Chapter 1

About

PEBL (Psychology Experiment Building Language) is a cross-platform, opensource programming language and execution environment for constructing programs to conduct a wide range of archetypal psychology experiments. It is entirely free of charge, and may be modified to suit your needs as long as you follow the terms of the GPL, under which the source code is licensed. PEBL is written primarily in C++, but requires a few other tools (flex, yacc) and libraries (SDL, SDL_image, SDL_gfx, and SDL_ttf) to use. In addition, a set of audio recording functions are available using the (now old and basically unmaintained) sdl_audioin library. Finally, the waave library optionally supports movie playback on linux and windows.

It currently compiles and runs on Linux (using g++), Mac OSX (using xcode), and Microsoft Windows (using code:blocks and mingw) platforms using free tools. It has been developed primarily by Shane T. Mueller, Ph.D. (smueller@obereed.net). This document was prepared with editorial and formatting help from Gulab Parab and Samuele Carcagno. In addition, much of the material in the chapter on the PEBL Test battery was contributed by Bryan Rowley. Contributions are welcome and encouraged.

Chapter 1. About

Chapter 2

Usage

Most users will be able to download a precompiled version of PEBL and run experiments directly. Some advanced users may wish to compile their own version, however. The next section describes how to do this.

2.1 How to Compile

Currently, there is no automated compile procedure. PEBL requires the SDL, SDL-image, SDL-gfx SDL_net, SDL_audioin and SDL-ttf libraries and development headers. It also uses flex and bison, but you can compile without these tools. PEBL compiles on both Linux and Windows using the free gcc compiler; on windows this is most easily supported through the code:blocks IDE. Note that SDL-image may require jpeg, png, and a zlib compression library, while SDL-ttf uses truetype 2.0.

2.1.1 Linux

PEBL should compile by typing 'make' in its base directory once all requisite tools are installed and the source distribution is uncompressed. Currently, PEBL does not use autotools, so its make system is rather brittle. Assistance is welcome.

On Linux, compiling will fail if you don't have an /obj directory and all the appropriate subdirectories (that mirror the main tree.) These will not exist if you check out from CVS.

2.1.2 Microsoft Windows

On Microsoft Windows, PEBL is designed to be compiled using the Free IDE code:blocks. A code:blocks project file is included in the source code directory. Email the PEBL list for more details.

2.1.3 Mac OSX

Originally, PEBL compiled to a command-line function. Since 0.12, PEBL will compile to a .app package using xcode. An xcode package is available in the source package.

2.2 Installation

2.2.1 Linux

On Linux, there are .deb packages available for debian. However, it is fairly easy to compile and install from source. To begin, be sure that all the sdl packages are installed. Then, go to the main pebl directory and type:

>make

>sudo make install

Once installed, you can install the test battery into Documents/pebl-exp.X using the command pebl-install.

2.2.2 Microsoft Windows

In Microsoft Windows, we provide an installer package that contains all necessary executable binary files and .dlls. This installer places PEBL in c:\Program Files\PEBL, and creates a directory pebl-exp.X in My Documents with a shortcut that allows PEBL to be launched and programs that reside there to be run.

2.2.3 Macintosh OSX

For OSX, we provide a .app package that can be dragged into your Applications folder. The first time any user runs pebl, it gives the option to install the battery and other files into Documentspebl-exp.X. Afterward, it will run the launcher from that directory.

2.3 How to Run a PEBL Program

The simplest way to run any PEBL script is via the launcher, which is available on all platforms. The launcher is covered in detail in Chapter 6. But, you can also launch experiments individually on each platform.

2.3.1 Linux

If you have installed PEBL into /usr/local/bin, you will be able to invoke PEBL by typing 'pebl' at a command line. PEBL requires you to specify one or more source files that it will compile and run, e.g., the command:

> pebl stroop.pbl library.pbl

will load the experiment described in stroop.pbl, and will load the supplementary library functions in library.pbl.

Additionally, PEBL can take the -v or -V command-line parameter, which allows you to pass values into the script. This is useful for entering subject numbers and condition types using an outside program like a bash script (possibly one that invokes dialog or zenity). A sample zenity script that asks for subject number and then runs a sample experiment which uses that input resides in the **bin** directory. The script can be edited to use fullscreen mode or change the display dimensions, for example. See Section 2.3.3: Command-Line Arguments. You can also specify directories without a filename on the command-line (as long as they end with '/'). Doing so will add that directory to the search path when files are opened.

2.3.2 Microsoft Windows

PEBL can be launched from the command line in Windows by going to the pebl\bin directory and typing 'pebl.exe'. PEBL requires you to specify one or more source files that it will compile and run. For example, the command

```
> pebl.exe stroop.pbl library.pbl
```

loads the experiment described in **stroop.pb1**, and loads supplementary library functions in **library.pb1**.

Additionally, PEBL can take the -v or -V command-line parameter, which allows you to pass values in to the script. This is useful for entering condition types using an outside program like a batch file. the -s and -S allow one to specify a subject code, which gets bound to the gSubNum variable. If no value is specified, gSubNum is initialized to 0. You can also specify directories without a file (as long as they end with '\'). Doing so will add that directory to the search path when files are opened. See Section 2.3.3: Command-Line Arguments.

Launching programs from the command-line on Windows is cumbersome. One easy way to launch PEBL on Windows is to create a shortcut to the executable file and then edit the properties so that the shortcut launches PEBL with the proper script and command-line parameters. Another way is to write and launch a batch file, which is especially useful if you wish to enter configuration data before loading the script.

2.3.3 Macintosh OSX

The latest version of PEBL packaged for OSX is 0.12. It is compiled as an application bundle with both 32-bit and 64-bit architectures available. We do not support PPC architecture.

The simplest way to run PEBL is through the launcher, but you can also use Applescript to create your own sequences of experiments. On OSX, PEBL can be run as a command-line tool, just as in linux. Once installed, the application is located at /Applications/pebl.app/Contents/MacOS/pebl.

2.4 How to stop running a program

In order to improve performance, PEBL runs at the highest priority possible on your computer. This means that if it gets stuck somewhere, you may have difficulty terminating the process. We have added an 'abort program' shortcut key combination that will immediately terminate the program and report the location at which it became stuck in your code: press <CTRL><SHIFT><ALT><\> simultaneously.

2.5 Command-line arguments

Some aspects of PEBL's display can be controlled via command-line arguments. Some of these are platform specific, or their use depends on your exact hardware and software. The following guide to command-line arguments is adapted from the output produced by invoking PEBL with no arguments:

Usage: Invoke PEBL with the experiment script files (.pbl) and command-line arguments.

Examples:

Command-Line Options

-v VALUE1 -v VALUE2

Invokes script and passes VALUE1 and VALUE2 (or any text immediately following a -v) to a list in the argument of the Start() function. This is useful for passing in conditions, subject numbers, randomization cues, and other entities that are easier to control from outside the script. Variables appear as strings, so numeric values need to be converted to be used as numbers.

-s VALUE

-S VALUE

Binds VALUE to the global variable gSubNum, which is set by default to 0.

--driver <drivername>

Sets the video driver, when there is more than one. In Linux SDL, options xf86, dga, svgalib (from console), itcan also be controlled via environment variables. In fact, for SDL versions of PEBL simply set the SDL_VIDE0_DRIVER environment variable to the passed-in argument, without doing any checking, and without checking or returning it to its original state.

--display <widthxheight>

Controls the screen width and height (in pixels). Defaults to the current resolution of the screen. Unlike older versions of PEBL, after 0.12 any legal combination of width and height should work.

The screensize a PEBL script runs at depends on a number of things. If no –display size is given (e.g., when 'default' is chosen in the launcher), PEBL will try to determine the current screen size and use that, for both fullscreen and windowed mode. Otherwise, it will try to use the specified value.

However, these values are only a request. When the script starts, it sets the values of the global variables gVideoWidth and gVideoHeight based on either the specified values or the current screen size. These values can be changed in the script before the MakeWindow function is called, so that a script can require a particular screen size. Then, the window will be created with those dimensions, overriding any command-line parameters. For greatest flexibility, it is recommended that you do not hard-code screen size but rather make your test adapt to a large number of screen sizes.

Finally, if a screen size is selected that the video card cannot support (i.e., in fullscreen mode), gVideWidth and gVideoHeight will be set to the legal screen size closest to the one you requested. PEBL should never crash because you have specified the wrong screen size, but it should rather use one it can support. The values of gVideoWidth and gVideoHeight will be changed by MakeWindow to whatever screen size it actually uses.

Controls the pixel depth, which also depends on your video card. Currently, depths of 2,8,15,16,24, and 32 are allowed on the command-line. There is no guarantee that you will get the specified bit depth, and bit depths such as 2 and 8 are likely never useful. Changing depths can, for some drivers and video cards, enable better performance or possibly better video sychrony. Defaults to 32.

--language

Allows user to specify a language code that can get tested for within a script to select proper translation. It sets a global variable gLanguage, and is "en" by default.

--windowed or --fullscreen Controls whether the script will run in a window or fullscreen. The screen resolution a PEBL script runs at depends on a number of things. See the --display option above for more details.

⁻⁻depth

Chapter 2. Usage

Chapter 3

How to Write a PEBL Program

3.1 Basic PEBL Scripts

PEBL has a fairly straightforward and forgiving syntax, and implements most of its interesting functionality in a large object system and function library of over 125 functions. The library includes many functions specific to creating and presenting stimuli and collecting responses. Efforts, however successful, have been made to enable timing accuracy at amillisecond-scale, and to make machine limitations easy to deal with.

Each PEBL program is stored in a text file. Currently, no special authoring environment is available. A program consists of one or more functions, and *must* have a function called **Start()**. Functions are defined with the following syntax:

```
define <function_name>(parameters)
{
   statement 1
   statement 2
   ....
   return value3
}
```

The parameter list and the return value are optional. For the Start(par){} function, par is normally bound to 0. However, if PEBL is invoked with -v command-line parameters, each value that follows a -v is added to a list contained in 'par', which can then be accessed within the program:

define Start(par)
{
 Print(First(par))
}

A simple PEBL program that actually runs follows:

```
define Start(par)
{
    Print("Hello")
}
```

Print() is a standard library function. If you run PEBL from a command-line, the text inside the Print function will be sent to the console. On Windows, it will appear in the file 'stdout.txt' in the PEBL directory. Although other functions do not need a parameter argument, the Start() function does (case values are passed in from the command-line).

A number of sample PEBL programs can be found in the /demo subdirectory.

3.2 Case Sensitivity

PEBL uses case to specify an item's token type. This serves as an extra contextual cue to the programmer, so that the program reads more easily and communicates more clearly.

Function names must start with an uppercase letter, but are otherwise caseinsensitive. Thus, if you name a function "DoTrial", you can call it later as "DOTRIAL" or "Dotrial" or even "DotRail". We recommend consistency, as it helps manage larger programs more easily.

Unlike function names, variable names must start with an lowercase letter; if this letter is a 'g', the variable is global. This enforces a consistent and readable style. After the first character, variable names are caseinsensitive. Thus, the variable 'mytrial' is the same as 'myTrial'.

Currently, syntax keywords (like loop, if, define, etc.) must be lowercase, for technical reasons. We hope to eliminate this limitation in the future.

3.3 Syntax

PEBL has a simple and forgiving syntax, reminiscent of S+ (or R) and c. However, differences do exist.

Table 3.1 shows a number of keywords and symbols used in PEBL. These need not appear in lowercase in your program.

Note that the '=' symbol does not exist in PEBL. Unlike other languages, PEBL does not use it as an assignment operator. Instead, it uses '<-'. Because it is confusing for users to keep track of the various uses of the = and == symbols, we've eliminated the '=' symbol entirely. Programmers familiar with c will notice a resemblance between PEBL and c. Unlike c, in PEBL a semicolon is not necessary to finish a statement. A carriage return indicates a statement is

Symbol/Keyword	Usage
+	Adds two expressions together
-	Subtracts one expression from another
/	Divides one expression by another
*	Multiplies two expressions together
^	Raises one expression to the power of another
;	Finishes a statement, or starts a new statement
	on the same line (is not needed at end of line)
	The property accessor. Allows properties to be accessed by name
<-	The assignment operator
()	Groups mathematical operations
{ }	Groups a series of statements
[]	Creates a list
#	Comment—ignore everything on the line that follows
<	Less than
>	Greater than
<=	Less than or equal to
>=	Greater than or equal to
==	Equal to
<> != ~=	Not equal to
and	Logical and
break	Breaks out of a loop prematurely
not	Logical not
or	Logical or
while	Traditional while loop
loop	Loops over elements in a list
if	Simple conditional test
ifelse	Complex conditional test
ifelseifelse	Extended conditional chain
define	Defines a function
return	Allows a function to return a value

Table 3.1: PEBL Symbols and Keywords

complete, if the current line forms a complete expression. You may terminate every command with a ';' if you choose, but it may slow down parsing and execution.

Another difference between c and PEBL is that in PEBL, {} brackets are not optional: they are required to define code blocks, such as those found in if and while statements and loops.

3.4 Expressions

An expression is a set of operations that produces a result. In PEBL, every function is an expression, as is any single number. Expressions include:

```
3 + 32
(324 / 324) - Log(32)
not lVariable
Print(32323)
"String " + 33
nsuho #this is legal if nsuho has been defined already.
```

Notice that "String " 33+ is a legal expression. It will produce another string: "String 33".

These are not expressions:

NSUHO #Not an expression (33 + 33 #Not an expression 444 / 3342 + #Not an expression

NSUHO is not a variable because it starts with a capital letter. The other lines are incomplete expressions. If the PEBL parser comes to the end of a line with an incomplete expression, it will automatically go to the next line:

Print("hello " +
 " world."
)

This can result in bugs that are hard to diagnose:

```
a <- 33 + 323 +
Print(1331)
```

sets a to the string "3561331".

But if a carriage return occurs at a point where the line does make a valid expression, it will treat that line as a complete statement:

```
a <- 33 + 323
* 34245
```

sets a equal to 356, but creates a syntax error on the next line. Any expression can be used as the argument of a function, but a function may not successfully operate when given bogus arguments.

If a string is defined across line breaks, the string definition will contain a linebreak character, which will get printed in output text files and textboxes.

```
text <- "this is a line
and so is this"</pre>
```

If you desire a long body of text without linebreaks, you must define it piecemeal:

```
text <- "This is a line " +
    "There is no line break before this line."</pre>
```

3.5 Variables

PEBL can store the results of expressions in named variables. Unlike many programming languages, PEBL only has one type of variable: a "Variant". This variable type can hold strings, integers, floating-point numbers, lists, graphical objects, and everything else PEBL uses to create an experiment. Unlike other languages, a variable need not be declared before it can be used. If you try to access a variable that has not yet been declared, PEBL will return a fatal error that stipulates as such.

3.5.1 Coercion/casting

Variants just hide the representational structure from the user. An actual string resides within the variant that holds a string. A long integer resides within the variant that holds an integer.

PEBL Variants are automatically coerced or cast to the most appropriate inner format. For example, 3232.2 + 33 starts out as a floating point and an integer. The sum is cast to a floating point number. Similarly, "banana" + 33 starts as a string and an integer, but the combination is a string.

3.5.2 Variable Naming

All variables must begin with a lowercase letter. Any sequence of numbers or letters may follow that letter. If the variable begins with a lowercase 'g', it has global scope; otherwise it has local scope.

3.5.3 Variable Scope

As described above, variables can have either local or global scope. Any variable with global scope is accessible from within any function in your program. A variable with local scope is accessible only from within its own function. Different functions can have local variables with the same name. Generally, it is a good idea to use local variables whenever possible, but using global variables for graphical objects and other complex data types can be intuitive.

3.5.4 Copies and Assignment

Variables may contain various types of data, such as simple types like integers, floating-point ratio numbers, strings; and complex types like lists, windows, sounds, fonts, etc. A variable can be set to a new value, but by design, there are very few ways in which a complex object can be changed once it has been set. For example:

```
woof <- LoadSound("dog.wav")
meow <- LoadSound("cat.wav")
dog <- woof</pre>
```

Notice that woof and dog refer to the same sound object. Now you may:

```
PlayBackground(woof)
Wait(50)
Stop(dog)
```

which will stop the sound from playing. If instead you:

```
PlayBackground(woof)
Wait(50)
Stop(meow)
```

woof will play until it is complete or the program ends. Images provide another example. Suppose you create and add an image to a window:

```
mWindow <- MakeWindow()
mImage <- MakeImage("test.bmp")
AddObject(mImage, mWindow)
Draw()</pre>
```

Now, suppose you create another variable and assign its value to mImage:

```
mImage2 <- mImage
Move(mImage2, 200, 300)
Draw()</pre>
```

Even though mImage2 was never added to mWindow, mImage has moved: different variables now point to the same object. Note that this does not happen for simple (non-object) data types:

a <- 33 b <- a a <- 55 Print(a + " " + b)

This produces the output:

55 33

This may seem confusing at first, but the consistency pays off in time. The '<-' assignment operator never changes the value of the data attached to a variable, it just changes what the variable points to. PEBL is functional in its handling of simple data types, so you can't, for example, directly modify the contents of a string.

a <- "my string" #assigns a string literal to a
b <- a #makes b refer to a's string literal
a <- "your string" #re-assigns a to a new string literal
b <- a #makes b refer to a's new string literal

3.5.5 Passing by Reference and by Value

The discussion in 3.5.4 on copying has implications for passing variables into functions. When a variable is passed into a function, PEBL makes a copy of that variable on which to operate. But, as discussed in 3.5.4, if the variable holds a complex data type (object or a list), the primary data structure allows for direct modification. This is practical: if you pass a window into a function, you do not want to make a copy of that window on which to operate. If the value is a string or a number, a copy of that value is made and passed into the function.

3.6 Functions

The true power of PEBL lies in its extensive library of functions that allow specific experiment-related tasks to be accomplished easily. For the sake of convenience, the library is divided into a number of subordinate libraries. This library structure is transparent to the user, who does not need to know where a function resides in order to use it. Chapter 5 includes a quick reference to functions; Chapter 9 includes a complete alphabetical reference.

3.7 A Simple Program

```
The previous sections provide everything you need to know to write a simple
program. Here is an annotated program:
# Any line starting with a # is a comment. It gets ignored.
#Every program needs to define a function called Start()
#Start always needs a parameter
define Start(par)
{
 number <- 10
                ##Assign a number to a variable
 hello <- "Hello World" ##Assign a string to a variable
 ##Create a global variable (starts with little g)
 gGlobalText <- "Global Text"
 ##Call a user-defined function (defined below).
 value <- PrintIt(hello, number)</pre>
 ##It returned a value
 #Call a built-in function
 Print("Goodbye. " + value)
}
##Define a function with two variables.
define PrintIt(text, number)
{
  #Seed RNG with the current time.
  RandomizeTimer()
  #Generate a random number between 1 and number
  i <- RandomDiscrete(number) #this is a built-in function
  ##Create a counter variable
  j <- 0
  ##Keep sampling until we get the number we chose.
  while(i != number)
  {
       Print(text + " " + i + gGlobalText)
       i <- RandomDiscrete(number)</pre>
       j <- j + 1
  }
  return(j) #return the counter variable.
}
```

More sample programs can be found in the demo/ and experiments/ directories of the PEBL source tree.

Chapter 4

Overview of Object Subsystems

In PEBL, complex objects are stored and automatically self-managed. These objects include lists, graphical display widgets like images and text displays, fonts, colors, audio files, and input or output files. Objects are created and modified with special functions, but many of their properties available directly for access and modification with a variable.property syntax. For example, the position of a textbox is controlled by .X and .Y properties, and can also be changed with the Move() function. To move the label lab, which is located at 100,100, to 150,100, you can either do Move(lab,150,100) or lab.X <- 150. The available properties and accessor function are listed in the decriptions of their relevant objects below.

4.1 Lists

Lists are incredibly useful and flexible storage structures that play an important role in PEBL. A list is simply a series of variables. It is the equivalent to a vector, array, or other similar data structure in many other programming languages. Creating and accessing elements of lists can be accomplished in a number of ways. If you have a set of values you want to create a list from, you simply need to put them inside square brackets, separated by commas:

mylist <- [1,2,3,4,5,6,7,8,9]

Many functions related to experimental design return lists already created. Two simple functions are Repeat and Sequence:

list1 <- Repeat(0,10) ##ten zeroes
list2 <- Sequence(0,20,2) ##numbers 0 to 20 step 2</pre>

Accessing list items can be done in a number of ways. The simplest is using the Nth() function. For a slightly more complex example, suppose you want to

print out every item in a list. Looping through, accessing, and printing all the items of a list using this approach:

```
list <- Sequence(1,9,1)
len <- Length(list)
i <- 1
while (i <= len)
{
    item <- Nth(list,i)
    Print(item)
    i <- i + 1
}</pre>
```

Note that prior to PEBL 0.12, using Nth to access list items was inefficient. Since PEBL 0.13, you can use Nth to access list items in amortized constant time! But nevertheless, the above method of looping is verbose and error-prone. There is an alternative. Items from lists can be iterated over using the 'loop' command:

```
list <- Sequence(1,9,1)
loop(item, list)
{
    Print(item)
}</pre>
```

These two code blocks produce identical output, but in the former block, each item of the list must be found on each iteration, but in the latter block, a list item is bound directly to 'item' on each iteration. There is no appreciable difference in the efficiency of these two methods, but the second is simpler and in many cases easier to use, and avoids some errors (like forgetting to increment i).

4.1.1 Growing Lists

Oftentimes, you want to create a list one element at a time. For example, you may have a sampling scheme for stimuli and need to pick each consecutive randomly, or you want to record response times or accuracies one trial at a time. There are two ways you can do this. If you know how long your list will be, you can create a list with as many elements as you need, and then alter each element one at a time.

```
##I need ten items
items <- Repeat(0,10)
i <- 1</pre>
```

```
while(i <= Length(items))
{
   SetElement(items,i,Random())
}</pre>
```

Oftentimes, however, this is difficult because you do no know how long the list should be at the beginning. The Append() function is able to add an item to the end of a list, and you can use that to 'grow' a list one item at a time:

```
##I need ten items
items <- []
i <- 1
while(i <= 10)
{
    items <- Append(items,Random())
}</pre>
```

This ideom is used in many places in PEBL test batteries. However, it can be inefficient as the length of the list grows. This is because on each iteration, a new list is created that is 1 element longer than the previous list (and each element is copied to the new list). For small lists, even ones hundred of items long, this overhead is pretty small and you hardly notice. But as a list gets thousands of items long, this can start to slow things down, especially if you are doing something complex between each trial. As of PEBL 0.13, we support another function called PushOnEnd():

```
items <- []
i <- 1
while(i <= 10)
{
    PushOnEnd(items,Random())
}</pre>
```

PushOnEnd will alter items directly, and do so in a very efficient way. Notice that you don't need to copy the new list and overwrite itself. However, for ease of use, PushOnEnd() returns the current copy of the list, and so you can often use it as a drop-in replacement for Append (in cases where you are throwing away the original list). In tests, this method appears to be only 5-10% less efficient than using PushOnEnd alone, and so it should hardly be noticed.

```
items <- []
i <- 1
while(i <= 10)
{
    items <- PushOnEnd(items,Random())
}</pre>
```

A caveat when using lists: Some functions operate on lists to produce new lists (sub-lists, re-ordered lists, etc.). When the lists contain simple data types (numbers, strings, etc.), entirely new data structures are created. But when the data structures are complex (windows, sounds, images, etc.), the objects are not copied. Only new pointers to the original objects are created. So if you change the original object, you may end up accidentally changing the new object. Although that is relatively difficult, because PEBL allows only limited modification of existing data structures, it is still possible. This is a special case of the copy/assignment issue discussed in Section 3.5.4: Copies and Assignment.

4.1.2 Recursion on lists

Many mathematical functions that take a single argument can be applied either to a number or a list of numbers. When applied to an entire list, it will return the function applied to each element of that list. For example, Ln(1) return 0, but Ln([1,1,1] returns [0,0,0].

A list of functions that support this include:

٠	Log10	٠	Log2	٠	Ln	٠	Exp
•	Sqrt	٠	Tan	٠	Sin	٠	Cos
•	ATan	٠	ASin	٠	ACos	٠	DegToRad
•	RadToDeg	٠	Round	٠	Floor	٠	Ceiling
•	AbsFloor	•	Sign	٠	Abs		

In addition, a number of math functions that take two argumunts will apply themselves recursively to the first argument should it be a list. For example, LogN([1,1,1],5) will return [0,0,0]. Functions that support this include:

• LogN • Pow • NthRoot

4.2 Fonts

PEBL uses truetype fonts for the display of text in labels and other text widgets. In addition to the filename, font objects have the following properties: style (i.e., normal, bold, italic, underline), size (in points), foreground color, background color, and whether it should be rendered anti-aliased.

We distribute a series of high-quality freely available and redistributable fonts, including the DejaVu series, freefont series, and a few others. These include the typeface/files shown below 4.1:

These should always be available for use in experiments. The fonts.pbl script in the demo/ directory will display what symbols from each of these fonts looks like.

To use, you need only specify the font name in the MakeFont() function:

```
colorRed <- MakeColor("red")
colorGrey <- MakeColor("grey")
myFont <- MakeFont("VeraMono.ttf",0,22,colorRed,colorGrey,1)</pre>
```

This code makes a red 22-point anti-aliased font on a grey background. Other fonts may be used by specifying their absolute pathname or copying them to the working directory and using them.

Accessible font properties:

```
font.FILENAME
font.BOLD
font.UNDERLINE
font.ITALIC
font.SIZE
font.FGCOLOR
font.BGCOLOR
font.ANTIALIASED
```

Having the right fonts is important for translating PEBL scripts into new languages. Previously, this was challenging because the default font used in many scripts was Vera, and Vera has poor support for international characters. As of PEBL 0.11, a few things have changed to make international character support easier:

- Three new fonts that support international characters much better ("DejaVuSans.ttf", "DejaVuSansMono.ttf", and "DejaVuSerif.ttf") are now included and available.
- Three new global variables are set on initiation: gPEBLBaseFont, gPEBLBaseFontMono, and gPEBLBaseFontSerif, which are set by default to these three font names.
- Helper functions and battery tests are all updated to use these values to set up fonts.

${f Filename}$	Description					
	FreeFont Fonts					
FreeSans.ttf	Simple Clean sans serif font					
${\tt FreeSansBold.ttf}$						
${\tt FreeSansOblique.ttf}$						
${\tt FreeSansBoldOblique.ttf}$						
FreeMono.ttf	Courier-like fontface					
FreeMonoBold.ttf						
FreeMonoOblique.ttf						
${\tt FreeMonoBoldOblique.ttf}$						
FreeSerif.ttf	Similar to Times New Roman					
FreeSerifBold.ttf						
FreeSerifItalic.ttf						
FreeSerifBoldItalic.ttf						
	Fontforge Fonts					
Caliban.ttf	Helvetica-style					
CaslonRoman.ttf	Quirky Roman Font series					
CaslonBold.ttf						
CaslonItalic.ttf						
Caslon-Black.ttf						
Humanistic.ttf	Sharp, refined fontface					
	SIL Fonts					
DoulosSILR.ttf	Comprehensive font with roman and cyrillic glyphs					
GenR102.ttf	Includes many latin alphabet letters					
GenI102.ttf						
CharisSILR.ttf	Like doulos, optimized for printing					
CharisSILB.ttf						
CharisSILI.ttf						
CharisSILBI.ttf						
	PEBL Fonts					
Stimulasia.ttf	A small set of $\operatorname{arrow}/\operatorname{boxes}$					
Bitstrea	m Vera Series (Deprecated in favor of DejaVu)					
Vera.ttf	Sans serif Roman-style base font					
VeraMono.ttf	Sans serif Roman-style mono-spaced base font					
VeraSe.ttf	Serif Roman-style base font (similar to times)					
VeraBd.ttf	Bold Vera					
VeraIt.ttf	Italic Vera					
VeraBI.ttf	Bold Italic Vera					
VeraMoBd.ttf	Bold Vera Mono					
VeraMoIt.ttf	Italic Vera Mono					
VeraMoBI.ttf	Bold Italic Vera Mono					
VeraSeBd.ttf	Bold Serif Vera					
 DejaVu Ser	ies (Version of Vera with international characters)					
 DejaVuSerif.ttf	Serif Roman-style base font (similar to times)					
DejaVuSans.ttf	Serif Roman-style base font					
DejaVuSansMono.ttf	Sans serif Roman-style mono-spaced base font					
 29C.IK Fonts						
wqy-zenhei.ttc	All-purpose font with support for Chinese, Korean and Japanese					

 Table 4.1:
 Typeface/Files
 Available
 in
 PEBL

So now, many international characters will be handled by default. For character sets that aren't handled by DejaVu, simply needs to change gPEBLBaseFont to name a font that can handle your characters (and include that font in the program directory), and everything should work out fine.

