance data for I/O groups. This report supports IBM System Storage SAN Volume Controller systems only.

Column	Description
Subsystem	ID of the storage system
I/O Group	The ID of the specified input/output (I/O) group.
Time	Date and time that the data was collected.
Interval	The actual duration of the sample interval (in seconds) for the performance data that was collected.
CPU Utilization Percentage	Average utilization percentage of the CPUs.
Read I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential read operations for a component over a specified time interval.
Write I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential write operations for a component over a specified time interval.
Total I/O Rate (overall)	Average number of I/O operations per second for both sequential and nonsequential read and write operations.
Read Data Rate	Average number of megabytes (2^20 bytes) per second that were transferred for read operations for a component over a specified time interval.
Write Data Rate	Average number of megabytes (2^20 bytes) per second that were transferred for write operations for a component over a specified time interval.
Total Data Rate	Average number of megabytes (2^20 bytes) per second that were transferred for read and write operations for a component over a specified time interval.
Read Response Time	Average number of milliseconds that it took to service each read operation for a component over a specified time interval.
Write Response Time	Average number of milliseconds that it took to service each write operation for a component over a specified time interval.
Overall Response Time	Average number of milliseconds that it took to service each I/O operation (read and write) for a component over a specified time interval.
Port to Host Send I/O Rate	Average number of exchanges (I/Os) per second sent to host computers by a component over a specified time interval.
Port to Host Receive I/O Rate	Average number of exchanges (I/Os) per second received from host computers by a component over a specified time interval.

Column	Description
Total Port to Host I/O Rate	Average number of exchanges (I/Os) per second transmitted between host computers and a component over a specified time interval.
Port to Disk Send I/O Rate	Average number of exchanges (I/Os) per second sent to storage subsystems by a component over a specified time interval.
Port to Disk Receive I/O Rate	Average number of exchanges (I/Os) per second received from storage subsystems by a component over a specified time interval.
Total Port to Disk I/O Rate	Average number of exchanges (I/Os) per second transmitted between storage subsystems and a component over a specified time interval.
Port to Host Send Data Rate	Average number of megabytes (2^20 bytes) per second sent to host computers by a component over a specified time interval.
Port to Host Receive Data Rate	Average number of megabytes (2^20 bytes) per second received from host computers by a component over a specified time interval.
Total Port to Host Data Rate	Average number of megabytes (2^20 bytes) per second transmitted between host computers and a component over a specified time interval.
Port to Disk Send Data Rate	Average number of megabytes (2^20 bytes) per second sent to storage subsystems by a component over a specified time interval.
Port to Disk Receive Data Rate	Average number of megabytes (2^20 bytes) per second received from storage subsystems by a component over a specified time interval.
Total Port to Disk Data Rate	Average number of megabytes (2^20 bytes) per second transmitted between storage subsystems and a component over a specified time interval.

Managed Disk Group Performance:

This report shows performance data for managed-disk (MDisk) groups. This report supports IBM System Storage SAN Volume Controller systems only.

Column	Description
Subsystem	ID of the storage system
Managed Disk Group	The ID of the specified managed disk.
Time	Date and time that the data was collected.
Interval	The actual duration of the sample interval (in seconds) for the performance data that was collected.
Read Transfer Size	Average number of KB per input/output (I/O) for read operations, for a particular component over an interval.

Column	Description
Write Transfer Size	Average number of KB per I/O for write operations, for a particular component over an interval.
Overall Transfer Size	Average number of KB per I/O for read and write operations, for a particular component over an interval.
Backend Read I/O Rate	Average number of I/O operations per second for read operations.
Backend Write I/O Rate	Average number of I/O operations per second for write operations.
Total Backend I/O Rate	Average number of I/O operations per second for read and write operations.
Backend Read Data Rate	Average number of Mbps that were transferred for read operations.
Backend Write Data Rate	Average number of Mbps that were transferred for write operations.
Total Backend Data Rate	Average number of Mbps that were transferred for read and write operations.

Node Cache Performance report:

This report lists the most recently gathered performance data for IBM System Storage SAN Volume Controller nodes, which is aggregated to the node level from the per-node VDisk sample data.

Column	Description
Subsystem	ID of the storage system
Node	The ID of the specified node.
Time	Date and time that the data was collected.
Interval	The actual duration of the sample interval (in seconds) for the performance data that was collected.
Read Cache Hits Percentage (overall)	Percentage of cache hits for both sequential and nonsequential read operations, for a particular component over an interval.
Write Cache Hits Percentage (overall)	Percentage of cache hits for both sequential and nonsequential write operations, for a particular component over an interval.
Total Cache Hits Percentage (overall)	Percentage of cache hits for both sequential and nonsequential read and write operations, for a particular component over an interval.
Read I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential read operations for a component over a specified time interval.
Write I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential write operations for a component over a specified time interval.

Column	Description
Total I/O Rate (overall)	Average number of I/O operations per second for both sequential and nonsequential read and write operations.
Disk to Cache Transfer Rate	Average number of I/O operations (track transfers) per second for disk to cache transfers, for a particular component over an interval.
Cache to Disk Transfer Rate	Average number of I/O operations (track transfers) per second for cache to disk transfers, for a particular component over an interval.
Write-cache Delay Percentage	Percentage of I/O operations that were delayed because of write-cache space constraints or other conditions, for a particular component over an interval. (The ratio of delayed operations to total I/Os.)
Write-cache Overflow Percentage	Percentage of write operations that were delayed because of lack of write-cache space, for a particular component over an interval.
Write-cache Flush-through Percentage	Percentage of write operations that were processed in flush-through write mode, for a particular component over an interval.
Write Cache Write-through Percentage	Percentage of write operations that were processed in write-through write mode, for a particular component over an interval.
Write-cache Delay I/O Rate	Average number of I/O operations per second that were delayed because of write-cache space constraints or other conditions, for a particular component over an interval.
Write-cache Overflow I/O Rate	Average number of tracks per second that were delayed because of lack of write-cache space, for a particular component over an interval.
Write Cache Flush-through I/O Rate	Average number of tracks per second that were processed in flush-through write mode, for a particular component over an interval.
Write Cache Write-through I/O Rate	Average number of tracks per second that were processed in write-through write mode, for a particular component over an interval.
Readahead Percentage of Cache Hits	Percentage of all read cache hits, which occurred on prestaged data.
Dirty Write Percentage of Cache Hits	Percentage of all write cache hits, which occurred on already dirty data in the cache.

Port Performance:

This report shows performance data for ports. This report supports all storage systems.

Column	Description
Subsystem	ID of the storage system
Port	The ID of the specified port.
WWPN	The World Wide Port Name (WWPN) of the selected port.
Time	Date and time that the data was collected.
Interval	The actual duration of the sample interval (in seconds) for the performance data that was collected.
Port Send Bandwidth Percentage	The approximate bandwidth utilization percentage for send operations by a port based on its current negotiated speed.
Port Receive Bandwidth Percentage	The approximate bandwidth utilization percentage for receive operations by this port, based on its current negotiated speed.
Overall Port Bandwidth Percentage	The approximate bandwidth utilization percentage for send and receive operations by this port.
Port Send Utilization Percentage	The average amount of time that the port was busy sending data over a time interval.
Port Receive Utilization Percentage	The average amount of time that the port was busy receiving data over a time interval.
Overall Port Utilization Percentage	The average amount of time that the port was busy sending or receiving data over a time interval.
Port Send I/O Rate	The average number of input/output (I/O) operations per second for send operations for a port over a time interval.
Port Receive I/O Rate	Average number of I/O operations per second of receive operations for a port over a time interval.
Total Port I/O Rate	Average number of I/O operations per second for send and receive operations for a port over a time interval.
Port Send Data Rate	The average number of megabytes (2^20 bytes) per second that were transferred for send (read) operations for a port over a time interval.
Port Receive Data Rate	The average number of megabytes (2^20 bytes) per second that were transferred for receive (write) operations for a port over a time interval.
Total Port Data Rate	The average number of megabytes (2^20 bytes) per second that were transferred for send and receive operations for a port over a time interval.
Port to Host Send I/O Rate	The average number of exchanges (I/Os) per second sent to host computers by a component over a time interval.
Port to Host Receive I/O Rate	The average number of exchanges (I/Os) per second received from host computers by a component over a time interval.

Column	Description
Total Port to Host I/O Rate	The average number of exchanges (I/Os) per second transmitted between host computers and a component over a time interval.
Port to Disk Send I/O Rate	The average number of exchanges (I/Os) per second sent to storage subsystems by a component over a time interval.
Port to Disk Receive I/O Rate	The average number of exchanges (I/Os) per second received from storage subsystems by a component over a time interval.
Total Port to Disk I/O Rate	The average number of exchanges (I/Os) per second transmitted between storage subsystems and a component over a time interval.
Port to Host Send Data Rate	The average number of megabytes (2^20 bytes) per second sent to host computers by a component over a time interval.
Port to Host Receive Data Rate	The average number of megabytes (2^20 bytes) per second received from host computers by a component over a time interval.
Total Port to Host Data Rate	The average number of megabytes (2^20 bytes) per second transmitted between host computers and a component over a time interval.
Port to Disk Send Data Rate	Average number of megabytes (2^20 bytes) per second sent to storage subsystems by a component over a time interval.
Port to Disk Receive Data Rate	Average number of megabytes (2^20 bytes) per second received from storage subsystems by a component over a time interval.
Total Port Data Rate	Average number of megabytes (2^20 bytes) per second transmitted between storage subsystems and a component over a time interval.
Port Send Response Time	The average number of milliseconds that it took to service each send (read) operation for a port over a time interval.
Port Receive Response Time	The average number of milliseconds that it took to service each receive (write) operation for a port over a time interval.
Total Port Response Time	The average number of milliseconds that it took to service each operation (send and receive) for a port over a time interval.
Port Send Transfer Size	The average number of KB sent per I/O by a port over a time interval.
Port Receive Transfer Size	The average number of KB received per I/O by a port over a time interval.
Total Port Transfer Size	The average number of KB transferred per I/O by a port over a time interval.

Subsystem Performance:

This report shows performance data for storage systems. This report supports all storage systems.

Column	Description
Subsystem	ID of the storage system.
Time	Date and time that the data was collected.
Interval	The actual duration of the sample interval (in seconds) for the performance data that was collected.
Read I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential read operations for a component over a specified time interval.
Write I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential write operations for a component over a specified time interval.
Total I/O Rate (overall)	Average number of I/O operations per second for both sequential and nonsequential read and write operations.
Read Data Rate	Average number of megabytes (2^20 bytes) per second that were transferred for read operations for a component over a specified time interval.
Write Data Rate	Average number of megabytes (2^20 bytes) per second that were transferred for write operations for a component over a specified time interval.
Total Data Rate	Average number of megabytes (2^20 bytes) per second that were transferred for read and write operations for a component over a specified time interval.
Read Response Time	Average number of milliseconds that it took to service each read operation for a component over a specified time interval.
Write Response Time	Average number of milliseconds that it took to service each write operation for a component over a specified time interval.
Overall Response Time	Average number of milliseconds that it took to service each I/O operation (read and write) for a component over a specified time interval.

Top Active Volumes Cache Hit Performance:

This report summarizes the primary metrics for active volumes, prioritized by cache hit ratio. Only volumes with an input/output (I/O) rate that is greater than 0 will be included in this report. If all volumes are inactive, this report will be empty. This report supports all storage systems.

Column	Description
Subsystem	ID of the storage system.
Volume	The ID of the volume.
Time	Date and time that the data was collected.
Interval	The actual duration of the sample interval (in seconds) for the performance data that was collected.
Read Cache Hits Percentage (overall)	Overall read cache percentage for both sequential and nonsequential read operations.
Write Cache Hits Percentage (overall)	Percentage of cache hits for both sequential and nonsequential write operations.
Total Cache Hits Percentage (overall)	Percentage of cache hits for both sequential and nonsequential read and write operations.
Readahead Percentage of Cache Hits	Percentage of all read cache hits which occurred on prestaged data.
Dirty Write Percentage of Cache Hits	Percentage of all write cache hits which occurred on already dirty data in the cache.
Read I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential read operations for a component over a specified time interval.
Write I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential write operations for a component over a specified time interval.
Total I/O Rate (overall	Average number of I/O operations per second for both sequential and nonsequential read and write operations.
Read Data Rate	Average number of megabytes (2^20 bytes) per second that were transferred for read operations for a component over a specified time interval.
Write Data Rate	Average number of megabytes (2^20 bytes) per second that were transferred for write operations for a component over a specified time interval.
Total Data Rate	Average number of megabytes (2^20 bytes) per second that were transferred for read and write operations for a component over a specified time interval.
Read Response Time	Average number of milliseconds that it took to service each read operation for a component over a specified time interval.
Write Response Time	Average number of milliseconds that it took to service each write operation for a component over a specified time interval.
Overall Response Time	Average number of milliseconds that it took to service each I/O operation (read and write) for a component over a specified time interval.

Top Volumes Data Rate Performance:

This report summarizes the primary performance metrics for volumes, prioritized by data rate. This report supports all storage systems.

Column	Description
Subsystem	ID of the storage system
Volume	The ID of the specified volume.
Time	Date and time that the data was collected.
Interval	The actual duration of the sample interval (in seconds) for the performance data that was collected.
Read Data Rate	Average number of megabytes (2^20 bytes) per second that were transferred for read operations for a component over a specified time interval.
Write Data Rate	Average number of megabytes (2^20 bytes) per second that were transferred for write operations for a component over a specified time interval.
Total Data Rate	Average number of megabytes (2^20 bytes) per second that were transferred for read and write operations for a component over a specified time interval.
Read I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential read operations for a component over a specified time interval.
Write I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential write operations for a component over a specified time interval.
Total I/O Rate (overall)	Average number of I/O operations per second for both sequential and nonsequential read and write operations.
Read Response Time	Average number of milliseconds that it took to service each read operation for a component over a specified time interval.
Write Response Time	Average number of milliseconds that it took to service each write operation for a component over a specified time interval.
Overall Response Time	Average number of milliseconds that it took to service each I/O operation (read and write) for a component over a specified time interval.

Top Volumes Disk Performance:

This report summarizes the primary performance metrics for volumes, prioritized by disk rate. This report supports all storage systems.

Column	Description
Subsystem	ID of the storage system.

Column	Description
Volume	The ID of the volume.
Time	Date and time that the data was collected.
Interval	The actual duration of the sample interval (in seconds) for the performance data that was collected.
Disk to Cache Transfer Rate	Average number of I/O operations (track transfers) per second for disk to cache transfers, for a particular component over an interval.
Cache to Disk Transfer Rate	Average number of I/O operations (track transfers) per second for cache to disk transfers, for a particular component over an interval.
Write-cache Delay Percentage	Percentage of I/O operations that were delayed because of write-cache space constraints or other conditions, for a particular component over an interval. (The ratio of delayed operations to total I/Os.)
Write-cache Overflow Percentage	Percentage of write operations that were delayed because of lack of write-cache space, for a particular component over an interval.
Write-cache Flush-through Percentage	Percentage of write operations that were processed in flush-through write mode, for a particular component over an interval.
Write Cache Write-through Percentage	Percentage of write operations that were processed in write-through write mode, for a particular component over an interval.
Write-cache Delay I/O Rate	Average number of I/O operations per second that were delayed because of write-cache space constraints or other conditions, for a particular component over an interval.
Write-cache Overflow I/O Rate	Average number of tracks per second that were delayed because of lack of write-cache space, for a particular component over an interval.
Write Cache Flush-through I/O Rate	Average number of tracks per second that were processed in flush-through write mode, for a particular component over an interval.
Write Cache Write-through I/O Rate	Average number of tracks per second that were processed in write-through write mode, for a particular component over an interval.
Read I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential read operations for a component over a specified time interval.
Write I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential write operations for a component over a specified time interval.

Column	Description
Total I/O Rate (overall)	Average number of I/O operations per second for both sequential and nonsequential read and write operations.
Read Data Rate	Average number of megabytes (2^20 bytes) per second that were transferred for read operations for a component over a specified time interval.
Write Data Rate	Average number of megabytes (2^20 bytes) per second that were transferred for write operations for a component over a specified time interval.
Total Data Rate	Average number of megabytes (2^20 bytes) per second that were transferred for read and write operations for a component over a specified time interval.
Read Response Time	Average number of milliseconds that it took to service each read operation for a component over a specified time interval.
Write Response Time	Average number of milliseconds that it took to service each write operation for a component over a specified time interval.
Overall Response Time	Average number of milliseconds that it took to service each I/O operation (read and write) for a component over a specified time interval.

Top Volumes I/O Rate Performance:

This report summarizes the primary performance metrics for volumes, prioritized by I/O rate. This report supports all storage systems.

Column	Description
Subsystem	ID of the storage system.
Volume	The ID of the specified volume.
Time	Date and time that the data was collected.
Interval	The actual duration of the sample interval (in seconds) for the performance data that was collected.
Read I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential read operations for a component over a specified time interval.
Write I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential write operations for a component over a specified time interval.
Total I/O Rate (overall)	Average number of I/O operations per second for both sequential and nonsequential read and write operations.

Column	Description
Read Data Rate	Average number of megabytes (2^20 bytes) per second that were transferred for read operations for a component over a specified time interval.
Write Data Rate	Average number of megabytes (2^20 bytes) per second that were transferred for write operations for a component over a specified time interval.
Total Data Rate	Average number of megabytes (2^20 bytes) per second that were transferred for read and write operations for a component over a specified time interval.
Read Response Time	Average number of milliseconds that it took to service each read operation for a component over a specified time interval.
Write Response Time	Average number of milliseconds that it took to service each write operation for a component over a specified time interval.
Overall Response Time	Average number of milliseconds that it took to service each I/O operation (read and write) for a component over a specified time interval.

Top Volumes Response Performance:

This report summarizes the primary performance metrics for volumes, prioritized by response rate. This report supports all storage systems.

Column	Description
Subsystem	ID of the storage system.
Volume	The ID of the volume.
Time	Date and time that the data was collected.
Interval	The actual duration of the sample interval (in seconds) for the performance data that was collected.
Read Response Time	Average number of milliseconds that it took to service each read operation for a component over a specified time interval.
Write Response Time	Average number of milliseconds that it took to service each write operation for a component over a specified time interval.
Overall Response Time	Average number of milliseconds that it took to service each I/O operation (read and write) for a component over a specified time interval.
Peak Read Response Time	The peak (worst) response time for disk reads for a component over a time interval.
Peak Write Response Time	The peak (worst) response time for disk writes for a component over a time interval.

Column	Description
Read I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential read operations for a component over a specified time interval.
Write I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential write operations for a component over a specified time interval.
Total I/O Rate (overall)	Average number of I/O operations per second for both sequential and nonsequential read and write operations.
Read Data Rate	Average number of megabytes (2^20 bytes) per second that were transferred for read operations for a component over a specified time interval.
Write Data Rate	Average number of megabytes (2^20 bytes) per second that were transferred for write operations for a component over a specified time interval.
Total Data Rate	Average number of megabytes (2^20 bytes) per second that were transferred for read and write operations for a component over a specified time interval.

System reports - Fabric Manager

Use these predefined reports to view performance information about fabrics.

Port Connections:

Use the Port Connections report to view information about the ports on the switches in your storage area network (SAN). This report includes information about the port connections and status, as well as the port and switch IDs.

Fabric ID
The ID of the fabric that the switch is in.

Switch
The label value of the switch.

Switch Port
The ID of the port (*domainID,port_number*).

Slot The number for the blade that the port is on.

Index The unique number for the port across the whole switch.

Switch Port State
The state of the switch port: Normal, Warning, or Critical.

Connection State
The state of the connection between the two ports: Normal, Warning, or Critical.

Connected Port
The port that the switch port is connected to. This value is the WWN of the device connected to that port.

Connected Port State
The state of the connected port: Normal, Warning, or Critical.

Device
The device that the connected port is on.

Device State
The state of the device that the connected port is on: Normal, Warning, or Critical.

SAN Assets (ALL):

Use the SAN Assets (All) report to generate and view reports that provide information about all the assets discovered by IBM Tivoli Storage Productivity Center.

The following list describes the columns that are on the SAN Assets (ALL) report. All of the columns in the report are for display only.

Fabric ID
The ID of the fabric that the asset is in.

Type The type of discovered asset.

Label The label of the asset.

Identifier
The unique identifier of the storage asset. For example, a switch WWN.

Status The state of the device, either Normal, Warning, or Critical.

SAN Assets (Connected Devices):

Use the SAN Assets (Connected Devices) report to generate and view reports that provide information about all the connected devices discovered by IBM Tivoli Storage Productivity Center.

The following table lists the columns that are on the SAN Assets (Connected Devices) report. All of the columns in the report are for display only.

Fabric ID
The ID of the fabric that the asset is in.

Type The type of discovered asset.

Label The label of the asset.

Identifier
The unique identifier of the asset. For example, the device worldwide name.

Status The status of the asset: Normal, Warning, or Critical.

SAN Assets (Switches):

Use the SAN Assets (Switches) report to generate and view reports that provide information about switches in your SAN. These reports provide information about the switch ID, type, manufacturer, WWN, location, and other details.

The following list describes the columns that are on the SAN Assets (Switches) report. All of the columns in the report are for display only.

Fabric ID
The ID of the fabric that the switch is in.

Type The type is always "Switch".

Switch Type
The type of discovered switch. For example, a physical switch.

Label The label of the switch.

Status The status of the switch. The possible states are **Normal** and **Missing**.

IP Address
The IP address of the switch.

Vendor ID
The manufacturer of the switch.

Model The model name and number of the switch.

Version
The version information of the switch.

Serial Number
The serial number of the switch.

Object ID
The object ID of the switch.

Management ID
The management ID of the switch.

Management Address
The URL of the switch element manager.

Domain
The ID of the domain that the switch is in.

Contact
The contact information for the switch.

WWN The world-wide name (WWN) of the switch.

Location
The physical location of the switch.

Physical Switch WWN
The WWN for the parent or physical switch of a virtual switch. If this is not a virtual switch then this column is empty.

Switch Performance:

Use the Switch Performance report to generate and view reports that provide information about the free and occupied ports on the switches in your SAN. These reports provide information about the port connections and status, as well as the port and switch IDs, data and packet transfer rates, and other details. This report can be generated only for switches that have had performance monitors run on them.

The following list describes the columns that are on the Switch Performance report. All of the columns in the report are for display only.

Switch
The ID of the switch.

Time The date and time of the data collection.

Interval
The size of the sample interval, in seconds.

Port Send Packet Rate
The rate at which packets are sent through this port.

Port Receive Packet Rate
The rate at which packets are received through this port.

Total Port Packet Rate
The total rate at which packet operations are performed through this port.

Port Send Data Rate
The rate at which data is sent through this port.

Port Receive Data Rate
The rate at which data is received through this port.

Total Port Data Rate
The total rate at which data is processed through this port.

Port Peak Send Data Rate
The peak rate at which data is sent through this switch.

Port Peak Receive Data Rate
The peak rate at which data is received through this switch.

Port Send Packet Size
The size of the data block that is sent out through this switch.

Port Receive Packet Size
The size of the data block that is received in through this switch.

Overall Port Packet Size
The total size of the data block that is transferred by the switch.

Error Frame Rate
The rate at which error frames are generated by the switch.

Dumped Frame Rate
The rate at which frames are dumped by the switch.

Link Failure Rate
The rate at which failed links are generated by the switch.

Switch Port Errors:

Use the Switch Port Errors report to generate and view reports that provide information about the errors that are being generated by ports on the switches in your SAN. These reports provide information about the error frames, dumped frames, link failures, port and switch IDs, and other details. This report can be generated only for switches that have had performance monitors run on them.

To view more information for a specific file, click . Detailed information per computer is displayed in a **Network** tab. The **Network** tab displays file summary by computer.

The following list describes the fields on the Switch Port Errors report. All the fields on the report are for display only.

Switch
The ID of the switch.

Port The ID of the port.

WWPN
The World Wide Port Name (WWPN) of the selected port.

Slot The number for the blade that the port is on.

Index The unique number for the port across the whole switch.

Time The date and time of the data collection.

Interval
The size of the sample interval, in seconds.

Port Send Packet Size
The size of the data block that is sent out through this switch.

Port Receive Packet Size
The size of the data block that is received in through this switch.

Overall Port Packet Size
The total size of the data block that is transferred by the switch.

Error Frame Rate
The rate at which error frames are generated by the switch.

Dumped Frame Rate
The rate at which frames are dumped by the switch.

Link Failure Rate
The rate at which failed links are generated by the switch.

Loss of Sync Rate
The average number of times per second that synchronization was lost after the last reset of the device, for a particular component over a particular time interval.

Loss of Signal Rate
The average number of times per second that the signal was lost after the last reset of the device, for a particular component over a particular time interval.

CRC Error Rate
The average number of frames received per second in which the CRC in the frame did not match the CRC computed by the receiver, for a particular component over a particular time interval.

Short Frame Rate
The average number of frames received per second that were shorter than 28 octets (24 header + 4 CRC), not including any start of frame/end of frame bytes, for a particular component over a particular time interval.

Long Frame Rate
The average number of frames received per second that were longer than 2140 octets (24 header + 4 CRC + 2112 data), not including any start of frame/end of frame bytes, for a particular component over a particular time interval.

Encoding Disparity Error Rate
The average number of disparity errors received per second, for a particular component over a particular time interval.

The following list describes columns that are not part of the Switch Port Errors system report. However, you can include them, and save the resulting report in the *<user-id> Reports* node.

Port Send Packet Rate
The rate at which packets are sent through this port.

Port Receive Packet Rate
The rate at which packets are received through this port.

Total Port Packet Rate
The total rate at which packet operations are performed through this port.

Port Send Data Rate
The rate at which data is sent through this port.

Port Receive Data Rate
The rate at which data is received through this port.

Total Port Data Rate
The total rate at which data is processed through this port.

Port Peak Send Data Rate
The peak rate at which data is sent through this switch.

Port Peak Receive Data Rate
The peak rate at which data is received through this switch.

Top Switch Ports Data Rate Performance:

Use the Top Switch Port Data Rate Performance report to generate and view reports that provide information about the switches in your SAN that have the top data rates. This report can be generated only for switches that have had performance monitors run on them.

This report only displays rows for the 25 highest data rates from the switch ports monitored. It displays those rows in descending order by Total Port Data Rate. You can adjust the number of rows shown on the **Selection** tab.

To view more information for a specific file, click . Detailed information per computer is displayed in a **Network** tab. The **Network** tab displays the file summary by computer.

The following list describes the fields that are on the Top Switch Ports Data Rate Performance report. All of the fields on the report are for display only.

Switch
The ID of the switch.

Port The ID of the port.

Time The date and time of the data collection.

Interval
The size of the sample interval, in seconds.

Total Port Data Rate
The total rate at which data is processed through this port.

Total Port Packet Rate
The total rate at which the packet operations are performed through this port.

The following list describes columns that are not part of the Top Switch Ports Data Rate Performance report. However, you can include them, and save the resulting report in the ***<user> Reports*** node.

Port Send Packet Rate
The rate at which packets are sent through this port.

Port Receive Packet Rate
The rate at which packets are received through this port.

Port Send Data Rate
The rate at which data is sent through this port.

Port Receive Data Rate
The rate at which data is received through this port.

Port Peak Send Data Rate
The peak rate at which data is sent through this switch.

Port Peak Receive Data Rate
The peak rate at which data is received through this switch.

Port Send Packet Size
The size of the data block that is sent out through this switch.

Port Receive Packet Size
The size of the data block that is received in through this switch.

Overall Port Packet Size
The total size of the data block that is transferred by the switch

Error Frame Rate
The rate at which error frames are generated by the switch.

Dumped Frame Rate
The rate at which frames are dumped by the switch.

Link Failure Rate
The rate at which failed links are generated by the switch.

WWPN
The World Wide Name identifier for the FC port.

Slot The number for the blade that the port is on.

Index The unique number for the port across the whole switch.

Top Switch Ports Packet Rate Performance:

Use the Top Switch Ports Packet Rate Performance report to generate and view reports that provide information about the switches in your SAN that have the top packet rates. This report can only be generated for switches that have had performance monitors run on them.

This report only displays rows for the 25 highest packet rates from the switch ports monitored. It displays those rows in descending order by Total Port Packet Rate. You can adjust the number of rows shown on the Selection tab.

To view more information for a specific file:

- Click . Detailed information per computer will be displayed in a **Network** tab. The **Network** tab displays file summary by computer.

This section describes the fields on the Top Switch Ports Packet Rate Performance report. All the fields on the report are for display only.

Switch
The ID of the switch.

Port The ID of the port.

Time The date and time of the data collection.

Interval
The size of the sample interval, in seconds.

Total Port Packet Rate
The total rate at which the packet operations are performed through this port.

Total Port Data Rate
The total rate at which data is processed through this port.

The following list describes the columns that are not part of the Top Switch Ports Packet Rate Performance report. However, you can include them, and save the resulting report in the ***<user> Reports*** node.

Port Send Packet Rate
The rate at which packets are sent through this port.

Port Receive Packet Rate
The rate at which packets are received through this port.

Port Send Data Rate
The rate at which data is sent through this port.

Port Receive Data Rate
The rate at which data is received through this port.

Port Peak Send Data Rate
The peak rate at which data is sent through this switch.

Port Peak Receive Data Rate
The peak rate at which data is received through this switch.

Port Send Packet Size
The size of the data block that is sent out through this switch.

Port Receive Packet Size
The size of the data block that is received in through this switch.

Overall Port Packet Size
The total size of the data block that is transferred by the switch.

Error Frame Rate
The rate at which error frames are generated by the switch.

Dumped Frame Rate
The rate at which frames are dumped by the switch.

Link Failure Rate
The rate at which failed links are generated by the switch.

WWPN
The World Wide Name identifier for the FC port.

Slot The number for the blade that the port is on.

Index The unique number for the port across the whole switch.

Batch reports

Use the information in this section to learn how to generate and view batch reports. These reports are available in the IBM Tivoli Storage Productivity Center > **Reporting > My Reports** > **Batch Reports** node in the navigation tree.

A batch report represents any Tivoli Storage Productivity Center report that you want to run on a regular basis and save its data to a file. Schedule batch reports to run immediately, run once at a specified date and time, or run repeatedly at a specified date, time, cycle, and day. You can also select the time zone to use when running the report.

You can view the information in a generated batch report file directly or import it into an application of your choice. Batch reports provide a convenient and powerful way for you to save report definitions and schedule when to run those reports.

Creating batch reports

Create a batch report.

To create a batch report follow this procedure:

1. Expand **IBM Tivoli Storage Productivity Center → Reporting → My Reports**.
2. Right-click the **Batch Reports** node and select **Create Batch Report**.

   Note: If the batch report you want to create is similar to an existing one, click the name of the existing report, edit it and save it using a different name.
3. Click the **Report** tab and select the type of report you want to create and move it from **Available** to **Current Selections** by clicking . See "Selecting batch report options" on page 1563 for details of the tab contents.
4. Click the **Selection** tab and refine the criteria for selecting and displaying report data. Some options might not be available for all reports. Use the **Selection** page to:
   - Select a profile for controlling which data is collected. This option is not available for all reports. See "Use profiles" on page 315 for information about profiles.
   - Click **Selection** to specify the resources (for example, computers) that will be displayed in the report. This option is not available for all reports. For details about selecting resources, see "Selecting resources to display on a report" on page 1324.
   - Click **Filters** to apply filters the data that you want to display (for example, show only the machines that contain over 80% used space). For details about applying filters, see "Filtering the resources that appear on a report" on page 1326.
   - Select the columns you want to include in the report and move them from **Available Columns** to **Included Columns** by clicking .

   Note:
   - The values you set in **Available Columns** and **Included Columns** are not used for the following types of batch reports: History CSV File, PDF Chart, and HTML Chart.
   - The value you set in the **Summation Level** field is not used for the following types of batch reports: History CSV File, PDF Chart, and HTML Chart.

5. Click the **Options** tab of the Batch Report job window, specify the following:
   - The machine on which the report file will be saved
   - The report format (for example, HTML)
   - Whether to run a script when the report process is complete
   - The format for the name of the batch report

   See "Selecting batch report options" for details of the tab contents.
6. In the **When to Run** tab of the Batch Report job window, specify when and how often to run the batch report. See "Scheduling a batch report" on page 1567 for details of the tab contents.
7. In the **Alert** tab of the Batch Report job window, define the conditions that will trigger an alert and the method of notification (for example, e-mail). See "Defining alerts for batch reports" on page 1568 for details of the tab contents.
8. Click **File** → **Save** and type a name for the batch report. The batch report will be saved using your user ID as a prefix. For example, if you are logged onto Tivoli Storage Productivity Center as "Smith," the name of the batch report will be Smith.*report_name*.

Selecting batch report options:

Define the agent computer that you want to run the batch report on and specify the format of the file to be saved.

Use the **Options** page to define where the batch report is run and specify information about the output file.

1. Use the following fields to specify the location where a batch report is saved.

   TPC Server
   Save the batch report on the computer where the Tivoli Storage Productivity Center server is located. Use the **Report Location** field to specify the directory where the batch report file is saved.

   Agent Save the batch report on the computer where an agent is located. Use the **Report Location** field to specify the directory where the batch report file is saved.

   You can save batch reports to computers on which Storage Resource agents that are v4.2 or higher are deployed.

   The **Select Agent** field becomes active if you select to save a batch report to an agent.

   Select Agent
   Select the name of the computer on which an agent is deployed. This menu only displays computers on which Storage Resource agents that are v4.2 or higher are deployed:

   To save a batch report to a computer on which v4.1 of a Storage Resource agent is deployed, you must upgrade that agent to v4.2 or higher.

   Note:
   - The type of report that is selected for the batch report determines the agents that are available in this list. Agents that do not support the selected report are not displayed. For example, agents for versions of the product before v4.1 are not available for Data Source reports.

- If the agent you select from this menu is removed from the computer before the batch report is run, an error occurs and the batch report is not generated. If this error occurs, edit the definition of the batch report to specify an existing agent and then run the report again.
- There are differences in the batch reports depending on whether a Storage Resource agent is selected. If you are using a Storage Resource agent to collect data, these additional columns are available in the batch reports using the Selection tab:
  - Is Encryptable
  - Is Encrypted

Report Location
Specify the directory where you want to save the batch report. This field is only available for batch reports that are sent to the following locations:

- TPC Server
- Storage Resource agents that are v4.2 or higher.

For Storage Resource agent batch reports, when you select a Storage Resource agent from the **Select Agent** drop-down list, you see the location for the batch reports.

Windows
SRA_location\agent\log*computername*\reports

UNIX or Linux
SRA_location/agent/log/*computername*/reports

Note:

You can modify the location of the batch reports for Storage Resource agents and the TPC server only.

You also have the option of saving the report on the Tivoli Storage Productivity Center server. The default path for the Tivoli Storage Productivity Center server is:

Windows
C:\Program Files\IBM\TPC\data\log\reports

UNIX or Linux
/opt/IBM/TPC/data/log/reports

2. In the **Report Type Specification** section, select the type of batch report you want to generate. You are limited to one type of output per batch report job and can select from the following output formats:

CSV File
Create a CSV (comma delimited) file of the batch report. Select **Include Headers** to include column headers in the batch report output file. Select **Include Totals** to include the Totals column in the report output file.

Formatted File
Create a formatted text file of the batch report.

HTML File
Create an HTML file of the batch report.

History CSV File
For reports with historical trending, you can export the historical data

to a CSV file. The CSV file has the following format: <*object name, date, amount, date, amount*> and so on, where <*date, amount*> corresponds to each data point on the history chart.

PDF Chart

Create a chart for the batch report in PDF format. After you select this option, you can determine the type of chart you want to create. The list of available chart types vary by the report you selected on the **Report** tab:

- Chart space usage
- History chart: File Count
- History chart: Free Space
- History chart: Free Space %
- History chart: Used Space
- History chart: Used Space %
- History chart: Capacity

Note:

- You must use Adobe Acrobat Reader to view the resulting PDF. You can download Adobe Acrobat Reader from: http://get.adobe.com/reader/.
- This option is available for reports that support charting only.
- For agents that run on Linux and UNIX computers, you must perform additional configuration steps to enable this option. For information about how to configure the agent system, go to the Tivoli Storage Productivity Center Information Center. Search for the topic "Configuring IBM Tivoli Storage Productivity Center for batch reports on UNIX or Linux."
- The batch chart uses any customization settings that are defined for the corresponding "online" chart. "Online" charts are those charts generated using the Reporting facility.

  For example, if you choose to generate a **TPC-wide Storage Space > File System Space > By Filesystem > PDF Chart > Chart space usage** batch report chart, any customization settings defined in the Reporting facility for **Data Manager > Reporting > TPC-wide Storage Space > File System Space > By Filesystem > Chart space usage for selected** is applied to the batch report chart.

  Any batch chart with an associated online report that provides a choice between "selected" and "all" for its generated charts use the customization settings defined for the "selected" chart.
- If you select **PDF Chart > Pie Chart** from the Chart Customization window and one of the elements represented in the pie chart is much smaller than the other elements, the pie chart displays a graphical error. For example, if the pie chart for a batch report shows disk space, and the disk space used is 4 KB and the free space is 10 GB, a graphical error is displayed.

HTML Chart

Select this option if you want to create a chart for the batch report in HTML format. When HTML Chart is selected, the drop-down list to the right becomes active. Use this drop-down list to select the type of chart you want to create. The list of available chart types vary by the report you selected on the **Report** tab:

- Chart space usage
- History chart: File Count
- History chart: Free Space
- History chart: Free Space %
- History chart: Used Space
- History chart: Used Space %
- History chart: Capacity

Note:

- If you generate charts for reports and these charts contain long path names or a large number of segments, the text on the charts might overlap and make them difficult to read.
- For agents that run on Linux and UNIX computers, you must perform additional configuration steps to enable this option. For information about how to configure the agent system, go to the Tivoli Storage Productivity Center Information Center. Search for the topic "Configuring IBM Tivoli Storage Productivity Center for batch reports on UNIX or Linux."
- The batch chart you generate uses any customization settings that are defined for the corresponding "online" chart. "Online" charts are those generated using the Reporting facility.

  For example, if you choose to generate a **TPC-wide Storage Space > File System Space > By Filesystem > PDF Chart > Chart space usage** batch report chart, any customization settings defined in the Reporting facility for **Data Manager > Reporting > TPC-wide Storage Space > File System Space > By Filesystem > Chart space usage for selected** is applied to the batch report chart.

  Any batch chart with an associated online report that provides a choice between "selected" and "all" for its generated charts use the customization settings defined for the "selected" chart.

Customize this chart

Click this button to use the Chart Customization window to customize the chart that is generated for the batch report. You will be able to select a chart type and chart orientation. If there is a customized chart for the corresponding online report, the customized chart is used for this batch report. However, you can override that customized chart by using this function.

The button is active only when **PDF Chart** or **HTML Chart** is selected.

3. In the **Classic Column Names Specification** section, check **Use Classic Column Names** to use the original names of report columns in the output for batch reports. If you do not select this option, the new names of columns are used. For your reference, the online help displays the original names of those columns within parentheses ( ) next to their new names.

   Note: The titles of some reports have been updated. These new titles are always used for batch reports
4. In the **Script** section, check **Run Script** to run a script when the batch report is completed.

   Select this option and enter the name of the script you want to run against the results of the batch report. For example, if you create a batch report for the

most obsolete files on monitored computers, you can indicate a script that runs a program to archive all the files that appear in that report.

5. In the **Output File Specification** section, define the output file naming format for the batch report file.

   Enter Mask that will be used to create the output file name
   Displays the parameters that determine the name of the output file. For example, if you use the default parameters, {Report creator} {Report name} {Report run number}, Tivoli Storage Productivity Center retrieves the values for these parameters and uses them to name the output file. Click any of the following parameters to include them in the mask for the name of an output file:

   - Report creator (default)
   - Report name (default)
   - Report run number (default)
   - Report title
   - Report run date
   - Report run time
   - Unique number

   Note: If you include {Report name} in the mask, Tivoli Storage Productivity Center uses the name of the batch report definition in the name of the output file. If you included NLS characters in the name of the batch report definition, errors might occur if you selected a Storage Resource agent as a destination for the batch report. You can use NLS characters in the name of a batch report definition in the following situations:

   - TPC server is selected as the destination for a batch report.
   - A Storage Resource agent is selected as the destination for a batch report and the {Report name} parameter is not included in the mask for the output file name. If {Report name} is not used in the mask, it is recommended that other parameters are included in the mask to ensure that the output file name is unique. For example, `{Report Creator} {Report Run Number} {Report Title} {Unique number}`.

Scheduling a batch report:

Determine when and how often to run a batch report.

Use the **When to Run** page to specify when and how often to run the batch reporting job.

You have the following options for determining when to generate a report:

- Generate the report immediately
- Generate the report once at a specified time and date
- Generate the report repeatedly according to a schedule you specify

Select the option you want and then edit the time and date information accordingly. You can also use the fields in the How to handle time zones section to indicate the time zone that IBM Tivoli Storage Productivity Center should use when scheduling and running the batch report. For example, if you selected to run the job at 9:00 AM, you can use the fields in this section to run the batch report at:

- 9:00 AM local time of the agent running the batch report

- 9:00 AM of the time zone where the server resides
- 9:00 AM of a specific time zone, such as 9:00 AM CST or 9:00 GMT. For example, if you select 9:00 AM CST, the batch report will run at 7:00 AM on an agent located in the PST time zone.

Local time in each timezone. Select this option to use the time zone of the computer where the agent that collects data for the job is deployed. For probes of storage systems and fabrics, the time zone of the Tivoli Storage Productivity Center server is used.

Same Global time across all timezones. Use the options in this section to apply the same global time across all the time zones where the probe is being run.

- **Use the timezone that the server runs in.** Select this option to use the time zone of the location where the Tivoli Storage Productivity Center server resides.
- **Use this timezone.** Select this option to indicate a specific time zone for when to run the job. Select a timezone from the list box.

Defining alerts for batch reports:

Define the alert that will be triggered if the batch report fails to run.

Use the **Alert** tab to define an alert that will be triggered if the report does not run on schedule.

To define alert values for a batch report, complete the following steps:

1. Expand **IBM Tivoli Storage Productivity Center** > **Reporting -> My Reports** and right-click on **Batch Reports**.
2. Select **Create Batch Reports**. The Create Batch Reports window opens.
3. For information on creating the batch report, see "Batch reports" on page 1562.
4. Click the **Alerts** tab.
5. Define the conditions that will trigger the alert. The default setting is **Report Failed**. No other alerting conditions are currently available.
6. Select alert mechanisms in addition to writing an error to the error log:
   - If you want to use Simple Network Management Protocol (SNMP) traps, IBM Tivoli Enterprise Console events, or email as an alert notification, you must specify disposition values in the Alert Dispositions window. Expand **Administrative Services** > **Configuration** > **Alert Disposition**.
   - If you want a script to be run after an event has been triggered, you must create the script before you create the alert.
7. Save the file:
   a. Click **File** > **Save**.
   b. The **Save As** window opens. Enter a name for the batch report and click **OK**.

Editing alert values for a batch report

1. Expand **IBM Tivoli Storage Productivity Center** > **My Reports** > **Batch Reports**. The list of existing batch reports is displayed.
2. Click the batch report. The **Edit Batch Report** window opens.
3. In the **Alerts** tab, make any necessary changes.
4. Click **File** > **Save**.

"Batch reports" on page 1562

Creating batch reports for storage subsystem or switch performance:

This topic describes how to create a batch report for storage subsystem performance or switch performance.

To create a batch report for storage subsystem performance or switch performance, follow these steps:

1. Expand **IBM Tivoli Storage Productivity Center > Reporting > My Reports**.
2. Right-click the **Batch Reports** node and select **Create Batch Report**.
3. Click the **Report** tab and select the type of report you want to create and move it from **Available** to **Current Selections** by clicking the right-arrow button (>>). Select an item from **Storage Subsystem Performance** or **Switch Performance**.
4. Click the **Selection** tab. The Report Filter Specifications window displays.

   Selection button

   This determines the resources upon which you want to report, such as the storage subsystems, the fibre-channel ports, and so forth. The Select Resources window displays. The type of resources displayed for selection depends on the type of report you previously selected on the **Report** tab. For example, if you selected a By Storage Subsystem report, all displayed resources will be storage subsystems. If you clear the box for a resource on the Select Resources window, a warning icon displays on the Selection button.

   Filter button

   This further defines the data that you want to include in the report. Filters enable you to apply general rules to the report. When you click this button, the Edit Filter window displays.

   For example, to select only data associated with subsystems that have a name ending with "123–IBM", select the "Subsystem" column, the "LIKE" operator, and type "*123–IBM" (without the quotation marks) in the Value 1 field. To select only data which has a Read I/O Rate greater than 0, select the "Read I/O Rate (overall)" column, the ">" operator, and type "0" (without the quotation marks) in the Value 1 field.

   If a filter is defined for this report, a warning icon displays on the **Filter** button.

   Time range selectors

   All performance reports display historical performance data. Use the time range selectors to specify the exact time range that you want the report to cover. Click one of the following radio buttons to select the type of historical report you want:

   Display latest performance data

   This report contains only the latest available performance data for the selected resources. Note that even the latest data available might still be somewhat old, depending on whether data was recently collected for the resources. Including the time column in the report will help you determine how old the latest available data actually is. Regardless of the age of the data, clicking this button ensures that only a single row (representing a single point in time) for each selected resource is included in the report. If no data has ever been collected for

a particular resource, then that resource is not included in the report. If no data has ever been collected for any resource, then the resulting report will be empty.

Display historic performance data using absolute time
This report contains only data that falls within a specific time range. Select the time range using the **From** and **To** selectors. The specified from and to values are interpreted as inclusive. The resulting report contains all the performance data that is available within the specified time range, for each selected resource. This means that the data can consist of potentially many rows per resource, each with a unique timestamp. If no data has been collected for a particular resource during the specified time range, that resource is not included in the report. If no data has been collected for any resource during the specified time range, then the resulting report will be empty.

To determine which historical performance records fall within the specified time range, the **beginning timestamp** of the collection intervals is used for comparison. If an historical record contains performance data for an interval of time from 1:00 PM to 1:05 PM, that record would be included in the report for a time range of 1:00 PM to 8:00 PM. However, that same record would not be included if a time range of 1:02 PM to 8:02 PM was specified, because it is the beginning of the time period (for example, 1:00 PM in this example) that is used to determine inclusion in the specified time interval.

Specifying an absolute time range is not suitable for batch reports that are run on a repeating schedule, because the specified time range is fixed and will not automatically be updated based on the most current date and time. The result will be that the same report is generated every time that the batch report is run. Instead, use a relative time range for this type of report.

Display historic performance data using relative time
This report contains only data that falls within a specific time range extending backward from the current date and time. Specify the number of days in the desired time range, using the **days ago until now** field. The report will be exactly the same as a report using absolute time, with the **To** selector set to the current date and time, and the **From** selector set to the current date and time minus the number of **days ago until now**. However, when regenerating this report periodically, as the current date and time advances, the data included in the report will advance as well. As a result, this is the suitable option to select when defining batch reports that are run on a repeated schedule.

Note that the same criteria applies as if determining which historical performance records fall within the specified time range. Only the beginning timestamp of the collection intervals is used for comparison. This means that data for the current hour or the current day is not included in the report when selecting hourly or daily summation data, because data for the current hour or current day is only saved in the database when the hour or day is complete. As an alternative, consider using

the first radio button, **Display latest performance data**, to see a report showing the most recent daily summation data.

Summation Level

Use this selector to select which type of performance data records to include in the report. The Tivoli Storage Productivity Center Performance Manager collects and stores three different types of performance data:

By sample

Represents the most detailed data. There is usually one sample record per resource for every **n** minutes, where **n** is the performance monitor interval length that was specified when the monitor was defined. Each sample represents the average performance of the resource over those **n** minutes. A sample record with a timestamp of **t** will be saved at time **t+n**. In other words, the beginning of each **n** minute time interval is used for display and for time range matching.

Hourly

Represents an hourly average of the performance of the specified resources. There will be one hourly record written every hour, per resource. Each such record will be written at or shortly after each hour mark on the (device) clock. For example, a record with a timestamp of 12:00 PM and interval length of 1 hour will be written at 1:00 PM.

Daily Represents a daily average of the performance of the resources. There will be one daily record written every day, per resource. Each daily record will be written at or shortly after midnight, according to the device clock. For example, a record with a timestamp of April 21, 12:00 AM and interval length of 24 hours will be written on April 22, 12:00 AM.

