I know some others run this style clip so possibly you can help. I want to run manual steering and im aware the s10 boxes bolt in, but there 7.5 turns lock to lock. Anyone have a quicker ratio manual box for a 81 camaro clip. Thanks for any help shane Sent from my DROID device using the TJJ mobile appI could fab a mount really easy and there super small. Are these things reliable in the long run. The truck will be driven ALOT. Sent from my DROID device using the TJJ mobile appFriggin unreal the prices for these things. Sent from my DROID device using the TJJ mobile appMay be worth a lookAnyone else have an idea. Sent from my DROID device using the TJJ mobile appSent from my DROID device using the TJJ mobile appApparently the bolt in s10 boxes are 86 to 93 or something like that.Sent from my DROID device using the TJJ mobile appI could fab a mount really easy and there super small. Sent from my DROID device using the TJJ mobile app Click to expand. I havent used one since my street stock Camaro days but had no issues then.I dont know the ratio of the mid size GM boxes . May be worth a look Click to expand. I would think the fastest ratio manual boxes would be found in very light cars, 6 cyl intermediates with no AC etc. What is your objection to a power setup. Ought to be able to bolt on a box and pump pretty easily and pretty inexpensively too. RayUsed this info for help selecting a box for the 30 coupe. A list of direct bolton boxes and some that need modifications. Make sure you compare the input shaft length or the length from the bolt holes to the end of the input shaft to your power box. ORIGINAL Your 1965-69 Chevilles had gears

with 17.51 ratio, 43 degree travel, and light effort valves. The travel is restricted so your turning circle is going to get larger. It also has restricted travel and has the ink stamp WS on the gear. Another possibility is the 199295 Jeep Grand Cherokee gear. It is 12.71 and it will have the same 43 degree travel as your original gear.<http://www.incibit.eu/userfiles/calculus-solutions-manual-stewart-7th-edition.xml>

It will have even lighter effort than the regular Camaro gear. I cant tell but it may be as light effort as your original gear but it is a fast ratio gear!. It should have either AL or JH ink stamps. All of the pitman shafts on these gears are the same. So the splines that attach to the pitman arms are the same. I have to assume that you know that your original pitman arms mate up correctly or you have a source for correct pitman arms. Also you should already be aware that these gears have metric oring hose connections 16mm and 18mm. CanuckPower steering is just another thing to worry about. I dont mind driving manual steering at all, in fact i prefer it anywhere but super tight parking lots, which is why a quicker ratio would be awesome. Plus i just picked up a set of 2.02 double humps with no accesory hole, so i just want it really clean with a low mount alt and thats it. As far as chevelles and misc nova boxes etc, i could make em work, but the s10 box is far more appealing because it literally bolts in and uses my existing steering linkage and pitman arm. The others may require more parts. But then im gonna have to deal with the expensive u joints, and the quickener. Idk, each option has pros and cons. Sent from my DROID device using the TJJ mobile app Click to expand. Regional Sorry, but its bugging the hell out of me. There were also manual second gen Camaro boxes, but they are probably not so common and for that matter not so many Camaro in junkyards anymore. Always u joints. I thought very one had. It guides the wheels movement in conjunction with the direction that the steering wheel is rotated, helping achieve ideal steering response for more efficient driving. The box seems to function adequately. Definitely less than 3 turns lock to lock. Only complaint is after install, my steering wheel is no longer straight when the front wheels are straight. I am going to change my steering wheel soon anyway, so I am hoping I can reclock the wheel to get things in alignment again. This was not an installation error. 1988 S10, steering shaft will only go one way. Pitman arm had to fall where the splines would allow. No clue if box was rebuilt a little off or what. I would recommend, however I would also keep in mind it may not be 100% from where your old one was. The box seems to function adequately. I found the stock in Advance stores within my region are very poorly stocked. However, the time I saved by buying the remand box was negated by the fact that the input shaft was clocked 90 degrees off of where it should have been. Thus, the flat spot on the steering shaft and the 4 spots on the output shaft did not line up and I was forced to dismantle the steering column to reclock the locking ring so that my steering wheel would not be 90 degrees off. Its not that hard to mark the case and the shafts to ensure proper alignment upon reassembly, but who ever rebuilt it obviously didnt care. This is the last remanufactured steering box I plan on ever buying. No reason to pay more for the same headache. On the plus side, the box feels good on the road and doesnt leak. Also, its actually the 12.71 quickratio box, not a generic whatever ratio box that some parts stores will sell you because they dont know the difference.

The first thing you notice is how that new car steering wheel has a direct connection to the road, while that 60s muscle car feels like a soggy bowl of porridge. In fact, we've driven some of the more upscale computer simulations that have better feedback through the steering wheel than a stock 64 Chevelle. The good news is there's an easy fix for this vagueness if you own a 64 to 72 Chevelle, 67 to 81 Camaro, or 68 to 74 Nova. And the parts are no farther away than the local boneyard. Back in the 60s, GM thought the one-finger approach to twirling the steering wheel in a parallel parking exercise was the blue-ribbon pass for the ultimate driving experience.

While that might have been great for your grandmother in 1965, any track day junkie will tell you it's the effort and feedback through the steering wheel from the front tires that is part and parcel of the handling holy grail. Beginning in the late 70s and through the 90s, GM's classic recirculating ball steering box has drastically improved steering feel and, as you might guess, there are almost as many different versions of this box as Pamela Anderson has plastic surgeons in her Rolodex. Several years ago, certain steering boxes had surfaced as ideal junkyard swaps for these early Chevys. To be accurate, this swap will also work for any early ABody, such as a Pontiac, a Buick, or an Oldsmobile and also first and second generation Camaros and Firebirds. All the demand for these good boxes, such as the 85 to 88 Monte Carlo SS box, has put a crimp in the supply. We drilled a little deeper into the GM steering box grab bag and discovered several other body styles that are excellent candidates for this swap. We also spent a day with Tom Lee at Lee Manufacturing, the guru of steering box science who builds steering boxes for Sprint Cars, Cup cars, and many of the hardcharging offroad racers who are masters of steering box abuse. The beauty of all this is that the knowledge transfer that trickles down from race cars will make your street car box a real treat. Best Buys The following condensed chart was derived from a much longer original created by Jim Shea, which appears on the Team Chevelle website formatted by Wes Vann and used with permission. Jim also goes into great detail on modifying the steering column to mount the new flexible coupling, which we don't have room to detail here. See all 13 photos In the above chart, the code can be found stamped on the bottom cover of the steering box. The arrow points to the faint YA code. You will most likely have to carefully clean dirt and oil off of a used box to find this code.
