<http://www.manuallib.com/philips/74alvch16500-transceiver-datasheet.html>

The 74ALVCH16500 is a high-performance CMOS product.

This device is an 18-bit universal transceiver featuring non-inverting 3-State bus compatible outputs in both send and receive directions. Data flow in each direction is controlled by output enable (OEAB and OEBA), latch enable (LEAB and LEBA), and clock (CPAB and CPBA) inputs. For A-to-B data flow, the device operates in the transparent mode when LEAB is High. When LEAB is Low, the A data is latched if CPAB is held at a High or Low logic level. If LEAB is Low, the A-bus data is stored in the latch/flip-flop on the High-to-Low transition of CPAB. When OEAB is High, the outputs are active. When OEAB is Low, the outputs are in the high-impedance state.

18-bit universal bus transceiver (3-State)

74ALVCH16500

FEATURES

- Complies with JEDEC standard no. 8-1A
- CMOS low power consumption
- Direct interface with TTL levels
- Current drive ± 24 mA at 3.0 V
- All inputs have bushold circuitry
- Output drive capability 50 Ω transmission lines @ 85°C
- MULTIBYTE™ flow-through standard pin-out architecture
- Low inductance multiple V_{CC} and ground pins for minimum noise and ground bounce

DESCRIPTION

The 74ALVCH16500 is a high-performance CMOS product. This device is an 18-bit universal transceiver featuring non-inverting 3-State bus compatible outputs in both send and receive directions. Data flow in each direction is controlled by output enable (\overline{OE}_{AB} and \overline{OE}_{BA}), latch enable (LE_{AB} and LE_{BA}), and clock (\overline{CP}_{AB} and \overline{CP}_{BA}) inputs. For A-to-B data flow, the device operates in the transparent mode when LE_{AB} is High. When LE_{AB} is Low, the A data is latched if \overline{CP}_{AB} is held at a High or Low logic level. If LE_{AB} is Low, the A-bus data is stored in the latch/flip-flop on the High-to-Low transition of \overline{CP}_{AB} . When \overline{OE}_{AB} is High, the outputs are active. When \overline{OE}_{AB} is Low, the outputs are in the high-impedance state.

Data flow for B-to-A is similar to that of A-to-B but uses \overline{OE}_{BA} , LE_{BA} and \overline{CP}_{BA} . The output enables are complimentary (\overline{OE}_{AB} is active High, and \overline{OE}_{BA} is active Low).

To ensure the high impedance state during power up or power down, \overline{OE}_{BA} should be tied to V_{CC} through a pullup resistor and \overline{OE}_{AB} should be tied to GND through a pulldown resistor; the minimum value of the resistor is determined by the current-sinking/current-sourcing capability of the driver.

Active bus-hold circuitry is provided to hold unused or floating data inputs at a valid logic level.

QUICK REFERENCE DATA

GND = 0V; $T_{amb} = 25^\circ\text{C}$; $t_r = t_f = 2.5\text{ns}$

SYMBOL	PARAMETER	CONDITIONS	TYPICAL	UNIT	
t_{PHL}/t_{PLH}	Propagation delay An, Bn to Bn, An	$V_{CC} = 2.5\text{V}, C_L = 30\text{pF}$ $V_{CC} = 3.3\text{V}, C_L = 50\text{pF}$	3.1 2.9	ns	
$C_{I/O}$	Input/output capacitance		8.0	pF	
C_I	Input capacitance		4.0	pF	
C_{PD}	Power dissipation capacitance per latch	$V_I = \text{GND to } V_{CC}^1$	Outputs enabled	21	pF
			Outputs disabled	3	

NOTES:

- C_{PD} is used to determine the dynamic power dissipation (P_D in μW):
 $P_D = C_{PD} \times V_{CC}^2 \times f_i + \sum (C_L \times V_{CC}^2 \times f_o)$ where: f_i = input frequency in MHz; C_L = output load capacitance in pF;
 f_o = output frequency in MHz; V_{CC} = supply voltage in V; $\sum (C_L \times V_{CC}^2 \times f_o)$ = sum of outputs.
