INTERFACE DESCRIPTION

Section 1: Interface Description

This section provides information on the following aspects of the G1000 VHF NAV/COM interface:

1.1 OVERVIEW

On both the PFD and the MFD, the G1000 VHF NAV/COM interface occupies the top portion of the panel. As shown in Figure 1-1, the NAV-related controls, windows and fields are located on the left side, whereas the COM-related controls, windows and fields are located on the right side.

- Windows and fields
- Frequency status
- Color code
- Tuning box
- Frequency Toggle Arrow
- Radio status indications
- Controls

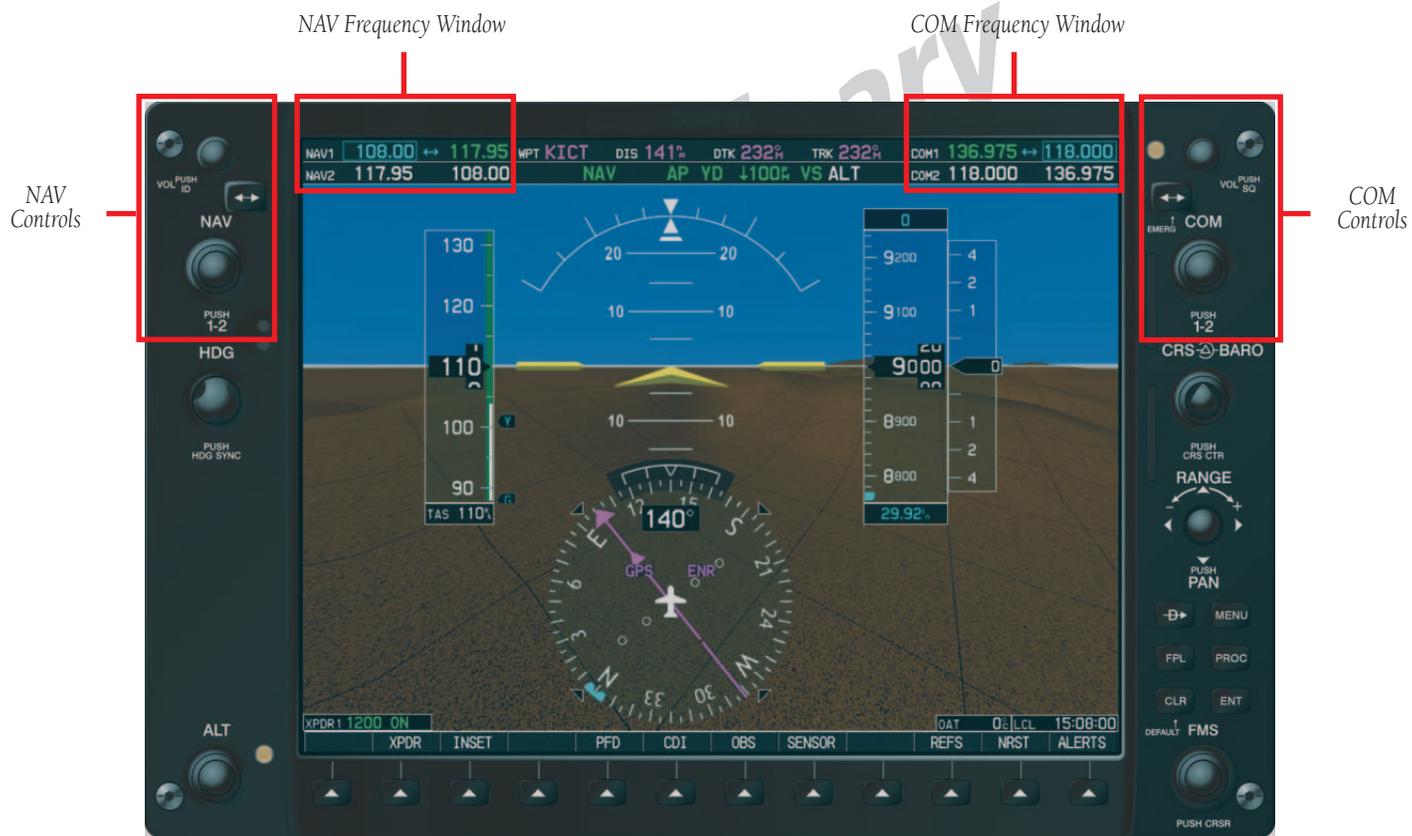

Figure 1-1 G1000 VHF NAV/COM Interface (PFD)

INTERFACE DESCRIPTION

1.2 WINDOWS AND FIELDS

On both the PFD and the MFD, the NAV and COM Frequency windows are located at the top of the display on either side of the Navigation Status bar.