4.3 Colors

Colors are PEBL objects. A color can be created by specifying its name using the MakeColor() function, or by specifying its RGB values using the MakeColorRGB() function. A list of colors and their respective RGB values can be found in the Colors.txt file in the documentation directory, or in the final chapter of the manual. There are nearly 800 from which to choose, so you can create just about anything you can imagine.

Accessible color properties:

color.RED color.GREEN color.BLUE color.ALPHA

4.4 Windows

To run an experiment, you usually need to create a window in which to display stimuli. This is done with the MakeWindow() function. MakeWindow() will create a grey window by default, or you can specify a color. Currently, an experiment can have only one window.

4.5 Graphical Widgets

Graphical "widgets" are the building blocks of experimental stimuli. Currently, four widgets are available: images, labels, canvasses, and textboxes. More complicated widgets are in progress or planned. There are also a number of shapes that in some ways behave like widgets, but are technically not.

To be used, a widget must be created and added to a parent window, and then the parent window must be drawn. You can hide widgets with the Hide() function, and show them with the Show() function; however, this affects only the visibility of the widget: it is still present and consuming memory. Widgets can be moved around on the parent window using the Move() function. Move() moves the center of an image or label to the specified pixel, counting from the upper-left corner of the screen. Move() moves the upper left-hand corner of textboxes. For the sake of convenience, the MoveCorner function is available, which will move an image or label by its upper left-hand corner.

You should remove widgets from their parent window when you are finished using them.

All widgets have several properties available for controlling their behavior.

widget.name

```
widget.X
widget.Y
widget.WIDTH
widget.HEIGHT
widget.VISIBLE
widget.ROTATION
widget.ZOOMX
widget.ZOOMY
```

4.6 Images

PEBL can read numerous image types, courtesy of the SDL_image library. Use the MakeImage() function to read an image into an image object. As images are often used as stimuli, Move() centers the image on the specified point. To move by the upper-left hand corner, use the PEBL-defined MoveCorner() function:

```
define MoveCorner(object, x, y)
{
  size <- GetSize(object)
  centerX <- x + First(size)/2
  centerY <- y + Last(size)/2
  Move(object, centerX, centerY)
}</pre>
```

Images have all the properties available for widgets, but the width and height can only be read, and not set. Width and height are controlled by the dimensions of the image file.

4.7 Canvases

A canvas is a blank rectangle, sort of like an 'imageless' image. As with an image, Move() centers the image on the specified point. A canvas appears similar to a Rectangle() shape, but differs in some important ways. First, a Canvas has a piece of video memory associated with it—shapes do not. This means that other objects can be added to a canvas, just as it can be added to a window. If you move the canvas around, the attached objects will move with the canvas.

Second, individual pixels of a canvas can be set, using the SetPoint() function. SetPoint works on images too, but not on text. This is because a Draw() command re-renders text, and so will wipe out any pixel damage you have done. This can be useful for making special-purpose drawing functions to create stimuli, especially noise distributions.

Finally, a canvas can be drawn on with another object. In fact, you can you another image as a brush. Add an image to a canvas, and anytime you call Draw() on the canvas (rather than without an argument), the image gets imprinted on the canvas. This will remain until you call Reset Canvas().

For example:

```
tb <- MakeCanvas(600,400,d)
AddObject(tb,win)
##add the image to canvas, not win
pebl <- MakeImage("pebl.png")
AddObject(pebl,tb)
##Nothing will appear on the screen in these intermediate draws
Move(pebl,100,100)
Draw(pebl)
Move(pebl,200,100)
Draw(pebl)
Move(pebl,200,200)
Draw(pebl)
Move(pebl,100,200)
Draw(pebl)
```

Draw() ##Now, we will see the canvas with 4 pebl images on it.

The draw-on trick can be used to add noise to a text stimulus. Make a label and add it to a canvas, use Draw() on the label, then hide the label, and add noise to the canvas by using SetPoint(). Anything drawn on the canvas won't get reset until the ResetCanvas() function is called.

Images have all the properties available for widgets. Size cannot be updated once the canvas is created.

Note that the background color can have an alpha value. If you use an alpha value of 0, the background will be invisible.

4.8 Shapes

PEBL allows you to define a number of shape objects that can be added to another widget. A demonstration script exercising these shapes is found in demo/shapes.pbl.

The following is a list of shape and their properties.

4.8.1 Circle

Description: A standard circle. Move commands move the center of the circle to the specified location.

Command: Circle(<x>,<y>,<r>,<color>,<filled>)

Properties: .name .filled = 0,1 (whether it is filled) .color (color) .x (x position of center) .y (y position of center) .height (read-only height) .width (read-only width) .R (radius)

4.8.2 Ellipse

Description: An ellipse, with height and width differing. Cannot be pointed in an arbitrary direction. Move commands move the center of the shape to the specified location.

Command: Ellipse(<x>,<y>,<rx>,<ry>,<color>,<filled>)

Properties: .name
.filled = 0,1 (whether it is filled)
.color (color)
.x (x position of center)
.y (y position of center)
.height (read-only height)
.width (read-only width)
.rx (x radius)
.ry (y radius

4.8.3 Square

Description: A square. Move commands move the center of the shape to the specified location. *Command:* Square(<x>,<y>,<size>,<color>,<filled>)

Properties: .name .filled = 0,1 (whether it is filled) .color (color) .x (x position of center) .y (y position of center) .height (read-only height) .width (read-only width) .dx, .dy, .size (Length of side)

4.8.4 Rectangle

Description: A Rectangle. Move commands move the center of the rectangle to the specified location.

Command: Rectangle(<x>,<y>,<dx>,<dy>,<color>,<filled>)

Properties: .name
.filled = 0,1 (whether it is filled)
.color (color)
.x (x position of center)
.y (y position of center)
.height (read-only height)
.width (read-only width)
.dx, (width) .dy, (height)

4.8.5 Line

Description: A Line. Move commands move the center of the line to the specified location. Command: Line(<x>, <y>,<dx>,<dy>,<color>)

Properties: .color (color) .x (x position of start) .y (y position of start) .width, (x length) .height, (y length)

4.8.6 Polygon

Description: An arbitrary polygon. Command: Polygon(<x>, <y>,<xpoints>,<ypoints>,<color>,<filled>)

Properties: .name .color (color) .x (x position of start) .y (y position of start)

4.8.7 Bezier

Description: An arbitrary bezier curve. Command: Bezier(<x>, <y>,<xpoints>,<ypoints>,<steps>,<color>)

Properties: .name .color (color) .x (x position of start) .y (y position of start)

4.9 Text Labels

You can create a text label object with the MakeLabel() function, which requires specifying a font, and the foreground and background colors. Labels are only a single line of text. Like images, when you move them, they center on the specified point.

The text inside a label can be extracted with GetText() and set with SetText(). When you change a text object, it will not appear until the next time you call a Draw() function.

Text labels have all the regular widget properties, plus:

label.TEXT label.FONT

The .HEIGHT and .WIDTH accessible, but cannot be changed because they are controlled by the text and the font size.

4.10 Text Boxes

A text box is a graphical widget that contains a body of text. Text automatically wraps when it is too long to fit on a single line. Like labels, the text inside a TextBox can be extracted with GetText() and set with SetText(). When a text object is changed, it rerenders immediately, but does not appear until the next time a Draw() function is called.

Textbox properties:

textbox.EDITABLE textbox.CURSORPOS textbox.DIRECTION textbox.LINEHEIGHT textbox.LINEWRAP

4.11 User-Editable Text Boxes

Text box editing can be performed using the GetInput(<textbox>,<escape-key>) function. This returns the text that is present in the box when the participant hits the key associated with <escape-key>. <escape-key> is just a text-based code that describes the keypress that should be checked for exit. Typical escape-key options include:

```
"<return>"
"<esc>"
"<backspace>"
"<kp_enter>"
" "
"A"
```

See the Keyboard Entry section below for a more complete list.

Translation from string to keyboard input is still crude, and is handled in src/utility/PEBLUtility.cpp:TranslateString

4.12 Audio

Currently, audio output is very primitive, and there are no facilities for recording or analyzing audio input. Audio .wav files can be loaded with the LoadSound() function, which returns an audio stream object that can be played with either the PlayForeground() or PlayBackground() functions. The PlayForeground() function returns once the sound is finished playing; PlayBackground() returns immediately and the sound plays in a separate thread. When using PlayBackground, playing can be stopped using the Stop() function. If another PlayForeground() or PlayBackground() is then used, the initial sound will immediately terminate and the new file will play. Currently, PEBL can only play one sound at a time.

4.13 Movie Files

If compiled to support them, PEBL can read numerous video and audio media files waave library and ffmpeg. Use the LoadMovie() function to read a movie file into a movie object. The Move() function moves the upper left corner of the movie to the specified point. An audio file can be similarly loaded using the LoadAudioFile function.

Movie playback is done via a handler placed in the event loop. This handler is placed there with the StartPlayback function. Then, when the event loop runs, the movie will get updated in proper time sequence. The event loop is used for most WaitFor type events. This allows you to play a movie and wait for a response at the same time. Alternately, a complete movie file can be played in full (with no possibility for stopping early) using the PlayMovie() function. Movies have a number of properties that can be set to change playback or determine aspects of the movie. These are all accessible via .property syntax, and can be printed by the PrintProperties function. Properties include:

- DURATION: time in ms
- FILENAME: filename
- HEIGHT: pixels high
- NAME: <MOVIE>
- PLAYBACKPOSITION: where playback is
- ROTATION: Inherited; will not work
- VISIBLE: whether hidden or visible
- VOLUME: volume on a logarithmic scale–can go from 0 to +infinity
- WIDTH: screen width in pixels
- X: upper left corner x
- Y: upper left corner y
- ZOOMX: scaling; not used (just set width)
- ZOOMY: scaling; not used (just set height)

4.14 Custom objects

Along with the built-in objects, PEBL lets you create your own object with properties that can be added, changed, and accessed using the .property notation. With appropriate use of the CallFunction command, you can also specify function handlers for functions such as Move(), Draw(), Inside(), or whatever you want. The object system in PEBL is fairly (and intentionally) primitive, without things you might expect from full-fledged object-oriented languages (i.e., accessor functions, inheritance, methods, constructors, etc.). Nevertheless, it can be very useful for encapsulating a lot of information about a computing object, and is used heavily in the GUI objects found in the launcher and other PEBL tools.

Use MakeCustomObject(name) to create a custom object. Then, a property can be added by assigning obj.name. For example, suppose you want an object to represent the x,y location of a point.

p1 <- MakeCustomObject("point")
p1.x <- 100</pre>

```
p1.y <- 100
```

Now, if you want to use access the x and y properties, do:

```
Print("position is:" p1.x + ","+ p1.y)
```

An object can take a function name as a property. For example:

```
p1.inside <- "InsidePoint"</pre>
```

With the function InsidePoint defined as:

```
define InsidePoint(x,y,p)
{
   return (x==p.x and y==p.y)
}
```

If you had a bunch of objects, you could define the .inside property of each differently. Then, later, you could define InsideObject to check any of them:

```
define InsideObject(x,y,p)
{
    CallFunction(p.inside,[x,y,p])
}
```

4.15 Keyboard Entry

PEBL can examine the state of the keyboard, and wait for various keyboard events to happen. Functions such as WaitForKeyDown(), WaitForAnyKeyDown(), etc., allow you to collect responses from subjects. Most keys are specified by their letter name; others have special names: "<left>" "<up>" "<down>" "<right>" "<enter>" "<return>" "<esc>" "<backspace>" or "<back>" "<kp_0>" through "<kp_9>", as well as "<kp_period>", "<kp_divide>", "<kp_multiply>", "<kp_minus>", "<kp_plus>", "<kp_equals>", "<kp_enter>" for keypad keys. "<insert>","<delete>", "<home>", "<end>","<pageup>","<pagedown>" for other special keys.

Function keys "<F1>" through "<F15>".

Also, the traditional "modifier" keys can serve as normal keys:

```
<lpri><lshift>, <rshift> <numlock>, <capslock>, <scrollock>,
<rctrl>, <lctrl>, <ralt>,<lalt>,<rmeta>,<lmeta>,<lsuper>,
<rsuper>,<mode>,<compose>
```

4.16 Joystick Input

PEBL supports input with a joystick. In order to use a joystick, you first need to poll the computer to determine whether a joystick is attached, and create a joystick object. The file joysticktest.pbl in the demo directory creates a simple visual depiction of a fairly standard gamepad.

A joystick will have up to four types of inputs on it: buttons, axes, hats, and balls. But different joysticks are different, and so you may need to do some checking and testing for your particular setup. PEBL currently does not support force-feedback or rumble functions available on some joysticks. **Axes:**

Each axis takes on a value between 1 and 32768. For a normal hand-grasp joystick, the first two axis will be determined by the relative x and y positions of the joystick. Gamepads often have triggers that are additional axis, or sometimes there are throttles (or gas/brake pedals in driving devices) that are mapped to axes. Find out how many axes exist with GetNumJoystickAxes(). Get the state of a particula axis with GetJoystickAxisState().

Hats:

Hats are the little 8-way buttons that control direction on many game pads. They are sort of a digital axis, because each state is absolute. The entire hat state takes on a single integer number between 0 and 15. It is binary coded to specify whether each of the four major axes buttons are depressed:

- left: 8
- bottom: 4
- right: 2
- top: 1

The mechanics of the hat allows two buttons to be pressed simultaneously, indicating, for example, southeast or northwest. An example of how to extract the bitwise button states is found in the joysticktest.pbl file.

Buttons:

Usually, the state of each of the buttons on the joystick can be identified. Button state is coded so that 0=unpressed, 1=pressed. There can easily be a dozen or more buttons on a joystick, enabling some pretty elaborate response modes for experiments.

Balls:

Balls are very rare; you may have seen them in old-style arcade games like Arkenoid. No consumer joysticks available today appear to have balls that operate this way, and they have not been tested in PEBL. If you want to support trackballs, there are plenty of trackball mice that work as normal joystick controllers.

A number of functions are available for creating a joystick object and polling the joystick's current state:

Summary of joystick functions:

```
GetNumJoysticks()
OpenJoystick()
GetNumJoystickAxes()
GetNumjJoystickBalls()
GetNumJoystickButtons()
GetJoystickHats()
GetJoystickHatState()
GetJoystickHatState()
```

Currently, the joystick state is not integrated into PEBL's event loop. Consequently, there are no functions such as WaitForJoystickButton(), and no way to create or monitor events. To use the joystick, you need to monitor the state of the device manually, and create a polling loop yourself, like:

```
##This will keep looping until you press the first button
js < OpenJoystick(1) ##open the first joystick connected to the system
gCont <- 1
while (gCont)
    {
      state <- GetJoystickAxisState(js,1)
      Print(state)
      ##Do something with the axis1 here
      gCont <- GetJoystickButtonState(1)
    }
</pre>
```

The file demo/joysticktest.pbl uses most of the available joystick functions to display a virtual gamepad on the screen as it captures input.

4.17 Files

Files are objects that can be read from or written to using several PEBL functions. To use a file object, create one using one of the functions listed below. Each function returns a file object:

```
FileOpenRead()
FileOpenWrite()
FileOpenOverwrite()
FileOpenAppend()
```

```
For example, you can use the command:
myfile <- FileOpenRead("stimuli.txt")
to create 'myfile', a readable file stream.
```

FileOpenWrite is made with a safety backup. It will never overwrite an existing file; instead it will create a new file name by appending a number (i.e. 1) to the end of the base file name. The new filename will be saved as in the .filename property of the resulting file. The function FileOpenOverwrite() will overwite any existing files, and should not be used for data files when you have the chance for a collision in a subject code.

The function GetNewDataFile() offers another all-in-one path for creating a data file. It will take a base name and a subject identifier, a file extension, and a header. If the file has not previously been created, it will create the new file and add a header row. If it has been created before, it will ask you whether to append to the current data file (in which case it won't add a header row), or select a new data file. Data files are created in separated subdirectories (one per participant) within the data directory of the experiment.

Other Functions described below allow filestreams to be written to or read from. When you are finished, you can close a filestream Using the 'FileClose()' function.

A number of related functions have been created to help make reading and writing to files easier. For example, the following functions enable reading an entire file into either a string variant, a list (with one list item per row), or a table:

```
ReadCSV()
FileReadCharacter()
FileReadLine()
FileReadWord()
FileReadTable()
FileReadText()
FileReadList()
FileReadList()
```

4.18 Network Connections

PEBL has limited ability to open and communicate via TCP/IP connections, either some other system (e.g., for synchronizing with an e.e.g. or eyetracking computer), or another computer running PEBL (e.g., to create multi-subject game theory experiments or to have an experimenter controlling the task from another computer.)

4.18.1 TCP/IP Overview

TCP/IP is a protocol by which computers can talk to one another. It is fairly barebones, and PEBL tries to hide much of its complexity. The information you send from one computer to another is guaranteed to arrive in the correct order, at the potential cost of serious delays, especially if the computers are on different networks or in different locations. Furthermore, connecting PEBL to another computer in this way is a potential security risk. However, the ability to transfer information between computers opens up huge potential for the types of experiments that can be constructed.

4.18.2 Addresses and Ports

To do this, you first must open a network object to communicate with another computer. To do this, you must know (1) the IP number (like 127.0.0.1) or hostname (like myname.myschool.edu) of the computer you want to connect to, and (2) the port you want to connect on. You can even use the protocol to connect to another program running on your own computer, by specifying an IP address of 127.0.0.1, or the hostname "localhost". A port is a number–usually 2 to 5 digits, specifying a type of service on your computer. Many ports are frequently used for specific types of communication, but you can use any port you wish to communicate, as long as both computers know this port. Most

ports on your computer should be blocked by default, so you may need to turn off your firewall or allow your chosen port to pass through the security or you may have trouble communicating.

To allow two PEBL programs to communicate, you need to decide that one computer is the "server" and the other is the "client". On the server, you execute the function WaitForNetworkConnection(port), which listens on the specified port until the client tries to connect. After the server is started, the client calls ConnectToHost(hostname, port) or AcceptNetworkConnection(port) ConnectToIP(ipnum, port), depending upon whether you are using the hostname or ip address. Typically, ip numbers are specified by four three-digit numbers separated by dots, like 196.168.0.1. This actually represents a 4-byte integer, and this 4-byte integer is what ConnectToIP() expects. To create that integer, use the function

ConvertIPString(ipnum), which accepts an IP address specified in a string. So, you can use:

net <- ConnectToIP(ConvertIPString("127.0.0.1"), 1234)</pre>

to create a connection to another program listening on port 1234 on your own computer. These functions all return a network object (e.g., **net**) that must be used in later communication.

4.18.3 Sending and Receiving Data

Once connected, the distinction between client and server essentially disappears. However, to communicate, one computer must send data with the SendData(net, data), and the other must receive the data, using the

GetData(net, size) function. PEBL can only send text strings, and you must know the length of the message you want to receive. More complex communication can be done by creating a set of PEBL functions that encapsulate messages into text strings with templated headers that specify the message length. Then, to receive a message, you first read the fixed-length header, determine how much more data needs to be read, then read in the rest of the data.

4.18.4 Closing networks

If you are using a network connection to synchronize timing of two computers, you probably want to close the network connection with

CloseNetworkConnection(net) after you have synchronized, to avoid any extra overhead.

A simple example of an experiment that uses $\rm TCP/\rm IP$ to communicate is the NIM game in demo/nim.pbl.

4.19 Parallel Port

Starting with Version 0.12, PEBL can send and receive information via a standard parallel (printer) port. These don't appear on many computers anymore, but you can still get them, and they are still important ways to interface with hardware devices such as EEG and MRI machines and homebrew button boxes. Currently, parallel port access is fairly limited to setting and getting the state of the 8 data bits. Parallel ports have a number of bits you can play with, but currently PEBL only supports the basic 8 data bits. Basically, you can set the state of the bits or read the state of the bits, which can either control things like LEDs, or be impacted by making connections between the ground and the data bit.

If you have a parallel port, it is mapped to one of three ports: LPT1, LPT2, or LPTX. To initialize access to a port, you must call OpenPPort with the name of your port: "

port <- OpenPPort("LPT1")</pre>

Parallel ports have two modes, input and output. To read data in, it needs to be in input mode; to change the state of the bits, it needs to be in output mode. Set the state with SetPPortMode(port,"<input>") or SetPPortMode(port,"<output>").

To access the state of a port, use GetPPortState(port). It will return a string of "|" separated 1s and 0s, which specify the state of each of the 8 bits.

To set the state of the port, use SetPPortState(port, state). state should be a list of 8 0s or 1s:

SetPPortState(port, [0,0,0,0,0,0,0,1])

The internal c++ parallel port classes have substantially more flexibility, and can be adapted to do more complex access of parallel ports.

4.20 Serial Port

- OPENCOMPORT
- COMPORTSENDBYTE
- COMPORTGETBYTE

4.21 The Event Loop

To assist in testing for multiple input events simultaneously, PEBL implements an event loop that will quickly scan multiple conditions and execute proper results whenever any one condition is met.

The event loop works by maintaining a list of triggers that can be satisfied by various conditions. The conditions typically specify a device or other data source to examine, such as the timer. On each cycle of the loop, all events are examined, and when any of them are satisfied, either a specified function will be executed, or the event loop will exit. Most of the timing and input functions use the event loop behind the scenes.

As of Version 0.12, simple means to program the event loop are available. Three functions include:

• RegisterEvent(). This allows you to specify a condition and a function name which executes whenever the condition is true.

- StartEventLoop(). This starts the event loop, with all available events.
- ClearEventLoop(). This clears out the event loop so other events can be used.

Note that because other functions, such as Wait(), use the event loop, you can pre-load extra events and start the event loop with one of these functions. These are used in a number of test battery tasks. However, their use is currently

somewhat experimental, and their names and arguments may change in the future, and so we will not provide a detailed description of their use here.

4.22 Parameter Setting

PEBL offers an interface to set a large set of experimental parameters from a text file. Furthermore, the PEBL launcher allows you to edit and save new parameter sets. This allows you to create common versions of a test that you call, without editing the PEBL script.

The PEBL parameter system is based on a custom object created with the CreateParameters() function. To use this, it requires you to set default parameters (in case the parameter file is not found or damaged). Create default parameters as a nested list containing property-value pairs. For example: parameterpairs <- [["length",10],

```
["trialsperblock",15],
["numblocks",3]]
```

If you want to override these values, create a text file (typically saved in the params folder with the extension .par) that contains comma-separated values parname, value, like this:

length,5
trialsperblock,25
numblocks,5

Then, create a parameter object using CreateParameters:

gParams <- CreateParameters(pairlist, filename)</pre>

Any values in the .par file will override the values in the default list. PEBL tries to convert text values to numbers, and the value will be a number whenever the round-trip from text-to-number-to-text does not change the original value. Thus, avoid using floating-point values for parameters, and you may need to write "0.1" instead of ".1" if you do.

The PEBL launcher offers a way to set parameters. To do so, it needs more information, including the default values and a description. It looks for a .schema file in the params folder with the same name as the experiment. This file uses the | character to separate field (this allows you to use commas in the description):

```
length|10|The number of words per trial
trialsperblock|15|Trials in each block
numblock|3|Number of blocks.
```

Notice that quotes are not used in these files. The values in this file are ONLY relevant to the PEBL launcher. These are used to reset the values in a .par file or tell the experiment what typical values are. They can differ from the default values in the .pbl file, but for clarity they should not.

4.23 Errors and Warnings

PEBL does a great deal of error-checking to ensure that your program will run. If you crash with a segmentation fault, this is an error and you should report it. When a fatal error or non-fatal warning occurs, PEBL attempts to identify the location in your input file that led to the warning. On Linux, the warning and this location are printed to the command-line upon exit; on MS Windows or if you are using the launcher on any platform, they are printed to the file stderr.txt.

You can do error checking in your own scripts with the SignalFatalError() function. This is especially useful in combination with the functions testing the type of object passed into the function. To ensure proper processing and ease of debugging, test the format of an argument passed into a function: define MyFunction(par)

```
{
    if(not IsList(par))
    {
        SignalFatalError("MyFunction passed a non-list variable.")
    }
    ##Do other stuff here
}
```

4.24 Paths and Path Searching

Numerous functions and objects open files on your computer to read in information such as graphics, sounds, fonts, program files, and text files. When you attempt to open a file, PEBL will search in a number of places, in this order:

- The (current) working directory
- The directory of each file specified in the command line arguments
- media/fonts
- media/sounds
- media/images
- media/text

You can also specify other paths to be searched by specifying them on the command line. Be sure to end the directory with whatever is appropriate for your platform, e.g. '\' on Microsoft Windows or '/' on Linux.

On OSX, as of version 0.12, the media/ directory is located within the Resources/ subdirectory of the application package.

4.25 Provided Media Files

PEBL comes with various media files that can be specified from any script without including the complete path. If a user's file has the same name, it will be loaded before the PEBL-provided version. Table 4.2 describes the files included.

Name	Description
In 'media/fonts/':	
Listing of fonts appears in Table 4.1	
In 'media/images/':	
pebl.bmp	Demonstration bitmap image
pebl.png	Demonstration PNG image
smiley-small.png	25x25 smiley face
frowney-small.png	25x25 frowney face
smiley-large.png	100x100 smiley face
frowney-large.png	100x100 frowney face
plus.png	A green plus sign
x.png	A red x sign, matching the red plus
In 'media/sounds/':	
buzz500ms.wav	A 500-ms buzzer
buzz500ms.wav chirp1.wav	A 500-ms buzzer A chirp stimulus
buzz500ms.wav chirp1.wav boo.wav	A 500-ms buzzer A chirp stimulus A really bad booing sound
buzz500ms.wav chirp1.wav boo.wav cheer.wav	A 500-ms buzzer A chirp stimulus A really bad booing sound A pretty lame cheering sound
buzz500ms.wav chirp1.wav boo.wav cheer.wav beep.wav	A 500-ms buzzer A chirp stimulus A really bad booing sound A pretty lame cheering sound A simple beep
buzz500ms.wav chirp1.wav boo.wav cheer.wav beep.wav boo.wav	A 500-ms buzzer A chirp stimulus A really bad booing sound A pretty lame cheering sound A simple beep Boo–useful for errors
buzz500ms.wav chirp1.wav boo.wav cheer.wav beep.wav boo.wav cheer.wav	A 500-ms buzzer A chirp stimulus A really bad booing sound A pretty lame cheering sound A simple beep Boo–useful for errors A cheer-useful for correct feedback
buzz500ms.wav chirp1.wav boo.wav cheer.wav beep.wav boo.wav cheer.wav kaching.wav	A 500-ms buzzer A chirp stimulus A really bad booing sound A pretty lame cheering sound A simple beep Boo–useful for errors A cheer-useful for correct feedback Sound of a coin in a jar
<pre>buzz500ms.wav chirp1.wav boo.wav cheer.wav beep.wav boo.wav cheer.wav kaching.wav knock.wav</pre>	A 500-ms buzzer A chirp stimulus A really bad booing sound A pretty lame cheering sound A simple beep Boo-useful for errors A cheer-useful for correct feedback Sound of a coin in a jar simple knocking/click sound
buzz500ms.wav chirp1.wav boo.wav cheer.wav beep.wav boo.wav cheer.wav kaching.wav kaching.wav knock.wav 0.wav through 9.wav	A 500-ms buzzer A chirp stimulus A really bad booing sound A pretty lame cheering sound A simple beep Boo-useful for errors A cheer-useful for correct feedback Sound of a coin in a jar simple knocking/click sound Recording of numerals, used in digit span and others
buzz500ms.wav chirp1.wav boo.wav cheer.wav beep.wav boo.wav cheer.wav kaching.wav knock.wav 0.wav through 9.wav correct.wav	A 500-ms buzzer A chirp stimulus A really bad booing sound A pretty lame cheering sound A simple beep Boo-useful for errors A cheer-useful for correct feedback Sound of a coin in a jar simple knocking/click sound Recording of numerals, used in digit span and others correct feedback
buzz500ms.wav chirp1.wav boo.wav cheer.wav beep.wav boo.wav cheer.wav kaching.wav kaching.wav knock.wav 0.wav through 9.wav correct.wav incorrect.wav	A 500-ms buzzer A chirp stimulus A really bad booing sound A pretty lame cheering sound A simple beep Boo-useful for errors A cheer-useful for correct feedback Sound of a coin in a jar simple knocking/click sound Recording of numerals, used in digit span and others correct feedback Incorrect feedback

Table 4.2: Media Files Provided with PEBL

In 'media/text/':

_

Chapter 4 . Overview of Object Subsy	systems
---	---------

Name Description	
Conconenta tut	List of all conconents, both cases
Digita tyt	List of digits 0.0
DigitNames tyt	List of digit names
Letters.txt	All letters, both cases
Lowercase.txt	Lowercase letters
LowercaseConsonants.txt	Lowercase Consonants
LowercaseVowels.txt	Lowercase Vowels
Uppercase.txt	Uppercase Letters
${\tt UppercaseConsonants.txt}$	Uppercase Consonants
${\tt UppercaseVowels.txt}$	Uppercase Vowels
Vowels.txt	Vowels (both cases)

Additionally, the PEBL Project distributes a number of other media files separately from the base system. These are available for separate download on the pebl website (http://pebl.sourceforge.net), and include a set of images (including shapes and sorting-task cards), and a set of auditory recordings (including beeps, the digits 0-10, and a few other things).

