Not only do they sound amazing at idle, but the further you push your foot down on the gas pedal, the better they sound. Although this upgrade remains popular, because of the noise a tuned exhaust header creates, there is actually a scientific reason to go for this aftermarket upgrade. If we relate both of these upgrades to how an athlete performs we can better understand why we'll see a big boost in horsepower. The intake manifold represents the inhalation of oxygen for a human being. The exhaust manifold represents the exhale, but more importantly, the ability to expel all of the air from the lungs. This allows us to take in the maximum amount of oxygen on the next inhale. Imperfections in the casting slowed down the intake of air and fuel. In the same way the sharp bends and rough inside castings of a standard exhaust manifold reduce the flow of exhaust. If we only increase the ability for the intake to pull in more air and fuel, without increasing flow on the exhaust side we don't reap all of the benefits. So let's talk about a few reasons to upgrade the exhaust headers. On a classic muscle car era automobile you'll find a compact part with 90 turns and ports that share the task of removing exhaust fumes from multiple cylinders. These exhaust manifolds are so inefficient that it actually creates back pressure in the combustion chamber. In other words, exhaust gases don't flow out fast enough to empty the cylinder. In turn, this restriction of exhaust flow robs the engine of generating its full ability to produce horsepower and torque. When using an aftermarket exhaust header you find dedicated tubes for each cylinder. In addition, you find that the surfaces inside are highly polished. <http://circuitoinsulargc.com/documentos/forklift-operators-manuals.xml>

Instead the exhaust takes a long flowing turn that enhances the ability to remove exhaust gases from the combustion chamber. This improves the volumetric efficiency of the engine. Therefore, we can say highperformance exhaust headers provide enhanced efficiency, because of the large diameter tubing, long flowing bends and polished inside surfaces to reduce drag and back pressure. The factory installed these compact manifolds because they didn't have the room in the engine compartment. With that said, they also didn't see it as the best way to increase horsepower at the time. Nevertheless, installing aftermarket headers on some classic muscle cars presents major challenges. I installed a pair of Lakewood performance exhaust headers on a friend's Dodge Charger RT. Long story short, the header installation on the big block 440 cubic inch engine became a nightmare. We purchased model specific parts from a reputable Mopar specialist that designed the headers specifically for the Dodge Charger application. In addition, interference with the upper control arms and the tie rods became another issue. After we completed the installation the true problems began to surface. In order to clear some suspension parts the driver side header becomes the lowest part under the automobile. After going over a few speed bumps the tubes that carried exhaust gases from the front cylinders became completely smashed closed. Instead of increasing efficiency the end result became exactly the opposite. In fact, you can even find an article about nitrous oxide upgrades you can put in the trunk to provide the boost you're looking for. But no

matter where we decide to boost performance, deciding to upgrade the exhaust headers maximizes the benefits of all the other alterations. I'm talking about cars like the Chevrolet Malibu Super Sport and the Ford Mustang pony cars. These automobiles utilized some of the most inefficient exhaust manifolds ever created by

man. <https://absolute-siberia.com/userfiles/how-do-i-sync-my-ipod-manually.xml>

It's not that the original designers of these engines did not understand volumetric efficiency, they just approached the horsepower wars in a different way. They decided to increase combustion ratios and cubic inches to achieve the desired performance level. Of course, they also had leaded fuel available to them at the time. This forced them in the direction of improving the intake and exhaust cycles on modern automobiles. Therefore, the general rule of thumb becomes the newer the automobile the less performance gains you'll find from upgrading the intake and exhaust manifolds. Why It's because the automotive manufacturers upgrade the exhaust headers on their own. They also do a good job on the intake side of manufacturing efficient cold air intakes and intake plenums installed on the assembly line. In the classic car world the more original parts you retain the better. However, on a 50yearold automobile the original weatherstrips can cost you some quality points at the local car show. When it comes to replacing classic car weatherstripping the name of the game is finding exact replica replacement parts. On classic cars susceptible to rusting sheet metal panels, the weather strips ability to seal properly becomes more important than the appearance. Since every car built in the last 120 years, utilizes rubber weatherstripping this article applies to all automobiles. Nevertheless, those with Ttops and sunroofs will want to pay special attention to the tips provided here. In addition, we'll discuss sourcing new parts that look exactly like the original ones from the factory. Whether you have a classic Pontiac Firebird Trans Am or a vintage MercedesBenz achieving a watertight seal becomes paramount. In fact, it's just as important is how the replacement parts look. This is why we'll spend some time discussing the final installation. Classic car enthusiasts have a saying. Rust never sleeps.