- The **NAV Frequency window** is displayed to the left of the Navigation Status bar.
- The **COM Frequency window** is displayed to the right of the Navigation Status bar.

Each radio frequency sub-window is composed of two (2) fields, a **standby field** and an **active field**.

- In the NAV Frequency window, the active frequency field is located on the right side, while the standby frequency field is located on the left side.
- In the COM Frequency window, the active frequency field is located on the left side, while the standby frequency field is located on the right side.

1.3 FREQUENCY STATUS

Frequencies on the VHF NAV/COM interface can either be standby, active or selected.

- **Standby** – indicates that the frequency is located in the standby field of the associated radio.
- **Active** – indicates that the frequency is located in the active field of the associated radio.
- **Selected** – indicated that the frequency is active and that the associated radio is selected:
 - on the **HSI** (NAV frequencies)
 - on the **GMA 1347** audio panel (COM frequencies) - COM MIC.

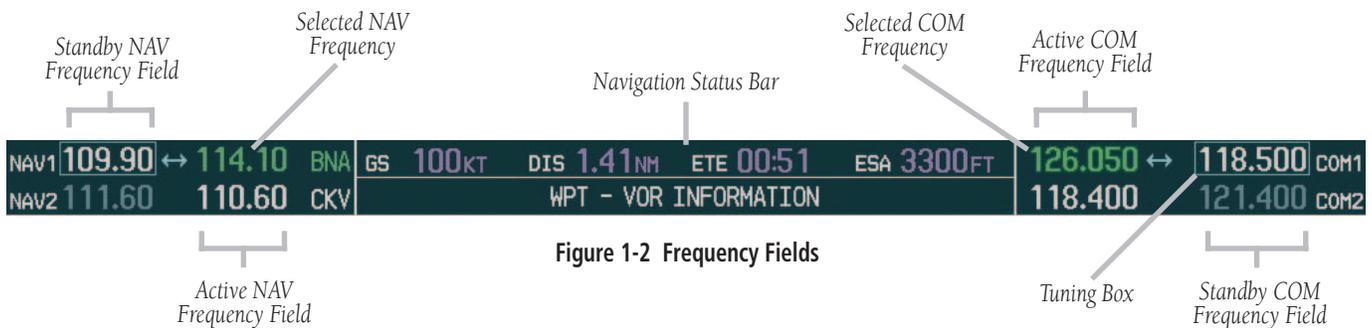

Figure 1-2 Frequency Fields

1.4 COLOR CODE

Frequencies located in the **active field** are displayed in **either green or white**.

- An active frequency that is displayed in **green** indicates that the corresponding radio is selected (i.e., in use).
- An active frequency that is displayed in **white** indicates that the corresponding radio is not selected.

Frequencies located in the **standby field** are displayed in **either white or gray**.

- The standby frequency that appears in the tuning box is displayed in **white**.
- The standby frequency that is not in the tuning box is displayed in **gray**.

NOTE: In GPS mode, both active NAV frequencies are displayed in white.

NOTE: In split COM mode, both active COM frequencies are displayed in green.

1.5 TUNING BOX

On both the PFD and the MFD, a cyan tuning box appears over the standby frequency field and can be moved from one standby frequency field to another for the purpose of tuning or radio selection.

In both the COM and NAV windows, the frequency toggle arrow appears next to the tuning box, between the active and standby frequencies.

Frequency Toggle Arrow

Frequency Tuning Box

Figure 1-3 Frequency Toggle Arrow and Tuning Box

1.6 FREQUENCY TOGGLE ARROW

A **Frequency Toggle Arrow** appears between the two frequencies of the radio sub-window on which the frequency tuning box is located. Pressing the dual **COM** or **NAV** knob toggles both the frequency tuning box and the **Frequency Toggle Arrow** between the radios.

NOTE: If the frequency tuning box is on a selected COM sub-window when a signal is received or transmitted for this radio, the **Frequency Toggle Arrow** is replaced by an **RX** or a **TX** indication, respectively.

NOTE: When the desired frequency is entered in the tuning box, it becomes a standby frequency. Pressing the **Frequency Toggle** key places this standby frequency into the active field, and vice versa.