Note that hourly and daily records are usually retained in the database for longer periods of time, compared to By Sample records. As a result, if a generated report indicates that sample data is no longer available for a particular time range in the past, it is possible that the sample data has already been purged, in which case you can try generating the report using hourly or daily summation levels.

Be aware that when selecting a time range using the **Display historic performance data using relative time** radio button, it is necessary to select the length of the range in days. This can lead to unexpected results when also selecting the daily summation level. Remember that a daily record is not written until the day is complete, which means that at any given time during the day, the current day's data does not yet exist in the database. Therefore, selecting the daily summation level as well as a relative time range of n **days ago until now**, will usually result in n-1 records being returned per resource, assuming that at least n-1 days worth of data has been previously collected for those resources. Specifying a relative time range of 1 **days ago until now** will result in an empty report.

Available Columns, Included Columns

Use these items to specify which columns to include and which columns to exclude from the generated report.

Available Columns

Displays the columns that you can include in the generated

report that are not already included. If a column appears in the **Included Columns** list box, it will not appear in the **Available Columns** list box.

Included Columns
Displays the columns that will appear in the generated report. By default, all columns for a report are listed in this list box and will be displayed in the generated report. You can highlight the columns and use the up and down arrows to rearrange the order of the columns in the report. The order of the items in this list box determines the order in which the columns will appear in the generated report. The columns with grayed-out names are the frozen columns, which cannot be selected, removed, or reordered for this type of report.

If a column appears in the **Available Columns** list box, it will not appear in the **Included Columns** list box.

To exclude a column from a report, click the name of the column in the **Included Columns** list box. Click **Shift+click** and **Ctrl+click** to select multiple columns, if so desired. Then click the left-arrow button (<<). The selected columns are removed from the **Included Columns** list box, and will appear in the **Available Columns** list box.

To include a column in a report, click the name of the column in the Available Columns list box. Click **Shift+click** and **Ctrl+click** to select multiple columns, if so desired. Then click the right-arrow button (>>). The selected columns will be removed from the **Available Columns** list box, and will appear in the **Included Columns** list box.

To rearrange the order of columns that will appear in the generated report, click the name of a column in the **Available Columns** list box. Click **Shift+click** and **Ctrl+click** to select multiple columns, if so desired. Then click the up-arrow button (^) or the down-arrow button (v) to move the selected columns up or down in the list, relative to the other columns.

5. Click the **Options** tab of the Batch Report job window, specify the following:
   - The machine on which the report file will be saved
   - The report format (for example, HTML)
   - Whether to run a script when the report process is complete
   - The format for the name of the batch report
6. In the **When to Run** tab of the Batch Report job window, specify when and how often to run the batch report.
7. In the **Alert** tab of the Batch Report job window, define the conditions that will trigger an alert and the method of notification.
8. Click **File > Save** and type a name for the batch report. The batch report will be saved using your user ID as a prefix. For example, if you are logged onto Tivoli Storage Productivity Center as "Smith," the name of the batch report will be Smith.*report_name.*

Editing batch reports

Edit existing batch report definitions.

To edit a batch-report definition, follow this procedure:

1. Expand **IBM Tivoli Storage Productivity Center → Reporting → My Reports → Batch Reports**.
2. Click the report name, make your changes and then click **File → Save**.

Viewing job information for a batch report

View job information for batch reports on the Job Management panel. Use this panel to check the status of a batch report schedule and view the runs, jobs, and log files associated with it.

To display a list of the runs and jobs for a batch report, complete the following steps:

1. Expand **IBM Tivoli Storage Productivity Center → Reporting → My Reports → Batch Reports**.
2. Click the name of a batch report. The content pane displays information about the batch report schedule.
3. Click **View Job History**. The Job Management panel is displayed and the batch report schedule is highlighted in the **Schedules** section.
4. View the runs and jobs for the highlighted batch report schedule in the **Jobs for Selected Schedule** section. See "Managing schedules, jobs, and runs" on page 605 for more information about how to use the Job Management panel.

Displaying log files for a batch report

Display the log files batch reports.

To display the log files for a batch report schedule, complete these steps:

1. Expand **IBM Tivoli Storage Productivity Center → Reporting → My Reports → Batch Reports**.
2. Click the name of a batch report. The content pane displays information about the batch report schedule.
3. Click **View Job History**. The Job Management panel is displayed and the batch report schedule is highlighted in the **Schedules** section.
4. In the **Jobs for Selected Schedule**, expand the run whose log files you want to view. Click **+** or **-** to expand or collapse the job listing under a run.
5. Select the job whose log file you want to view and click **View Log File(s)**. See "Managing schedules, jobs, and runs" on page 605 for more information about how to use the Job Management panel.

Displaying batch reports from the saved directory

Access the report file that is generated from a batch report schedule. This file contains the data for the report that you generated as a batch report.

After you run a batch report, batch report files are saved in the directory that you specified on the **Options** page of the Create Batch Report panel. Batch reports for Storage Resource agents are automatically saved to the following default locations:

- Windows: C:\Program Files\IBM\TPC\agent\log\computername\reports
- UNIX/Linux: /opt/IBM/TPC/agent/log/computername/reports

Viewing CSV batch reports with spreadsheet applications

View CSV-formatted batch reports in third-party spreadsheet applications.

If you are using a spreadsheet program (such as Excel) to view a CSV-type batch report file, that program might display data in the wrong columns either because

the data was exported from Data Manager, the data contains commas, or the file was opened or formatted in the spreadsheet program by double-clicking it.

If data is displaying in the wrong columns, open the CSV file using the spreadsheet program's open command.

Exporting and importing settings that you define

This topic describes how to export batch report definitions, constraints, groups, and profiles.

You can export settings that you define from one instance of IBM Tivoli Storage Productivity Center and import the settings into another instance. To export and import your definitions, complete the following steps:

1. On the system running the server component, change to the following directory:

   On Linux and UNIX operating systems

   ```
   /opt/IBM/TPC/data/server/tools/
   ```

   On Windows operating systems

   ```
   C:\Program files\IBM\TPC\data\server\tools\
   ```

2. To export the definitions from a command prompt, type the following command and press **Enter**:

   ```
   export -e <file>
   ```

   where <file> is the fully qualified name of the file where the definition information is written.

3. On the system to which you want to migrate the definitions, change to the **tools** directory.
4. To import the definitions, type the following command and press Enter:

   ```
   export -i <file>
   ```

   where <file> is the fully qualified name of the file that you created when exporting.

User ID (saved) reports

Use the information in this section to learn how to generate, save, and view user ID reports. You can create a user ID reports based on a system report or any of the online reports available in Data Manager, Data Manager for Databases, Disk Manager, or Fabric Manager. Once saved, user ID reports are available in the **IBM Tivoli Storage Productivity Center** > **Reporting >My Reports** > **user ID name** node in the navigation tree.

Creating a user-defined report

Create a custom report based on a system report or any of the online reports available in Data Manager, Data Manager for Databases, Disk Manager, or Fabric Manager.

To create a custom report, follow this procedure:

1. Specify new report criteria by doing one of the following:
   - Access a system report and change its format according to your organization's needs.
   - Create a new report using the reporting component in any of the IBM Tivoli Storage Productivity Center managers. For example, **Data Manager → Reporting → Usage → Access Load → Access Time → By Filesystem**.

2. Click **File → Save** and a type a name for the report. The report is saved in the **Tivoli Storage Productivity Center > Reporting > My Reports > *user name's*** node, where ***user name's*** is your login name. For example, if you are logged in as "Smith", your custom reports appear under the **Smith's Reports** node.

Displaying user-defined reports

Display a custom report saved under your user ID.

To display a list of custom reports, expand the **IBM Tivoli Storage Productivity Center > Reporting > My Reports > <*your user ID*>** node. Click the name of the report you want to view.

Editing user-defined reports

Change the settings for an existing user ID report and save those changes.

To edit a custom report definition, follow this procedure:

1. Expand **My Reports → *user name's* Reports**.
2. Click the report name, make your changes and then click **File → Save**.

Rollup reports

Use rollup reports to view the storage information that is collected by the master IBM Tivoli Storage Productivity Center server from its associated subordinate servers. Rollup reports offer a network-wide perspective of storage usage in an environment where multiple Tivoli Storage Productivity Center servers are deployed and collecting storage metrics.

Before you can generate rollup reports, you must perform the following tasks:

- Associate subordinate servers with the master server on the **Administrative Services** > **Data Sources** > **Tivoli Storage Productivity Center Servers window**.
- Run discoveries, probes, and scans from the subordinate servers to gather information about their locally monitored storage entities.
- Run discoveries, probes, and scans from the master server to gather information about its locally monitored storage entities. Information about the storage entities that are monitored by a master server are automatically shown in rollup reports.
- Run TPC Server probes from the master against the subordinate servers to collect their storage information for the rollup reports. Use the Tivoli Storage Productivity Center **Monitoring** > **TPC Server Probes** node to define and schedule probe jobs.

  Note:

  – If the same storage entity is managed by multiple subordinate servers, rollup reports reflect the storage information from the subordinate server that most recently probed that entity.

  – After upgrading to Tivoli Storage Productivity Center 5.1, you must run probes against the monitored storage assets for the master server to have information about those assets displayed in **Tivoli Storage Productivity Center** > **Reporting** > **Rollup Reports**.

Tivoli Storage Productivity Center includes different rollup reporting categories that provide you with the flexibility to view data about your storage resources according to the needs of your environment. The following rollup reporting categories are available:

Generating rollup reports

Learn how to generate and view rollup reports.

1. Expand the navigation tree to display the type of report you want to generate. For example, if you want to generate a database capacity report, expand **IBM Tivoli Storage Productivity Center** > **Reporting** > **Rollup Reports** > **Database Capacity**.
2. Highlight a By Clause to determine how you want to view a report. For example, to view rollup capacity information according to computer group, click **Tivoli Storage Productivity Center** > **Reporting** > **Rollup Reports** > **All DBMSs** > **By Computer Group**. The **Selection** page displays.
3. Use the **Selection** page to determine what columns appear within a report, what storage assets to report upon (Capacity and Database Capacity reports only), and how to filter that values that appear report columns.
4. (Capacity and Database Capacity reports only) Click **Selection...** to select the objects that you want to report upon from the Select Resources window. See "Selecting resources to display on a report" on page 1324 for information.
5. Click **Filter...** to further filter the objects that appear in a report. Filters enable you to apply general rules to the report based on the rows in that report. See "Filtering the resources that appear on a report" on page 1326 for more information on filtering.
6. Use the **Available Columns** and **Included Columns** list boxes to determine what columns are displayed in a generated report.
7. Click **Generate Report**. A new tab will be added to the tab dialog representing the report that you generated.
8. Click the new tab to view the report. Reports are tabular in format and composed of rows and columns. You can scroll the report to view the entire report. Use the **View** menu to hide/show the navigation tree to increase the viewable area of the report or drag the divider bar in the middle of the screen back and forth to reallocate the amount of space that is given each pane.

Rollup reports - fragmentation:

Fragmentation occurs when related storage entities are being monitored by different subordinate IBM Tivoli Storage Productivity Center servers.

The following example shows when fragmentation can occur using subordinate servers and rollup reports:

- **Example:** Host A is assigned a volume from storage subsystem 1. Host A is being monitored only by one Tivoli Storage Productivity Center subordinate server (Server 1) and storage subsystem 1 is being monitored by another subordinate server (Server 2). Server 1 and Server 2 are subordinate servers to the master server (Server 3).

  Reason for fragmentation: In this example, the host and subsystem are fragmented because they are not being monitored by the same Tivoli Storage Productivity Center server. This will cause the **Correlated Volume Space** value in the rollup reports for storage subsystems and volumes to be incorrect.

To prevent fragmentation when using master and subordinate server relationships to generate rollup reports, we recommend the following:

- Do not monitor a storage subsystem and the hosts to which its volumes are assigned with different subordinate servers that are associated with the same master server.

- Do not monitor a fabric and its related switches with different subordinate servers that are associated with the same master server.
- If an agent machine is using storage from a subsystem, then both the agent and subsystem should be monitored by the same subordinate server.
- Configure all the subordinate servers to discover all the storage subsystems within your environment. Note that if a subordinate server is monitoring a subsystem with an agent other than the agent that is using storage on that subsystem, the value for the **Correlated Volume Space** column in rollup reports will be incorrect. For example:
  - Host A has storage from Subsystem 1
  - Subordinate server B is Monitoring Host A and Subsystem 1
  - Subordinate server C is Monitoring Subsystem 1 and probed the subsystem more recently than server B.
  - The master server is monitoring subordinate servers B and server C.

  The master server will report the storage subsystem data from server C. Because the master server does not know about Host A, the value for the **Correlated Volume Space** column will be incorrect.

Rollup Reports - Asset

Use these reports to view detailed statistics about agents (IBM Tivoli Storage Productivity Center), computers, storage subsystems, disk and volume groups, disks, file systems, logical volumes, volumes, and fabrics that are monitored by subordinate servers.

The information that is shown in these reports is gathered by the master server when it runs Tivoli Storage Productivity Center server probes against associated subordinate servers. If the same storage entity is managed by multiple subordinate servers, rollup reports reflect the storage information from the subordinate server that most recently probed that entity.

Rollup Reports - Asset - Agents:

Use this report to view information about Fabric agents and Storage Resource agents that are associated with subordinate servers in your environment.

You can generate and sort the data within this report using the following By clauses:

- By Agent: Shows agents sorted according to the name of the computer on which they are installed.
- By OS Type: Shows agents sorted according to the operating system under which they run. Click the magnifying glass icon next to an operating system type to view more detailed information about each of the agents running under that operating system.
- By TPC Server: Shows agents sorted according to the subordinate server that manages them. Click the magnifying glass icon next to subordinate server to view more detailed information about each of the agents associated with that server.

Note: The first column in each report remains displayed when scrolling through the other columns on the report.

By Agent

Agent Name
Name of the computer on which an agent is installed.

Data/SR Agent Version
Tivoli Storage Productivity Center version number of a Storage Resource agent (for example, 4.2.0).

Fabric Agent Version
Tivoli Storage Productivity Center version number of a Fabric agent (for example, 4.1.1).

OS Type
Operating system on the computer where an agent is installed.

Data/SR Agent Status
Status of a Storage Resource agent. Possible statuses include Up and Down. A down agent represents an agent that is still running but with which the server is not communicating.

Fabric Agent Status
Status of a Fabric agent. Possible statuses include Up and Down. A down agent represents an agent that is still running but with which the server is not communicating.

Data/SR Agent Port
Port number on which a Storage Resource agent listens for requests. Port 9549 is registered for use by IBM.

Fabric Agent Port
Port number on which a Fabric agent listens for requests. Port 9550 is registered for use by IBM.

Host Address
Network name or IP address of an agent as seen by subordinate server.

Time Zone
Time zone where the agent is installed (for example, CDT).

CPU Architecture
Instruction set architecture on the computer where an agent is running.

By OS Type

OS Type
Operating system on the computer where an agent is installed.

Number of Data Agents/SR Agents
Total number of Storage Resource agents that are running on the operating system.

Number of Data Agents/SR Agents (Status: Up)
Number of Storage Resource agents that are running on the operating system that have a status of Up.

Number of Data Agents/SR Agents (Status: Down)
Number of Storage Resource agents that are running on the operating system that have a status of Down. A down agent represents an agent that is still running but with which the server is not communicating.

Number of Data Agents/SR Agents (Status: Defected)
Number of Storage Resource agents that are running on the operating system that have been reassigned to another server.

Number of Data Agents/SR Agents (Status: Upgrading)
Number of Storage Resource agents that are running on the operating system and are currently in the process of upgrading to the same version as the subordinate server.

Number of Data Agents/SR Agents (Status: Unreachable)
Number of Storage Resource agents that are running on the operating system that are unreachable. This status indicates that an agent that is unreachable and not responding to the server. This status might occur when the agent is not running but did not inform the server that it was shutting down, or when a network problem has occurred.

Number of Data Agents/SR Agents (Status: Upgrade Required)
Number of Storage Resource agents that are running on the operating system that require an upgrade to the same version as the subordinate server.

Number of Data Agents/SR Agents (Status: Deleted)
Number of Storage Resource agents that are running on the operating system that have a status of Deleted.

Number of Fabric Agents
Total number of Fabric agents that are running on the operating system.

Number of Fabric Agents (Status: Up)
Number of Fabric agents that are running on the operating system that have a status of Up.

Number of Fabric Agents (Status: Down)
Number of Fabric agents that are running on the operating system that have a status of Down. A down agent represents an agent that is still running but with which the server is not communicating.

By TPC Server

TPC Server
Name of the TPC server on which an agent is associated.

Number of Data/SR Agents
Total number of Storage Resource agents that are associated with the TPC server.

Number of Data Agents/SR Agents (Status: Up)
Number of Storage Resource agents that are associated with the TPC server that have a status of Up.

Number of Data Agents/SR Agents (Status: Down)
Number of Storage Resource agents that are associated with the TPC server that have a status of Down. A down agent represents an agent that is still running but with which the server is not communicating.

Number of Data Agents/SR Agents (Status: Defected)
Number of Storage Resource agents that are associated with the TPC server that have been reassigned to another server.

Number of Data Agents/SR Agents (Status: Upgrading)
Number of Storage Resource agents that are associated with the TPC server and are currently in the process of upgrading to the same version as the subordinate server.

Number of Data Agents/SR Agents (Status: Unreachable)
Number of Storage Resource agents that are associated with the TPC

server that are unreachable. This status indicates that an agent that is unreachable and not responding to the server. This status might occur when the agent is not running but did not inform the server that it was shutting down, or when a network problem has occurred.

Number of Data Agents/SR Agents (Status: Upgrade Required)
Number of Storage Resource agents that are associated with the TPC server that require an upgrade to the same version as the subordinate server.

Number of Data Agents/SR Agents (Status: Deleted)
Number of Storage Resource agents that are associated with the TPC server that have a status of Deleted.

Number of Fabric Agents
Total number of Fabric agents associated with the TPC server.

Number of Fabric Agents (Status: Up)
Number of Fabric agents associated with the TPC server that have a status of Up.

Number of Fabric Agents (Status: Down)
Number of Fabric agents associated with the TPC server that have a status of Down.

Rollup Reports - Asset - Computers:

Use this report to view information about the hosts and computers (including NetApp) that are monitored by subordinate servers in your environment. This includes VMWare-related entities such as hypervisors and virtual machines.

Note: The names of some columns have been changed. For your reference, the original names of those columns appear within parentheses ( ) next to their new names.

You can generate and sort the data within this report using the following by clauses:

- By Computer: Shows computers monitored by subordinate servers. Sorted by computer name.
- By TPC Server: Shows subordinate servers that are monitoring computers. Sorted by subordinate server name. Click the magnifying glass icon next to subordinate server to view more detailed information about each of the computers associated with that server.

Note: The first column in each report remains displayed when scrolling through the other columns on the report.

By Computer

Note: Two entries for the same host might appear in this report and the values for that host are counted twice in the **TOTAL** column. This scenario occurs under the following circumstances:

- You install two Storage Resource agents on the same host (using the long and short names of the host) that point to different Tivoli Storage Productivity Center servers. For example, you install an agent from serverA using the short name of a host (for example, hostC). You install another agent from serverB using the long name of the same host (for example, hostC.storage.chicago.com). You then set up the servers in a master and subordinate relationship. For

example, serverA is the master and serverB is the subordinate. In this example, there are two entries in the report for the host: hostC and hostC.storage.chicago.com. The values for hostC are counted twice in the **TOTAL** column.

- A Storage Resource agent on a host (hostC) points to two different Tivoli Storage Productivity Center servers (serverA and serverB). The host has a dynamic IP address. You set up serverA as the master and serverB as the subordinate. Server serverA probes hostC, but then the IP address of hostC changes before serverB probes the host. In this example, the report might display two entries for hostC: one entry with the IP address that was probed by serverA; the other entry with the changed IP address that was probed by serverB. The values for hostC are counted twice in the **TOTAL** column.
- A Storage Resource agent on a host (hostC) points to two different Tivoli Storage Productivity Center servers (serverA and serverB). The host has a name that resolves to hostC.storage.chicago.com on serverA and hostC.srm.storage.chicago.com on serverB. You then set up the servers in a master and subordinate relationship. For example, serverA is the master and serverB is the subordinate. In this example, there are two entries in the report for the host: hostC.storage.chicago.com and hostC.srm.storage.chicago.com. The values for hostC are counted twice in the **TOTAL** column.

Computer
Name of a computer monitored by a subordinate server.

OS Type
Operating system running on a computer.

OS Version
Version of the operating system running on a computer.

RAM Amount of RAM installed on a computer.

Disk Space (Capacity)
Total storage capacity for a computer. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks on a computer that has not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

Note: If the computer is an IBM Tivoli Storage SAN File Systems client, then this value will also include the capacity of any storage subsystem volumes visible to this computers that are owned by the SAN File System.

Number of Disks
Total number of disks for a computer. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value in this column:

- Computer disks on a computer that has not been probed by a Storage Resource agent.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

Processor Count
Number of CPUs running on a computer.

IP Address
IP address of a computer.

Serial Number
Serial number of a computer.

Model Model number or name of a computer.

Manufacturer
Manufacturer of a computer (for example, IBM).

Time Zone
Time zone where the computer is located.

Available File System Space (Filesystem Free Space)
Total amount unique file system storage space that is not used or available to the computer. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

Network Address
Network name of a computer.

Processor Type
Type of processor running on a computer (for example, GenuineIntel: x86 Family 15).

Processor Speed
Speed at which a computer's processor is running (in MHz).

CPU Arch
Architecture of the processor (for example, IA32).

Swap Space
Amount of swap space (virtual memory) defined on a computer.

By TPC Server

TPC Server
Name of a subordinate server that is monitoring computers in your environment.

# of Computers
Number of computers monitored by the subordinate server.

Disk Space (Capacity)
Total storage capacity of the computers monitored by the subordinate server. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks on a computer that has not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

Note: If a computer is an IBM Tivoli Storage SAN File Systems client, then this value will also include the capacity of any storage subsystem volumes visible to this computers that are owned by the SAN File System.

Available File System Space (Filesystem Free Space)
Total amount unique file system storage space that is not used or available to the computers that are monitored by the subordinate server. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

Number of Disks
Number of disks associated with the computers monitored by the subordinate server. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value in this column:

- Computer disks on a computer that has not been probed by the Storage Resource agent.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

Rollup Reports - Asset - Storage Subsystems:

Use this report to view information about the storage subsystems that are monitored by subordinate servers in your environment.

Note: The names of some columns have been changed. For your reference, the original names of those columns appear within parentheses ( ) next to their new names.

You can generate and sort the data within this report using the following By clauses:

- By Storage Subsystem: Sorted according to storage systems name. The names of storage systems monitored by subordinate servers appear in the first column and remain displayed when scrolling through the other columns on the report.
- By Disk Space: Sorted according to the storage capacity of storage systems. The names of storage systems monitored by subordinate servers and their disk capacity appear in the first two columns and remain displayed when scrolling through the other columns on the report.
- By TPC Server: Shows storage systems aggregated at subordinate server level. The names of subordinate servers that are monitoring storage systems appear in the first column and remain displayed when scrolling through the other columns on the report. Click the magnifying glass icon next to subordinate server to view more detailed information about each of the storage systems monitored by that server.

Note:

- Storage systems that have been discovered but not probed are not displayed in these reports.
- This report includes information about storage system volumes. For IBM System Storage SAN Volume Controller systems, IBM Tivoli Storage Productivity Center uses the term "Volume" to represent "virtual disks" for those systems.

By Storage Subsystem, and By Disk Space

Name Name or alias of a storage system that is monitored by a subordinate server or the master server.

Disk Space (Capacity)
Total raw (unformatted) disk capacity of a storage system. Tivoli Storage Productivity Center does not include the following capacity information in its calculation of the value for this column:

- Capacity of spare disks identified on IBM TotalStorage Enterprise Storage Server, IBM System Storage DS8000, and IBM System Storage DS6000 storage systems.
- Capacity of storage system disks that become missing after a storage system probe.

Note: For Hitachi Data Systems storage systems, this value is the capacity of all the volumes in the storage system.

Available Disk Space (Unallocated Space)
Total unformatted disk free space of the storage system. Tivoli Storage Productivity Center does not include the following storage space in its calculation of the value for this column:

- Storage system disks that become missing after a storage system probe.
- RAID overhead on storage systems that are identified by Tivoli Storage Productivity Center.
- External back-end storage for TagmaStore systems.
- Storage space that is consumed by volumes that reside on external disks when Hitachi Data Systems (HDS) storage systems are configured as storage virtualizers.

Note: For Hitachi Data Systems storage systems, internal disk information is not available. This field is set to 0.

Number of Disks
Total number of disks in the storage system. Tivoli Storage Productivity Center does not include disks that become missing after a successful storage system probe in its calculation of the value for this column. For Hitachi Data Systems storage systems, internal disk information is not available. This field is to 1.

Number of Volumes (LUNs)
Number of storage volumes and virtual storage volumes discovered by a probe. Tivoli Storage Productivity Center does not include storage volumes or virtual storage volumes that become missing after a successful probe in its calculation of the value for this column.

Volume Space (LUN Capacity)
Total amount of unique storage system volume space or virtual storage volume space discovered on monitored storage system arrays. Tivoli Storage Productivity Center does not include storage volumes or virtual storage volumes that become missing after a successful probe in its calculation of the value for this column.

Note: For space-efficient volumes, this value is the amount of storage space that is requested for these volumes, not the actual allocated amount. This value can result in discrepancies in the overall storage space reported for a storage system that uses space-efficient volumes. This situation also

applies to other space calculations, such as the calculations for the storage system's Consumable (Available) Volume Space and FlashCopy Target Volume Space.

Consumable Volume Space (Usable LUN Capacity)
Total amount of unique storage system volume space or virtual storage volume space discovered on monitored storage system arrays. Tivoli Storage Productivity Center does not include the following storage entities in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a probe
- Storage system volumes or virtual storage volumes that are used as flash copy targets.
- Storage system volumes or virtual storage volumes that are identified as a Business Continuance Volume extended (BCVx) (EMC only).
- Storage system volumes or virtual storage volumes used as a Volume Configuration Management (VCM) database (EMC only).

FlashCopy Target Volume Space (Capacity)
Total amount of unique storage system volume space and virtual storage volume space discovered on monitored storage system arrays and has been identified as flash copy target space. Tivoli Storage Productivity Center does not include the following storage entities in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a probe.
- Storage system volumes or virtual storage volumes that are not used as flash copy targets.

Note: TotalStorage Enterprise Storage Server systems must have at least the following microcode levels: ess800mincodelevel = 2.4.3.56, essf20mincodelevel = 2.3.3.89. Tivoli Storage Productivity Center does not report FlashCopy information if the TotalStorage Enterprise Storage Server systems do not meet this requirement.

Correlated Volume Space (LUN Capacity Visible to Data Manager)
Total amount of storage system volume space or virtual storage volume space on systems where the systems disks are identified by Tivoli Storage Productivity Center as residing within the monitored storage systems in a group. This includes storage system volumes or virtual storage volumes identified as back-end storage volumes on monitored storage system virtualizers.Tivoli Storage Productivity Center does not include the following entities in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Disks that are assigned to a monitored storage system but are not identified by Tivoli Storage Productivity Center as a disk residing within the storage system. Reasons why these disks are not identified as residing within the storage system include:
  - Tivoli Storage Productivity Center does not support the identification of disks for some storage system types.
  - The connection of the disk to the storage system is lost and is no longer detectable during a probe.
- Storage system volumes or virtual storage volumes that are identified as Business Continuance Volume extended (BCVx).

- Storage system volumes or virtual storage volumes used as a Volume Configuration Management (VCM) database.

Volume Space Not Correlated (LUN Capacity Not Visible to Data Manager)
Total amount of unique storage system volume space and virtual storage volume space discovered on monitored storage system arrays in a group that can be assigned or are assigned to systems within the network. Tivoli Storage Productivity Center does not include the following entities in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Disks that reside within a monitored storage system.
- Storage system volumes or virtual storage volumes that Tivoli Storage Productivity Center identifies as back-end storage volumes on monitored storage system virtualizers.

Unavailable Disk Space (Overhead)
Amount of storage system volume or virtual storage volume space that is dedicated to redundancy. This value is dependent on the storage system SMI-S provider returning a valid RAID value that can be used to determine the overhead. If the value is zero for a storage system, the overhead cannot be calculated.Tivoli Storage Productivity Center does not include the storage system volumes or virtual storage volumes that become missing after a probe in its calculation of the value for this column.

Formatted Space (Capacity)
Total amount of formatted storage space associated with the storage system that is used or can be used for system storage volumes or virtual storage volumes. This value is dependent on the storage system SMI-S provider returning a formatted value.

For some storage systems, this value is the total managed space which includes space that cannot be used for storage volumes or virtual storage volumes. This can occur due to a number of reasons, such as space not being formatted until storage volumes are created.

For SAN Volume Controller, this value represents the total size of the managed disk groups created on the SAN Volume Controller. This value does not include managed disk space that is not defined to a managed disk group.

Formatted Space with No Volumes (Formatted Space with No Volumes)
Total amount of formatted storage space associated with the storage system that can be used for system storage volumes or virtual storage volumes. This value is dependent on the storage system SMI-S provider returning a formatted value.

For some systems, this value represents the remaining managed space that includes space that cannot be used for storage volumes or virtual storage volumes. This can occur due to a number of reasons, such as space not being formatted until storage volumes are created.

For SAN Volume Controller, this value represents the space within the managed disk groups that does not include the size of the virtual disks created and the corresponding virtual disk extent overhead.

Overall Unavailable Disk Space (Total Overhead)
(TotalStorage Enterprise Storage Server, DS6000, DS8000,and SAN Volume Controller storage systems only.) Total amount of unformatted space within disk groups or array sites.

Unformatted Disk Space (Undefined Disk Group or Array Site Capacity)
This value does not apply to all storage systems. For TotalStorage Enterprise Storage Server, DS6000, DS8000 storage systems, this value is the total raw disk space of any unformatted disk groups or array sites. For IBM XIV Storage System, this value is the total available physical (hard) space that remains for pool creation. For other storage systems, this value is the total disk space that is not within a storage pool or**N/A** if the value is not applicable for the storage system.

Cache Amount of RAM or other cache for a storage system.

Note: This column is blank for SAN Volume Controllers.

Manufacturer
Manufacturer of a storage system.

Model Model number/name of a storage system.

Serial Number
Serial number of a storage system.

Firmware Revision
Microcode level of a storage system.

Assigned Volume Space (Subsystem Assigned LUN Capacity)
Total storage system volume space within the storage system that is mapped or assigned to host systems. Tivoli Storage Productivity Center does not include the following capacity information in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a probe.
- Storage system volumes that are not mapped or are not assigned to host systems.

Unassigned Volume Space (Subsystem Unassigned LUN Capacity)
Total storage system volume space within a storage system that is not mapped or not assigned to host systems. Tivoli Storage Productivity Center does not include the following capacity information in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a probe.
- Storage system volumes that are mapped or assigned to host systems.

Unassigned and Available Formatted Space (Subsystem Total Formatted Free Space) Total storage system space that is not mapped or not assigned to host systems and the total amount of formatted storage space associated with the storage system that can be used for system storage volumes.

This total amount of formatted storage space is dependent on the storage system SMI-S provider returning a formatted value. For some systems, this value represents the remaining managed space that might include space that cannot be used for storage volumes or virtual storage volumes. This can occur due to a number of reasons, such as space not being formatted until storage volumes are created.

Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system volumes that become missing after a probe.
- Storage system volumes that are mapped or assigned to host systems.

zOS Volume Space (LUN Capacity)
Total storage system space that is reserved for use on mainframe storage such as used by zOS. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system volumes that become missing after a storage system probe.
- Storage system volumes that are reserved for use on open system server or non-mainframe storage.

Open System Volume Space (LUN Capacity)
Total storage system space that is reserved for use on open system storage such as used by operating systems like Linux, AIX, HP/UX, Oracle Solaris, and Windows. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system volumes that become missing after a storage system probe.
- Storage system volumes that are reserved for use on mainframe storage.

Last Probed Timestamp
Date and time when a storage system was last probed by the subordinate or master server.

Physical Disk Space (Capacity)
Total amount of physical disk space discovered on the monitored storage system arrays. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system disks that become missing after a storage system probe.
- Back-end storage volumes on monitored storage system virtualizers (for example, SAN Volume Controller) that are attached from a storage system.

Backend Volume Space (LUN Capacity)
Total amount of storage system volume space or virtual storage space that Tivoli Storage Productivity Center identifies as the back-end disk space on a monitored storage system virtualizer (for example, SAN Volume Controller). Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Storage system volumes or virtual storage volumes that are back-end disks on a storage system virtualizer that is not monitored.

By TPC Server

TPC Server
Name of a subordinate server that is monitoring storage systems in your environment.

Number of Subsystems (Total)
Number of storage systems monitored by the subordinate server.

Disk Space (Total Disk Capacity)
Total raw (unformatted) disk capacity of the storage systems that are monitored by the subordinate server. Tivoli Storage Productivity Center does not include the following capacity information in its calculation of the value for this column:

- Capacity of spare disks identified on TotalStorage Enterprise Storage Server, DS8000, and DS6000 storage systems.
- Capacity of storage system disks that become missing after a storage system probe.

Note: For Hitachi Data Systems storage systems, this value is the capacity of all the Volumes in the storage system.

Available Disk Space (Total Disk Unallocated Space)
Total unformatted disk free space of the storage systems that are monitored by the subordinate server. Tivoli Storage Productivity Center does not include the following storage space in its calculation of the value for this column:

- Storage system disks that become missing after a storage system probe.
- RAID overhead on storage systems that are identified by Tivoli Storage Productivity Center.
- External back-end storage for TagmaStore systems.
- Storage space that is consumed by volumes that reside on external disks when Hitachi Data Systems (HDS) storage systems are configured as storage virtualizers.

Note: For Hitachi Data Systems storage systems, internal disk information is not available. This field is set to 0.

Number of Disks (Total)
Total number of disks in the storage systems that are monitored by the subordinate server. Tivoli Storage Productivity Center does not include disks that become missing after a successful storage system probe in its calculation of the value for this column. For Hitachi Data Systems storage systems, internal disk information is not available. This field is set to 1.

Number of Volumes (Total Number of LUNs)
Total number of storage volumes and virtual storage volumes discovered by the subordinate server. Tivoli Storage Productivity Center does not include storage volumes or virtual storage volumes that become missing after a successful probe in its calculation of the value for this column.

Volume Space (Total LUN Capacity)
Total amount of unique storage system volume space or virtual storage volume space discovered on storage system arrays that are monitored by the subordinate server. Tivoli Storage Productivity Center does not include storage volumes or virtual storage volumes that become missing after a successful probe in its calculation of the value for this column.

Note: For space-efficient volumes, this value is the amount of storage space that is requested for these volumes, not the actual allocated amount. This value can result in discrepancies in the overall storage space reported for a storage system that uses space-efficient volumes. This situation also applies to other space calculations, such as the calculations for the storage system's Consumable (Available) Volume Space and FlashCopy Target Volume Space.

Consumable Volume Space (Total Usable LUN Capacity)
Total amount of unique storage system volume space or virtual storage volume space discovered on storage system arrays that are monitored by the subordinate server. Tivoli Storage Productivity Center does not include the following storage entities in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a probe
- Storage system volumes or virtual storage volumes that are used as flash copy targets.
- Storage system volumes or virtual storage volumes that are identified as a Business Continuance Volume extended (BCVx) (EMC only).
- Storage system volumes or virtual storage volumes used as a Volume Configuration Management (VCM) database (EMC only).

FlashCopy Target Volume Space (Total FlashCopy Target Capacity)
Total amount of unique storage system volume space and virtual storage volume space discovered on storage system arrays that are monitored by the subordinate server and have been identified as flash copy target space. Tivoli Storage Productivity Center does not include the following storage entities in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a probe.
- Storage system volumes or virtual storage volumes that are not used as flash copy targets.

Note: TotalStorage Enterprise Storage Server systems must have at least the following microcode levels: ess800mincodelevel = 2.4.3.56, essf20mincodelevel = 2.3.3.89. Tivoli Storage Productivity Center does not report FlashCopy information if the TotalStorage Enterprise Storage Server systems do not meet this requirement.

Unavailable Disk Space (Overhead)
Amount of storage system volume or virtual storage volume space that is dedicated to redundancy and is monitored by the subordinate server. This value is dependent on the storage system SMI-S provider returning a valid RAID value that can be used to determine the overhead. If the value is zero for a storage system, the overhead cannot be calculated.Tivoli Storage Productivity Center does not include the storage system volumes or virtual storage volumes that become missing after a probe in its calculation of the value for this column.

Correlated Volume Space (Total LUN Capacity Visible to Data Manager)
Total amount of storage system volume space or virtual storage volume space on systems where the systems disks are identified by Tivoli Storage Productivity Center as residing within the storage systems that are monitored by the subordinate server. This includes storage system volumes or virtual storage volumes identified as back-end storage volumes on monitored storage system virtualizers.

The value in this column reflects the systems that are monitored by the subordinate server.Tivoli Storage Productivity Center does not include the following entities in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Disks that are assigned to a monitored storage system but are not identified by Tivoli Storage Productivity Center as a disk residing within the storage system. Reasons why these disks are not identified as residing within the storage system include:
  - Tivoli Storage Productivity Center does not support the identification of disks for some storage system types.

– The connection of the disk to the storage system is lost and is no longer detectable during a probe.

- Storage system volumes or virtual storage volumes that are identified as Business Continuance Volume extended (BCVx).
- Storage system volumes or virtual storage volumes used as a Volume Configuration Management (VCM) database.

Volume Space Not Correlated (Total LUN Capacity Not Visible to Data Manager)

Total amount of unique storage system volume space and virtual storage volume space discovered on monitored storage system arrays that can be assigned or are assigned to servers within the network. The value in this column reflects the storage systems that are monitored by the subordinate server.Tivoli Storage Productivity Center does not include the following entities in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Disks that reside within a monitored storage system.
- Storage system volumes or virtual storage volumes that Tivoli Storage Productivity Centeridentifies as back-end storage volumes on monitored storage system virtualizers.

Overall Unavailable Disk Space (Total Formatted Capacity)

Total amount of formatted storage space that is used or can be used for system storage volumes or virtual storage volumes. The value in this column reflects the storage systems that are monitored by the subordinate server. This value is dependent on the storage system SMI-S provider returning a formatted value.

For some storage systems, this value is the total managed space which includes space that cannot be used for storage volumes or virtual storage volumes. This can occur due to a number of reasons, such as space not being formatted until storage volumes are created.

Note: This value does not apply to SAN Volume Controller.

Formatted Space (Total Formatted Space with No Volumes)

Total amount of formatted storage space that can be used for system storage volumes or virtual storage volumes. The value in this column reflects the storage systems that are monitored by the subordinate server. This value is dependent on the storage system SMI-S provider returning a formatted value.

For some systems, this value represents the remaining managed space that includes space that cannot be used for storage volumes or virtual storage volumes. This can occur due to a number of reasons, such as space not being formatted until storage volumes are created.

For SAN Volume Controller, this value represents the total size of the managed disk groups created on the SAN Volume Controller. This value does not include managed disk space that is not defined to a managed disk group.

Formatted Space with No Volumes (Total Subsystem Total Formatted Free Space) Total storage system space that is not mapped or not assigned to host systems and the total amount of formatted storage space associated with

the storage system that can be used for system storage volumes. The value in this column reflects the storage systems that are monitored by the subordinate server.

This total amount of formatted storage space is dependent on the storage system SMI-S provider returning a formatted value. For some systems, this value represents the remaining managed space that might include space that cannot be used for storage volumes or virtual storage volumes. This can occur due to a number of reasons, such as space not being formatted until storage volumes are created.

For SAN Volume Controller, this value represents the space within the managed disk groups that does not include the size of the virtual disks created and the corresponding virtual disk extent overhead.

Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system volumes that become missing after a probe.
- Storage system volumes that are mapped or assigned to host systems.

Capacity Overhead (Total)
(TotalStorage Enterprise Storage Server and SAN Volume Controller only.) Sum of all the space in a disk group minus the formatted capacity of the storage systems monitored by a subordinate server.

Unformatted Disk Space (Total Undefined Disk Group or Array Site Capacity)
This value does not apply to all storage systems. For TotalStorage Enterprise Storage Server, DS6000, DS8000 storage systems, this value is the total raw disk space of any unformatted disk groups or array sites that are monitored by the subordinate server. For the XIV system, this value is the total available physical (hard) space that remains for pool creation. For other storage systems, this value is the total disk space that is not within a storage pool or **N/A** if the value is not applicable for the storage system.

Cache (Total)
Amount of RAM or other cache for the storage systems that are monitored by the subordinate server.

Assigned Volume Space
Total storage system volume space within the storage system that is mapped or assigned to host systems. Tivoli Storage Productivity Center does not include the following capacity information in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Storage system volumes that are not mapped or are not assigned to host systems.

Unassigned Volume Space (Total Subsystem Assigned LUN Capacity)
Total storage system volume space within storage systems that is mapped or assigned to host systems. The value in this column reflects the storage systems that are monitored by the subordinate server. Tivoli Storage Productivity Center does not include the following capacity information in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a probe.
- Storage system volumes that are not mapped or are not assigned to host systems.

Unassigned and Available Formatted Disk Space (Total Subsystem Unassigned LUN Capacity)

Total storage system volume space within storage systems that is not mapped or not assigned to host systems. The value in this column reflects the storage systems that are monitored by the subordinate server. Tivoli Storage Productivity Center does not include the following capacity information in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a probe.
- Storage system volumes that are mapped or assigned to host systems.

zOS Volume Space (Total zOS LUN Capacity)

Total storage system space that is reserved for use on mainframe storage such as used by zOS. The value in this column reflects the storage systems that are monitored by the subordinate server.Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system volumes that become missing after a storage system probe.
- Storage system volumes that are reserved for use on open system server or non-mainframe storage.

Open System Volume Space (Total Open System LUN Capacity)

Total storage system space that is reserved for use on open system storage such as used by operating systems like Linux, AIX, HP/UX, Oracle Solaris, and Windows. The value in this column reflects the storage systems that are monitored by the subordinate server. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system volumes that become missing after a storage system probe.
- Storage system volumes that are reserved for use on mainframe storage.

Physical Disk Space (Capacity)

Total amount of physical disk space discovered on the storage system arrays that are monitored by the subordinate server. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system disks that become missing after a storage system probe.
- Back-end storage volumes on monitored storage system virtualizers (for example, SAN Volume Controller) that are attached from a storage system.

Backend Volume Space (LUN Capacity)

Total amount of storage system volume space or virtual storage space that Tivoli Storage Productivity Center identifies as the back-end disk space on a monitored storage system virtualizer (for example, SAN Volume Controller). The value in this column reflects the volumes that are monitored by the subordinate server. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Storage system volumes or virtual storage volumes that are back-end disks on a storage system virtualizer that is not monitored.

Rollup Reports - Asset - Disk/Volume Groups:

Use this report to view information about the disk and volume groups that are monitored by subordinate servers in your environment.

You can generate and sort the data within this report by using the following By-clauses.

- By Computer: Shows disk and volume groups that are aggregated at the computer level and sorted by computer name.
- By Disk/Volume Group Space: Shows disk and volume groups that are aggregated at the computer level and sorted by storage capacity.
- By Available Disk/Volume Group Space: Shows disk and volume groups that are aggregated at the computer level and sorted by storage free space.
- By TPC Server: Shows disk and volume groups that are aggregated at the subordinate server level and sorted by subordinate server name. Click the magnifying glass icon next to the name of a subordinate server to view information about the computers it monitors.

Note: The first column in each report remains displayed when you scroll through the other columns on the report.

By Computer

Note: The names of some columns are changed. For your reference, the original names of those columns display within parentheses ( ) next to their new names.

Computer Name
Name of a computer with disk and volume groups that is monitored by a subordinate server.

Number of Disk/Volume Groups (Volume Groups)
Number of volume groups on a computer.

Disk/Volume Group Space (Total Capacity)
Total storage capacity of the disks and volume groups on a computer.

Available Disk/Volume Group Space (Total Free Space)
Amount of storage space available on the disk and volume groups that are monitored by a subordinate server.

OS Type
Operating system that runs on a computer.

Number of Disks
Number of disks on a computer.

Last Probe Time
Date and time when a computer was last probed.

By Disk/Volume Group Space (Free Space)

Computer Name
Name of a computer with disk and volume groups that are monitored by a subordinate server.

Disk/Volume Group Space (Total Free Space)
Amount of storage space available on the disks and volume groups that are associated with a computer.

Number of Disk/Volume Groups (Number of Volume Groups)
Number of volume groups on a computer.

Available Disk/Volume Group Space (Total Capacity)
Total storage capacity of the disks and volume groups on a computer.

OS Type
Operating system that runs on a computer.

Number of Disks
Number of disks on a computer.

Last Probe Time
Date and time when a computer was last probed.

By Available Disk/Volume Group Space (Capacity)

Computer Name
Name of a computer with disk and volume groups that is monitored by a subordinate server.

Available Disk/Volume Group Space (Total Capacity)
Total storage capacity of the disks and volume groups on a computer.

Number of Disk/Volume Groups (Volume Groups)
Number of volume groups on a computer.

Disk/Volume Group Space (Total Free Space)
Amount of storage space available on the disks and volume groups that are associated with a computer.

OS Type
Operating system that runs on a computer.

Number of Disks
Number of disks on a computer.

Last Probe Time
Date and time when a computer was last probed.

By TPC Server

TPC Server
Name of a subordinate server that is monitoring computers with disk and volume groups.

Number of Disk/Volume Groups
Number of disk and volume groups that are monitored by a subordinate server.

Disk/Volume Group Space (Total Free Space)
Amount of storage space available on the disks and volume groups that are monitored by a subordinate server.

Available Disk/Volume Group Space (Total Capacity)
Total storage capacity of the disks and volume groups that are monitored by a subordinate server.

Rollup Reports - Asset - Disks:

Use this report to view information about the disks that are monitored by subordinate servers in your environment.

You can generate and sort the data within Disk reports using the following by clauses:

- By Available Disk Space (Computers): Shows disks aggregated at the computer level and sorted by unallocated space. The names of computers and their system type appear in the first two columns and remain displayed when scrolling through the other columns on the report.
- By Available Disk Space (Subsystems): Shows disks aggregated at the storage subsystem level and sorted by unallocated space. The names of storage subsystems and their system type appear in the first two columns and remain displayed when scrolling through the other columns on the report.
- By TPC Server (computers): Shows computer disks aggregated at the subordinate server level. The names of subordinate servers appear in the first column and remain displayed when scrolling through the other columns on the report. Click the magnifying glass icon next to a subordinate server name to view more information about the computers monitored by that subordinate server.
- By TPC Server (subsystems): Shows storage subsystem disks aggregated at the subordinate server level. The names of subordinate servers appear in the first column and remain displayed when scrolling through the other columns on the report. Click the magnifying glass icon next to a subordinate server name to view more information about the storage subsystems monitored by that subordinate server.

Note: The names of some columns have been changed. For your reference, the original names of those columns appear within parentheses ( ) next to their new names.

By Available Disk Space (Computers)

TOTAL
Shows the system-wide totals for each of the columns in the report.

System Name
Name of a computer with disks that are monitored by a subordinate server.

OS Type
Operating system running on a computer.

Available Disk Space (Total Unallocated Space)
Amount of storage space on disks that is not allocated to any logical volume. Note: the value that appears in the TOTAL row for this column includes the unallocated capacity of all disks within the computers monitored by subordinate servers.

Disk Space (Total Capacity)
Amount of storage space available on the disks associated with a computer.

Number of Disks
Number of disks on a computer.

By Available Disk Space (Subsystems)

System Name
Name of a storage subsystem with disks that are monitored by a subordinate server.

Subsystem Type
Operating system running on a storage subsystem.

Available Disk Space (Total Unallocated Space)
Amount of space on the disk that is not allocated to any volumes for disks within storage subsystems). Note: the value that appears in the TOTAL row for this column includes the unallocated capacity of all disks within the storage subsystem, including the capacity of spare disks.

Disk Space (Total Capacity)
Amount of storage space available on the disks associated with a storage subsystem.