With that said, it's a failed weather strip that lets the water in and helps the rust take over. For this reason removal procedures can often become model specific. Some classic car auto repair manuals provide helpful stepbystep information to facilitate the removal of failed weatherstripping. Unfortunately, on older classic cars, with original parts, removing the old rubber can be a difficult operation. Thankfully, some special tools help make this task easier. They make narrow blade scrapers that fit inside of the weather strip retaining tracks. For vintage automobiles that utilize a combination of glue and retainers, you can use specialized solvents. Patience is a virtue when it comes to using weatherstrip removing solvents. Make sure to provide enough soaking time for the chemicals to their job. Although these weatherstrip solvents work well when used as directed, precautions must be taken to protect the paint. Body shop technicians often lay down protective masking tape around the tracks. In addition, they cover the painted surfaces in the vicinity in case any splashes occur. Taking extra time in this area is critical. There are a few more areas that also require some protection. After removing the bulk of the old weatherstripping go back and soak any remaining pieces and glue spots with additional solvent. Body technicians use a clever trick. They place a rag on top of the stubborn spot and then apply the solvent to the rag. Failure to completely remove all of the old glue can cause improper sealing of the new weatherstrips. When you're finished, the tracks and mounting surfaces should look brandnew. Many auto parts companies do an excellent job of serving this niche market. Several large, respectable autoparts companies provide complete classic car weatherstripping kits. Whether you have a 50yearold classic Cadillac Eldorado or a 1970 Chevrolet Chevelle muscle car you will find exact match parts available.

As a mechanic that has performed more than a few classic car restoration projects I can tell you that there are often surprises included in the weatherstripping kits. When you perform a complete restoration you uncover rubber components that exist in places you never thought of. Let me provide

an example using a 1948 Cadillac 2door fastback I helped restore. These old Cadillac cars are known for water leaks in the trunk. Often by the time people figure out where the leak was coming from, it became necessary to replace the trunk pan. Replacing the tiny little weatherstrip underneath the trunk emblem can save you a lot of time and aggravation down the road. The companies that produce these weatherstrip kits also supply specialized molding clips and oddball retaining fasteners. My advice is to give one of these companies a call and speak to somebody before you begin the project. This is better than ordering it online and figuring it out for yourself. These rubber pieces can also come with a manufacturing residue on them. Therefore, wash all of the weatherstripping with soap and water, especially the spots where you apply the weatherstrip adhesive. Now it's time to perform a dry fit installation. The dry fit is when you fully install the parts without the retainers and the glue. This allows you to get a feel for the curves and straight runs. With the dry fit completed, you're now ready for a permanent installation. Body shop technicians usually have their favorite types of weatherstrip adhesives. With that said, 3M makes an excellent weatherstrip adhesive product. The best advice is to apply the adhesive to one section at a time. Although you will have to work quickly, you still have plenty of time before the weatherstrip adhesive cures completely. This is another reason for working one section at a time. Finally, allow 24 to 48 hours for a complete cure before performing a water test to verify proper sealing.

However, as time passes these cars are fading from memory. This is a sad chain of events that we're going to attempt to undo right here. Before we get into the three AMC cars that will make you say, "oh yeah, I remember that car" let's talk about the American Motors Corporation. In 1954 an epic coming together of Hudson, Nash and Kelvinator formed the American Motors Corporation. Nash had been building cars since 1916 and Hudson had large manufacturing facilities located in North America. The two struggling companies banded together with plans to make a run at the big three car makers. The company hit the ground running by building small, midsize and fullsize automobiles. By 1965, with several models on the top 10 bestsellers list, the debtfree company seemed poised to give Chevy and Ford a run for its money. Although this didn't turn out to be true, the company produced some AMC cars worth remembering in the 60s and early 70s. The company faced major challenges with an increase in government intervention in the form of mandatory automotive regulations. Then the gas crunch crashed onto the shores of the United States in the early 1970s. With AMC cars producing some of the worst gas mileage numbers, the uphill battle to remain competitive turned into a slippery slope. Nevertheless, the American motors Corporation didn't give up without a fight. They launched the Eagle series of automobiles featuring some unique fourwheeldrive cars. Unfortunately, in the mid80s the debt ridden company accepted an offer from the Chrysler Corporation for a complete buyout. The little Nash Rambler had been around for a decade, but the AMC version launched in 1958 with a new look. They built the car for more than 10 years and it went through three different redesigns. The company touted the two door sedan as an economical workhorse built for hardworking Americans.

Although these AMC cars remained unchanged under the hood from the previous years, the exterior received a heavy restyling. They moved this workhorse into the fun category in 1961 when they offered a convertible version. Sidebar A sharp looking 1962 Rambler American convertible wearing fire engine red paint starred in the hit sitcom series The Third Rock from the Sun. Thanks to abundant fuel and the need for speed, automotive consumers started moving away from economy cars. In 1966 the American Motors Corporation responded with the launch of a 225 HP V8 powered Rambler in an attempt to turn the grocery getter into a muscle car. By 1970, with slumping sales, they decided to move the platform back to its roots of the family car and renamed it the Hornet. AMC through big money at the car and even formed a race team run by Penske. Mark Donahue piloted a Javelin to victory in several Trans Am series races. However, competing with the Chevrolet Camaro and the Ford Mustang would prove to be more than challenging. The acronym stood for American Motors Experimental. This car packed the allnew 6.4 liter 390 cubic inch big block engine.