1.7 RADIO STATUS INDICATIONS

- **RX** – When a signal is received on a COM radio, a white **RX** indication appears to the right of the corresponding COM frequency for the duration of the signal reception.
- **TX** – When a microphone is keyed, a white **TX** indication appears to the right of the corresponding COM frequency for the duration of the signal transmission.
- **ID** – When the **VOL/PUSH ID** knob is pressed, a white **ID** indication appears to the left of the NAV frequency on the selected NAV sub-window and the Morse code identifier audio for the selected VOR frequency can be heard if the corresponding NAV radio is selected on the audio panel.

1.8 CONTROLS

The NAV Frequency window is controlled by knobs and keys located to the left side of the display, while the COM Frequency window is controlled by knobs and keys located to the right side of the display.

The controls associated with the NAV window are:

- A **VOL/PUSH ID** knob
 - **Turn** to adjust the NAV radio volume level.
 - **Press** to turn the Morse code identifier ON and OFF.
- A **Frequency Toggle** key
 - **Press** to toggle the NAV frequencies between the active and standby fields.
- A dual **NAV** knob
 - **Turn** to tune a NAV frequency in the NAV tuning box (**large** knob for **MHz**; **small** knob for **kHz**).
 - **Press** to toggle the NAV tuning box between the NAV radios.

The controls associated with the COM window are the following ones:

- A **VOL/PUSH SQ** knob
 - **Turn** to adjust the COM radio volume level.
 - **Press** to turn squelch ON and OFF.
- A **Frequency Toggle** key
 - **Press** to toggle the COM frequencies between the active and standby fields.
- A dual **COM** knob
 - **Turn** to tune a COM frequency in the COM tuning box (**large** knob for **MHz**; **small** knob for **kHz**).
 - **Press** to toggle the COM tuning box between the COM radios.

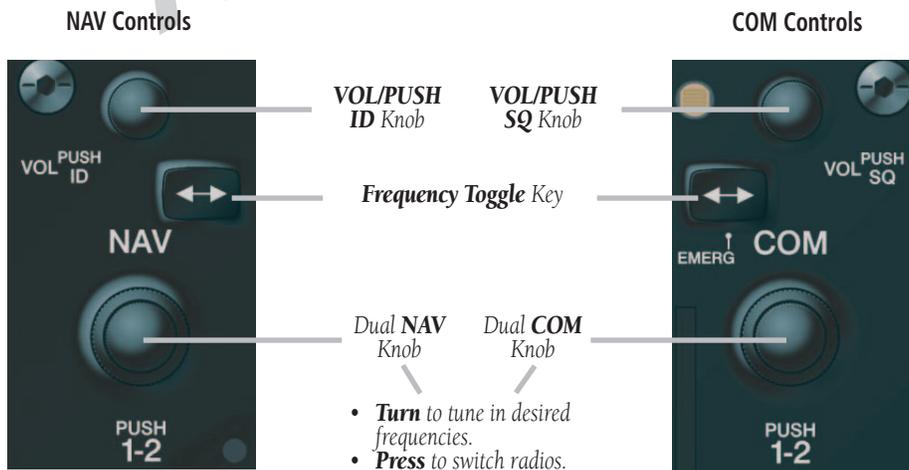

Figure 1-4 NAV/COM Controls

Section 2: COM Frequency Window

2.1 OVERVIEW

The G1000 COM radios operate in the aviation frequency band of 118.000 to 136.990 MHz with either 25 kHz or 8.33 kHz channel spacing.

NOTE: COM channel spacing can be configured through the MFD, in the System Setup Page of the AUX Page group.

The Communications Frequency window is located to the right of the Navigation Status bar, provides the control and display of dual VHF Radio Communication Transceivers (COM1 and COM2) and displays the following information:

- COM1 and COM2 active and standby frequencies
- Color-coded indication of the selected COM radio
- Indication of signal reception and transmission

NOTE: In split COM mode, both COM1 and COM2 active frequencies are selected and thus displayed in green.

2.2 VOLUME

Volume level for the COM radios can be adjusted using the **VOL/PUSH SQ** knob (top knob on the right side of the display) located above the **COM Frequency Toggle** key. Turning the **VOL/PUSH SQ** knob clockwise increases volume level, while turning this knob counter-clockwise decreases volume level.

2.3 AUTOMATIC SQUELCH

Automatic squelch provides maximum sensitivity to weaker signals while canceling most localized noise sources. Automatic squelch can be disabled for a COM radio by pressing the **COM** knob to select the desired COM sub-window, then by pressing the **VOL/PUSH SQ** knob.

