JVC

SERVICE MANUAL

FULLY-AUTOMATIC DIRECT-DRIVE TURNTABLE

MODEL L-F210/L-F210B

Model	Color Version
L-F210	Silver
L-F210B	Black

 There are two types of L-F210/L-F210Btype A and type B-depending on the type of tonearm.

The type A has an universal type tonearm and the type B has an integrated tonearm. The cartridge is not provided on units of type A for the U.S.A. and Canada and the dust cover is not provided on units of type B for the U.S.A.

L-F210

Safety Precautions

- The design of this product contains special hardware, many circuits and componets specially for safety purposes.
- For continued protection, no changes should be made to the original design unless authorized in writing by the manufacturer. Replacement parts must be identical to those used in the original circuits. Service should be performed by qualified personnel only.
- Alterations of the design or circuitry of the product should not be made. Any design alterations or additions will void the manufacturer's warranty and will further relieve the manufacturer of responsibility for personal injury or property damage resulting therefrom.
- 3. Many electrical and mechanical parts in the product have special safety-related characteristics. These characteristics are often not evident from visual inspection nor can the protection afforded by them necessarily be obtained by using replacement components rated for higher voltage, wattage, etc. Replacement parts which have these special safety characteristics are identified in the parts list of Service manual. Electrical components having such features are identified by shading on the schematics and by (on the parts list in Service manual. The use of a substitute replacement which does not have the same safety characteristics as the recommended replacement part shown in the parts list in Service manual may create shock, fire, or other hazards.
- 4. The leads in the products are routed and dressed with ties, clamps, tubings, barriers and/or the like to be separated from live parts, high temperature parts, moving parts and/or sharp edges for the prevention of electric shock and fire hazard.
- When service is required, the original lead routing and dress should be observed, and they should be confirmed to be returned to normal, after re-assembling.
- 5. Leakage current check

(Safety for electrical shock hazard)

After re-assembling the product, always perform an isolation check on the exposed metal parts of the

Products (antenna terminals, knobs, metal cabinet, screw heads, headphone jack, control shafts, etc.) to be sure the product is safe to operate without danger of electrical shock.

Do not use a line isolation transformer during this check.

- Plug the AC line cord directly into the AC outlet.
 Using a "Leakage Current Tester", measure the leakage current from each exposed metal part of the cabinet, particularly any exposed metal part having a return path to the chassis, to a known good earth ground. Any leakage current must not exceed 0.5 mA AC (r.m.s.).
- Alternate check method

Plug the AC line cord directly into the AC outlet. Use an AC voltmeter having 1,000 ohms per volt or more sensitivity in the following manner. Connect a 1500 Ω 10 W resistor paralleled by a 0.15 μF AC-type capacitor between an exposed metal part and a known good earth ground.

Measure the AC voltage across the resistor with the AC voltmeter.

Move the resistor connection to each exposed metal part, particularly any exposed metal part having a return path to the chassis, and measure the AC voltage across the resistor. Now, reverse the plug in the AC outlet and repeat each measurement. Any voltage measured must not exceed 0.75 V AC (r.m.s.). This corresponds to 0.5 mA AC (r.m.s.).

CHECKING YOUR LINE VOLTAGE (For U.S. Military Market and Other Countries)

Before inserting the power plug, please check this setting to see that it corresponds with the line voltage in your area. If it doesn't, be sure to adjust the voltage selector switch to the proper setting before operating this equipment. The voltage selector switch is located undernearth the platter on the cabinet.

CAUTION Before selecting the "Voltage selector swtich" to proper voltage disconnect the power plug.

(No. 2714)

2. Operation of Automatic Mechanism

2-(1) Start/stop Mechanism

1. Start

If you press the START/STOP button when the tonearm is on the rest, the mechanism operates as described below to turn ON the turntable's power and prepare to move the tonearm to the predetermined position on the record. Operation (See Fig. 1).

When the start rod is pushed in direction "a", the slider moves in direction "b". During this time, cam \bigcirc of the slider pushes part \bigcirc of the off lever, which is in turn rotated in direction "d", thus unlocking boss \bigcirc

of the switch lever. Thereby, the microswitch switches ON to rotate the platter. On the other hand, as cam B of the slider pushes part A of the reject lever in direction "c", the trip lever is driven in direction "e". The trip lever drives the engagement in direction "f". As a result, the platter spindle gear engages with the main gear and the "change cycle" starts.

Fig. 2 shows the state at the end of the above operation.

Fig. 1

Fig. 2

No. 2714)

2.Stop

Stop operation starts if the START/STOP button is pressed when the tonearm is in the "play" position (not on the rest).

Operation (See Fig. 2).

When the slider moves in direction "b", part © of the off lever is pushed. During this time, the switch lever is not driven with its boss © unlocked and the reject lever alone is pushed in direction "c". In this way, the trip lever is driven and the "change cycle" starts.