4.26 Special Variables

There are a number of special variables that be set by PEBL, and can later be accessed by an experiment. These are described in table 4.3.

Name Purpose Controls continued execution in event loop (unused). gKeepLooping gSleepEasy Sets 'busy-waiting' to be either on or off. Busy-waiting can improve timing, but is often not needed and pegs CPU. The width in pixels of the display (set by gVideoWidth default or command-line option). Changing this before calling MakeWindow will change display width, if that width is available. gVideoHeight The height in pixels of the display (set by default or command-line). Change this before using MakeWindow() to change the display height The bit depth of the video. gVideoDepth A global variable set to whatever follows the --s or gSubNum --S command-line argument. Defaults to "0". A global variable specified on the command line gLanguage which can be used by a script to target a specific language. Defaults to 'en'. A quotation mark: ". Use it to add quotes in text. gQuote gClick [x,y] location last click in WaitForClickOnTarget. gPEBLBaseFont Name of the default font to use in helper functions and most battery tasks. By default, set to "DejaVuSans.ttf". Change to override. Name of the default mono-spaced font gPEBLBaseFontMono By default, it is set to "DejaVuSansMono.ttf". gPEBLBaseFontSerif Name of the default serif font. By default, it is set to "DejaVuSerif.ttf".

 Table 4.3:
 Special Variables in PEBL

Chapter 5

Function Quick Reference

Table 5.1 lists the functions available for use with PEBL. Those that are unimplemented are noted as such. If you want the functionality of an unimplemented function, or want functionality not provided in any of these functions, contact us, or better yet, contribute to the PEBL project by implementing the function yourself.

Name	Arguments	Description	
Math Functions			
Log10	<num></num>	Log base 10 of <num></num>	
Log2	<num></num>	Log base 2 of <num></num>	
Ln	<num></num>	Natural log of <num></num>	
LogN	<num> <base/></num>	Log base <base/> of <num></num>	
Exp	<pow></pow>	e to the power of <pow></pow>	
Pow	<num> <pow></pow></num>	<num> to the power of <pow></pow></num>	
Sqrt	<num></num>	Square root of <num></num>	
NthRoot	<num> <root></root></num>	<num> to the power of $1/$<root></root></num>	
Tan	<deg></deg>	Tangent of <deg> degrees</deg>	
Sin	<deg></deg>	Sine of $\langle deg \rangle$ degrees	
Cos	<deg></deg>	Cosine of $\langle deg \rangle$ degrees	
ATan	<num></num>	Inverse Tan of $<$ num $>$, in degrees	
ASin	<num></num>	Inverse Sine of $<$ num>, in degrees	
ACos	<num></num>	Inverse Cosine of <num>, in degrees</num>	
DegToRad	<deg></deg>	Converts degrees to radians	
RadToDeg	<rad></rad>	Converts radians to degrees	
Round	<num>, (optional)</num>	Rounds <num> to nearest integer, or op-</num>	
	<precision></precision>	tionally power of $1/ten$ precision.	
Floor	<num></num>	Rounds <num> down to the next integer $\$</num>	
Ceiling	<num></num>	Rounds $<$ num> up to the next integer	

 Table 5.1: Function Quick Reference

Name	Arguments	Description
AbsFloor	<num></num>	Rounds <num> toward 0 to an integer</num>
Mod	<num> <mod></mod></num>	Returns <num> mod <mod> or remainder of <num>/<mod></mod></num></mod></num>
Div	<num> <mod></mod></num>	Returns round(<num>/<mod>)</mod></num>
ToInteger	<num></num>	Rounds a number to an integer, and changes internal representation
ToFloat	<num></num>	Converts number to internal floating- point representation
ToNumber	<>	
ToString	<num></num>	Converts a numerical value to a string representation
Sign	<num></num>	Returns +1 or -1, depending on sign of argument
Abs	<num></num>	Returns the absolute value of the number
CumNormInv		Returns accurate numerical approxima- tion of cumulative normal inverse.
NormalDensity	<x></x>	Returns density of standard normal dis- tribution.
SDTDPrime	<hr/> , <far></far>	Computes SDT dprime.
SDTBeta	<hr/> , <far></far>	Computes SDT beta.
Order	<list></list>	Returns a list of integers representing the order of <list></list>
Rank	<list></list>	Returns integers representing the ranked indices of the numbers of <list></list>
Median	<list></list>	Returns the median value of the numbers in <list></list>
Min	<list></list>	Returns the smallest of <list></list>
Max	<list></list>	Returns the largest of <list></list>
Bound	<val>, <min>,</min></val>	Returns val, bounded by min and max.
	<max></max>	
StDev	<list></list>	Returns the standard dev of <list></list>
Sum	<list></list>	Returns the sum of the numbers in <list></list>
Median	<list></list>	Returns the median of a set of values
Quantile	<list> <num></num></list>	Returns the <num> quantile of the num- bers in <list></list></num>
SummaryStats	<data>,<cond></cond></data>	Returns statistics (cond, N, median, mean, sd) computed on data for each distinct value of <cond></cond>
SeedRNG	<num></num>	Seeds the random number generator with <num> to reproduce a random se- quence</num>

Chapter 5. Function Quick Reference

Name	Arguments	Description
RandomizeTimer Random	-	Seeds the RNG with the current time Returns a random number between 0 and 1
RandomDiscrete	<num></num>	Returns a random integer between 1 and <num></num>
RandomUniform	<num></num>	Returns a random floating-point number between 0 and <num></num>
RandomNormal	<mean> <stdev></stdev></mean>	Returns a random number according to the standard normal distribution with <mean> and <stdev></stdev></mean>
RandomExponential	<mean></mean>	Returns a random number according to exponential distribution with mean <mean> (or decay 1/mean)</mean>
RandomLogistic		Returns a random number according to the logistic distribution with parameter
RandomLogNormal	<median> <spread></spread></median>	Returns a random number according to the log-normal distribution with pa- rameters <median> and <spread></spread></median>
RandomBinomial	<n></n>	Returns a random number according to the Binomial distribution with proba- bility and repetitions <n></n>
RandomBernoulli		Returns 0 with probability (1-) and 1 with probability
ZoomPoints	<[xs,yy]>, <xzoom>, <yzoom></yzoom></xzoom>	Zooms a set of points in 2 directions
ReflectPoints	<[xs,yy]>	Reflects points on vertical axis
RotatePoints	<[xs,yy]>, <angle></angle>	Rotates point <angle> degrees</angle>
GetAngle	<x>,<y></y></x>	Returns the angle in degrees of a vector.
Dist	<x1,y1>,<[x2,y2]></x1,y1>	Returns distance between two points.
ToRight	<p1,p2,p3></p1,p2,p3>	Determines whether $p3$ is to the right of line $p1p2$
GetAngle3	<a,b,c></a,b,c>	Gets angle abc.
SegmentsIntersect	<ax,ay,bx,by,cx,cy< td=""><td>,dx,dy></td></ax,ay,bx,by,cx,cy<>	,dx,dy>
U U		Determines whether line segment ax in- tersects cd.
NonOverlapLayout	<xmin,xmax,ymin,ym< td=""><td>ax,tol,num> Creates a set of num points that don't overlap, but fails gracefully</td></xmin,xmax,ymin,ym<>	ax,tol,num> Creates a set of num points that don't overlap, but fails gracefully
LayoutGrid	<minx,maxx,miny,ma< td=""><td>xy,height,width,vertical> Creates [x,y] pairs in a grid for graphi- cal layout</td></minx,maxx,miny,ma<>	xy,height,width,vertical> Creates [x,y] pairs in a grid for graphi- cal layout

Name	Arguments	Description		
File/Network/Device Functions				
Print	<value></value>	Prints <value> to stdout, appending a new line afterwards. stdout is the con- sole (in Linux) or the file stdout.txt (in Windows)</value>		
Print_	<value></value>	Prints <value> to stdout, without appending a newline afterwards</value>		
PrintList	<value></value>	Prints <list>, getting rid of '[', ']' and ',' characters.</list>		
Format	<object> <size></size></object>	Prints a number with specified spaces by truncating or padding		
ZeroPad	<number> <size></size></number>	Pads the beginning of a number with 0s so the number is size long		
FileOpenRead	<filename></filename>	Opens a filename, returning a stream to be used for reading information		
FileOpenWrite	<filename></filename>	Opens a filename, returning a stream that can be used for writing informa- tion. Creates new file if file already ex- ists		
FileOpenOverwrite	<filename></filename>	Opens a filename, returning a stream that can be used for writing informa- tion. Overwrites if file already exists		
FileOpenAppend	<filename></filename>	Opens a filename, returning a stream that can be used for writing info. Ap- pends if the file already exists, opens i file does not		
FileClose	<filestream></filestream>	Closes a filestream variable. Pass the variable name, not the filename		
FilePrint	<filestream> <value></value></filestream>	Like Print, but to a file.		
FilePrint_	<filestream> <value></value></filestream>	Like Print_, but to a file.		
FilePrintList	<file><list></list></file>	Prints <list> to <file>, getting rid o '[', ']' and ',' characters.</file></list>		
FileReadCharacter	<filestream></filestream>	Reads and returns a single character from a filestream		
FileReadWord	<filestream></filestream>	Reads and returns a 'word' from a file the next connected stream of characters not including a ' ' or a newline. Wil not read newline characters		

Name	Arguments	Description
FileReadLine	<filestream></filestream>	Reads and returns a line from a file; all characters up until the next newline or the end of the file
FileReadList	<filename></filename>	Given a filename, will open it, read in all the items into a list (one item per line), and close the file afterwards
FileReadTable	<filename></filename>	Like FileReadList, but reads in tables.
	<opt-sep></opt-sep>	Optionally, specify a token separator
GetNewDatafile	<id-code>,<window>, <basename>, <extension>, <header></header></extension></basename></window></id-code>	, Opens a data file in subnum directory
ReadCSV	<filename></filename>	$ \begin{array}{l} Opens \ a \ csv \ file < returning \ a \ table \ with \\ its \ elements \end{array} $
FileReadText	<filename></filename>	Reads all of the text in the file into a variable
EndOfLine	<filestream></filestream>	Returns true if at end of line
EndOfFile	<filestream></filestream>	Returns true if at the end of a file
GetDirectoryListi	ng	
	<path></path>	Returns a list of all the files/subdirectories in a path
FileExists	<path></path>	Checks whether a file exists
IsDirectory	<path></path>	Checks whether a file is a directory
MakeDirectory	<path>,<dirname></dirname></path>	Creates a directory in path
RemoveFile	<file></file>	Removes and deletes a file
AppendFile	<file1> ,<file2></file2></file1>	Appends a file2 to file1
DeleteFile	<file1></file1>	Deletes a file
ConnectToIP	<ip> <port></port></ip>	Connects to a port on another com- puter, returning network object.
ConnectToHost	<hostname> <port></port></hostname>	Connects to a port on another com- puter, returning network object.
WaitForNetworkCon	inection	F,
	<port></port>	Listens on a port until another com- puter connects, returning a network ob- ject
CloseNetworkConne	ection	
	<network></network>	Closes network connection
SendData	<network></network>	Sends a data string over connection.
	<datastring></datastring>	
GetData	<network> <length></length></network>	return a string from network connection
ConvertIPString	<ip-as-string></ip-as-string>	Converts an ip-number-as-string to us- able address

Chapter 5.	Function	Quick	Reference
------------	----------	-------	-----------

Name	Arguments	Description
OpenNetworkListen	er	
-	<port></port>	Opens a port for listening
CheckForNetworkCo	nnection	
	<network></network>	Checks for incoming connection
GetHTTPFile	<server>, <file>,</file></server>	Gets and saves a file from a website
	<outputfile></outputfile>	
GetHTTPText	<server>,</server>	Gets a file from a website and saves it
	<file></file>	to a variable.
PostHTTP	<host>,<page>,</page></host>	Post to a server form.
	<headers>,</headers>	
	<content>,</content>	
MD5Sum	<text></text>	Computes MD5 checksum on text
MD5File	<filename></filename>	Computes MD5 Checksum on file.
WritePNG	<filename>,</filename>	Makes a .png from a window or object
	<object></object>	
GetNumJoysticks	no argument	Determines how many joysticks are
Open Iowatick	iovatick id	Cota a joyotick object
CotNum Lougtick	JOUSTICK_IU	Counts how many aves on a joystick
GetNumJoyStickAxe	S JOYSLICK_ODJECL	Counts now many axes on a joystick
GethumJOyStickDai	iovetick object	Counts how many halls on a joyetick
GetNumIovstickBut	joystick_object	Counts now many bans on a joystick
deenumooyberenbut	iovstick object	Counts how many buttons on a joystick
GetNum.lovstickHat	5	County now many success on a joyseion
	iovstick object	Counts how many hats on a joystick
GetJovstickAxisSt	ate	
	iovstick obiect.	Gets the state of a joystick axis
	axis id	
GetJovstickHatSta	te –	
0	joystick_object,	Gets the state of a joystick hat
	hat_id	
GetJoystickButton	State	
·	joystick_object,	Gets the state of a joystick button
	button_id	
GetJoystickBallSt	ate	
	joystick_object,	Gets the state of a joystick ball
	ball_id	
OpenCOMPort	<portnum>, <baud></baud></portnum>	Opens a serial (com) port
COMPortGetByte	<port></port>	Gets a byte from the comport
COMPortSendByte	<port>,<byte></byte></port>	Sends a character to the comport
OpenPPort	<portname></portname>	Opens parallel port
${\tt SetPPortMode}$	<port> <mode></mode></port>	Sets parallel port mode (input/output)
SetPPortState	<port> <state></state></port>	Sets parallel port state

Chapter 5. Function Quick Reference

Name	Arguments	Description
GetPPortState	<port></port>	Gets state of parallel port data bits
	Graphical Obje	ects Functions
MakeWindow	<colorname></colorname>	Creates main window, in color named by argument, or grey if no argument is named
MakeImage	<filename></filename>	Creates an image by reading in an im- age file (jpg, gif, png, bmp, etc.)
MakeLabel	<text> </text>	Creates a single line of text filled with <text> written in font </text>
MakeTextBox	<text> <width> <height></height></width></text>	Creates a sized box filled with <text> written in font </text>
MakeCanvas	<width>, <height>,</height></width>	Creates a blank canvas
ResetCanvas	<color> <canvas></canvas></color>	to add objects to or draw on Resets a canvas to its background, eras- ing anything drawn on the canvas
EasyLabel	<text> <x><y> <win><fontsize></fontsize></win></y></x></text>	Creates a single line of text and adds it to win at $\langle x \rangle \langle y \rangle$
EasyTextBox	<text> <x> <y> <win> <fontsize> <width> <height></height></width></fontsize></win></y></x></text>	Creates a textbox and adds it to <win> at <x><y></y></x></win>
MakeColor	<colorname></colorname>	Creates a color based on a color name
MakeColorRGB	<red> <green> <blue></blue></green></red>	Creates a color based on red, green, and blue values
RGBToHSV	<color></color>	Converts a color to HSV triple
MakeFont	<ttf_filename> <style></style></ttf_filename>	

		
Name	Arguments	Description
GetInput	<textbox></textbox>	Allows a textbox to be edited by user,
	<escape-key></escape-key>	returning its text when <escape-key></escape-key>
		is pressed.
SetText	<textobject>,</textobject>	Sets the text in a textbox or label
	<text></text>	
SetFont	<textobject>,</textobject>	Changes the font of a text object
		
Move	<object> <x> <y></y></x></object>	Move an object (e.g., an image or a label
		to an x,y location)
MoveCorner	<object> <x> <y></y></x></object>	Moves an image or label by its upper
a . a.		corner.
GetSize	<object></object>	Returns a list of dimensions <x,y> of a</x,y>
	(-);+>	graphical object.
Addubject	<pre><object> </object></pre>	Adds an object to a parent object (win-
PomouroObject	<pre><parent></parent></pre>	Bemeyes an object from a parent win
removenplect	<pre><object> </object></pre>	dow
Show	<pre><pre>></pre></pre>	Shows an object
Hide	<pre><object></object></pre>	Hides an object
ShowCursor	<pre><object></object></pre>	Hides or show mouse cursor
GetMouseCursorPo	osition	Gets [x,v] position of mouse
GetMouseState		Gets [x,y,b1,b2,b3] list of mouse state,
		including button states
SetMouseCursorPo	osition	0
	<x>,<y></y></x>	Sets x,y position of mouse
Draw	<object> or no ar-</object>	Redraws a widget and its children
	gument	
DrawFor	<object></object>	Draws for exactly <cycles> cycles,</cycles>
	<cycles></cycles>	then returns
Circle	<x> <y> <r></r></y></x>	Creates circle with radius r centered at
	<color> <filled></filled></color>	position x,y
Ellipse	<x> <y> <rx></rx></y></x>	Creates ellipse with radii rx and ry cen-
	<ry><color></color></ry>	tered at position x,y
_	<filled></filled>	~ · · · · · · · ·
Square	<x> <y> <size></size></y></x>	Creates square with width size centered
	<color> <filled></filled></color>	at position x,y
Rectangle	<x> <y> <dx></dx></y></x>	Creates rectangle with size (dx, dy)
	<ay><color></color></ay>	centered at position x,y
Line		Creates line starting at www.and cr.dir.
r T II G	<pre><x> <y> <ax> <dy></dy></ax></y></x></pre>	∇ teates nine starting at x, y and ending
	<cotol></cotol>	at x+ux, y+uy

Chapter 5. Function Quick Reference

Name	Arguments	Description
Polygon	<x> <y> <xpoints> <ypounts> <color><filled></filled></color></ypounts></xpoints></y></x>	Creates polygon centered at x,y with relative points <pre>xpoints>,<ypoints></ypoints></pre>
Bezier	<pre><x> <y> <xpoints> <ypoints> <steps> <color></color></steps></ypoints></xpoints></y></x></pre>	Creates bezier curve centered at x,y with relative points
BlockE	<pre><x> <y> <h> <w> <thickness> <orientation> <color></color></orientation></thickness></w></h></y></x></pre>	Creates a block E as a useable poly- gon which can be added to a window directly.
Plus	<x> <y> <size> <w> <color></color></w></size></y></x>	Creates a plus sign as a useable poly- gon which can be added to a window directly.
MakeStarPoints	<r_outer> <r_inner> <npeaks></npeaks></r_inner></r_outer>	Creates points for a star, which can then be fed to Polygon
MakeNGonPoints	<radius> <npeaks></npeaks></radius>	Creates points for a polygon, which can then be fed to Polygon
ThickLine	<x1> <y1> <x2> <y2> <thickness> <color></color></thickness></y2></x2></y1></x1>	Creates a thick line between two points
MakeAttneave	<radius>, <numpoints>, <minangle>, <maxangle></maxangle></minangle></numpoints></radius>	
ConvexHull	<list-of-pts></list-of-pts>	Makes a complex "Attneave" polygon Returns a convex subset of points for a set
KaneszaSquare	<squaresize>, <circleradius>, <fg>, <bg></bg></fg></circleradius></squaresize>	Creates a 'Kanesza Square' stimulus.
KaneszaPolygon	<pre><points>, <circtf>, <circleradius>, <fg>, <bg>,<show></show></bg></fg></circleradius></circtf></points></pre>	Create generic Kanesza polygon.
Inside	<[x,y]> <object></object>	Determines whether a point is inside a graphical object
SetPixel	x,y,color	Sets the color of a pixel on an image or canvas to color
SetPoint	x,y,color	Sets the color of a pixel on an image or canvas to color
GetPixelColor	<obj>,x,y</obj>	Gets the color of a specified pixel on a widget

Name	Arguments	Description
MakeGabor	<size>, <freq>, <sd>, <angle>, <phase>, <bglev></bglev></phase></angle></sd></freq></size>	Creates a 'gabor patch' with specified parameters
	Sound Object	s Functions
LoadSound	<filename></filename>	Loads a soundfile from the filename, re- turning a variable that can be played
PlayForeground	<sound></sound>	Plays the sound 'in the foreground', not returning until the sound is complete
PlayBackground	<sound></sound>	Plays the sound 'in the background', re- turning immediately
Stop	<sound></sound>	Stops a sound playing in the back- ground from playing
MakeSineWave	freq,duration,ampl:	itude Creates a pure sine wave.
MakeAudioInputBu	ffer	
	<time-in-ms></time-in-ms>	Creates a buffer to record audio input
SaveAudioToWaveF	ile	
GetVocalResponse	<filename>,<buffer Time</buffer </filename>	>Saves buffer to a .wav file format A simple voice key
	<buffer>,<threshol< td=""><td>d>,<duration></duration></td></threshol<></buffer>	d>, <duration></duration>
LoadMovie	<movie_filename></movie_filename>	Load a movie file
	<window>,<width>,<ł</width></window>	height>
LoadAudioFile	<audio_filename></audio_filename>	Load an audio file
PlayMovie	<movie></movie>	Plays a movie until its end
StartPlayback	<movie></movie>	Initiates playback in background, up- dated with Wait()
PausePlayback	<movie></movie>	Pauses playback of movie
	Graphical User Int	erface Functions
GetTime	\diamond	Gets a number, in milliseconds, repre- senting the time since the PEBL pro- gram began running.
MakeButton	<label><x>,<y> <win>.<width></width></win></y></x></label>	Makes a button for clicking on.
PushButton	<pre><button><[x.v]></button></pre>	Pushes a button and releases.
MakeCheckBox	<label><x>.<v>.</v></x></label>	Makes a two-state checkbox on a button
	<pre><win>.<width></width></win></pre>	background.
ClickCheckBox	<checkbox><[x,y]></checkbox>	Handles checkbox click and updates state.
SetCheckBox MakeScrollingTex	<checkbox><state></state></checkbox>	Sets checkbox state.

Chapter 5.	Function	Quick	Reference
------------	----------	-------	-----------

Name	Arguments	Description
	<text>, <x>, <y>, <win>, <fontsize>, <width>, <height>, <linewrap></linewrap></height></width></fontsize></win></y></x></text>	Make a box for text that can be scrolled if too long.
SetScrollingText	<pre><obj><text>, <linewrap></linewrap></text></obj></pre>	Changes text of a scrolling textbox.
MakeScrollBox	<pre><opts>, <header>, <x>, <y>, <win>,<fontsize>, <width>, <height>, <selected></selected></height></width></fontsize></win></y></x></header></opts></pre>	Make a scrolling selection box.
UpdateScrollBox	<obj></obj>	Recalculates scrollbox layout.
DrawScrollBox	<obj></obj>	Draws a scrollbox.
ClickOnScrollBox	<obj>, <click></click></obj>	Handles click on scrollbox.
PopuUpMessageBox	<label><win></win></label>	Makes a small message box at the mouse location.
PopuUpEntryBox	<label><win><[x,y]</win></label>	Makes a small entry box at [xy] location.
MakePullDown	<pre><optionlist>, <x>,<y>, <win>, <fontsize>, <width>, <selected>,</selected></width></fontsize></win></y></x></optionlist></pre>	Make a pulldown selection box for a list.
PullDown	<obj><[x,y]></obj>	Handle click on a pulldown.
UpdatePullDown	<obj>, <newlist></newlist></obj>	Updates the list of a pulldown.
DrawPullDown	<obj></obj>	Redraws a pulldonw if state changes.
MakeTextlist	<list>, <listoffset>, <prebuffer></prebuffer></listoffset></list>	Creates a text body from a list.
InsideTB	<[xy]> <obj></obj>	Determine inside for a textbox-style object (location is upper left)
MakeMenu	<pre><header>, <x>, <y>, <win>, <fontsize>, <width>, <subitems>, <functions></functions></subitems></width></fontsize></win></y></x></header></pre>	Creates menu with suboptions.

Name	Arguments	Description
MakeMenuItem	<text>, <x>, <y>, <win>, <fontsize>, <width>, <function></function></width></fontsize></win></y></x></text>	Creates menu sub-item.
ClickOnMenu	<obj>, <[x,y]></obj>	Handles menu click, calling the .clickon function of menu.
OpenSubMenus	<obj>, <[x,y]></obj>	Opens the sub-menus of a menu.
C	ustom and Built-in	Object Functions
PrintProperties	<object></object>	Prints a list of all available properties of an object (for debugging)
GetPropertyList	<object></object>	Gets a list of all the property names of an object
PropertyExists	<object> <prop></prop></object>	Determines whether a particular prop- erty exists
SetProperty	<object> <prop> <value>Sets prop- erty of an object</value></prop></object>	·
GetProperty	<pre><object> <prop></prop></object></pre>	Returns value of property
MakeCustomObject	<name></name>	Creates custom object.
IsCustomObject	<object></object>	Tests whether object is a custom object.
DrawObject	obj	Calls the .draw property of an object
MoveObject	obj, x, y	Calls the .move property of an object
Clickon	obj, [x,y]	Calls the .clickon property of an object
	Misc Event	Functions
GetTime	<>	Gets a number, in milliseconds, repre- senting the time since the PEBL pro- gram began running.
Wait	<time></time>	Pauses execution for <time> ms</time>
IsKeyDown	<keyval></keyval>	Determines whether the key associated with <keyval> is down</keyval>
IsKeyUp	<keyval></keyval>	Determines whether the key associated with <keyval> is up</keyval>
IsAnyKeyDown	<>	Determines whether any key is down.
WaitForKeyDown	<keyval></keyval>	Waits until <keyval> is detected to be in the down state</keyval>
WaitForAnyKeyDown	<>	Waits until any key is detected in down state
WaitForKeyUp	<keyval></keyval>	Waits until <keyval> is in up state.</keyval>
WaitForAllKeysUp		Waits until all keys are in up state
WaitForAnyKeyDownW	/ithTimeout	

Name	Arguments	Description
	<time></time>	Waits for a key to be pressed, but only for <time> ms</time>
WaitForKeyListDown		
	<list-of-keyvals></list-of-keyvals>	Waits until one of the keys is in down state
WaitForKeyPress	<key></key>	Waits until <key> is pressed</key>
WaitForAnyKeyPress	<>	Waits until any key is pressed
WaitForKeyRelease	<key></key>	Waits until <key> is released</key>
WaitForListKeyPres	S	Waits until one of <list-of-keys> is</list-of-keys>
	<list-of-keys></list-of-keys>	pressed
WaitForListKeyPres	sWithTimeout	
	<list-of-keyvals></list-of-keyvals>	Waits for either a key to be pressed or
	<timeout> <type></type></timeout>	a time to pass.
WaitForMouseButton		Waits until any of the mouse buttons is pressed or released, and returns mes- sage indicating what happened
WaitForMouseClickW	lithTimeout	0 0 11
	<timeout></timeout>	
		Waits until any of the mouse buttons is pressed, or a prespecified timout has elapsed.
WaitForClickOnTarg	et	F
	<target></target>	Waits until any of a set of target objects are clicked.
WaitForClickOnTarg	etWithTimeout	
	<target>,</target>	Waits with a max time for a set of tar-
	<timeout></timeout>	gets to be clicked.
WaitForDownClick		Waits for mouse button to be clicked
RegisterEvent	<>	Registers events to trigger based on par- ticular conditions
StartEventLoop	\Leftrightarrow	Starts the event loop
ClearEventLoop	<>	Clears all trigger events from event loop
SignalFatalError	<message></message>	Halts execution, printing out message
TranslateKeyCode	<>	Converts a keycode to a key name
TimeStamp		Returns a string containing the current date and time
GetPEBLVersion	<>	Returns a string indicating which ver- sion of PEBL you are using
GetSystemType	\Leftrightarrow	Identifies the type of operating system being used.
GetVideoModes	<>	Gets list of available screen resolutions
GetCurrentScreenRe	solution	Gets the current widthxheight of the screen

Chapter 5. Function Quick Reference

Name	Arguments	Description
SystemCall	<command/>	Executes command in operating system
	<pre><optional-args></optional-args></pre>	
LaunchFile	<file></file>	Launches a file using platform-specific
		handlers
GetNIMHDemograph	.ics <code></code>	Asks NIMH-related questions
01	<window> <file></file></window>	-
GetSubNum	<window></window>	Asks user to enter subject number
MessageBox	<text> <win></win></text>	Pops up a message, overtop the entire screen, and waits for a click to continue.
GetEasyInput	<text> <win></win></text>	Gets typed input based on a prompt.
GetEasyChoice	<text>,</text>	Simple multiple choice
J	<choices>.</choices>	
	<output>,</output>	
	<window></window>	
CountDown	<window></window>	Displays a 3 2 1 countdown on screen
IsAudioOut	<variant></variant>	Tests whether <variant> is a Au-</variant>
		dioOut stream
IsCanvas	<variant></variant>	Tests whether <variant> is a Canvas</variant>
IsColor	<variant></variant>	Tests whether <variant> is a Color</variant>
IsFileStream	<variant></variant>	Tests whether <variant> is a</variant>
		${ m FileStream}$
IsFloat	<variant></variant>	Tests whether <variant> is a floating-</variant>
		point number
IsFont	<variant></variant>	Tests whether <variant> is a Font</variant>
IsImage	<variant></variant>	Tests whether <variant> is an Image</variant>
IsInteger	<variant></variant>	Tests whether <variant> is an integer-</variant>
		type number
IsLabel	<variant></variant>	Tests whether <variant> is a Text La-</variant>
		bel
IsList	<variant></variant>	Tests whether <variant> is a List</variant>
IsNumber	<variant></variant>	Tests whether $$ is a number
IsTextBox	<variant></variant>	Tests whether <variant>is a TextBox</variant>
IsText	<variant></variant>	Tests whether <variant> is a text</variant>
		string
IsShape	<variant></variant>	Tests whether <variant> is any draw-</variant>
		ing shape, such as a circle, square or
		polygon
IsString	<variant></variant>	Tests whether $$ is a string
IsWidget	<variant></variant>	Tests whether <variant> is any Widget</variant>
IsWindow	<variant></variant>	Tests whether <variant> is any Win-</variant>
		dow