When automatic squelch is disabled for a COM radio, COM audio remains continuously open and an RX indication appears between the active and standby frequency fields of this radio.

Figure 2-1 Overriding Automatic Squelch

NOTE: Pressing the **VOL/PUSH SQ** knob when automatic squelch is disabled reactivates the automatic squelch function.

2.4 SWITCHING THE TUNING BOX BETWEEN COM RADIOS

Pressing the **COM** knob toggles the frequency tuning box between the COM1 and COM2 fields.

NOTE: When a different COM MIC is selected on the audio panel, the frequency tuning box also moves on both the PFD and MFD.

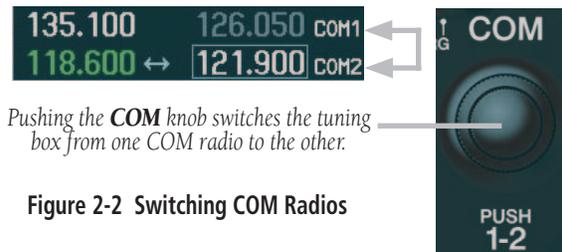

Figure 2-2 Switching COM Radios

2.5 MANUALLY TUNING A COM FREQUENCY

COM frequency manual tuning is performed by using the dual **COM** knob.

- The MHz (left) portion of the frequency can be tuned by turning the large **COM** knob.
- The kHz (right) portion of the frequency can be tuned by turning the small **COM** knob.

Turning either knob clockwise increases the tuned frequency. Conversely, turning either knob counterclockwise decreases the tuned frequency. The tuned frequency is placed in the standby frequency field of the COM Frequency window.

NOTE: Only when tuning frequencies manually can the standby frequency field for a COM radio be tuned to the same frequency as that located in the active field for the same COM radio.

2.6 TOGGLING COM FREQUENCIES

Pressing the **COM Frequency Toggle** key toggles the COM frequencies between the active and standby fields of the COM radio on which the **Frequency Toggle Arrow** is located.

Pressing the **COM Frequency Toggle** key toggles the COM frequencies.

Figure 2-3 Toggling COM Frequencies

2.7 SELECTING COM RADIOS

To be selected, a COM frequency must be placed in the active field and the corresponding COM radio must be selected on the GMA 1347 audio panel. When selected, the COM frequency of the selected COM radio is displayed in green.

NOTE: A COM radio can only be selected through the GMA 1347 audio panel (**COM MIC** key). Please, see *Garmin GMA 1347 Pilot's Guide* for details.

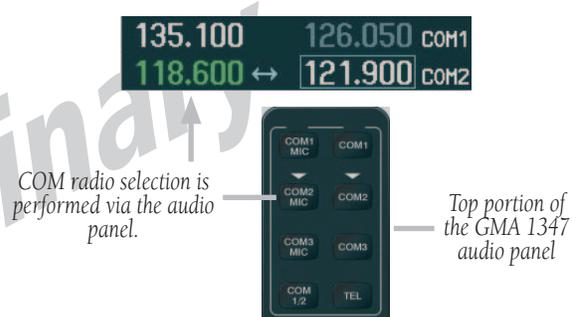

Figure 2-4 Selecting COM Radios

NOTE: The selected COM frequency is always displayed in green.

NOTE: In split COM mode, both COM1 and COM2 radios are selected; the associated active frequencies are thus displayed in green in the COM Frequency window.

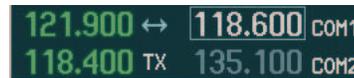

Figure 2-5 Split COM

2.8 RADIO STATUS

When a microphone is keyed, a white **TX** indication appears between the active COM frequency and the standby COM frequency to indicate that a transmission is in progress. The **TX** indication disappears once COM transmission is completed.

When a COM signal is received, a white **RX** indication appears to the right of the active COM frequency to indicate that a COM signal reception is in progress. The **RX** indication disappears once COM signal reception is over.

Figure 2-6 Radio Status Indications

NOTE: If a signal is transmitted or received on a COM radio for which frequency toggling is enabled (i.e., on which the tuning box is located), the **Frequency Toggle Arrow** disappears and is replaced by a **TX** or an **RX** indication, respectively.

2.9 EMERGENCY FREQUENCY (121.500 MHZ)

If data for the selected COM frequency is not received for a duration of one second, a communication failure is assumed by the system and the selected frequency is automatically changed to the emergency frequency (121.500 MHz).