Note: For space-efficient volumes, this value is the amount of storage space that is requested for these volumes, not the actual allocated amount. This value can result in discrepancies in the overall storage space reported for a storage system that uses space-efficient volumes. This situation also applies to other space calculations, such as the calculations for the storage system's Consumable (Available) Volume Space and FlashCopy Target Volume Space.

Number of Disks
Total number of disks in a storage subsystem.

Physical Disk Space
Total amount of physical disk space discovered on the monitored storage subsystem arrays. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage subsystem disks that become missing after a storage subsystem probe.
- Back-end storage volumes on monitored storage subsystem virtualizers (for example, IBM SAN Volume Controller) that are attached from a storage subsystem.

By TPC Server (Computers)

TOTAL
Shows the system-wide totals for each of the columns in the report.

TPC Server
Name of a subordinate server that is monitoring disks on computers.

Available Disk Space (Total Unallocated Space)
Amount of storage space on computer disks that is not allocated to any logical volume and are monitored by a subordinate server.

Disk Space (Total Capacity)
Amount of storage space available on all the computer disks that are monitored by a subordinate server.

Note: For space-efficient volumes, this value is the amount of storage space that is requested for these volumes, not the actual allocated amount. This value can result in discrepancies in the overall storage space reported for a storage system that uses space-efficient volumes. This situation also applies to other space calculations, such as the calculations for the storage system's Consumable (Available) Volume Space and FlashCopy Target Volume Space.

Number of Disks
Number of computer disks monitored by a subordinate server.

By TPC Server (Subsystems)

TPC Server
Name of a subordinate server that is monitoring disks on storage subsystems.

Available Disk Space (Total Unallocated Space)
Amount of storage space on storage subsystem disks that is not allocated to any volume and are monitored by a subordinate server.

Disk Space (Total Capacity)
Amount of storage space available on all the storage subsystem disks that are monitored by a subordinate server.

Number of Disks
Number of storage subsystem disks monitored by a subordinate server.

Physical Disk Space
Total amount of physical disk space discovered on the monitored storage subsystem arrays. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage subsystem disks that become missing after a storage subsystem probe.
- Back-end storage volumes on monitored storage subsystem virtualizers (for example, IBM SAN Volume Controller) that are attached from a storage subsystem.

Rollup Reports - Asset - File Systems or Logical Volumes:

Use this report to view information about the file systems or logical volumes that are monitored by subordinate servers in your environment.

You can generate and sort the data within File Systems or Logical Volumes reports by using the following by-clauses.

- By Available File System or Logical Volume Space: Shows file systems that are aggregated at the computer level and sorted by free space and computer name.
- By TPC Server: Shows file systems that are aggregated at the subordinate server level and sorted by subordinate server name. Click the magnifying glass icon next to a subordinate server name to view more information about the file systems or logical volumes that are monitored by that subordinate server.

Note: The first column in each report remains displayed when you scroll through the other columns on the report.

Note: The names of some columns are changed. For your reference, the original names of those columns are within parentheses ( ) next to their new names.

By Available File System or Logical Volume Space

Computer Name
Name of a computer with file systems or logical volumes that are monitored by a subordinate server.

Available File System/Logical Volume Space (Free Space)
Amount of storage space available in the file systems or logical volumes on a computer.

Consumed File System/Logical Volume Space (Used Space)
Amount of storage space that is used by the file systems or logical volumes on a computer.

File System/Logical Volume Space (Capacity)
Total storage capacity of the file systems or logical volumes on a computer.

OS Type
Operating system on a computer.

Number of File Systems/Logical Volumes (Number of FSs/LVs)
Number of file systems or logical volumes on a computer.

By TPC Server

TPC Server
Name of a subordinate server that is monitoring the file systems and logical volumes in your environment.

Available File System/Logical Volume Space (Total Free Space)
Amount of storage space available in all the file systems or logical volumes on the computers that are monitored by the subordinate server.

Consumed File System/Logical Volume Space (Total Used Space)
Amount of storage space that is used by all the file systems or logical volumes on the computers that are monitored by the subordinate server.

File System/Logical Volume Space (Total Capacity)
Total storage capacity of all the file systems or logical volumes on the computers that are monitored by the subordinate server.

Number of File Systems/Logical Volumes (Number of FSs/LVs)
Number of file systems or logical volumes on the computers that are monitored by the subordinate server.

Rollup Reports - Asset - Storage Subsystem Volumes:

Use this report to view information about the Storage Subsystem Volumes that are monitored by subordinate servers in your environment.

You can generate and sort the data within this report using the following by clauses:

- By Storage Subsystem: Shows Storage Subsystem Volume capacity and count aggregated at the storage subsystem level.
- By Storage Subsystem Volume Space: Shows Storage Subsystem Volume capacity and count aggregated at the subsystem level. Sorted according to the storage capacity of Storage Subsystem Volumes.
- By TPC Server: Shows Storage Subsystem Volume capacity and count aggregated at the subordinate server level. Sorted by subordinate server name. Click the magnifying glass icon next to a subordinate server to view information about the storage subsystems it monitors.

Note: The first column in each report remains displayed when scrolling through the other columns on the report.

Note: The names of some columns have been changed. For your reference, the original names of those columns appear within parentheses ( ) next to their new names.

By Storage Subsystem

Storage Subsystem Name
Name of a storage subsystem containing Storage Subsystem Volumes that is monitored by a subordinate server.

Storage Subsystem Type
Type of storage subsystem, such as the IBM SAN Volume Controller.

Volume Space (LUN Capacity)
Total storage capacity of the Storage Subsystem Volumes in a storage subsystem.

Consumable Volume Space (Usable LUN Capacity)
Storage capacity of Storage Subsystem Volumes in the created disk array (not including BCVs, VCM database, and Replication targets).

Correlated Volume Space (LUN Capacity Visible to Data Manager)
Sum of the capacity of all monitored Storage Subsystem Volumes visible to a monitored host computer and the capacity of all monitored Storage Subsystem Volumes that are back-end disks on a monitored Storage Subsystem Virtualizer.

Formatted Space (Formatted Capacity)
(IBM TotalStorage Enterprise Storage Server, IBM FAStT, HP StorageWorks, and Hitachi Data Systems only) Total amount of formatted storage space in the storage pools associated with a storage subsystem. For example, a RAID volume space has more capacity than a stripe-mirror volume space.

For SAN Volume Controller, this value represents the total size of the managed disk groups created on the SAN Volume Controller. This value does not include managed disk space that is not defined to a managed disk group.

Assigned Volume Space (Subsystem Assigned LUN Capacity)
Total storage capacity of all Storage Subsystem Volumes that the storage subsystem knows are assigned to a host computer.

zOS Volume Space (zOS LUN Capacity)
Total storage capacity for all the Storage Subsystem Volumes allocated to zOS. Data for this column is calculated for TotalStorage Enterprise Storage Server only. The value for this column is set to N/A for other storage subsystems.

Number of Volumes (Number of LUNs)
Number of Storage Subsystem Volumes associated with a storage subsystem.

Backend Volume Space
Total amount of storage subsystem volume space or virtual storage space that Tivoli Storage Productivity Center identifies as the back-end disk space on a monitored storage subsystem virtualizer (for example, SAN Volume Controller). Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage subsystem volumes or virtual storage volumes that become missing after a storage subsystem probe.
- Storage subsystem volumes or virtual storage volumes that are back-end disks on a storage subsystem virtualizer that is not monitored.

By Storage Subsystem Volume Space

Volume Space (LUN Capacity)
Total storage capacity of the Storage Subsystem Volumes in a storage subsystem.

Consumable Volume Space (Usable LUN Capacity)
Storage capacity of Storage Subsystem Volumes in the created disk array (not including BCVs, VCM database, and Replication targets).

Correlated Volume Space (LUN Capacity Visible to Data Manager)
Sum of the capacity of all monitored Storage Subsystem Volumes visible to a monitored host computer and the capacity of all monitored Storage Subsystem Volumes that are back-end disks on a monitored Storage Subsystem Virtualizer.

Formatted Space (Formatted Capacity)
(IBM TotalStorage Enterprise Storage Server, IBM FAStT, HP StorageWorks, and Hitachi Data Systems only) Total amount of formatted storage space in the storage pools associated with a storage subsystem. For example, a RAID volume space has more capacity than a stripe-mirror volume space.

For SAN Volume Controller, this value represents the total size of the managed disk groups created on the SAN Volume Controller. This value does not include managed disk space that is not defined to a managed disk group.

Assigned Volume Space (Subsystem Assigned LUN Capacity)
Total storage capacity of all Storage Subsystem Volumes that the storage subsystem knows are assigned to a host computer.

zOS Volume Space (zOS LUN Capacity)
Total storage capacity for all the storage subsystem volumes allocated to zOS. Data for this column is calculated for TotalStorage Enterprise Storage Server and SAN Volume Controller and SAN Volume Controller only. The value for this column is set to N/A for other storage subsystems.

Number of Volumes (Number of LUNs)
Number of storage subsystem volumes associated with a storage subsystem.

Storage Subsystem Name
Name of a storage subsystem containing storage subsystem volumes that is monitored by a subordinate server.

Storage Subsystem Type
Type of storage subsystem, such as the IBM SAN Volume Controller.

Backend Volume Space
Total amount of storage subsystem volume space or virtual storage space that Tivoli Storage Productivity Center identifies as the backend disk space on a monitored storage subsystem virtualizer (for example, SAN Volume Controller). Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage subsystem volumes or virtual storage volumes that become missing after a storage subsystem probe.
- Storage subsystem volumes or virtual storage volumes that are backend disks on a storage subsystem virtualizer that is not monitored.

By TPC Server

TPC Server
Name of a subordinate server that is monitoring storage subsystems.

Storage Subsystem Count
Number of storage subsystems that are monitored by a subordinate server.

Volume Space (LUN Capacity)
Total storage capacity of the Storage Subsystem Volumes that are monitored by a subordinate server.

Consumable Volume Space (Usable LUN Capacity)
Storage capacity of Storage Subsystem Volumes in the created disk array (not including BCVs, VCM database, and Replication targets) that are monitored by a subordinate server.

Correlated Volume Space (LUN Capacity Visible to Data Manager)
Sum of the capacity of all monitored Storage Subsystem Volumes visible to a monitored host computer and the capacity of all monitored Storage Subsystem Volumes that are back-end disks on a monitored Storage Subsystem Virtualizer associated with a subordinate server.

Formatted Space (Formatted Capacity)
(IBM TotalStorage Enterprise Storage Server, IBM FAStT, HP StorageWorks, and Hitachi Data Systems only) Total amount of formatted storage space in the storage pools associated with the storage subsystems that are monitored by a subordinate server. For example, a RAID volume space has more capacity than a stripe-mirror volume space.

For SAN Volume Controller, this value represents the total size of the managed disk groups created on the SAN Volume Controller. This value does not include managed disk space that is not defined to a managed disk group.

Assigned Volume Space (Subsystem Assigned LUN Capacity)
Total storage capacity of all Storage Subsystem Volumes that the monitored storage subsystems know are assigned to a host computer.

zOS Volume Space (zOS LUN Capacity)
Total storage capacity for all the Storage Subsystem Volumes allocated to zOS that are monitored by a subordinate server. Data for this column is calculated for TotalStorage Enterprise Storage Server and SAN Volume Controller only. The value for this column is set to N/A for other storage subsystems.

Number of Volumes (Number of LUNs)
Number of Storage Subsystem Volumes associated with the storage subsystems monitored by a subordinate server.

Backend Volume Space
Total amount of storage subsystem volume space or virtual storage space that Tivoli Storage Productivity Center identifies as the backend disk space on a monitored storage subsystem virtualizer (for example, SAN Volume Controller). Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage subsystem volumes or virtual storage volumes that become missing after a storage subsystem probe.
- Storage subsystem volumes or virtual storage volumes that are backend disks on a storage subsystem virtualizer that is not monitored.

Rollup Reports - Asset - Fabrics:

Use this report to view information about the fabrics that are monitored by subordinate servers in your environment.

You can view the following reports about fabrics:

- SAN Assets (ALL): Use this report to view information about all the SAN assets for each subordinate server.
- SAN Assets (Connected Dev): Use this report to view information about all the connected devices for each subordinate server.
- SAN Assets (Switches): Use this report to view information about switches in your SAN for each subordinate server.

SAN Assets (ALL)

TPC Server
Name of a subordinate server that is monitoring fabrics.

Fabric ID
The ID of the fabric that the asset is in.

Type The type of asset discovered. For example: switch, host, host bus adapter, storage subsystem.

Label The label of the asset. For example: the host name, switch name, storage subsystem name, node name of the port.

Identifier
The unique identifier of the switch. For example, the switch WWN.

Status The status of the asset: Normal, Warning, or Critical.

SAN Assets (Connected Dev)

TPC Server
Name of a subordinate server that is monitoring a connected device.

Fabric ID
The ID of the fabric that the asset is in.

Type The type of asset discovered. For example: switch, host, host bus adapter, storage subsystem.

Label The label of the asset. For example: the host name, switch name, storage subsystem name, node name of the port.

Identifier
The unique identifier of the switch. For example, the switch WWN.

Status The status of the asset: Normal, Warning, or Critical.

SAN Assets (Switches)

TPC Server
Name of a subordinate server that is monitoring a switch.

Fabric ID
The ID of the fabric that a switch is in.

Type The type of switch discovered.

Switch Type
The switch type, such as physical.

Label The label of a switch.

Status The status of a switch: Normal, Warning, or Critical.

IP Address
The IP address of a switch.

Vendor ID
The manufacturer of the switch.

Model The model name and number of a switch.

Version
The version information of the switch.

Serial Number
The serial number of the switch.

Object ID
The object ID of the switch.

Management ID
The management ID of the switch.

Management Address
The URL of the switch element manager.

Domain
The name of the domain that the switch is in.

Contact
The contact information for the switch.

WWN The world-wide name (WWN) of the switch.

Location
The physical location of the switch.

Physical Switch WWN
The WWN for the parent or physical switch of a virtual switch. If this is not a virtual switch then this column is empty.

Rollup Reports - Asset - Hypervisors:

Use this report to view information about the hypervisors that are monitored by subordinate servers in your environment.

You can generate and sort the data within this report using the following by clause:

- By Hypervisor: Sorted according to hypervisor name. The names of hypervisors monitored by subordinate servers appear in the first column and remain displayed when scrolling through the other columns on the report.

By Hypervisors

Hypervisor Name
Name of a hypervisor monitored by a subordinate server.

OS Version
Version of the operating system running on a computer.

RAM The amount of RAM installed on a computer.

Disk Space
Total raw (unformatted) disk capacity of a storage subsystem. Tivoli

Storage Productivity Center does not include the following capacity information in its calculation of the value for this column:

- Capacity of spare disks identified on IBM TotalStorage Enterprise Storage Server, IBM DS8000, and IBM DS6000 storage subsystems.
- Capacity of storage subsystem disks that become missing after a storage subsystem probe.

Note: For Hitachi Data Systems storage subsystems, this is the capacity of all the Volumes in the storage subsystem.

Number of Disks
Total number of disks for a computer. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value in this column:

- Computer disks on a computer that has not been probed by a Storage Resource agent.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

Processor Count
Number of CPUs running on a computer.

IP Address
IP address of a computer.

Serial Number
Serial number of a computer.

Model Model number or name of a computer.

Manufacturer
Manufacturer of a computer (for example, IBM).

Time Zone
Time zone where the computer is located.

Available File System Space
Total amount unique file system storage space that is not used or available to the computer. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

OS Type
Operating system running on a computer.

Network
Network name of a computer.

Processor Type
Type of processor running on a computer (for example, GenuineIntel: x86 Family 15).

Processor Speed
Speed at which a computer's processor is running (in MHz).

CPU Architecture
Architecture of the processor (for example, IA32).

Swap Space
Amount of swap space (virtual memory) defined on a computer.

Rollup Reports - Database Asset

Use these reports to view detailed statistics that have been collected by subordinate servers about the RDBMSs in your environment, including Oracle, SQL Server, Sybase, and UDB/DB2.

The information shown in these reports is gathered by the master server when it runs Tivoli Storage Productivity Center server probes against associated subordinate servers. If the same storage entity is managed by multiple subordinate servers, rollup reports reflect the storage information from the subordinate server that most recently probed that entity.

Rollup Reports - Database Asset - All DBMSs:

Use this report to view information about the RDBMSs (including Oracle, Sybase, SQL Server, and UDB/DB2) that are monitored by subordinate servers in your environment.

You can generate and sort the data within this report using the following by clauses:

- By Instance: Shows databases for each computer sorted by computer name.
- By Version: Shows databases for each computer sorted by RDBMS version.
- By DBMS Type: Shows databases for each computer sorted by RDBMS type.
- By TPC Server: Shows databases aggregated at the subordinate server level and sorted by subordinate server name.

Note: The first column in each report remains displayed when scrolling through the other columns on the report.

Note: The names of some columns have been changed. For your reference, the original names of those columns appear within parentheses ( ) next to their new names.

By Instance

Computer Name
Name of the computer on which an Instance resides.

Instance
Name of an instance.

RDBMS Type
RDBMS to which an instance belongs (e.g., Oracle, SQL Server, Sybase, UDB, etc.).

RDBMS Version
Version of the RDBMS under which an instance is running.

Port Port on which an instance listens for requests.

Home Directory
Path of the home directory for an instance.

Logonid
ID used by Tivoli Storage Productivity Center to log in to an instance.

Probe Status
Status of the last probe run against an instance.

Last Start Time
Date and time when an instance was last started.

Last Probe Time
Date and time when an instance was last probed.

Tablespace count
Number of tablespaces associated with an instance.

File Count
Number of data files associated with an instance.

Log File Count
Number of log files associated with an instance.

File Free Space
Amount of storage free space available on the data files associated with an instance.

Total Size
Amount of storage space allocated to an instance.

File Capacity
Amount of storage space allocated to the data files associated with an instance.

By Version

RDBMS Version
Version of the RDBMS under which an instance is running.

Computer Name
Name of the computer on which an instance resides.

Instance
Name of an instance.

RDBMS Type
RDBMS to which an instance belongs (e.g., Oracle, SQL Server, Sybase, UDB, etc.).

Port Port on which an instance listens for requests.

Home Directory
Path of the home directory for an instance.

Logonid
ID used by Tivoli Storage Productivity Center to log in to an instance.

Probe Status
Status of the last probe run against an instance.

Last Start Time
Date and time when an instance was last started.

Last Probe Time
Date and time when an instance was last probed.

Tablespace Count
Number of tablespaces associated with an instance.

File Count
Number of data files associated with an instance.

Log File Count
Number of log files associated with an instance.

File Free Space
Amount of storage free space available on the data files associated with an instance.

Total Size
Amount of storage space allocated to an instance.

File Capacity
Amount of storage space allocated to the data files associated with an instance.

By DBMS Type

RDBMS Type
RDBMS to which an instance belongs (e.g., Oracle, SQL Server, Sybase, UDB, etc.).

Computer Name
Name of the computer on which an instance resides.

Instance
Name of an instance.

RDBMS Version
Version of the RDBMS under which an instance is running.

Port Port on which an instance listens for requests.

Home Directory
Path of the home directory for an instance.

Logonid
ID used by Tivoli Storage Productivity Center to log in to an instance.

Probe Status
Status of the last probe run against an instance.

Last Start Time
Date and time when an instance was last started.

Last Probe Time
Date and time when an instance was last probed.

Tablespace count
Number of tablespaces associated with an instance.

File Count
Number of data files associated with an instance.

Log File Count
Number of log files associated with an instance.

File Free Space
Amount of storage free space available on the data files associated with an instance.

Total Size
Amount of storage space allocated to an instance.

File Capacity
Amount of storage space allocated to the data files associated with an instance.

By TPC Server

TPC Server
Name of a subordinate server that is monitoring DBMSs in your environment.

Total Number of DBMSs
Number of DBMSs monitored by a subordinate server.

Number of UDB Instances
Number of UDB instances monitored by a subordinate server.

Number of Oracle Instances
Number of Oracle instances monitored by a subordinate server.

Number of SQL/Server Instances
Number of SQL/Server instances monitored by a subordinate server.

Number of Sybase Instances
Number of Sybase instances monitored by a subordinate server.

Tablespace Count
Number of tablespaces associated with the instances monitored by a subordinate server.

File Count
Number of data files associated with the instances monitored by a subordinate server.

Log File Count
Number of log files associated with the instances monitored by a subordinate server.

File Free Space
Amount of storage free space available on the data files associated with the instances monitored by a subordinate server.

Total Size
Amount of storage space allocated to the instances monitored by a subordinate server.

Total File Capacity (File Capacity)
Amount of storage space allocated to the data files associated with the instances monitored by a subordinate server.

Rollup Reports - Database Asset - Oracle, SQL/Server, Sybase, UDB:

Use this report to view information about Oracle, Sybase, SQL Server, and UDB/DB2 instances that are monitored by subordinate servers in your environment.

You can generate and sort the data within this report using the following by clauses:

- By Instance: Shows databases for each computer sorted by computer name.
- By Version: Shows databases for each computer sorted by the version of the RDBMS under which a database is running.
- By TPC Server: Shows databases aggregated at the subordinate server level and sorted by subordinate server name.

Note: The first column in each report remains displayed when scrolling through the other columns on the report.

By Instance

Computer Name
Name of the computer on which an Instance resides.

Instance
Name of an instance.

RDBMS Type
RDBMS to which an instance belongs (e.g., Oracle, SQL Server, Sybase, UDB, etc.).

RDBMS Version
Version of the RDBMS under which an instance is running.

Port Port on which an instance listens for requests.

Home Directory
Path of the home directory for an instance.

Logonid
ID used by Tivoli Storage Productivity Center to log in to an instance.

Probe Status
Status of the last probe run against an instance.

Last Start Time
Date and time when an instance was last started.

Last Probe Time
Date and time when an instance was last probed.

Tablespace count
Number of tablespaces associated with an instance.

File Count
Number of data files associated with an instance.

Log File Count
Number of log files associated with an instance.

File Free Space
Amount of storage free space available on the data files associated with an instance.

Total Size
Amount of storage space allocated to an instance.

File Capacity
Amount of storage space allocated to the data files associated with an instance.

By Version

RDBMS Version
Version of the RDBMS under which an instance is running.

Computer Name
Name of the computer on which an instance resides.

Instance
Name of an instance.

RDBMS Type
RDBMS to which an instance belongs (e.g., Oracle, SQL Server, Sybase, UDB, etc.).

Port Port on which an instance listens for requests.

Home Directory
Path of the home directory for an instance.

Logonid
ID used by Tivoli Storage Productivity Center to log in to an instance.

Probe Status
Status of the last probe run against an instance.

Last Start Time
Date and time when an instance was last started.

Last Probe Time
Date and time when an instance was last probed.

Tablespace Count
Number of tablespaces associated with an instance.

File Count
Number of data files associated with an instance.

Log File Count
Number of log files associated with an instance.

File Free Space
Amount of storage free space available on the data files associated with an instance.

Total Size
Amount of storage space allocated to an instance.

File Capacity
Amount of storage space allocated to the data files associated with an instance.

By TPC Server

TPC Server
Name of a subordinate server that is monitoring DBMSs in your environment.

Number of Oracle Instances
Number of Oracle instances monitored by a subordinate server.

Number of SQL/Server Instances
Number of SQL/Server instances monitored by a subordinate server.

Number of Sybase Instances
Number of Sybase instances monitored by a subordinate server.

Number of UDB Instances
Number of UDB instances monitored by a subordinate server.

Tablespace count
Number of tablespaces associated with the instances monitored by a subordinate server.

File Count
Number of data files associated with the instances monitored by a subordinate server.

Log File Count
Number of log files associated with the instances monitored by a subordinate server.

File Free Space
Amount of storage free space available on the data files associated with the instances monitored by a subordinate server.

Total Size
Amount of storage space allocated to the instances monitored by a subordinate server.

Total File Capacity
Amount of storage space allocated to the data files associated with the instances monitored by a subordinate server.

Rollup Reports - TPC Server Storage Space

Use these reports to view storage metrics that are related to the disk space, file system space, used file system space, and available file system space that is gathered by the subordinate servers in your environment.

The information that is shown in these reports is gathered by the master server when it runs "Collect storage statistics from Tivoli Storage Productivity Center servers" on page 331 against associated subordinate servers. If the same storage entity is managed by multiple subordinate servers, rollup reports reflect the storage information from the subordinate server that most recently probed that entity.

Rollup Reports - TPC Server Storage Space - Disk Space:

Use this report to view disk capacity information about the computers and storage systems that are monitored by subordinate servers in your environment.

You can generate and sort the data within this report using the following by clauses:

- By Storage Subsystem: Shows disk capacity aggregated at the storage system level and sorted by storage system name. Storage systems that have been discovered but not probed are not displayed in this report.
- By Storage Subsystem Group: Shows disks capacity aggregated at the storage system monitoring group and storage system reporting group levels and sorted by group name. Storage systems that have been discovered but not probed are not included in the values shown in this report.
- By Computer: Shows disks capacity aggregated at the computer level and sorted by computer name.
- By Computer Group: Shows disks capacity aggregated at the computer monitoring group and computer reporting group levels and sorted by group name.
- By Cluster: Shows disks capacity aggregated at the cluster level and sorted by cluster name.
- By TPC Server (Computers): Shows computer disk capacity aggregated at the subordinate server level and sorted by subordinate server name.
- By TPC Server (Storage Subsystems): Shows storage system disk capacity aggregated at the subordinate server level and sorted by subordinate server name. Storage systems that have been discovered but not probed are not included in the values shown in this report.

Note: The first column in each report remains displayed when scrolling through the other columns on the report.

Note: The names of some columns have been changed. For your reference, the original names of those columns appear within parentheses ( ) next to their new names.

By Storage Subsystem

Subsystem Name
Name of a storage system that is monitored by a subordinate server.

Subsystem Type
Type of storage system, such as the IBM System Storage SAN Volume Controller.

Disk Space (Disk Capacity)
Total raw (unformatted) disk capacity of a storage system.

Available Disk Space (Available Capacity)
Amount of storage space available on the disks associated with a storage system. For Hitachi Data Systems storage systems, internal disk information is not available. This field will be 0.

Number of Disks
Number of disks associated with a storage system. For Hitachi Data Systems storage systems, internal disk information is not available. This field will be set to 1.

Number of Volumes (Number of LUNs)
Number of volumes associated with a storage system.

Storage Subsystem Volume Space (LUN capacity)
Amount of storage space allocated to the volumes associated with the storage system.

Consumable Storage Subsystem Volume Space (Usable LUN Capacity)
Storage capacity of volumes in the created disk array (not including BCVs, VCM database, and Replication targets).

Correlated Volume Space (Visible LUN Capacity)
Capacity of all volumes visible to a Storage Resource agent associated with a storage system.

FlashCopy Target Storage Subsystem Volume Space (FlashCopy Target Capacity)
The total capacity of all FlashCopy target volumes in the system. Note: TotalStorage Enterprise Storage Server systems must have at least the following microcode levels: ess800mincodelevel = 2.4.3.56, essf20mincodelevel = 2.3.3.89. Tivoli Storage Productivity Center does not report FlashCopy information if the TotalStorage Enterprise Storage Server systems do not meet this requirement.

Volume Space Not Correlated (Not Visible LUN Capacity)
Usable volume capacity minus assigned volume capacity.

Unavailable Disk Space (Overhead)
Amount of capacity that is dedicated to redundancy.

Formatted Disk Space (Formatted Capacity)
(IBM TotalStorage Enterprise Storage Server, FAStT, HP StorageWorks, and Hitachi Data Systems only.) Total amount of formatted storage space in the

storage pools associated with the storage system. For example, a RAID volume space has more capacity than a stripe-mirror volume space.

Formatted Disk Space with No Volumes (Total Formatted Space with No Volumes)
(TotalStorage Enterprise Storage Server, FAStT, HP StorageWorks, and Hitachi Data Systems only.) Amount of storage space available to allocate to volumes in the storage pools associated with the storage system.

Unformatted Disk Space (Undefined Disk Group or Array Site Capacity)
Raw disk space in ranks on which no volume space has been defined. For TotalStorage Enterprise Storage Server systems, this value is the total raw capacity of any unformatted disk groups. For IBM XIV Storage System, this value is the total available physical (hard) space that remains for pool creation. For FAStT, HP StorageWorks, and Hitachi Data Systems storage systems, this value is the total capacity of the disks that are not in a storage pool.

Cache Amount of RAM or other cache for a storage system.

Note: This column is blank for SAN Volume Controllers.

Assigned Volume Space (Subsystem Assigned LUN Capacity)
Total storage capacity of all volumes that the storage system knows are assigned to a host computer. Note: The column is blank for SAN Volume Controller.

Unassigned Volume Space (Subsystem Unassigned LUN Capacity)
Total storage capacity of all volumes that the storage system knows are not assigned to a host computer. Note: The column is blank for SAN Volume Controller.

zOS Volume Space (zOS LUN Capacity)
Total storage capacity for all the volumes allocated to zOS. Data for this column is calculated for TotalStorage Enterprise Storage Server only. The value for this column is set to N/A for other storage systems.

Open System Volume Space (Open System LUN Capacity)
Total volume storage capacity (excluding the zOS volume space).

Physical Disk Space
Total amount of physical disk space discovered on the monitored storage system arrays. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system disks that become missing after a storage system probe.
- Back-end storage volumes on monitored storage system virtualizers (for example, SAN Volume Controller) that are attached from a storage system.

Backend Volume Space
Total amount of storage system volume space or virtual storage space that Tivoli Storage Productivity Center identifies as the back-end disk space on a monitored storage system virtualizer (for example, SAN Volume Controller). Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Storage system volumes or virtual storage volumes that are back-end disks on a storage system virtualizer that is not monitored.

By Storage Subsystem Group

Subsystem Group Name
Name of a storage system monitoring group or storage system reporting group.

TPC Server
Name of a subordinate server to which the group is associated.

Disk Space (Disk Capacity)
Total raw (unformatted) disk capacity of the storage systems in a group.

Available Disk Space (Available Capacity)
Amount of storage space available on the disks associated with the storage systems in a group.

Number of Disks
Number of disks associated with the storage systems in a group.

Number of Volumes (Number of LUNs)
Number of volumes associated with the storage systems in a group.

Storage Subsystem Volume Space (LUN capacity)
Amount of storage space allocated to the volumes associated with the storage systems in a group.

Consumable Storage Subsystem Volume Space (Usable LUN Capacity)
Storage capacity of volumes in the created disk array (not including BCVs, VCM database, and Replication targets).

FlashCopy Target Storage Subsystem Volume Space (FlashCopy Target Capacity)
The total capacity of all FlashCopy target volumes in the storage systems in a group.

Correlated Volume Space (LUN Capacity Visible to Data Manager)
Capacity of all volumes visible to a Storage Resource agent associated with the storage systems in a group.

Volume Space Not Correlated (LUN Capacity Not Visible to Data Manager)
Usable volume capacity minus assigned volume capacity on the storage systems in a group.

Unavailable Volume Space (Overhead)
Amount of capacity that is dedicated to redundancy in the storage systems in a group.

Formatted Space (Formatted Capacity)
(TotalStorage Enterprise Storage Server, FAStT, HP StorageWorks, and Hitachi Data Systems only.) Total amount of formatted storage space in the storage pools associated with the storage systems in a group.

Total Formatted Space with no Volumes (Total Formatted Space with No Volumes)
(TotalStorage Enterprise Storage Server, FAStT, HP StorageWorks, and Hitachi Data Systems only.) Amount of storage space available to allocate to volumes in the storage pools associated with the storage systems in a group.

Unformatted Disk Space (Total Overhead)
(TotalStorage Enterprise Storage Server only.) Sum of all the space in a disk group minus the formatted capacity on the storage systems in a group.

Cache Amount of RAM or other cache for the storage systems in a group.

Note: This column does not include values for SAN Volume Controllers.

Assigned Volume Space (Subsystem Assigned LUN Capacity)
Total storage capacity of all volumes that the storage systems in a group know are assigned to a host computer.

Unassigned Volume Space (Subsystem Unassigned LUN Capacity)
Total storage capacity of all volumes that the storage systems in a group know are not assigned to a host computer.

zOS Volume Space (zOS LUN Capacity)
Total storage capacity for all the volumes on the storage systems in a group allocated to zOS.

Open System Volume Space (Open System LUN Capacity)
Total volume storage capacity (excluding the zOS volume capacity) of the storage systems in a group.

Physical Disk Space
Total amount of physical disk space discovered on the monitored storage system arrays. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system disks that become missing after a storage system probe.
- Back-end storage volumes on monitored storage system virtualizers (for example, SAN Volume Controller) that are attached from a storage system.

Backend Volume Space
Total amount of storage system volume space or virtual storage space that Tivoli Storage Productivity Center identifies as the back-end disk space on a monitored storage system virtualizer (for example, SAN Volume Controller). Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Storage system volumes or virtual storage volumes that are back-end disks on a storage system virtualizer that is not monitored.

By Computer

Note: Two entries for the same host might appear in this report and the values for that host are counted twice in the **TOTAL** column. This scenario occurs under the following circumstances:

- You install two Storage Resource agents on the same host (using the long and short names of the host) that point to different Tivoli Storage Productivity Center servers. For example, you install an agent from serverA using the short name of a host (for example, hostC). You install another agent from serverB using the long name of the same host (for example, hostC.storage.chicago.com). You then set up the servers in a master and subordinate relationship. For example, serverA is the master and serverB is the subordinate. In this example, there are two entries in the report for the host: hostC and hostC.storage.chicago.com. The values for hostC are counted twice in the **TOTAL** column.
- A Storage Resource agent on a host (hostC) points to two different Tivoli Storage Productivity Center servers (serverA and serverB). The host has a dynamic IP address. You set up serverA as the master and serverB as the subordinate. Server serverA probes hostC, but then the IP address of hostC changes before serverB

probes the host. In this example, the report might display two entries for hostC: one entry with the IP address that was probed by serverA; the other entry with the changed IP address that was probed by serverB. The values for hostC are counted twice in the **TOTAL** column.

- A Storage Resource agent on a host (hostC) points to two different Tivoli Storage Productivity Center servers (serverA and serverB). The host has a name that resolves to hostC.storage.chicago.com on serverA and hostC.srm.storage.chicago.com on serverB. You then set up the servers in a master and subordinate relationship. For example, serverA is the master and serverB is the subordinate. In this example, there are two entries in the report for the host: hostC.storage.chicago.com and hostC.srm.storage.chicago.com. The values for hostC are counted twice in the **TOTAL** column.

Computer Name
Name of a computer.

Disk Space (Total Capacity)
Total storage capacity for a computer. If the computer is an IBM Tivoli Storage SAN File Systems client, then this value also includes the capacity of any volumes visible to this computer that are owned by the SAN File System.

Available Disk Space (Total Unallocated Space)
Amount of unused storage space on a computer (not in file systems seen by this operating system). If the computer is an IBM Tivoli Storage SAN File Systems client, then this value excludes the unallocated space on any volumes visible to it that are owned by the SAN File System.

Number of Disks
Number of disks on a computer.

Owned Disk Space (Owned Capacity)
Total storage capacity for a computer that is owned by that computer. If Data Manager can determine that a disk was configured for a different host, the capacity for that disk is counted in the "Owned Capacity".

If the computer is an IBM Tivoli Storage SAN File Systems client, then this value does not include the capacity of any volumes visible to it that are owned by the SAN File System. If the host is Solaris and Veritas Volume Manager (VxVM) is in use, the product examines the Veritas disk-label and reads the host-ID. If this host-ID does not agree with the local host-ID, the disk is classified as belonging to a different (Solaris) host.

Other Available Disk Space (Other Unallocated Space)
Total unallocated space on disks owned by the computer. This column does not display the total unallocated disk space on disks not owned by the computer. If the computer is an IBM Tivoli Storage SAN File Systems client, then this value excludes the unallocated space on any volumes visible to it that are owned by the SAN File System.

Non-Fibre Channel Attached Disk Space (Total Other Attached Capacity)
Total disk capacity of all non-Fibre attached disks for a computer.

Fibre Channel Attached Disk Space (Total Other Attached Unallocated Space)
Total unallocated space of all non-Fibre attached disks for a computer.

Non-Fibre Channel Attached Available Disk Space (Total Fibre Channel Attached Capacity)
Total disk capacity of all fibre channel attached disks for a computer.

Fibre Channel Attached Available Disk Space (Total Fibre Channel Attached Unallocated Space)
Total unallocated space of all fibre channel attached disks for a computer.

By Computer Group

Computer Group Name
Name of a computer monitoring group or computer reporting group.

Disk Space (Total Capacity)
Total storage capacity for the computers in a group. If the computer is an IBM Tivoli Storage SAN File Systems client, then this value also includes the capacity of any volumes visible to this computer that are owned by the SAN File System.

Available Disk Space (Total Unallocated Space)
Amount of unused storage space on the computers in a group.

Number of Disks
Number of disks on the computers in a group.

Owned Disk Space (Owned Capacity)
Total storage capacity for the computers in a group that is owned by those computers. If Data Manager can determine that a disk was configured for a different host, the capacity for that disk is counted in the "Owned Capacity".

If any computers in the group are IBM Tivoli Storage SAN File Systems clients, then this value does not include the capacity of any volumes visible to it that are owned by the SAN File System. If the host is Solaris and Veritas Volume Manager (VxVM) is in use, the product examines the Veritas disk-label and reads the host-ID. If this host-ID does not agree with the local host-ID, the disk is classified as belonging to a different (Solaris) host.

Other Available Disk Space (Other Unallocated Space)
Total unallocated space on disks owned by the computers in a group. This column does not display the total unallocated disk space on disks not owned by computers. If any of the computers in the group are IBM Tivoli Storage SAN File Systems clients, then this value excludes the unallocated space on any volumes visible to it that are owned by the SAN File System.

Non-Fibre Channel Attached Disk Space (Total Other Attached Capacity)
Total disk capacity of all non-Fibre attached disks on the computers in a group.

Fibre Channel Attached Disk Space (Total Other Attached Unallocated Space)
Total unallocated space of all non-Fibre attached disks on the computers in a group.

Non-Fibre Channel Attached Available Disk Space (Total Fibre Channel Attached Capacity)
Total disk capacity of all fibre channel attached disks on the computers in a group.

Fibre Channel Attached Available Disk Space (Total Fibre Channel Attached Unallocated Space)
Total unallocated space of all fibre channel attached disks on the computers in a group.

By Cluster

Cluster Name
Name of a cluster.

For Storwize V7000 Unified or IBM SONAS clusters, the storage system name is included with the cluster name in the Computer or Device column. The format of the column is `storagesystem_name: cluster_name`, where storagesystem_name is the name of the Storwize V7000 Unified or IBM SONAS device that the cluster belongs to. For example, tpcserver1.tpc.example.com: kq98n5d.acct displays storage system tpcserver1.tpc.example.com that cluster kq98n5d.acct belongs to.

Disk Space (Total Capacity)
Total storage capacity for a cluster.

Available Disk Space (Total Unallocated Space)
Amount of unused storage space on a cluster (not in file systems seen by this operating system).

Owned Disk Space (Owned Capacity)
Total storage capacity for a cluster that is owned by that cluster. If Data Manager can determine that a disk was configured for a different host, the capacity for that disk is counted in the "Owned Capacity".

If the computer is an IBM Tivoli Storage SAN File Systems client, then this value does not include the capacity of any volumes visible to it that are owned by the SAN File System. If the host is Solaris and Veritas Volume Manager (VxVM) is in use, the product examines the Veritas disk-label and reads the host-ID. If this host-ID does not agree with the local host-ID, the disk is classified as belonging to a different (Solaris) host.

Other Available Disk Space (Other Unallocated Space)
Total unallocated space on disks owned by the cluster. This column does not display the total unallocated disk space on disks not owned by the cluster. If a computer in a cluster is an IBM Tivoli Storage SAN File Systems client, then this value excludes the unallocated space on any volumes visible to it that are owned by the SAN File System.

Non-Fibre Channel Attached Disk Space (Total Other Attached Capacity)
Total disk capacity of all non-Fibre attached disks in a cluster.

Fibre Channel Attached Disk Space (Total Other Attached Unallocated Space)
Total unallocated space of all non-Fibre attached disks in a cluster.

Non-Fibre Channel Attached Available Disk Space (Total Fibre Channel Attached Capacity)
Total disk capacity of all fibre channel attached disks in a cluster.

Fibre Channel Attached Available Disk Space (Total Fibre Channel Attached Unallocated Space)
Total unallocated space of all fibre channel attached disks in a cluster.

By TPC Server (Computers)

TPC Server
Name of a subordinate server that is monitoring computer disks in your environment.

Disk Space (Total Capacity)
Total storage capacity of all the computer disks monitored by a subordinate server.

Available Disk Space (Total Unallocated Space)
Amount of unused storage space on all the computer disks monitored by a subordinate server.

Number of Disks
Number of computer disks monitored by a subordinate server.

Non-Fibre Channel Attached Disk Space (Total Other Attached Capacity)
Total disk capacity of all non-Fibre attached disks monitored by a subordinate server.

Fibre Channel Attached Disk Space (Total Other Attached Unallocated Space)
Total unallocated space of all non-Fibre attached disks monitored by a subordinate server.

Non-Fibre Channel Attached Available Disk Space (Total Fibre Channel Attached Capacity)
Total disk capacity of all fibre channel attached disks monitored by a subordinate server.

Fibre Channel Attached Available Disk Space (Total Fibre Channel Attached Unallocated Space)
Total unallocated space of all fibre channel attached disks monitored by a subordinate server.

By TPC Server (Storage Subsystems)

TPC Server
Name of a subordinate server that is monitoring storage system disks in your environment.

Disk Space (Total Capacity)
Total raw (unformatted) disk capacity of the storage systems monitored by a subordinate server.

Available Disk Space (Total Unallocated Space)
Amount of storage space available on the disks associated with the storage systems monitored by a subordinate server.

Number of Disks
Number of storage system disks monitored by a subordinate server.

Physical Disk Space
Total amount of physical disk space discovered on the monitored storage system arrays. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system disks that become missing after a storage system probe.
- Back-end storage volumes on monitored storage system virtualizers (for example, SAN Volume Controller) that are attached from a storage system.

Rollup Reports - TPC Server Storage Space - File System Space:

Use this report to view file system space information about the file systems that are monitored by subordinate servers in your environment.

You can generate and sort the data within this report by using the following by clauses:

- By Computer: Shows file system capacity that is aggregated at the computer level and sorted by computer name.

- By Computer Group: Shows file system capacity that is aggregated at the computer monitoring group and computer reporting group levels and sorted by group name.
- By Cluster: Shows file system capacity that is aggregated at the cluster level and sorted by cluster name.
- By TPC Server: Shows file system capacity that is aggregated at the subordinate server level and sorted by subordinate server name.

Note: The first column in each report remains displayed when you scroll through the other columns on the report.

By Computer

Computer Name
Name of the computer with a file system.

Total Capacity
Total amount (capacity) of storage space in the file systems on a computer. The value in this field might be greater than **Total Used Space** + **Total Free Space** for some UNIX systems. The extra storage occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents and by the **df** command) does not include some space that is reserved by the operating system (overhead). Therefore, the value in the **Total Capacity** field is greater than or equal to the value of **Total Used Space** + **Total Free Space**. The difference represents the space that is wasted because of the system overhead.

Total Used Space
Total amount of used storage space in the file systems on a computer. On some UNIX file systems, this value does not include storage space that is reserved by the operating system (overhead). Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column.

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

The value that is displayed in the TOTAL row for this column represents the difference between the TOTAL values in the **Total Capacity** and **Total Free Space** columns. If the calculated value for the TOTAL row is negative, the column displays 0.

The TOTAL row does not add the space that is used by VMWare computers. See the *VMWare capacity reports* topic in the *Planning* chapter of the *Tivoli Storage Productivity Center Installation and Configuration Guide* for information about how file system and disk capacity are calculated in this report for VMWare computers. For related information, see the *Planning* section of the *Tivoli Storage Productivity Center Information Center*.

The value that is displayed in the TOTAL row for this column does not include the following file systems:

- File systems on discovered hypervisors that are assigned to virtual machine servers where the Storage Resource agent is installed.
- File systems on discovered virtual machine servers where the Storage Resource agent is installed. The hypervisor for the virtual machine

servers is not discovered yet and the total used space exceeds the capacity of the total file system capacity.

Total Free Space
Total amount of unused storage space in the file systems on a computer.

Number of FS/LV
Number of file systems or logical volumes on a computer.

By Computer Group

Computer Group
Name of a computer monitoring group or computer reporting group.

Total Capacity
Total amount (capacity) of storage space on the file systems in a group. The value in this field might be greater than **Total Used Space** + **Total Free Space** for some UNIX systems. The extra storage occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents and by the **df** command) does not include some space that is reserved by the operating system (overhead). Therefore, the value in the **Total Capacity** field is greater than or equal to the value of **Total Used Space** + **Total Free Space**. The difference represents the space that is wasted because of the system overhead.

Total Used Space
Total amount of used storage space on the file systems in a group. On some UNIX file systems, this value does not include storage space that is reserved by the operating system (overhead).

Total Free Space
Total amount of unused storage space on the file systems in a group.

Number of FS/LV
Number of file systems or logical volumes in a group.

By Cluster

Cluster
Name of a cluster.

Total Capacity
Total storage capacity of the file systems in a cluster. The value in this field might be greater than **Total Used Space** + **Total Free Space** for some UNIX systems. The extra storage occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents and by the **df** command) does not include some space that is reserved by the operating system (overhead). Therefore, the value in the **Total Capacity** field is greater than or equal to the value of **Total Used Space** + **Total Free Space**. The difference represents the space that is wasted because of the system overhead.

Total Used Space
Total amount of used storage space on the file systems in a cluster. On some UNIX file systems, this value does not include storage space that is reserved by the operating system (overhead).

Total Free Space
Total amount of unused storage space on the file systems in a cluster.

By TPC Server

TPC Server
Name of a subordinate server that is monitoring file systems in your environment.

Total Capacity
Total storage capacity of all the file systems that are monitored by a subordinate server.

Total Used Space
Total amount of used storage space on the file systems that are monitored by a subordinate server. On some UNIX file systems, this value does not include storage space that is reserved by the operating system (overhead).

Total Free Space
Total amount of unused storage space on the file systems that are monitored by a subordinate server.

Total Number of FS/LV
Total number of file systems or logical volumes that are monitored by a subordinate server.

Rollup Reports - TPC Server Storage Space - Consumed File System Space:

Use this report to view information about the used storage space on file systems that are monitored by subordinate servers in your environment.

You can generate and sort the data within this report by using the following by clauses.

- By Computer: Shows file system used space that is aggregated at the computer level and sorted by computer name.
- By Computer Group: Shows file system used space that is aggregated at the computer monitoring group and computer reporting group levels and sorted by group name.
- By Cluster: Shows file system used space that is aggregated at the cluster level and sorted by cluster name.
- By TPC Server: Shows file system used space that is aggregated at the subordinate server level and sorted by subordinate server name.

Note: The first column in each report remains displayed when you scroll through the other columns on the report.

By Computer

Computer Name
Name of the computer with a file system.

Total Used Space
Total amount of used storage space in the file systems on a computer. On some UNIX file systems, this value does not include storage space that is reserved by the operating system (overhead). Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

The value that displays in the TOTAL row for this column represents the difference between the TOTAL values in the **Total Capacity** and **Total Free Space** columns. If the calculated value for the TOTAL row is negative, the column displays 0.

The TOTAL row does not add the used space that is used by VMWare computers. See the *VMWare capacity reports* topic in the *Planning* chapter of the *Tivoli Storage Productivity Center Installation and Configuration Guide* for information about how file system and disk capacity are calculated in this report for VMWare computers. For related information, see the *Planning* section of the *Tivoli Storage Productivity Center Information Center*.

The value that displays in the TOTAL row for this column does not include the following file systems:

- File systems on discovered hypervisors that are assigned to virtual machine servers where the Storage Resource agent is installed.
- File systems on discovered virtual machine servers where the Storage Resource agent is installed, but the hypervisor for the virtual machine servers is not discovered yet and the total used space exceeds the capacity of the total file system capacity.

Total Free Space
Total amount of unused storage space in the file systems on a computer.

Total Capacity
Total amount (capacity) of storage space in the file systems on a computer. The value in this field might be greater than **Total Used Space** + **Total Free Space** for some UNIX systems. The extra space occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents and by the **df** command) does not include some space that is reserved by the operating system (overhead). Therefore, the value in the **Total Capacity** field is greater than or equal to the value of **Total Used Space** + **Total Free Space**. The difference represents the space that is wasted because of the system overhead.