List Manipulation Functions

Name	Angumonta	Description
	Arguments	Description
Shuffle	<list></list>	Returns a new list with the items in list shuffled randomly.
ShuffleRepeat	<list> <times></times></list>	Generates a list of n shuffled versions of <list></list>
ShuffleWithoutAdj	acents	
	<nested-list></nested-list>	Shuffle specifying items that should not appear adjacently
Repeat	<item> <n></n></item>	Repeats an item n times in a list
RepeatList	<list> <n></n></list>	Makes a new list containing the ele- ments of <list> repeated <n> times</n></list>
Sequence	<start> <end></end></start>	Makes a sequence of numbers from
	<step></step>	<pre><start> to <end>, with <step>-sized increments</step></end></start></pre>
ChooseN	<list> <n></n></list>	Returns a sublist of <n> items from a list, in the order they appear in the orig- inal list</n>
Sample	<list></list>	Picks a single item randomly from <list>.</list>
SampleN	<list> <n></n></list>	Returns a randomly-ordered sublist of <n> items from a list</n>
SampleNWithReplac	ement <list></list>	Returns a sublist of $\langle n \rangle$ items from a
1 1	<n></n>	list
DesignLatinSquare		
· ·	<list1> <list2></list2></list1>	
LatinSquare	<list></list>	A simple latin square constructor
DesignGrecoLatinS	quare <list1></list1>	<list2> <list3></list3></list2>
DesignBalancedSam	pling <list></list>	<number></number>
DesignFullCounter	balance <list1></list1>	<list2></list2>
CrossFactorWithou	tDuplicates <list></list>	Returns a list of all pairs of items in the list, excluding pairs that where an element appears twice.
Rotate	<list> <n></n></list>	Rotates a list by $\langle n \rangle$ items.
FoldList	<list> <n></n></list>	Folds list into length-n sublists.
Flatten	<list></list>	Flattens a nested list completely
FlattenN	<list> <n></n></list>	Flattens n levels of a nested list
Length	<list></list>	Returns the number of elements in a list.
First	<list></list>	Returns the first item in a list.
Last	<list></list>	Returns the last item in a list.
Merge	<list1> <list2></list2></list1>	Combines two lists.
Append	<list> <item></item></list>	Returns new list combining <list> and <item></item></list>

Name	Arguments	Description
PushOnEnd	<list> <item></item></list>	Adds <item> to <list> efficiently</list></item>
List	<item1></item1>	Makes a list out of items
	<item2></item2>	
Sort	<list></list>	Sorts a list by its values.
SortBy	<list> <key></key></list>	Sorts list by the values in <key></key>
Nth	<list> <n></n></list>	Returns the nth item in a list.
Subset	<list></list>	returns a subset of items from a list
	<list-of-indices></list-of-indices>	
SetElement	<list>, <index>,</index></list>	Sets an element of list to value
Match	[list], <item></item>	Returns a list of $0/1$ s, indicating which elements of list match item.
Filter	[list], <indicators< td=""><td>>Filters a list based on a $0/1$ list pro- duced by Match.</td></indicators<>	>Filters a list based on a $0/1$ list pro- duced by Match.
Levels	[list]	Returns a sorted list of unique elements in list.
Rest	<list></list>	Returns a list minus its first element
ExtractListItems	<list></list>	Gets a subset of items from a list
	<list-of-indices></list-of-indices>	
IsMember	<item> <list></list></item>	Checks whether <item> is a member of <list></list></item>
Replace	<template></template>	Replaces items in a data structure
-	<replacementlist></replacementlist>	-
Lookup	<key> <keylist> <database></database></keylist></key>	returns element in <database> corre- sponding to element of <keylist> that matches <key>.</key></keylist></database>
Transpose	<list-of-lists></list-of-lists>	Transposes a list of equal-length lists.
SubList	<list> <start></start></list>	Returns a sublist of a list.
	<finish></finish>	
RemoveSubset	<list></list>	Removes items at positions
	<list-of-pos></list-of-pos>	<list-of-pos> from a list.</list-of-pos>
ListToString	<list></list>	Concatenates all elements of a list into a single string
Insert	<list>,<item>,<pos< td=""><td>Anserts <item> into <list> at <pos></pos></list></item></td></pos<></item></list>	Anserts <item> into <list> at <pos></pos></list></item>
ListBy	<list>,<conds></conds></list>	Segments a list into sublist by the values of a second list

String Management Functions		
CR	<num></num>	Returns string with <num> linefeeds.</num>
Tab	<num></num>	Returns string with $<$ num> tabs.

Name	Arguments	Description
Format	<value> <num></num></value>	Makes string from value exactly <num> characters by truncating or padding.</num>
Enquote	<text></text>	Returns string surrounded by quote marks.
Uppercase	<string></string>	Returns uppercased string
Lowercase	<string></string>	Returns lowercased string
ReplaceChar	<string> <char> <char2></char2></char></string>	
		Substitutes <char2> for <char> in <string>.</string></char></char2>
SplitString	<string> <split></split></string>	Splits <string> into a list of <split>- delimited substrings</split></string>
SplitStringSlow	<string> <split></split></string>	Splits <string> into a list of <split>- delimited substrings</split></string>
StringLength	<string></string>	Returns the length of a string
SubString	<string></string>	Returns a substring
0	<position></position>	U U
	<length></length>	
FindInString	<string> <key></key></string>	Returns position of <key> in <string>,</string></key>
U U	<pos></pos>	
	1	starting at position <pos></pos>
StripSpace	<string></string>	Strips whitespace from the start and end of <string>.</string>
StripQuotes	<string></string>	Strips quotation marks from the start and end of <string>.</string>

Chapter 5. Function Quick Reference

Chapter 6

The PEBL Launcher

The PEBL Launcher is the best way to navigate and launch PEBL experiments, especially for novices or research assistants. It allows one to specify a few specific options that are frequently changed, navigate through the PEBL Test Battery, and create and save 'experiment chains' to let you run multiple experiments in a row.

6.1 History of the Launcher

Prior to 2011, a front-end launcher was only available for PEBL on Windows. It was written in Visual Basic 6, which was old-fashioned, single-platform, no longer supported by Microsoft, and created a situation where a critical piece of PEBL infrastructure depended on a non-free tool. The main obstacle to a new launcher has always been: PEBL needs a cross-platform launcher using a free software, and we don't want to have to distribute a whole additional interpreter. This means that Python, wxBasic, TCL/TK, etc. were out of the consideration. Why couldn't there be an easy-to-use cross-platform programming tool we could use?

As of PEBL Version 0.12, we found one: PEBL itself. PEBL is not really designed to create GUI applications, but it can be beat into submission to do so. For Version 0.12, enough filesystem access functions and other features were available to make a reasonable launcher.

For PEBL 0.14, the launcher received a major overhaul. With the advent of custom objects, we added a bunch of GUI objects (buttons, scrolling text boxes, checkboxes, menus, etc.) that enabled a much more polished version of the launcher that integrates better with other desktop options. This allowed streamlining the launcher, adding functionality, improving its usefulness in the research lab. This includes the ability to set and change script-based parameters, which allows an experimenter to better tailor the PEBL battery tests to their particular needs.

6.2 How it works

The simplest usage of the Launcher is that you use the file selector on the left to choose a .pbl file, then click the button 'Run selected script" to run that experiment. ONLY .pbl files and directories will appear in the file window.

6.3 Features

6.3.1 File browser

On the left is a file browser. It will only show .pbl files and subdirectories. To navigate to a subdirectory, simply click on the directory to select it, then click on the selected directory. To move back up a directory, click on the '..\' row. When you have a .pbl file selected, you can use the 'Run selected script' button to launch it.

6.3.2 Participant code

This will allow you to select the participant code you want sent to any experiments you are about to run. By default, PEBL saves the last experiment code when you exit, and then reloads it the next time, incrementing by one. This makes it easier to avoid colliding participant codes and overwriting data. Participant code need not be a number, but the launcher currently does not understand how to

increment non-numeric codes, and will probably restart at 1. The plus button next to the code box will increment the current number by 1, which is useful if you are running multiple sessions in a row.

The automatic incrementation of participant code can be turned off by opening the fileselect.pbl file and changing the variable gAutoSubcode from 1 to 0.

When an experiment is launched, the specified code will be fed into the experiment using the -s command-line option, and will be bound to the gSubNum variable. Some of the standard experiments will ask you to enter a participant code regardless of whether you have one selected. If that is the case, you should be able to edit the script to remove the request to specify a participant code. However, most experiments in the test battery should only ask the experimenter to specify a participant code if the participant code is '0', which is what it will be when no -s command is given. So, if you are using code 0, many of the experiments will ask you to enter a code after they launch.

6.3.3 Experimenter code

Many times, you may wish to keep track of the experimenter or research assistant who collected the data. Have them enter their name in the 'experimenter' window. The name will be saved on exit. The experimenter code will be saved to the runlog file (see below).

6.3.4 Language

Some experiments have instructions and stimuli that are translated into different languages. Enter your two-character language code in the language box to tell the experiment what language to use. If your chosen language is not available, the experiment will fall back to English. For Chinese and related languages, setting this will also change the default fontface used. If you want to translate an experiment into your own language, ask on the PEBL mailing list.

6.3.5 Command Line Options

There are a number of command line options available for PEBL that are not present as options in the launcher. If you want to use any, you can type them in the "Command line Options" box and the launcher will pass them to PEBL. You can use these to specify -V options that pass parameters into your experiment (e.g., controlling whether a practice or a test round is given).

6.3.6 Edit and Parameters

The Edit button will let you edit the parameters used in the test. When you edit and save the parameter set, it will then appear as an option in the parameters pulldown. Before you run an experiment, you can select the parameter set you want to use from the pulldown (or save it permanently to an experiment chain).

6.3.7 Fullscreen Mode

If you want to launch your experiment in full-screen mode to improve video latency and to avoid distractions, check this box. The secret escape key combo is ctrl-alt-shift-\: hit these four to abort out of an experiment before it is complete.

6.3.8 Demographics Collection

The U.S. NIMH requires a number of demographic variables for research they fund. Checking this box will collect this data and save it to a data log file called demographics-log.csv, prior to running your experiment or experiment chain.

6.3.9 Experiment Chains

The launcher allows you to set up a 'chain' of experiments that get run in sequence. All the experiments will be run consecutively, with an identical subject code. This is accomplished by running a separate instance of PEBL for each experiment. This can sometimes lead to a 'flash' between each experiment if running in fullscreen mode. Below the experiment chain window is a pulldown that lets you select the particular chain you want to use. The default chain is loaded by default, and is also responsible for setting the parameter sets above.

6.3.10 Saving Experiment Chains

When you exit the launcher, the current experiment chain will get saved in the the current config file. By default, this file is called default.config. This same file is loaded when the launcher starts again, restoring your settings. By hitting the 'save chain' button, you will be asked to enter a new name to save the current configuration under. Similarly, 'Delete chain' will delete the file in which the current chain is saved. A chain can be loaded at start-up (by specifying the name of the config file with the -v command-line option).

6.3.11 Editing Experiment chains

A chain can be edited by inserting, appending, or deleting steps, or clearing the entire chain, using the buttons below the experiment chain box. Be sure to save the chain after editing so your edits will be saved.

6.3.12 Loading Experiment Chains

A previously saved experiment chain can be loaded by selecting the chain name from the pulldown selection box.

6.3.13 Description and Screenshot

On the right side of the launcher is a window that will show a screenshot and print a description of a script when it is highlighted. These need to be created by hand for each script. The launcher does its best to show you a preview of the test inside any directory. But to run an experiment, you need to select a .pbl file in the file window on the left. So, even if a screenshot appears on the right, you need to select the actual .pbl file to run the experiment.

6.3.14 Message feedback windows

Whenever a PEBL script runs, error and debug messages are saved to files called stdout.txt and stderr.txt, within the directory the file is run from. When a test is completed, PEBL will look for and try to load these files in the tabbed window at the bottom of the launcher. stdout.txt typically contains any messages saved using the Print() command, and is useful for debugging code. If an experiment crashes, it will be logged in the stderr.txt file and the Error messages tab. In addition, a lot of bookkeeping information is saved to that file, which can help diagnose other possible problems. If you need to access these files directly to help report bugs, you can open them using the 'Open Debug Output' and 'Open error output' buttons.

6.3.15 Other buttons

The launcher has a number of other buttons to help you use PEBL. These include:

- *Open/Edit selected* On the lower left, there is a button labeled "Open/Edit selected". This will open a selected .pbl script in a text editor, and will open a directory in your system's file manager. An easy way to look at or make changes to the script, or to locate data files after a script is run.
- Wiki This will launch a web browser that will take you to the PEBL wiki page that is related to the currently selected test. THis should help provide information about the test, its background, parameters, and data format.
- Combine data This will launch a data combining utility described below. It will help merge all your data files together into a single spreadsheet.
- Open debug output Whenever an experiment is run, any time you use the Print() function, it will print the resulting text to a file names stdout.txt the directory it was run in. This button will open that file.
- Open error output Whenever an experiment is run, the error and status messages are saved to a file called stderr.txt in the directory it was run in. This button will open that file.

6.3.16 Menu

A lot of functionality is present in menus at the top of the window.

- *File/Exit* This will exit the launcher and save the current configuration options to the named experiment chain.
- Options/change launcher size. The launcher has trouble running on netbooks with only 600 pixels vertical distance. This will make a 'small' launcher that is more compact, but only works next time the launcher is opened.
- *Help/About* This provides a short description of the launcher.
- *Help/Manual* This opens the PEBL .pdf manual. The manual is located in different places on each platform, and will change names for each release.
- *Help/Website* This will take you to the main PEBL website.
- *Help/Wiki* This button will take you to the PEBL wiki, and do its best to find a WIKI page related to the experiment you are looking at. They won't always exist, and if not, you can always sign in and make your own.
- *Help*/*Tutorial* This will open a wiki page containing a basic PEBL usage tutorial.
- *Help*/*Review* This will let you provide feedback about PEBL
- *Help/Donate* This will let you donate funds to help support PEBL development.

6.4 Launching an experiment

To launch an experiment, navigate through the directories in the file listing box. Only directories and files with the .pbl extension are shown in this box. To open a directory, click once to move the highlight box onto the directory name, and a second time to open the directory. When a new directory is opened, the first available .pbl file will be automatically selected. To run that script, just press the 'Run Selected script' button above the file select box. It will run with the specified parameter, including subject code, language, fullscreen mode. In addition, if the 'collect demographics' button is selected, a demographic survey will happen prior to the study running.

6.5 Launching an experiment chain

If you have a series of experiments you want to run, create an experiment chain and launch it using the 'Launch chain' button above the experiment chain selection box. Tip: Use experiment chains even if you are are running just single experiment, with just a single experiment selected. This give faster access and is less error-proned.

6.6 Translating the Launcher

You can translate the launcher to your own language. Open the launcher file (fileselect.pbl), and go to the end of the script, to a function named "GetStrings":

```
define GetStrings(lang)
{
    lang <- Uppercase(lang)
    if(lang == "EN")
    {
        gRunText <- "Run selected script"
        gOpenText <- "Open"
        gExitText <- "EXIT"
        gViewDebugText <- "View debug output"
        gViewErrorText <- "View error output"
        gAddToChainText <- "Add to Chain"
        gClearChainText <- "Save Chain"
</pre>
```

. . . .

The labels used in the launcher all appear here. You should be able to just translate the text of each on into the language of your choice. Send the translations back to the author so they can be incorporated into the next launcher version. You can also make a section in the if statement for your particular language. When you change the language in launcher, it will save that option and use your language of choice next time.

6.7 Utility:Parameter setting

Version 0.14 of the PEBL Launcher allows you to set parameters from tests before launching. A basic screenshot is shown below:

Editing parameters for ./battery/ANT/params/ANT.pbl						
Exit without saving	Reset	to defaults	Parameters:			
Save file and exit	New pa	arameter set	ANT.pbl.par			
iti		4000	Inter-trial interval, in ms. (default: (4000))			
showfooter		1	Show/hide footer ("left-shift" and "right-sh (default: [1])	ift")(showFooter 0 == hide / showFooter 1 == show)		
leftresponse	•	<lshift></lshift>	Left response key. An alternative value is ;	z. (default: (<lshift>))</lshift>		
rightrespons	se	<rshift></rshift>	Right response key. An alternative is /. (def	ault (<rshift>))</rshift>		
reps		2	Number of repetitions through the design (directions x 3 flanker conditions (default: [2	which is 4 cue conditions x 2 target locations x 2 target ?])		
showRT		0	Show/hide reaction time display in practice (default: [0])	block (ShowRT <- 0 == hide / gShowRT <- 1 == show)		
showNeutral	IFlankers	0	Show/hide neutral flankers (dashs in the n gShowNeutralFlankers <- 1 == show) (defa	eutral condition) (gShowNeutralFlankers <- 0 == hide / sult: [0])		

Here, the first column shows the name of the parameter. The second is the current value, which can be edited by clicking on the box and typing a new value. When complete, hit enter and the new set will be recorded. The rightmost column provides a basic description of the parameter, and its default value.

To create a new parameter set, write the name of the parameter set you want to use in the box at the top of the screen. Then, when you hit 'Save file and exit', it will be saved to this parameter file. There is no need to include .par in the filename, as it will be added if you do not add it yourself. To edit a current parameter set, select the parameter set you want and press 'edit' in the main window.

6.8 Utility: Combining data files

Once an experiment is done, the data files are typically stored within the data directory in which the test appeared. Furthermore, each participant may be saved in his or her own subdirectory. On some tests, a merged or pooled data file is also saved, but this is not always the case. In order to merge all of you data into one master file, you can use PEBL's data combining tool, accessible through a button on the lower left of the launcher.

To use this, navigate to the data directory of your tests, and click the 'Combine data' button. A screen like the one below should open.

Combine and open	2PEBL Data Combining Tool	
? Combine and save	Files Identified: 62	
Exit	ANT-31.csv ANT-44.csv	ĥ
<u>?</u> Add filename to data	ANT-summary-31.txt ANT-summary-30.txt	_0
? Files contain header	ANT-summary-3.txt	
<u>?</u> Match: *	ANT-log.csv	
?Excludes:	ANT-all.csv stderr.txt pooled.csv	
?Save file: pooled.csv	ANTcsv	
	ANT-summary-44.txt	
Instructions:	ANT-3. csv	
*Specify matching and exclusion filters to	ANT-DOOLED.CSV	
add or remove filenames from the merge.	120/ANT-120.csv	
*Check 'Add filename to data' to put the	120/ANT-summary-120.csv	Υ.
filename on each line.		
*Check Files contain header if your data files contain a common header line. This	Preview: ANT-summary-30.txt	
will strip the header from each file and	Preview:	
add a single header to the merged file. * Matching filters are applied first, followed by exclusion filters. Within filter, space or indicates OR, & indicates AND, ANDs are handled before OR. * Example: add [.csv dat] to include all files having either .csv and dat in their names. Add [.csvdts] to include only files that have both .csv and test in their names.		
	status: Files read	

On the upper right, a list of all files within the selected directory (and subdirectories) will be displayed. You want to choose some (but probably not all) of these. You can choose a subset by typing match values into the match and exclude boxes on the left. Currently, the * indicates all files will match. You may want to just include .csv files, in which case deleting the * and typing csv into the box will bring up only files with csv in their name. You may want to exclude summary files, in which case you can type summary into the excludes box. Each time you change the selection criteria and hit enter, the list of files will update. A preview of any of the files can be seen in the lower right window. IN the match and exclude boxes, spaces act as logical 'or's. matching with the following '* csv' will match all files, because the first * will match all files. Or can also be specified using the | character. The & character can be used to specify AND criteria. To match csv files from participant 300, you would enter '300&csv'. The matches are process before the excludes.

Once you have selected the right files using match and exclude criteria, you should determine whether the files have a header. If they have a header, you probably want to remove the header, including just once in the merged file. The combiner is not smart enough to detect this on its own, so you must check 'files contain header' if you want the header stripped from each individual data set and added to the final merged set.

Finally, especially if your data does not have a participant code in it, you may check 'add filename to data' which will add a column at the beginning of the data indicating the source file of each row of data.

Once you are ready, you can choose 'combine and save' which will save the data to the filename you specified in 'save file'. If you use the combiner more than once, be sure to exclude 'pooled' from your match list so you don't get multiple copies of your data. You can also choose 'combine and open', which will create the pooled file, but then try to open in with whatever program is associated with that file type (i.e., microsoft excel for .csv files).

Chapter 7

The PEBL Psychological Test Battery

This chapter contributed by Bryan Rowley in collaboration with Shane Mueller

About the Battery

This site is for a battery of psychological tests implemented in PEBL and distributed (and redistributeable) freely. They are designed to be easily used on multiple computing platforms, running natively under Win32, Linux, and OSX Operating Systems. The tests are designed to implement a wide range of computer-administered psychological tests and experiments of interest to neuropsychological, cognitive, clinical communities.

The current version of the battery is designed to work with PEBL version 0.14 and was released in 2014. It is distributed with PEBL 0.14, and is automatically installed in My Documents\pebl.0.14\battery on windows.

These tests are designed to implement a wide range of tests that are used throughout the psychological, neuropsychological research and clinical communities. Some are reimplementations of tests that are only available on limited computing platforms or cost hundreds of dollars. Each experiment saves the complete data set for later analysis, and many compute basic analyses that it writes in report format.

Tests

The following table describes the basic tests currently implemented in the PEBL Test Battery. Many of them represent the only Free version of proprietory tests available anywhere. They include a free Iowa Gambling Task, a free version of the TOVA ($\mathbf{\hat{R}}$), a free Wisconsin Card Sort Test($\mathbf{\hat{R}}$), a free version of Conners Continuous Performance task, and a number of other useful tasks, with more to come. All screenshots found on this page are released into the public domain, and can be used for whatever purpose without copyright assignment, including in academic papers. More information on tests is found in the PEBL WIKI

Table	7.1:	Test	Battery
-------	------	------	---------

PEBL Test/Version of:	Description
Bechera's Gambling Task (version of Bechara's Iowa Gam- bling Task (R) wikipedia) Select deck by pressing key 1-4 1 2 3 4 Creaters: 2 Revart: \$100 Peralty: \$-0 Net Gain: \$100	Choose from four decks, each choice with a cost and each providing reward. Used for tests of executive control. Key Skills used: Decision Making, Strategy and Problem Solving, Risk Assessment. Note: the task requires individuals to decide on which deck to choose from, with the chance of loosing in the process. Test can be modified to ask individual to achieve a certain amount of money.
The "Hungry Donkey" Task A version of Bechera's Gambling Task for children	The donkey chooses from four doors, each door has a cost and reward in apples. Used for tests of executive control. Key Skills used: Fine-motor skills, Visual processing. Note: Test can be modified to ask individual to reach a certain number of apples (i.e. 10 apples) in a certain amount of time.
TOAV: Test of Attentional Vigilance A Version of TOVA(R): Test of Variables of Attention wikipedia	 22-minute test requiring subject to detect a rare visual stimulus (top or bottom). Used to diagnose ADD, ADHD, etc. Key Skills used: Concentration, Reaction Time, Attention
	Note: This task requires the individual to concentrate for an extended period of time. Thus, the extent to which their reaction time scores alter through the duration of this test can be indicative of how their attention levels have been affected.

PEBL Test/Version of:	Description			
PEBL Continuous Performance Test Version of Conners CPT wikipedia	 14-minute vigilance test requiring subject respond to non-matches. Used to diagnose ADD, ADHD, etc. Key Skills Used: Reaction Time, Attention, Concentration. Note: The test length allows for observation of how their results change overtime (i.e. attention levels altering). 			
PEBL Perceptual Vigilance Task (PPVT) Wilkinson & Houghton's Psy- chomotor Vigilance Task wikipedia	A vigilance task used to detect vigilance and sleep lapses. Key Skills Used: Reaction Time, Attention, Concentration. Note: The individual's results can be viewed in data section, and we can observe how their performance declines or improves throughout test duration.			
Berg's Card Sorting Test version of Berg's (1948) Wiscon- sin Card Sorting Test wikipedia	Sort multi-attribute cards into piles according to an unknown and changing rule. Key Skills used: Strategy and Problem Solving, Decision Making, Inhibition, Work- ing Memory. Note: The results from the data section pro- vide an indication of which rule (shape, color or number) is easiest for the individual via re- action time. We are able to see how the indi- vidual's working memory is operating by their ability to recall which rule is active (via cor- rect responses).			

Chapter	7.	The	PEBL	Psy	chole	gical	Test	Batter	у
---------	----	-----	------	-----	-------	-------	-----------------------	--------	---

PEBL Test/Version of:	Description			
Simple Response Time wikipedia	Detect the presence of a visual stimulus, as quickly and accurately as possible.			
	Key Skills Used: Reaction Time, Attention, Fine Motor Skills.			
X	Note: The task allows for observation of how their attention and reactivity alter throughout the test's duration. The individ- ual can also work on their executive control and fine motor ability.			
Digit Span A component of many intelli- gence tests wikipedia	Remember a sequence of digits. Key Skills Used: Working Memory, Numerical Processing, Short Term Memory.			
Use 0.9 and " to respond.	Note: Primacy, Recency effects can be observed in this task (i.e. which numbers in the set are being remembered, first numbers or last numbers).			
Partial Report Procedure Lu et al.'s (2005) update of Sperling's iconic memory proce- dure. wikipedia	May provide an early-warning sign for Alzheimer's. Key Skills used: Reaction Time, Decision Making, Working Memory. Note: Individuals are required to make quick decision based on a brief stimulus shown. Not recommended for people with slow reaction times.			
Prepared using 2.7.2.5				

PEBL Test/Version of:	Description			
Implicit Association Test A test of automatic associations between memory representa- tions. wikipedia	Tests association between two sets of binary classifications.			
L Man- made They				
Tower of London Traditional problem solv-	Tests ability to make and follow plans in problem solving task.			
ing/planning task	V Cl:ll. H. Curtan and Dashlan			
wikipedia	Solving,			
Sector	Color Processing, Hand-eye coordination, Fine Motor Skills. Note: Test cannot be completed successfully for color-blind individuals. Task is great for			
Click on pile to pick up and drop disk	individuals trying to improve on executive control, and requires both strategy and prob- lem solving skills to complete successfully.			
Symbol Counter Task	Useful indicator of executive control.			
Garavan (2000) counter task #	Key Skills used: Reaction Time, Working Memory, Selective Attention. Note: We can view if the individual will be able to recall which symbols are associated with which shift tab (i.e. a measure of working memory via correct responses).			
, , , , , , , , , , , , , , , , , , ,	· 1 /			

PEBL Test/Version of:	Description		
Four choice response time Wilkinson & Houghton's 4- choice response time wikipedia	 Respond to a plus sign that appears in one of four corners of the screen. Key Skills used: Reaction Time, Selective Attention, Visual Processing. Note: the task measures how quickly the individual's attention leads them to the correct location, combining visual processing abilities with reaction time. 		
Time Wall UTCPAB's Time wall	Estimate the time when a moving target will reach a location behind a wall. Key Skills Used: Reasoning, Calculating, Reaction Time, Strategy and Problem Solv- ing. Note: this task requires tracking of an object after its disappearance. It requires the indi- vidual to in a sense to imagine the location of this object using precise calculating (of ob- ject's speed).		
PEBL Compensatory Tracker Similar to Makeig & Jolley's CompTrack	Use mouse/trackball to keep a randomly mov- ing target inside a bullseye. Key Skills used: Fine Motor Skills, Strategy and Problem Solving, Hand Eye Coordination. Note: this task can be helpful for individuals wanting to get better with using a mouse for the computer.		

