## Digitally Controlled Potentiometer (XDCP ${ }^{\text {M }}$ )

The Intersil X93155 is a digitally controlled potentiometer (XDCP). The device consists of a resistor array, wiper switches, a control section, and nonvolatile memory. The wiper position is controlled by a 3-wire interface.

The potentiometer is implemented by a resistor array composed of 31 resistive elements and a wiper switching network. The position of the wiper element is controlled by the $\overline{\mathrm{CS}}, \mathrm{U} / \overline{\mathrm{D}}$, and $\overline{\mathrm{INC}}$ inputs. The position of the wiper can be stored in nonvolatile memory and then be recalled upon during a subsequent power-up operation.

The device is connected as a two-terminal variable resistor and can be used in a wide variety of applications including:

- Bias and Gain Control
- LCD Contrast Adjustment

## Features

- Solid-state potentiometer
- Up/Down interface
- 32 wiper tap points per potentiometer
- Wiper position stored in nonvolatile memory and recalled on power-up
- 31 resistive elements per potentiometer
- Temperature compensated
- Maximum resistance tolerance $\pm 25 \%$
- Terminal voltage, 0 to $\mathrm{V}_{\mathrm{CC}}$
- Low power CMOS
- $\mathrm{V}_{\mathrm{CC}}=5 \mathrm{~V} \pm 10 \%$
- Active current, $200 \mu \mathrm{~A}$ typ.
- Standby current, $2.0 \mu \mathrm{~A}$ max
- High reliability
- Endurance 200,000 data changes per bit
- Register data retention, 100 years
- $\mathrm{R}_{\text {TOTAL }}$ value $=50 \mathrm{k} \Omega$
- Packages
- Pb-free available (RoHS compliant)

Pinout

*NC can be left unconnected, or connected to any voltage between $\mathrm{V}_{\text {SS }}$ and $\mathrm{V}_{\mathrm{CC}}$.

## Ordering Information

| PART NUMBER | PART MARKING | $\mathrm{V}_{\text {cc }}$ LIMITS (V) | $\mathrm{R}_{\text {TOTAL }}(\mathrm{k} \Omega$ ) | TEMP RANGE ( ${ }^{\circ} \mathrm{C}$ ) | PACKAGE | PKG DWG. \# |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| X93155UM8I* | AGM | $5 \pm 10 \%$ | 50 | -40 to +85 | 8 Ld MSOP | M8.118 |
| X93155UM8IZ* (Note) | DCH |  |  | -40 to +85 | 8 Ld MSOP (Pb-free) | M8.118 |

*Add "T1" suffix for tape and reel. Please refer to TB347 for details on reel specifications.
NOTE: These Intersil Pb-free plastic packaged products employ special Pb-free material sets; molding compounds/die attach materials and $100 \%$ matte tin plate PLUS ANNEAL - e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb -free requirements of IPC/JEDEC J STD-020.

## Block Diagram

## Pin Descriptions

| MSOP | SYMBOL | BRIEF DESCRIPTION |
| :---: | :---: | :---: |
| 1 | $\overline{\mathrm{INC}}$ | Increment ( $\overline{\mathrm{INC}}$ ). The $\overline{\mathrm{INC}}$ input is negative-edge triggered. Toggling $\overline{\mathrm{INC}}$ will move the wiper and either increment or decrement the counter in the direction indicated by the logic level on the $U / \bar{D}$ input. |
| 2 | U/FM |  |
| 3 | $\mathrm{R}_{\mathrm{H}}$ | $\mathbf{R}_{\mathbf{H}}$. The $\mathrm{R}_{\mathrm{H}}$ and $\mathrm{R}_{\mathrm{L}}$ pins of the X 93155 are equivalent to the end terminals of a variable resistor. |
| 4 | $\mathrm{V}_{\mathrm{SS}}$ | Ground. |
| 5 | NC | No Connection (or can be connected to any voltage between $\mathrm{V}_{\mathrm{SS}}$ and $\mathrm{V}_{\mathrm{CC}}$.) |
| 6 | $\mathrm{R}_{\mathrm{L}}$ | $\mathbf{R}_{\mathbf{L}}$. The $\mathrm{R}_{\mathrm{H}}$ and $\mathrm{R}_{\mathrm{L}}$ pins of the X 93155 are equivalent to the end terminals of a variable resistor. |
| 7 | $\overline{\mathrm{CS}}$ | Chip Select ( $\overline{\mathbf{C S}}$ ). The device is selected when the $\overline{\mathrm{CS}}$ input is LOW. The current counter value is stored in nonvolatile memory when $\overline{\text { CS }}$ is returned HIGH while the INC input is also HIGH. After the store operation is complete, the X93155 will be placed in the low power standby mode until the device is selected once again. |
| 8 | $\mathrm{V}_{\mathrm{CC}}$ | Supply Voltage. |

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

NOTES:

1. Absolute linearity is utilized to determine actual wiper resistance versus expected resistance $=\left(R_{H(n)}(\right.$ actual $\left.)-R_{H(n)}(\operatorname{expected})\right)= \pm 1 \mathrm{MI}$ Maximum. $\mathrm{n}=1$.. 29 only
2. Relative linearity is a measure of the error in step size between taps $=R_{H(n+1)}\left[R_{H(n)}+M I\right]= \pm 0.5 M I, n=1$.. 29 only.
3. $1 \mathrm{Ml}=$ Minimum Increment $=\mathrm{R}_{\mathrm{TOT}} / 31$.
4. Typical values are for $\mathrm{T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}$ and nominal supply voltage.
5. Limits established by characterization and are not production tested.
6. When performing multiple write operations, $\mathrm{V}_{\mathrm{CC}}$ must not decrease by more than 150 mV from its initial value.
7. Parts are $100 \%$ tested at $+25^{\circ} \mathrm{C}$. Over-temperature limits established by characterization and are not production tested.