Number of FS/LV
Number of file systems or logical volumes on a computer.

By Computer Group

Computer Group
Name of a computer monitoring group or computer reporting group.

Total Capacity
Total amount (capacity) of storage space on the file systems in a group. The value in this field might be greater than **Total Used Space** + **Total Free Space** for some UNIX systems. The extra storage occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents and by the **df** command) does not include some space that is reserved by the operating system (overhead). Therefore, the value in the **Total Capacity** field is greater than or equal to the value of **Total Used Space** + **Total Free Space**. The difference represents the space that is wasted because of the system overhead.

Total Used Space
Total amount of used storage space on the file systems in a group. On some UNIX file systems, this value does not include storage space that is reserved by the operating system (overhead).

Total Free Space
Total amount of unused storage space on the file systems in a group.

Number of FS/LV
Number of file systems or logical volumes in a computer group.

By Cluster

Cluster
Name of a cluster.

Total Used Space
Total amount of used storage space on the file systems in a cluster. On some UNIX file systems, this value does not include storage space that is reserved by the operating system (overhead).

Total Free Space
Total amount of unused storage space on the file systems in a cluster.

Total Capacity
Total storage capacity of the file systems in a cluster. The value in this field might be greater than **Total Used Space** + **Total Free Space** for some UNIX systems. This extra space occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents and by the **df** command) does not include some space that is reserved by the operating system (overhead). Therefore, the value in the **Total Capacity** field is greater than or equal to the value of **Total Used Space** + **Total Free Space**. The difference represents the space that is wasted because of the system overhead.

Number of FS/LV
Number of file systems or logical volumes in a cluster.

By TPC Server

TPC Server
Name of a subordinate server that is monitoring file systems in your environment.

Total Used Space
Total amount of used storage space on the file systems that are monitored by a subordinate server. On some UNIX file systems, this value does not include storage space that is reserved by the operating system (overhead).

Total Free Space
Total amount of unused storage space on the file systems that are monitored by a subordinate server.

Total Capacity
Total storage capacity of all the file systems that are monitored by a subordinate server.

Total Number of FS/LV
Number of file systems or logical volumes that are monitored by a subordinate server.

Rollup Reports - TPC Server Storage Space - Available File System Space:

Use this report to view information about the available storage space on file systems that are monitored by subordinate servers in your environment.

You can generate and sort the data within this report by using the following by-clauses:

- By Computer: Shows file system free space that is aggregated at the computer level and sorted by computer name.
- By Computer Group: Shows file system free space that is aggregated at the computer monitoring group and computer reporting group levels and sorted by group name.
- By Cluster: Shows file system free space that is aggregated at the cluster level and sorted by cluster name.
- By IBM Tivoli Storage Productivity Center Server: Shows file system free space that is aggregated at the subordinate server level and sorted by subordinate server name.

Note: The first column in each report remains displayed when you scroll through the other columns on the report.

By Computer

Computer Name
Name of the computer with a file system.

Total Free Space
Total amount of unused storage space in the file systems on a computer.

Total Used Space
Total amount of used storage space in the file systems on a computer. On some UNIX file systems, this value does not include storage space that is reserved by the operating system (overhead). Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

The value that is displayed in the TOTAL row for this column represents the difference between the TOTAL values in the **Total Capacity** and **Total Free Space** columns. If the calculated value for the TOTAL row is negative, the column displays 0.

The TOTAL row does not add the space that is used by VMWare computers. See the *VMWare capacity reports* topic in the *Planning* chapter of the *Tivoli Storage Productivity Center Installation and Configuration Guide* for information about how file system and disk capacity are calculated in this report for VMWare computers. For related information, see the *Planning* section of the *Tivoli Storage Productivity Center Information Center*.

The value that displays in the TOTAL row for this column does not include the following file systems:

- File systems on discovered hypervisors that are assigned to virtual machine servers where the Storage Resource agent is installed.
- File systems on discovered virtual machine servers where the Storage Resource agent is installed, but the hypervisor for the virtual machine servers is not discovered yet and the total used space exceeds the capacity of the total file system capacity.

Total Capacity
Total amount (capacity) of storage space in the file systems on a computer. The value in this field might be greater than **Total Used Space** + **Total Free Space** for some UNIX systems. This extra space occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents and by the **df** command) does not include some space that is reserved by the operating system (overhead). Therefore, the value in the **Total Capacity** field is greater than or equal to the value of **Total Used Space** + **Total Free Space**. The difference represents the space that is wasted because of the system overhead.

Number of FS/LV
Number of file systems or logical volumes on a computer.

By Computer Group

Computer Group
Name of a computer monitoring group or computer reporting group.

Total Free Space
Total amount of unused storage space on the file systems in a group.

Total Used Space
Total amount of used storage space on the file systems in a group. On some UNIX file systems, this value does not include storage space that is reserved by the operating system (overhead).

Total Capacity
Total amount (capacity) of storage space on the file systems in a group. The value in this field might be greater than **Total Used Space** + **Total Free Space** for some UNIX systems. This extra space occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents and by the **df** command) does not include some space that is reserved by the operating system (overhead). Therefore, the value in the **Total Capacity** field is greater than or equal to the value of **Total Used Space** + **Total Free Space**. The difference represents the space that is wasted because of the system overhead.

Number of FS/LV
Number of file systems or logical volumes in a computer group.

By Cluster

Cluster
Name of a cluster.

Total Free Space
Total amount of unused storage space on the file systems in a cluster.

Total Used Space
Total amount of used storage space on the file systems in a cluster. On some UNIX file systems, this value does not include storage space that is reserved by the operating system (overhead).

Total Capacity
Total storage capacity of the file systems in a cluster. The value in this field might be greater than **Total Used Space** + **Total Free Space** for some UNIX systems. This extra space occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents and by the **df** command) does not include some space that is reserved by the operating system (overhead). Therefore, the value in the **Total Capacity**

field is greater than or equal to the value of **Total Used Space** + **Total Free Space**. The difference represents the space that is wasted because of the system overhead.

By TPC Server

TPC Server
Name of a subordinate server that is monitoring file systems in your environment.

Total Free Space
Total amount of unused storage space on the file systems that are monitored by a subordinate server.

Total Used Space
Total amount of used storage space on the file systems that are monitored by a subordinate server. On some UNIX file systems, this value does not include storage space that is reserved by the operating system (overhead).

Total Capacity
Total storage capacity of all the file systems that are monitored by a subordinate server.

Number of FS/LV
Number of file systems or logical volumes that are monitored by a subordinate server.

Rollup Reports - Database Capacity

Use these reports to view storage capacity, used space, and free space at the computer, computer group, database, instance, and IBM Tivoli Storage Productivity Center server level for RDBMSs that are monitored by subordinate servers.

For a specific instance, computer, group of computers, or database that is monitored by a subordinate server, you can use these rollup reports to view:

- how much storage you have for an RDBMS and the objects it contains
- how much storage is being used for an RDBMS and the objects it contains
- what percentage of RDBMS storage is free for expansion

The information shown in these reports is gathered by the master server when it runs Tivoli Storage Productivity Center server probes against associated subordinate servers. If the same storage entity is managed by multiple subordinate servers, rollup reports reflect the storage information from the subordinate server that most recently probed that entity.

Rollup Reports - Database Capacity - All DBMSs:

Use this report to view storage capacity information for the DBMSs (including Oracle, Sybase, SQL Server, and UDB/DB2) that are monitored by subordinate servers in your environment.

You can generate and sort the data within this report using the following by clauses:

- By Instance: Shows database capacity aggregated at the computer level and sorted by instance name.
- By Computer: Shows database capacity aggregated at the computer level and sorted by computer name.

- By Computer Group: Shows database capacity aggregated at the computer monitoring group and computer reporting group levels and sorted by group name.
- By TPC Server: Shows database capacity aggregated at the subordinate server level and sorted by subordinate server name.

Note: The first column in each report remains displayed when scrolling through the other columns on the report.

By Instance

Instance
Name of an instance.

RDBMS Type
RDBMS to which an instance belongs (e.g., Oracle, SQL Server, Sybase, UDB, etc.).

Computer Name
Name of the computer on which an Instance resides.

Total Size
Amount of storage space allocated to an instance.

File Capacity
Amount of storage space allocated to the data files associated with an instance.

File Free Space
Amount of storage free space available on the data files associated with an instance.

Tablespace Count
Number of tablespaces associated with an instance.

File Count
Number of data files associated with an instance.

Log File Count
Number of log files associated with an instance.

By Computer

Computer Name
Name of the computer on which an Instance resides.

Total Size
Amount of storage space allocated to an instance.

File Capacity
Amount of storage space allocated to the data files associated with an instance.

File Free Space
Amount of storage free space available on the data files associated with an instance.

Tablespace Count
Number of Tablespaces associated with an instance.

File Count
Number of data files associated with an instance.

Log File Count
Number of log files associated with an instance.

By Computer Group

Computer Group
Name of a computer monitoring group or reporting group.

Total Size
Amount of storage space allocated to instances in a group.

File Capacity
Amount of storage space allocated to the data files associated with instances in a group.

File Free Space
Amount of storage free space available on the data files associated with instances in a group.

Tablespace Count
Number of databases or tablespaces associated with instances in a group.

File Count
Number of data files associated with instances in a group.

Log File Count
Number of log files associated with instances in a group.

TPC Server
Name of a subordinate server that is monitoring the computer group.

By TPC Server

TPC Server
Name of a subordinate server that is monitoring DBMSs in your environment.

Total Size
Amount of storage space allocated to instances monitored by a subordinate server.

Total File Capacity
Amount of storage space allocated to the data files associated with instances monitored by a subordinate server.

File Free Space
Amount of storage free space available on the data files associated with instances monitored by a subordinate server.

Tablespace Count
Number of tablespaces associated with instances monitored by a subordinate server.

File Count
Number of data files associated with instances monitored by a subordinate server.

Log File Count
Number of log files associated with instances monitored by a subordinate server.

Rollup Reports - Database Capacity - Oracle, Sybase, SQL Server, and UDB:

Use this report to view storage capacity information for the Oracle, Sybase, SQL Server, and UDB/DB2 databases that are monitored by subordinate servers in your environment.

You can generate and sort the data within this report using the following by clauses:

- By Database: Shows database capacity aggregated at the computer level and sorted by instance name.
- By Computer: Shows database capacity aggregated at the computer level and sorted by computer name.
- By Computer Group: Shows database capacity aggregated at the computer monitoring group and computer reporting group levels and sorted by group name.
- By TPC Server: Shows database capacity aggregated at the subordinate server level and sorted by subordinate server name.

Note: The first column in each report remains displayed when scrolling through the other columns on the report.

By Database

Database Instance
Name of a database instance.

Computer Name
Name of the computer on which an instance resides.

Total Size
Amount of storage space allocated to an instance.

File Capacity
Amount of storage space allocated to the data files associated with an instance.

File Free Space
Amount of storage free space available on the data files associated with an instance.

Tablespace Count
Number of tablespaces associated with an instance.

File Count
Number of data files associated with an instance.

Log File Count
Number of log files associated with an instance.

By Computer

Computer Name
Name of the computer on which an instance resides.

Total Size
Amount of storage space allocated to an instance.

File Capacity
Amount of storage space allocated to the data files associated with an instance.

File Free Space
Amount of storage free space available on the data files associated with an instance.

Tablespace Count
Number of tablespaces associated with an instance.

File Count
Number of data files associated with an instance.

Log File Count
Number of log files associated with an instance.

By Computer Group

Computer Group
Name of a computer monitoring group or reporting group.

Total Size
Amount of storage space allocated to instances in a group.

File Capacity
Amount of storage space allocated to the data files associated with instances in a group.

File Free Space
Amount of storage free space available on the data files associated with instances in a group.

Tablespace Count
Number of tablespaces associated with instances in a group.

File Count
Number of data files associated with instances in a group.

Log File Count
Number of log files associated with instances in a group.

TPC Server
Name of a subordinate server that is monitoring the group.

By TPC Server

TPC Server
Name of a subordinate server that is monitoring DBMSs in your environment.

Total Size
Amount of storage space allocated to instances monitored by a subordinate server.

Total File Capacity
Amount of storage space allocated to the data files associated with instances monitored by a subordinate server.

File Free Space
Amount of storage free space available on the data files associated with instances monitored by a subordinate server.

Tablespace Count
Number of tablespaces associated with instances monitored by a subordinate server.

File Count
Number of data files associated with instances monitored by a subordinate server.

Log File Count
Number of log files associated with instances monitored by a subordinate server.

Data source reports - overview

Use data source reports to view detailed information about the agents from which IBM Tivoli Storage Productivity Center collects information about storage resources. Data sources include CIMOM agents, Storage Resource agents, Fabric agents, VMWare, and subordinate Tivoli Storage Productivity Center servers.

Data source reports - CIMOM agents

Use these reports to view detailed information about the CIMOM agents that have been associated with IBM Tivoli Storage Productivity Center.

Related Topics

- Selecting resources upon which to report
- Filtering the resources that appear in a report
- Generating a report
- Drilling down a report row (By Managed Device report only)
- Navigating tabs

Data source report - By CIMOM Agent

Use this report to view detailed information about the CIMOM agents that are used as data sources for IBM Tivoli Storage Productivity Center.

Each CIMOM that has been associated with IBM Tivoli Storage Productivity Center appears as its own row in this report.

Service URL
The service URL of the CIMOM containing the IP address of the CIMOM, the port on which the CIMOM is listening, and the protocol used for communication. This URL has a protocol [http | https], an IP address (IPv4 or IPv6), and a port number. For example:

- **IPv4:** https://127.0.0.1:5989
- **IPv6:** https://[2001:DB8::1234:0000:0000:5678:ABCD]:5989

Display Name
The name of the CIMOM as specified by the CIMOM provider that will appear in the Tivoli Storage Productivity Center user interface.

Description
The optional description that was entered on the Add CIMOM panel.

Managed Device Category
The type of device that is managed by a CIMOM (for example, storage subsystem or switch). The value **NA** appears in this column if you have not run a CIMOM discovery against a CIMOM or a CIMOM does not manage any devices.

Connection Status
The status of this CIMOM with respect to Tivoli Storage Productivity Center. Possible values are: SUCCESS, UNCONFIGURED, UNKNOWN,

INVALID_NAMESPACE, TIMEOUT, REFUSED, LOGIN_FAILED, SSL_HANDSHAKE_ERROR, SSL_REGISTRATION_INVALID, CIMCLIENT_ERROR

Status Timestamp
The date and time when the **Connection Status** information was last collected.

Number of Managed Devices
The number of devices managed by a CIMOM.

Interoperability Namespace
The interoperability namespace of a CIMOM. This namespace within the CIMOM allows for accessing the CIM Interop Schema (including the class instances of the Server Profile) and determines how Tivoli Storage Productivity Center interacts with the CIMOM when retrieving information. For a NetApp CIMOM, enter /interop.

Username
The CIMOM user name used for authentication.

Truststore Location
The location (path on this computer) of a certificate file for certificate based authentication in the https protocol.

User Interface Description
The name of the Human Interface Service (if any) supported by this CIMOM.

Software Level
The software version level of the CIMOM agent.

Protocol Version
The version of the cim-xml protocol.

Authentication Mechanism
The authentication mechanism supported by the CIMOM. This column can contain the following values: **Unknown**, **None**, **Other**, **Basic**, **Digest**.

Alias The alias of the CIMOM.

Protocol
The protocol used to communicate with the CIMOM. Possible values are **http** and **https**.

SLP Attributes
The standard set of attributes for this CIMOM. The attributes are retrieved via SLP.

Data source report - By Managed Device

Use this report to view information about the devices managed by CIMOMs in your environment. Only devices that are managed by the CIMOMs used as data sources for IBM Tivoli Storage Productivity Center are displayed.

You must run a CIMOM discovery job before you can view the devices managed by CIMOMs in this report. If a device is managed by multiple CIMOMs, the report displays a separate row for each of those CIMOMs. Therefore, the number of rows for a device in the report is equal to the number of CIMOMs managing that device.

Magnifying glass icon
Click this button to view a more detailed report about a device.

Device Name
The display name (label) of the managed storage subsystem or switch.

Device Category
Indicates whether a device that is managed by a CIMOM is a storage subsystem or switch.

Device Type
Indicates the type of a managed device based on its category. For example, a device that is a storage subsystem might have a value of **DS8000** in this column.

Device Status
The consolidated status of the managed device.

Device Operational Status
The operational status of a storage subsystem.

Device Last Probe Time
The date and time when a probe was last run on a managed device.

Device Vendor
The manufacturer of the managed device.

Device Model
The model number of the managed device.

Device Serial Number
The serial number of the managed device.

Device Microcode Level
The microcode or firmware level of the managed device.

Device IP Address
The IP address of the managed device.

Device Element Manager
The URL or the fully-qualified name of the executable file that launches the element manager.

CIMOM Service URL
The service URL of the CIMOM. This URL includes the IP address or host name of the CIMOM, the port on which the CIMOM is listening, and the protocol used for communication (http|https). For example: https://127.0.0.1:9551.

CIMOM Display Name
The name of the CIMOM as specified by the CIMOM provider that will appear in the Tivoli Storage Productivity Center user interface.

CIMOM Description
The optional description that was entered on the Add CIMOM panel.

CIMOM Connection Status
The status of this CIMOM with respect to Tivoli Storage Productivity Center. Possible values are: SUCCESS, UNCONFIGURED, UNKNOWN, INVALID_NAMESPACE, TIMEOUT, REFUSED, LOGIN_FAILED, SSL_HANDSHAKE_ERROR, SSL_REGISTRATION_INVALID, CIMCLIENT_ERROR

CIMOM Status Timestamp
The date and time when the **Connection Status** information was last collected.

CIMOM Interoperability Namespace
The interoperability namespace of a CIMOM. This namespace within the CIMOM allows for accessing the CIM Interop Schema (including the class instances of the Server Profile) and determines how Tivoli Storage Productivity Center interacts with the CIMOM when retrieving information. For a NetApp CIMOM, enter /interop.

CIMOM Username
The CIMOM user name used for authentication.

CIMOM Trustore Location
The location (path on this computer) of a certificate file for certificate based authentication in the https protocol.

CIMOM User Interface Description
The name of the Human Interface Service (if any) supported by this CIMOM.

CIMOM Software Level
The software version level of the CIMOM agent.

CIMOM Protocol Version
The version of the cim-xml protocol.

CIMOM Authentication Mechanism
The authentication mechanism supported by the CIMOM. This column can contain the following values: **Unknown**, **None**, **Other**, **Basic**, **Digest**.

CIMOM Alias
The alias of the CIMOM.

CIMOM Protocol
The protocol used to communicate with the CIMOM. Possible values are **http** and **https**.

CIMOM SLP Attributes
The standard set of attributes for this CIMOM. The attributes are retrieved via SLP.

Tivoli Storage Productivity Center Monitoring Agent reports

After you have installed and configured the Tivoli Storage Productivity Center Monitoring Agent, you can view reports and information from Tivoli Storage Productivity Center.

There are four predefined workspaces which are shipped with Tivoli Storage Productivity Center:

TPC Server Overview
Provides an over view of the key parameters and infrastructure metrics about the Data server and Device server managed entities.

Managed SAN Overview
Provides an overview about several metrics concerning the managed SAN environment.

Managed SAN Health
Monitors the health and availability of the SAN attached devices managed by Tivoli Storage Productivity Center.

TPC Data Collection Overview
Displays the status of the latest probe jobs and performance monitors.

Managed SAN Overview workspace

The Managed SAN Overview workspace provides an overview about several metrics about the managed SAN environment. You can access this workspace by clicking **Managed SAN Overview** in the navigation tree of the Navigator window.

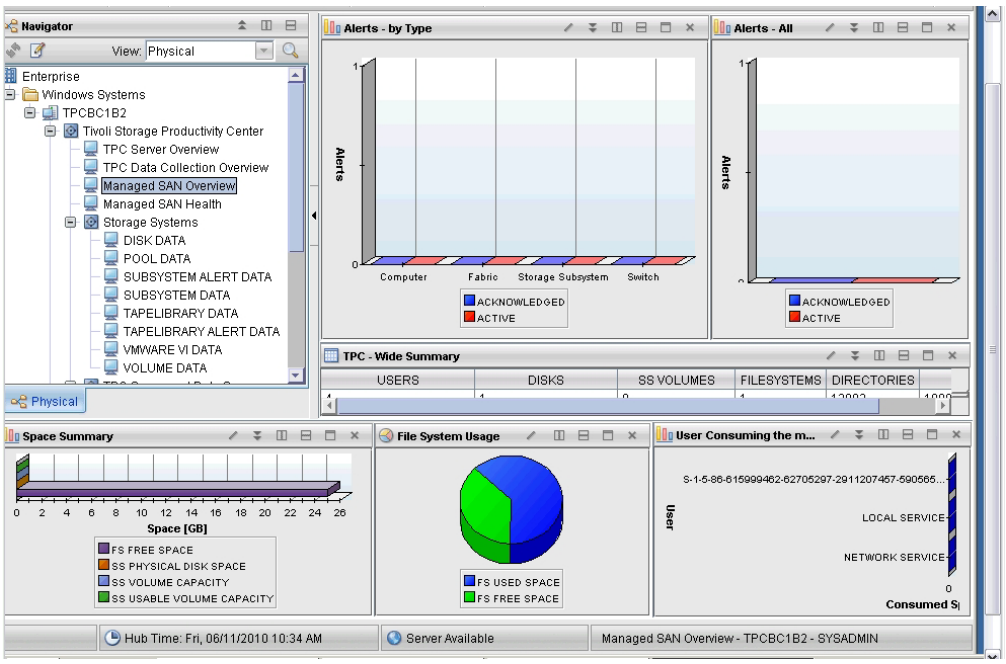

Figure 42. Managed SAN overview report

You can see the following views:

Alerts - by Type
Displays a bar chart showing the number of all computers, switches, storage systems, and fabric alerts including their current state (acknowledged or active).

Alerts - All
Displays a bar chart showing the number of all alerts of all devices including their current state (acknowledged or active).

TPC-Wide Summary
Displays a table showing the total amount of users, disks, storage system volumes, file systems, files, and folders.

Space Summary
Displays a bar chart showing the total amount of file system capacity, physical disk space of all storage systems, total amount of the available volume capacity, and total amount of usable volume capacity in the managed storage environment.

User Consuming the most Space
Displays a chart with the total amount of space allocated by single users. Only the ten users using the most space is shown.

File System Usage
Displays a pie chart showing the total amount of free and used file system space in the managed storage environment.

Managed SAN Health workspace

The Managed SAN Health workspace provides an overview about the objects in the managed SAN environment. You can access this workspace by clicking **Managed SAN Health** in the navigation tree of the Navigator window.

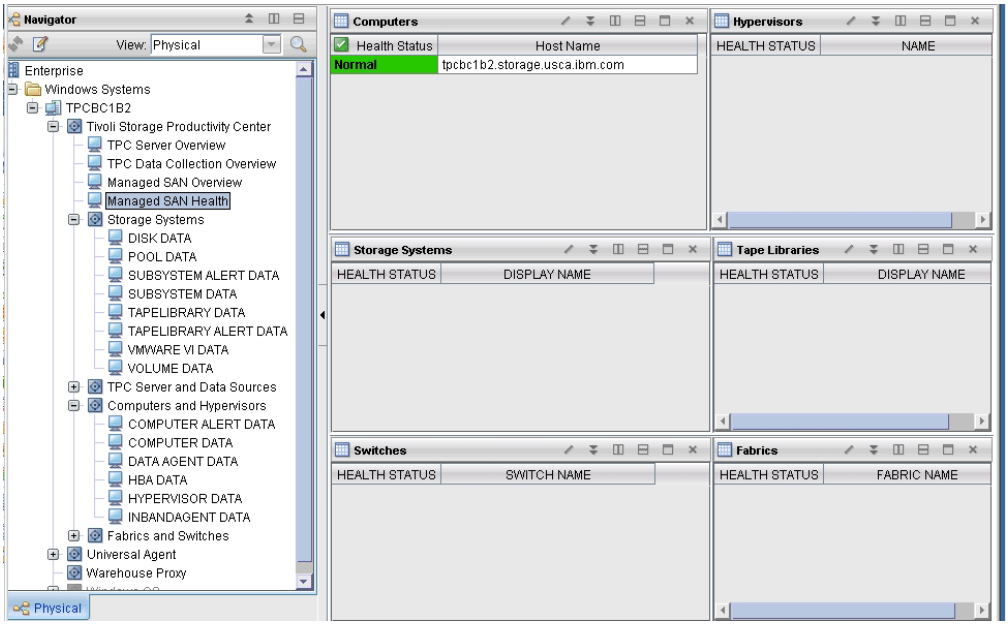

Figure 43. Managed SAN Health report

This workspace shows the following information:

Computers
Displays a list of all managed computers including their health status.

Hypervisors
Displays a list of all managed VMware hypervisors including their health status.

Storage Systems
Displays a list of all managed storage systems including their health status.

Fabrics
Displays a list of all managed fabrics including their health status.

Switches
Displays a list of all managed switches including their health status.

TPC Server Overview workspace

The TPC Server Overview workspace provides an overview of several metrics about the Tivoli Storage Productivity Center server. You can access this workspace by clicking **TPC Server Overview** in the navigation tree of the Navigator window.

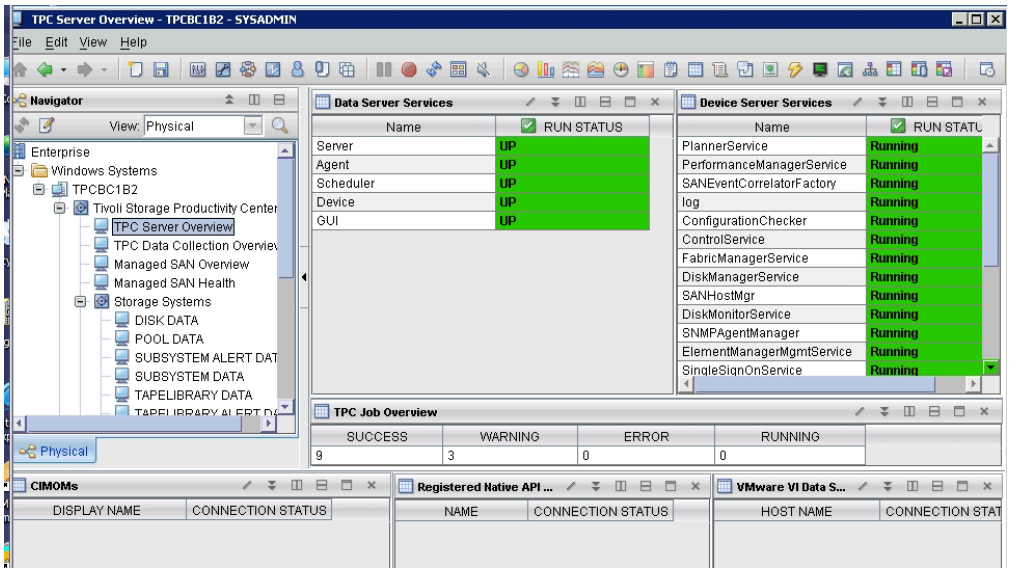

Figure 44. TPC Server overview report

This workspace provides the following views:

Data Server Services
Displays a table showing all the Data server services (Server, Agent, Scheduler, Device, and GUI) including their run status.

Device Server Services
Displays a table showing all Device server services including their run status.

TPC Job Overview
Displays a table showing statistics about the total amount of jobs and their corresponding status.

CIMOMs
Displays a table showing all the managed CIMOMs including their connection status.

Registered Native API Devices
Displays a table showing all managed native interface devices including their corresponding connection status.

VMware VI Data Sources
Displays a report showing all attached VMware VI Data Sources and their corresponding connection status.

TPC Data Collection Overview workspace

The TPC Data Collection Overview workspace provides the status of the latest probe jobs and performance monitor jobs. You can access this workspace by clicking **TPC Data Collection Overview** in the navigation tree of the Navigator window.

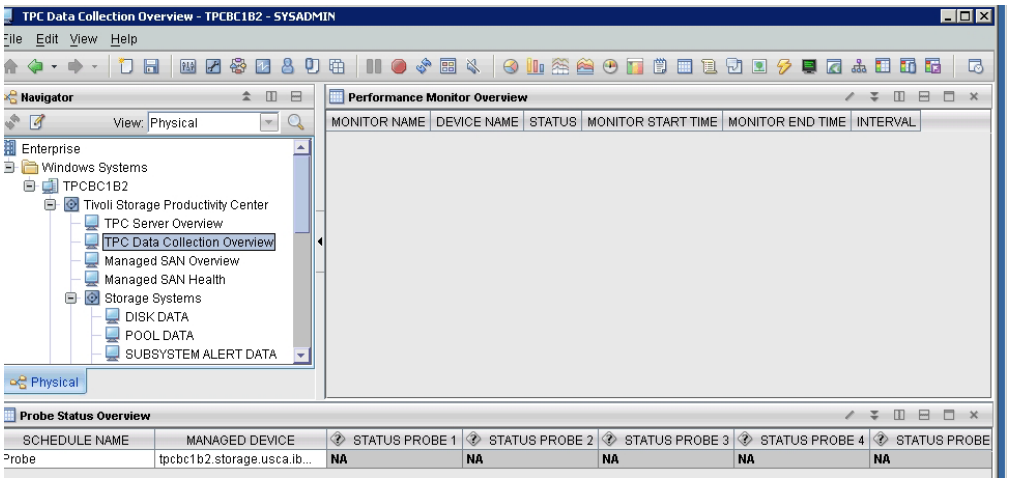

Figure 45. TPC Server overview report

This workspace provides the following information:

Probe status overview
Displays a table showing all probe jobs and their status with the last five runs.

Performance monitor overview
Displays a table showing all performance monitor jobs and their corresponding status.

Detailed Tivoli Storage Productivity Center reports

There are several reports which provide detailed information about the monitored entities. You can access these reports by clicking the appropriate entity in the navigation tree of the Navigator window. These entities are:

Storage Systems
Under **Storage Systems**, you can view these detailed reports:

- DISK DATA
- POOL DATA
- SUBSYSTEM ALERT DATA
- SUBSYSTEM DATA
- VMWARE VI DATA
- VOLUME DATA

TPC Server and Data Sources
Under TPC Server and Data Sources, you can view these detailed reports:

- CIMOM DATA
- DATASERVER API
- DEVICESERVER API
- JOB STATUS DATA
- REGISTERED NATIVE API DATA
- OTHER DEVICE DATA
- PERFORMANCE MONITOR DATA
- PROBE STATUS DATA
- SCHEDULED JOB DATA

- TPC SERVER DATA

Computers and Hypervisors

Under **Computers and Hypervisors**, you can view these detailed reports:

- COMPUTER ALERT DATA
- COMPUTER DATA
- HBA DATA
- HYPERVISOR DATA

Fabrics and Switches

Under **Fabrics and Switches**, you can view these detailed reports:

- FABRIC DATA
- FABRIC ALERT DATA
- OUTBANDAGENT DATA
- SWITCH DATA
- SWITCH ALERT DATA

See the Tivoli Storage Productivity Center online help for information about these entities.

Sharing Tivoli Storage Productivity Center alerts

Alerts can be shared with external applications such as VMware and viewed by administrators. You can share Tivoli Storage Productivity Center alerts that are mapped against VMware alerts.

To be available to VMware vSphere, a Tivoli Storage Productivity Center alert must be enabled for external reporting.

In the Alert Definition dialog in the stand-alone GUI, select the **Share with external applications** check box for each of the alerts from the following table that you want to share.

This table correlates Tivoli Storage Productivity Center alert names with the alert messages in vCenter:

Table 127. Tivoli Storage Productivity Center alerts in vCenter

Alert	vCenter name	Details
Export State Change	`Alarm.ExportStateChanged`	The export state {name} changed from {old_value} to {new_value}.
Export Is Missing	`Alarm.ExportIsMissing`	Export {name} is missing
Export Was Rediscovered	`Alarm.ExportWasRediscovered`	Export {name} was rediscovered.
Volume Status Change Offline	`Alarm.VolumeStatusChangeOffline`	Volume {name} is now offline.
Volume Status Change Online	`Alarm.VolumeStatusChangeOnline`	Volume {name} is now online.
Volume Not Found	`Alarm.VolumeIsMissing`	Volume {name} is missing.
Pool Shortfall Too High	`Alarm.ThinProvisionedLUNCapacityExceeded`	Thin provisioned LUN {name} capacity threshold exceeded.
Volume Capacity Change	`Event.VolumeCapacityChanged`	The volume capacity changed from {old_value} to {new_value} for volume {name}.

Note: Tivoli Storage Productivity Center VASA provider currently supports the sharing of alerts only with VMware vCenter.

Tivoli Storage Productivity Center can share only alerts that relate to volumes or file systems that are mapped to ESX hosts connected to vCenter.

Viewing Tivoli Storage Productivity Center VASA provider reports

Use the Tivoli Storage Productivity Center VASA provider to view Tivoli Storage Productivity Center data in vCenter reports.

When a Tivoli Storage Productivity Center VASA provider is online and inventory details are loaded, you can view Tivoli Storage Productivity Center data in vCenter reports. You can use the vSphere Client or the vSphere Web Client.

1. **vSphere Client**: Under **Home**, click **Hosts and Clusters**. Select **ESX** and click the **Storage Views** tab.
2. **vSphere Web Client**: Under **Home**, click **Hosts and Clusters**. Select **ESX** and in the **Monitor** tab, click **Storage Reports**.
3. From the **Report On** list, select **Show all SCSI Volumes (LUNs)**, **Show all Datastores**, or **Show all NAS Mounts**.

vCenter periodically updates storage data from the Tivoli Storage Productivity Center VASA provider.

To view current storage data in storage views and reports on vCenter, trigger the most recent vCenter Server updates from the Tivoli Storage Productivity Center VASA provider:

1. **vSphere Client**: Under **Home**, click **Storage Providers**.
2. Select the provider and click **Sync**.
3. Allow some minutes for the sync to take effect. Click **Refresh All**. Verify that the **Last Sync Time** value for the VASA provider is updated to the latest time stamp.

or

1. **vSphere Web Client**: Click **Hosts and Clusters**.
2. In the **Manage** tab, click **Storage Providers**.
3. Select the provider and click the **Rescan** icon.
4. Allow some minutes for the sync to take effect. Refresh the page. Verify that the **Last Rescan Time** value for the VASA provider is updated to the latest time stamp.

Now update the storage views and reports on vCenter:

1. Under **Home**, click **Hosts and Clusters**. Select **ESX** and click the **Storage Views** tab.
2. Click the **Update...** link to update the storage views.

or

1. Under **Home**, click **Hosts and Clusters**. Select **ESX** and in the **Monitor** tab, click **Storage Reports**.
2. Click the **Rescan vCenter Server for new inventory and storage devices** icon to update the storage reports.

Reporting in a vSphere environment

You can use the vSphere Web Client extension for Tivoli Storage Productivity Center to view reports on your virtual environment and storage devices.

You can view reports that are customized to use information from Tivoli Storage Productivity Center. The reports include fabric connections, storage mapping information, and performance metrics for storage systems.

To view Tivoli Storage Productivity Center storage information in block and file storage reports, you must register Tivoli Storage Productivity Center as a VASA provider.

For VASA provider-specific reports, ensure that the storage systems from which hypervisors have volumes or assigned shares are managed by Tivoli Storage Productivity Center.

For **Fabric Connections**, ensure that both the hypervisor and the fabric that is part of are managed by Tivoli Storage Productivity Center.

For **Storage Mappings**, ensure that both the hypervisor and the storage system are managed by Tivoli Storage Productivity Center and that there is an SRA deployed on the virtual machine.

For **Storage System Metrics**, ensure that both the hypervisor and the storage system are managed by Tivoli Storage Productivity Center and that performance is running on the storage system.

Use the following vSphere reports to view information about your virtual resources and the back-end storage systems:

Fabric Connections
This storage report displays fabric information that includes zone and switch details in the vSphere Web Client.

Storage Mapping
This storage mapping report displays end-to-end mappings between back-end storage that is monitored by Tivoli Storage Productivity Center and the virtual resources that are monitored by vSphere.

Storage System Metrics
This performance report displays performance metrics that include the total I/O rate and response time for the back-end storage systems that are monitored by Tivoli Storage Productivity Center, and that performance is running on the storage system.

SCSI Volumes (LUNs)
This volume report displays block storage information that is provided by Tivoli Storage Productivity Center. The information includes the following details:

- Space that is committed to the volume
- Thin provisioning status
- System capability
- Storage array name
- Volume identifier on the array
- Namespace of the VASA provider

Datastores
The Datastores report includes file system information that is provided by Tivoli Storage Productivity Center, including the system capability and the namespace of the VASA provider.

NAS Mounts
The NAS Mounts report includes file system information that is provided by Tivoli Storage Productivity Center, including the system capability and the namespace of the VASA provider.

Viewing vSphere storage mapping to Tivoli Storage Productivity Center

Use the vSphere Web Client extension to view the end-to-end mappings between back-end storage that is monitored by Tivoli Storage Productivity Center and virtual resources that are monitored by vSphere.

Start the vSphere Web Client, and log in to the vCenter Server system.

1. From the vSphere Web Client Inventories view, select the appropriate inventory object. For example, select a virtual machine.
2. Click the **Monitor** tab to view the monitoring options for the object.
3. Click the **Storage Mapping** tab to view a table that contains the mapping information from the virtual resource to Tivoli Storage Productivity Center.
4. Optional: To change the column that determines the sort order of resources, click the name of that column. For example, click the **Virtual Disk Size** column to sort the list of virtual disks according to size.

   Tip: To view descriptions of the columns in the **Storage Mapping** table, click the **Help** icon beside the **Hypervisor Host Name**.
5. Optional: To retrieve new data from Tivoli Storage Productivity Center, click the **Refresh** icon beside the **Guest OS Host Name**. The **Last updated** information in the toolbar is also updated.
6. Optional: To export storage mapping data to a CSV file or to copy the data to the clipboard, click the **Export** icon or select the relevant option from the **Export menu** in the status bar.

vSphere storage mapping to Tivoli Storage Productivity Center

You can use the vSphere Web Client extension to view the end-to-end mappings between back-end storage that is monitored by Tivoli Storage Productivity Center and virtual resources that are monitored by vSphere.

In the vSphere Web Client, use the **Monitor** tab to access the **Storage Mapping** tab for a virtual resource. You can view the attributes of each virtual disk, including the information that is provided by Tivoli Storage Productivity Center.

Use the **Storage Mapping** tab to help you to understand the relationships between an inventory object and all the virtual and physical storage resources that are related to this object. You can view details of storage usage inside the Guest Operating System (OS) and the back-end storage details such as volume, pool, and storage system information.

The Storage attribute column in the following table displays all of the attributes that are displayed in the **Storage Mapping** tab for a virtual disk. The Information source column shows whether the attribute information is from Tivoli Storage Productivity Center or vSphere.

Table 128. vSphere Storage mapping to Tivoli Storage Productivity Center

Storage attribute	Information source
Guest OS Host Name	vSphere
Virtual Disk	vSphere
Virtual Disk Size	vSphere
Virtual Disk Maximum Size	vSphere
Thin Provisioned	vSphere
Raw Device Mapping	vSphere
File	vSphere
Mount Point on Guest OS	Tivoli Storage Productivity Center This value is not available and "--" is displayed in any of the following situations: • The Guest OS on the virtual machine is not monitored by Tivoli Storage Productivity Center using a Storage Resource agent. • The ESX Server is not monitored by Tivoli Storage Productivity Center. • There is no file system on the virtual disk.
Used Space on Guest OS	Tivoli Storage Productivity Center This value is not available and "--" is displayed in any of the following situations: • The Guest OS on the virtual machine is not monitored by Tivoli Storage Productivity Center using a Storage Resource agent. • The ESX Server is not monitored by Tivoli Storage Productivity Center. • There is no file system on the virtual disk.
Disk on Guest OS	Tivoli Storage Productivity Center This value is not available and "--" is displayed in any of the following situations: • The Guest OS on the virtual machine is not monitored by Tivoli Storage Productivity Center using a Storage Resource agent. • The ESX Server is not monitored by Tivoli Storage Productivity Center. • There is no file system on the virtual disk.
Disk on Hypervisor	vSphere

Table 128. vSphere Storage mapping to Tivoli Storage Productivity Center (continued)

Storage attribute	Information source
Storage System	Tivoli Storage Productivity Center This value is not available and "--" is displayed if the storage system or ESX Server is not monitored by Tivoli Storage Productivity Center. This value is not applicable and "N/A" is displayed if the back-end storage is a NAS device.
Storage Pool	Tivoli Storage Productivity Center This value is not available and "--" is displayed if the storage system or ESX Server is not monitored by Tivoli Storage Productivity Center. This value is not applicable and "N/A" is displayed if the back-end storage is a NAS device.
Storage Volume	Tivoli Storage Productivity Center This value is not available and "--" is displayed if the storage system or ESX Server is not monitored by Tivoli Storage Productivity Center. This value is not applicable and "N/A" is displayed if the back-end storage is a NAS device.
NAS Server	vSphere This value is not available and "--" is displayed if the NAS server or ESX Server is not monitored by Tivoli Storage Productivity Center. This value is not applicable and "N/A" is displayed if the back-end storage is a storage system.
NAS Share Path	vSphere This value is not available and "--" is displayed if the NAS server or ESX Server is not monitored by Tivoli Storage Productivity Center. This value is not applicable and "N/A" is displayed if the back-end storage is a storage system.

Related tasks:

"Viewing vSphere storage mapping to Tivoli Storage Productivity Center" on page 1644

Use the vSphere Web Client extension to view the end-to-end mappings between back-end storage that is monitored by Tivoli Storage Productivity Center and virtual resources that are monitored by vSphere.

CSV file exports

You can use the export actions to export the information from the reports tables in the vSphere Web Client extension for Tivoli Storage Productivity Center to a CSV file. You can also copy the information to the clipboard.

Columns that are hidden on a page are included in the generated file. Depending on your web browser, you can determine the name and location of the file. The default file name is in the format `export_yyyy_mm_dd_hh_mm_ss.csv`.

To export information, click the **Export** icon or select the relevant option from the **Export menu** in the status bar. If no resources are selected, the information for all resources is exported.

Viewing storage system metrics in vSphere Web Client extension

Use the vSphere Web Client extension to view the key performance data for virtual resources that are monitored by vSphere. The data is retrieved from the back-end storage systems that are monitored by IBM Tivoli Storage Productivity Center.

Start the vSphere Web Client, and log in to the vCenter Server system.

1. From the vSphere Web Client Inventories view, select **Hosts and Clusters** and browse to the host for which you want to view performance data.
2. Click **Monitor** > **Performance** > **Storage System Metrics** to navigate to the performance data that was collected by Tivoli Storage Productivity Center. The performance information is displayed in the following formats:

   Performance Chart
   The chart shows a visual representation of how storage resource performance trends over time. Each line on the chart represents a metric and a resource. If the corresponding volumes have the same metric value, lines are overlaid on the chart.

   Performance Chart Legend
   The Performance Chart Legend shows performance information that is formatted into rows and columns.
3. To show the performance chart for a volume, in the **Performance Chart Legend**, click the volume. To select multiple volumes, press Ctrl and click the volumes. To select a series of volumes, select the first volume, and then press Shift and click the last volume. You can also press Shift and the Up/Down Arrow. If you select more than 10 volumes, only the first 10 volumes are shown in the performance chart. When you select volumes, the performance chart for those volumes is shown.
4. To select the time period for which you want to view performance data, select a value in the **Time** field. New data is retrieved from Tivoli Storage Productivity Center and a new chart is generated.
5. To select the metric that you want to view, select a value in the **Metric** field. New data is retrieved from Tivoli Storage Productivity Center and a new chart is generated.
6. To view the default chart for the 10 volumes with the worst performance, press Ctrl and click the selected volumes to deselect them. The chart is generated again.

Tip: To view descriptions of the metrics in the performance chart and the columns in the **Performance Chart Legend**, click the **Help** icon beside the **Refresh** icon .

7. Optional: To retrieve new data from Tivoli Storage Productivity Center, click the **Refresh** icon . The **Last updated** information in the toolbar is also updated.
8. Optional: To customize the column display in the **Performance Chart Legend**, use the pop-up menu for the table.
9. Optional: To export storage system metrics to a CSV file or to copy the data to the clipboard, click the **Export** icon or select the relevant option from the **Export menu** in the status bar.

Related reference:

"Report Displays" on page 1653
You can change the appearance of the **Storage System Metrics** table in the vSphere Web Client extension for Tivoli Storage Productivity Center. You can customize the appearance of table columns, including showing columns that are hidden, and hiding columns that are shown.

"CSV file exports" on page 1647
You can use the export actions to export the information from the reports tables in the vSphere Web Client extension for Tivoli Storage Productivity Center to a CSV file. You can also copy the information to the clipboard.

Storage System Metrics

Use the **Storage System Metrics** tab to view key performance data about the storage system that was collected from IBM Tivoli Storage Productivity Center during the last hour, day, or week. You can view the data in chart or table format, and export data to a CSV file. If no performance data was collected for the resource, the message `No data available` is displayed.

Performance Chart

You can view the key performance data for storage systems in a chart layout. The chart shows a visual representation of how storage resource performance trends over time. The x-axis shows the time period in which the data was collected. The y-axis shows the unit of measurement for a metric. Each line on the chart represents a metric and a resource. By default, the chart displays lines that represent the read I/O rate for the 10 volumes with the worst performance in the last hour.

Tip: Lines are overlaid on the chart if the corresponding volumes have the same metric value.

Click a row in the **Performance Chart Legend** to show the performance chart for that volume. To select multiple volumes, press Ctrl and click the volumes. To select a series of volumes, select the first volume, and then press Shift and click the last volume. You can also press Shift and the Up/Down Arrow. To deselect a volume, press Ctrl and click the selected volume.

Restriction: If you select more than 10 volumes, only the first 10 volumes are shown in the performance chart.

When you deselect all volumes, the default chart for the 10 volumes with the worst performance is generated again.

Note: When you select or deselect a volume, the chart is updated, but new data is not retrieved from Tivoli Storage Productivity Center. To retrieve new data, click the **Refresh** icon .

You can view the following information for volumes in the performance chart:

Time The time period that is used to select performance data. When you change the time period, new data is retrieved from Tivoli Storage Productivity Center and a new chart is generated.

You can select from the following options:

Last 1 Hour
The performance data that is selected on a sample basis from the data that was collected over the last hour. This sample data is collected at the same frequency as the data collection by the performance monitor for the volume. For example, if a performance monitor is scheduled to collect sample data every 15 minutes, each point on the chart is shown in 15-minute increments for the last hour. The default time period is **1 hour**.

Last 1 Day
The performance data that is selected on an hourly basis from the data that was collected over the last day.

Last 1 Week
The performance data that is selected on an hourly basis from the data that was collected over the last week.

Metric The performance metric that is displayed for the selected volume or volumes. When you change the **Metric**, new data is retrieved from Tivoli Storage Productivity Center and a new chart is generated.

You can select from the following options:

Read I/O rate (ops/s)
The average number of read operations per second over the specified time period.

Write I/O rate (ops/s)
The average number of write operations per second over the specified time period.

Total I/O rate (ops/s)
The average number of read and write operations per second over the specified time period.

Read data rate (KiB/s)
The average number of kibibytes per second that were transferred for read operations over the specified time period.

Write data rate (KiB/s)
The average number of kibibytes per second that were transferred for write operations over the specified time period.

Total data rate (KiB/s)
The average number of kibibytes per second that were transferred for read and write operations over the specified time period.

Read response time (ms/op)
The average number of milliseconds to complete a read operation over the specified time period.

Write response time (ms/op)
The average number of milliseconds to complete a write operation over the specified time period.

Overall response time (ms/op)
The average number of milliseconds to complete read and write operations over the specified time period.

Read transfer size (KiB/op)
The average number of kibibytes that are transferred per read operation over the specified time period.

Write transfer size (KiB/op)
The average number of kibibytes that are transferred per write operation over the specified time period.

Overall transfer size (KiB/op)
The average number of kibibytes that are transferred for read operations and write operations over the specified time period.

Refresh

Click the **Refresh** icon to retrieve new data from Tivoli Storage Productivity Center and generate a new chart.