2-(2) Lead-in Mechanism

When the change cycle starts and the main gear rotates, the drive plate is moved to rotate the elevator cam as shown in Fig. 3.

As the elevator cam rotates with the linear motion of drive plate in direction "a", the elevator is pushed up by the sloping part of the elevator cam to lift the tonearm, at this motion the lead-in lever moves from the position as shown in Fig.4 to the position as shown in Fig.5.

At the end of the linear motion of the drive plate in direction "a", stud B (mold) of the lead-in lever enters the cam hole in the chassis base, then the lead-in lever rotates in direction "c", and arm lever stud (A) is holded between lead-in lever and case as shown in Fig. 5, and the drive plate moves in direction "b". Arm lever stud (A) moves with the drive plate to move the tonearm onto the record.

According the SIZE button setting (17 or 30 cm), the tonearm will be moved to the predetermined position on the record. Part \bigcirc of the arm lever (See Fig. 6) contacts the index stopper (17 or 30 cm) and this determines the lead-in position, then the lead-in lever returns in direction to the initial position.

To adjust the arm lever position (lead-in position), screw the eccentric adjuster.

2-(3) Change Cycle Start Mechanism

During play, the relationship between the main gear notch and the platter spindle gear is as shown in Fig. 7. Since the projection is apart from the engagement, the main gear is stationary even when the platter is rotating. As play proceeds, the arm lever pushes the trip lever and this moves the lower trip which, in turn, gradually drives out the engagement mounted on the lower trip. The relationship between the engagement and the projection at this time is as shown in Fig. 8. When the pitch of the record groove is small, the pitch of engagement advance is also small and the engagement will be pushed by the projection. The main gear, therefore, remains stationary.

At the end of play, when the tonearm comes to the leadout groove having a larger pitch, the engagement advances more than the projection pushes it back and their relationship is now as shown in Fig. 9. The projection pushes the engagement, the main gear starts to turn, the main gear notch moves and the platter spindle gear engages with the main gear. Thus, the change cycle starts as the main gear starts to turn

When the main gear stops turning, the relationship shown in Fig. 7 is restored and the main gear remains stationary even when the platter spindle gear turns.

In the change cycle, the off lever prepares for locking boss $\stackrel{\frown}{E}$ of the switch lever by spring $\stackrel{\frown}{F}$. At the end of the change cycle, boss $\stackrel{\frown}{H}$ of the off lever is pushed by part $\stackrel{\frown}{G}$ of the drive plate. In this way, the switch lever returns to its initial position and the microswitch switches OFF. The series of operation ends in this condition.

0

Arm Lever

Fig. 5

On the other hand, the driven out engagement and lower trip are pushed back to their initial positions by the edge of the platter spindle gear just before the main gear stops turning. The cam of the main gear pushes the trip lever back to its initial position earlier than the engagement and lower trip. The return position can be fine-adjusted to start earlier or later by screwing the adjuster.

17 cm

30 cm Stoppe

Fig. 6

30 cm

2-(4) Repeat Mechanism

When the REPEAT knob is turned ON, the slider is placed in the position (where the slider contacts the stopper at part "A") shown in Fig. 11 and the mechanism operates to lead in the tonearm repeatedly to the same position. As the repeat rod moves in direction "a", the slider moves in direction "b" and stays there.

If the change cycle starts in this state, the lead-in lever turns in direction "c" and moves with arm lever stud (A). As the drive plate moves, the tonearm will be driven in direction "d" to perform the lead-in operation.

Fig. 11

3. Removal and Reassembly Procedure

3-(1) Removel of Cabinet

- Remove feet 1 ~ 4 shown in Fig. 12.
 Remove the cord stopper 5 of the signal cord as shown in Fig.12.
- 3. Remove the head shell and main weight from the
- 4. Move the tonearm in direction of the center spindle as shown in Fig.13.
- 5. Life the cabinet up, then remove the cabinet. Note: When the cabinet touches the tonearm, this may damage the tonearm and the cabinet.

3-(2) Reassembly of Cabinet

1. Set the operation switches on the front as follows:

Operation switch	Setting
SIZE	30
REPEAT	OFF
CUEING	DOWN

- 2. Set the tonearm as in Fig. 13.
- 3. Reassemble the cabinet.

lo. 2714)

Note: When remouting the feet (1) - (4), mount the feet having slipproof at the front side.

Fig. 13

3-(3) Removal of Pickup Base Ass'y

- 1. Remove screws (1) (3) as shown in Fig. 14.
- 2. Remove screw (4) as shown in Fig. 15.

Fig. 14

3-(4) Reassembly of Pickup Base Ass'y

1. Push the switch lever by top of the finger as shown in Fig. 16, then mount the pickup base ass'y. So that, the stad of the arm lever is located as shown in Fig. 17.

3-(5) Reassembly of Anti-skating Lever

When mounting the anti-skating lever, set the anti-skating knob to "O" position.