Figure 2-7 Communication Failure

NOTE: In the event of a dual CDU failure, the emergency frequency (121.500 MHz) automatically becomes available to the pilot through the pilot headset.

Quickly Tuning and Activating 121.500 MHz

Pressing and holding the **COM Frequency Toggle** key for approximately two (2) seconds automatically loads the emergency COM frequency (121.500 MHz) in the active frequency field of the COM radio for which frequency toggling is enabled.

Figure 2-8 Quickly Tuning 121.500 MHz

2.10 STUCK MICROPHONE

If the **COM1 (or COM2) Remote Transfer** key becomes stuck, an alert appears on the PFD to advise the crew of a stuck COM microphone. Transmit capability is reset after 35 seconds of continuous transmitting.

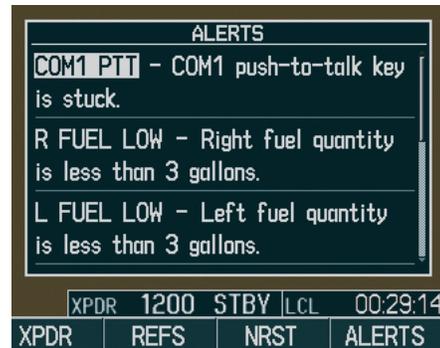

Figure 2-9 Stuck MIC Alert

OPERATION – AUTO-TUNING

Preliminary

This page intentionally left blank.

Section 3: NAV Frequency Window

3.1 OVERVIEW

The G1000 NAV radios operate in the aviation frequency band of 108.00 to 117.95 MHz, with 50 kHz channel spacing.

The Navigation Frequency window is located to the left of the Navigation Status bar, provides the control and display of dual VOR/ILS receivers (NAV1 and NAV2) and displays the following information:

- NAV1 and NAV2 active and standby frequencies
- NAV1 or NAV2 identifier indication (if the active NAV frequency is a valid frequency and its Morse code identifier signal is received by the system).
- Color code indication of the selected NAV receiver
- Indication of the Morse code identifier filter status

3.2 VOLUME

Volume level for the NAV radios can be adjusted by using the **VOL/PUSH ID** knob (top knob on the left side of the display) located above the **NAV Frequency Toggle** key. Turning the **VOL/PUSH ID** knob clockwise increases volume level, while turning this knob counter-clockwise decreases volume level.

3.3 MORSE CODE IDENTIFIER

Pressing the **VOL/PUSH ID** knob toggles the Morse code identifier filter ON and OFF for the active NAV frequency next to which the tuning box is located. When the Morse code identifier filter is ON, an **ID** indication appears to the left of the corresponding active NAV frequency.

NAV1 109.00 ↔ 114.10 BNA
NAV2 110.60 ID 111.60 GHM

The Morse code identifier filter is ON for the GHM VOR.

Figure 3-1 ID Indication

The Morse code identifier for an active NAV frequency can only be heard if the Morse code identifier filter for the corresponding NAV radio is turned on (i.e., if the ID indication appears next to the active NAV frequency) and if the corresponding NAV radio is selected on the GMA 1347 audio panel (i.e., the associated NAV radio annunciator lights are illuminated).

NAV1 109.00 ID 114.10 BNA
NAV2 110.60 ID 111.60 GHM

Here, since NAV2 is the only NAV radio selected on the audio panel, only the Morse code identifier for the GHM VOR can be heard.

NAV portion of the GMA 1347 audio panel

Figure 3-2 Morse Code Identifier Audio

3.4 SWITCHING THE TUNING BOX BETWEEN NAV RADIOS

Pressing the dual **NAV** knob toggles the frequency tuning box between the NAV1 and NAV2 sub-windows.

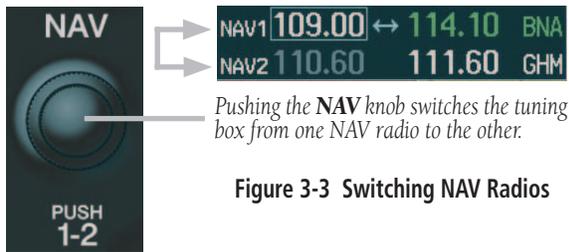

Figure 3-3 Switching NAV Radios

NOTE: When a different NAV radio is selected on the HSI via the **CDI** key, the NAV frequency tuning box also moves on the PFD and MFD. However, the NAV frequency tuning box does not move when GPS mode is selected.