Hover the mouse pointer over a point on a volume line to view the following information:

Volume WWN
The worldwide name of the volume.

Time The date and time that the performance data was collected.

The details for the selected metric are also displayed. If you hover the mouse pointer over the highest point on a volume line, the highest (worst) value for the **I/O rate**, **Data rate**, or **Response time** metric, is displayed. If the **Transfer size** metric is selected, the worst value is the lowest point on the volume line.

Performance Chart Legend

You can view performance data for storage systems in table format. The table shows performance information that is formatted into rows and columns. Each row represents a resource and a time stamp. Each metric is shown as a column in the table. The type of resource determines the metrics and information that is available. Click a column name to change the column that is used to sort the table. Click the link to open the associated page in the Tivoli Storage Productivity Center web-based GUI.

You can view information for each volume that is monitored by Tivoli Storage Productivity Center. The following information is displayed in the table by default:

Key The color key for the volume. The chart line for a volume is displayed in this color.

Tip: The chart color palette uses 24 colors. If the number of volumes is greater than 24, the colors repeat.

Name The name of the volume. Click the link to open the **Hypervisors** > **View Details** > **Disks** > **View Properties** page in the Tivoli Storage Productivity Center web-based GUI. If you are not authenticated, you must first log in to Tivoli Storage Productivity Center, and then the page is displayed.

Tip: Right-click on any column heading in the volumes table and select the **Unique ID** column. Use the information in this column to filter the search to locate the volume in the table.

Location
The location of the volume.

Snapshot time
The date and time that the performance data for the volume was collected.

Interval (sec.)
The size of the sample interval (in seconds) for the collection of performance data for the volume.

Storage system
The name of the storage system as displayed in Tivoli Storage Productivity Center. Click the link to open the **Storage System** > **Block Storage** > **View Details** page for the storage system in the Tivoli Storage Productivity Center web-based GUI. If you are not authenticated, you must first log in to Tivoli Storage Productivity Center, and then the page is displayed.

Storage volume
The name or identifier of the storage volume as displayed in Tivoli Storage Productivity Center. Click the link to open the **Storage System** > **Block Storage** > **View Details** > **Volume Properties** page for the storage volume in the Tivoli Storage Productivity Center web-based GUI. If you are not authenticated, you must first log in to Tivoli Storage Productivity Center, and then the page is displayed.

Storage pool
The name of the storage pool as displayed in Tivoli Storage Productivity Center. Click the link to open the **Storage System** > **Block Storage** > **View Details** > **Pool Properties** page for the storage pool in the Tivoli Storage Productivity Center web-based GUI. If you are not authenticated, you must first log in to Tivoli Storage Productivity Center, and then the page is displayed.

Read I/O rate sample (ops/s)
The average number of read operations per second for the last hour of sample performance data.

Read I/O rate hourly (ops/s)
The hourly average number of read operations per second for the selected last day or week of performance data.

Total I/O rate sample (ops/s)
The average number of read and write operations per second for the last hour of sample performance data.

Total I/O rate hourly (ops/s)
The hourly average number of read and write operations per second for the selected last day or week of performance data.

Overall response time sample (ms/op)
The average number of milliseconds that it took to complete each read and write operation for the latest sample of performance data.

Overall response time hourly (ms/op)
The hourly average number of milliseconds that it took to complete each read and write operation for the selected last day or week of performance data.

When you select a **Metric** in the performance chart, the corresponding columns for both sample and hourly averages are also displayed in the table:

Write I/O rate sample (ops/s)
The average number of write operations per second for the last hour of sample performance data.

Write I/O rate hourly (ops/s)
The hourly average number of write operations per second for the selected last day or week of performance data.

Read data rate sample (KiB/s)
The average number of kibibytes per second that were transferred for read operations for the latest sample of performance data.

Read data rate hourly (KiB/s)
The hourly average number of kibibytes per second that were transferred for read operations for the selected last day or week of performance data.

Write data rate sample (KiB/s)
The average number of kibibytes per second that were transferred for write operations for the latest sample of performance data.

Write data rate hourly (KiB/s)
The hourly average number of kibibytes per second that were transferred for write operations for the selected last day or week of performance data.

Total data rate sample (KiB/s)
The average number of kibibytes per second that were transferred for read and write operations for the latest sample of performance data.

Total data rate hourly (KiB/s)
The hourly average number of kibibytes per second that were transferred for read and write operations for the selected last day or week of performance data.

Read response time sample (ms/op)
The average number of milliseconds that it took to service each read operation for the latest sample of performance data.

Read response time hourly (ms/op)
The hourly average number of milliseconds that it took to service each read operation for the selected last day or week of performance data.

Write response time sample (ms/op)
The average number of milliseconds that it took to service each write operation for the latest sample of performance data.

Write response time hourly (ms/op)
The hourly average number of milliseconds that it took to service each write operation for the selected last day or week of performance data.

Read transfer size sample (KiB/op)
The average number of kibibytes that were transferred per read operation for the latest sample of performance data.

Read transfer size hourly (KiB/op)
The hourly average number of kibibytes that were transferred per read operation for the selected last day or week of performance data.

Write transfer size sample (KiB/op)
The average number of kibibytes that are transferred per write operation for the latest sample of performance data.

Write transfer size hourly (KiB/op)
The hourly average number of kibibytes that are transferred per write operation for the selected last day or week of performance data.

Overall transfer size sample (KiB/op)
The average number of kibibytes that were transferred per read and write operation for the latest sample of performance data.

Overall transfer size hourly (KiB/op)
The hourly average number of kibibytes that were transferred per read and write operation for the selected last day or week of performance data.

"Report Displays"
You can change the appearance of the **Storage System Metrics** table in the vSphere Web Client extension for Tivoli Storage Productivity Center. You can customize the appearance of table columns, including showing columns that are hidden, and hiding columns that are shown.

"CSV file exports" on page 1647
You can use the export actions to export the information from the reports tables in the vSphere Web Client extension for Tivoli Storage Productivity Center to a CSV file. You can also copy the information to the clipboard.

Report Displays:

You can change the appearance of the **Storage System Metrics** table in the vSphere Web Client extension for Tivoli Storage Productivity Center. You can customize the appearance of table columns, including showing columns that are hidden, and hiding columns that are shown.

Use the pop-up menu for the table to show, hide, size, or lock columns in the table:

Hide [Column Name]
Hides the selected column in the table.

Restriction: If only one column is visible, this column cannot be hidden.

Size [Column Name] to Fit
Resizes the selected column to fit the data in the column.

Size All Columns to Fit
Resizes all columns in the table to fit in the view and removes the scrollbar.

Lock First Column
Locks the first available column in the table and keeps it visible when you are scrolling.

Show/Hide Columns
Shows or hides the columns in the table.

Show Toolbar

Changes the display space for the table by showing or hiding the performance chart toolbar. If you hide the toolbar, you cannot change the metric or time that is displayed in the chart. You also cannot refresh the data and generate a new chart. Show the toolbar again to use these options.

Viewing Tivoli Storage Productivity Center fabric connections in vSphere Web Client extension

Use the vSphere Web Client extension for Tivoli Storage Productivity Center to view information about the fabric that is connected to a storage adapter.

Start the vSphere Web Client, and log in to the vCenter Server system.

1. From the vSphere Web Client Inventories view, select **Hosts and Clusters**.
2. Select a host and click the **Manage** tab.
3. Click the **Storage** tab, and then click **Storage Adapters**.
4. In the **Adapter Details** section of the **Storage Adapters** page, select a Fibre Channel host bus adaptor.
5. Click the **Fabric Connections** tab to view the details of the fabric that the host is connected to.

   Tip: To view descriptions of the fields in the **Fabric Connections** tab, click the **Help** icon in the upper-right part of the tab.
6. Optional: Click the links in the Fabric name, Switch name, and Switch port fields to open the associated pages in the Tivoli Storage Productivity Center web-based GUI. If you are not authenticated, you must first log in to Tivoli Storage Productivity Center, and then the pages are displayed.

Viewing block storage reports in the vSphere Web Client

Use the vSphere Web Client to view information for volumes. When you configure Tivoli Storage Productivity Center as a VASA provider, you can view detailed block storage information in the SCSI Volumes (LUNs) report. When you use the Provision Block Storage wizard to create a data store, you can view the details in the Datastores report.

Tip: You can also view detailed block storage information from Tivoli Storage Productivity Center in the vSphere Client.

Start the vSphere Web Client, and log in to the vCenter Server system.

1. From the vSphere Web Client Inventories view, select **Hosts and Clusters**, and browse to the entity that contains the volumes or data stores that you want to view. You can select from the following entities:
   - Data center
   - Host
   - Cluster
   - Virtual machine

   The SCSI Volumes (LUNs) report is not available for data store clusters.
2. Click **Monitor** > **Storage Reports**.
3. To view the details for all volumes, in the **Report On** list, select the **SCSI Volumes (LUNs)** category.

4. To view the details for all data stores, in the **Report On** list, select the **Datastores** category.
5. Optional: Move the cursor over the column headings to see the description of each column. An asterisk indicates that the information in a report column is provided by Tivoli Storage Productivity Center.

Block storage reports in vSphere Web Client

You can view block storage reports in the vSphere Web Client. When you configure Tivoli Storage Productivity Center as a VASA provider, you can then view detailed block storage information in the storage reports. When you use the Provision Block Storage wizard to create a data store, you can view the details in the Datastores report.

Use the **Monitor** > **Storage Reports** page to view the reports. In the vSphere Web Client, an asterisk indicates that the information in a report column is provided by Tivoli Storage Productivity Center.

SCSI Volumes (LUNs) report

You can view the following information, which is provided by Tivoli Storage Productivity Center, in the SCSI Volumes (LUNs) report:

Committed
The amount of storage space that is allocated to the volume by the back-end storage system, if the volume is thin-provisioned.

Thin Provisioned
Shows whether the volume is thin provisioned.

System Capability
The storage capability of the volume. This capability describes the physical capabilities and services that the back-end storage offers, such as performance and redundancy of the volume.

Storage Array
The identifier of the storage array.

Identifier on Array
The identifier of the volume on the storage array.

Storage Provider Namespace
The namespace of the storage provider.

Datastores report

You can view the following information, which is provided by Tivoli Storage Productivity Center, in the Datastores report:

System Capability
The storage capability of the data store. This capability describes the physical capabilities and services that the back-end storage offers, such as performance and redundancy of the data store.

User Defined Capability
The namespace of the storage provider.

Storage Provider Namespace
The namespace of the storage provider.

Viewing file system reports in the vSphere Web Client

Use the vSphere Web Client to view detailed information for file systems. When you configure Tivoli Storage Productivity Center as a VASA provider, you can then view detailed file system information in the vSphere Web Client Datastores report and in the NAS Mounts report.

Tip: You can also view detailed file system information from Tivoli Storage Productivity Center in the vSphere Client.

Start the vSphere Web Client, and log in to the vCenter Server system.

1. From the vSphere Web Client Inventories view, select **Hosts and Clusters**, and browse to the entity that contains the NAS mounts that you want to view. You can select from the following entities:
   - Data center
   - Host
   - Cluster
   - Virtual machine

   The NAS Mounts report is not available for data store clusters.
2. Click **Monitor** > **Storage Reports**.
3. To view the details for all data stores, in the **Report On** list, select the **Datastores** category.
4. To view the details for all NAS mounts, in the **Report On** list, select the **NAS Mounts** category.
5. Optional: Move the cursor over the column headings to see the description of each column. An asterisk indicates that the information in a report column is provided by Tivoli Storage Productivity Center VASA provider.

File system reports in vSphere Web Client

You can view storage reports in the vSphere Web Client. When you configure Tivoli Storage Productivity Center as a VASA provider, you can then view detailed file system information in the storage reports.

Use the **Monitor** > **Storage Reports** page to view the **Datastores** report and the **NAS Mounts** report. In the vSphere Web Client, an asterisk indicates that the information in a report column is provided by Tivoli Storage Productivity Center.

You can view the following information that is provided by Tivoli Storage Productivity Center, in both the **Datastores** report and the **NAS Mounts** report:

System Capability
: The storage capability of the NAS mount. For file system storage, this column displays either the service class that is associated with the NAS mount or the value File.

Storage Provider Namespace
: The namespace of the storage provider.

Viewing Tivoli Storage Productivity Center VASA provider reports

Use the Tivoli Storage Productivity Center VASA provider to view Tivoli Storage Productivity Center data in vCenter reports.

When a Tivoli Storage Productivity Center VASA provider is online and inventory details are loaded, you can view Tivoli Storage Productivity Center data in vCenter reports. You can use the vSphere Client or the vSphere Web Client.

1. **vSphere Client**: Under **Home**, click **Hosts and Clusters**. Select **ESX** and click the **Storage Views** tab.
2. **vSphere Web Client**: Under **Home**, click **Hosts and Clusters**. Select **ESX** and in the **Monitor** tab, click **Storage Reports**.
3. From the **Report On** list, select **Show all SCSI Volumes (LUNs)**, **Show all Datastores**, or **Show all NAS Mounts**.

vCenter periodically updates storage data from the Tivoli Storage Productivity Center VASA provider.

To view current storage data in storage views and reports on vCenter, trigger the most recent vCenter Server updates from the Tivoli Storage Productivity Center VASA provider:

1. **vSphere Client**: Under **Home**, click **Storage Providers**.
2. Select the provider and click **Sync**.
3. Allow some minutes for the sync to take effect. Click **Refresh All**. Verify that the **Last Sync Time** value for the VASA provider is updated to the latest time stamp.

or

1. **vSphere Web Client**: Click **Hosts and Clusters**.
2. In the **Manage** tab, click **Storage Providers**.
3. Select the provider and click the **Rescan** icon.
4. Allow some minutes for the sync to take effect. Refresh the page. Verify that the **Last Rescan Time** value for the VASA provider is updated to the latest time stamp.

Now update the storage views and reports on vCenter:

1. Under **Home**, click **Hosts and Clusters**. Select **ESX** and click the **Storage Views** tab.
2. Click the **Update...** link to update the storage views.

or

1. Under **Home**, click **Hosts and Clusters**. Select **ESX** and in the **Monitor** tab, click **Storage Reports**.
2. Click the **Rescan vCenter Server for new inventory and storage devices** icon to update the storage reports.

Appendix A. Reference

View reference information that is related to Tivoli Storage Productivity Center. Topics include information about alerts, fabrics, commands, configuration and log files, performance metrics, protocols, standards, and accessibility features.

Return codes used by Storage Resource agent

This topic lists the return codes used by the Storage Resource agent.

The following table lists the return codes used by the Storage Resource agent during installation, uninstallation, and upgrade.

Table 129. Storage resource agent return codes

Return code	Explanation
1	There is a problem uninstalling the Fabric agent. For more information about what caused the uninstallation to fail, check the uninstallation logs for the Fabric agent.
2	Command not valid.
3	Option provided is not valid.
5	Argument is not valid.
6	Missing value for argument (e.g. -installLoc <Value>, where <Value> is missing).
7	Missing localized string in message file.
8	Probe is running.
9	Failed to open file for write.
10	Failed to close file.
11	Logfile not specified.
19	Failed in tracing.
21	Cannot spawn a probe because it is busy.
30	This is an internal error in initializing tracing. Save the error message and error log and contact your service representative for assistance in resolving the error.
32	Invalid socket.
33	Start service failed.
34	Registry entry not found.
35	Deployment of the agent failed, error creating startup scripts.
36	File does not exist.
40	Missing upgrade files.
41	Failed to extract files in upgrade process.
42	Failed to stop probe in upgrade process.
43	Failed to stop Agent.
44	Failed to start Agent.
45	Agent Registration to server failed.

© Copyright IBM Corp. 2001, 2013

Table 129. Storage resource agent return codes (continued)

Return code	Explanation
46	File extraction needs more space.
47	Failed to open archive file.
48	Agent did not start after upgrade.
49	Installation directory not valid at upgrade time.
50	Probe is running.
51	Data file not found.
52	Exit code not in the output file.
53	Failed to send job status.
54	Failed to copy certificate files.
55	Failed to create directory.
56	Failed to remove directory.
57	Exec command failed.
58	Conversion of wide character failed.
59	Installation directory not valid.
60	Server name not defined.
61	Error in removing entries from configuration file.
62	Failed to stop probe at uninstall time.
63	Failed to remove registry entry at uninstall time.
64	Failed to remove service entry at uninstall time.
65	Failed to stop service at uninstall time.
66	Specified server name is not valid.
67	There is an error installing the Storage Resource agent as part of the migration process. For more information about what caused the installation to fail, check the installation logs for the Storage Resource agent.
71	Failed to spawn process.
73	Failed to spawn probe process.
101	Failed to create lock at installation time.
102	Failed to stop probe at re-installation time.
103	Failed to stop agent at re-installation time.
104	Failed to create registry at installation time.
105	Failed to extract files at installation time.
106	Failed to create entries in configuration file at installation time.
107	Failed to stop service at re-installation time.
108	Service already exists.
109	Failed to create service.
110	Failed to start service.
111	Probe failed at installation time.
112	Creation of daemon failed.
113	Installation of GUID failed.
114	Commtype parameter is not valid.

Table 129. Storage resource agent return codes (continued)

Return code	Explanation
115	Specified port is in use.
116	Installation/Upgrade does not have enough space.
117	Installation in progress.
118	Cannot get server name from Server.
119	Installation location is not empty.
120	Missing parameter Server Name.
121	Missing parameter Server Port.
123	Missing parameter Server IP.
124	Missing parameter Agent Port.
125	Missing parameter Installation location.
126	A value has not been specified for parameter userID. A value for this parameter is required when using RXA-based communication to deploy a Storage Resource agent as a non-daemon service. Tivoli Storage Productivity Center uses this user ID when connecting to the computer on which the agent will be installed.
127	Deployment from Windows to Linux failed.
130	Failed to send probe results.
131	Failed to initialize Agent.
133	Missing port number for Service.
134	Get data file stat failed.
135	Get data file read failed.
137	Failed to send data to server.
138	Failed to receive data from server.
139	Full path not specified for copy file.
140	Create file failed in copy file function.
141	Write file failed in copy file function.
142	Open file failed in copy file function.
143	Read file failed in copy file function.
145	UCS conversion failed.
146	Server connection failed.
148	Failed to create zip file.
149	Failed to unzip file.
160	Failed to send scan results.
161	Failed to send TSM status results.
164	Failed to validate user.
165	Job file was not found.
166	Job was not stopped.
168	Not enough free space available while copying file from server.
169	Multipath driver not found.
170	Multipath device not found.
171	Multipath policy is not supported.

Table 129. Storage resource agent return codes (continued)

Return code	Explanation
172	Only Round Robin policy is supported for Multipath DM driver.

Agent types for monitoring fabrics and switches

Depending on the monitoring functions that you want to use for switches and fabrics, you can use a CIM agent, SNMP agent, or Storage Resource agent to manage switches. The vendors of the switches can help you determine which agents to use.

Table 130. Supported agent types for Switch and Fabric Functions

Function > Switch	Brocade	Cisco [1]	QLogic
Switch Performance Monitoring	CIMOM agent	CIMOM agent	CIMOM agent
Switch and switch port information collected	Recommended: CIMOM agent Also supported: Out-of-band Fabric agent or Storage Resource agent	Recommended: CIMOM agent Also supported: Out-of-band Fabric agent or Storage Resource agent	Out-of-band Fabric agent or Storage Resource agent
Topology connectivity information collected	Recommended: CIMOM agent Also supported: Out-of-band Fabric agent or Storage Resource agent	Out-of-band Fabric agent or Storage Resource agent	Out-of-band Fabric agent or Storage Resource agent
Zoning information collected [2]	Recommended: CIMOM agent	Storage Resource agent required in each VSAN [3] [4] [5]	Storage Resource agent
Tivoli Storage Productivity Center Alerts	Recommended: CIMOM agent Also supported: Out-of-band Fabric agent or Storage Resource agent	Out-of-band Fabric agent or Storage Resource agent	Out-of-band Fabric agent or Storage Resource agent
Hosts, endpoint devices, device-centric and host-centric information collected	Storage Resource agent	Storage Resource agent	Storage Resource agent
Switch “"Sensors and Events”	Out-of-band Fabric agent	Out-of-band Fabric agent	Out-of-band Fabric agent

Table 130. Supported agent types for Switch and Fabric Functions (continued)

Function > Switch	Brocade	Cisco [1]	QLogic

Notes

[1] The Storage Resource agent gets the information about a VSAN basis. Each VSAN is viewed as an individual SAN. The Out-of-band Fabric agent and CIMOM agent get the physical fabric information and can correlate the VSAN information to a physical infrastructure. The Out-of-band Fabric agent also collects some VSAN information.

[2] "Zone information collected" indicates that the active zone set and the inactive zoning library information is collected during a fabric probe.

[3] For many Cisco proprietary zone members, the values are displayed as zeros.

[4] If a zoning configuration has Cisco proprietary zone members, then you will not be able to modify the zoning for that configuration through Tivoli Storage Productivity Center. You need to use the element manager to remove proprietary zone members or do zoning.

[5] Orphan Cisco zones are not reported.

Supported storage systems providing full disk encryption and solid-state drives

IBM Tivoli Storage Productivity Center supports full disk encryption and solid-state drives in the IBM System Storage DS8000 and IBM System Storage DS5000 Storage Manager systems described in this topic.

DS8000 4.2 and later

Tivoli Storage Productivity Center supports full disk encryption and solid-state drives in DS8000 4.2 and later.

IBM System Storage DS5000 Storage Manager series

IBM Tivoli Storage Productivity Center supports full disk encryption and solid-state drives in the following DS5000 series systems:

- DS5100 and DS5300 - full disk encryption, solid-state drives, 1 TB SATA drives
- DS5020 - full disk encryption

To support full disk encryption and solid-state drives in DS5000, the LSI SMI-S Provider is required. For more information about the LSI SMI-S Provider, see the LSI Web site at http://www.lsi.com.

Alerts

Determining when and how you are alerted to conditions and violations of performance thresholds within a storage environment is important to helping you maintain and administer storage resources. Many conditions can trigger alerts. You can set up Tivoli Storage Productivity Center so that it examines the data about your resources for the conditions and performance thresholds that you specify.

Alerts are triggered by conditions and violations of performance thresholds that are detected during data collection and event processing. For storage systems such as SAN Volume Controller, Storwize V7000, Storwize V7000 Unified, or the XIV system, events are polled every minute from the resource. For other resources, events are subscription-based, where the resource itself or a data source such as a CIM agent sends the events to Tivoli Storage Productivity Center when conditions change on the resource.

Triggering conditions for alerts

The conditions that trigger alert notifications depend on the type of resource that you are monitoring. Some triggering conditions, like performance thresholds, require you to enter values for triggering alerts. In general, the following types of conditions can trigger alerts:

- A performance threshold was violated
- A data collection job did not complete
- A change occurred in the storage infrastructure

For example, you can use performance thresholds to be notified when the total I/O rate for storage systems falls outside a specified range. This information can help you identify areas in your storage infrastructure that are over utilized or under utilized. Tivoli Storage Productivity Center provides many metrics for measuring performance and determining violations of the thresholds that you specify.

Alert notifications and triggered actions

When an event occurs and triggers an alert, the alert is written to a log. You can also select one or more other ways to be notified of the event. These alert notifications include SNMP traps, Tivoli Enterprise Console events, login notifications, entries in Windows event log or UNIX syslog, and emails. Additionally, if a Storage Resource agent is deployed on a monitored server, you can run a script or start an IBM Tivoli Storage Manager job in response to the alert.

Acknowledging alerts: Some alerts are triggered by conditions that commonly occur and can be ignored. In such cases, you acknowledge these alerts to indicate that they were reviewed and do not require immediate resolution. By acknowledging alerts, you can more quickly identify other alerts that must be reviewed and resolved.

Prerequisites for using alerts

The following conditions must be met to successfully use alerts:

- Data collection schedules are configured and scheduled to run regularly. For example, to detect violations of performance thresholds, you must run performance monitors to collect performance data about resources. Running performance monitors regularly also helps to establish a history of performance for trending analysis.
- If you want to be notified about an alert in some way other than an entry in the log file, such as using SNMP traps, Tivoli Enterprise Console events, or email, you must configure those alert destinations before you use the alert.
- If an alert is triggered based on an SNMP trap from the monitored resource, you must properly configure the SNMP server of the monitor resource to enable Tivoli Storage Productivity Center to listen to SNMP traps. The default port number is 162, and the default community is public.

Determining when and how you are alerted to conditions and violations of performance thresholds within your storage environment is important to helping you maintain and administer storage resources. Many conditions can trigger alerts. You can set up Tivoli Storage Productivity Center so that it examines the data about your resources for the conditions and performance thresholds that you specify.

Related tasks:

"Configuring alert destinations" on page 355
In the stand-alone GUI, configure the control information that is used to generate alerts when a corresponding event is discovered. You can specify default configuration settings for SNMP, TEC/OMNIbus, and email-directed alerts.

"Acknowledging alerts" on page 359
Some alerts in Tivoli Storage Productivity Center are triggered by conditions that commonly occur and can be ignored. In such cases, you acknowledge these alerts to indicate that they were reviewed and do not require immediate resolution. By acknowledging alerts, you can more quickly identify the other alerts in lists that must still be reviewed and resolved.

Triggering conditions for alerts

You can define alerts so that IBM Tivoli Storage Productivity Center notifies you when a specified event occurs. Such events are the *triggering conditions* for the alert. The specific triggering conditions that you can use to define an alert depend on the sort of storage resource that you are monitoring.

Some triggering conditions, like thresholds, require you to enter values. If input is not required for the triggering condition you select, the value fields will be grayed out. For information about thresholds, see "Performance thresholds" on page 1690.

Related concepts:

Determining when and how you are alerted to conditions and violations of performance thresholds within your storage environment is important to helping you maintain and administer storage resources. Many conditions can trigger alerts. You can set up Tivoli Storage Productivity Center so that it examines the data about your resources for the conditions and performance thresholds that you specify.

Related tasks:

"Adding resources" on page 257
You must add resources to Tivoli Storage Productivity Center before you can collect data, generate reports, and manage storage that is related to those resources.

Triggering conditions for computer alerts

Triggering conditions are events on a computer that generate alerts in Tivoli Storage Productivity Center. Each condition has a related error message identifier that is displayed when the condition is detected on a computer.

Remember: The term "computer" is used in the stand-alone GUI to refer to a server.

Table 131. Triggering conditions and related error messages for computer alerts

Triggering Condition	Explanation	Related Error Message*
RAM Increased	The amount of RAM on a monitored computer is increased.	ALR0001I
RAM Decreased	The amount of RAM on a monitored computer is decreased.	ALR0001W
Virtual Memory Increased	The amount of virtual memory on a monitored computer is increased.	ALR0002I
Virtual Memory Decreased	The amount of virtual memory on a monitored computer is decreased.	ALR0002I

Table 131. Triggering conditions and related error messages for computer alerts (continued)

Triggering Condition	Explanation	Related Error Message*
New Disk Detected	A new disk is discovered on a monitored computer.	ALR0003I
Disk Not Found	A disk is removed from a monitored computer.	ALR0004E
New Disk Defect Found	A new grown disk defect is detected on a monitored disk.	ALR0011W
Grown Disk Defects Exceed *n* value	The grown disk defect threshold is exceeded. Enter a value for *n*.	ALR0012W
Disk Failure Predicted	A managed disk predicts that a disk failure is imminent.	ALR0007E
Cluster Resource Group Added	A new cluster resource group is added.	ALR0055I
Cluster Resource Group Removed	A cluster resource group is removed.	ALR0056I
Cluster Resource Group Moved	A cluster resource group is moved.	ALR0057I
Computer Discovered	A new, unmanaged computer is discovered. This alert condition is not triggered when hypervisor virtual machines are discovered.	ALR0022I
Computer Status Change Offline	A monitored computer goes offline.	ALR4273E, ALR4044W
Computer Status Change Online	A monitored computer comes online.	ALR4274I, ALR4045I
Computer Property Change	An HBA or HBA to a computer node is newly discovered, is missing, or is rediscovered.	ALR4275W
HBA Driver Version Change	The driver version of host bus adapter changes.	ALR4034W
HBA Firmware Version Change	The firmware version of host bus adapter changes.	ALR4035W
Note: * Use the error message identifiers in this column to locate any additional information about the error messages related to triggering conditions in the *Messages* section of the *IBM Tivoli Storage Productivity Center Information Center* or the *IBM Tivoli Storage Productivity Center Messages Guide*.		

Triggering conditions for file system alerts

Triggering conditions are events on a file system that generate alerts in Tivoli Storage Productivity Center. Each condition has a related error message identifier that is shown when the condition is detected on a file system.

Table 132. Triggering conditions and related error messages for file system alerts

Triggering Condition	Explanation	Related Error Message*
New File System Detected	A file system was detected for the first time. This alert applies to a file system on a Storwize V7000 Unified or a server managed by a Storage Resource agent.	ALR0005I, ALR0005W
File System Was Not Found	A file system is removed or unmounted from a cluster. This alert applies to a file system on a Storwize V7000 Unified or a server managed by a Storage Resource agent.	ALR0006E

Table 132. Triggering conditions and related error messages for file system alerts (continued)

Triggering Condition	Explanation	Related Error Message*
File System Was Reconfigured	The physical space definition of a managed file system is reconfigured. This alert applies to a file system on a Storwize V7000 Unified or a server managed by a Storage Resource agent.	ALR0008I
File System Free Space Less Than	A file system is low on available storage space. This value is usually entered as a percent.	ALR0009W
Available UNIX File System I-Nodes Less Than	A UNIX file system is low on free inodes. This value is usually as a percent.	ALR0010W
New File System Was Detected	A file system was detected for the first time.	ALR4427I, ALR0005W
File System Is Low on Relative Free Space	A file system is low on free space based on a percentage value threshold. This alert is triggered when the corresponding SNMP trap is received from Storwize V7000 Unified.	ALR4433W
File System Is Low on Absolute Free Space	A file system is low on free space based on an absolute value threshold. This alert is triggered when the corresponding SNMP trap is received from Storwize V7000 Unified.	ALR4433W
File System Mount State Changed to Normal	The mount state for a file system reached normal level. This alert is triggered when the corresponding SNMP trap is received from Storwize V7000 Unified.	ALR4358I
File System Mount State Changed to Error	The mount state for a file system reached error level. This alert is triggered when the corresponding SNMP trap is received from Storwize V7000 Unified.	ALR4356E
File System Is Low On Relative Free I-Nodes	A file system is low on free i-nodes based on a percentage value threshold. This alert is triggered when the corresponding SNMP trap is received from Storwize V7000 Unified.	ALR4458W
File System Is Low On Absolute Free I-Nodes	A file system is low on free i-nodes based on an absolute value threshold. This alert is triggered when the corresponding SNMP trap is received from Storwize V7000 Unified.	ALR4458W
New File Set Was Detected	A file set was detected for the first time. This alert applies only to Storwize V7000 Unified.	ALR4447I
File Set Is Missing	A file set that was found during a previous probe was not found in the current probe. This alert applies only to Storwize V7000 Unified.	ALR4474W
File Set Is Linked	A file set was linked to a file system. This alert applies only to Storwize V7000 Unified.	ALR4448I
File Set Is Unlinked	A file set was unlinked from a file system. This alert applies only to Storwize V7000 Unified.	ALR4455I
File Set Was Rediscovered	A file set that was missing was found by the current probe. This alert applies only to Storwize V7000 Unified.	ALR4475I
Quota Was Exceeded	A quota was exceeded. This alert applies only to Storwize V7000 Unified.	ALR4482W
New Quota Was Detected	A quota was detected for the first time. This alert applies only to Storwize V7000 Unified.	ALR4496I

Table 132. Triggering conditions and related error messages for file system alerts (continued)

Triggering Condition	Explanation	Related Error Message*
New Home System Was Detected	A home system was detected on a file set.	ALR4393I
Home System Is Removed	A home system is removed from a file set.	ALR4394I
Home System Is Missing	A home system that was found during a previous probe was not found in the current probe.	ALR4395W
Home System Was Rediscovered	A home system that was missing was found by the current probe.	ALR4396I
New Cache Client Was Detected	A cache client was detected for the first time.	ALR4403I
Cache Client Is Removed	A cache client that was found during a previous probe was not found in the current probe.	ALR4404I
New Cache File Set Was Detected	A cache file set was detected for the first time.	ALR4397I
Cache File Set Is Missing	A cache file set that was found during a previous probe was not found in the current probe.	ALR4398W
Cache File Set Was Rediscovered	A cache file set that was missing was found by the current probe.	ALR4399I
Cache File Set Name Has Changed	A cache file set name was changed.	ALR4400I
Cache File Set Mode Changed	A cache file set mode has changed.	ALR4402I
Note: * Use the error message identifiers in this column to locate any additional information about the error messages related to triggering conditions in the *Messages* section of the *IBM Tivoli Storage Productivity Center Information Center* or the *IBM Tivoli Storage Productivity Center Messages Guide*.		

Triggering conditions for directory alerts

Triggering conditions are events in a monitored directory that generate alerts in Tivoli Storage Productivity Center. Each condition has a related error message identifier that is shown when the condition is detected in a directory.

Table 133. Triggering conditions and related error messages for directory alerts

Triggering Condition	Explanation	Related Error Message*
Directory Not Found	A directory cannot be found.	ALR0014E
Directory Consumes More Than	A user or directory storage quota is exceeded. Enter a value, usually in megabytes.	ALR0015W
Note: * Use the error message identifiers in this column to locate any additional information about the error messages related to triggering conditions in the *Messages* section of the *IBM Tivoli Storage Productivity Center Information Center* or the *IBM Tivoli Storage Productivity Center Messages Guide*.		

Triggering conditions for instance alerts

Triggering conditions are events on a database instance that generate alerts in Tivoli Storage Productivity Center. Each condition has a related error message identifier that is displayed when the condition is detected on an instance.

Table 134. Triggering conditions and related error messages for instance alerts

Database Application	Triggering Condition	Explanation	Related Error Message*
All	New Database - Tablespace Discovered	A new database-tablespace is discovered.	ALR0028I
Oracle	Archive Log Directory Contains More Than	An archived log directory quota is exceeded. Enter a value for quota.	ALR0027W
	New Tablespace Discovered	A new tablespace is discovered.	ALR0028I
SQL Server	New Database Discovered	A new database is discovered.	ALR0028I
Sybase	New Device Discovered	A new device is discovered.	ALR0042I
	Device Dropped	A device is dropped.	ALR0043E
	New Database Discovered	A new database is discovered.	ALR0028I
DB2	New Tablespace Discovered	A new database-tablespace is discovered.	ALR0028I

Note: * Use the error message identifiers in this column to locate any additional information about the error messages related to triggering conditions in the *Messages* section of the *IBM Tivoli Storage Productivity Center Information Center* or the *IBM Tivoli Storage Productivity Center Messages Guide*.

Trigger conditions for database-table space alerts

Triggering conditions are events on a database-table space that generate alerts in Tivoli Storage Productivity Center. Each condition has a related error message identifier that is displayed when the condition is detected on a database-table space.

Table 135. Triggering conditions and related error messages for database-table space alerts

Database application	Triggering Condition	Explanation	Related Error Message*
All	Database - Table Space Free Space Less Than	The free space on a database-table space is less than a specified amount.	ALR0031W
	Database - Table Space Offline	A database-table space is taken offline.	ALR0030E
	Database - Table Space Dropped	A database-table space is dropped.	ALR0029E
Oracle	Table Space Free Space Less Than	The free space on a table space is less than a specified amount.	ALR0031W
	Free Space Fragmented into More Than	The free space on a table space is fragmented into more than the specified number of extents.	ALR0032W
	Largest Free Extent Less Than	The largest free extent is less than the specified size.	ALR0033W
	Table Space Offline	A table space is taken offline	ALR0030E
	Table Space Dropped	A table space is dropped.	ALR0029E
SQL Server	Database Data Free Space Less Than	The free space on a database is less than a specified amount.	ALR0031W
	Database Log Free Space Less Than	The free space on a database log is less than the specified percent.	ALR0041W
	Database Offline	A database is taken offline.	ALR0030E
	Database Dropped	A database is dropped.	ALR0029E

Table 135. Triggering conditions and related error messages for database-table space alerts (continued)

Database application	Triggering Condition	Explanation	Related Error Message*
Sybase	Database Data Free Space less Than	The free space on a database is less than a specified amount.	ALR0031W
	Database Log Free Space Less Than	The free space on a database log is less than the specified percent.	ALR0027W
	Database Dropped	A database is dropped	ALR0029E
DB2	Table Space Free Space Less Than	The free space on a table space is less than a specified amount.	ALR0031W
	Table Space Offline	A table space is taken offline.	ALR0030E
	Table Space Dropped	A table space is dropped	ALR0029E
Note: * Use the error message identifiers in this column to locate any additional information about the error messages that are related to triggering conditions in the Messages section of the *IBM Tivoli Storage Productivity Center Information Center* or the *IBM Tivoli Storage Productivity Center Messages Guide*.			

Triggering conditions for table alerts

Triggering conditions are events on a database table that generate alerts in Tivoli Storage Productivity Center. Each condition has a related error message identifier that is displayed when the condition is detected on a table.

Table 136. Triggering conditions and related error messages for table alerts

Database application	Triggering Condition	Explanation	Related Error Message*
All	Total Table Size Greater Than	The total size of a table is greater than a specified size.	ALR0036W
	Table Dropped	A table is dropped.	ALR0039E
Oracle	Max Extents - Allocated Extents	A table segment is near its maximum allowed extents.	ALR0035W
	Segment Has More Than	A table segment has taken too many extents.	ALR0034W
	Chained Row Count Greater Than	A table has too many chained rows.	ALR0037W
	Empty Used Segment Space Exceeds	An empty used segment space exceeds the specified size.	ALR0038W
	Total Table Size Greater Than	The total size of a table is greater than a specified size.	ALR0036W
	Table Dropped	A table is dropped.	ALR0039E
SQL Server	Total Table Size Greater Than	The total size of a table is greater than a specified size.	ALR0036W
	Table Dropped	A table is dropped.	ALR0039E
Sybase	Forwarded Row Count Greater Than	A forwarded row count is greater than the specified percent.	ALR0037W
	Total Table Size Greater Than	The total size of a table is greater than a specified size.	ALR0036W
	Table Dropped	A table is dropped.	ALR0039E

Table 136. Triggering conditions and related error messages for table alerts (continued)

Database application	Triggering Condition	Explanation	Related Error Message*
DB2	Overflow Row Count Greater Than	An overflow row count is greater than the specified percent.	ALR0037W
	Total Table Size Greater Than	The total size of a table is greater than a specified size.	ALR0036W
	Table Dropped	A table is dropped.	ALR0039E

Note: * Use the error message identifiers in this column to locate any additional information about the error messages related to triggering conditions in the *Messages* section of the *IBM Tivoli Storage Productivity Center Information Center* or the *IBM Tivoli Storage Productivity Center Messages Guide*.

Triggering conditions for storage system alerts

Triggering conditions are events in a storage system that generate alerts in Tivoli Storage Productivity Center. Each condition has a related error message identifier that is displayed when the condition is detected on a storage system.

Table 137. Triggering conditions and related error messages for storage-system alerts

Triggering Condition	Explanation	Related Error Message[1]
New Storage System discovered	A new storage system is discovered.	ALR1114I
Cache Increased	A storage system cache increases.	ALR0050W
Cache Decreased	A storage system cache decreases.	ALR0050W
New Disk Detected[2]	A new disk is detected.	ALR4323I
Disk Not Found[2]	A previously detected disk is not found.	ALR4324W
Storage System Not Found	A previously detected storage system is not found.	ALR0048W
Storage System Status Change Offline	A storage system goes offline.	ALR4241E
Storage System Status Change Online	A storage system comes online.	ALR4242W
Storage System Version Change	A storage system version changes.	ALR4243W
Storage System Property Change	A port on a storage system is newly discovered, missing, or rediscovered.	ALR4278W
Storage System Allocated Capacity Change	The allocated capacity of a storage system changes.	ALR4244W
Storage System Available Capacity Change	The available capacity of a storage system changes.	ALR4245W
Storage System Backend Capacity Change	The allocated capacity of a storage system changes.	ALR4246W
Backend Storage System Status Change Offline	A back-end storage system goes offline.	ALR4247W
Backend Storage System Status Change Online	A back-end storage system comes online.	ALR4248I

Table 137. Triggering conditions and related error messages for storage-system alerts (continued)

Triggering Condition	Explanation	Related Error Message[1]
Volume Status Change Offline	A volume goes offline.	ALR4249W
Volume Capacity Change	The capacity of a volume changes.	ALR4251W
Pool Status Change	A pool is missing or rediscovered.	ALR4252W
Pool Discovered	A pool is discovered.	ALR4253I
Pool Status Change Offline	A pool goes offline.	ALR4254W
Pool Status Change Online	A pool comes online.	ALR4255I
Pool Capacity Change	The capacity of a pool changes.	ALR4256W
Pool Available Space Change	The available space in a pool changes.	ALR4257W
Pool Available Space Lower Than Critical Boundary	The available space is too low for a pool on a storage system. The measured value violates the critical boundary.	ALR4541E
Pool Available Space Lower Than Warning Boundary	The available space is too low for a pool on a storage system. The measured value violates the warning boundary.	ALR4542W
Pool Allocation Percentage Higher Than Critical Boundary	The allocation percentage is too high for a pool on a storage system. The measured value violates the critical boundary.	ALR4543E
Pool Allocation Percentage Higher Than Warning Boundary	The allocation percentage is too high for a pool on a storage system. The measured value violates the critical boundary.	ALR4544W
Realizable Allocation Percentage Below Critical Boundary	The realizable allocation percentage is too low for a pool on a storage system. The measured value violates the critical boundary.	ALR4545E
Realizable Allocation Percentage Below Warning Boundary	The realizable allocation percentage is too low for a pool on a storage system. The measured value violates the warning boundary.	ALR4546W
Pool Available Space Too Low	Two threshold boundary values can be specified, a warning and a critical boundary. You can specify a value in Gigabytes or as a %.	ALR4541E, ALR4542W
Pool Virtual Allocation Too High	Two threshold boundary values can be specified, a warning and a critical boundary. You can specify a value in Gigabytes or as a %.	ALR4543E, ALR4544W
Pool Shortfall too High	Two threshold boundary values can be specified, a warning and a critical boundary. You can specify a value as a %.	ALR4545E, ALR4546W
Node Status Change Offline	A node goes offline.	ALR4226W
Node Status Change Online	A node comes online.	ALR4227I
Node State Change	An IBM System Storage SAN Volume Controller node is missing or rediscovered.	ALR4224W
Node Discovered	A SAN Volume Controller node is discovered.	ALR4225I

Table 137. Triggering conditions and related error messages for storage-system alerts (continued)

Triggering Condition	Explanation	Related Error Message[1]
Datapath State Change	The state of a data path changes.	ALR4353W
Datapath Discovered	A data path is discovered.	ALR4354I
New Volume discovered	A new volume is discovered during a probe of a storage system.	ALR4325W
Volume not found	A volume which had existed before is not found during a probe of a storage system.	ALR4326W
Link Failure Rate Threshold	The average number of miscellaneous fibre channel link errors (for example, an unexpected Not Operational (NOS) received or a link state machine failure detected) per second that were encountered by a port over a period of time.	ALR0548E, ALR0549W, ALR0550W, ALR0551E
Error Frame Rate Threshold	The threshold for the number of frames per second that violated Fibre Channel protocol for a port over a period of time.	ALR0544E, ALR0545W. ALR0546W, ALR0547E
Overall Port Response Time Threshold	The threshold for the average number of milliseconds that it took to service each operation (send and receive), by a particular port over a particular time interval.	ALR0540E, ALR0541W, ALR0542W, ALR0543E
Total Port Data Rate Threshold	The threshold for the average number of megabytes transferred (send and receive) for a particular port over a particular time interval	ALR0536E, ALR0537W, ALR0538W, ALR0539E
Total Port IO Rate Threshold	The threshold for the average number of send and receive operations processed per second, for a particular port over a particular time interval	ALR0532E, ALR0533W, ALR0534W, ALR0535E
CPU Utilization Threshold	The threshold is based on the average utilization percentage of the CPUs in the SAN Volume Controller nodes. This value for each node is checked against the threshold boundaries for each collection interval.	ALR0556E, ALR0557W, ALR0558W, ALR0559E
Cache Holding Time Threshold	The threshold is reached for the average cache holding time, in seconds, for I/O data in a particular component over a particular time interval. Shorter time periods indicate adverse performance	ALR0528E, ALR0529W, ALR0530W, ALR0531E
Write-cache Delay Percentage Threshold	The threshold is based on the percentage of I/O operations that were delayed due to write-cache space constraints. This value for each node is checked against the threshold boundaries for each collection interval	ALR0524E, ALR0525W, ALR0526W, ALR0527E
Total Data Rate Threshold	For the storage system controllers or I/O groups, the threshold for the average number of MB per second for read and write operations is reached	ALR0520E, ALR0521W, ALR0522W, ALR0523E
Total I/O Rate Threshold	For the storage system controllers or I/O groups, the threshold for the average number of I/O operations per second is reached	ALR0516E, ALR0517W, ALR0518W, ALR0519E
Overall Backend Response Time Threshold	The threshold for the average number of milliseconds that it takes to respond to MDisk I/O operations is reached	ALR0512E, ALR0513W, ALR0514W, ALR0515E
Total Backend Data Rate Threshold	For MDisk groups, the threshold for the average number of megabytes per second that are transferred for MDisk read and write operations is reached	ALR0508E, ALR0509W, ALR0510W, ALR0511E
Zero Buffer-Buffer Credit Timer Threshold	The number of microseconds that the port was not able to send frames because of insufficient buffer credit since the last node reset.	ALR0624E, ALR0625W, ALR0626W, ALR0627E

Table 137. Triggering conditions and related error messages for storage-system alerts (continued)

Triggering Condition	Explanation	Related Error Message[1]
Total Backend I/O Rate Threshold	For MDisk groups, the threshold for the average number of MDisk read and write operations per second is reached.	ALR0504E , ALR0505W, ALR0506W, ALR0507E
Invalid Transmission Word Rate Threshold	The threshold for the average number of times per second that "bit" errors are detected on a port over a period of time.	ALR0620E, ALR0621W, ALR0622W, ALR0623E
CRC Error Rate Threshold	The threshold for the average number of frames received per second where the CRC in the frame did not match the CRC computed by the receiver for a component over a period of time.	ALR0616E, ALR0617W, ALR0618W, ALR0619E
Disk Utilization Percentage Threshold	The threshold is reached for the approximate utilization percentage of a particular array over a particular time interval. For example, the average percentage of time that the disk associated with the array was busy	ALR0500E, ALR0501W, ALR0502W, ALR0503E
Port Receive Bandwidth Percentage Threshold[3]	The threshold for the average port bandwidth utilization percentage for receive operations.	ALR0612E, ALR0613W, ALR0614W, ALR0615E
Port Send Bandwidth Percentage Threshold[3]	The threshold for the average port bandwidth utilization percentage for send operations.	ALR0608E, ALR0609W, ALR0610W, ALR0611E
Port Receive Utilization Percentage Threshold	The threshold for the average amount of time that ports are busy receiving data.	ALR0604E, ALR0605W, ALR0606W, ALR0607E
Port Send Utilization Percentage Threshold	The threshold for the average port bandwidth utilization percentage for send operations.	ALR0600E, ALR0601W, ALR0602W, ALR0603E
Peak Back-end Write Response Time Threshold	The threshold for the peak (worst) response time among all MDisk write operations by a node.	ALR0596E, ALR0597W, ALR0598W, ALR0599E
Non-preferred Node Usage Percentage Threshold	The threshold for the non-preferred node usage percentage of an I/O group.	ALR0592E, ALR0593W, ALR0594W, ALR0595E
Port to Local Node Receive Queue Time Threshold	The threshold for the average number of milliseconds that each receive operation issued to another node in the local SVC cluster spent on the queue before being issued.	ALR0588E, ALR0589W, ALR0590W, ALR0591E
Port to Local Node Send Queue Time Threshold	The threshold for the average number of milliseconds that each send operation issued to another node in the local SVC cluster spent on the queue before being issued.	ALR0584E, ALR0585W, ALR0586W, ALR0587E
Port to Local Node Receive Response Time Threshold	The threshold for the average number of milliseconds it took to service each receive operation from another node in the local SVC cluster.	ALR0580E, ALR0581W, ALR0582W, ALR0583E
Port to Local Node Send Response Time Threshold	The threshold for the average number of milliseconds it took to service each send operation from another node in the local SVC cluster.	ALR0576E, ALR0577W, ALR0578W, ALR0579E
Back-end Write Queue Time Threshold	The threshold for the average number of milliseconds that each write operation spent on the queue before being issued to the back-end device.	ALR0572E, ALR0573W, ALR0574W, ALR0575E
Back-end Read Queue Time Threshold	The threshold for the average number of milliseconds that each read operation spent on the queue before being issued to the back-end device.	ALR0568E, ALR0569W, ALR0570W, ALR0571E

Table 137. Triggering conditions and related error messages for storage-system alerts (continued)

Triggering Condition	Explanation	Related Error Message[1]
Back-end Write Response Time Threshold	The threshold for the average number of milliseconds that it took to service each array and MDisk write operation.	ALR0564E, ALR0565W, ALR0566W, ALR0567E
Back-end Read Response Time Threshold	The threshold for the average number of milliseconds that it took to service each array and MDisk read operation.	ALR0560E, ALR0561W, ALR0562W, ALR0563E

Notes:

1. Use the error message identifiers in this column to locate any additional information about the error messages related to triggering conditions in the *Messages* section of the *IBM Tivoli Storage Productivity Center Information Center* or the *IBM Tivoli Storage Productivity Center Messages Guide*.
2. This condition does not trigger alerts for the following storage systems:
   - Storwize V3500
   - Storwize V3700
   - Storwize V7000
   - Storwize V7000 Unified
   - SAN Volume Controller
3. This condition does not trigger alerts for the DS6000.