	Chapter	7.	The	PEBL	Psychological	Test	Battery
--	---------	----	-----	------	---------------	------	---------

PEBL Test/Version of:	Description
Lexical Decision Meyer & Schvaneveldt's LDT wikipedia	Determine whether a stimulus is a word or nonword. Key skills used: Linguistic Processing, Lan-
PROSE	guage Processing. Note: the words are able to be changed for the test. They can be changed to fit closely to an individual's expertise (ex. If individual is aphasic but has an interest in bands, the words can be altered to include words of bands they listen to frequently).
Mental Rotation	Determine whether two figures are identical,
wikipedia	Key Skills used: Reasoning, Visual Process-
	ing, Decision Making.
1<	dividual is required to make a decision of whether the objects are similar, and requires precise reasoning due to their similarities (i.e. be able to reason that object on left looks iden- tical to the object on the right, only inverted from the object on the right)
Press 'S' for same and 'D' for different	
Matrix Rotation Version of UTC test battery matrix rotation	Determine whether a 6x6 matrix is the same (with rotation) as another. Key skills used: Selective Attention, Work- ing Memory, Visual Processing. Note: Working Memory is being tested, we can see how individual's object manipulation
	or 'visuo-spatial sketchpad' is operating (I.e. correct responses being a measure of working memory, and the 'sketchpad' the specific com- ponent being measured).
SAME respond using shift keys DIFFERENT	

Chapter	7.	The	PEBL	Psy	ychol	ogical	Test	Battery
---------	----	-----	------	-----	-------	--------	------	---------

PEBL Test/Version of:	Description
Spatial Cueing Posner's attentional cueing (spotlight) task.wikipedia	Given a probabilistic cue of where a stimulus will appear, respond as fast as possible. Key Skills used: Selective Attention, Inhi- bition. Note: this task tests the individual's ability to make the correct response regardless of the correct cue or the distracter cue. We can view how the distracter cue affects the individual via correct responses and reaction time.
Two column addition UTC test battery's 2-column addition.	Add three two-digit numbers and respond quickly and accurately. Key Skills Used: Mathematical Processing, Numerical Processing, Working Memory. Note: it is important to distinguish between Mathematical and Numerical, as mathemat- ical processing in this test refers to the ma- nipulation of numerical information, whereas numerical processing refers to the knowledge of numerical information (i.e. the understand- ing that the number 'one' means '1'.)
Stroop task Stroop's attention task wikipedia	Respond to either the color or name of stim- uli. Key Skills Used: Inhibition, Selective At- tention. Note: Reaction Time is recorded in the data section, allowing for analysis of which trails are easiest, and which are most challenging.

Chapte	er 7.	The	PEBL	Psychological	Test	Battery
Chapte	JI .	THO	т прп	I Sychological	TCDU	Dattery

PEBL Test/Version of:	Description
PEBL Manual Dexterity	Move a noisy cursor to the target. Key Skills used: Fine Motor Skills, Strategy and Problem Solving, Hand-eye Coordination. Note: This task is helpful for individuals try- ing to improve their mouse ability with the computer.
PEBL Trail-making test Version of Reitan's (1958) Trail- making A and B tests. wikipedia	Connect the dots task. Key Skills used: Language Processing, Nu- merical Processing, Hand-eye coordination. Note: this task tests both linguistic and nu- merical processing, and tests the individual's ability to navigate to the correct location (i.e. visual processing).
Aimed Movement (Fitts's Law) test wikipedia	Mouse-driven implementation of classic perceptual-motor task. Key Skills used: Hand-eye coordination, Fine Motor Skills, Concentration. Note: The number of trails (105) requires continuous concentration on the participants' behalf.

PEBL Test/Version of:	Description
Pursuit Rotor task Classic mechanical test device	Mouse-driven motor pursuit. Key Skills used: Hand –eye coordination, Fine Motor Skills, Strategy and Problem Solv- ing. Note: The task requires the individual to adapt to the rate at which the circle is moving, thus requiring incorporation of a calculating strategy to complete successfully.
Match to sample task Classic non-visual short-memory task	Match a matrix pattern to one presented after a delay. Key Skills used: Reasoning, Calculating, Color-processing. Note: color-blind individuals will not be as successful in this task.
Corsi block test Version of physical "Corsi block- tapping test"	Measure of visual-spatial working memory. Key Skills used: Working Memory, Visual Processing. Note: reaction time can be measured in the trails varying in length.

Chapter	7.	The	PEBL	Psv	cholo	gical	Test	Battery	7
---------	----	-----	------	-----	-------	-------	------	---------	---

PEBL Test/Version of:	Description
Change Detection test Version of numerous change blindness paradigms	Assess whether participant sees change in a display of colored circles. Key Skills used: Selective attention, Visual processing, Concentration. Note: the changing object may not be so ob- vious at first, so additional concentration may be required.
Clock Test Mackworth's Sustained atten- tion test	 Watch a clock, and respond whenever it skips a beat. Key Skills used: Selective attention. Note: Reaction Time is revealed in the data section, indicating the individual's attention levels as the task progresses.
Device Mimicry Test	Operate a 4-df etch-a-sketch to recreate paths produced by the computer. Key Skills used: Calculating, Hand-eye co- ordination, concentration, Fine Motor Skills, Strategy and Problem Solving. Note: This task requires precision to com- plete successfully. Test can be very helpful for individual's trying to improve their computer skills, or in cognitive rehabilitation sessions.

PEBL Test/Version of:	Description
Item-Order Test DYNRBFV	Assess two consecutive letter strings, and de- termine whether they are the same or differ- ent. Different trials are creating either by changing identity of a letter or the order of two adjacent letters. Key Skills used: Language Processing, Working Memory. Note: Does the duration of the test result in better or poorer performance? This can be measured in the data section.
Letter-Digit substitution Version of UTCPAB and Wech- sler tests	 Recode stimuli according to a letter-digit code chart. Key Skills used: Language Processing, Numerical Processing. Note: great test to use with Aphasiac patients to see how they map language information with mathematical information. Reaction time revealed in data section.
Math Processing 8 - 1 - 4 = Left Shift Right Shift Sum less than 5 Sum greater than 5	Do simple arithmetic problems. Key Skills used: Mathematical processing, Numerical processing, Reaction Time. Note: Important to distinguish between mathematical and numerical processes, as the former refers to the manipulation of numeri- cal information, and the latter refers to basic processing of numerical information (i.e. that '1' means 'one').

Chapter	7.	The	PEBL	Psycho	logical	Test	Battery

PEBL Test/Version of:	Description
Memory Span (Visual) Classic experimental paradigm	See a sequence of items, then respond using mouse or touchscreen. Key Skills used: Working Memory, Short Term Memory, Visual Processing. Note: Individuals familiarity with certain ob- jects may result in better recall for those ob- jects (i.e. animal lovers).
Object Judgment	Determine whether two polygons are identical, while manipulating shape, orientation, size. Key Skills used: Calculating, Reasoning, Visual Processing. Note: may require concentration due to the duration of task. Task requires visual manip- ulation of the stimuli presented.
Pattern Comparison Test	 Examine two grid patterns and determine whether they are the same. Key Skills used: Calculating, Visual Processing. Note: pattern-samediff.pbl requires reaction time (found in data section), while pattern-sequential.pbl requires working memory to function (via correct responses).

PEBL Test/Version of:	Description
Probability Monitor Probability Interview detect a signal	 Watch a set of gauges to determine when one gets a hit. Key Skills used: Calculating, Inhibition, Visual Processing, Reasoning. Note: while trying to detect a pattern (calculating and reasoning), the individual is required to inhibit other random dials on later trails (trails 2 and 3). Reaction time is measured in data section.
Situation Awareness Test	Watch a set of moving targets and respond to probes about their locations and identities. Key Skills used: Selective Attention, Work- ing Memory, Visual Processing. Notes: Test great for combining visual aware- ness with working memory.
Comfort scales	Respond to four visual-analytic scales about different dimensions of comfort. Key Skills used: Linguistic Processing, Cal- culating. Note: Allows for extensive self reflection, and requires linguistic ability for responses (to in- dicate how they feel).

Chapter 7. The PEBL Psychological Test Battery

PEBL Test/Version of:	Description
Speed tapping test Version of Reitan test battery	Tap a key as quickly as possible. Key Skills used: Fine Motor Skills. Note: can be used for individuals in rehabilitation sessions.
Time tapping test	Tap for a production period at a prespecified pace. Key Skills used: Calculating, Working Memory. Note: requires individual to recall and imple- ment the pace at which they are required to tap.
Tower of Hanoi test Classic puzzle and cognitive test of planning	 Solve game with disks. Key Skills used: Calculating, Reasoning, Hand-eye coordination, Fine Motor Skills, Working Memory, Visual Processing, Strategy and Problem Solving. Note: Able to track the individual's number of moves. Task is very great for a multitude of cognitive abilities, and is helpful for patients with cognitive disorders.

PEBL Test/Version of:	Description
Two-column addition	Do mental arithmetic of at least three two- digit summands. Key Skills used: Mathematical Processing, Working Memory, Calculating. Note: Individual can be asked how they de- cided to solve the problems (i.e. with what strategy: first column then the next two columns, or adding all the numbers at once etc.)
Visual Search	Find the target amidst clutter.
G G U D C D C U C D C U C D U C U C D C U C D C U C D C U C C C D C C C C C C C C C C C C C C C C	Key Skills used: Language Processing, Vi- sual Processing, Selective Attention, Colour Processing, Inhibition, Concentration. Note: X's and O's are quite distinguishable letters. O's look more similar to the other let- ters than X does, and therefore the trials with X's and O's can be compared to see which ones are easier (via correct response or not) and found quicker (via reaction time).
Attentional Network Task Version of Fan et al.'s ANT	Assess three types of attention. Key Skills used: Selective Attention, Reaction Time, Inhibition. Note: The data section reveals trial and the corresponding reaction times. Can be viewed is how their attention processes alter through the test's duration.
left-shift right-shift	

	Chapter	7.	The	PEBL	Psychol	logical	Test	Battery
--	---------	----	-----	------	---------	---------	------	---------

PEBL Test/Version of:	Description
PEBL Balloon Analog Risk Task Version of LeJuez et al's BART	Assess three types of attention. Key Skills used: Risk Assessment and risk aversion. Note: Test can be modified to ask the partic- ipant to reach a certain money value in a set amount of time.
ran to Constant Party of the Allow Allow Data Luckerson and Tacak	Ver Skille used, Coloulating Desision Mole
Dot Judgment Task Determine which field has more	ing
dots.	Note: Threshold provides an opportunity to
Which field has more dots?	observe how the individual performs (with cor- rect judgment) when dot amounts are similar
	rect judgment) when dot amounts are similar.
lett-shitt right-shift	
Flanker Task Eriksen's Flanker Task	Make direction response with distraction. Key Skills used: Selective Attention, Reaction Time, Inhibition. Note: The data section reveals trial and the corresponding reaction times. Can be viewed is how their attention processes progress through the test's duration.
left-shift right-shift	

Chapter	7.	The	PEBL	Psych	ological	Test	Battery
					()		•/

PEBL Test/Version of:	Description
Go/No-go Task Version of Bezdjian's 2009 Im- plementation	Classic continuous performance task. Key Skills used: Inhibition, Reaction Time, Language Processing, Selective attention. Note: The data section allows for observation of their scores, and to view if their inhibition skills are increasing or decreasing with time.
Manikin Task	Assess mental rotation.

TLX Workload Assessment

An implementation of NASA's TLX workload assessment wikipedia

		2002.			
Test of the local division of the local divi	Contraction of the local division of the loc	Contraction of Contraction	California de la califo	Concerned in the local division of the local	Section 2
					100000000000000000000000000000000000000

Assess workload of task on multiple dimensions.

Key Skills used: Concentration, Linguistic Processing, Calculating.

Note: requires the individual to self reflect, read the information, and calculate their levels according to the scale provided.

Chapter 2	7 . The	PEBL	Psychol	ogical	Test	Battery
-----------	----------------	------	---------	--------	------	---------

PEBL Test/Version of:	Description
Muller-Lyer Illusion Classic perceptual illusion wikipedia	Psychometric study of Illusion. Key Skills used: Calculating, Reaction Time. Note: the task requires a quick response, thus attention abilities can be hard to measure in this task.
Oddball Task Version of Huettel's implemen- tation	Respond to a stimulus dimension overshad- owed by irrelevant dimension. Key Skills used: Inhibition, Selective Atten- tion, Visual Processing, Reaction Time. Note: Inhibition skills require the individual to ignore the location and instead focus on the shape differences.
Simon Task Simon's S-R compatibility test	Respond to a stimulus dimension, overshad- owed by spatial location. Key Skills used: Color Processing, Inhibi- tion, Visual Processing, Selective Attention, Reaction Time.
Lift addit NES SUIE	Note: those who are color blind will have dif- ficulty in completing this task. Individual's inhibition abilities can be measured (via cor- rect responses) to see how well they can focus on the point of the task (color) and not be distracted by its location.

PEBL Test/Version of:	Description		
Switcher Task Shape	 Respond to a matched and changing stimulus dimension. Key Skills used: Visual Processing, Selective Attention. Note: reaction time is measured in the data section, along with trail type. Thus, times associated with color, shape and letter can be measured to see which is easiest and most challenging for the individual. 		

Norms and Other Uses

Many of the original versions of the tasks we implement here have been normed on a large population. Such norms are available in published articles. Because these implementations are not identical (many of them use slightly different stimuli, response methods, timing, etc.) one must be careful when applying the results to the normed data. If you use PEBL or the PEBL Psychological Test Battery, please reference us! If you are interested in helping develop norms for PEBL tests, have access to subject populations and testing facilities, join the pebl-norms@lists.sourceforge.net mailing list and tell us what norms you are most interested in.

Support and Contact info

If you have any general questions about PEBL or the PEBL Psychological Test Battery, you can contact us at: pebl-list@lists.sourceforge.net. Email support is available free-of-charge. You can sign up for this email list or browse the archives here. More information about the main author is available here. Enquire on the list if you are interested in paying someone to write new experiments or modify existing ones for your needs.

Obtaining the Battery The PEBL Test Battery is installed with the main PEBL installation. The first time you run PEBL, it will be copied into a folder in your Documents directory called pebl-exp.0.14 (or similar depending on the version of PEBL you are running). On Linux, running > pebl -install will copy the battery directory there. The PEBL launcher will start in that directory, and let you explore and navigate the different tests in the battery.

Chapter 8

Detailed Function and Keyword Reference

8.1 Symbols

Name/Symbol: +

Description:	Adds two expressions together. gether.	Also	ϕ , concatenates	strings	to-
Usage:	<num1> + <num2> <string1> + <string2> <string1> + <num1> Using other types of variables w</num1></string1></string2></string1></num2></num1>	vill ca	use errors.		
Example:	33 + 322 "Hello" + " " + "World" "Hello" + 33 + 322.5 33 + 322.5 + "Hello"	> > >	355 "Hello World' "Hello355.5" "33322.5Hello	' >"	
See Also:	-, ToString()				

Name/Symbol: -

Description: Subtracts one expression from another

Usage: <num1> - <num2>

Example:

See Also:

$\mathbf{Name}/\mathbf{Symbol}$:	/
Description:	Divides one expression by another
Usage:	<expression> / <expression></expression></expression>
Example:	333 / 10 # == 33.3
See Also:	

Name/Symbol: *

Description:	Multiplies two expressions together
Usage:	<expression> * <expression></expression></expression>
Example:	32 * 2 # == 64
See Also:	

Name/Symbol: $\widehat{}$

$\mathbf{Description}$:	Raises one expression to the power of another expression
Usage:	<pre><expression> ^ <expression></expression></expression></pre>
Example:	25 ^ 2 # == 625
See Also:	Exp, NthRoot

Name/Symbol:;

Description:	Finishes a statement, can start new statement on the same line (not needed at end of line)
Usage:	
Example:	
See Also:	

Name/Symbol: #

Description: Comment indicator; anything until the next CR following this character is ignored Usage: Example: See Also: Name/Symbol: <-Description: The assignment operator. Assigns a value to a variable N.B.: This two-character sequence takes the place of the '=' operator found in many programming languages. Usage: Example: See Also: Name/Symbol: () Description: Groups mathematical operations Usage: (expression) Example: (3 + 22) * 4 # == 100See Also:

Chapter 8. Detailed Function and Keyword Reference

Name/Symbol: { }

Description: Groups a series of statements Usage: { statement1 statement2 statement3 } Example: See Also:

Name/Symbol: []

Description:	Creates a list. Closing] of list, even for nested list	must be on same line as last element s.
Usage:	[<item1>, <item2>,</item2></item1>]
Example:	[] [1,2,3] [[3,3,3],[2,2],0]	#Creates an empty list #Simple list #creates a nested list structure
See Also:	List()	

Name/Symbol: <

Description:	Less than. Used to compare two numeric quantities.
Usage:	3 < 5 3 < value
Example:	<pre>if(j < 33) { Print ("j is less than 33.") } See Also: >, >=, <=, ==, ~=, !=, <></pre>

Name/Symbol: >

Description:	Greater than. Used to compare two numeric quantities.
Usage:	5 > 3 5 > value
Example:	if(j > 55) { Print ("j is greater than 55.") }
See Also:	<, >=, <=, ==, ~=, !=, <>

Name/Symbol: \leq

Description: Less than or equal to. Usage: 3<=5 3<=value

Chapter 8. Detailed Function and Keyword Reference

Example:	if(j <= 33) {
	Print ("j is less than or equal to 33.") }
See Also:	<, >, >=, ==, ~=, !=, <>

Name/Symbol: >=

$\mathbf{Description}:$	Greater than or equal to.
Usage:	5>=3 5>=value
Example:	if(j >= 55) { Print ("j is greater than or equal to 55.") }
See Also:	<, >, <=, ==, ~=, !=, <>

Name/Symbol: ==

Description:	Equal to.
Usage:	4 == 4
Example:	2 + 2 == 4
See Also:	<, >, >=, <=, ~=, !=, <>

Name/Symbol: <>, !=, ~=

Description: Not equal to.

Usage:

Example:

See Also: <, >, >=, <=, ==

8.2 A

Name/Symbol:	Abs()	
Description:	Returns the absolute value of the number.	
Usage:	Abs(<num>)</num>	
Example:	Abs(-300) # ==300 Abs(23) # ==23	
See Also:	<pre>Round(), Floor(), AbsFloor(), Sign(), Ceiling()</pre>	

Name/Symbol: AbsFloor()

Description:	Rounds <num> toward 0 to an integer.</num>
Usage:	AbsFloor(<num>)</num>
Example:	AbsFloor(-332.7) # == -332 AbsFloor(32.88) # == 32
See Also:	<pre>Round(), Floor(), Abs(), Sign(), Ceiling()</pre>

Name/Symbol: ACos()

Description:	Inverse cosine of $<$ num $>$, in degrees.
Usage:	ACos(<num>)</num>
Example:	
See Also:	Cos(), Sin(), Tan(), ATan(), ATan()

Name/Symbol: AddObject()

Description:	Adds a widget to a parent window, at the top of the object stack. Once added, the object will be drawn onto the parent last, meaning it will be on top of anything previously added.
	In general, objects can be added to other objects as well as windows. For example, you can add drawing objects (circles, etc.) to an image to annotate the image and maintain its proper x,y coordinates.
	Also, if you 're-add' an object that is already on a widget, it will get automatically removed from the window first. This is an easy way to reorder elements on a screen.
	AddObject(<obj>, <window>) AddObject(<obj>, <canvas>) AddObject(<obj>, <widget>)</widget></obj></canvas></obj></window></obj>
Example:	<pre>define Start(p) { win <- MakeWindow() img <- MakeImage("pebl.png") circ <- Circle(20,20,10,MakeColor("red"),1) AddObject(circ,img) AddObject(img,win) Move(img,100,100) Draw() WaitForAnyKeyPress() }</pre>
See Also:	RemoveObject()
Name/Symbol: and	

Description:	Logical and operator.
Usage:	<expression> and <expression></expression></expression>
Example:	
See Also:	or, not

Name/Symbol: Append

Description:	Appends an item to a list. Useful for constructing lists in con- junction with the loop statement.
	Note: Append() is useful, but inefficent for large data struc- tures, because it requires making a copy of the entire data list and then overwriting it, if you use list <- Append(list, item). The overhead will be hardly noticeable unless you are building lists hundreds of elements long. In that case you shuold either create the list upfront and use SetElement, or you PushOnEnd to modify the list directly.
Usage:	<pre>Append(<list>, <item>)</item></list></pre>
Example:	<pre>list <- Sequence(1,5,1) double <- [] loop(i, list) { double <- Append(double, [i,i]) } Print(double)</pre>
	# Produces [[1,1],[2,2],[3,3],[4,4],[5,5]]
See Also:	<pre>SetElement() List(), [], Merge(), PushOnEnd</pre>

Name/Symbol: AppendFile

Description:	Appends onto the end of <file1> the contents of <file2>. Use- ful for compiling pooled data at the end of an experiment.</file2></file1>
Usage:	<pre>AppendFile(<file1>, <file2>)</file2></file1></pre>
Example:	: The following open ten consecutive files, writes 50 random num- bers to each, then appends each to a master file:
	<pre>loop(j, Sequence(1,10,1)) { file <- FileOpenWrite(j+".txt") loop(i,Sequence(1,50,1))</pre>

{
 FilePrint(file,j+","+i+","+Random())
}
AppendFile("master.txt",j+".txt")
}

See Also: FileOpenWrite()

Name/Symbol:	ASin()
Description:	Inverse Sine of <num>, in degrees.</num>
Usage:	ASin(<num>)</num>
Example:	
See Also:	<pre>Cos(), Sin(), Tan(), ATan(), ACos(), ATan()</pre>

Name/Symbol: ATan

Description: Inverse Tan of <num>, in degrees.

Usage:

Example:

See Also: Cos(), Sin(), Tan(), ATan(), ACos(), ATan()

8.3 B

Name/Symbol: Bezier

Description:	Creates a smoothed line through the points specified by <pre>xpoints>, <ypoints>. The lists <pre>xpoints> and <ypoints> are adjusted by <pre>x</pre> and <pre><pre>y></pre>, so they should be relative to 0, not the location you want the points to be at.</pre></ypoints></pre></ypoints></pre>
	Like other drawn objects, the bezier must then be added to the window to appear. $<\!\!$ steps> denotes how smooth the approximation will be.
Usage:	<pre>Bezier(<x>,<y>,<xpoints>,<ypoints>,</ypoints></xpoints></y></x></pre>
Example:	<pre>win <- MakeWindow() #This makes a T xpoints <- [-10,10,10,20,20,-20,-20,-10] ypoints <- [-20,-20,40,40,50,50,40,40] p1 <- Bezier(100,100,xpoints, ypoints,</pre>
See Also:	<pre>BlockE(), Polygon(), MakeStarPoints(), MakeNGonPoints()</pre>

Name/Symbol: BlockE

Description:	Creates a polygon in the shape of a block E, pointing in one of four directions. Arguments include position in window.
	• <x> and <y> is the position of the center</y></x>
	\bullet <h> and <w> or the size of the E in pixels</w></h>
	• <thickness> thickness of the E</thickness>
	• <direction> specifies which way the E points: 1=right, 2=down, 3=left, 4=up.</direction>
	• <color> is a color object (not just the name)</color>
	Like other drawn objects, the Block E must then be added to the window to appear.
Usage:	<pre>BlockE(x,y,h,w,thickness,direction,color)</pre>

Chapter 8. Detailed Function and Keyword Reference

Example:	win <- MakeWindow() e1 <- BlockE(100,100,40,80,10,1,MakeColor("black")) AddObject(e1,win) Draw()
See Also:	<pre>Plus(), Polygon(), MakeStarPoints(), MakeNGonPoints()</pre>

Name/Symbol: break

Description: Breaks out of a loop immediately. Usage: break Example: loop(i,[1,3,5,9,2,7]) { Print(i) if(i == 3) { break } } See Also: loop, return

8.4 C

Name/Symbol:	Ceiling()
Description:	Rounds <num> up to the next integer.</num>
Usage:	Ceiling(<num>)</num>
Example:	Ceiling(33.23) # == 34 Ceiling(-33.02) # == -33
See Also:	<pre>Round(), Floor(), AbsFloor(), Ceiling()</pre>

Name/Symbol: ChooseN()

Description:	Samples <number> items from list, returning a list in the original order. Items are sampled without replacement, so once an item is chosen it will not be chosen again. If <number> is larger than the length of the list, the entire list is returned in order. It differs from SampleN in that ChooseN returns items in the order they appeared in the originial list, but SampleN is shuffled.</number></number>
Usage:	ChooseN(<list>, <n>)</n></list>
Example:	<pre># Returns 5 numbers ChooseN([1,1,1,2,2], 5) # Returns 3 numbers from 1 and 7: ChooseN([1,2,3,4,5,6,7], 3)</pre>
See Also:	<pre>SampleN(), SampleNWithReplacement(), Subset()</pre>

Name/Symbol: Circle()

Description: Creates a circle for graphing at x,y with radius r. Circles must be added to a parent widget before it can be drawn; it may be added to widgets other than a base window. The properties of circles may be changed by accessing their properties directly, including the FILLED property which makes the object an outline versus a filled shape.

Usage: Circle(<x>, <y>, <r>,<color>)
Example:

c <-	Circle(30,30,20,	<pre>MakeColor(green))</pre>
AddOl	bject(c, win)	
Draw	()	

See Also: Square(), Ellipse(), Rectangle(), Line()

Name/Symbol: CheckForNetworkConnection()

Description:	Checks to see if there is an incoming TCP/IP connection on a network that is opened using <code>OpenNetworkListener</code> . This is an alternative to the <code>WaitForNetworkConnection</code> function that allows more flexibility (and allows updating the during waiting for the connection).
Usage:	<pre>net <- CheckForNetwokConnection(network)</pre>
Example:	<pre>network <- OpenNetworkListener(4444) time <- GetTime() while(not connected and (GetTime() < time + 5000)) { connected <- CheckForNetwokConnection(network) }</pre>
See Also:	<pre>OpenNetworkListener(), Getdata(), WaitForNetworkConnection(), CloseNetwork()</pre>

Name/Symbol: ClearEventLoop()

Description:	Clears the event loop. This function is currently experimental, and its usage may change in future versions of PEBL.
Usage:	USAGE CURRENTLY UNDOCUMENTED
Example:	
See Also:	RegisterEvent(), StartEventLoop()

Name/Symbol: ClickCheckbox()

Description:	This 'clicks' a checkbox, changing its status (both the visual display and its .status property). Its state can also be set using the SetCheckBox() function. The text "ClickCheckBox" is by default bound to the .clickon property of any checkbox, enabling you to handle on a number of graphical object the same (see callfunction example). The [x,y] coordinates are ignored, and so anything can be fed to them, but the standard approach is to use give gClick, which is a global bound to the last click coordinates when WaitForClickOnTarget is used.
Usage:	ClickCheckBox(obj, [x,y])
Example:	The following creates a button, waits for you to click on it, and animates a button press
	ok <- MakeCheckbox("OK?",400,250,gWin,150) resp <- WaitForClickOnTarget([ok],[1]) ClickCheckBox(done,gClick) Draw()
	You can handle a bunch of objects together using an idiom like this:
	ok <- MakeCheckbox("OK?",400,250,gWin,150) ok2 <- MakeCheckbox("Otherwise?",400,280,gWin,150)
	<pre>checks <- [ok,ok2] resp <- WaitForClickOnTarget(checks,[1,2]) check <- Nth(checks.resp)</pre>
	CallFunction(check.clickon,[check,gClick]) Draw()
	Examples of its use can be found in demo ui.pbl
See Also:	<pre>MakeCheckBox(), SetCheckBox()</pre>

Name/Symbol: Clickon()

Description: Calls the function named by the .clickon property of a custom object. Useful for handling click events of a bunch of different objects. This is essentially the same as CallFunction(obj.clickon, [obj,gClick]).

Usage: Clickon(obj,[x,y])

Example:

	<pre>##This overrides buttons placement at the center: done <- MakeButton("QUIT",400,250,gWin,150) WaitForClickOnTarget([done],[1]) Clickon(done,gClick)</pre>
See Also:	<pre>Inside(), ClickCheckbox MoveObject, DrawObject</pre>
Name/Symbol:	ClickOnMenu()
Description:	Handles clicking on a menu item. It will call the .clickon property of that item, and then hide the menu.
Usage:	ClickOnMenu(obj,[x,y])
	This function is typically not used directly, but rather it is called via MakeMenu. However, it can be used as a quick-and-dirty button.
Example:	This creates a menu and awaits clicking on. More complete examples are available in ui.pbl. It requires that MyMessage is created somewhere
	<pre>menu1 <- MakeMenuItem("File",0,0,gWin,14,10,"MYMESSAGE")</pre>
	<pre>menu2<- MakeMenu("Edit",70,0,gWin,14,10, "MYMESSAGE")</pre>
	menus <- [menu1,menu2] opt <- WaitForClickOntarget(menu,[1,2]) ClickOnMenu(Nth(menus,opt),gClick)
See Also:	MakeMenu(), OpenSubMenus(), MakeMenuItem

Name/Symbol: ClickOnScrollbox()

Description: Handles a click event on the a ScrollBox. This should be called after one checks (e.g., via InsideTB) whether the scrollbox was actually clicked on. It will handle scrolling, moving via the thumb, up/down arrows, and reselection. It is also used to interact with ScrollingTextBox objects. This function name is bound to the .clickon property of scrollboxes, so it can be called using CallFunction (see example below).