In its original version it produced about 320 HP. However, the factory started installing high performance exhaust manifolds, an aggressive camshaft and a high flow performance intake manifold. With horsepower reported in the 350 range these cars fell just short of taking down the Chevy Camaro, Ford Mustang and the Dodge Challenger. In 1970 the company wanted to think outside of the box by making a car that looked like a box. Its overall look, with a long front end and a boxy rear end received mixed reviews. What many don't realize is the car remains only a few inches longer than the Volkswagen Beetle. In fact, they built the car with the intention to take a bite out of the Volkswagen Beetle's market share. However, sales figures disappointed the AMC executives. Despite the higher price tag sales increased to over 122,000 units that year.

In 1974 American Motors struggled with the design and installation of catalytic converters to meet tightening government emission requirements. Nevertheless, in 1974 and 1975 the company posted its best sales figures with around 175,000 cars sold in each of these years. They gave up on the Gremlin in 1978, yet it remains one of the classic AMC cars worth remembering. Then, you will definitely love Americans muscle cars. Coined in 1949 due to the demand for a fast car, muscle cars have become one of Americas most loved cars. The 1960s and 1970s saw the creation of some of the best muscle cars of all time. If you are looking for a muscle car, read on as we look into some of the best muscle cars. The Mustangs have undergone a series of transformation from the first to the fifth generation. There is more to this car that will make you want to own it. It was based on an Fbody platform and offered no less than three sixcylinder engines and four V8s. A longer and wider Camaro was then introduced in 1970. The fifth generation Camaro was later introduced in 2010 with a better body and an even better performing engine. Several other challengers were later introduced over the years but the oil crisis crippled the sales of the muscle cars and this lead to the early retirement of this car in 1974. In 2008 the challenger made its way back and this 3rd generation challenger has soldiered on and so far has had a number of stylistic updates. It is very fast and has a 797 horsepower supercharged V8 engine. It featured fourwheel disc brakes, optional side exhaust pipes, a big block, and a 6.5 liter V8. This muscle car has gotten even better with time and the C6 generation that was produced from 20052013 and has better handling and is a muchloved sports car. Get ready to experience this legendary ZR1 supercar with a 755 horsepower and a top speed of 212 MPH.

If you want a luxurious muscle car, the dodge viper will be an ideal choice. This car has been in the market for 25 years and it is one of the best classics. It also borrowed a little bit from the Ferrari. This muscle car was an instant hit and GM improved its performance over the years. However, in 1974, its sales went down forcing its production to stop. Though you will not be able to find a new Pontiac because 2006 was the last year it was produced you can still buy it from its original owners. In 1967, the second generation Plymouth was introduced and it had responded to the need of the market. The model was much more aggressive with a V8 motor and better handling. It had three V8 engines and was on its way to muscle cars success. These cars have both high and low performing options but if you want to feel the real American muscle cars, then the high performing option is your ideal choice. Subscribe to our newsletters. Once you have done your car research and found the perfect one for you, it's time to choose when you will step into a dealership. This is the end of the year, and dealerships have sales quotas to meet and exceed. If they exceed their goals by a certain amount, the dealership might get a nice bonus check, and therefore they want to get you into a new car. This puts you right at the end of meeting sales quotas. Salespeople, sales managers, and dealership owners are all working together to end the year with a bang with it comes to their numbers. The best day to get the lowest car price is the last day of the year. Yes, December 31st can mean saving a couple of thousand of dollars. Going into a dealership right at the end of the quarter is another great savings day. The average person goes car shopping during the weekend because it is normally the days they have off. Very few people go into a dealership on a Monday because it is

the start of their workweek. If you can't go in on a Monday, then Thursday is another good option.

If not then Wednesday is third in line, then Friday, then Tuesday. Many people think that weekends are the best because they see so many people at the dealership, but the truth is your power to negotiate lessens because they have people there ready to buy. The last thing you want is to invest your hardearned money into a vehicle that is not reliable and breaks down on you. Nothing worse than knowing you owe way more than your car is worth because no one wants a piece of junk. You want to make sure you set yourself up with a realistic budget when it comes to your car payment. You do not want to put yourself in a situation where you can't repay your car loan. You have to take into account budgeting money for full liability insurance if you are financing, plus annual registration renewals, oil changes, new brake pads, and don't forget gas. If you live in a state that requires vehicle inspections, then you will have to add that into the budget as well. They say knowledge is power, and in this case, knowledge will save you money. Make sure you show up with your negotiating hat on and make your car salesman a reasonable offer that they can't resist. Due to lack of production capacities, export versions of the model appeared only in November 2011, and the car went to the Russian market in April next year. Another important difference from the SS version was the adaptive Magnetic Ride suspension, a high efficiency brake system designed in cooperation with Brembo engineers, and 20inch wheels. Already in the minimum configuration, customers get a rearview camera with a projection of the image to the salon mirror, an acoustic system from Boston Acoustics with nine speakers, as well as a full set of electric adjustments for the front seats, xenon headlights and 6 airbags. The coupe received a new narrow radiator grille, a new front and rear optics. Slightly modified bumper and hood, supplemented with a list of additional equipment.