Related tasks:

"Creating a performance threshold and viewing violations" on page 100
You can monitor the performance of a storage environment by defining performance thresholds for storage systems and SAN switches. A threshold violation is detected when a performance monitor discovers that the measured value of a metric falls outside of the specified threshold range for a resource. By defining alerts that are triggered by performance thresholds, you can get timely information about performance issues in your environment.

Related reference:

"Performance thresholds" on page 1690
Performance thresholds are triggering conditions which are used to monitor a component with user-defined values.

Triggering conditions for fabric alerts

Triggering conditions are events in a fabric that generate alerts in Tivoli Storage Productivity Center. Each condition has a related error message identifier that is displayed when the condition is detected in a fabric.

Table 138. Triggering conditions and related error messages for fabric alerts

Triggering Condition	Explanation	Related Error Message*
Fabric Discovered	A fabric is discovered.	ALR4046I
Fabric State Change	A fabric is missing or rediscovered.	ALR4047W, ALR4048I
Fabric to Switch Change	A switch to fabric association is discovered, rediscovered, or missing.	ALR4066I, ALR4067W, ALR4068I
Zone State Change	A zone is missing or rediscovered.	ALR4052W, ALR4053I, ALR4090W, ALR4094I
Zone Discovered	A zone is discovered.	ALR4051I, ALR4091I
Zone Set State Change	A zone set in a fabric was activated, deactivated, or has gone missing.	ALR4055W, ALR4089W, ALR4093E, ALR4056I, ALR4095I
Zone Set Discovered	A zone set is discovered.	ALR4054I, ALR4092I

Table 138. Triggering conditions and related error messages for fabric alerts (continued)

Triggering Condition	Explanation	Related Error Message*
Zone to Zone Alias Change	A zone to zone alias association is discovered, missing, or rediscovered.	ALR4079W, ALR4080I, ALR4110W, ALR4111I, ALR4078I, ALR4109I
Zone to Zone Member Change	A zone to zone member association is discovered, missing, or rediscovered.	ALR4081I, ALR4096I, ALR4082I, ALR4083I, ALR4097I, ALR4098I
Zone Set to Zone Change	A zone set to zone association is discovered, missing, or rediscovered.	ALR4084I, ALR4099I, ALR4085I, ALR4086I, ALR4107I, ALR4108I
New Connection	A new connection is detected.	ALR4063I
Connection State Change	A connection is missing or rediscovered.	ALR4064W, ALR4065I
Zone Alias to Member Change	A zone alias to member association is discovered, rediscovered, or missing.	ALR4329I, ALR4330I, ALR4331I
Endpoint Discovered	An endpoint is discovered.	ALR4000I
Endpoint State Change	An endpoint is missing or rediscovered.	ALR4001W, ALR4002I
Note: * Use the error message identifiers in this column to locate any additional information about the error messages related to triggering conditions in the *Messages* section of the *IBM Tivoli Storage Productivity Center Information Center* or the *IBM Tivoli Storage Productivity Center Messages Guide*.		

Triggering conditions for switch alerts

Triggering conditions are events on a switch that generate alerts in Tivoli Storage Productivity Center. Each condition has a related error message identifier that is displayed when the condition is detected on a switch.

Important: The following triggering conditions are performance thresholds. A performance monitor must collect data about a switch before Tivoli Storage Productivity Center can determine if a performance threshold has generated an alert.

- Total Port Data Rate Threshold
- Port Receive Bandwidth Percentage Threshold
- Port Send Bandwidth Percentage Threshold
- Link Failure Rate Threshold
- Error Frame Rate Threshold
- Total Port Packet Rate Threshold

Table 139. Triggering conditions and related error messages for switch alerts

Triggering Condition	Explanation	Related Error Message*
Switch Discovered	A switch is discovered.	ALR4020I
Switch State Change	A switch is missing or is rediscovered.	ALR4021E, ALR4022I
Switch Property Changes	A port on the switch has changed to online or offline, is discovered, is missing, or is rediscovered.	ALR4015I, ALR4016W, ALR4017I, ALR4018W, ALR4019I,
Switch Status Degraded	The status of the switch has changed from OK to a reduced level. This condition does not necessarily mean that the switch is missing.	ALR4024W
Switch Status Improved	The status of the switch has been upgraded to OK.	ALR4025I
Switch Version Change	The version of a switch changes.	ALR4023W

Table 139. Triggering conditions and related error messages for switch alerts (continued)

Triggering Condition	Explanation	Related Error Message*
Switch to Port Change	A switch to switch port association is discovered, is missing, or is rediscovered.	ALR4069I, ALR4070W, ALR4071I
Switch Blade Change	A switch module is discovered, is missing, or is rediscovered.	ALR4026I, ALR4027W, ALR4028I
Switch Blade Change Offline	A switch module goes offline.	ALR4029E
Switch Blade Change Online	A switch module comes online.	ALR4030I
Total Port Data Rate Threshold	A total port data rate threshold is reached.	ALR0536E, ALR0537W, ALR0538W, ALR0539E
Port Receive Bandwidth Percentage Threshold	The threshold on the average port bandwidth utilization percentage for receive operations. The Port Send Utilization Percentage metric is checked against the threshold boundaries for each collection interval. This threshold uses the following default values: 85,75,-1,-1.	ALR0612E, ALR0613W, ALR0614W, ALR0615E
Port Send Bandwidth Percentage Threshold	The threshold on the average port bandwidth utilization percentage for send operations. The Port Send Utilization Percentage metric is checked against the threshold boundaries for each collection interval. This threshold uses the following default values: 85,75,-1,-1.	ALR0608E, ALR0609W, ALR0610W, ALR0611E
Link Failure Rate Threshold	A link failure rate threshold is reached.	ALR0548E, ALR0549W, ALR0550W, ALR0551E
Error Frame Rate Threshold	An error frame rate threshold is reached.	ALR0544E, ALR0545W, ALR0546W, ALR0547E
Total Port Packet Rate Threshold	A total port packet rate threshold is reached.	ALR0552E, ALR0553W, ALR0554W, ALR0555E
Note: * Use the error message identifiers in this column to locate any additional information about the error messages related to triggering conditions in the *Messages* section of the *IBM Tivoli Storage Productivity Center Information Center* or the *IBM Tivoli Storage Productivity Center Messages Guide*.		

Triggering conditions for endpoint device alerts

Use this topic to view the events that can trigger endpoint device alerts and their related error message identifiers.

Table 140. Triggering conditions and related error messages for endpoint device alerts

Triggering Condition	Explanation	Related Error Message*
Endpoint Discovered	An endpoint device is discovered.	ALR4239W
Endpoint State Change	An endpoint device is missing or is rediscovered.	ALR4231W
Endpoint Version Change	The version for an endpoint device changes.	ALR4313W
Note: * Use the error message identifiers in this column to locate any additional information about the error messages related to triggering conditions in the *Messages* section of the *IBM Tivoli Storage Productivity Center Information Center* or the *IBM Tivoli Storage Productivity Center Messages Guide*.		

Triggering conditions for hypervisor alerts

Triggering conditions are events on a hypervisor that generate alerts in Tivoli Storage Productivity Center. Each condition has a related error message identifier that is displayed when the condition is detected on a hypervisor.

Table 141. Triggering conditions and related error messages for hypervisor alerts

Triggering Condition	Explanation	Related Error Message*
Hypervisor Discovered	A hypervisor is discovered.	ALR4315I
Hypervisor Missing	A hypervisor that was previously discovered is missing.	ALR4321W
Virtual Machine Added	A new virtual machine was added.	ALR4316I
Virtual Machine Removed	A virtual machine was removed.	ALR4317W
Note: * Use the error message identifiers in this column to locate any additional information about the error messages related to triggering conditions in the *Messages* section of the *IBM Tivoli Storage Productivity Center Information Center* or the *IBM Tivoli Storage Productivity Center Messages Guide*.		

Triggering conditions for Other NAS alerts

Triggering conditions are events on network-attached storage (NAS) that generate alerts in Tivoli Storage Productivity Center. Each condition has a related error message identifier that is displayed when the condition is detected on a NAS device.

Table 142. Triggering conditions and related error messages for NAS alerts

Triggering Condition	Explanation	Related Error Message*
Node Status Changed to Normal	The clustered Common Internet File System (CIFS) for a NAS device is active. This alert is triggered when the corresponding SNMP trap is received from Storwize V7000 File Module.	ALR4365I
Node Status Changed to Warning	The clustered CIFS for a NAS device is disabled. This alert is triggered when the corresponding SNMP trap is received from Storwize V7000 File Module.	ALR4366W
Node Status Changed to Error	The status of a clustered CIFS for a NAS device reached the error level. This alert is triggered when the corresponding SNMP trap is received from Storwize V7000 File Module.	ALR4367E
GPFS Status Reached Normal Level	The General Parallel File System (GPFS) for a NAS device is active. This alert is triggered when the corresponding SNMP trap is received from Storwize V7000 File Module.	ALR4368I
GPFS Status Reached Warning Level	The GPFS state for a NAS device reached the warning level. This alert is triggered when the corresponding SNMP trap is received from Storwize V7000 File Module.	ALR4369W
GPFS Status Reached Error Level	The GPFS for a NAS device is down. This alert is triggered when the corresponding SNMP trap is received from Storwize V7000 File Module.	ALR4370E
Node State Changed	The state of a node changed.	ALR1245W
Node Was Discovered	A node was discovered.	ALR1246W
Node Status Changed to Online	A node status changed to online.	ALR4227W
Node Status Changed to Offline	A node status changed to offline.	ALR4226W
Processor Usage Reached Normal Level	Processor use for a network-attached storage (NAS) device reached the normal level. This alert is triggered when the corresponding SNMP trap is received from Storwize V7000 File Module.	ALR4361I

Table 142. Triggering conditions and related error messages for NAS alerts (continued)

Triggering Condition	Explanation	Related Error Message*
Processor Usage Reached Warning Level	Processor use for a NAS device reached the warning level. This alert is triggered when the corresponding SNMP trap is received from Storwize V7000 File Module.	ALR4360W
Processor Usage Reached Error Level	Processor use for a NAS device reached the error level. This alert is triggered when the corresponding SNMP trap is received from Storwize V7000 File Module.	ALR4359E
Memory Usage Reached Normal Level	Memory use for a NAS device reached the normal level. This alert is triggered when the corresponding SNMP trap is received from Storwize V7000 File Module.	ALR4364I
Memory Usage Reached Error Level	Memory use for a NAS device reached the error level. This alert is triggered when the corresponding SNMP trap is received from Storwize V7000 File Module.	ALR4362E
Cluster Was Discovered	A cluster was discovered.	ALR4528I
Cluster Was Removed	A cluster that was found during a probe was not found in the current probe.	ALR4529I
Cluster Was Rediscovered	A cluster that was missing was found by the current probe.	ALR4530I
New Export Was Detected	An export was detected for the first time.	ALR4460I
Export Is Missing	An export that was found during a previous probe was not found in the current probe.	ALR4470W
Export Was Rediscovered	An export that was missing was found by the current probe.	ALR4471I
Export State Changed	The state of an export changed.	ALR4461W
Export Path Changed	An export was linked to a new path.	ALR4462W
Export Protocol Changed	The protocols that were configured for an export changed.	ALR4463W
New NSD Detected	A Network Shared Disk (NSD) was detected for the first time.	ALR4503I
NSD Is Missing	An NSD that was found during a previous probe was not found in the current probe.	ALR4505W
NSD State Changed	The state of an NSD changed.	ALR4507W
NSD Status Reached Normal Level	NSD use for a NAS device reached the normal level.	ALR4387I
NSD Status Reached Warning Level	NSD use for a NAS device reached the warning level.	ALR4386W
NSD Status Reached Error Level	NSD use for a NAS device reached the error level.	ALR4385E
Node Is Selected As Cache Gateway Node	A node was selected as a cache gateway node.	ALR4391I
Node Is Unselected As Cache Gateway Node	A node was unselected as a cache gateway node.	ALR4392I
Note: * Use the error message identifiers in this column to locate any additional information about the error messages related to triggering conditions in the *Messages* section of the *IBM Tivoli Storage Productivity Center Information Center* or the *IBM Tivoli Storage Productivity Center Messages Guide*.		

Triggering conditions for replication alerts

Triggering conditions are events in Tivoli Storage Productivity Center for Replication that generate alerts in Tivoli Storage Productivity Center. Each condition has a related error message identifier that is displayed when it is detected.

Table 143. Triggering conditions and related error messages for replication alerts

Triggering Condition	Explanation	Related Error Message*
Replication Session Change	An alert is generated if a replication session changes to the following states: • Terminating • Target Available • Suspended, Suspended H2H3, Suspended H1H3 • Recovering • Preparing • Prepared • Flashing • Defined An alert is generated if the following conditions are detected for a role pair: • The role pair in a replication session passed the Recovery Point Objective (RPO) warning threshold. • The role pair in a replication session passed the RPO severe threshold.	ALR4339W
Replication Suspending Event Notification	The state of a replication session changed to suspending.	ALR4339W
Replication Communication Failure	An alert is generated when the following communication errors are detected: • The Replication standby server encountered communication errors with the Active server. • The Replication server timed out when attempting to communicate with the storage system. • The Replication server encountered communication errors with the storage system. • The Replication active server stopped communicating with the standby server.	ALR4339W
Replication Management Server State Change	An alert is generated when the replication HA connection changes to the following states: • Unknown • Synchronized • Synchronization Pending • Disconnected • Disconnected Consistent	ALR4339W
Replication Configuration Change	An alert is generated when the following replication configuration changes are detected: • One or more path definitions were added or removed. • One or more copy sets were added to a session. • One or more copy sets were deleted from a session.	ALR4339W

Table 143. Triggering conditions and related error messages for replication alerts (continued)

Triggering Condition	Explanation	Related Error Message*
Note: * Use the error message identifiers in this column to locate any additional information about the error messages related to triggering conditions in the *Messages* section of the *IBM Tivoli Storage Productivity Center Information Center* or the *IBM Tivoli Storage Productivity Center Messages Guide*.		

Alert suppression actions

If you selected a threshold as a triggering condition for alerts, you can specify the conditions under which alerts are triggered and choose whether you want to suppress repeating alerts. Alerts can be suppressed to avoid generating too many alert log entries or too many actions when the triggering condition occurs often. You can view suppressed alerts in the constraint violation reports.

You can define the following options that enable you to specify conditions that trigger and suppress alerts. If a threshold is not selected as a triggering condition, these options are not available.

Trigger alerts for both critical and warning conditions
Generates an alert upon the violation of either critical or warning threshold boundaries. This is the default.

Trigger alerts for critical conditions only
Generates alerts only upon violation of one of the critical threshold boundaries. Violation of a warning boundary creates an entry in the constraint violation report, but does not result in an entry in the alert log or an action being triggered.

Trigger no alerts
Does not generate an alert upon violation of any threshold boundaries. Creates entries only in the constraint violation report.

Do not suppress repeating alerts
Does not suppress any repeating alerts. This is the default.

Suppress alerts unless the Triggering Condition has been violated continuously for a specified length of time
Generates alerts only if the triggering condition has occurred continuously within the length of time specified in the **Length of time** field. Alerts for the first and any subsequent occurrences of the triggering condition within the specified time in minutes will be suppressed. At the point that there have been consecutive occurrences with the specified number of minutes, an alert is generated. When the specified suppression period has expired, the cycle starts again. Note that the timing for this feature is based on the IBM Tivoli Storage Productivity Center server clock rather than the various system clocks.

This option is useful for cases when a single occurrence of the triggering condition may be insignificant, but repeated occurrences can signal a potential problem.

Suppress alerts if a repeat violation has occurred within a specified length of time after the initial violation of the Triggering Condition
Generates alerts only for the first occurrence of the triggering condition. Alerts for repeated occurrences of the triggering condition within the length of time specified in the **Length of time** field are suppressed. When the specified suppression period has expired, the cycle starts again. Note

that the timing for this feature is based on the IBM Tivoli Storage Productivity Center server clock rather than the various system clocks.

This option is useful for avoiding e-mail messages or similar disruptive alerts if the same triggering condition occurs repeatedly in successive sample passes. This option generally useful for all threshold types.

Triggered actions for alerts

You define triggered actions to occur as a result of the alert.

An alert is always entered in the error log file each time it occurs. In addition, you can define the following notifications or triggered actions:

SNMP Trap
Generates an SNMP trap message to any network-management system, console, or terminal. You must set up the SNMP trap ringer with the `fabric.mib` and `tivoliSRM.mib` files.

TEC / OMNIbus Event
Sends an alert to the IBM Tivoli Enterprise Console or OMNIbus EIF probe server in your environment. The Tivoli Enterprise Console administrator can write correlation and automation rules to analyze theIBM Tivoli Storage Productivity Center events. Tivoli Enterprise Console also performs responses such as sending further notifications, creating or updating trouble tickets, and running programs. You must load the `tivoliSRM.baroc` and `fabric.baroc` files into the active rulebase of the Tivoli Enterprise Console server.

Login Notification
Tivoli Storage Productivity Center lists the alerts for the specified users when they log in. Use the **Preferences** > **Edit General** option on the Tivoli Storage Productivity Center menu bar to control which alerts a user views upon logging in to the product.

Windows Event Log, UNIX Syslog
Writes the alerts to the operating-system log. You can select from the following levels of operating-system events:

- UNIX: Informational, Notice, Warning, Error, Critical, or Alert
- Microsoft Windows: Error, Warning, and Information.

For UNIX, you also can select User or Local.

Run Script
Runs a script in response to the alert. Use this option to run third-party tools for such actions as recovery and provisioning.

1. Click **Define** to specify the script that is run when the triggering condition occurs. The **Specify Script** window opens.
2. Type the name of the script in the **Script Name** field.
3. Select where to run the script.

If parameters are given for the triggering condition, they are listed in the **Specify Script** window. These parameters are used when the alert is triggered.

Note: Scripts can only be run against systems on which a Storage Resource agent is deployed.

Archive/Backup
(Constraints only) Runs an IBM System Storage Productivity Center backup or archive job in response to an alert associated with a constraint. Click the Define button.

Email Sends an email. Use this section to view, add, and delete email addresses and edit the text of the message in the email.

For **Directory Alerts**, if the **Directory Consumes More Than** triggering condition is selected, additional fields are available to send email to the quota violator. The email address can be based on **Directory Owner** or **Directory Name**.

Alert display colors

In the stand-alone GUI, status symbols for alerts are shown in the colors that are listed for the alert action.

When you have active alerts that are shown within the nodes under the **IBM Tivoli Storage Productivity Center** > **Alerting** > **Alert Log** node in the navigation tree, the indicator next to those nodes are displayed as green or red depending on their corresponding alerts. The following table shows the colors that are generated for the subnodes by their different alerts:

Table 144. Alert colors

Alert	Color
Probe failed	Red
RAM increase	Green
RAM decrease	Red
Memory increase	Green
Memory decrease	Red
New disk	Green
Missing disk	Red
Disk defect	Red

Upgrade failed	Red
Added cluster resource group	Green
Removed cluster resource group	Green
Moved cluster resource group	Green
DB report failed	Red
File backup failed	Red
Hypervisor discovered	Green
Hypervisor missing	Red
Virtual machine discovered	Green
Virtual machine missing	Red

Alerts and monitoring groups

Use alerts to notify you when conditions on monitored resources are detected by Tivoli Storage Productivity Center. Include resources in predefined monitoring groups to automatically associate a set of alerts with those resources.

Alerts are triggered by conditions that are detected during data collection and event processing. For storage systems such as SAN Volume Controller, Storwize V7000, Storwize V7000 Unified, or the XIV system, events are polled every minute from the resource. For other resources, events are subscription-based, where the resource itself or a data source such as a CIM agent sends the events to Tivoli Storage Productivity Center when conditions change on the resource.

IBM Tivoli Storage Productivity Center includes predefined groups that are associated with sets of alerts. The group that you select for a resource determines what conditions are checked for those resources.

Tips:

- If you want to include a resource in a group, you can select a user-defined group rather than a predefined group. Any alerts that are associated with a user-defined group are automatically applied to the resource.
- You are not required to include a resource in a group to associate alerts with it. You can associate alerts with a resource at any time. Monitoring groups are intended to help you assign a set of alerts to a number of related resources at the same time.

- You can modify predefined monitoring groups and their associated alerts at any time.

Storage Subsystems

Table 145. Predefined monitoring groups and alerts for storage subsystems

Group name	Alert conditions that are checked for resources in the group during data collection[1, 2]
Subsystem Basic Group	Subsystem Discovered Disk Not Found Storage Subsystem Not Found Subsystem Status Change Offline Subsystem Status Change Online Volume Status Change Offline Volume Status Change Online Pool Status Change Pool Discovered Pool Status Change Offline Pool Status Change Online Volume Not Found File System Is Missing Cluster Was Rediscovered Cluster Was Removed NSD Is Missing NSD State Changed

Default Storage Subsystem Group[3]	No alert conditions are associated with this group

Table 145. Predefined monitoring groups and alerts for storage subsystems (continued)

Group name	Alert conditions that are checked for resources in the group during data collection[1, 2]
Notes: 1. For descriptions of the alert triggering conditions for storage systems, see Triggering conditions for storage subsystem alerts. 2. Performance alerts for storage subsystems are not associated with groups. Performance alerts are alerts that contain a "threshold" triggering condition. If you want to associate a performance alert with a storage subsystem, you must create an alert with a threshold triggering condition and then individually include the storage subsystem in that alert. For information about how to create storage subsystem alerts, see Creating storage subsystem alerts. 3. The Default Storage Subsystem Group is not automatically associated with alerting conditions. However, you can manually associate alerts with it at any time.	

Fabrics

Table 146. Predefined monitoring groups and alerts for fabrics

Group name	Alert conditions that are checked for resources in the group during data collection[1]
Fabric Basic Group	Fabric State Change Fabric to Switch Change Switch discovered Switch State Change Switch Status Change Offline Switch Status Change Online

Use the IBM Tivoli Storage Productivity Center to view the performance data of devices in your environment.

Performance thresholds

Performance thresholds are triggering conditions which are used to monitor a component with user-defined values.

You can monitor the performance of your enterprise by creating alerts on performance thresholds for switches and storage subsystems. By creating alerts that are triggered by performance thresholds, you can be informed about performance issues in your enterprise. Threshold events tell you when a component has fallen outside of the user-defined values. For example, when a threshold value has reached critical stress.

Threshold boundaries

You can establish your boundaries for the normal expected subsystem performance when defining storage subsystem alerts for performance threshold events. When the collected performance data samples fall outside the range you have set, you are notified of this threshold violation so you are aware of the potential problem. The upper-threshold boundaries are **Critical Stress** and **Warning Stress**. The lower-threshold boundaries are **Warning Idle** and **Critical Idle**. Usually you will want the stress boundaries to be high numbers and the idle to be low numbers. The exception to this rule is **Cache Holding Time Threshold**, where you want the stress numbers to be low and the idle numbers to be high.

If you do not want to be notified of threshold violations for any boundaries, you can leave the boundary field blank and the performance data will not be checked against any value. For example, if you leave the **Critical Idle** and **Warning Idle** fields blank, no alerts will be sent for any idle conditions.

The **Ignore triggering condition when the sequential I/O percentage exceeds** check box is active only for the triggering condition **Disk Utilization Percentage Threshold**. It is a filter condition. The default is 80%.

The **Ignore triggering condition when the Back-end Read I/O Rate is less than** check box only applies to the **Back-end Read Response Time** and **Back-end Read Queue Time** thresholds.

The **Ignore triggering condition when the Back-end Write I/O Rate is less than** check box only applies to the **Back-end Write Response Time** and **Back-end Write Queue Time** thresholds.

The **Ignore triggering condition when the Total Back-end I/O Rate is less than** check box only applies to the **Overall Back-end Response Time** threshold.

The **Ignore triggering condition when the Total I/O Rate is less than** check box only applies to the **Non-preferred Node Usage Percentage** threshold.

The **Ignore triggering condition when the Write-cache Delay I/O Rate is less than** check box only applies to the **Write-cache Delay Percentage** threshold.

Setting the thresholds

Only a few thresholds have defaults and on the other thresholds you will have to determine the best values for stress, idle, critical, and warning values so you can derive the maximum benefit without generating too many false alerts. Since suitable stress thresholds are highly dependant on the type of workload you are running, your exact hardware configuration, the number of physical disks, exact model numbers, and so forth, there are no easy or standard default rules.

One of the best approaches is to monitor your performance for a number of weeks and, using this historical data, determine reasonable values for each threshold setting. Once that is done you can fine tune these settings to minimize the number of false alerts.

Related concepts:

"Alerting" on page 341
Determining when and how you are alerted to conditions and violations of performance thresholds within your storage environment is important to helping you maintain and administer storage resources. Many conditions can trigger alerts. You can set up Tivoli Storage Productivity Center so that it examines the data about your resources for the conditions and performance thresholds that you specify.

"Monitoring the performance of resources" on page 383
Tivoli Storage Productivity Center can collect information about the performance of storage systems and switches. This information includes key performance metrics and notifications of threshold violations. Metrics can help you measure, identify, and troubleshoot performance issues and bottlenecks in your storage. Threshold violations alert you when the performance of a monitored resource falls outside of a specified range.

Related tasks:

"Archiving and deleting files" on page 103
In this scenario, you are shown how to increase storage space by archiving and deleting files that meet the criteria, such as file size and file usage, that you set.

"Adding resources" on page 257
You must add resources to Tivoli Storage Productivity Center before you can collect data, generate reports, and manage storage that is related to those resources.

Port thresholds are used to set limits for such things as bandwidth utilization, data rates, and I/O operations.

"Array thresholds" on page 1692
The following table lists and describes the Array thresholds.

Array thresholds

The following table lists and describes the Array thresholds.

Table 148. Array thresholds

Threshold (Metric)	Device/Component Type	Description
Array Thresholds		
Disk Utilization Percentage	TotalStorage Enterprise Storage Server, DS6000, DS8000 array	Sets thresholds on the approximate utilization percentage of the arrays in a particular subsystem; for example, the average percentage of time that the disks associated with the array were busy. The Disk Utilization metric for each array is checked against the threshold boundaries for each collection interval. This threshold is enabled by default for TotalStorage Enterprise Storage Server systems and disabled by default for others. The default threshold boundaries are 80%, 50%, -1, -1. For DS6000 and DS8000 subsystems, this threshold applies only to those ranks which are the only ranks in their associated extent pool.
Total Back-end I/O Rate	SAN Volume Controller MDisk group and MDisk, TotalStorage Enterprise Storage Server, DS6000, DS8000 array	Sets thresholds on the average number of I/O operations per second for array and MDisk read and write operations. The Total I/O Rate metric for each array or MDisk is checked against the threshold boundaries for each collection interval. This threshold is disabled by default.
Total Back-end Data Rate	SAN Volume Controller MDisk group and MDisk, TotalStorage Enterprise Storage Server, DS6000, DS8000 array	Sets thresholds on the average number of MB per second that were transferred for array and MDisk read and write operations. The Total Data Rate metric for each array or MDisk is checked against the threshold boundaries for each collection interval. This threshold is disabled by default.
Back-end Read Response Time	SAN Volume Controller MDisk, TotalStorage Enterprise Storage Server, DS6000, DS8000 array	Sets thresholds on the average number of milliseconds that it took to service each array and MDisk read operation. The Back-end Read Response Time metric for each array or MDisk is checked against the threshold boundaries for each collection interval. Though this threshold is disabled by default, suggested boundary values of 35,25,-1,-1 are pre-populated. A filter is available for this threshold which will ignore any boundary violations if the Back-end Read I/O Rate is less than a specified filter value. The pre-populated filter value is 5.

Table 148. Array thresholds (continued)

Threshold (Metric)	Device/Component Type	Description
Back-end Write Response Time	SAN Volume Controller MDisk, TotalStorage Enterprise Storage Server, DS6000, DS8000 array	Sets thresholds on the average number of milliseconds that it took to service each array and MDisk write operation. The Back-end Write Response Time metric for each array or MDisk is checked against the threshold boundaries for each collection interval. Though this threshold is disabled by default, suggested boundary values of 120,80,-1,-1 are pre-populated. A filter is available for this threshold which will ignore any boundary violations if the Back-end Write I/O Rate is less than a specified filter value. The pre-populated filter value is 5.
Overall Back-end Response Time	SAN Volume Controller MDisk	Sets thresholds on the average number of milliseconds that it took to service each MDisk I/O operation, measured at the MDisk level. The Total Response Time (external) metric for each MDisk is checked against the threshold boundaries for each collection interval. This threshold is disabled by default. A filter is available for this threshold which will ignore any boundary violations if the Total Back-end I/O Rate is less than a specified filter value. The pre-populated filter value is 10.
Back-end Read Queue Time	SAN Volume Controller MDisk	Sets thresholds on the average number of milliseconds that each read operation spent on the queue before being issued to the back-end device. The Back-end Read Queue Time metric for each MDisk is checked against the threshold boundaries for each collection interval. Though this threshold is disabled by default, suggested boundary values of 5,3,-1,-1 are pre-populated. A filter is available for this threshold which will ignore any boundary violations if the Back-end Read I/O Rate is less than a specified filter value. The pre-populated filter value is 5. Violation of these threshold boundaries means that the SVC deems the MDisk to be overloaded. There is a queue algorithm that determines the number of concurrent I/O operations that the SVC will send to a given MDisk. If there is any queuing (other than during a backup process) then this suggests performance can be improved by resolving the queuing issue.

Table 148. Array thresholds (continued)

Threshold (Metric)	Device/Component Type	Description
Back-end Write Queue Time	SAN Volume Controller MDisk	Sets thresholds on the average number of milliseconds that each write operation spent on the queue before being issued to the back-end device. The Back-end Write Queue Time metric for each MDisk is checked against the threshold boundaries for each collection interval. Though this threshold is disabled by default, suggested boundary values of 5,3,-1,-1 are pre-populated. A filter is available for this threshold which will ignore any boundary violations if the Back-end Read I/O Rate is less than a specified filter value. The pre-populated filter value is 5. Violation of these threshold boundaries means that the SVC deems the MDisk to be overloaded. There is a queue algorithm that determines the number of concurrent I/O operations that the SVC will send to a given MDisk. If there is any queuing (other than during a backup process) then this suggests performance can be improved by resolving the queuing issue.
Peak Back-end Write Response Time	SAN Volume Controller Node	Sets thresholds on the peak (worst) response time among all MDisk write operations by a node. The Back-end Peak Write Response Time metric for each node is checked against the threshold boundaries for each collection interval. This threshold is enabled by default, with default boundary values of 30000,10000,-1,-1. Violation of these threshold boundaries means that the SVC cache is having to “partition-limit” for a given MDisk group. The de-staged data from the SVC cache for this MDisk group is causing the cache to fill up (writes are being received faster than they can be de-staged to disk). If delays reach 30 seconds or more, then the SVC will switch into “short-term mode” where writes are no longer cached for the MDisk Group.

Table 148. Array thresholds (continued)

Threshold (Metric)	Device/Component Type	Description
Port to Local Node Send Response Time	SAN Volume Controller Node	Sets thresholds on the average number of milliseconds it took to service each send operation to another node in the local SVC cluster. The Port to Local Node Send Response Time metric for each node is checked against the threshold boundaries for each collection interval. This threshold is enabled by default, with default boundary values of 3,1.5,-1,-1. Violation of these threshold boundaries means that it is taking too long to send data between nodes (on the fabric), and suggests that there is either congestion around these FC ports, or an internal SVC microcode problem.
Port to Local Node Receive Response Time	SAN Volume Controller Node	Sets thresholds on the average number of milliseconds it took to service each receive operation from another node in the local SVC cluster. The Port to Local Node Receive Response Time metric for each node is checked against the threshold boundaries for each collection interval. This threshold is enabled by default, with default boundary values of 1,0.5,-1,-1. Violation of these threshold boundaries means that it is taking too long to send data between nodes (on the fabric), and suggests that there is either congestion around these FC ports, or an internal SVC microcode problem.
Port to Local Node Send Queue Time	SAN Volume Controller Node	Sets thresholds on the average number of milliseconds that each send operation issued to another node in the local SVC cluster spent on the queue before being issued. The Port to Local Node Send Queue Time metric for each node is checked against the threshold boundaries for each collection interval. This threshold is enabled by default, with default boundary values of 2,1,-1,-1. Violation of these threshold boundaries means that the node has to wait too long to send data to other nodes (on the fabric), and suggests congestion on the fabric.

Table 148. Array thresholds (continued)

Threshold (Metric)	Device/Component Type	Description
Port to Local Node Receive Queue Time	SAN Volume Controller Node	Sets thresholds on the average number of milliseconds that each receive operation issued to another node in the local SVC cluster spent on the queue before being issued. The Port to Local Node Receive Queue Time metric for each node is checked against the threshold boundaries for each collection interval. This threshold is enabled by default, with default boundary values of 1,0.5,-1,-1. Violation of these threshold boundaries means that the node has to wait too long to receive data from other nodes (on the fabric), and suggests congestion on the fabric.

Controller thresholds

The following table lists and describes the Controller thresholds.

Table 149. Controller thresholds

Threshold (Metric)	Device/Component Type	Description
Controller Thresholds		
Total I/O Rate (overall)	TotalStorage Enterprise Storage Server, DS6000, DS8000 controller SAN Volume Controller I/O group	Sets threshold on the average number of I/O operations per second for read and write operations, for the subsystem controllers (clusters) or I/O groups. The Total I/O Rate metric for each controller or I/O group is checked against the threshold boundaries for each collection interval. These thresholds are disabled by default.
Total Data Rate	TotalStorage Enterprise Storage Server, DS6000, DS8000 controller SAN Volume Controller I/O group	Sets threshold on the average number of MB per second for read and write operations for the subsystem controllers (clusters) or I/O groups. The Total Data Rate metric for each controller or I/O group is checked against the threshold boundaries for each collection interval. These thresholds are disabled by default.
NVS Full Percentage	TotalStorage Enterprise Storage Server, DS6000, DS8000 controller	Sets thresholds on the percentage of time that NVS space constraints caused I/O operations to be delayed, for the subsystem controllers (clusters). The NVS Full Percentage metric for each controller is checked against the threshold boundaries for each collection interval. This threshold is enabled by default, with default boundaries of 10, 3, -1, -1.

Table 149. Controller thresholds (continued)

Threshold (Metric)	Device/Component Type	Description
Cache Holding Time	TotalStorage Enterprise Storage Server, DS6000, DS8000 controller	Sets thresholds on the average cache holding time, in seconds, for I/O data in the subsystem controllers (clusters). Shorter time periods indicate adverse performance. The Cache Holding Time metric for each controller is checked against the threshold boundaries for each collection interval. This threshold is enabled by default, with default boundaries of 30, 60, -1, -1.
Write-cache Delay Percentage	TotalStorage Enterprise Storage Server, DS6000, DS8000 controller, SAN Volume Controller node	Sets thresholds on the percentage of I/O operations that were delayed due to write-cache space constraints. This metric for each controller or node is checked against the threshold boundaries for each collection interval. This threshold is enabled by default, with default boundaries of 10, 3, -1, -1. In addition, a filter is available for this threshold which will ignore any boundary violations if the Write-cache Delay I/O Rate is less than a specified filter value. The pre-populated filter value is 10 I/Os per second.
Non-Preferred Node Usage Percentage	SAN Volume Controller I/O group	Sets thresholds on the Non-Preferred Node Usage Percentage of an I/O group. This metric of each I/O group is checked against the threshold boundaries at each collection interval. his threshold is disabled by default. In addition, a filter is available for this threshold which will ignore any boundary violations if the Total I/O Rate of the I/O group is less than a specified filter value.

Port thresholds

Port thresholds are used to set limits for such things as bandwidth utilization, data rates, and I/O operations.

Table 150. Port thresholds

Threshold (Metric)	Device/Component Type	Description
Port Thresholds		
Total Port I/O Rate	TotalStorage Enterprise Storage Server, DS6000, DS8000 switch port, XIV	Sets thresholds for ports on the average number of I/O operations or packets per second for send and receive operations. The Total I/O Rate metric for each port is checked against the threshold boundaries for each collection interval. This threshold is disabled by default.

Table 150. Port thresholds (continued)

Threshold (Metric)	Device/Component Type	Description
Total Port Data Rate	TotalStorage Enterprise Storage Server, DS6000, DS8000 switch port, XIV	Sets thresholds for ports on the average number of MB per second for send and receive operations. The Total Data Rate metric for each port is checked against the threshold boundaries for each collection interval. This threshold is disabled by default.
Overall Port Response Time	TotalStorage Enterprise Storage Server, DS6000, DS8000	Sets thresholds for ports on the average number of milliseconds that it takes to service each send and receive I/O operation. The Total Response Time metric for each port is checked against the threshold boundaries for each collection interval. This threshold is disabled by default.
Error Frame Rate	DS8000	Sets thresholds on the average number of frames per second received in error by ports. The Error Frame Rate metric for each port is checked against the threshold boundary for each collection interval. This threshold is disabled by default.
Link Failure Rate	DS8000 SAN Volume Controller	Sets thresholds on the average number of link errors per second for ports. The Link Failure Rate metric for each port is checked against the threshold boundary for each collection interval. The default boundaries are 0.0030,-1,-1,-1 cnt/s. This threshold is disabled by default.
Total Port Data Rate	Switch port	Sets thresholds on the critical and warning data rates for stress and idle in MB per second. The Total Port Data Rate metric for each port is checked against the threshold boundary for each collection interval. This threshold is disabled by default.

Table 150. Port thresholds (continued)

Threshold (Metric)	Device/Component Type	Description
Total Port Packet Rate	Switch port	Sets thresholds on critical and warning data rates for stress and idle conditions in packets per second. For example, a critical stress or warning stress condition occurs when the upper-threshold boundary for the packet rate of a switch is detected. A critical idle or warning idle condition occurs when the lower-threshold boundary for the packet rate of a switch is detected. The Total Port Packet Rate metric for each port is checked against the threshold boundary for each collection interval. This threshold is disabled by default.
Port Send Utilization Percentage	TotalStorage Enterprise Storage Server, DS6000, DS8000	Sets thresholds on the average amount of time that ports are busy sending data. The metric for each port is checked against the threshold boundaries for each collection interval. This threshold is disabled by default.
Port Receive Utilization Percentage	TotalStorage Enterprise Storage Server, DS6000, DS8000	Sets thresholds on the average amount of time that ports are busy receiving data. The metric for each port is checked against the threshold boundaries for each collection interval. This threshold is disabled by default.
Port Send Bandwidth Percentage	TotalStorage Enterprise Storage Server, DS8000, SAN Volume Controller switch port, XIV	Sets thresholds on the average port bandwidth utilization percentage for send operations. The Port Send Utilization Percentage metric is checked against the threshold boundaries for each collection interval. This threshold is enabled by default, with default boundaries 85,75,-1,-1.

Table 150. Port thresholds (continued)

Threshold (Metric)	Device/Component Type	Description
Port Receive Bandwidth Percentage	TotalStorage Enterprise Storage Server, DS8000, SAN Volume Controller switch port, XIV	Sets thresholds on the average port bandwidth utilization percentage for receive operations. The Port Send Utilization Percentage metric is checked against the threshold boundaries for each collection interval. This threshold is enabled by default, with default boundaries 85,75,-1,-1.
CRC Error Rate	DS8000 port, SAN Volume Controller switch port	Sets thresholds on the average number of frames that are received in which the cyclic redundancy check (CRC) in a frame does not match the CRC computed by the receiver. The CRC Error Rate metric for each port is checked against the threshold boundary for each collection interval. The default boundaries are 0.033, 0.01, -1, -1 cnt/s. This threshold is disabled by default.
Invalid Transmission Word Rate	DS8000, SAN Volume Controller switch port	Sets thresholds on the average number of bit errors that are detected on a port. The Invalid Transmission Word Rate metric for each port is checked against the threshold boundary for each collection interval. The default boundaries are 0.033, 0.01, -1, -1 cnt/s. This threshold is disabled by default.
Zero Buffer - Buffer Credit Timer	SAN Volume Controller	Sets thresholds on the number of microseconds that a port was unable to send frames because of a lack of buffer credit since the last node reset. The Zero Buffer-Buffer Credit Timer metric for each port is checked against the threshold boundary for each collection interval. The default boundaries are 198000000,75000000,-1,-1 us. This threshold is disabled by default.

Performance metrics

Tivoli Storage Productivity Center can collect information about the performance of monitored storage systems and switches. This information includes metrics that measure the performance of volumes, ports, and disks.

You can view performance metrics in the web-based GUI and stand-alone GUI at the following locations:

Resource pages in the web-based GUI
To access a view of performance metrics for a resource, go to the following pages in the web-based GUI:

- Server details page > Related Resources
- Storage systems page, Storage system details page
- Switches page, Switch details page

Reports in the web-based GUI
To view detailed performance reports for multiple resources in the web-based GUI, hover the mouse pointer over **Reporting** in the navigation pane and select an option.

Reports in the stand-alone GUI
To view detailed performance reports for multiple resources in the stand-alone GUI, run the reports that are available under the following nodes in the navigation tree:

- **Disk Manager** > **Reporting**
- **Fabric Manager** > **Reporting**
- **Tivoli Storage Productivity Center** > **System Reports**

Common information

The following table contains information that is common to performance reports in the stand-alone GUI.

Column	Description
Time	Date and time that the data was collected
Interval	Size of the sample interval in seconds. You can specify a minimum interval length of 5 minutes and a maximum interval length of 60 minutes for the following storage systems: • TotalStorage Enterprise Storage Server • DS6000 • DS8000 • XIV system For SAN Volume Controller models earlier than V4.1, you can specify a minimum interval length of 15 minutes and a maximum interval length of 60 minutes. For SAN Volume Controller models V4.1 and later, you can specify a minimum interval length of 5 minutes, and a maximum interval length of 60 minutes.

Metrics for ESS and DS6000 and DS8000 storage systems

When you view metrics for the ESS and DS6000 and DS8000 storage systems, you must take into account the following differences between IBM Tivoli Storage Productivity Center reports and the native reports of those systems:

- Tivoli Storage Productivity Center reports display port performance metrics as send and receive metrics, such as Send Data Rate and Receive Data Rate.
- Reports that are included with storage systems (for example, reports based on data that is collected by the DS CLI) display port performance metrics as read and write metrics, such as Byteread and Bytewrite.

When a host runs a read operation, the DS port sends data to the host. Therefore, "read" metrics in DS6000 and DS8000 reports correspond to "send" metrics in Tivoli Storage Productivity Center reports. When a host runs a write operation, DS6000 and DS8000 ports receive data from the host. Therefore, "write" metrics in DS6000 and DS8000 reports correspond to "receive" metrics in Tivoli Storage Productivity Center reports. When you view port Peer-to-Peer Remote Copy (PPRC) performance metrics, you must take into account the following additional differences between Tivoli Storage Productivity Center reports and native reports for storage systems:

- Metrics for PPRC reads in storage system native reports are represented as PPRC receives in Tivoli Storage Productivity Center (reads = receives).
- Metrics for PPRC writes in storage system native reports are represented as PPRC sends in Tivoli Storage Productivity Center (writes = sends).

Restriction: Tivoli Storage Productivity Center does not calculate volume-based metrics if thin-provisioned volumes are allocated in an extent pool that consists of multiple ranks. In this case, the columns for volume-based metrics display the value **N/A** in the Storage Subsystem Performance > By Array report for the arrays that are associated with that extent pool. However, if no thin-provisioned volumes are allocated in a multi-rank extent pool, or if the space efficient volumes are allocated in an extent pool that consists of a single rank, then this limitation does not apply and all volume-based metrics are displayed in the By Array report.

Metrics for XIV systems

To distinguish between metrics that were introduced in different versions of the XIV systems, the following conventions are used:

- [2] is displayed next to metrics that are available in the XIV system version 10.2.2 or later.
- [3] is displayed next to metrics that are available in the XIV system version 10.2.4 or later.

For example:

- The Read I/O Rate (overall) metric is available for the XIV systems version 10.2.2 and later. In the Resources: components column of the list of metrics, the entry for Read I/O Rate (overall) is displayed like this example: XIV[2]: volume, module, storage system
- The Small Transfers Response Time metric is available for the XIV systems version 10.2.4 and later. In the Resources: components column of the list of metrics, the entry for Small Transfers Response Time is displayed in the following format: XIV[3]: volume, module, storage system

Restriction: XIV systems do not track performance statistics for volumes that were never used. Because there are no performance statistics, Tivoli Storage Productivity Center does not display metrics for these volumes and their related components.

Metrics for SAN Volume Controller

Metrics that apply to SAN Volume Controller also apply to Storwize V3500, Storwize V3700, Storwize V7000, and Storwize V7000 Unified. For example, the Read I/O Rate (overall) metric is available for SAN Volume Controller and Storwize storage system volumes, even though only SAN Volume Controller is shown in the Resources: components column of the following lists.

Volume metrics

The following table describes the metrics for the volumes in storage systems.

Metric	Resources: components[1]	Description
I/O Rates		
Read I/O Rate (normal)	ESS, DS6000, DS8000: volume, RAID array, pool, controller, host connection, storage system	Average number of I/O operations per second for nonsequential read operations for a component over a specified time interval.
Read I/O rate (sequential)	ESS, DS6000, DS8000: volume, RAID array, pool, controller, host connection, storage system	Average number of I/O operations per second for sequential read operations for a component over a specified time interval.
Read I/O Rate (overall)	ESS, DS6000, DS8000: volume, RAID array, pool, controller, host connection, storage system SAN Volume Controller[1]: volume, pool, node, I/O group, host connection, storage system SMI-S BSP: volume, controller, storage system XIV[2]: volume, pool, module, host connection, storage system	Average number of I/O operations per second for both sequential and nonsequential read operations for a component over a specified time interval.
Write I/O Rate (normal)	ESS, DS6000, DS8000: volume, RAID array, pool, controller, host connection, storage system	Average number of I/O operations per second for nonsequential write operations for a component over a specified time interval.
Write I/O Rate (sequential)	ESS, DS6000, DS8000: volume, RAID array, pool, controller, host connection, storage system	Average number of I/O operations per second for sequential write operations for a component over a specified time interval.

Metric	Resources: components[1]	Description
Write I/O Rate (overall)	ESS, DS6000, DS8000: volume, RAID array, pool, controller, host connection, storage system SAN Volume Controller: volume, pool, node, I/O group, host connection, storage system SMI-S BSP: volume, controller, storage system XIV[2]: volume, pool, module, host connection, storage system	Average number of I/O operations per second for both sequential and nonsequential write operations for a component over a specified time interval.
Total I/O Rate (normal)	ESS, DS6000, DS8000: volume, RAID array, pool, controller, host connection, storage system	Average number of I/O operations per second for nonsequential read and write operations for a component over a specified time interval.
Total I/O Rate (sequential)	ESS, DS6000, DS8000: volume, RAID array, pool, controller, host connection, storage system	Average number of I/O operations per second for sequential read and write operations for a component over a specified time interval.
Total I/O Rate (overall)	ESS, DS6000, DS8000: volume, RAID array, pool, controller, host connection, storage system SAN Volume Controller: volume, pool, node, I/O group, host connection, storage system SMI-S BSP: volume, controller, storage system XIV[2]: volume, pool, module, host connection, storage system	Average number of I/O operations per second for both sequential and nonsequential read and write operations for a component over a specified time interval.
Global Mirror Write I/O Rate	SAN Volume Controller: volume, node, I/O group, host connection, storage system	Average number of write operations per second issued to the Global Mirror secondary site for a component over a specified time interval.