	Chapter 8. Detailed Function and Keyword Reference
Usage:	ClickOnScrollbox(sb,[x,y])
	Here, sb is the scrollbox object. [x,y] is a list of xy coordinates, which can also be the global variable gClick
Example:	See ui.pbl in the demo directory for examples of the use of a scrolling text box. A brief example follows:
	<pre>sb <- MakeScrollBox(Sequence(1,50,1),"The numbers",40,40,gWin,12,150,5 Draw()</pre>
	<pre>resp <- WaitForClickOntarget([sb],[1]) ClickOnScrollbox(sb,gClick)</pre>
	#Alternately: CallFunction(sb.clickon,[sb,gClick])
	<pre>##change the selected items sb.list <- Sequence(sb.selected,sb.selected+50,1) UpdateScrollbox(sb) DrawScrollbox(sb) Draw()</pre>
See Also:	MakeScrollingTextBox MakeScrollBox UpdateScrollBox DrawScrollBox
Name/Symbol:	CloseNetworkConnection()
Description:	Closes network connection
Usage:	CloseNetwork(<network>)</network>
Example:	net <- WaitForNetworkConnection("localhost",1234) SendData(net,"Watson, come here. I need you.") CloseNetworkConnection(net)
	Also see nim.pbl for example of two-way network connection.
See Also:	ConnectToIP, ConnectToHost, WaitForNetworkConnection, GetData, SendData, ConvertIPString

Name/Symbol: ConnectToHost()

Description:	Connects to a host computer waiting for a connection on <port>, returning a network object that can be used to communicate. Host is a text hostname, like "myname.indiana.edu", or use "localhost" to specify your current computer.</port>
Usage:	ConnectToHost(<hostname>,<port>)</port></hostname>
Example:	See nim.pbl for example of two-way network connection.
	net <- ConnectToHost("localhost",1234) dat <- GetData(net,20) Print(dat) CloseNetworkConnection(net)
See Also:	ConnectToIP, GetData, WaitForNetworkConnection, SendData, ConvertIPString, CloseNetworkConnection

Name/Symbol: ConnectToIP()

Description: Connects to a host computer waiting for a connection on <port>, returning a network object that can be used to communicate. <ip> is a numeric ip address, which must be created with the ConvertIPString(ip) function.

Usage: ConnectToIP(<ip>,<port>)

Example: See nim.pbl for example of two-way network connection.

ip <- ConvertIPString("192.168.0.1")
net <- ConnectToHost(ip,1234)
dat <- GetData(net,20)
Print(dat)
CloseNetworkConnection(net)</pre>

See Also: ConnectToHost, GetData, WaitForNetworkConnection, SendData, ConvertIPString, CloseNetworkConnection

Name/Symbol: ConvertIPString()

Description: Converts an IP address specified as a string into an integer that can be used by ConnectToIP.

Usage: ConvertIPString(<ip-as-string>)

Example: See nim.pbl for example of two-way network connection.

```
ip <- ConvertIPString("192.168.0.1")
net <- ConnectToHost(ip,1234)
dat <- GetData(net,20)
Print(dat)
CloseNetworkConnection(net)
See Also: ConnectToHost, ConnectToIP, GetData,
WaitForNetworkConnection, SendData,
CloseNetworkConnection</pre>
```

Name/Symbol: ConvexHull()

Description: Computes the convex hull of a set of [x,y] points. It returns a set of points that forms the convex hull, with the first and last point identical. A convex hull is the set of outermost points, such that a polygon connecting just those points will encompass all other points, and such that no angle is acute. It is used in MakeAttneave.

```
Usage: ConvexHull(<list-of-x-y-points>)

Example: pts <- [[0.579081, 0.0327737],

[0.0536094, 0.378258],

[0.239628, 0.187751],

[0.940625, 0.26526],

[0.508748, 0.840846],

[0.352604, 0.200193],

[0.38684, 0.212413],

[0.00114761, 0.768165],

[0.432963, 0.629412]]

Print(ConvexHull(pts))
```

output:

[[0.940625, 0.26526]
, [0.508748, 0.840846]
, [0.00114761, 0.768165]
, [0.0536094, 0.378258]
, [0.239628, 0.187751]
, [0.579081, 0.0327737]
, [0.940625, 0.26526]

See Also: MakeAttneave,

Name/Symbol:	Cos()
Description:	Cosine of <deg> degrees.</deg>
Usage:	
Example:	Cos(33.5) Cos(-32)
See Also:	Sin(), Tan(), ATan(), ACos(), ATan()

Name/Symbol: Countdown()

Description:	Displays a 3-2-1 countdown on the screen in with 500 ms ISI. CountDown temporarily hides whatever is on the screen. It is useful in orienting participants to the first trial of a task.
Usage:	CountDown(win)
Example:	win <- MakeWindow() MessageBox("Press any key to begin",win) CountDown(win) Trial()
See Also:	MessageBox

Name/Symbol: CR()

Description:	Produces <number> linefeeds which can be added to a string and printed or saved to a file. CR is an abbreviation for "Carriage Return".</number>
Usage:	CR(<number>)</number>
Example:	Print("Number: " Tab(1) + number + CR(2)) Print("We needed space before this line.")
See Also:	Format(), Tab()

Name/Symbol: CrossFactorWithoutDuplicates()

Description: This function takes a single list, and returns a list of all pairs, excluding the pairs that have two of the same item. To achieve the same effect but include the duplicates, use: DesignFullCounterBalance(x,x).

Usage:	CrossFactorWithoutDuplicates(<list>)</list>
Example:	- CrossFactorWithoutDuplicates([a,b,c]) # == [[a,b],[a,c],[b,a],[b,c],[c,a],[c,b]]
See Also:	<pre>DesignFullCounterBalance(), Repeat(), DesignBalancedSampling(), DesignGrecoLatinSquare(), DesignLatinSquare(), RepeatList(), LatinSquare(), Shuffle()</pre>
Name/Symbol:	CumNormInv()
Description:	This function takes a probability and returns the corresponding z-score for the cumulative standard normal distribution. It uses an accurate numerical approximation from: http://home.online.no/ pjacklam/notes/invnorm
Usage:	CumNormInv()
Example:	Print(CumNormInv(0)) #= NA Print(CumNormInv(.01)) #= -2.32634 Print(CumNormInv(.5)) #= 0 Print(CumNormInv(.9)) #= 1.28 Print(CumNormInv(1)) #= NA
See Also:	NormalDensity(), RandomNormal()

8.5 D

Namo/Symbol	dofino
Name/Symbol.	deline
Description:	Defines a user-specified function.
Usage:	<pre>define functionname (parameters) { statement1 statement2 statement3</pre>
Example:	See above.
See Also:	
Name/Symbol:	DegToRad()
Description:	Converts degrees to radians.
Usage:	DegToRad(<deg>)</deg>
Example:	DegToRad(180) # == 3.14159
See Also:	<pre>Cos(), Sin(), Tan(), ATan(), ACos(), ATan()</pre>

Name/Symbol: DesignBalancedSampling()

Description: Samples elements "roughly" equally. This function returns a list of repeated samples from <treatment_list>, such that each element in <treatment_list> appears approximately equally. Each element from <treatment_list> is sampled once without replacement before all elements are returned to the mix and sampling is repeated. If there are no repeated items in <list>, there will be no consecutive repeats in the output. The last repeat-sampling will be truncated so that a <length>-size list is returned. If you don't want the repeated epochs this function provides, Shuffle() the results.

Usage: DesignBalancedSampling(<list>, <length>)

Example:	<pre>DesignBalancedSampling([1,2,3,4,5],12) ## e.g., produces something like: ## [5,3,1,4,2, 3,1,5,2,4, 3,1]</pre>
See Also:	CrossFactorWithoutDuplicates(), Shuffle(), DesignFullCounterBalance(), DesignGrecoLatinSquare(), DesignLatinSquare(), Repeat(), RepeatList(), LatinSquare()
Name/Symbol:	DesignFullCounterbalance()
Description:	This takes two lists as parameters, and returns a nested list of lists that includes the full counterbalancing of both parameter lists. Use cautiously; this gets very large.
Usage:	<pre>DesignFullCounterbalance(<lista>, <listb>)</listb></lista></pre>
Example:	<pre>a <- [1,2,3] b <- [9,8,7] DesignFullCounterbalance(a,b) # == [[1,9],[1,8],[1,7], # [2,9],[2,8],[2,7], # [3,9],[3,8],[3,7]]</pre>
See Also:	CrossFactorWithoutDuplicates(), LatinSquare(), Shuffle(), DesignBalancedSampling(), DesignGrecoLatinSquare(), DesignLatinSquare(), Repeat(), RepeatList(),
Name/Symbol:	DesignGrecoLatinSquare()
Description:	This will return a list of lists formed by rotating through each element of the <treatment_list>s, making a list containing all element of the list, according to a greco-latin square. All lists must be of the same length.</treatment_list>
Usage:	<pre>DesignGrecoLatinSquare(<factor_list>,</factor_list></pre>
Example:	<pre>x <- ["a","b","c"] y <- ["p","q","r"] z <- ["x","y","z"] Print(DesignGrecoLatinSquare(x,y,z)) # produces: [[[a, p, x], [b, q, y], [c, r, z]], # [[a, q, z], [b, r, x], [c, p, y]], # [[a, r, y], [b, p, z], [c, q, x]]]</pre>

See Also:	CrossFactorWithoutDuplicates(), LatinSquare(), DesignFullCounterBalance(), DesignBalancedSampling(), DesignLatinSquare(), Repeat(), RepeatList(), Shuffle()	
Name/Symbol:	DesignLatinSquare()	
$\operatorname{Description}$:	This returns return a list of lists formed by rotating through each element of <treatment_list>, making a list containing all element of the list. Has no side effect on input lists.</treatment_list>	
Usage:	<pre>DesignLatinSquare(<treatment1_list>,</treatment1_list></pre>	
Example:	<pre>order <- [1,2,3] treatment <- ["A","B","C"] design <- DesignLatinSquare(order,treatment) # produces: [[[1, A], [2, B], [3, C]], # [[1, B], [2, C], [3, A]], # [[1, C], [2, A], [3, B]]]</pre>	
See Also:	CrossFactorWithoutDuplicates(), DesignFullCounterBalance(), DesignBalancedSampling(), DesignGrecoLatinSquare(), Repeat(), LatinSquare() RepeatList(), Shuffle(), Rotate()	

Name/Symbol: Dist()

Description:	Returns Euclidean distance between two points. Each point should be $[x,y]$, and any additional items in the list are ignored.
Usage:	<pre>Dist(<xylist1>, <xylist2>)</xylist2></xylist1></pre>
Example:	p1 <- [0,0] p2 <- [3,4] d <- Dist(p1,p2) #d is 5
See Also:	

Name/Symbol: Div()

Description: Returns round(<num>/<mod>)

Usage: Div(<num>, <mod>)

Example:

See Also: Mod() Name/Symbol: Draw() Description: Redraws the screen or a specific widget. Usage: Draw() Draw(<object>) Example: See Also: DrawFor(), Show(), Hide()

Name/Symbol: DrawFor()

Description:Draws a screen or widget, returning after <cycles> refreshes.
This function currently does not work as intended in the SDL
implementation, because of a lack of control over the refresh
blank. It may work in the future.Usage:DrawFor(<object>, <cycles>)Example:See Also:Draw(), Show(), Hide()

Name/Symbol: DrawObject()

Description:	Calls the function named by the .draw property of a custom object. Useful for handling drawing of a bunch of different objects. This is essentially the same as CallFunction(obj.draw, [obj]), but falls back to a normal Draw() command so it handles built-in objects as well.	
Usage:	DrawObject(obj)	
Example:	<pre>##This overrides buttons placement at the center: done <- MakeButton("QUIT",400,250,gWin,150) WaitForClickOnTarget([done],[1]) Clickon(done,gClick) DrawObject(done)</pre>	
See Also:	<pre>Inside(), ClickOnCheckbox MoveObject, Draw</pre>	

Name/Symbol: DrawPulldown()

Description:	This handles layout/drawing of a pulldown box. This does not actually call Draw() on the window, and so an additional draw command is needed before the output is displayed. The main use case for this function is if you need to manually change the selected object (by changing .selected). This will redraw the pulldown with the new selection.
Usage:	DrawPullDown(object)
Example:	options <- MakePulldownButton(["A",B","C"],400,250,gWin,14,100,1) Draw() WaitForAnyKeyPress() options.selected <- 2 DrawPulldown(options) Draw() WaitForAnyKeyPress()
See Also:	<pre>MakePullDown(), Pulldown(), UpdatePulldown</pre>

Name/Symbol: DrawScrollbox()

Description:	Redraws a ScrollBox. This is called by various inter-
	nal functions, but should be used to handle redrawing if
	UpdateScrollbox is used. When things like the scrollbar, off-
	set, and selected item change, this can be called directly. If the
	actual list is changed, UpdateScrollBox should be called first.
	Note that the redrawn scrollbox won't be changed on the screen
	until a Draw() command is issued.

Usage: DrawScrollBox(sb)

Here, sb is the scrollbox object.

Example: See ui.pbl in the demo directory for examples of the use of a scrolling text box. A brief example follows:

```
sb <- MakeScrollBox(Sequence(1,50,1),"The numbers",40,40,gWin,12,150,500,3)
Draw()</pre>
```

```
resp <- WaitForClickOntarget([sb],[1])
CallFunction(sb.clickon,[sb,gClick])</pre>
```

```
#Alternately: ClickOnScrollbox(sb,gClick)
##change the selected items
sb.list <- Sequence(sb.selected,sb.selected+50,1)
UpdateScrollbox(sb)
DrawScrollbox(sb)
Draw()</pre>
```

See Also: MakeScrollingTextBox MakeScrollBox UpdateScrollBox ClickOnScrollBox

8.6 E

Name/Symbol: EasyLabel()

Description:	Creates and adds to the window location a label at specified location. Uses standard vera font with grey background. (May in the future get background color from window). Easy-to-use replacement for the MakeFont, MakeLabel, AddObject, Move, steps you typically have to go through.
Usage:	EasyLabel(<text>,<x>, <y>, <win>, <fontsize>)</fontsize></win></y></x></text>
Example:	win <- MakeWindow() lab <- EasyLabel("What?",200,100,win,12) Draw()
See Also:	EasyTextBox(), MakeLabel()

Name/Symbol: EasyTextBox()

Description:	Creates and adds to the window location a textbox at speci- fied location. Uses standard vera font with white background. Easy-to-use replacement for the MakeFont,MakeTextBox, Ad- dObject, Move, steps.
Usage:	<pre>EasyTextBox(<text>,<x>, <y>, <win>,</win></y></x></text></pre>
Example:	win <- MakeWindow() entry <- EasyTextBox("1 2 3 4 5",200,100, win,12,200,50) Draw()
See Also:	EasyLabel(), MakeTextBox()

Name/Symbol: Ellipse()

Description: Creates a ellipse for graphing at x,y with radii rx and ry. Ellipses are only currently definable oriented in horizontal/vertical directions. Ellipses must be added to a parent widget before it can be drawn; it may be added to widgets other than a base window. The properties of ellipses may be changed by accessing their properties directly, including the FILLED property which makes the object an outline versus a filled shape.

Usage:	<pre>Ellipse(<x>, <y>, <rx>, <ry>,<color>)</color></ry></rx></y></x></pre>
Example:	e <- Ellipse(30,30,20,10, MakeColor(green)) AddObject(e, win) Draw()
See Also:	<pre>Square(), Circle(), Rectangle(), Line()</pre>

Name/Symbol: EndOfFile()

Description:	Returns true if at the end of a file.
Usage:	<pre>EndOfFile(<filestream>)</filestream></pre>
Example:	<pre>while(not EndOfFile(fstream)) { Print(FileReadLine(fstream)) }</pre>

See Also:

Name/Symbol: EndOfLine() Description: Returns true if at end of line. Usage: EndOfLine(<filestream>) Example: See Also:

Name/Symbol: Enquote()

Description:	Surrounds the argument with quotes.
Usage:	Enquote("one two three")
Example:	<pre>##use to add quoted text to instructions. instructions <- "Respond whenever you see an "+ Enquote("X")</pre>
	<pre>##Use it for saving data that may have spaces: resp <- GetInput(tb, "<enter>") FilePrint(fileout, Enquote(resp))</enter></pre>

Chapter 8. Detailed Function and Keyword Reference

tracted.

Usage:

Example:

See Also:

See Also: gQuote Name/Symbol: Exp() Description: e to the power of <pow>. Usage: Exp(<pow>) Example: Exp(0) # == 1 Exp(3) # == 20.0855 See Also: Log() Name/Symbol: ExtractListItems() Description: Extracts items from a list, forming a new list. The list <items>

ExtractListItems(<list>,<items>)

myList <- Sequence(101, 110, 1)
ExtractListItems(myList, [2,4,5,1,4])
produces [102, 104, 105, 101, 104]</pre>

Subset(), SubList(), SampleN(), Filter()

are the integers representing the indices that should be ex-

119

8.7 F Name/Symbol: FileClose() Description: Closes a filestream variable. Be sure to pass the variable name, not the filename. Usage: FileClose(<filestream>) Example: x <- FileOpenRead("file.txt") # Do relevant stuff here. FileClose(x)</pre>

See Also: FileOpenAppend(), FileOpenRead(), FileOpenWrite()

Name/Symbol: FileExists()

Description:	Checks whether a file exists. Returns 1 if it exists, 0 otherwise.
Usage:	<pre>FileExists(<path>)</path></pre>
Example:	<pre>filename <- "data-"+gSubNum+".csv" exists <- FileExists(filename) if(exists) { MessageBox("Subject file already exists. Please try a new one.",gWin SignalFatalError("filename already used") }</pre>
See Also:	<pre>GetDirectoryListing(), FileExists(), IsDirectory(), MakeDirectory()</pre>

Name/Symbol:	FileOpenAppend()		
Description:	Opens a filename, returning a stream that can be used for writ- ing information. Appends if the file already exists.		
Usage:	FileOpenAppend(<	filename>)	
Example:			
See Also:	<pre>FileClose(), FileOpenOverWrite</pre>	FileOpenRead(), e()	<pre>FileOpenWrite(),</pre>

Name/Symbol: FileOpenOverwrite()

Description:	Opens a filename, r ing information. Or should not be used f Write, which saves exists.	eturning a stream that car verwrites if file already exi for opening data files; inste to a backup file if the spe	h be used for writ- sts. This function ead, use FileOpen- ecified file already
Usage:	FileOpenOverWrit	e(<filename>)</filename>	
Example:			
See Also:	<pre>FileClose(), FileOpenWrite()</pre>	<pre>FileOpenAppend(),</pre>	FileOpenRead()

Name/Symbol: FileOpenRead()

Description:	Opens a filename, information.	returning a	stream to	be used	for reading
Usage:	FileOpenRead(<f< td=""><td>ilename>)</td><td></td><td></td><td></td></f<>	ilename>)			
Example:					
See Also:	FileClose(), FileOpenOverWri	FileOpenApp te()	pend(),	FileOp	enWrite(),

Name/Symbol: FileOpenWrite()

Description:	Opens a filename, returning a stream that can be used for writ- ing information. If the specified filename exists, it won't over- write that file. Instead, it will create a related filename, ap- pending a -integer before the filename extension.
Usage:	FileOpenWrite(<filename>)</filename>
Example:	In the following example, test.txt gets created with the text "testing 1", and then a second file test-1.txt gets created with the text "testing 2".
	<pre>f1 <- FileOpenWrite("test.txt") FilePrint(f1,"testing 1") FileClose(f1) f2 <- FileOpenWrite("test.txt") FilePrint(f2,"testing 2") FileClose(f2)</pre>

<pre>FileClose(), FileOpenAppend(), FileOpenRead(), FileOpenOverWrite()</pre>
FilePrint()
Like Print, but to a file. Prints a string to a file, with a carriage return at the end. Returns a copy of the string it prints.
<pre>FilePrint(<filestream>, <value>)</value></filestream></pre>
FilePrint(fstream, "Another Line.")
<pre>Print(), FilePrint_()</pre>

Name/Symbol: FilePrint_()

Like Print_, but to a file. Prints a string to a file, without appending a newline character. Returns a copy of the string it prints.
<pre>FilePrint_(<filestream>, <value>)</value></filestream></pre>
FilePrint_(fstream, "This line doesn't end.")
<pre>Print_(), FilePrint()</pre>

Name/Symbol: FilePrintList()

Description:	Prints a list to a file, without the ','s or [] characters. Puts a carriage return at the end. Returns a string that was printed. If a list contains other lists, the printing will wrap multiple lines and the internal lists will be printed as normal. To avoid this, try FilePrintList(file,Flatten(list)).
Usage:	<pre>FilePrintList(<filestream>, <list>)</list></filestream></pre>
Example:	<pre>FilePrintList(fstream, [1,2,3,4,5,5,5])</pre>

FilePrintList(fstream, [1,2,3,4,5,5,5])
##
Produces:
##1 2 3 4 5 5 5
FilePrintList(fstream,[[1,2],[3,4],[5,6]])
#Produces:
[1,2]
#,[3,4]

```
#,[5,6]
FilePrintList(fstream,Flatten([[1,2],[3,4],[5,6]]))
#Produces:
# 1 2 3 4 5 6
See Also: Print(), Print_(), FilePrint(), FilePrint_(),
PrintList(),
```

Name/Symbol: FileReadCharacter()

Description:	Reads and returns a	single character from a	filestream.
Usage:	FileReadCharacter(<filestream>)</filestream>	
Example:			
See Also:	<pre>FileReadList(), FileReadText(), Fil</pre>	FileReadTable() LeReadWord(),	<pre>FileReadLine(),</pre>

Name/Symbol: FileReadLine()

Description:	Reads and returns a line from a file; all characters up until the next newline or the end of the file.	
Usage:	FileReadLine(<filestream>)</filestream>	
Example:		
See Also:	<pre>FileReadCharacter(),FileReadList(), F FileReadText(), FileReadWord(),</pre>	ileReadTable()

Name/Symbol: FileReadList()

Description: Given a filename, will open it, read in all the items into a list (one item per line), and close the file afterward. Ignores blank lines or lines starting with #. Useful with a number of predefined data files stored in media/text/. See Section 4.18.4: Provided Media Files.

Usage: FileReadList(<filename>)

Example: FileReadList("data.txt")

See Also:	<pre>FileReadCharacter(), FileReadTable() FileReadLine(), FileReadText(), FileReadWord(),</pre>
Name/Symbol:	FileReadTable()
Description:	Reads a table directly from a file. Data in file should separated by spaces. Reads each line onto a sublist, with space-separated tokens as items in sublist. Ignores blank lines or lines beginning with #. Optionally, specify a token separator other than space.
Usage:	<pre>FileReadTable(<filename>, <optional-separator>)</optional-separator></filename></pre>
Example:	a <- FileReadTable("data.txt")
See Also:	<pre>FileReadCharacter(),FileReadList(), FileReadLine(), FileReadText(), FileReadWord(),</pre>

Name/Symbol: FileReadText()

Description:	Returns all of the text from a file, ignoring any lines beginning with #. Opens and closes the file transparently.	
Usage:	FileReadText(<filename>)</filename>	
Example:	<pre>instructions <- FileReadText("instructions.txt")</pre>	
See Also:	<pre>FileReadCharacter(),FileReadList(), FileReadTable() FileReadLine(), FileReadWord(),</pre>	

Name/Symbol: FileReadWord()

Description:	Reads and returns a 'word' from a file; the next connected stream of characters not including a ' ' or a newline. Will not read newline characters.
Usage:	FileReadWord(<filestream>)</filestream>
Example:	
See Also:	<pre>FileReadLine(), FileReadTable(), FileReadList() FileReadCharacter(),FileReadList(), FileReadTable() FileReadLine(),FileReadText(),FileReadWord(),</pre>

Name/Symbol: Filter()

Description:	Returns a subset of <list>, depending on whether the <filter> list is zero or nonzero. Both arguments must be lists of the same length.</filter></list>
Usage:	<pre>Filter(<list>,<filter>)</filter></list></pre>
Example:	<pre>x <- [1,2,3,3,2,2,1] Print(Filter(x,[1,1,1,0,0,0,0])) ##==[1,2,3] Print(Filter(x,Match(x,1))) ##== [1,1]</pre>
See Also:	<pre>Match(), Subset(), Lookup()</pre>

Name/Symbol: FindInString()

Description:	Finds a token in a string, returning the position (starting at a particular position).
Usage:	<pre>FindInString(<basestring>,<searchstring>,<startingpos>) If the string is not found, the value 0 is returned.</startingpos></searchstring></basestring></pre>
Example:	<pre>FindInString("about","bo",1) # == 2 FindInString("banana","na",1) # == 3 FindInString("banana","na",4) # == 5</pre>
See Also:	SplitString()

Name/Symbol: First()

Description:	Returns the first item of a list.
Usage:	<pre>First(<list>)</list></pre>
Example:	First([3,33,132]) # == 3
See Also:	Nth(), Last()

Name/Symbol: Flatten()

Description:	Flattens nested list ${\tt list}$ to a single flat list
Usage:	<pre>Flatten(<list>)</list></pre>
Example:	<pre>Flatten([1,2,[3,4],[5,[6,7],8],[9]]) # == [1,2,3,4,5,6,7,8,9] Flatten([1,2,[3,4],[5,[6,7],8],[9]]) # == [1,2,3,4,5,6,7,8,9]</pre>

See Also: FlattenN(), FoldList()
Name/Symbol: FlattenN()
Description: Flattens <n> levels of nested list <list>.
Usage: Flatten(<list>, <n>)
Example: Flatten([1,2,[3,4],[5,[6,7],8],[9]],1)
== [1,2,3,4,5,[6,7],8,9]
See Also: Flatten(), FoldList()

Name/Symbol: Floor()

Description:	Rounds <num> down to the next integer</num>
Usage:	Floor(<num>)</num>
Example:	Floor(33.23) # == 33 Floor(3.999) # ==3 Floor(-32.23) # == -33
See Also:	<pre>AbsFloor(), Round(), Ceiling()</pre>

Name/Symbol: FoldList()

Description:	Folds a list into equal-length sublists.
Usage:	<pre>FoldList(<list>, <size>)</size></list></pre>
Example:	FoldList([1,2,3,4,5,6,7,8],2) # == [[1,2],[3,4],[5,6],[7,8]]
See Also:	<pre>FlattenN(), Flatten()</pre>

Name/Symbol: Format()

Description: Formats the printing of values to ensure the proper spacing. It will either truncate or pad <value> with spaces so that it ends up exactly <length> characters long. Character padding is at the end.

Usage: Format(<value>, <length>)

CR() Tab()

Example:

```
x <- 33.23425225
y <- 23.3
Print("["+Format(x,5)+"]")
Print("["+Format(y,5)+"]")
## Output:
## [33.23 ]
## [23.3 ]
```

See Also:

8.8 G

Name/Symbol:	GetAngle()
Description:	Gets an angle (in degrees) from $(0,0)$ of an x,y coordinate
Usage:	GetAngle(<x>,<y>)</y></x>
Example:	<pre>##point sprite in the direction of a click sprite <- LoadImage("car.png") AddObject(sprite,gWin) Move(sprite,300,300) xy <- WaitForDownClick() newangle <- GetAngle(First(xy)-300,Second(xy)-300) sprite.rotation <- newangle Draw()</pre>
See Also:	DegtoRad, RadToDeg

Name/Symbol: GetAngle3()

	Degronda, haarobeg, derningre, rohrent
See Also:	DegtoBad BadToDeg GetAngle ToBight
	Print(GetAngle3(a,b,c)) ## .2157
	c <- [0.239628, 0.187751]
Example:	a <- [0.579081, 0.0327737] b <- [0.0536094, 0.378258]
Usage:	GetAngle3(<a>,,<c>)</c>
Description:	Gets an angle (in radians) of abc.

Description: Returns an list of [width,height] specifying what the current computer screen resolution is. This is used within the pebl launcher in order to use the current resolution to run the experiment.

Usage: res <- GetCurrentScreenResolution()

Chapter 8	. Detailed	Function	and	Keyword	Reference
-----------	------------	----------	-----	---------	-----------

Example:	<pre>define Start(p) {</pre>
	<pre>## For testing, let's make the screen resolution a bit smaller than the ## current one so that it doesn't get hidden by the bottom task bar ## res <- GetCurrentScreenResolution() gVideoWidth <- First(res)-100 gVideoHeight <- Second(res)-100 gWin <- MakeWindow()</pre>
	<pre>MessageBox("Window slightly smaller than screen",gWin) }</pre>
See Also:	GetVideoModes()
Name/Symbol:	GetCursorPosition()
Description:	Returns an integer specifying where in a textbox the edit cursor is. The value indicates which character it is on.
Usage:	GetCursorPosition(<textbox>)</textbox>
Example:	
See Also:	<pre>SetCursorPosition(), MakeTextBox(), SetText()</pre>
Name/Symbol:	GetData()
Description:	Gets Data from network connection. Example of usage in demo/nim.pbl.
Usage:	<pre>val <- GetData(<network>,<size>)</size></network></pre>
Example:	On 'server':
	net <- WaitForNetworkConnection("localhost",1234) SendData(net,"Watson, come here. I need you.") value <- GetData(net,10) Print(value)
	On Client:
	net <- ConnectToHost("localhost",1234) value <- GetData(net,20) Print(value) ##should print out "Watson, come here. I need you."