NOTE: Only when tuning frequencies manually can the standby frequency field for a NAV radio be tuned to the same frequency as that located in the active field for the same NAV radio.

3.6 TOGGLING NAV FREQUENCIES

Pressing the **NAV Frequency Toggle** key toggles the NAV frequencies between the active and standby fields of the NAV radio on which the **Frequency Toggle Arrow** is located.

Figure 3-4 Toggling NAV Frequencies

3.5 MANUALLY TUNING A NAV FREQUENCY

NAV frequency manual tuning is performed by using the dual **NAV** knob.

- The MHz (left) portion of the frequency can be tuned by turning the large **NAV** knob.
- The kHz (right) portion of the frequency can be tuned by turning the small **NAV** knob.

Turning either knob clockwise increases the tuned frequency. Conversely, turning either knob counterclockwise decreases the tuned frequency. The tuned frequency is placed in the standby frequency field of the NAV Frequency window.

3.7 SELECTING A NAV RADIO

To be selected, a NAV frequency must be placed in the active field and the corresponding NAV radio must be displayed on the HSI. When selected, the active NAV frequency of the selected NAV radio is displayed in green.

The desired NAV radio can be selected using the **CDI** softkey. The three navigation modes that can be selected with the **CDI** softkey are as follows:

- **NAV1** – If NAV1 is selected as the NAV radio, a **single green arrow** is displayed on the HSI and the active NAV1 frequency is displayed in green.
- **NAV2** – If NAV2 is selected as the NAV radio, a **double green arrow** is displayed on the HSI and the active NAV2 frequency is displayed in green.
- **GPS Mode** – If GPS mode is selected, a **single magenta arrow** appears on the HSI and none of the active NAV frequencies are selected.

NOTE: In GPS mode, all active NAV frequencies are displayed in white.

When a VOR signal is received, the corresponding VOR name identifier is displayed to the right of the associated active NAV frequency.

NAV1	109.00	↔	114.10	BNA
NAV2	110.60		111.60	GHM

NAV radio selection is performed via the **CDI** softkey.

Figure 3-5 Selecting NAV Radios

OPERATION – NAV

Preliminary

This page intentionally left blank.

Section 4: Frequency Auto-tuning

4.1 OVERVIEW

The G1000 system offers multiple auto-tuning capabilities that help to reduce cockpit workload. The PFD allows for the auto-tuning of COM frequencies associated with the nearest airports, while the MFD provides auto-tuning of both COM and NAV frequencies from various pages. In addition, regardless of the display, the pertinent primary NAV frequency is entered systematically in the NAV window upon approach loading or activation.

In brief, frequencies can be automatically loaded in their respective frequency windows in the following ways:

- By using the **ENT** key when the frequency is highlighted on the appropriate page (PFD and MFD).
- By using the **LD NAV1** and **LD NAV2** softkeys when on the appropriate page (MFD only).
- Upon loading or activating an approach (PFD and MFD).

NOTE: Turn the **FMS** knob to scroll through a list of frequencies.

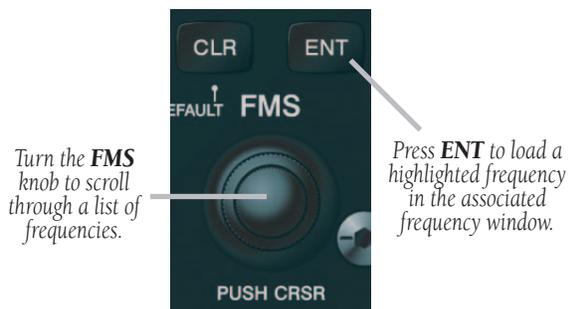

Figure 4-1 Loading Frequencies

4.2 AUTO-TUNING ON THE PFD

COM frequencies for the nearest airports may be viewed and automatically loaded from the Nearest Airport window on the PFD.

To auto-tune a COM frequency for a nearby airport:

1. Press the **NRST** softkey to open the Nearest Airports window, which displays the list of airport identifiers and corresponding COM frequencies.
2. Turn either **FMS** knob to highlight the desired COM frequency, and ensure that the COM frequency tuning box is on the desired COM sub-window.
3. Press the **ENT** key to load the COM frequency in the COM tuning box.

NOTE: When the desired frequency is entered in the tuning box, it becomes a standby frequency. Pressing the **Frequency Toggle** key places this standby frequency into the active field.