Metric	Resources: components[1]	Description
Global Mirror Overlapping Write Percentage	SAN Volume Controller: volume, node, I/O group, host connection, storage system	Average percentage of write operations that are issued by the Global Mirror primary site and are serialized overlapping writes for a component over a specified time interval. For SAN Volume Controller 4.3.1 and later, some overlapping writes are processed in parallel (are not serialized) and are excluded. For earlier versions of SAN Volume Controller, all overlapping writes were serialized.
Global Mirror Overlapping Write I/O Rate	SAN Volume Controller: volume, node, I/O group, host connection, storage system	Average number of serialized overlapping write operations per second encountered by the Global Mirror primary site for a component over a specified time interval. For SAN Volume Controller 4.3.1 and later, some overlapping writes are processed in parallel (are not serialized) and are excluded. For earlier versions of SAN Volume Controller, all overlapping writes are serialized.
HPF Read I/O Rate	DS8000: volume, RAID array, pool, controller, host connection, storage system	Average number of read operations per second that were issued by the High Performance FICON (HPF) feature of the storage system for a component over a specified time interval.
HPF Write I/O Rate	DS8000: volume, RAID array, pool, controller, host connection, storage system	Average number of write operations per second that were issued by the High Performance FICON (HPF) feature of the storage system for a component over a specified time interval.
Total HPF I/O Rate	DS8000: volume, RAID array, pool, controller, host connection, storage system	Average number of read and write operations per second that were issued by the High Performance FICON (HPF) feature of the storage system for a component over a specified time interval.
HPF I/O Percentage	DS8000: volume, RAID array, pool, controller, host connection, storage system	The percentage of all I/O operations that were issued by the High Performance FICON (HPF) feature of the storage system for a component over a specified time interval.
PPRC Transfer Rate	ESS/DS6000/DS8000: volume, RAID array, pool, controller, host connection, storage system	Average number of track transfer operations per second for PPRC usage for a component over a specified time interval. This metric shows the activity for the source of the PPRC relationship, but shows no activity for the target.
Small Transfers I/O Percentage	XIV[3]: module, pool, volume, host connection, storage system	Percentage of I/O operations over a specified interval. Applies to data transfer sizes that are <= 8 KB.
Medium Transfers I/O Percentage	XIV[3]: module, pool, volume, host connection, storage system	Percentage of I/O operations over a specified interval. Applies to data transfer sizes that are > 8 KB and <= 64 KB.
Large Transfers I/O Percentage	XIV[3]: module, pool, volume, host connection, storage system	Percentage of I/O operations over a specified interval. Applies to data transfer sizes that are > 64 KB and <= 512 KB.
Very Large Transfers I/O Percentage	XIV[3]: module, pool, volume, host connection, storage system	Percentage of I/O operations over a specified interval. Applies to data transfer sizes that are > 512 KB.
Cache hit percentages		

Metric	Resources: components[1]	Description
Read Cache Hits Percentage (normal)	ESS, DS6000, DS8000: volume, RAID array, pool, controller, host connection, storage system	Percentage of cache hits for nonsequential read operations for a component over a specified time interval.
Read Cache Hits Percentage (sequential)	ESS, DS6000, DS8000: volume, RAID array, pool, controller, host connection, storage system	Percentage of cache hits for sequential read operations for a component over a specified time interval.
Read Cache Hits Percentage (overall)	ESS, DS6000, DS8000: volume, RAID array, pool, controller, host connection, storage system SAN Volume Controller: volume, node, I/O group, host connection, storage system SMI-S BSP: volume, controller, storage system XIV[1]: volume, pool, module, host connection, storage system	Percentage of cache hits for both sequential and nonsequential read operations for a component over a specified time interval.
Write Cache Hits Percentage (normal)	ESS, DS6000, DS8000: volume, RAID array, pool, controller, host connection, storage system	Percentage of cache hits for nonsequential write operations for a component over a specified time interval.
Write Cache Hits Percentage (sequential)	ESS, DS6000, DS8000: volume, RAID array, pool, controller, host connection, storage system	Percentage of cache hits for sequential write operations for a component over a specified time interval.
Write Cache Hits Percentage (overall)	ESS, DS6000, DS8000: volume, RAID array, pool, controller, host connection, storage system SAN Volume Controller: volume, node, I/O group, host connection, storage system SMI-S BSP: volume, controller, storage system XIV[2]: volume, pool, module, host connection, storage system	Percentage of cache hits for both sequential and nonsequential write operations for a component over a specified time interval.

Metric	Resources: components[1]	Description
Total Cache Hits Percentage (normal)	ESS, DS6000, DS8000: volume, RAID array, pool, controller, host connection, storage system	Percentage of cache hits for nonsequential read and write operations for a component over a specified time interval.
Total Cache Hits Percentage (sequential)	ESS, DS6000, DS8000: volume, RAID array, pool, controller, host connection, storage system	Percentage of cache hits for sequential read and write operations for a component over a specified time interval.
Total Cache Hits Percentage (overall)	ESS, DS6000, DS8000: volume, RAID array, pool, controller, host connection, storage system SAN Volume Controller: volume, node, I/O group, host connection, storage system SMI-S BSP: volume, controller, storage system XIV: volume, pool, module, host connection, storage system	Percentage of cache hits for both sequential and nonsequential read and write operations for a component over a specified time interval.
Readahead Percentage of Cache Hits	SAN Volume Controller: volume, node, I/O group, host connection, storage system	Percentage of all read cache hits, which occurred on prestaged data.
Dirty Write Percentage of Cache Hits	SAN Volume Controller: volume, node, I/O group, host connection, storage system	Percentage of all write cache hits, which occurred on already dirty data in the cache.
Read Data Cache Hit Percentage	XIV[3]: module, pool, volume, host connection, storage system	Percentage of read data that was read from the cache over a specified time interval.
Write Data Cache Hit Percentage	XIV[3]: module, pool, volume, host connection, storage system	Percentage of write data that was written to the cache over a specified time interval.
Total Data Cache Hit Percentage	XIV[3]: module, pool, volume, host connection, storage system	Percentage of all data that was read from or written to the cache for a component over a specified time interval.

Metric	Resources: components[1]	Description
SSD Read Cache Hit Percentage	XIV[3]: module, pool, volume, host connection, storage system	The percentage of all read operations for a component that accessed SSD cache memory during a specified time interval. This metric is only available for XIV systems that use SSD drives as an additional layer of caching. The value for this metric is also included in the value for the Read Cache Hit Percentage (overall) metric.
SSD Read Data Cache Hit Percentage	XIV[3]: module, pool, volume, host connection, storage system	The percentage of all read data for a component that was read from SSD cache memory during a specified time interval. This metric is only available for XIV systems that use SSD drives as an additional layer of caching. The value for this metric is also included in the value for the Read Data Cache Hit Percentage (overall) metric.
Data rates		
Read Data Rate	ESS, DS6000, DS8000: volume, RAID array, pool, controller, host connection, storage system SAN Volume Controller: volume, pool, node, I/O group, host connection, storage system SMI-S BSP: volume, controller, storage system XIV[2]: volume, pool, module, host connection, storage system	Average number of megabytes (2^20 bytes) per second that were transferred for read operations for a component over a specified time interval.
Write Data Rate	ESS, DS6000, DS8000: volume, RAID array, pool, controller, host connection, storage system SAN Volume Controller: volume, pool, node, I/O group, host connection, storage system SMI-S BSP: volume, controller, storage system XIV[2]: volume, pool, module, host connection, storage system	Average number of megabytes (2^20 bytes) per second that were transferred for write operations for a component over a specified time interval.

Metric	Resources: components[1]	Description
Total Data Rate	ESS, DS6000, DS8000: volume, RAID array, pool, controller, host connection, storage system SAN Volume Controller: volume, pool, node, I/O group, host connection, storage system SMI-S BSP: controller, volume, storage system XIV[2]: module, pool, volume, host connection, storage system	Average number of megabytes (2^20 bytes) per second that were transferred for read and write operations for a component over a specified time interval.
Small Transfers Data Percentage	XIV[3]: module, volume, host connection, storage system	Percentage of data that was transferred over a specified interval. Applies to I/O operations with data transfer sizes that are <= 8 KB.
Medium Transfers Data Percentage	XIV[3]: module, volume, host connection, storage system	Percentage of data that was transferred over a specified interval. Applies to I/O operations with data transfer sizes that are > 8 KB and <= 64 KB.
Large Transfers Data Percentage	XIV[3]: module, volume, host connection, storage system	Percentage of data that was transferred over a specified interval. Applies to I/O operations with data transfer sizes that are > 64 KB and <= 512 KB.
Very Large Transfers Data	XIV[3]: module, volume, host connection, storage system	Percentage of data that was transferred over a specified interval. Applies to I/O operations with data transfer sizes that are > 512 KB.
Response times		
Read Response Time	ESS, DS6000, DS8000: volume, RAID array, pool, controller, host connection, storage system SAN Volume Controller: volume, pool, node, I/O group, host connection, storage system SMI-S BSP: volume, controller, storage system XIV[2]: volume, pool, module, host connection, storage system	Average number of milliseconds that it took to service each read operation for a component over a specified time interval.

Metric	Resources: components[1]	Description
Write Response Time	ESS, DS6000, DS8000: volume, RAID array, pool, controller, host connection, storage system SAN Volume Controller: volume, pool, node, I/O group, host connection, storage system SMI-S BSP volume, controller, storage system XIV[2]: volume, pool, module, host connection, storage system	Average number of milliseconds that it took to service each write operation for a component over a specified time interval.
Overall Response Time	ESS, DS6000, DS8000: volume, RAID array, pool, controller, host connection, storage system SAN Volume Controller: volume, pool, node, I/O group, host connection, storage system SMI-S BSP: volume, controller, storage system XIV[2]: volume, pool, module, host connection, storage system	Average number of milliseconds that it took to service each I/O operation (read and write) for a component over a specified time interval.
Peak Read Response Time	SAN Volume Controller: volume, node, I/O group, host connection, storage system	The peak (worst) response time among all read operations.
Peak Write Response Time	SAN Volume Controller: volume, node, I/O group, host connection, storage system	The peak (worst) response time among all write operations.
Global Mirror Write Secondary Lag	SAN Volume Controller: volume, node, I/O group, host connection, storage system	The average number of additional milliseconds it takes to service each secondary write operation for Global Mirror, beyond the time that is required to service primary writes.

Metric	Resources: components[1]	Description
Overall Host Attributed Response Time Percentage	SAN Volume Controller: volume, node, I/O group, host connection, storage system	The percentage of the average response time, both read response time and write response time, that can be attributed to delays from host systems. This metric is provided to help diagnose slow hosts and poorly performing fabrics. The value is based on the time that is taken for hosts to respond to transfer-ready notifications from the SAN Volume Controller nodes (for read) and the time that is taken for hosts to send the write data after the node responds to a transfer-ready notification (for write).
Read Cache Hit Response Time	XIV[3]: volume, pool, module, host connection, storage system	Average number of milliseconds that it takes to service each read cache hit operation over a specified time interval.
Write Cache Hit Response Time	XIV[3]: volume, pool, module, host connection, storage system	Average number of milliseconds that it takes to service each write cache hit operation over a specified time interval.
Overall Cache Hit Response Time	XIV[3]: volume, pool, module, host connection, storage system	Average number of milliseconds that it takes to service each read cache hit operation and each write cache hit operation over a specified time interval.
Read Cache Miss Response Time	XIV[3]: volume, pool, module, host connection, storage system	Average number of milliseconds that it takes to service each read cache miss operation over a specified time interval.
Write Cache Miss Response Time	XIV[3]: volume, pool, module, host connection, storage system	Average number of milliseconds that it takes to service each write cache miss operation over a specified time interval.
Overall Cache Miss Response Time	XIV[3]: volume, pool, module, host connection, storage system	Average number of milliseconds that it takes to service each read cache miss operation and each write cache miss operation over a specified time interval.
Small Transfers Response Time	XIV[3]: volume, pool, module, host connection, storage system	Average number of milliseconds that it takes to service each I/O operation. Applies to data transfer sizes that are <= 8 KB.
Medium Transfers Response Time	XIV[3]: volume, pool, module, host connection, storage system	Average number of milliseconds that it takes to service each I/O operation. Applies to data transfer sizes that are > 8 KB and <= 64 KB.
Large Transfers Response Time	XIV[3]: volume, pool, module, host connection, storage system	Average number of milliseconds that it takes to service each I/O operation. Applies to data transfer sizes that are > 64 KB and <= 512 KB.
Very Large Transfers Response Time	XIV[3]: volume, pool, module, host connection, storage system	Average number of milliseconds that it takes to service each I/O operation. Applies to data transfer sizes that are > 512 KB.

Metric	Resources: components[1]	Description
SSD Read Cache Hit Response Time	XIV[3]: volume, pool, module, host connection, storage system	Average number of milliseconds that was required to service each hit operation of SSD read memory for a component over a specified time interval. This metric is only available for XIV systems that use SSD drives as an additional layer of caching. The value for this metric is also included in the value for the Read Cache Hit Response Time metric.
Transfer sizes		
Read Transfer Size	ESS, DS6000, DS8000: volume, RAID array, pool, controller, host connection, storage system SAN Volume Controller: volume, pool, node, I/O group, host connection, storage system SMI-S BSP: volume, controller, storage system XIV[2]: volume, pool, module, host connection, storage system	Average number of KB per I/O for read operations.
Write Transfer Size	ESS, DS6000, DS8000: volume, RAID array, pool, controller, host connection, storage system SAN Volume Controller: volume, pool, node, I/O group, host connection, storage system SMI-S BSP: volume, controller, storage system XIV[2]: volume, pool, module, host connection, storage system	Average number of KB per I/O for write operations.

Metric	Resources: components[1]	Description
Overall Transfer Size	ESS, DS6000, DS8000: volume, RAID array, pool, controller, host connection, storage system SAN Volume Controller: volume, pool, node, I/O group, host connection, storage system SMI-S BSP: volume, controller, storage system XIV[2]: volume, pool, module, host connection, storage system	Average number of KB per I/O for read and write operations.
Write-cache constraints		
Write-Cache Delay Percentage	ESS, DS6000, DS8000: volume, RAID array, pool, controller, host connection, storage system SAN Volume Controller: volume, node, I/O group, host connection, storage system	Percentage of I/O operations that were delayed because of write-cache space constraints or other conditions for a component over a specified time interval. (The ratio of delayed operations to total I/Os.)
Write-Cache Delay I/O Rate	ESS, DS6000, DS8000: volume, RAID array, pool, controller, host connection, storage system SAN Volume Controller: volume, node, I/O group, host connection, storage system	Average number of I/O operations per second that were delayed because of write-cache space constraints or other conditions for a component over a specified time interval.
Write-Cache Overflow Percentage	SAN Volume Controller: volume, node, I/O group, host connection, storage system	The percentage of write operations that are delayed because there is not enough space in the write cache for a component over a specified time interval.
Write-Cache Overflow I/O Rate	SAN Volume Controller: volume, node, I/O group, host connection, storage system	Average number of write operations per second that are delayed because there is not enough space in the write cache for a component over a specified time interval.
Write-Cache Flush-through Percentage	SAN Volume Controller: volume, node, I/O group, host connection, storage system	Percentage of tracks that is written to disk in flush-through mode for a component over a specified time interval.
Write-Cache Flush-through I/O Rate	SAN Volume Controller: volume, node, I/O group, host connection, storage system	Average number of tracks per second that are written to disk in flush-through mode for a component over a specified time interval.

Metric	Resources: components[1]	Description
Write-Cache Write-through Percentage	SAN Volume Controller: volume, node, I/O group, host connection, storage system	Percentage of tracks that is written to disk in write-through mode for a component over a specified time interval.
Write-Cache Write-through I/O Rate	SAN Volume Controller: volume, node, I/O group, host connection, storage system	Average number of tracks per second that are written to disk in write-through mode for a component over a specified time interval.
Record mode reads		
Record Mode Read I/O Rate	ESS, DS6000, DS8000: volume, RAID array, pool, controller, host connection	Average number of I/O operations per second for record mode read operations for a component over a specified time interval.
Record Mode Read Cache Hit Percentage	ESS, DS6000, DS8000: volume, RAID array, pool, controller, host connection	Percentage of cache hits for record mode read operations for a component over a specified time interval.
Cache transfers		
Disk to Cache I/O Rate	ESS/DS6000/DS8000: volume, RAID array, pool, controller, host connection SAN Volume Controller: volume, node, I/O group, host connection, storage system	Average number of I/O operations (track transfers) per second for disk to cache transfers for a component over a specified time interval.
Cache to Disk I/O Rate	ESS/DS6000/DS8000: volume, RAID array, pool, controller, host connection SAN Volume Controller: volume, node, I/O group, host connection, storage system	Average number of I/O operations (track transfers) per second for cache to disk transfers for a component over a specified time interval.
Miscellaneous computed values		
Cache Holding Time	ESS, DS6000, DS8000: controller, storage system	Average cache holding time, in seconds, for I/O data in this storage system controller (cluster). Shorter time periods indicate adverse performance.
CPU Utilization	SAN Volume Controller: node, I/O group, storage system	Average utilization percentage of the processors.
Non-Preferred Node Usage Percentage	SAN Volume Controller: volume, I/O group, host connection	The overall percentage of I/O performed or data transferred through the non-preferred nodes of the volumes, for a component over a specified time interval.

Metric	Resources: components[1]	Description
Volume Utilization	ESS, DS6000, DS8000: volume SAN Volume Controller: volume SMI-S BSP: volume XIV[2]: volume	The approximate utilization percentage of a volume over a specified time interval (the average percent of time that the volume was busy).
Important: • [1] The "Resource: components" column shows the resources and components that are measured by a metric. Metrics that apply to SAN Volume Controller also apply to Storwize V3500, Storwize V3700, Storwize V7000, and Storwize V7000 Unified. • [2] This metric is available in the XIV system version 10.2.2 or later. • [3] This metric is available in the XIV system version 10.2.4 or later.		

Disk metrics

The following table describes the metrics for the disks on storage systems.

Column	Resources: components[1]	Description
I/O rates		
Backend Read I/O Rate	ESS, DS6000, DS8000: rank, RAID array, pool, controller, storage system SAN Volume Controller[1]: volume, pool, node, I/O group, storage system	Average number of I/O operations per second for read operations.
Backend Write I/O Rate	ESS, DS6000, DS8000: rank, RAID array, pool, controller, storage system SAN Volume Controller: volume, pool, node, I/O group, storage system	Average number of I/O operations per second for write operations.
Total Backend I/O Rate	ESS, DS6000, DS8000: rank, RAID array, pool, controller, storage system SAN Volume Controller: volume, pool, node, I/O group, storage system	Average number of I/O operations per second for read and write operations.
Data rates		

Column	Resources: components[1]	Description
Backend Read Data Rate	ESS, DS6000, DS8000: rank, RAID array, pool, controller, storage system SAN Volume Controller: managed disk, pool, node, I/O group, storage system	Average number of megabytes (2^20 bytes) that were transferred for read operations.
Backend Write Data Rate	ESS, DS6000, DS8000: rank, RAID array, pool, controller, storage system SAN Volume Controller: managed disk, pool, node, I/O group, storage system	Average number of megabytes (2^20 bytes) that were transferred for write operations.
Total Backend Data Rate	ESS, DS6000, DS8000: rank, RAID array, pool, controller, storage system SAN Volume Controller: managed disk, pool, node, I/O group, storage system	Average number of megabytes (2^20 bytes) that were transferred for read and write operations.
Response times		
Backend Read Response Time	ESS, DS6000, DS8000: rank, RAID array, pool, controller, storage system SAN Volume Controller: managed disk, pool, node, I/O group, storage system	Average number of milliseconds that it took to respond to each read operation. For SAN Volume Controller models, this time is the external response time of the managed disks (MDisks).
Backend Write Response Time	ESS, DS6000, DS8000: rank, RAID array, pool, controller, storage system SAN Volume Controller: managed disk, pool, node, I/O group, storage system	Average number of milliseconds that it took to respond to each write operation. For SAN Volume Controller models, this time is the external response time of the managed disks (MDisks).
Overall Backend Response Time	ESS, DS6000, DS8000: rank, RAID array, pool, controller, storage system SAN Volume Controller: managed disk, pool, node, I/O group, storage system	Average number of milliseconds that it took to respond to each I/O operation (read and write). For SAN Volume Controller models, this time is the external response time of the managed disks (MDisks).

Column	Resources: components[1]	Description
Backend Read Queue Time	SAN Volume Controller: managed disk, pool, node, I/O group, storage system	Average number of milliseconds that each read operation was in the queue before it was issued to the back-end resource.
Backend Write Queue Time	SAN Volume Controller: managed disk, pool, node, I/O group, storage system	Average number of milliseconds that each write operation was in the queue before it was issued to the back-end resource.
Overall Backend Queue Time	SAN Volume Controller: managed disk, pool, node, I/O group, storage system	Average number of milliseconds that read and write operations were in the queue before they were issued to the back-end resource.
Peak Back-end Read Response Time	SAN Volume Controller: managed disk, pool, node, I/O group, storage system	The peak (worst) response time among all read operations for a component over a specified time interval. For SAN Volume Controller, it represents the external response time of the managed disks.
Peak Back-end Write Response Time	SAN Volume Controller: managed disk, pool, node, I/O group, storage system	The peak (worst) response time among all write operations for a component over a specified time interval. For SAN Volume Controller, it represents the external response time of the managed disks.
Peak Back-end Read Queue Time	SAN Volume Controller: managed disk, pool, node, I/O group, storage system	The lower bound on the peak (worst) queue time for read operations for a component over a specified time interval. The queue time is the amount of time that the read operation was in the queue before it was issued to the back-end resource.
Peak Back-end Write Queue Time	SAN Volume Controller: managed disk, pool, node, I/O group, storage system	The lower bound on the peak (worst) queue time for write operations for a component over a specified time interval. The queue time is the amount of time that the write operation was in the queue before it was issued to the back-end resource.
Transfer sizes		
Back-end Read Transfer Size	ESS, DS6000, DS8000: rank, RAID array, pool, controller, storage system SAN Volume Controller: managed disk, pool, node, I/O group, storage system	Average number of KB per I/O for read operations for a component over a specified time interval.
Back-end Write Transfer Size	ESS, DS6000, DS8000: rank, RAID array, pool, controller, storage system SAN Volume Controller: managed disk, pool, node, I/O group, storage system	Average number of KB per I/O for write operations for a component over a specified time interval.

Column	Resources: components[1]	Description
Overall Back-end Transfer Size	ESS, DS6000, DS8000: rank, RAID array, pool, controller, storage system SAN Volume Controller: managed disk, pool, node, I/O group, storage system	Average number of KB per I/O for read and write operations for a component over a specified time interval.
Disk utilization		
Disk Utilization Percentage	ESS, DS6000, DS8000: RAID array	The approximate utilization percentage of a rank over a specified time interval (the average percent of time that the disks associated with the array were busy). **Note:** Tivoli Storage Productivity Center does not calculate a value for this column if there are multiple ranks in the extent pool where thin-provisioned volumes are allocated. This column displays value of **N/A** for the reports in which it is displayed. However, if there is only a single rank in the extent pool, Tivoli Storage Productivity Center does calculate the value for this column regardless of the thin-provisioned volumes.
Sequential I/O Percentage	ESS, DS6000, DS8000: RAID array	Percentage of all I/O operations that were completed for a RAID array over a specified time interval that were sequential operations.
Important: [1] The "Resource: components" column shows the resources and components that are measured by a metric. Metrics that apply to Storwize V3500, Storwize V3700, Storwize V7000, and Storwize V7000 Unified.		

Port metrics

The following table describes the metrics for the ports on storage systems and switches.

Column	Resources: components[1]	Description
I/O or frame rates		
Port Send I/O Rate	ESS, DS6000, DS8000: port, storage system SAN Volume Controller[1]: port, node, I/O group, storage system SMI-S BSP: port XIV[3]: port	Average number of I/O operations per second for send operations for a port over a specified time interval.

Column	Resources: components[1]	Description
Port Receive I/O Rate	ESS, DS6000, DS8000: port, storage system SAN Volume Controller: port, node, I/O group, storage system SMI-S BSP: port XIV[3]: port	Average number of I/O operations per second for receive operations for a port over a specified time interval.
Total Port I/O Rate	ESS, DS6000, DS8000: port, storage system SAN Volume Controller: port, node, I/O group, storage system SMI-S BSP: port XIV[3]: port	Average number of I/O operations per second for send and receive operations for a port over a specified time interval.
Port Send Frame Rate	switch port, switch	Average number of frames per second that are sent through the port.
Port Receive Frame Rate	switch port, switch	Average number of frames per second that are received by the port.
Total Port Frame Rate	switch port, switch	Average number of frames per second that are transferred. This value includes frames that are sent and frames that are received by the port.
Port to Host Send I/O Rate	SAN Volume Controller: port, node, I/O group, storage system	Average number of exchanges (I/Os) per second sent to host computers by a component over a specified time interval.
Port to Host Receive I/O Rate	SAN Volume Controller: port, node, I/O group, storage system	Average number of exchanges (I/Os) per second received from host computers by a component over a specified time interval.
Total Port to Host I/O Rate	SAN Volume Controller: port, node, I/O group, storage system	Average number of exchanges (I/Os) per second transmitted between host computers and a component over a specified time interval.
Port to Disk Send I/O Rate A	SAN Volume Controller: port, node, I/O group, storage system	Average number of exchanges (I/Os) per second sent to storage systems by a component over a specified time interval.
Port to Disk Receive I/O Rate	SAN Volume Controller: port, node, I/O group, storage system	Average number of exchanges (I/Os) per second received from storage systems by a component over a specified time interval.
Total Port to Disk I/O Rate	SAN Volume Controller: port, node, I/O group, storage system	Average number of exchanges (I/Os) per second transmitted between storage systems and a component over a specified time interval.

Column	Resources: components[1]	Description
Port to Local Node Send I/O Rate	SAN Volume Controller: port, node, I/O group, storage system	Average number of exchanges (I/Os) per second sent to other nodes in the local SAN Volume Controller cluster by a component over a specified time interval.
Port to Local Node Receive I/O Rate	SAN Volume Controller: port, node, I/O group, storage system	Average number of exchanges (I/Os) per second received from other nodes in the local SAN Volume Controller cluster by a component over a specified time interval.
Total Port to Local Node I/O Rate	SAN Volume Controller: port, node, I/O group, storage system	Average number of exchanges (I/Os) per second transmitted between other nodes in the local SAN Volume Controller cluster and a component over a specified time interval.
Port to Remote Node Send I/O Rate	SAN Volume Controller: port, node, I/O group, storage system	Average number of exchanges (I/Os) per second sent to nodes in the remote SAN Volume Controller cluster by a component over a specified time interval.
Port to Remote Node Receive I/O Rate	SAN Volume Controller: port, node, I/O group, storage system	Average number of exchanges (I/Os) per second received from nodes in the remote SAN Volume Controller cluster.
Total Port to Remote Node I/O Rate	SAN Volume Controller: port, node, I/O group, storage system	Average number of exchanges (I/Os) per second transmitted between nodes in the remote SAN Volume Controller cluster and a component over a specified time interval.
Port FCP Send I/O Rate	ESS, DS6000, DS8000: port	Average number of send operations per second using the FCP protocol, for a port over a specified time interval.
Port FCP Receive I/O Rate	ESS, DS6000, DS8000: port	Average number of receive operations per second using the FCP protocol for a port over a specified time interval.
Total Port FCP I/O Rate	ESS, DS6000, DS8000: port	Average number of send and receive operations per second using the FCP protocol for a port over a specified time interval.
Port FICON Send I/O Rate	ESS, DS6000, DS8000: port	Average number of send operations per second using the FICON protocol for a port over a specified time interval.
Port FICON Receive I/O Rate	ESS, DS6000, DS8000: port	Average number of receive operations per second using the FICON protocol for a port over a specified time interval.
Total Port FICON I/O Rate	ESS, DS6000, DS8000: port	Average number of send and receive operations per second using the FICON protocol for a port over a specified time interval.
Port PPRC Send I/O Rate	ESS, DS6000, DS8000:: port, storage system	Average number of send operations per second for Peer-to-Peer Remote Copy usage for a port over a specified time interval.
Port PPRC Receive I/O Rate	ESS, DS6000, DS8000: port, storage system	Average number of receive operations per second for Peer-to-Peer Remote Copy usage for a port over a specified time interval.

Column	Resources: components[1]	Description
Total Port PPRC I/O Rate	ESS, DS6000, DS8000: port, storage system	Average number of send and receive operations per second for Peer-to-Peer Remote Copy usage for a port over a specified time interval.
Data rates		
Port Send Data Rate	ESS, DS6000, DS8000: port, storage system SAN Volume Controller: port, node, I/O group, storage system SMI-S BSP: port switch port, switch XIV[3]: port	Average number of megabytes (2^20 bytes) per second that were transferred for send (read) operations for a port over a specified time interval.
Port Receive Data Rate	ESS, DS6000, DS8000: port, storage system SAN Volume Controller: port, node, I/O group, storage system SMI-S BSP: port switch port, switch XIV[3]: port	Average number of megabytes (2^20 bytes) per second that were transferred for receive (write) operations for a port over a specified time interval.
Total Port Data Rate	ESS, DS6000, DS8000: port, storage system SAN Volume Controller: port, node, I/O group, storage system SMI-S BSP: port switch port, switch XIV[3]: port	Average number of megabytes (2^20 bytes) per second that were transferred for send and receive operations for a port over a specified time interval.
Port Peak Send Data Rate	switch port	Peak number of megabytes (2^20 bytes) per second that were sent by a port over a specified time interval
Port Peak Receive Data Rate	switch port	Peak number of megabytes (2^20 bytes) per second that were received by a port over a specified time interval.
Port to Host Send Data Rate	SAN Volume Controller: port, node, I/O group, storage system	Average number of megabytes (2^20 bytes) per second sent to host computers by a component over a specified time interval.

Column	Resources: components[1]	Description
Port to Host Receive Data Rate	SAN Volume Controller: port, node, I/O group, storage system	Average number of megabytes (2^20 bytes) per second received from host computers by a component over a specified time interval.
Total Port to Host Data Rate	SAN Volume Controller: port, node, I/O group, storage system	Average number of megabytes (2^20 bytes) per second transmitted between host computers and a component over a specified time interval.
Port to Disk Send Data Rate	SAN Volume Controller: port, node, I/O group, storage system	Average number of megabytes (2^20 bytes) per second sent to storage systems by a component over a specified time interval.
Port to Disk Receive Data Rate	SAN Volume Controller: port, node, I/O group, storage system	Average number of megabytes (2^20 bytes) per second received from storage systems by a component over a specified time interval.
Total Port to Disk Data Rate	SAN Volume Controller: port, node, I/O group, storage system	Average number of megabytes (2^20 bytes) per second transmitted between storage systems and a component over a specified time interval.
Port to Local Node Send Data Rate	SAN Volume Controller: port, node, I/O group, storage system	Average number of megabytes (2^20 bytes) per second sent to other nodes in the local SAN Volume Controller cluster by a component over a specified time interval.
Port to Local nNode Receive Data Rate	SAN Volume Controller: port, node, I/O group, storage system	Average number of megabytes (2^20 bytes) per second received from other nodes in the local SAN Volume Controller cluster by a component over a specified time interval.
Total Port to Local Node Data Rate	SAN Volume Controller: port, node, I/O group, storage system	Average number of megabytes (2^20 bytes) per second transmitted between other nodes in the local SAN Volume Controller cluster and a component over a specified time interval.
Port to Remote Node Send Data Rate	SAN Volume Controller: port, node, I/O group, storage system	Average number of megabytes (2^20 bytes) per second sent to nodes in the remote SAN Volume Controller cluster by a component over a specified time interval.
Port to Remote Node Receive Data Rate	SAN Volume Controller: port, node, I/O group, storage system	Average number of megabytes (2^20 bytes) per second received from nodes in the remote SAN Volume Controller cluster by a component over a specified time interval.
Total Port to Remote Node Data Rate	SAN Volume Controller: port, node, I/O group, storage system	Average number of megabytes (2^20 bytes) per second transmitted between nodes in the remote SAN Volume Controller cluster and a component over a specified time interval.
Port FCP Send Data Rate	ESS, DS6000, DS8000: port	Average number of megabytes (2^20 bytes) per second sent over the FCP protocol for a port over a specified time interval.
Port FCP Receive Data Rate	ESS, DS6000, DS8000: port	Average number of megabytes (2^20 bytes) per second received over the FCP protocol for a port over a specified time interval.

Column	Resources: components[1]	Description
Total Port FCP Data Rate	ESS, DS6000, DS8000: port	Average number of megabytes (2^20 bytes) per second sent or received over the FCP protocol for a port over a specified time interval.
Port FICON Send Data Rate	ESS, DS6000, DS8000: port	Average number of megabytes (2^20 bytes) per second sent over the FICON protocol for a port over a specified time interval.
Port FICON Receive Data Rate	ESS, DS6000, DS8000: port	Average number of megabytes (2^20 bytes) per second received over the FICON protocol, for a port over a specified time interval.
Total Port FICON Data Rate	ESS, DS6000, DS8000: port	Average number of megabytes (2^20 bytes) per second sent or received over the FICON protocol for a port over a specified time interval.
Port PPRC Send Data Rate	ESS, DS6000, DS8000: port, storage system	Average number of megabytes (2^20 bytes) per second sent for Peer-to-Peer Remote Copy usage for a port over a specified time interval.
Port PPRC Receive Data Rate	ESS, DS6000, DS8000: port, storage system	Average number of megabytes (2^20 bytes) per second received for Peer-to-Peer Remote Copy usage for a port over a specified time interval.
Total Port PPRC Data Rate	ESS, DS6000, DS8000: port, storage system	Average number of megabytes (2^20 bytes) per second transferred for Peer-to-Peer Remote Copy usage for a port over a specified time interval.
Response times		
Port Send Response Time	ESS, DS6000, DS8000: port, storage system XIV[3]: port	Average number of milliseconds that it took to service each send (read) operation for a port over a specified time interval.
Port Receive Response Time	ESS, DS6000, DS8000: port, storage system XIV[3]: port	Average number of milliseconds that it took to service each receive (write) operation for a port over a specified time interval.
Overall Port Response Time	ESS, DS6000, DS8000: port, storage system XIV[3]: port	Average number of milliseconds that it took to service each operation (send and receive) for a port over a specified time interval.
Port to Local Node Send Response Time	SAN Volume Controller: node, I/O group, storage system	Average number of milliseconds it took to service each send operation to another node in the local SAN Volume Controller cluster for a component over a specified time interval. This value is the external response time of the transfers.
Port to Local Node Receive Response Time	SAN Volume Controller: node, I/O group, storage system	Average number of milliseconds it took to service each receive operation from another node in the local SAN Volume Controller cluster for a component over a specified time interval. This value is the external response time of the transfers.
Total Port to Local Node Response Time	SAN Volume Controller: node, I/O group, storage system	Average number of milliseconds it took to service each send or receive operation between another node in the local SAN Volume Controller cluster and a component over a specified time interval. This value is the external response time of the transfers.

Column	Resources: components[1]	Description
Port to Local Node Send Queued Time	SAN Volume Controller: node, I/O group, storage system	Average number of milliseconds that each send operation issued to another node in the local SAN Volume Controller cluster spent on the queue before being issued for a component over a specified time interval.
Port to Local Node Receive Queued Time	SAN Volume Controller: node, I/O group, storage system	Average number of milliseconds that each receive operation from another node in the local SAN Volume Controller cluster spent on the queue before being issued for a component over a specified time interval.
Total Port to Local Node Queued Time	SAN Volume Controller: node, I/O group, storage system	Average number of milliseconds that each operation issued to another node in the local SAN Volume Controller cluster spent on the queue before being issued for a component over a specified time interval.
Port to Remote Node Send Response Time	SAN Volume Controller: node, I/O group, storage system	Average number of milliseconds it took to service each send operation to a node in the remote SAN Volume Controller cluster for a component over a specified time interval. This is the external response time of the transfers.
Port to Remote Node Receive Response Time	SAN Volume Controller: node, I/O group, storage system	Average number of milliseconds it took to service each receive operation from a node in the remote SAN Volume Controller cluster for a component over a specified time interval. This value is the external response time of the transfers.
Total Port to Remote Node Response Time	SAN Volume Controller: node, I/O group, storage system	Average number of milliseconds it took to service each send or receive operation between a node in the remote SAN Volume Controller cluster and a component over a specified time interval. This value is the external response time of the transfers.
Port to Remote Node Send Queued Time	SAN Volume Controller: node, I/O group, storage system	Average number of milliseconds that each send operation issued to a node in the remote SAN Volume Controller cluster spent on the queue before being issued for a component over a specified time interval.
Port to Remote Node Receive Queued Time	SAN Volume Controller: node, I/O group, storage system	Average number of milliseconds that each receive operation from a node in the remote SAN Volume Controller cluster spent on the queue before being issued for a component over a specified time interval.
Total Port to Remote Node Queued Time	SAN Volume Controller: node, I/O group, storage system	Average number of milliseconds that each operation issued to a node in the remote SAN Volume Controller cluster spent on the queue before being issued for a component over a specified time interval.
Port FCP Send Response Time	ESS, DS6000, DS8000: port	Average number of milliseconds it took to service all send operations over the FCP protocol for a port over a specified time interval.

Column	Resources: components[1]	Description
Port FCP Receive Response Time	ESS, DS6000, DS8000: port	Average number of milliseconds it took to service all receive operations over the FCP protocol for a port over a specified time interval.
Overall Port FCP Response Time	ESS, DS6000, DS8000: port	Average number of milliseconds it took to service all I/O operations over the FCP protocol for a port over a specified time interval.
Port FICON Send Response Time	ESS, DS6000, DS8000: port	Average number of milliseconds it took to service all send operations over the FICON protocol for a port over a specified time interval.
Port FICON Receive Response Time	ESS, DS6000, DS8000: port	Average number of milliseconds it took to service all receive operations over the FICON protocol for a port over a specified time interval.
Overall Port FICON Response Time	ESS, DS6000, DS8000: port	Average number of milliseconds it took to service all I/O operations over the FICON protocol for a port over a specified time interval.
Port PPRC Send Response Time	ESS, DS6000, DS8000: port, storage system	Average number of milliseconds it took to service all send operations for Peer-to-Peer Remote Copy usage for a port over a specified time interval.
Port PPRC Receive Response Time	ESS, DS6000, DS8000: port, storage system	Average number of milliseconds it took to service all receive operations for Peer-to-Peer Remote Copy usage for a port over a specified time interval.
Overall Port PPRC Response Time	ESS, DS6000, DS8000: port, storage system	Average number of milliseconds it took to service all I/O operations for Peer-to-Peer Remote Copy usage for a port over a specified time interval.
Transfer sizes		
Port Send Transfer Size	ESS, DS6000, DS8000: port, storage system SMI-S BSP: port	Average number of KB sent per I/O by a port over a specified time interval.
Port Receive Transfer Size	ESS, DS6000, DS8000: port, storage system SMI-S BSP: port	Average number of KB received per I/O by a port over a specified time interval.
Overall Port Transfer Size	ESS, DS6000, DS8000: port, storage system SMI-S BSP: port	Average number of KB transferred per I/O by a port over a specified time interval.
Port Send Frame Size	switch port, switch	The average size of a frame that is sent out through a port.
Port Receive Frame Size	switch port, switch	The average size of a frame that is received in through a port.
Overall Port Frame Size	switch port, switch	The average frame transfer size. This value includes frames that are sent and frames that are received by a port.

Column	Resources: components[1]	Description
Special computed values		
Port Send Utilization Percentage	ESS, DS6000, DS8000: port	Average amount of time that the port was busy sending data over a specified time interval.
Port Receive Utilization Percentage	ESS, DS6000, DS8000: port	Average amount of time that the port was busy receiving data over a specified time interval.
Overall Port Utilization Percentage	ESS, DS6000, DS8000: port	Average amount of time that the port was busy sending or receiving data over a specified time interval.
Port Send Bandwidth Percentage	ESS, DS8000: port SAN Volume Controller: port switch, port XIV[3]: port	The approximate bandwidth utilization percentage for send operations by a port, based on its current negotiated speed.
Port Receive Bandwidth Percentage	ESS, DS8000: port SAN Volume Controller: port switch, port XIV[3]: port	The approximate bandwidth utilization percentage for receive operations by this port, based on its current negotiated speed.
Overall Port Bandwidth Percentage	ESS, DS8000: port SAN Volume Controller: port switch, port XIV[3]: port	The approximate bandwidth utilization percentage for send and receive operations by this port.
Error rates		
Error Frame Rate	switch port, switch DS8000: port, storage system	The average number of error frames per second that are received. An error frame is a frame that violates the Fibre Channel Protocol.
Discarded Frame Rate	switch port, switch	The average number of frames per second that are discarded because host buffers are unavailable for the port.
Link Failure Rate	switch port, switch DS8000: port, storage system SAN Volume Controller: port, node, I/O group, storage system	The number of link errors per second.

Column	Resources: components[1]	Description
Loss of Sync Rate	switch port, switch DS8000: port, storage system SAN Volume Controller: port, node, I/O group, storage system	The average number of times per second that synchronization is lost. Synchronization is assumed lost after a timeout interval expires.
Loss of Signal Rate	switch port, switch DS8000: port, storage system SAN Volume Controller: port, node, I/O group, storage system	The average number of times per second that the signal is lost.
CRC Error Rate	switch port, switch DS8000: port, storage system SAN Volume Controller: port, node, I/O group, storage system	The average number of frames per second that are received in which a cyclic redundancy check (CRC) error is detected. A CRC error is detected when the CRC in the transmitted frame does not match the CRC computed by the receiver.
Short Frame Rate	switch port, switch	The average number of frames that are received per second that are shorter than 28 octets. This number excludes start-of-frame bytes and end-of-frame bytes. The 28 octet limit is calculated based on the assumption that a frame has 24 header bytes, and 4 CRC bytes.
Long Frame Rate	switch port, switch	The average number of frames that are received per second that are longer than 2140 octets. This number excludes start-of-frame bytes and end-of-frame bytes. The 2140 octet limit is calculated based on the assumption that a frame has 24 header bytes, 4 CRC bytes, and 2112 data bytes.
Encoding Disparity Error Rate	switch port, switch	The average number of disparity errors per second that are received.
Discarded Class3 Frame Rate	switch port, switch	The average number of class 3 frames per second that are discarded.
F-BSY Frame Rate	switch port, switch	The average number of F-BSY frames per second that are generated. An F-BSY frame is issued by the fabric to indicate that a frame cannot be delivered because the fabric or destination N_port is busy.
F-RJT Frame Rate	switch port, switch	The average number of F-RJT frames per second that are generated. An F-RJT frame is issued by the fabric to indicate that delivery of a frame was denied.

Column	Resources: components[1]	Description
Primitive Sequence Protocol Error Rate	switch port, switch DS8000: port, storage system SAN Volume Controller: port, node, I/O group, storage system	The average number of primitive sequence protocol errors per second that are detected. This error occurs when there is a link failure for a port.
Invalid Transmission Word Rate	switch port, switch DS8000: port, storage system SAN Volume Controller: port, node, I/O group, storage system	The average number of bit errors per second that are detected. Errors include an 8b10 code violation in one or more characters, a K28.5 in the second, third, or fourth character positions, or an ordered set that had an incorrect Beginning Running Disparity.
Zero Buffer-Buffer Credit Timer	SAN Volume Controller: port, node, I/O group, storage system	The number of microseconds that the port was unable to send frames because of a lack of buffer credit since the last node reset.
Zero Buffer-Buffer Credit Percentage	SAN Volume Controller: port, node, I/O group, storage system	The percentage of sampling time that the port was unable to send frames because of a lack of buffer credit since the last node reset.
Link Reset Transmitted Rate	switch port, switch DS8000: port, storage system	The average number of times per second that the port changes from an active (AC) state to a Link Recovery (LR1) state.
Link Reset Received Rate	switch port, switch DS8000: port, storage system	The average number of times per second that the port changes from an active (AC) state to a Link Recovery (LR2) state.
Out of Order Data Rate	DS8000: port, storage system	The average number of times per second that an out of order frame was detected for a port over a specified time interval.
Out of Order ACK Rate	DS8000: port, storage system	The average number of times per second that an out of order ACK frame was detected for a port over a specified time interval.
Duplicate Frame Rate	DS8000: port, storage system	The average number of times per second that a frame was received and also was detected as previously processed for a port over a specified time interval.
Invalid Relative Offset Rate	DS8000: port, storage system	The average number of times per second that a frame was received with invalid relative offset in the frame header for a port over a specific time interval.
Sequence Timeout Rate	DS8000: port, storage system	The average number of times per second the port detected a timeout condition on receiving sequence initiative for a Fibre Channel exchange for a port over a specified time interval.

Column	Resources: components[1]	Description
Important: • [1] The "Resource: components" column shows the resources and components that are measured by a metric. Metrics that apply to Storwize V3500, Storwize V3700, Storwize V7000, and Storwize V7000 Unified. • [2] This metric is available in the XIV system version 10.2.2 or later. • [3] This metric is available in the XIV system version 10.2.4 or later.		

Related concepts:

"Monitoring the performance of resources" on page 383
Tivoli Storage Productivity Center can collect information about the performance of storage systems and switches. This information includes key performance metrics and notifications of threshold violations. Metrics can help you measure, identify, and troubleshoot performance issues and bottlenecks in your storage. Threshold violations alert you when the performance of a monitored resource falls outside of a specified range.

Arguments and window locations available with the inbound launch in context feature

This section describes the arguments and window locations available with the inbound launch in context feature.

Launch in context parameters

You can use the launch in context parameters, definitions, and examples.

The command format for Java Web Start is unique in that a parameter and its value are separated by an equal sign (=). Parameter=value pairs are separated by an ampersand (&).

Not all parameters can be used with all launch types. Where this is true, it is noted in the parameter definition.

Parameters

-user The user ID. The value must be a valid user ID to log on to the IBM Tivoli Storage Productivity Center server, for example, `-user admin`.

Note: This parameter is not supported in a Web Browser's URL when using Java Web Start to launch the Tivoli Storage Productivity Center user interface.

-passwd
The password. The value must be a valid password to log on to the Tivoli Storage Productivity Center server, for example, `-passwd MyPassword`.

Note: This parameter is not supported in a Web Browser's URL when using Java Web Start to launch the Tivoli Storage Productivity Center user interface.

-encpasswd
The password encrypted. This is used if you choose to encrypt the password instead of entering the text password, for example, `-encpasswd 48735`.

Tip: To encrypt a password using Tivoli Storage Productivity Center (the preferred method), enter the following command in the Command Prompt window:

TPC-HOME/data/server/tools/tpctool encrypt *text password*

The encrypted password is returned.

Note: This parameter is not supported in a Web Browser's URL when using Java Web Start to launch the Tivoli Storage Productivity Center user interface.

-encmethod

The encryption method used to encrypt the password. The password can be encrypted using Tivoli Storage Productivity Center or Tivoli Enterprise Portal. The preferred method is to use Tivoli Storage Productivity Center to encrypt the password. If **encpasswd** is selected, you must also select **encmethod** with a value. The default is TPC. For example, `-encpasswd 48735 -encmethod TPC`

Note: This parameter is not supported in a Web Browser's URL when using Java Web Start to launch the Tivoli Storage Productivity Center user interface.

Tip: The Tivoli Enterprise Portal graphical user interface (GUI) does not start the Tivoli Storage Productivity Center GUI properly with a Tivoli Enterprise Portal-encrypted password if that encryption creates a string with spaces in it. Such a string is handled as multiple values unless it is enclosed in double quotation marks (").

Tip: Encryption using Tivoli Enterprise Portal creates a string pattern. There are multiple string patterns that can result in the same decrypted value, so it is possible that different string patterns used as an encrypted password might result in same decrypted password.