See Also:	ConnectToIP, ConnectToHost, WaitForNetworkConnection, SendData, ConvertIPString, CloseNetworkConnection
Name/Symbol:	GetDirectoryListing()
Description:	Returns a list of files and directories in a particular directory/folder.
Usage:	<pre>list <- GetDirectoryListing(<path>)</path></pre>
Example:	<pre>files <- GetDirectoryListing("./")</pre>
See Also:	<pre>GetDirectoryListing(), FileExists(), IsDirectory(), MakeDirectory()</pre>

Name/Symbol: GetEasyChoice()

Description: Hides what is on the screen and presents a textbox with specified message, and a series of options to select from. Returns element from corresponding position of the <output> list.

Usage: GetEasyChoice(<message>,<list-of-choices>, <output>,<window>)

Example: The code snippet below produces the following screen:

What Year are you in school Click box to select option.	
First-year	
Sophomore	
Junior	
Senior	
Other	

See Also: MessageBox,GetEasyChoice, EasyTextBox

Name/Symbol: GetEasyInput()

Description: Hides what is on the screen and presents a textbox with specified message, and a second text box to enter input. Continues when 'enter' it hit at the end of text entry.

	X PEBL Experiment _
	Enter Participant ID Code 332-2342
Usage:	
	<pre>GetEasyInput(<message>,<window>)</window></message></pre>
Example:	gWin <- MakeWindow() inp <- GetEasyInput("Enter Participant ID Code",gWin)
See Also:	<pre>MessageBox() GetEasyChoice(), EasyTextBox()</pre>
Name/Symbol:	GetInput()
Description	Allows user to type input into a textbox
Description.	
∪sage:	Getinput(<textbox>,<escape-key>)</escape-key></textbox>
Example:	
See Also:	<pre>SetEditable(), GetCursorPosition(), MakeTextBox(), SetText()</pre>

Name/Symbol: GetJoystickAxisState

Description:	This gets the state of a particular joystick axis. You need to specify a joystick object, which is created with OpenJoystick(). You also need to specify the axis. You can determine how many axes a joystick has with the GetNumJoystickAxes() function. The function returns a value between 1 and 32768.
Usage:	GetJoystickAxisState(js,1)
Example:	See joysticktest.pbl in the demo directory
See Also:	GetNumJoysticks(), OpenJoystick(), GetNumJoystickAxes() GetNumJoystickBalls(), GetNumJoystickButtons(), Get- NumJoystickHats() GetJoystickAxisState(), GetJoystickHat- State(), GetJoystickButtonState()
Name/Symbol:	GetJoystickButtonState
Description:	This gets the state of a particular joystick button. You need to specify a joystick object, which is created with OpenJoystick(). You also need to specify the button. You can determine how many buttons a joystick has with the GetNumJoystickButtons() function. The function returns either 0 (for unpressed) or 1 (for pressed).

- Usage: GetJoystickButtonState(js,1)
- Example: See joysticktest.pbl in the demo directory
- See Also: GetNumJoysticks(), OpenJoystick(), GetNumJoystickAxes() GetNumJoystickBalls(), GetNumJoystickButtons(), GetNumJoystickHats() GetJoystickAxisState(), GetJoystickHat-State(), GetJoystickButtonState()

Name/Symbol: GetJoystickBallState

- Description: Not implemented.
- Usage: GetJoystickBallState(js,1)
- Example: See joysticktest.pbl in the demo directory
- See Also: GetNumJoysticks(), OpenJoystick(), GetNumJoystickAxes() GetNumJoystickBalls(), GetNumJoystickButtons(), GetNumJoystickHats() GetJoystickAxisState(), GetJoystickHat-State(), GetJoystickButtonState()

Name/Symbol: GetJoystickHatState

Description:

ът

10

1. 1

a . w

2

ъ · · ·

Usage:	GetJoystickHatState(js,1) This gets the state of a particu-
	lar joystick hat. You need to specify a joystick object, which
	is created with OpenJoystick(). You also need to specify the
	hat id. You can determine how many hats a joystick has with
	the GetNumJoystickHats() function. The function returns a
	value between 0 and 15, which is the sum of values specifying
	whether each primary NSEW direction is pressed. The coding
	is: 0=no buttons; 1=N, 2=E, 4=S, 8=W. Thus, if 1 is returned,
	the north hat button is pressed. If 3 is returned, NorthEast. If
	12 is returned, SW, and so on.
Example:	See joysticktest.pbl in the demo directory
See Also:	GetNumJovsticks(), OpenJovstick(), GetNumJovstickAxes()

See Also: GetNumJoysticks(), OpenJoystick(), GetNumJoystickAxes() GetNumJoystickBalls(), GetNumJoystickButtons(), Get-NumJoystickHats() GetJoystickAxisState(), GetJoystickHat-State(), GetJoystickButtonState()

 \sim

Name/Symbol:	GetMouseCursorPosition()	
Description:	Gets the current x,y coordinates of the	mouse pointer.
Usage:	<pre>GetMouseCursorPosition()</pre>	
Example:		
	pos <- GetMouseCursorPosition()	
See Also:	ShowCursor, SetMouseCursorPosition.GetMouseCu	WaitForMouseButton, rsorPosition

Name/Symbol: GetMouseState()

Description: Gets the current x,y coordinates of the mouse pointer, plus the current state of the buttons. Returns a 5-element list, with the first two indicating x,y position, the third is either 0 or 1 depending on if the left mouse is clicked, the fourth 0 or 2 depending on whether the middle mouse is clicked, and the fifth either 0 or 4 depending on whether the right mouse is clicked.

Usage: GetMouseState()

```
Example:
              define Start(p)
              {
                win <- MakeWindow()</pre>
                i <- 1
                while(i < 100)
                {
                  Draw()
                  Print(GetMouseState())
                  Wait(100)
                  i <- i + 1
                }
              ##Returns look like:
              [417, 276, 0, 0, 0]
              [495, 286, 0, 0, 0]
              [460, 299, 0, 0, 0]
              [428, 217, 0, 0, 0]
              [446, 202, 0, 0, 4]
              [446, 202, 1, 0, 0]
              [446, 202, 1, 0, 0]
              [446, 202, 0, 2, 0]
```

See Also: ShowCursor WaitForMouseButton, SetMouseCursorPosition, GetMouseCursorPosition

Name/Symbol: GetNewDataFile()

Usage:

Description: Creates a data file for output, asking for either append or renumbering the subject code if the specified file is already in use.

> Here, subnum should be a subject code you want to use. win should refer to the window a prompt will be displayed on if the subject code is already in use. basename should be the base filename of the file, and extension should be the . extension (without the dot) at the end of the file. Finally, header is what will be printed on the first row of a file.

GetNewDataFile(subnum,win,basename,extension,header)

When this file is used, a 'data' subdirectory will first be created in the current directory (i.e., the directory where the experiment is). Then, a subdirectory will be created inside data based on the subnum. Spaces and some other characters will be removed to ensure easy and uniform access to this directory. Then, a filename will be created composed of:

data\subnum\basename-subnum.extension

If this file does not exist, one will be created and the header will be printed to the first line. If it does exist, you will be prompted that the file exists, and at that point you can choose to either append to the existing file (in which case no header will be added), or choose a new subject code (in which case, a new directory will be made). The process can repeat until you either append or choose an unused file.

Multiple files can be made, and they will all appear in the subnum directory. If you get a filename collision, you decision on the first file will carry forward on future files, controlled by a special global variable called gResetNumber.

Note that nearly all of the test battery tests use this function. This can make pooling subject data more difficult, but use the combine data dialog in the launcher to easily combine data from multiple files in multiple subdirectories.

In all situations, the global variable gSubNum is set to the resulting subject code (whether or not gSubNum is passed to this function). This should only be called at the beginning of an experiment, when the experimenter still has control of the computer, in case a subject code is reused and a decision needs to be made. Finally, the extension chosen has essentially nothing to do with how the internals are formatted; it is up to you

Example:	<pre>file1 <- GetNewDataFile("1",gWin,"memorytest","csv",</pre>
	##above creates a file data\1\memorytest-1.csv
	file2 <- GetNewDataFile("1",gWin,"memorytest","csv", "sub,trial,word,answer,rt,corr") # above will prompt you for new subject code
	<pre>file3 <- GetNewDataFile("1",gWin,"memorytest-report","txt", "")</pre>
	##No header is needed on a text-based report file.
See Also:	FileOpenWrite, FileOpenAppend, FileOpenOverwrite

Name/Symbol: GetNIMHDemographics()

Description: Gets demographic information that are normally required for NIMH-related research. Currently are gender (M/F/prefer not to say), ethnicity (Hispanic or not), and race (A.I./Alaskan, Asian/A.A., Hawaiian, black/A.A., white/Caucasian, other). It then prints their responses in a single line in the demographics file, along with any special code you supply and a time/date stamp. This code might include a subject number, experiment number, or something else, but many informed consent forms assure the subject that this information cannot be tied back to them or their data, so be careful about what you record. The file output will look something like:
 31, Thu May 12 17:00:35 2011, F, hisp, asian, 3331 32, Thu May 12 22:49:10 2011, M, nothisp, amind, 3332

The first column is the user-specified code (in this case, indicating the experiment number). The middle columns indicate date/time, and the last three columns indicate gender (M, F, other), Hispanic (Y/N), and race.

Usage:	GetNIMHDemographics(<code-to-print-out>, <window>, <filename>)</filename></window></code-to-print-out>
Example:	GetNIMHDemographics("x0413", gwindow, "x0413-demographics.txt")

See Also:

Name/Symbol: GetNumJoystickAxes

$\mathbf{Description}:$	This gets the number of axes on a joystick. You need to specify a joystick object, which is created with $OpenJoystick()$.
Usage:	GetNumJoystickAxes(js,1)
Example:	See joysticktest.pbl in the demo directory
See Also:	GetNumJoysticks(), OpenJoystick(), GetNumJoystickAxes() GetNumJoystickBalls(), GetNumJoystickButtons(), Get- NumJoystickHats() GetJoystickAxisState(), GetJoystickHat- State(), GetJoystickButtonState()

Name/Symbol: GetNumJoystickBalls

Description:	This gets the number of joystick balls available on a particular joystick. You need to specify a joystick object, which is created with OpenJoystick().
Usage:	GetNumJoystickBalls(js)
Example:	See joysticktest.pbl in the demo directory
See Also:	GetNumJoysticks(), OpenJoystick(), GetNumJoystickAxes() GetNumJoystickBalls(), GetNumJoystickButtons(), Get- NumJoystickHats() GetJoystickAxisState(), GetJoystickHat- State(), GetJoystickButtonState()

 $Name/Symbol: \ {\tt GetNumJoystickButtons}$

Description:	This gets the number of joystick buttons available on a particular joystick. You need to specify a joystick object, which is created with OpenJoystick().
Usage:	GetNumJoystickButtons(js,1)
Example:	See joysticktest.pbl in the demo directory
See Also:	GetNumJoysticks(), OpenJoystick(), GetNumJoystickAxes() GetNumJoystickBalls(), GetNumJoystickButtons(), Get- NumJoystickHats() GetJoystickAxisState(), GetJoystickHat- State(), GetJoystickButtonState()

Name/Symbol: GetNumJoystickHats

Description:	This gets the number of hats available on a particular joystick.
	You need to specify a joystick object, which is created with
	OpenJoystick().

Usage: GetNumJoystickHats(js,1)

Example: See joysticktest.pbl in the demo directory

See Also: GetNumJoysticks(), OpenJoystick(), GetNumJoystickAxes() GetNumJoystickBalls(), GetNumJoystickButtons(), Get-NumJoystickHats() GetJoystickAxisState(), GetJoystickHat-State(), GetJoystickButtonState()

Name/Symbol: GetNumJoysticks

Description:	This gets the number of joysticks available on a system. It returns an integer, which if greater than you can open a joystick using the OpenJoystick() function
Usage:	GetNumJoysticks()
Example:	See joysticktest.pbl in the demo directory
See Also:	GetNumJoysticks(), OpenJoystick(), GetNumJoystickAxes() GetNumJoystickBalls(), GetNumJoystickButtons(), Get- NumJoystickHats() GetJoystickAxisState(), GetJoystickHat- State(), GetJoystickButtonState()
Name/Symbol:	GetPEBLVersion()

rume, symbol.	
Description:	Returns a string describing which version of PEBL you are running.
Usage:	GetPEBLVersion()
Example:	Print(GetPEBLVersion())
See Also:	TimeStamp()

Name/Symbol: GetPixelColor()

Description:	Gets a color object specifying the color of a particular pixel on a widget.
Usage:	<pre>color <- GetPixelColor(widget,x,y)</pre>
Example:	<pre>##Judge brightness of a pixel img <- MakeImage("test.png") col <- GetPixelColor(img,20,20) hsv <- RGBtoHSV(col) Print(Third(hsv))</pre>
See Also:	SetPixel()

Name/Symbol: GetPPortState

Description: Gets the parallel port state, as a list of 8 'bits' (1s or 0s).

Usage: out <- SetPPortState(pport)
Example:

See Also: COMPortGetByte, COMPortSendByte, OpenPPort OpenCOMPort, SetPPortMode, GetPPortState

Name/Symbol: GetProperty

Description:	Gets a particular named property of an object. This works
	for custom or built-in objects. If the property does not exist,
	a fatal error will be signaled, and so you should check using
	PropertyExists() if there is any chance the property does not
	exist.

U	sage:	out	<-	GetProperty	(obj	,property)
---	-------	-----	----	-------------	------	------------

Example:	obj <- MakeCustomObject("myobject") obj.taste <- "buttery" obj.texture <- "creamy" SetProperty(obj,"flavor","tasty")
	list <- GetPropertyList(obj) loop(i,list)
	i if(PropertyExists(obj,i) { Print(i + ": " + GetProperty(obj,i))
	} }

See Also: GetPropertyList, PropertyExists, SetProperty MakeCustomObject, PrintProperties

Name/Symbol: GetPropertyList

Description:	Gets a list of all of the properties an object has. This works for custom or built-in objects.
Usage:	<pre>out <- GetPropertyList(obj)</pre>
Example:	obj <- MakeCustomObject("myobject") obj.taste <- "buttery" obj.texture <- "creamy" SetProperty(obj,"flavor","tasty")

```
list <- GetPropertyList(obj)
loop(i,list)
{
    if(PropertyExists(obj,i)
      {
        Print(i + ": " + GetProperty(obj,i))
    }
}</pre>
```

See Also: GetProperty, PropertyExists, SetProperty MakeCustomObject, PrintProperties

```
Name/Symbol: GetSize()
```

Description:	Returns a list of [height, width], specifying the size of the widget. The .width and .height properties can also be used instead of this function
Usage:	GetSize(<widget>)</widget>
Example:	<pre>image <- MakeImage("stim1.bmp") xy <- GetSize(image) x <- Nth(xy, 1) y <- Nth(xy, 2)</pre>

See Also:

Name/Symbol: GetSubNum()

Description:	Creates dialog to ask user to input a subject code
Usage:	GetSubNum(<win>)</win>
Example:	<pre>## Put this at the beginning of an experiment, ## after a window gWin has been defined. ## if(gSubNum == 0) { gSubNum <- GetSubNum(gWin) }</pre>
	Note: gSubNum can also be set from the command line.

See Also:

Name/Symbol:	GetSystemType()		
Description:	Returns a string identify what type of computer system you are using. It will return either: OSX, LINUX, or WINDOWS.		
Usage:	GetSystemType()		
Example:	<pre>## Put this at the beginning of an experiment, ## after a window gWin has been defined. if(GetSystemType() == "WINDOWS") { SignalFatalError("Experiment untested on windows") }</pre>		
See Also:	SystemCall()		
Name/Symbol:	GetText()		
Description:	Returns the text stored in a text object (either a textbox or a label). The .text properties can also be used instead of this function.		
Usage:	GetText(<widget>)</widget>		
Example:			
See Also:	SetCursorPosition(), GetCursorPosition(), SetEditable(), MakeTextBox()		

Name/Symbol: GetTextBoxCursorFromClick()

Description:	Returns the position (in characters) corresponding to a x,y click on a text box. The X,Y position must be relative to the x,y position of the box, not absolute. Once obtained, the cursor position can be set with SetCursorPosition().	
Usage:	GetTextBoxCursorFromClick(<widget>,<x>,<y>)</y></x></widget>	
Example:	<pre>win <- MakeWindow() tb <- EasyTextBox("Click here to set cursor position" ,100,100,win,200,200) Draw() WaitForClickOnTarget([tb],[1]) #get the x and y cursor positions relx <- First(gClick) - (tb.x) </pre>	

	tb.cursorpos <- GetTextBoxCurs	orFromClick(tb,
	Draw() WaitForAnyKeyPress()	<pre>relx,rely))</pre>
See Also:	<pre>SetCursorPosition(), SetEditable(), MakeTextBox()</pre>	<pre>GetCursorPosition(),</pre>

Name/Symbol: GetTime()

Description:	Gets time, in milliseconds, from when PEBL was initialized. Do not use as a seed for the RNG, because it will tend to be about the same on each run. Instead, use RandomizeTimer().	
Usage:	GetTime()	
Example:	a <- GetTime() WaitForKeyDown("A") b <- GetTime() Print("Response time is: " + (b - a))	
See Also:	TimeStamp()	

Name/Symbol: GetVideoModes()

Description:	Gets a list of useable video modes (in width/height pixel pairs), as supplied by the video driver.
Usage:	<pre>modes <- GetVideoModes()</pre>
Example:	<pre>Print(GetVideoModes) ##Might return: [[1440, 900] , [1360, 768] , [1152, 864] , [1024, 768] , [960, 600] , [960, 540] , [840, 525] , [832, 624] , [800, 600] , [800, 512] , [720, 450] , [720, 400] , [700, 525]]</pre>

See Also: GetCurrentScreenResolution, gVideoWidth,gVideoHeight Name/Symbol: GetVocalResponseTime Description: This is a simple audio amplitude voice key controlled by two parameters ONLY AVAILABLE ON WINDOWS AND LINUX. Usage: GetVocalResponseTime(buffer, timethreshold. energythreshold) This is a simple function that fairly reliably gets an audio response time. It works by recording audio to a buffer, and computing energy for 1-ms bins. When enough bins (whose number/duration is set by timethreshold) in a row surpass an energy threshold (scaled from 0 to 1, set by energythreshold), recording will stop, and the voice key will return. Reasonable values depend on the amount of noise in your microphone, and the types of vocal responses being made. The return time will lag the detection time a bit, and so using the time it takes for the function to return is an unreliable measure of vocal response time. It returns a list of three elements: • Response time (in ms), • End time (using ms counter), • Responded flag: either 0 or 1, depending on whether the key was tripped, If the responded flag is 0, the other two numbers will be as well. See number-stroop.pbl in the stroop directory of the test battery and testaudioin.pbl in demo/ for examples. Example: buffer <- MakeAudioInputBuffer(5000)</pre> resp0 <- GetVocalResponseTime(buffer,.35, 200)</pre> SaveAudioToWaveFile("output.wav",buffer) See Also: MakeAudioInputBuffer(), SaveAudioToWaveFile(),

8.9 H

Name/Symbol: Hide()

Description:	Makes an object invisible, so it will not be drawn.	
Usage:	Hide(<object>)</object>	
Example:	<pre>window <- MakeWindow() image1 <- MakeImage("pebl.bmp") image2 <- MakeImage("pebl.bmp") AddObject(image1, window) AddObject(image2, window) Hide(image1) Hide(image2) Draw() # empty screen will be drawn.</pre>	
	Wait(3000) Show(image2) Draw() # image2 will appear. Hide(image2) Draw() # image2 will disappear.	
See Also:	Wait(1000) Show(image1) Draw() # image1 will appear. Show()	

Chapter 8. Detailed Function and Keyword Reference

8.10

Name/Symbol: if

Τ

Description:	Simple conditional test.
Usage:	<pre>if(test) { statements to be executed }</pre>
Example:	

See Also:

Name/Symbol: if...elseif...else

Description: Complex conditional test. Be careful of spacing the else—if you put carriage returns on either side of it, you will get a syntax error. The elseif is optional, but multiple elseif statements can be strung together. The else is also optional, although only one can appear.

Usage:	if(test) {
	statements if true
	<pre>} elseif (newtest) {</pre>
	statements if newtest true; test false
	} else {
	other statements
	}
Example:	if(3 == 1) {
	Print("ONE")
	}elseif(3==4){
	Print("TWO")
	elseif(4==4)
	Print("THREE")
	elseif(4==4)
	Print("FOUR")
	<pre>}else{Print("FIVE")}</pre>
See Also:	if

See Also:

```
Name/Symbol: Insert()
```

Description:	Inserts an element into a list at a specified position, returning the new list. The original list in unchanged.
Usage:	<pre>Insert(<[list]>,<item>,<position>)</position></item></pre>
Example:	x <- [1,2,3,5] y <- Insert(x,1,4) ##y== [1,2,3,1,5]
See Also:	List(), Merge, Append

Name/Symbol: Inside()

Description: Determines whether an [x,y] point is inside another object. Will operate correctly for rectangles, squares, circles, textboxes, images, and labels. For custom objects having a function name bound to their .inside property, it will use that function to test for insideness. [xylist] can be a list containing [x,y], and if it is longer the other points will be ignored (such as the list returned by WaitForMouseButton(). Returns 1 if inside, 0 if not inside. Usage: Inside(<[xylist]>,<object>) Example: button <- EasyLabel("Click me to continue", 100,100,gWin,12) continue <- 1 while(continue)

```
{
    xy <- WaitForMouseButton()
    continue <- Inside(xy,button)
    }
See Also: WaitForMouseButton(), GetMouseCursorPosition, InsideTB</pre>
```

Name/Symbol: InsideTB()

Description: Determines whether an [x,y] point is inside an object having .x, .y, .width, and .height properties, with .x and .y representing the upper left corner of the object. This is bound to the .inside property of many custom ui objects. The Inside function will use the function bound to the .inside property for any custom object having that property, and so this function's use is mainly hidden from users.

Usage:	<pre>InsideTB([x,y],<obj>)</obj></pre>
Example:	pulldown <- MakePulldown(["one","two","three","four"],400-75,300,gWin,12,150,1)
	<pre>if(InsideTB([300,300],pulldown)) { Print("INSIDE") }</pre>
See Also:	<pre>Inside(), MoveObject ClickOn, DrawObject</pre>
Name/Symbol: Description:	IsAnyKeyDown()
Usage:	IsAnyKeyDown()
Example:	
See Also:	
Name/Symbol:	IsAudioOut()
Description:	Tests whether <variant> is a AudioOut stream.</variant>
Usage:	IsAudioOut(<variant>)</variant>
Example:	<pre>if(IsAudioOut(x)) { Play(x) }</pre>
See Also:	<pre>IsColor(), IsImage(), IsInteger(), IsFileStream(), IsFloat(), IsFont(), IsLabel(), IsList(), IsNumber(), IsString(), IsTextBox(), IsWidget()</pre>

Name/Symbol: IsCanvas()

Description: Tests whether <variant> is a Canvas widget.
Usage: IsCanvas(<variant>)
Example: if(IsCanvas(x)
 {
 SetPixel(x,10,10,MakeColor("red"))
 }

See Also: IsAudioOut(), IsImage(), IsInteger(), IsFileStream(), IsFloat(), IsFont(), IsLabel(), IsList(), IsNumber(), IsString(), IsTextBox(), IsText() IsWidget(), IsWindow()

$\mathbf{Name}/\mathbf{Symbol}$:	IsColor()
Description:	Tests whether <variant> is a Color.</variant>
Usage:	IsColor(<variant>)</variant>
Example:	<pre>if(IsColor(x) { gWin <- MakeWindow(x) }</pre>
See Also:	<pre>IsAudioOut(), IsImage(), IsInteger(), IsFileStream(), IsFloat(), IsFont(), IsLabel(), IsList(), IsNumber(), IsString(), IsTextBox(), IsWidget(), IsWindow()</pre>

Name/Symbol: IsCustomObject()

Description:	Tests whether <variant> is a Custom object (created with MakeCustomObject.) Return 1 if so, 0 if not.</variant>
Usage:	IsCustomObject(<obj>)</obj>
Example:	<pre>if(IsCustomObject(obj) { MoveObject(obj,x,y) } else { Move(obj,x,y) }</pre>
See Also:	<pre>IsAudioOut(), IsImage(), IsInteger(), IsFileStream(), IsFloat(), IsFont(), IsLabel(), IsList(), IsNumber(), IsString(), IsTextBox(), IsText() IsWidget(), IsWindow()</pre>

Name/Symbol: IsDirectory()

Description: Determines whether a named path is a directory. Returns 1 if it exists and is a directory, and 0 otherwise.

Usage: IsDirectory(<path>)

Example:	filename <- "data-"+gSubNum+".csv" exists <- FileExists(filename) if(exists) {	
	out <- IsDirectory(filename) Print(out) }	
See Also:	<pre>GetDirectoryListing(), FileExists(), MakeDirectory()</pre>	<pre>IsDirectory(),</pre>

Name/Symbol: IsImage()

Description:	Tests whether <variant> is an Image.</variant>
Usage:	IsImage(<variant>)</variant>
Example:	if(IsImage(x)) { AddObject(gWin, x) }
See Also:	<pre>IsAudioOut(), IsColor(), IsInteger(), IsFileStream(), IsFloat(), IsFont(), IsLabel(), IsList(), IsNumber(), IsString(), IsTextBox(), IsWidget()</pre>

Name/Symbol: IsInteger()

Description: Tests whether <variant> is an integer type. Note: a number represented internally as a floating-point type whose is an integer will return false. Floating-point numbers can be converted to internally- represented integers with the ToInteger() or Round() commands.

Usage: IsInteger(<variant>) Example: x <- 44

y <- 23.5 z <- 6.5 test <- x + y + z
IsInteger(x) # true
IsInteger(y) # false
IsInteger(z) # false
<pre>IsInteger(test) # false</pre>

See Also: IsAudioOut(), IsColor(), IsImage(), IsFileStream(), IsFloat(), IsFont(), IsLabel(), IsList(), IsNumber(), IsString(), IsTextBox(), IsWidget()

Name/Symbol: IsFileStream()

Description:	Tests whether <variant> is a FileStream object.</variant>	
Usage:	IsFileStream(<variant>)</variant>	
Example:	<pre>if(IsFileStream(x)) { Print(FileReadWord(x) }</pre>	
See Also:	<pre>IsAudioOut(), IsColor(), IsImage(), IsInteger(), IsFloat(), IsFont(), IsLabel(), IsList(), IsNumber(), IsString(), IsTextBox(), IsWidget()</pre>	

Name/Symbol: IsFloat()

Description:	Tests whether <variant> is a floating-point value. Note that floating-point can represent integers with great precision, so that a number appearing as an integer can still be a float.</variant>
Usage:	IsFloat(<variant>)</variant>
Example:	x <- 44 y <- 23.5 z <- 6.5 test <- x + y + z
	IsFloat(x) # false IsFloat(y) # true IsFloat(z) # true IsFloat(test) # true
See Also:	<pre>IsAudioOut(), IsColor(), IsImage(), IsInteger(), IsFileStream(), IsFont(), IsLabel(), IsList(), IsNumber(), IsString(), IsTextBox(), IsWidget()</pre>

Name/Symbol: IsFont()

Description: Tests whether <variant> is a Font object.