## AC Timing

## Power-up and Power-down Requirements

There are no restrictions on the power-up or power-down conditions of $\mathrm{V}_{\mathrm{CC}}$ and the voltages applied to the potentiometer pins provided that $\mathrm{V}_{\mathrm{CC}}$ is always more positive than or equal to $\mathrm{V}_{\mathrm{H}}$ and $\mathrm{V}_{\mathrm{L}}$, i.e., $\mathrm{V}_{\mathrm{CC}} \geq \mathrm{V}_{\mathrm{H}}, \mathrm{V}_{\mathrm{L}}$. The $V_{C C}$ ramp rate specification is always in effect.

## Pin Descriptions

## $\boldsymbol{R}_{\boldsymbol{H}}$ and $\boldsymbol{R}_{\boldsymbol{L}}$

The $R_{H}$ and $R_{L}$ pins of the X 93155 are equivalent to the end terminals of a variable resistor, The ml$) \mathrm{mu} n$ vo age is $\mathrm{V}_{\mathrm{SS}}$ and the maximum $s L_{C C} V_{h}$ tern ino avo $R_{H}$ an $R_{2}$ references the relative position of the terminal in relation to wiper movement direction selected by the U/D input.

## Up/Down (U/D)

The U/D input controls the direction of the wiper movement and whether the counter is incremented or decremented.

## Increment (INC)

The $\overline{\mathrm{INC}}$ input is negative-edge triggered. Toggling $\overline{\mathrm{INC}}$ will move the wiper and either increment or decrement the counter in the direction indicated by the logic level on the U/D input.

## Chip Select ( $\overline{C S}$ )

The device is selected when the $\overline{\mathrm{CS}}$ input is LOW. The current counter value is stored in nonvolatile memory when $\overline{\mathrm{CS}}$ is returned HIGH while the $\overline{\mathrm{INC}}$ input is also HIGH. After the store operation is complete, the X93155 will be placed in the low power standby mode until the device is selected once again.

## Principles of Operation

There are three sections of the X93155: the input control, counter and decode section; the nonvolatile memory; and the resistor array. The input control section operates just like an up/down counter. The output of this counter is decoded to turn on a single electronic switch connecting a point on the
resistor array to the wiper output. Under the proper conditions the contents of the counter can be stored in nonvolatile memory and retained for future use. The resistor array is comprised of 31 individual resistors connected in series. At either end of the array and between each resistor is an electronic switch that transfers the connection at that point to the wiper. The wiper is connected to the $R_{L}$ terminal, forming a variable resistor from $\mathrm{R}_{\mathrm{H}}$ to $\mathrm{R}_{\mathrm{L}}$.

The wiper, when at either fixed terminal, acts like its mechanical equivalent and does not move beyond the last position, That is, the counter does net wrap around when COPO IUPter SI|

If the wiper is moved several positions, multiple taps are connected to the wiper for up to $10 \mu \mathrm{~s}$. The 2 -terminal resistance value for the device can temporarily change by a significant amount if the wiper is moved several positions.

When the device is powered-down, the last wiper position stored will be maintained in the nonvolatile memory. When power is restored, the contents of the memory are recalled and the wiper is set to the value last stored.

## Instructions and Programming

The $\overline{\mathrm{INC}}, \mathrm{U} / \overline{\mathrm{D}}$ and $\overline{\mathrm{CS}}$ inputs control the movement of the wiper along the resistor array. With $\overline{\mathrm{CS}}$ set LOW, the device is selected and enabled to respond to the U/D and $\overline{\mathrm{INC}}$ inputs. HIGH to LOW transitions on $\overline{\mathrm{INC}}$ will increment or decrement (depending on the state of the $U / \bar{D}$ input) a five bit counter. The output of this counter is decoded to select one of thirty two wiper positions along the resistive array.
The value of the counter is stored in nonvolatile memory whenever $\overline{\mathrm{CS}}$ transitions HIGH while the $\overline{\mathrm{INC}}$ input is also HIGH. In order to avoid an accidental store during power-up, $\overline{\mathrm{CS}}$ must go HIGH with $\mathrm{V}_{\mathrm{CC}}$ during initial power-up. When left open, the $\overline{\mathrm{CS}}$ pin is internally pulled up to $\mathrm{V}_{\mathrm{CC}}$ by an internal $30 \mathrm{k} \Omega$ resistor.

The system may select the X93155, move the wiper and deselect the device without having to store the latest wiper
position in nonvolatile memory. After the wiper movement is performed as previously described and once the new position is reached, the system must keep INC LOW while taking $\overline{\mathrm{CS}}$ HIGH. The new wiper position will be maintained until changed by the system or until a power-up/down cycle recalled the previously stored data. In order to recall the stored position of the wiper on power-up, the $\overline{\mathrm{CS}}$ pin must be held HIGH.

This procedure allows the system to always power-up to a preset value stored in nonvolatile memory; then during system operation, minor adjustments could be made. The adjustments might be based on user preference, system parameter changes due to temperature drift, or other system trim requirements.

The state of U/D may be changed while $\overline{C S}$ remains LOW. This allows the host system to enable the device and then move the wiper up and down until the proper trim is attained.

## Mode Selection

## Applications Information

Electronic digitally controlled (XDCP) potentiometers provide three powerful application advantages:

1. The variability and reliability of a solid-state potentiometer
2. The flexibility of computer-based digital controls
3. The retentivity of nonvolatile memory used for the storage of multiple potentiometer settings or data