-function

Specify one of the following values:

- The task to perform on the remote data server. See "Launch-in-context task parameters" on page 1731 for tasks and their specific parameters. For example, `-function disk.create_volume -subsystem_id <ID of the subsystem>`.
- The window name to open on the target system. The window name is mapped to the name of the node on the navigation tree. See "Available windows" on page 1731 for a list of available windows. For example, `-function topology.computer`.

-server

The Tivoli Storage Productivity Center server to log on to. This argument specifies a single server. For example, `-server server1:9549`.

-servers

Not used with the Web Browser. The Tivoli Storage Productivity Center server or servers to log on to, in the format server:port. You can specify multiple server ports separated by commas. For example, `-servers "server1:9549,server2:9549,server3:9549"`. If you specify multiple server ports, Tivoli Storage Productivity Center will connect to the first server. If you later initiate a new connection from the main window (**Connection** > **New Connection**), the server list box will include the available servers in the **Connection** dialog.

-help **Not used with the Web Browser.** The help argument is used alone in the Arguments text field. It is entered as `-help functions`. This argument returns a list of the windows representing nodes in the navigation tree that can be launched. Typing `-help` with no arguments will return an error message.

You can also enter **help** as a command in the Command Prompt window as `tpc.bat -help functions` for Windows, and `TPCD.sh -help functions` for AIX. Linux, or UNIX.

Launch-in-context task parameters

Use the launch-in-context feature task parameters to complete storage tasks.

Task parameters that are associated with actions taken on the Data server also use the **-function** parameter. For example: `-function data.filesystem_capacity_by_computer -computer_id "<computer_id>"`.

Capacity report (data.filesystem_capacity_by_computer)

-computer_id
The ID of the computer for which the report is to be created. If this value is not specified, the Tivoli Storage Productivity Center GUI opens the default report panel for **Data Manager** > **Reporting** > **Capacity** > **FileSystem Capacity** > **By Computer**.

You must enter a value for **-computer_id** that matches the ID for that computer that is stored in the Tivoli Storage Productivity Center database repository. You receive a warning message if the computer ID you enter in the command line does not match the ID stored in the repository. To ensure that this report is displayed properly when you use launch-in-context, make sure to enter an ID for the computer that matches the ID that is displayed for it through the Topology Viewer or appropriate report in the product's user interface.

Wasted space report (TPC.reports_data.wasted_space)

This report has no parameters. The Tivoli Storage Productivity Center GUI opens the default report panel for **Data Manager** > **Reporting** > **System Reports** > **Data** > **Wasted Space**.

Available windows

You can use windows with the inbound launch-in-context feature to start IBM Tivoli Storage Productivity Center. These windows are called with the **-function** window name argument.

Available window names for function argument

Table 151. Available windows for inbound launch-in-context

Tree Node	Window Name
Administrative Services -> Data Sources ->IBM Tivoli Storage Productivity Center Servers[1]	datasource.tpc_servers
IBM Tivoli Storage Productivity Center->Alerting->Alert Log->All	alert.all
IBM Tivoli Storage Productivity Center->Alerting->Alert Log->Alerts Directed to user	alert.alerts_directed_to_user

Table 151. Available windows for inbound launch-in-context (continued)

Tree Node	Window Name
IBM Tivoli Storage Productivity Center->Alerting->Alert Log->Storage Subsystem	alert.storage_subsystem
IBM Tivoli Storage Productivity Center->Alerting->Alert Log->Computer	alert.computer
IBM Tivoli Storage Productivity Center->Alerting->Alert Log->Disk	alert.disk
IBM Tivoli Storage Productivity Center->Alerting->Alert Log->File system	alert.filesystem
IBM Tivoli Storage Productivity Center->Alerting->Alert Log->Directory[1]	alert.directory
IBM Tivoli Storage Productivity Center->Alerting->Alert Log->User[1]	alert.user
IBM Tivoli Storage Productivity Center->Alerting->Alert Log->OS User Group[1]	alert.os_user_group
IBM Tivoli Storage Productivity Center->Alerting->Alert Log->Fabric	alert.fabric
IBM Tivoli Storage Productivity Center->Alerting->Alert Log->Switch	alert.switch
IBM Tivoli Storage Productivity Center->Alerting->Alert Log->Endpoint Device	alert.endpoint_device
IBM Tivoli Storage Productivity Center->Alerting->Alert Log->External	alert.external
IBM Tivoli Storage Productivity Center->Alerting->Alert Log->Configuration Analysis[1]	alert.configuration_analysis
IBM Tivoli Storage Productivity Center->Alerting->Alert Log->Hypervisor[1]	alert.hypervisor
IBM Tivoli Storage Productivity Center->My Reports->System Reports->Data->Disk Space Summary[1]	data_report.disk_capacity
IBM Tivoli Storage Productivity Center->My Reports->System Reports->Data->Storage Access Times[1]	data_report.storage_access_times
IBM Tivoli Storage Productivity Center->My Reports->System Reports->Data->Most Obsolete Files[1]	data_report.most_obsolete_files

Opening Tivoli Storage Productivity Center on Windows operating systems

You can open Tivoli Storage Productivity Center CLIs and GUIs and administer Tivoli Storage Productivity Center on Windows operating systems.

Opening Tivoli Storage Productivity Center CLIs and GUIs

To manage and monitor storage resources, open Tivoli Storage Productivity Center CLIs and GUIs.

You can open the following GUIs and CLIs:

- "Opening Tivoli Storage Productivity Center Web-based GUI" on page 1734
- "Opening Tivoli Storage Productivity Center Stand-alone GUI" on page 1734
- "Opening Tivoli Storage Productivity Center Replication Manager GUI" on page 1734
- "Opening DB2 Command Window" on page 1735
- "Opening IBM Data Studio Administration client on Windows operating systems" on page 1735
- "Opening IBM Tivoli Monitoring Services" on page 1735

Opening Tivoli Storage Productivity Center Web-based GUI

1. Choose one of these options:

Option	Description
Windows Server 2012	1. On the Dashboard page, hover the mouse over the lower left corner of the page next to the **Server Manager** taskbar button, and then click **Start**. 2. On the Start page, right-click, and then click the **All apps** taskbar button.
Windows 7, Windows 2008, Windows Vista, Windows XP	Click **Start** > **All Programs**.

2. Click **Tivoli Storage Productivity Center** > **TPC Web-based GUI**.

Opening Tivoli Storage Productivity Center Stand-alone GUI

1. Choose one of these options:

Option	Description
Windows Server 2012	1. On the Dashboard page, hover the mouse over the lower left corner of the page next to the **Server Manager** taskbar button, and then click **Start**. 2. On the Start page, right-click, and then click the **All apps** taskbar button.
Windows 7, Windows 2008, Windows Vista, Windows XP	Click **Start** > **All Programs**.

2. Click **Tivoli Storage Productivity Center** > **TPC Stand-alone GUI**.

Opening Tivoli Storage Productivity Center Replication Manager GUI

1. Choose one of these options:

Option	Description
Windows Server 2012	1. On the Dashboard page, hover the mouse over the lower left corner of the page next to the **Server Manager** taskbar button, and then click **Start**. 2. On the Start page, right-click, and then click the **All apps** taskbar button.
Windows 7, Windows 2008, Windows Vista, Windows XP	Click **Start** > **All Programs**.

2. Click **Tivoli Storage Productivity Center** > **TPC Replication Manager GUI**.

Opening DB2 Command Window

1. Choose one of these options:

Option	Description
Windows Server 2012	1. On the Dashboard page, hover the mouse over the lower left corner of the page next to the **Server Manager** taskbar button, and then click **Start**. 2. On the Start page, right-click, and then click the **All apps** taskbar button.
Windows 7, Windows 2008, Windows Vista, Windows XP	Click **Start** > **All Programs**.

2. Click **IBM DB2** > **Command Line Tools** > **Command Window**.

Opening IBM Data Studio Administration client on Windows operating systems

1. Choose one of these options:

Option	Description
Windows Server 2012	1. On the Dashboard page, hover the mouse over the lower left corner of the page next to the **Server Manager** taskbar button, and then click **Start**. 2. On the Start page, right-click, and then click the **All apps** taskbar button.
Windows 7, Windows 2008, Windows Vista, Windows XP	Click **Start** > **All Programs**.

2. Click **IBM Data Studio** > **Data Studio Administration Client**.

Opening IBM Tivoli Monitoring Services

1. Choose one of these options:

Option	Description
Windows Server 2012	1. On the Dashboard page, hover the mouse over the lower left corner of the page next to the **Server Manager** taskbar button, and then click **Start**. 2. On the Start page, right-click, and then click the **All apps** taskbar button.
Windows 7, Windows 2008, Windows Vista, Windows XP	Click **Start** > **All Programs**.

2. Click **IBM Tivoli Monitoring** > **IBM Tivoli Monitoring Services**.

Accessing administration tools

To manage and maintain Tivoli Storage Productivity Center, access the Windows system administration tools.

To complete tasks in Tivoli Storage Productivity Center, you must open the following administration and maintenance facilities:

- "Accessing the Control Panel" on page 1736

- "Accessing Administrative Tools"
- "Accessing Windows Services"
- "Accessing Computer Management"
- "Accessing Programs and Program Features" on page 1737

Accessing the Control Panel

1. Choose one of these options:

Option	Description
Windows Server 2012	On the Dashboard page, hover the mouse over the lower left corner of the page next to the **Server Manager** taskbar button, and then click **Start**.
Windows 7, Windows 2008, Windows Vista, Windows XP	Click **Start**.

2. Click **Control Panel**

Accessing Administrative Tools

1. Choose one of these options:

Option	Description
Windows Server 2012	On the Dashboard page, hover the mouse over the lower left corner of the page next to the **Server Manager** taskbar button, and then click **Start**.
Windows 7, Windows 2008	Click **Start**.
Windows XP, Windows Vista	Click **Start** > **Control Panel**.

2. Click **Administrative Tools**

Accessing Windows Services

1. Choose one of these options:

Option	Description
Windows Server 2012	On the Dashboard page, hover the mouse over the lower left corner of the page next to the **Server Manager** taskbar button, and then click **Start**.
Windows 7, Windows 2008	Click **Start**.
Windows XP, Windows Vista	Click **Start** > **Control Panel**.

2. Click **Administrative Tools** > **Services**

Accessing Computer Management

1. Choose one of these options:

Option	Description
Windows Server 2012	On the Dashboard page, hover the mouse over the lower left corner of the page next to the **Server Manager** taskbar button, and then click **Start**.

Option	Description
Windows 7, Windows 2008, Windows Vista, Windows XP	Click **Start**.

2. Click **Control Panel** > **Computer Management**

Accessing Programs and Program Features

1. Choose one of these options:

Option	Description
Windows Server 2012	On the Dashboard page, hover the mouse over the lower left corner of the page next to the **Server Manager** taskbar button, and then click **Start**.
Windows 7, Windows 2008, Windows Vista, Windows XP	Click **Start**.

2. Click **Control Panel** > **Programs and Program Features**.

Accessing Window Run

1. Choose one of these options:

Option	Description
Windows Server 2012	On the Dashboard page, hover the mouse over the lower left corner of the page next to the **Server Manager** taskbar button, and then click **Start**.
Windows 7, Windows 2008, Windows Vista, Windows XP	Click **Start**.

2. Click **Run**.

Frequently Asked Questions

Use this section to view answers to common questions about IBM Tivoli Storage Productivity Center. These questions are organized according to the manager to which they apply.

General and Migration information

Learn about the issues when you work with IBM Tivoli Storage Productivity Center, upgrade to a new version of the product, or migrate from another product.

What Java version is officially supported by Tivoli Storage Productivity Center version 5.2 graphical user interface?

Java 7 is the level that is supported for the Tivoli Storage Productivity Center GUI. For information about how to start the Tivoli Storage Productivity Center graphical user interface, see the Tivoli Storage Productivity Center Information Center. Search for **Starting and stopping the console**.

You are entering namespaces manually for CIM agents and switches in the Tivoli Storage Productivity Center user interface. What are the current namespaces for the supported brands?

Table 152. Interop Namespaces for CIM Agents for switches and storage systems

Switch or system	Namespace
IBM (other than IBM System Storage TS3310 Tape Library)	/root/ibm
IBM System Storage TS3310 Tape Library	/root/cimv2
Brocade	/interop
Cisco	/root/cimv2 For version 3.2.1 or later: /root/pg_interop
Engenio	/interop
EMC	/root/emc
HDS	For HiCommand 5.6 or later, use: /root/smis/current For a HiCommand version that supports SMI-S 1.2, use following namespace to traverse the model as SMI-S 1.1: /root/smis/smis11 For HiCommand versions earlier than HiCommand 5.6, use: /root/hitachi/dm*xx*, where *xx* is represents the level of HiCommand.
HP	/root
LSI	/root/PG_InterOp
SUN	/root/sun3510 or /interop Note: This namespace is for a system and not a switch.
XYRATEX	/root/PG_interop

Check with your switch vendor to ensure you use the most current namespaces.

What if you specify an incorrect namespace?

If you specify an incorrect namespace, the following issues might occur:

- The connection test fails when the CIMOM is added.
- The discovery does not discover all information of the system that is managed by the CIMOM.
- The probe fails.
- The function that you want to start on the system might fail (for example, collecting performance data).

What are the required steps when you upgrade Tivoli Storage Productivity Center to the latest version?

For detailed information about how to upgrade the product, go to the Tivoli Storage Productivity Center Information Center and expand the **Tivoli Storage Productivity Center** > **Upgrading** node in the navigation tree.

You are using an older version of IBM Tivoli Storage Productivity Center for Data. How can I upgrade to this latest version?

For detailed information about how to upgrade the product, go to the Tivoli Storage Productivity Center Information Center and expand the **Tivoli Storage Productivity Center** > **Upgrading** node in the navigation tree.

Data Manager

Use the questions in this section to answer questions about working with the Data Manager component of IBM Tivoli Storage Productivity Center.

How do you know if your storage system is supported by Data Manager and which SMI-S agents are supported?

To confirm whether your storage system is supported and which SMI-S agent is supported for that system, review the supported products list for the current release of Tivoli Storage Productivity Center. Go to http://www-01.ibm.com/support/docview.wss?rs=40&context=SWJ50&q1=matrix&uid=swg21386446&loc=en_US&cs=utf-8&lang=en and click the applicable Tivoli Storage Productivity Center release in the Storage column.

Fabric Manager

Learn about the frequently asked questions for monitoring fabrics and switches in Tivoli Storage Productivity Center.

What type of fabric agents can be used in Tivoli Storage Productivity Center?

The following table shows the current agent types that are supported for the monitoring fabrics and switches.

Table 153. Agent types for switch and fabric functions

Function > Switch	Brocade	Cisco [1]	QLogic
Switch Performance Monitoring	CIM agent	CIM agent	CIM agent
Switch and switch port information collected	Recommended: CIM agent Also supported: SNMP agent or Storage Resource agent	Recommended: CIM agent Also supported: SNMP agent or Storage Resource agent	SNMP agent or Storage Resource agent
Topology connectivity information collected	Recommended: CIM agent Also supported: SNMP agent or Storage Resource agent	SNMP agent or Storage Resource agent	SNMP agent or Storage Resource agent
Zoning information collected [2]	Recommended: CIM agent	A Storage Resource agent is required in each VSAN [3] [4] [5]	Storage Resource agent
Tivoli Storage Productivity Center Alerts	Recommended: CIM agent Also supported: SNMP agent or Storage Resource agent	SMP agent or Storage Resource agent	SNMP agent or Storage Resource agent
Hosts, endpoint devices, device-centric and host-centric information collected	Storage Resource agent	Storage Resource agent	Storage Resource agent
Switch “Sensors and Events”	SNMP agent	SNMP agent	SNMP agent

Table 153. Agent types for switch and fabric functions (continued)

Function > Switch	Brocade	Cisco [1]	QLogic
Tips: [1] The Storage Resource agent collects the information about a VSAN basis. Each VSAN is viewed as an individual SAN. The SNMP agent and CIM agent get the physical fabric information and can correlate the VSAN information to a physical infrastructure. The SNMP agent also collects some VSAN information. [2] "Zone information collected" indicates that information about the active zone set and the inactive zoning library is collected during a fabric probe. [3] For many Cisco proprietary zone members, the values are displayed as zeros. [4] If a zoning configuration has Cisco proprietary zone members, then you cannot modify the zoning for that configuration through Tivoli Storage Productivity Center. You must use the element manager to remove proprietary zone members or do zoning. [5] Orphan Cisco zones are not reported. [6] Tivoli Storage Productivity Center does not get a transaction lock on the switch while zone changes are made on the fabric.			

What are the prerequisites for monitoring the performance of switches?
To monitor the performance of a switch, add the switch to Tivoli Storage Productivity Center. When you add the switch for monitoring, ensure that you schedule a probe and performance monitor to collect information about that switch.

Why does an Out of Band Fabric (SNMP) agent show a state of "not contacted"?
Complete the following tasks in the stand-alone GUI to help determine why an Out of Band Fabric (SNMP) agent shows a state of "not contacted":

- Check that the IP address or name is entered correctly in the Out of Band Fabric agent details panel.
- Ensure that the FA MIB is enabled on the switch.
- Ensure that the Tivoli Storage Productivity Center server IP address is included in any SNMP Access Control List that exists on the switches.
- Ensure that you are using SNMP v1.

Can a storage system be added as an Out of Band Fabric (SNMP) agent?
No. Out of Band Fabric agents within Tivoli Storage Productivity Center are meant for switches only. Disk Manager uses CIMOMs to gather subsystem information.

How do you manually change a fabric or switch label that is displayed in Tivoli Storage Productivity Center?
In the web-based GUI, go to **Network Resources** > **Fabrics** or **Network Resources** > **Switches**. Right-click a fabric or switch and select **View Properties**. On the properties notebook for a fabric or switch, click **Edit** and change the name in the **Name** field. Click **Save**.

Disk Manager

Use the questions in this section to answer questions about working with the Disk Manager component of IBM Tivoli Storage Productivity Center.

Keep in mind the following information and considerations:

You encounter errors while collecting performance data on SAN Volume Controller. You fail to associate SAN Volume Controller performance data from non-configuration node with SAN Volume Controller performance data from configuration node. You encounter incomplete SAN Volume Controller

performance data sample.

This issue is caused by a configuration issue with SAN Volume Controller (time zone). Reset the time zone on SAN Volume Controller by logging into the SAN Volume Controller through putty. Run this command first:

```
svctask settimezone -timezone 509
```

This forces the cluster into the Universal time zone. To get the time zone you want the cluster to be in, run this command:

```
svctask settimezone -timezone
```

Click on Launch Element Manager. The URL that appears is http://0.0.0.0/ica

This error is caused by the wrong configuration of the SAN Volume Controller ICAT. Use the SAN Volume Controller GUI to remove and add the cluster again to the ICAT. This populates the correct value for the access point which is stored in the database repository during the next discovery. Use this cli command to set the IP address and port of the user interface.

For example: `svcluster -x modify -p 9.155.62.91:9080`

This is the same command used by the user interface and CIMOM.

Protocols and standards

This section provides an overview of the protocols and standards that are used within IBM Tivoli Storage Productivity Center.

Web Based Enterprise Management

Web Based Enterprise Management (WBEM) is an initiative of the Distributed Management Task Force (DTMF) with the objective to enable the management of complex IT environments. It defines a set of management and internet standard technologies in order to unify the management of complex IT environments.

The WBEM initiative is composed of three main conceptual elements:

Common Interface Model (CIM)

CIM is a formal object-oriented modeling language that is used to describe the management aspects of systems.

xmlCIM

This is the grammar to describe CIM declarations and messages used by the CIM protocol.

Hypertext Transfer Protocol (HTTP)

HTTP is used as a way to enable communication between a management application and a device that both use CIM.

The WBEM architecture defines the following elements:

CIM Client

The CIM Client is a management application like IBM Tivoli Storage Productivity Center that uses CIM to manage devices. A CIM Client can reside anywhere in the network, because it uses HTTP to talk to CIM Object Managers and Agents.

CIM Managed Object

A Managed Object is a hardware or software component that can be managed by a management application by using CIM.

CIM Agent
A CIM Object Manager that includes the provider service for a limited set of resources. An agent may be embedded or hosted and can be an aggregator for multiple devices.

CIM Provider
A CIM Provider is the element that translates CIM calls to the device-specific commands. A provider is always closely linked to a CIM.

CIM Object Manager (CIMOM)
The central component of the CIM Server responsible for the communication between the CIM server components.

CIM Server
A server that receives and processes CIM Operation Message Requests and issues CIM Operation Message Responses.

Storage Management Initiative Specification

The Storage Networking Industry Association (SNIA) defines a standard that is used within IBM Tivoli Storage Productivity Center to create and develop a universal open interface for managing storage devices including storage networks.

Information on SMI-S can be found at this Web site:

`http://www.snia.org`

SNIA has fully adopted and enhanced the Common Information Model (CIM) standard for storage management in its Storage Management Initiative - Specification (SMI-S). SMI-S was launched to create and develop a universal open interface for managing storage devices including storage networks. SMI-S provides:

- A comprehensive specification for the management of heterogeneous storage and storage area networks (SANs).
- The information available to a WBEM client from an SMI-S compliant CIM server (provider).
- Profiles organized by:
  - Storage
  - Fabric
  - Host
  - Common profiles and subprofiles
- An object-oriented CIM and XML-based interface for managing SAN devices, services, and fabrics.
- An initial discovery, which is SLP based.

The idea behind SMI-S is to standardize the management interfaces so that management applications can utilize these and provide cross-device management. This means that a newly introduced device can be immediately managed as it will conform to the standards.

The models and protocols in the SMI-S implementation are platform-independent, enabling application development for any platform, and enabling them to run on different platforms. The SNIA will also provide interoperability tests which will help vendors test their applications and devices if they conform to the standard.

Service Location Protocol

The Service Location Protocol (SLP) is an Internet Engineering Task Force (IETF) standard. SLP provides a scalable framework for the discovery and selection of network services.

The Internet Engineering Task Force (IETF) is a large open international community of network designers, operators, vendors, and researchers that are concerned with the evolution of the Internet architecture and the smooth operation of the Internet. The IETF includes formal standards for SNMP and MIBs. More information on IETF can be found at this website:

`http://www.ietf.org`

SLP enables the discovery and selection of generic services, which can range in function from hardware services such as those for printers or fax machines, to software services such as those for file servers, email servers, web servers, databases, or any other possible services that are accessible through an IP network.

Traditionally, to use a particular service, a user, or client application provided the host name or network IP address for the service. With SLP, however, it is not necessary for the user or client application to know individual host names or IP addresses. Instead, the user or client application can search the network for the required service type and an optional set of qualifying attributes.

For example, a user can search for all available printers that support Adobe PostScript. Based on the service type such as printers and the attributes such as PostScript, SLP searches the user's network for matching services, and returns the discovered list to the user.

Simple Network Management Protocol

The Simple Network Management Protocol (SNMP) is an Internet Engineering Task Force (IETF) protocol for monitoring and managing systems and devices in a network. Functions supported by the SNMP protocol are the request and retrieval of data, the setting or writing of data, and traps that signal the occurrence of events.

SNMP is a method that enables a management application to query information from a managed device. The managed device has software running that sends and receives the SNMP information. This software module is usually called the SNMP agent.

An SNMP manager can read information from an SNMP agent in order to monitor a device. Therefore, the device needs to be polled on an interval bases. The SNMP manager can also change the configuration of a device, by setting certain values to corresponding variables. A device can also be set up to send a notification to the SNMP manager (this is called a trap) to asynchronously inform this SNMP manager of a status change.

Depending on the existing environment and organization it is very likely that your environment already has an SNMP management application in place. IBM Tivoli Storage Productivity Center can be set up to send traps.

SNMP uses a hierarchical structured Management Information Base (MIB) to define the meaning and the type of a particular value. A MIB defines managed objects that describe the behavior of the SNMP entity, which can be anything from an IP router to a storage subsystem. The information is organized in a tree structure.

For users planning to make use of the Tivoli Storage Productivity Center SNMP trap alert notification capabilities, an SNMP MIB is included in the server installation.

The MIB is provided for use by your SNMP management console software. Most SNMP management products provide a program called a MIB compiler that can be used to import MIBs. This will allow you to view Tivoli Storage Productivity Center generated SNMP traps from within your management console software. Refer to your management console software documentation for instructions on how to compile or import a third party MIB.

Tivoli Storage Productivity Center uses port 162 to listen for SNMP traps. This is the default port. For switches, you must configure the switch to send SNMP traps to the Device server IP address. If you need to change the default port number, use the **setdscfg** command. The attribute to set is **SNMPTrapPort**.

System administrators must set up their SNMP trap ringer with the provided MIB files in order to receive SNMP traps from Tivoli Storage Productivity Center. These files are located in the following directories on the product installation DVD:

For Data server:

```
data\snmp\tivoliSRM.mib
```

For Device server:

```
device\snmp\fabric.mib
```

Fibre Channel Methodologies of Interconnects

IBM Tivoli Storage Productivity Center supports the ANSI T11 Fibre Channel FC-MI (Fibre Channel Methodologies of Interconnects) for the automated discovery of FC SAN assets and topology.

ANSI T11 Fibre Channel FC-MI includes the following for the automated discovery of FC SAN assets and topology:

- Hosts (HBAs)
- FC interconnects
- FC storage devices

The T11 FC-MI also includes the following:

- FC-GS-3/4 (discovery, zoning, and so forth)
- RNID (advanced device recognition)
- Platform registration (device recognition and launch)
- Common HBA API (fabric and storage views)
- Name server (connectivity)
- Management server (SAN connectivity and topology)
- RSCN (advanced event detection)
- SCSI queries (storage views, volume information, and so forth)
- SNMP Fabric Element (FE) MIB
- SNMP FC Management MIB (discovery, performance statistics, and so forth)
- SNMP alerts

Appendix B. Accessibility features for Tivoli Storage Productivity Center

Accessibility features help users who have a disability, such as restricted mobility or limited vision, to use information technology products successfully.

Accessibility features

The following list includes the major accessibility features in IBM Tivoli Storage Productivity Center:

- Keyboard-only operation in the stand-alone GUI and the web-based GUI. Restriction: In the stand-alone GUI, you must use the mouse to navigate the Topology Viewer and report graphs.
- Interfaces that are commonly used by screen readers.
- An information center that includes the following accessibility features:
  - The information center is provided in XHTML 1.0 format, which is viewable in most web browsers. With XHTML, you can view documentation according to the display preferences that are set in your browser. XHTML supports screen readers and other assistive technologies.
  - All documentation for Tivoli Storage Productivity Center is available in Adobe Portable Document Format (PDF) by using the Adobe Acrobat Reader. You can access the PDFs from the Printable PDFs topic in the information center at http://publib.boulder.ibm.com/infocenter/tivihelp/v59r1/index.jsp.
  - All images in the information center are provided with alternative text, so that visually impaired users can understand the contents of the images.

Keyboard navigation in the stand-alone GUI

The stand-alone GUI uses standard Microsoft Windows navigation keys. However, you must use the mouse to navigate the Topology Viewer and report graphs. Standard operating system keystrokes are used for standard operating system operations.

Keyboard navigation in the web-based GUI

Most of the features of the web-based GUI are accessible by using the keyboard. For those features that are not accessible, equivalent function is available by using the command-line interface (CLI), except as noted in the product release notes.

You can use keys or key combinations to perform operations and initiate many menu actions that can also be done through mouse actions. The following sections describe the keys or key combinations for different parts of the web-based GUI:

For navigating the web-based GUI and the context-sensitive help system:

- To navigate to the next link, button, or topic within a panel, press Tab.
- To move to the previous link, button, or topic within a panel, press Shift+Tab.
- To select an object, when the object is in focus, press Enter.

For actions menus:

- To navigate to the grid header, press Tab.

© Copyright IBM Corp. 2001, 2013

- To reach the drop-down field, press the Left Arrow or Right Arrow key.
- To open the drop-down menu, press Enter.
- To select the menu items, press the Up Arrow or Down Arrow key.
- To start the action, press Enter.

For filters:

To specify a filter option and text:

1. Press Tab to navigate to the magnifying glass icon.
2. Press the Up Arrow or Down Arrow key to navigate the filtering list.
3. Press Enter to select a filtering option.
4. When a filtering option is selected, the cursor moves to the filter text box. Type the filter text and press Enter. To reset a filter, press Enter.

For text fields:

- To navigate to text fields, press Tab.
- To navigate to the fields that are available for editing, press Tab.
- To navigate to the next field or to the **Submit** button, press Tab.

For tables or lists:

- To navigate between column headers, focus on a column header and use the Left Arrow and Right Arrow keys to move to other column headers.
- To navigate between data cells, focus on a data cell and use the Left, Right, Up, Down, Pageup, and Pagedown Arrow keys.
- To sort a column, focus on a column header and press Enter. The focus remains on the column header after the sort occurs.
- To change the size of a column, focus on the column header, hold Shift+Control, and press the Left or Right Arrow keys.
- To follow a link in a data cell, focus on a data cell and press Shift+F9.
- To open a menu for a table row, focus on the row and press Shift+F10.
- To select consecutive rows, select the first row and hold Shift, press the Up or Down Arrow keys to go to the last row in the range, and press the Space bar to add the new rows to the selection.
- To select non-consecutive rows, select a row and hold Control, press the Up or Down Arrow keys, and press the Space bar to add the new row to the selection.

Restriction: For Chinese languages, the keyboard combination Control+Space bar is not enabled for selecting multiple rows at the same time.

IBM and accessibility

For more information about IBM's commitment to accessibility, see the IBM Human Ability and Accessibility Center website at http://www.ibm.com/able/.

Appendix C. Accessibility features for Tivoli Storage Productivity Center for Replication

Accessibility features help users who have a disability, such as restricted mobility or limited vision, to use information technology products successfully.

The following list includes the major accessibility features in Tivoli Storage Productivity Center for Replication:

- Keyboard-only operation
- Interfaces that are commonly used by screen readers
- Keys that are discernible by touch but do not activate just by touching them
- Industry-standard devices for ports and connectors
- The attachment of alternative input and output devices

For more information about the commitment that IBM has for accessibility, see the IBM Human Ability and Accessibility Center website at www.ibm.com/able.

Accessibility and keyboard shortcuts in the information center

Accessibility features help users with physical disabilities, such as restricted mobility or limited vision, to use software products successfully. Using the major accessibility features in this product, users can perform these tasks:

- Use assistive technologies, such as screen-reader software and digital speech synthesizer, to hear what is displayed on the screen. Consult the product documentation of the assistive technology for details on using those technologies with this product.
- Operate specific or equivalent features by using only the keyboard.
- Magnify what is displayed on the screen.

In addition, the documentation was modified to include the following features to aid accessibility:

- All documentation is available in HTML formats to give the maximum opportunity for users to apply screen-reader software technology.
- All images in the documentation are provided with alternative text so that users with vision impairments can understand the contents of the images.

Use the following key combinations to navigate the interface by keyboard:

- To go directly to the Topic pane, press Alt+K, and then press Tab.
- In the Topic pane, to go to the next link, press Tab.
- To go directly to the Search Results view, press Alt+R, and then press the Enter or Up-Arrow key to enter the view.
- To go directly to the Navigation (Table of Contents) view, press Alt+C, and then press the Enter or Up-Arrow key to enter the view.
- To expand and collapse a node in the navigation tree, press the Right and Left-Arrow keys.
- To move to the next topic node, press the Down-Arrow or Tab key.
- To move to the previous topic node, press the Up-Arrow key or Shift+Tab.
- To go to the next link, button, or topic node from inside on of the views, press Tab.

© Copyright IBM Corp. 2001, 2013

- To scroll all the way up or down in a pane, press Home or End.
- To go back, press Alt+Left Arrow; to go forward, press Alt+Right Arrow.
- To go to the next pane, press F6.
- To move to the previous pane, press Shift+F6.
- To print the active pane, press Ctrl+P.

Related accessibility information for sight-impaired users

The following list contains hints and tips that can help you more fully use the graphical user interface:

Drop-down lists are positioned directly over or before the radio button that activates it.

If you use a screen reader, you should be aware that there are radio buttons to activate drop-down lists for several GUI pages. The way to activate the drop-down list is by selecting the associated radio button. The drop-down list is positioned directly over or before the radio button that activates it. When you use a screen reader that processes the fields and controls of a page sequentially, you might select the radio button, but not know that the associated drop-down list has been activated. The screen reader processes inactive drop-down lists first, and then processes the next radio button. The drop-down list is activated if you select the radio button.

On the following pages, keep in mind that radio buttons activate a drop-down list:
- Administration
- ESS/DS Paths
- Sessions
- Session Details
- Storage Systems

Tables are best understood by reviewing the surrounding text and the table row and column number of the table.

On some graphical user pages, tables use the header or row ID attributes when reading a single cell. The screen reader reads the table row and column number, along with cell data. Therefore, you can infer the column header and row ID.

Experiment with and fine-tune the way your screen reader pronounces some of the product abbreviations.

Your screen reader might pronounce abbreviations as if they were words. For example, the common abbreviation for Enterprise Storage Server is ESS. Your screen reader might read ESS as the word "ess". With some screen readers you can hear alternate pronunciations. If you frequently use the software you might prefer to fine-tune such associations in your settings. When an association is created, the screen reader can recognize the abbreviation as a word. If you can add dictionary words with your screen reader, replace the capitalized character sequence with the sequence E space S space S.

Typically, this abbreviation is used in the combination form of ESS/DS. This term refers to the Enterprise Storage Server 800, the DS6000, or the DS8000.

Some decorative artifacts might persist if the cascading style sheet is disabled.

Enable cascading style sheets when possible; otherwise, some decorative elements might persist in the web browser GUI. These artifacts do not affect performance. If they become too distracting, consider using the command-line interface instead.

For efficiency, confirmation dialogs place initial focus on the Yes button.

When a confirmation dialog box is displayed, focus is given to the **Yes** button. Therefore, the screen reader reads "Yes" but does not read the confirmation text. The software processes the information in this way when you do the following types of tasks:

- Perform an action on a session
- Remove a connection to a storage system
- Click the **About link**
- Create a high-availability connection

To read the confirmation text before clicking the **Yes**, **No**, or **OK** button, view the previous heading before the button.

Dojo components are not read by all screen readers.

The Job Access for Windows and Speech (JAWS) screen reader does not read some Dojo components on Windows Internet Explorer. Use the command-line interface instead of the GUI with JAWS on Windows Internet Explorer.

Firefox is the preferred browser for use with a screen reader.

Use Firefox as the screen reader because other browsers might not fully expose assistive technology content to the screen reader.

Glossary

This glossary includes terms and definitions for IBM Tivoli Storage Productivity Center.

The following cross-references are used in this glossary:

- See refers you from a term to a preferred synonym, or from an acronym or abbreviation to the defined full form.
- See also refers you to a related or contrasting term.

To view glossaries for other IBM products, go to www.ibm.com/software/globalization/terminology (opens in new window).

A

active management server
A management server from which the storage environment can be monitored and managed. The active management server replicates its database to the standby server.

B

business continuity
The capability of a business to withstand outages and to operate mission-critical services normally and without interruption in accordance with predefined service-level agreements.

C

CIM See Common Information Model.

CIM agent
The code that consists of common building blocks that can be used instead of proprietary software or device-specific programming interfaces to manage devices that are compliant with the Common Information Model (CIM).

CKD See count key data.

cluster

1. In Storwize® V7000, a pair of nodes that provides a single configuration and service interface.
2. A loosely coupled collection of independent systems (or nodes) organized into a network for the purpose of sharing resources and communicating with each other.
3. A collection of complete systems that work together to provide a single, unified computing capability.
4. In IBM System Storage DS8000, a partition capable of performing all DS8000 series functions. With two clusters in the DS8000 storage unit, any operational cluster can take over the processing of a failing cluster.

Common Information Model (CIM)
An implementation-neutral, object-oriented schema for describing network management or systems management information. The Distributed Management Task Force (DMTF) develops and maintains CIM specifications.

community name
The part of an SNMP message that represents a password-like name and that is used to authenticate the SNMP message.

consistency group
A group of copy relationships between virtual volumes or data sets that are maintained with the same time reference so that all copies are consistent in time.

copy set
The set of source volumes or target volumes involved in a FlashCopy operation.

count key data (CKD)
In mainframe computing, a data-record format employing self-defining record formats in which each record is represented by up to three fields: a count field identifying the record and specifying its format, an optional key field that can be used to identify the data area contents, and an optional data field that typically contains the user data.

© Copyright IBM Corp. 2001, 2013

D

data collection
The process of obtaining performance and availability monitoring data and providing that data to a metric evaluator. Examples of data collectors include Domain Name System (DNS) probes, web page analyzers, or database analyzers. See also discovery.

data source
A storage resource or agent that provides data about a storage environment.

discovery
The process of finding resources within an enterprise, including finding the new location of monitored resources that were moved. See also data collection.

E

ECKD See extended count key data.

enterprise repository
A component of the data server that records and stores all information about the monitored computers' storage assets and their usage over time. The repository is organized into relational database tables and is accessed by the data server using Java Database Connectivity (JDBC).

event An occurrence of significance to a task or system. Events can include completion or failure of an operation, a user action, or the change in state of a process.

extended count key data (ECKD)
An extension of the count-key-data (CKD) architecture. It includes additional commands that can be used to improve performance.

F

FlashCopy
An optional feature of the Storage System DS family that can make an instant copy of data, that is, a point-in-time copy of a volume.

freeze An operation in which a storage system blocks I/O from the host system to the affected volumes on the primary site. A freeze operation stops mirroring between the primary and secondary volumes to ensure data consistency at the secondary site. See also thaw.

G

GB See gigabyte.

GiB See gibibyte.

gibibyte (GiB)
In digital information storage, a base-2 unit of measurement equal to 1,073,741,824 bytes (2 to the 30th power). See also gigabyte.

gigabyte (GB)
For processor storage, real and virtual storage, and channel volume, 10 to the power of nine or 1,073,741,824 bytes. For disk storage capacity and communications volume, 1,000,000,000 bytes. See also gibibyte.

Global Copy
A non-synchronous long-distance copy option for data migration and backup. See also Global Mirror, Metro Mirror, remote mirror and copy.

Globally Unique Identifier (GUID)
An algorithmically determined number that uniquely identifies an entity within a system.

Global Mirror
An optional capability of the remote mirror and copy feature that provides a two-site extended-distance remote copy. Data that is written by the host to the storage unit at the local site is automatically maintained at the remote site. See also Global Copy, Metro Mirror, remote mirror and copy.

grain size
The unit size for allocating space on thin-provisioned volumes, such as 32, 64, 128, and 256 kibibyte. The grain size is defined when a volume is created.

GUID See Globally Unique Identifier.

H

Hardware Management Console (HMC)
In a system storage environment, a system that acts as the focal point for configuration, management of Copy Services functions, and maintenance.

heat map
A color-coded data chart in which colors are used to differentiate values in a data set.

HMC See Hardware Management Console.

host volume
A volume that represents the volume functional role from an application point of view. The host volume can be connected to a host or server. It receives read, write, and update application I/O, depending on the site to which the application is writing.

hypervisor
Software or a physical device that enables multiple instances of operating systems to run simultaneously on the same hardware.

I

in-band discovery
The process of discovering information about the storage area network (SAN), including topology and attribute data, through the Fibre Channel data paths. See also out-of-band discovery.

J

journal volume
A volume that holds a consistent copy of data until a new consistent copy is formed. The journal volume restores the last consistent point during a recovery.

K

KB See kilobyte.

KiB See kibibyte.

kibibyte (KiB)
A base-2 unit of measurement that is equal to 1,024 bytes (2 to the 10th power). See also kilobyte.

kilobyte (KB)
For processor storage, real and virtual storage, and channel volume, 2 to the power of 10 or 1,024 bytes. For disk storage capacity and communications volume, 1,000 bytes. See also kibibyte.

L

launch-in-context
An operation in which a user starts a secondary application from a primary application to perform a specific task. Using the parameters, navigation instructions, and user credentials that are supplied by the primary application, the secondary application opens to the specific place in which to complete the task.

logical unit number (LUN)
In the Small Computer System Interface (SCSI) standard, a unique identifier used to differentiate devices, each of which is a logical unit (LU).

LUN See logical unit number.

M

Management Information Base (MIB)
In the Simple Network Management Protocol (SNMP), a database of objects that can be queried or set by a network management system.

management server
A system that provides a central point of control for managing data replication.

management server relationship
A connection between two replication servers, where one server acts as the active server and replicates the data that is necessary for the standby server to take control of the replication environment.

MB See megabyte.

mebibyte (MiB)
A base-2 unit of measurement that is equal to 1,048,576 bytes (2 to the 20th power). See also megabyte.

megabyte (MB)
For processor storage, real and virtual storage, and channel volume, 2 to the 20th power or 1,048,576 bytes. For disk storage capacity and communications volume, 1,000,000 bytes. See also mebibyte.

Metro Global Mirror
A three-site, high availability, disaster recovery solution. Metro Global Mirror uses synchronous replication to mirror data between a local site and an

intermediate site, and asynchronous replication to mirror data from an intermediate site to a remote site.

Metro Mirror
A function of the remote mirror and copy feature that constantly updates a secondary copy of a volume to match changes made to a source volume. See also Global Copy, Global Mirror, remote mirror and copy.

MiB See mebibyte.

MIB See Management Information Base.

N

namespace
The scope within which a Common Information Model (CIM) schema applies.

native interface
An interface that is specific to a system or subsystem.

O

out-of-band discovery
The process of discovering storage area network (SAN) information, including topology and device data, without using the Fibre Channel data paths. A common mechanism for out-of-band discovery is the use of SNMP Management Information Base (MIB) queries, which are invoked over an IP network. See also in-band discovery.

P

ping

1. The command that sends an Internet Control Message Protocol (ICMP) echo-request packet to a gateway, router, or host with the expectation of receiving a reply.
2. A job that tracks the availability of assets and that is performed by an agent. Several ping jobs can be used to monitor the availability of any computer or subset of computers in the network.

pool A grouping of storage space that consists of volumes, logical unit numbers (LUNs), or addresses that share a common set of administrative characteristics.

practice volume
A volume that can be used to test disaster-recovery actions while maintaining disaster-recovery capability.

primordial pool
Storage capacity that is unallocated on a storage device. Storage pools are created by allocating storage capacity from primordial pools.

probe A data collection job that itemizes and creates an inventory of assets, such as computers, controllers, disk drives, file systems, and logical units.

R

recovery point objective
The maximum amount of data loss that can be tolerated during a service interruption.

remote mirror and copy
A feature of a storage server that constantly updates a secondary copy of a logical volume to match changes made to a primary logical volume. The primary and secondary volumes can be on the same storage server or on separate storage servers. See also Global Copy, Global Mirror, Metro Mirror.

resource
In a storage environment, an entity that is monitored. Resources can include fabrics, switches, computers, and storage systems.

role A job function that identifies the tasks that a user can perform and the resources to which a user has access. A user can be assigned one or more roles.

role pair
The association of two volume roles in a session that take part in a copy relationship. For example, in a Metro Mirror session, the role pair can be the association between host volumes at the primary site and host volumes at the secondary site (H1-H2).

S

scan A data collection job that monitors storage usage and file statistics on the resources in an environment.

session
A collection of source and target volumes that are managed to create consistent copies of data. The type of data replication that is associated with the session determines the actions that can be conducted for the volumes.

site awareness
The association of a location with each storage system in a session. Site awareness ensures that a volume can only be selected for a session if it matches the location of the site. Site awareness helps to prevent both reversing a hardware relationship and selecting volumes at the wrong location.

SMI-S See Storage Management Initiative Specification.

standby management server
A management server that is a backup for the active server. The replication environment cannot be monitored or managed from the standby server.

Storage Management Initiative Specification (SMI-S)
A design specification developed by the Storage Networking Industry Association (SNIA) that specifies a secure and reliable interface with which storage management systems (SMSs) can identify, classify, monitor, and control physical and logical resources in a storage area network (SAN). The interface integrates the various devices to be managed in a SAN and the tools used to manage them.

storage pod
A logical entity of components of a system consisting of two storage nodes, and one or two storage subsystems directly connected with these storage nodes.

storage resource group
A named collection of logically related resources that are monitored by Tivoli Storage Productivity Center. Monitored resources can include fabrics, switches, computers, storage systems, and other storage resource groups.

T

target volume
A volume that receives data from a host volume or another intermediate volume.

thaw An operation in which a storage system releases the block of the I/O from the host system to the affected volumes on the primary site. A thaw operation can occur after a freeze operation ends and consistency is formed on the secondary site. See also freeze.

track space-efficient volume (TSE volume)
A volume in which storage space is allocated on an as-needed basis by using space on the target volume only when tracks are copied from the source volume to the target volume.

TSE volume
See track space-efficient volume.

V

virtualization
The substitution of virtual resources for actual resources, where the virtual resources have the same functions and external interfaces as their counterparts, but differ in attributes, such as size, performance, and cost. Virtualization is commonly applied to physical hardware resources by combining multiple physical resources into shared pools from which users receive virtual resources.

virtual storage area network (VSAN)
A fabric within the storage area network (SAN).

VSAN See virtual storage area network.

Z

zone A logical grouping of switches, switch ports, and their attached devices in a fabric.

zone alias
A name that is given to a collection of one or more zone members to be managed together.

zone set

A group of zones that function together on a fabric.

Notices

This information was developed for products and services offered in the U.S.A.

IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user's responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not grant you any license to these patents. You can send license inquiries, in writing, to:

IBM Director of Licensing
IBM Corporation
North Castle Drive
Armonk, NY 10504-1785
U.S.A.

For license inquiries regarding double-byte character set (DBCS) information, contact the IBM Intellectual Property Department in your country or send inquiries, in writing, to:

11400 Burnet Road
Austin, TX 78758
U.S.A

Such information may be available, subject to appropriate terms and conditions, including in some cases, payment of a fee.

The licensed program described in this document and all licensed material available for it are provided by IBM under terms of the IBM Customer Agreement, IBM International Program License Agreement or any equivalent agreement between us.

Any performance data contained herein was determined in a controlled environment. Therefore, the results obtained in other operating environments may vary significantly. Some measurements may have been made on development-level systems and there is no guarantee that these measurements will be the same on generally available systems. Furthermore, some measurements may have been estimated through extrapolation. Actual results may vary. Users of this document should verify the applicable data for their specific environment.

Information concerning non-IBM products was obtained from the suppliers of those products, their published announcements or other publicly available sources. IBM has not tested those products and cannot confirm the accuracy of performance, compatibility or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

This information contains examples of data and reports used in daily business operations. To illustrate them as completely as possible, the examples include the names of individuals, companies, brands, and products. All of these names are fictitious and any similarity to the names and addresses used by an actual business enterprise is entirely coincidental.

COPYRIGHT LICENSE: This information contains sample application programs in source language, which illustrate programming techniques on various operating platforms. You may copy, modify, and distribute these sample programs in any form without payment to IBM, for the purposes of developing, using, marketing or distributing application programs conforming to the application programming interface for the operating platform for which the sample programs are written. These examples have not been thoroughly tested under all conditions. IBM, therefore, cannot guarantee or imply reliability, serviceability, or function of these programs. The sample programs are provided "AS IS", without warranty of any kind. IBM shall not be liable for any damages arising out of your use of the sample programs.

If you are viewing this information softcopy, the photographs and color illustrations may not appear.

Privacy policy considerations

IBM Software products, including software as a service solutions, (“Software Offerings”) may use cookies or other technologies to collect product usage information, to help improve the end user experience, to tailor interactions with the end user, or for other purposes. In many cases no personally identifiable information is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect personally identifiable information. If this Software Offering uses cookies to collect personally identifiable information, specific information about this offering’s use of cookies is set forth below.

This Software Offering does not use cookies or other technologies to collect personally identifiable information.

If the configurations deployed for this Software Offering provide you as customer the ability to collect personally identifiable information from end users via cookies and other technologies, you should seek your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent.

For more information about the use of various technologies, including cookies, for these purposes, see IBM’s Privacy Policy at http://www.ibm.com/privacy and IBM’s Online Privacy Statement at http://www.ibm.com/privacy/details the section entitled “Cookies, Web Beacons and Other Technologies” and the “IBM Software Products and Software-as-a-Service Privacy Statement” at http://www.ibm.com/software/info/product-privacy.

Trademarks

IBM, the IBM logo, and ibm.com are trademarks or registered trademarks of International Business Machines Corp., registered in many jurisdictions worldwide.