Pressing the **NRST** softkey opens the Nearest Airports window.

Figure 4-2 Nearest Airports Window (PFD)

4.3 AUTO-TUNING ON THE MFD

Frequencies can be automatically loaded from the following MFD pages:

- WPT – **Airport Information**
- WPT – **VOR Information**
- NRST – **Nearest Airports**
- NRST – **Nearest VOR**
- NRST – **Nearest Frequencies**

Figure 4-3 MFD Page Group Icon

NOTE: Upon any VOR/ILS approach activation, the appropriate NAV frequency is automatically loaded into the standby field of the selected NAV radio, regardless of the current MFD page that is displayed.

WPT - Airport Information Page

The Airport Information Page displays runway information and a list of frequencies pertinent to the selected airport identifier as well as departure, arrival and approach information.

To display the entire list of frequencies for a desired airport:

1. On the Airport Information Page, press the **INFO** softkey to display runway and frequency information for a specific airport.
2. Press the **FMS** knob to activate the highlight in the window.
3. Select the desired airport identifier by turning the **FMS** knob and press **ENT**. A list of all available frequencies for the selected airport appears.

Figure 4-4 WPT - Airport Information Page (Info)

To load the desired COM frequency automatically into the COM tuning box:

1. When the list of frequencies for the selected airport is displayed, highlight the desired frequency by turning the large **FMS** knob.
2. Press **ENT**.

NOTE: The runway PCL frequency (located in the Runways box of the INFO portion of the Airport Information Page) may also be highlighted with the large **FMS** knob and automatically loaded into the COM tuning box by pressing **ENT**.

To load the primary approach NAV frequency automatically into the NAV tuning box:

1. On the Airport Information Page, press the **APR** softkey to display approach information for a specific airport.
2. Press the **FMS** knob to activate the highlight in the window.
3. Turn the large **FMS** knob to highlight the primary NAV frequency located in the Primary Frequency box.
4. Press **ENT**.

Figure 4-5 WPT - Airport Information Page (Approach)

WPT - VOR Information Page

The VOR Information Page displays information specific to individual VORs, including the airport that is nearest to the selected VOR. On this page, the VOR frequency for a selected VOR can be loaded automatically with the **LD NAV1** or **LD NAV2** softkeys.

NOTE: If the **MENU** key is pressed when on the VOR Information Page, the 'View Recent VOR List' menu option is displayed for quick access to recently used VORs. However, if no VOR frequencies have been tuned, this menu option is grayed out.

To load a VOR frequency automatically in the NAV window:

1. On the VOR Information Page, press the **FMS** knob to activate the VOR information window.
2. Turn the **FMS** knob as needed to select the desired VOR and press **ENT** to validate the selection.
3. Press either the **LD NAV1** or the **LD NAV2** softkey to load the VOR frequency in the corresponding NAV standby field.

Figure 4-6 WPT - VOR Information Page

NRST - Nearest Airports Page

The Nearest Airports Page displays a list of the nearest airports as well as related runway, frequency and approach information. On this page, any frequency associated with the selected airport can be loaded into the NAV or COM Frequency window.

To display the entire list of frequencies for a nearby airport and load a frequency from that list:

1. On the Nearest Airport Page, press the **FMS** knob to activate the highlight in the Nearest Airports sub-window.
2. Scroll through the list of nearest airport identifiers to the desired nearest airport by turning the **FMS** knob.
3. Press the **FREQ** softkey to activate the highlight in the Frequencies sub-window.
4. Turn the **FMS** knob to scroll through the list of frequencies for the selected airport.
5. When the desired frequency is highlighted, press **ENT** to load it in the tuning box of the appropriate window (NAV or COM).

Figure 4-7 NRST - Nearest Airport Page (Frequencies)

NRST - Nearest VOR Page

The Nearest VOR Page displays a list of the nearest VORs together with related information, including the associated VOR frequency. On this page, the VOR frequency for a selected VOR can be loaded automatically in the NAV window with the **LD NAV1** or **LD NAV2** softkeys.

To load a VOR frequency automatically in the NAV window:

1. On the Nearest VOR Page, press the **FMS** knob to activate the Nearest VOR window.
2. Turn the **FMS** knob (or press the **ENT** key as needed) to scroll through the list of nearest VORs.
3. When the desired VOR is highlighted, press the **LD NAV1** or **LD NAV2** softkey to load the frequency in the corresponding NAV standby field.