4. Stylus Replacement

(Type A)

How to remove the old stylus

Hold the cartridge and press the stylus assembly downwards (Fig. 18).

How to fit a new stylus

- 1. Insert the lug of the stylus assembly vertically (Fig. 19).
- 2. Press it upwards with both fingers until it snaps in place (Fig. 18).

(Type B)

How to replace

- 1. Pully diagonally downwards the stylus assembly as shown by the arrow in Fig. 20.
- 2. To install the stylus assembly, push it upwards in the direction of the arrow.

Note: Replace the stylus assembly with the stylus cover fitted so as not to damage the stylus tip.

Fig. 20

5. Cartridge Mounting

5-(1) Removal and mounting of the headshell

Turn the connector screw in direction "A" to remove the headshell from the tonearm. Fix it firmly when mounting the headshell. (Fig. 21)

(Type B)

Remove the cartridge fixing screw and pull the cartridge forward, (Fig. 22)

Note: A plug-in cartridge is used for the L-F210/L-F210B. Therefore, specify a T4P cartridge (JVC Model No. Z-45EP) when purchasing a new cartridge.

5-(2) Mounting Cartridge (Type A) (Fig. 23)

- 1. Remove the 2 screws securing the cartridge to the headshell
- 2. Install the cartridge onto the headshell provided.
- 3. The four headshell lead wires are colour-coded as follows; connect them correctly:

- 4. Mount the cartridge onto the headshell correctly and leave the screws slightly loose, then, after completing the "overhang adjustment", tighten them firmly.
- 5. After cartridge replcement, be sure to perform the "tracking force" and "anti-skating" adjustment.

6. Adjustment

6-(1) Tracking Force Adjustment (Type A)

- 1. Remove the stylus cover.
- 2. Slide the anti-skating knob to align its index mark with the "O" mark. (Fig. 21)
- 3. Slide the counterweight to the middle of the weight shaft and turn it until the tonearm is balanced with the stylus nearly touching the record surface. (Fig. 24)
- 4. Hold the counterweight at the adjusted position and turn the tracking force dial until the "O" mark is aligned with the index line on the tonearm weight shaft. (Fig. 25)
 - * It is most important to obtain the correct tracking
- 5. Turn the counterweight, being sure not to turn the dial. in the direction 0-1-2 until the "2" mark on the tracking force dial is aligned with the index line. (Fig. 26)
- * Be careful not to touch the tracking force dial when turning the counterweight.
- * Turning the tracking force dial alone has no effect on the tracking force.
- 6. Slide the anti-skating knob until the index mark of the knob points to "2" (JVC MD1055) mark (Fig. 27) Use the scale marked • with a conical stylus and the scale marked • with an elliptical or SHIBATA stylus.

Fig. 24

6-(2) Overhang Adjustment (Type A)

Adjust the overhang as shown, aligning the center lines of the cartridge and the headshell. Leave 32 mm between the stylus tip and the edge of the headshell as shown. An error of ± 1 mm will not degrade performance.

6-(3) Anti-skating Adjustment (Type B)

Turn the anti-skating knob until the index mark of the knob points to the "1.25" mark.

Fig. 28

6-(4) Tonearm Elevator-height Adjustment (Fig. 29)

The optimum clearance between the stylus tip and the record surface is about 6 mm when the tonearm is resting on the tonearm elevator (with the UP/DOWN knob switched to the UP position). Turning the adjusting screw clockwise lowers the height of the tonearm elevator and turning it counterclockwise increases it.

Fig. 29

6-(5) Lead-out Adjustment (Fig. 30)

Be sure to perform this adjustment posterior to the lead-in adjustment.

- -When auto-return functions too late, turn the screw counterclockwise with a screwdriver.
- -When auto-return functions too early, turn the screw clockwise.

When using test record, confirm the autoreturn functions as follows.

Test record	Auto-return function
RG652	To be returned
RG653	Not to be returned

Fig. 30

6-(6) Lead-in Adjustment

The L-F210/L-F210B is shipped from the JVC factory with the lead-in positions adjusted correctly. However, if the stylus lead-in positions are to be changed because the cartridge or head-shell has been changed, etc., adjust in the following manner:

When using test record (RG-325)

Record size	Counter's numbers
30 cm	7~29
17 cm	5~34

When completing this adjustment, be sure to check the lead-out position.

Fig. 31

No. 2714)

6-(6) Motor RPM Adjustments

Make adjustments in the following order when proper RPM is not obtained even after motor replacement or repair.

- Set the volume (semi-fix VR-S) (VR-801) on the Power P.C. Board to the center.
- 2. Set the speed button to 33-1/3 RPM. Press the start button to turn the platter.
- 3. Adjust with the volume (VR-1) on the motor P.C. Board so that the strobo pattern (33-1/3 RPM) on the platter seems to stand still.
- Next, switch over to 45 RPM and confirm that the strobo pattern (45 RPM) seems to stand still.
 Note: It is alright if there is only a small movement.