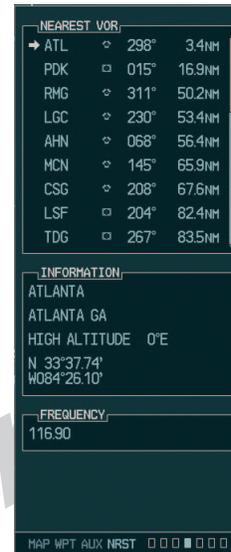

Figure 4-8 NRST - Nearest VOR Page

NRST - Nearest Frequencies Page

The Nearest Frequencies Page displays a list of nearest ARTCC, FSS and WX frequencies. For the purpose of frequency selection, the highlight can be activated on the ARTCC, FSS or WX sub-windows by using the **ARTCC**, **FSS** and **WX** softkeys, respectively.

To view a nearest ARTCC frequency and load it automatically in the standby frequency field:

1. Press the **ARTCC** softkey to activate the highlight in the Nearest ARTCC sub-window.
2. Using the **FMS** knob, highlight the desired ARTCC frequency.
3. Press **ENT** to load the desired ARTCC frequency in the standby frequency field.

NOTE: The Nearest ARTCC sub-window contains a ranked list of ARTCC frequencies as well as associated bearing and distance information.

To view a nearest FSS frequency and load it automatically in the standby frequency field:

1. Press the **FSS** softkey to activate the highlight in the Nearest FSS sub-window.
2. Using the **FMS** knob, highlight the desired FSS frequency.
3. Press **ENT** to load the desired FSS frequency in the standby frequency field.

NOTE: The Nearest FSS sub-window contains a ranked list of FSS frequencies as well as associated bearing and distance information.

To view a nearest WX frequency and load it automatically in the standby frequency field:

1. Press the **WX** softkey to activate the highlight in the Nearest WX sub-window.
2. Using the **FMS** knob, highlight the desired WX frequency.
3. Press **ENT** to load the desired WX frequency in the standby frequency field.

Figure 4-9 NRST - Nearest Frequencies Page

4.4 AUTO-TUNING UPON APPROACH ACTIVATION (NAV FREQUENCIES)

NAV frequencies can be automatically loaded in the NAV Frequency window upon approach activation, regardless of the display unit being used.

NOTE: The primary NAV frequency also becomes auto-tuned upon loading of an approach.

To auto-tune a NAV frequency if the desired approach is not already loaded:

1. Press the **PROC** key to open the Procedures window.
2. Turn the large **FMS** knob to highlight the 'SELECT APPROACH' menu option and press **ENT**.
3. Select the desired airport, VOR/ILS approach and transition, using both the **FMS** knob and the **ENT** key as needed.
4. Highlight either the 'LOAD?' or 'ACTIVATE?' prompt, using the **FMS** knob and press **ENT**. The primary NAV frequency for the activated approach becomes tuned in the standby field of the selected NAV radio.

Figure 4-10 Selecting an Approach

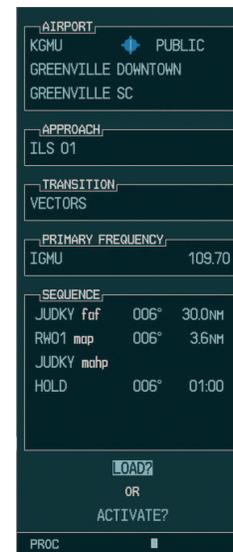

Figure 4-11 Loading an Approach

To auto-tune a NAV frequency if the desired approach is already loaded:

1. Press the **PROC** key to open the Procedures window.
2. Turn the large **FMS** knob to highlight the 'ACTIVATE APPROACH' menu option and press **ENT**. The approach primary NAV frequency becomes automatically tuned in the standby field of the selected NAV radio.

NOTE: Before loading or activating an approach, the associated primary NAV frequency may be loaded in the NAV tuning box by highlighting the frequency in the Select Approach window via the **FMS** knob, then by pressing **ENT**.

NOTE: Automatic loading of the NAV frequency also occurs upon vector-to-final activation, if the NAV frequency is not already loaded in either the standby or the active field of the selected NAV radio.

NOTE: Approach activation can also be performed via the **MENU** key when the Flight Plan window is open.

NOTE: If the system is in GPS mode when a VOR/ILS approach is loaded or activated, the approach primary NAV frequency is automatically loaded in the **active field of NAV1**.