Chapter 8. Detailed Function and Keyword Reference

Usage:	IsFont(<variant>)</variant>
Example:	if(IsFont(x)) {
	y <- MakeLabel("stimulus", x)
C 41	
5ee Also:	IsAudioUut(), IsColor(), IsImage(), IsInteger(), IsFileStream(), IsFloat(), IsLabel(), IsList(), IsNumber(), IsString(), IsTextBox(), IsWidget()
Name/Symbol:	IsKeyDown()
Description:	
Usage:	
Example:	
See Also:	IsKeyUp()
Name/Symbol:	IsKeyUp()
Description:	
Usage:	
Example:	
See Also:	IsKeyDown()
Name/Symbol:	IsLabel()
Description:	Tests whether <variant> is a text Label object.</variant>
Usage:	IsLabel(<variant>)</variant>
Example:	if(IsLabel(x)
	{ text <- GetText(x) }
See Also:	<pre>IsAudioOut(), IsColor(), IsImage(), IsInteger(), IsFileStream(), IsFloat(), IsFont(), IsList(), IsNumber(), IsString(), IsTextBox(), IsWidget()</pre>

```
Name/Symbol: IsList()
Description:
              Tests whether <variant> is a PEBL list.
Usage:
              IsList(<variant>)
Example:
              if(IsList(x))
              {
               loop(item, x)
               {
                Print(item)
               }
              }
See Also:
              IsAudioOut(),
                               IsColor(),
                                             IsImage(),
                                                          IsInteger(),
              IsFileStream(),
                                  IsFloat(),
                                                IsFont(),
                                                             IsLabel(),
              IsNumber(), IsString(), IsTextBox(), IsWidget()
```

Name/Symbol: IsMember()

Description:	Returns true if <element> is a member of <list>.</list></element>	
Usage:	<pre>IsMember(<element>,<list>)</list></element></pre>	
Example:	<pre>IsMember(2,[1,4,6,7,7,7,7]) # false IsMember(2,[1,4,6,7,2,7,7,7]) # true</pre>	
See Also:		

Name/Symbol: IsNumber()

Description:	Tests whether ${\tt variant\!\!>}$ is a number, either a floating-point or an integer.
Usage:	IsNumber(<variant>)</variant>
Example:	<pre>if(IsNumber(x)) { Print(Sequence(x, x+10, 1)) }</pre>
See Also:	<pre>IsAudioOut(), IsColor(), IsImage(), IsInteger(), IsFileStream(), IsFloat(), IsFont(), IsLabel(), IsList(), IsString(), IsTextBox(), IsWidget()</pre>

Name/Symbol: IsShape

Description:	Tests whether <variant> is a drawable shape, such as a circle, square rectangle, line, bezier curve, or polygon.</variant>
Usage:	IsShape(<variant>)</variant>
Example:	<pre>if(IsShape(x)) { Move(x,300,300) }</pre>
See Also:	<pre>Square(), Circle(), Rectangle(), Line(), Bezier(), Polygon() IsAudioOut(), IsColor(), IsImage(), IsInteger(), IsFileStream(), IsFloat(), IsFont(), IsLabel(), IsList(), IsNumber(), IsString(), IsTextBox(), IsWindow()</pre>

Name/Symbol: IsString()

Description:	Tests whether <variant></variant> is a text string.	
Usage:	IsString(<variant>)</variant>	
Example:	<pre>if(IsString(x)) { tb <- MakeTextBox(x, 100, 100) }</pre>	
See Also:	<pre>IsText() IsAudioOut(), IsColor(), IsImage(), IsInteger(), IsFileStream(), IsFloat(), IsFont(), IsLabel(), IsList(), IsNumber(), IsTextBox(), IsWidget()</pre>	

Name/Symbol: IsText()

Description:	Tests whether ${\tt `variant >}$ is a text string. Same as IsString().
Usage:	IsString(<variant>)</variant>
Example:	<pre>if(IsText(x)) { tb <- MakeTextBox(x, 100, 100) }</pre>

See Also:	<pre>IsString()</pre>	<pre>IsAudioOut(),</pre>	<pre>IsColor(),</pre>	<pre>IsImage(),</pre>
	<pre>IsInteger(),</pre>	<pre>IsFileStream(),</pre>	IsFloat(),	<pre>IsFont(),</pre>
	<pre>IsLabel(), IsI</pre>	List(), IsNumber()	, IsTextBox(),	<pre>IsWidget()</pre>

Name/Symbol: IsTextBox()

Description:	Tests whether <variant> is a TextBox Object</variant>	
Usage:	<pre>IsTextBox(<variant>)</variant></pre>	
Example:	<pre>if(IsTextBox(x)) { Print(GetText(x)) }</pre>	
See Also:	<pre>IsAudioOut(), IsColor(), IsImage(), IsInteger(), IsFileStream(), IsFloat(), IsFont(), IsLabel(), IsList(), IsNumber(), IsString(), IsWidget()</pre>	

Name/Symbol: IsWidget

Description:	Tests whether <variant> is any kind of a widget object (image, label, or textbox).</variant>
Usage:	IsWidget(<variant>)</variant>
Example:	<pre>if(IsWidget(x)) { Move(x, 200,300) }</pre>
See Also:	<pre>IsAudioOut(), IsColor(), IsImage(), IsInteger(), IsFileStream(), IsFloat(), IsFont(), IsLabel(), IsList(), IsNumber(), IsString(), IsTextBox()</pre>

Name/Symbol: IsWindow

```
Description: Tests whether <variant> is a window.
Usage: IsWindow(<variant>)
Example: if(IsWindow(x))
{
    AddObject(y,x)
}
```

See Also: IsAudioOut(), IsColor(), IsImage(), IsInteger(), IsFileStream(), IsFloat(), IsFont(), IsLabel(), IsList(), IsNumber(), IsString(), IsTextBox()

Name/Symbol:	KaniszaSquare
Description:	Creates generic Kanesza Square, one defined only by with "pac- man" circles at its vertices:
Usage:	KaniszaSquare(<size>, <circ-rad>,<fgcol>, <bgcol>) KaniszaSquare creates a graphical object that can be added to a window, moved to the proper location, etc. Parameters specify the size of the square, the size of the vertex circles, and the foreground and background colors.</bgcol></fgcol></circ-rad></size>
Example:	For detailed usage example, see http://peblblog.blogspot.com/2010/11/kanizsa-shapes.html
	gWin <- MakeWindow() square <- KaniszaSquare(150,20,MakeColor("red"), MakeColor("green")) AddObject(square,gWin) Move(square,200,200) Draw() WaitForAnyKeyPress()
See Also:	Polygon(), KaneszaPolygon()

157

8.12 L

Name/Symbol: Last()

Description:	Returns the last item in a list. Provides faster access to the last item of a list than does $Nth()$.
Usage:	Last(<list>)</list>
Example:	Last([1,2,3,444]) # == 444
See Also:	Nth(), First()

Name/Symbol: LatinSquare()

Description:	Quick and dirty latin square, taking on just one list argument.		
Usage:	LatinSquare(<list>)</list>		
Example:	<pre>Print(LatinSquare([11,12,13,14,15,16])) # Output: #[[11, 12, 13, 14, 15, 16] #, [12, 13, 14, 15, 16, 11] #, [13, 14, 15, 16, 11, 12] #, [14, 15, 16, 11, 12, 13] #, [15, 16, 11, 12, 13, 14] #, [16, 11, 12, 13, 14, 15] #]</pre>		
See Also:	DesignFullCounterBalance(), DesignBalancedSampling(), DesignGrecoLatinSquare(), DesignLatinSquare(), Repeat(), RepeatList(), Shuffle()		

Name/Symbol: LaunchFile()

Description:	Launch a specified file or URI with a platform-specific handler.
Usage:	LaunchFile("filename")
Example:	Example uses:

```
#open google:
LaunchFile("http://google.com")
#Open a .pbl file with text editor:
LaunchFile("test.pbl")
#Open a data directory in file manager:
LaunchFile("data\")
```

See Also: SystemCall()

Name/Symbol: LayoutGrid

Description:	Creates a grid of x,y points in a range, that are spaced in a specified number of rows and columns. Furthermore, you can specify whether they are vertical or horizontally laid out.
Usage:	LayoutGrid(<xmin>,<xmax>,<ymin>,<ymax>,<culumns>,<rows>,<vertical>)</vertical></rows></culumns></ymax></ymin></xmax></xmin>
Example:	Example PEBL Program using NonoverlapLayout:
	<pre>define Start(p) { gWin <- MakeWindow() gVideoWidth <- 800 gVideoHeight <- 300 lab1 <- EasyLabel("LayoutGrid, horizontal",</pre>
	<pre>stim1 <- Append(stim1,MakeLabel(i+",font)) }</pre>
	layout1 <- LayoutGrid(50,gVideoWidth/2-50, 50,gVideoHeight-50,5,4,0)
	<pre>layout2 <- LayoutGrid(gVideoWidth/2+50,gVideoWidth-50,</pre>

50,gVideoHeight-50,5,4,1)

```
##Now, layout the stuff.
loop(i,Transpose([stim1,layout1]))
 {
    obj <- First(i)</pre>
    xy <- Second(i)</pre>
    AddObject(obj,gWin)
    Move(obj, First(xy),Second(xy))
 }
loop(i,Transpose([stim2,layout2]))
 {
    obj <- First(i)</pre>
    xy <- Second(i)</pre>
    AddObject(obj,gWin)
    Move(obj, First(xy),Second(xy))
 }
Draw()
WaitForAnyKeyPress()
```

}

The output of the above program is shown below. Even for the left configuration, which is too compact (and which takes a couple seconds to run), the targets are fairly well distributed.

See Also: NonOverlapLayout()

Name/Symbol: Line()

Description:	Creates a line for graphing at x,y ending at $x+dx$, $y+dy$. dx and dy describe the size of the line. Lines must be added to a parent widget before it can be drawn; it may be added to widgets other than a base window. Properties of lines may be accessed and set later.
Usage:	Line(<x>, <y>, <dx>, <dy>, <color>)</color></dy></dx></y></x>
Example:	l <- Line(30,30,20,20, MakeColor("green") AddObject(1, win) Draw()
See Also:	<pre>Square(), Ellipse(), Rectangle(), Circle()</pre>

Name/Symbol: List()

Description:	Creates a list of items. Functional version of [].
Usage:	List(<item1>, <item2>,)</item2></item1>
Example:	List(1,2,3,444) # == [1,2,3,444]
See Also:	[], Merge(), Append()

Name/Symbol: ListBy()

Description:	organizes a list into sublists, based on the elements of a second list. It returns a list of two entities: (1) a condition list, de- scribing what values were aggregated across; (2) the nested list elements. The length of each element should be the same.
	Together with Match and Filter, ListBy is useful for aggregating data across blocks and conditions for immediate feedback.
Usage:	ListBy(<list>, <conds>)</conds></list>
Example:	<pre>a <- Sequence(1,10,1) b <- RepeatList([1,2],5) x <- ListBy(a,b) Print(x)</pre>

```
#[[1, 2],
              # [[1, 3, 5, 7, 9],
                  [2, 4, 6, 8, 10]]
              #
              #]
                  Print(ListBy(b,a))
              #[[1, 2, 3, 4, 5, 6, 7, 8, 9, 10],
              # [[1], [2], [1], [2], [1], [2], [1], [2], [1], [2]]]
See Also:
              List(), [ ], Merge(), Append()
Name/Symbol: ListToString()
Description:
              Converts a list of things to a single string
                ListToString(<list>)
Usage:
Example:
              ListToString([1,2,3,444]) # == "123444"
              ListToString(["a","b","c","d","e"]) # == "abcde"
See Also:
              SubString, StringLength
Name/Symbol: Length()
Description:
              Returns the number of items in a list.
Usage:
              Length(<list>)
Example:
              Length([1,3,55,1515]) # == 4
See Also:
              StringLength()
Name/Symbol: Levels()
Description:
              Returns sorted list of unique elements of a list.
              Levels(<list>)
Usage:
Example:
              Levels([1,3,55,1,5,1,5]) # == [1,3,5,55]
```

Match(), Filter(), Sort()

See Also:

Name/Symbol: LoadAudioFile()

Description:	Loads an audio file supported identical to LoadMovie(), but .mp3, .wav, .aiff, .wma, et.). can then be played using Play tions. Currently, only support	by the ffmpeg library. It is nearly only works for audio files (.ogg, It creates a movie object, which Movie() or StartPlayback() func- ed on Windows and Linux.
	The ffmpeg (http://ffmpeg range of audio formats, includ .aiff, .wma, and others. Curre be playback problems if the a sure to convert your audio to some problems with .flac data	(.org) library supports a wide ling most .wav, .mp3, .ogg, .flac, ntly, there appears to sometimes audio stream is not stereo, so be stereo. Also, there appears to be formats.
	If you have problems with play media file loads with another	back, you should verify that your ffmpeg media player.
Usage:	LoadAudioFile(audiofile)	
Example:	movie <- LoadAudioFile PrintProperties(inst) PlayMovie(inst) PausePlayback(insnt)	("instuctions.mp3")
See Also:	LoadMovie(), PausePlayback()	<pre>PlayMovie(),StartPlayback()</pre>

Name/Symbol: LoadMovie()

Description: Loads a movie file using the ffmpeg library. It creates a movie object, which can then be played using PlayMovie() or Start-Playback() functions. Currently, only supported on Windows and Linux.

The ffmpeg (http://ffmpeg.org) library supports a wide range of video and audio formats, including most .mpg, .avi, .ogg and .mp3 type formats. Audio-only formats should load and play with LoadMovie, but another function, LoadAudioFile(), has been created for these, as they do not need to be added to a window to work.

If you have problems with playback, you should verify that your media file loads with another ffmpeg media player.

For technical reasons, a movie MUST be loaded directly onto a window, and not another widget.

Usage: LoadMovie(movie,window, width, height)

Example:	<pre>movie <- LoadMovie("movie.avi",gWin,6 PrintProperties(movie) Move(movie,20,20) Draw() StartPlayback(movie) Wait(500) #Play 500 ms of the movie. PausePlayback(movie)</pre>	340,480)
See Also:	LoadAudioFile(), PlayMovie(),StartPlayback() PausePlayback	LoadMovie(), K()

Name/Symbol: LoadSound()

Description:	Loads a soundfile from <filename>, returning a variable that can be played using the PlayForeground or PlayBackground functions. LoadSound only loads uncompressed .wav files, but uses a background mixer to play them with fairly low latency. In contrast, LoadAudioFile can load many different multimedia files other than .wav, and uses a different audio playback mech- anism. LoadSound is appropriate for playing stimulus sounds and feedback, whereas LoadAudioFile may be more appropri- ate for instructions and longer feedback that should be encoded efficiently.</filename>		
	When the file gets load a stereo 44100-samplin inal playback rate. W can cause some proble multiple times in an e problems, try convertin if it helps.	led, it gets automaticall g rate audio stream, reg Ze have reports that in ems, especially if a mon experiment. If you exp ng your audio to stereo	y transcoded into ardless of its orig- some cases, this of file gets loaded perience playback 44100 hz and see
Usage:	LoadSound(<filename< td=""><td>e>)</td><td></td></filename<>	e>)	
Example:	woof <- LoadSound("dog.wav") PlayBackground(woof) Wait(200) Stop(woof) PlayForeground(woof)		
See Also:	PlayForeground, LoadMovie	PlayBackground,	LoadAudioFile,

Name/Symbol: Log10()

Description: Log base 10 of <num>.

Chapter 8. Detailed Function and Keyword Reference

Usage:	Log10(<num>)</num>
Example:	
See Also:	Log2(), LogN(), Ln(), Exp()

Name/Symbol: Log2()

Description:	Log base 2 of $<$ num>.
Usage:	Log2(<num>)</num>
Example:	
See Also:	Log(), LogN(), Ln(), Exp()

Name/Symbol: LogN()

Description:	Log base <base/> of <num></num> .
Usage:	LogN(<num>, <base/>)</num>
Example:	LogN(100,10) # == 2 LogN(256,2) # == 8
See Also:	Log(), Log2(), Ln(), Exp()

Name/Symbol: Lowercase()

Description: Changes a string to lowercase. Useful for testing user input against a stored value, to ensure case differences are not detected.

Usage: Lowercase(<string>)

Example: Lowercase("POtaTo") # == "potato"

See Also: Uppercase()

Name/Symbol: Ln()

Description: Natural log of <num>.

Usage: Ln(<num>)

Example:

Name/Symbol: Lookup()

Description:	Returns element in <database> corresponding to element of <keylist> that matches <key>.</key></keylist></database>	
	If no match exists, Match returns an empty list.	
Usage:	Lookup(<key>,<keylist>,<database>)</database></keylist></key>	
Example:	<pre>keys <- [1,2,3,4,5] database <- ["market","home","roast beef",</pre>	
	## Or, do something like this:	
	<pre>data <- [["punky","brewster"], ["arnold","jackson"], ["richie","cunningham"], ["alex","keaton"]]</pre>	
	d2 <- Transpose(data) key <- First(data)	
	Print(Lookup("alex", key, data)) ##Returns ["alex","keaton"]	
See Also:	Match	

Name/Symbol: loop()

Description:	Loops over elements in a list. During each iteration, <counter> is bound to each consecutive member of <list>.</list></counter>
Usage:	<pre>loop(<counter>, <list>) { statements to be executed }</list></counter></pre>

Example:

See Also: while(), { }

8.13 M

Name/Symbol: MakeAttneave()

Description: Makes a random 'Attneave' figure¹. An Attneave figure is a complex polygon that can be used as a stimulus in a number of situations. It returns a sequence of points for use in Polygon().

MakeAttneave uses ConvexHull, InsertAttneavePointRandom() and ValidateAttneaveShape(), found in Graphics.pbl. Override these to change constraints such as minimum/maximum side lengths, angles, complexity, etc.

MakeAttneave uses a sampling-and-rejection scheme to create in-bounds shapes. Thus, if you specify impossible or nearlyimpossible constraints, the time necessary to create shapes may be very long or infinite.

The arguments to MakeAttneave are:

- size: size, in pixels, of a circle from which points are sampled in a uniform distribution.
- numpoints: number of points in the polygon.
- minangle: smallest angle acceptable (in degrees).
- maxangle: largest angle acceptable (in degrees).

Usage:

MakeAttneave(size,numpoints,minangle,maxangle)

¹(Collin, C. A., & Mcmullen, P. A. (2002). Using Matlab to generate families of similar Attneave shapes. Behavior Research Methods Instruments and Computers, 34(1), 55-68.).

Example:	<pre>gWin <- MakeWindow() shape <- MakeAttneave(100,5+RandomDiscrete(5),5,170) pts <- Transpose(shape) poly <- Polygon(200,200,First(pts),Second(pts),</pre>
	WaitForAnyKeyPress()
See Also:	<pre>MakeImage(), Polygon(), Square()</pre>

Name/Symbol: MakeAudioInputBuffer(<time-in-ms>)

Description:	Creates a sound buffer to use for audio recording or voicekey sound input. It is currently very simple, allowing only to set the duration. By default, it record mono at 44100 hz.
Usage:	MakeAudioInputBuffer(<time-in-ms>)</time-in-ms>
	See number-stroop.pbl in the stroop directory of the test battery for examples.
	Note: Version 0.12 seems to have some trouble specifying buffers of different lengths. 5000 seems to work, but others (3500?) may not.
Example:	buffer <- MakeAudioInputBuffer(5000) resp0 <- GetVocalResponseTime(buffer,.35, 200) SaveAudioToWaveFile("output.wav",buffer)
See Also:	<pre>GetVocalResponseTime(), SaveAudioToWaveFile(),</pre>

Name/Symbol: MakeButton()

Description: Creates a button on a window that can be clicked and launches actions. The button is always 20 pixels high (using images in media images), with a rounded grey background. The label text will be shrunk to fit the width, although this should be avoided as it can look strange. A button is a custom object made from images and text. It has a property 'clickon' that is bound to 'PushButton'

	A button will look like this:
	Test entry
	Test message box.
Usage:	<pre>MakeButton(label,x,y,window,width)</pre>
Example:	The following creates a button, waits for you to click on it, and animates a button press
	<pre>done <- MakeButton("QUIT",400,250,gWin,150) resp <- WaitForClickOntarget([done],[1]) CallFunction(done.clickon,[done,gClick])</pre>
See Also:	<pre>PushButton(), MakeCheckBox()</pre>

Name/Symbol: MakeCanvas()

Description:	Makes a canvas object <x> pixels by y pixels, in color <color>.</color></x>
	A canvas is an object the philos by y philos, in color (correct) A canvas is an object that other objects can be attached to, and imprinted upon. When the canvas gets moved, the attached objects move as well. The background of a canvas can be made invisible by using a color with alpha channel == 0. The Setpixel and SetPoint functions let you change individual pixels on a canvas, to enable adding noise, drawing functional images, etc. A canvas gets 'cleared' by calling ResetCanvas(canvas). Any object added to a canvas creates an 'imprint' on the canvas that remains if the object is moved. This allows you to use another image as a paintbrush on the canvas, and lets you to add noise to text. Because a text label gets re-rendered when its drawn, if you want to add pixel noise to a stimulus, you can create a label, add it to a canvas, then add pixel noise to the canvas.

Usage:	MakeCanvas(<x>, <y>, <color>)</color></y></x>
Example:	gWin <- MakeWindow() clear <- MakeColor("white") clear.alpha <- 0 #make a transparent canvas:

```
x <- MakeCanvas(300,300,clear)</pre>
                 AddObject(x,gWin)
                 Move(x, 300, 300)
                 img <- MakeImage("pebl.png")</pre>
                 AddObject(img,x)
                 Move(img, 100, 100)
                 Draw(x)
                                   #imprint the image on the canvas
                 Move(img,100,200)
                 Draw(x)
                                   #imprint the image on the canvas
                Hide(img)
                 #draw a line on the canvas
                  i <- 10
                 red <- MakeColor("red")</pre>
                 while(i < 200)
                  {
                    SetPixel(x,20,i,red)
                    i <- i + 1
                  }
                 Draw()
                WaitForAnyKeyPress()
See Also:
              MakeImage(), SetPixel(), MakeGabor(), ResetCanvas()
```

Name/Symbol: MakeCheckbox()

Description: Creates a checkbox on a window that can be clicked and keeps track of its status. The checkbox uses a MakeButton object as its base. The checkbox button is always 20 pixels high (using images in media images), with a rounded grey background. The label text will be shrunk to fit the width, although this should be avoided as it can look strange. It has a property 'clickon' that is bound to ClickCheckBox, which flips its state and updates the graphics. It has a property state which is either 0 or 1, depending on the state of the checkbox. Its initial state is 0. Its state can be set using the SetCheckBox() function.

A checkbox will look like this:

Usage: MakeCheckBox(label,x,y,window,width)

Example:	The following creates a button, waits for you to click on it, and animates a button press
	ok <- MakeCheckbox("OK?",400,250,gWin,150) resp <- WaitForClickOnTarget([ok],[1]) CallFunction(done.clickon,[done,gClick]) Draw()
	Alternately:
	ok <- MakeCheckbox("OK?",400,250,gWin,150) resp <- WaitForClickOnTarget([ok],[1]) ClickCheckBox(done,gClick) Draw()
	Examples of its use can be found in demo ui.pbl
See Also:	ClickCheckBox(), SetCheckBox()

Name/Symbol: MakeColor()

Makes a color from <colorname> such as "red", "green", and nearly 800 others. Color names and corresponding RGB values can be found in doc/colors.txt.</colorname>
MakeColor(<colorname>)</colorname>
green <- MakeColor("green") black <- MakeColor("black")
MakeColorRGB(), RGBtoHSV()

Name/Symbol:	MakeColorRGB()
Description:	Makes an RGB color by specifying <red>, <green>, and <blue> values (between 0 and 255).</blue></green></red>
Usage:	MakeColorRGB(<red>, <green>, <blue>)</blue></green></red>
Example:	
See Also:	<pre>MakeColor(), RGBtoHSV()</pre>

Name/Symbol: MakeCustomObject

Description:	Creates a 'custom' object that can encapsulate multiple prop- erties. It takes a name as an argument, but this is currently not accessible.
Usage:	obj <- MakeCustomObject("mybutton")
Example:	<pre>obj <- MakeCustomObject("myobject") obj.taste <- "buttery" obj.texture <- "creamy" SetProperty(obj,"flavor","tasty") list <- GetPropertyList(obj) loop(i,list) { if(PropertyExists(obj,i) { Print(i + ": " + GetProperty(obj,i))</pre>
See Also:	} } GetPropertyList, PropertyExists, SetProperty IsCustomObject, PrintProperties,GetProperty
Name/Symbol:	MakeDirectory()
Description:	Creates a directory with a particular name. It will have no effect of the directory already exists.
Usage:	<pre>FileExists(<path>)</path></pre>
Example:	<pre>#create data subdirectory + subject-specific directory MakeDirectory("data") MakeDirectory("data/"+gsubnum) filename <- "data/"+gsubnum+"/output.csv"</pre>
See Also:	<pre>GetDirectoryListing(), FileExists(), IsDirectory(), MakeDirectory()</pre>

Name/Symbol: MakeFont()

Description:	Makes a font. The first argument must be a text name of a font. The font can reside anywhere in PEBL's search path, which would primarily include the media/fonts directory, and the working directory (where the script is saved).
	style changes from normal to bold/underline, italic.fgcolor and bgcolor need to be colors, not just names of colors
	• if show-backing is 0, the font gets rendered with an invisible
	• background; otherwise with a bgcolor background. (Note: previous to PEBL 0.11, the final argument = 0 rendered the font with non anti-aliased background, which I can see almost no use for.)
Usage:	<pre>MakeFont(<ttf_filename>, <style></style></ttf_filename></pre>

Name/Symbol: MakeGabor()

Description: Creates a greyscale gabor patch, with seven variables:

- size (in pixels) of square the patch is drawn on
- freq: frequency of grating (number of wavelengths in size)
- sd: standard deviation, in pixels, of gaussian window
- angle: angle of rotation of grating, in radians
- phase: phase offset of grating (in radians)
- bglev: number between 0 and 255 indicating background color in greyscale.

Usage: Example:	<pre>MakeGabor(<size>,<freq>,<sd>, <angle>,<phase>,<bglev>) MakeGabor creates a canvas that can be used like any image. It must be added to the window, placed, and drawn to appear. Typically, it can take several seconds to create a patch of any large size, so it is usually best to create the gabor patches when the test is initiatialized, or save and load images using WritePNG(). Typically, a sd roughly 1/4 to 1/10 the size of size is necessary to avoid vignetting. win <- MakeWindow() patch <- MakeGabor(80, 0,10,0,0,100) AddObject(patch win)</bglev></phase></angle></sd></freq></size></pre>		
	Move(patch,200,200) Draw()		
See Also:	<pre>MakeAttneave(), SetPixel()>, MakeCanvas()</pre>		
Name/Symbol:	MakeImage()		
Description:	Makes an image widget from an image filebmp formats should be supported; others may be as well.		
Usage:	MakeImage(<filename>)</filename>		
Example:			
See Also:			
Name/Symbol:	MakeLabel()		
Description:	Makes a text label for display on-screen. Text will be on a single line, and the Move() command centers <text> on the specified point.</text>		
Usage:	MakeLabel(<text>,)</text>		
Example:			
See Also:			

Name/Symbol: MakeMenu()

	Chapter 8 . Detailed Function and Keyword Reference
Description:	Creates a menu containing multiple automatically call functions specified Edit Options Preferences The numbe Options Settings R Parameters
Usage:	MakeMenu(label,x,y,window,fontsize, width, subitems,functions) The subitems list should include the names of the menu options. The functions list should be the same length, and contain the
	function names called when one of those items is used. Make- Menu uses MakeMenuItem to create each on of those items. Menus can only be nested one-deep (no submenus allowed).
Example:	This creates a menu and awaits clicking on. More complete examples are available in ui.pbl. It requires that MyMessage is created somewhere
	<pre>menu1 <- MakeMenu("File",0,0,gWin,14,10,</pre>
	<pre>menu2<- MakeMenu("Edit",70,0,gWin,14,10, ["Cut","Copy","Paste","Select"], ["MYMESSAGE","MYMESSAGE","MYMESSAGE","MYMESSAGE"])</pre>
	<pre>menu <- [menu1,menu2] opt <- WaitForClickOntarget(menu,[1,2]) ClickOnMenu(Nth(menu,opt),gClick)</pre>
See Also:	<pre>MakeMenuItem(), OpenSubMenus(), ClickOnMenu</pre>

J.D.f CL .: чи

Name/Symbol: MakeMenuItem()

Creates a single menu containing a label, whose .clickon prop-Description: erty is bound to some other function.

Usage:	MakeMenuItem(label,x,y,window,fontsize, width, function)
	This function is typically not used directly, but rather it is called via MakeMenu. However, it can be used as a quick-and-dirty button.
Example:	This creates a menu and awaits clicking on. More complete examples are available in ui.pbl. It requires that MyMessage is created somewhere
	<pre>menu1 <- MakeMenuItem("File",0,0,gWin,14,10,"MYMESSAGE")</pre>
	<pre>menu2<- MakeMenu("Edit",70,0,gWin,14,10, "MYMESSAGE")</pre>
	<pre>menus <- [menu1,menu2] opt <- WaitForClickOntarget(menu,[1,2]) ClickOnMenu(Nth(menus,opt),gClick)</pre>
See Also:	MakeMenu(), OpenSubMenus(), ClickOnMenu
Name/Symbol:	MakeNGonPoints()
Description:	Creates a set of points that form a regular n-gon. It can be transformed with functions like RotatePoints, or it can be used to create a graphical object with Polygon.
	Note: MakeNGonPoints returns a list like:
	[[x1, x2, x3,],[y1,y2,y3,]],
	while Polygon() takes the X and Y lists independently.
Usage:	MakeNGonPoints(<radius>, <num_peaks>)</num_peaks></radius>
Example:	<pre>window <- MakeWindow() ngonp <- MakeNGonPoints(50,10) ngon <- Polygon(200,200,First(ngonp),Nth(ngonp,2),</pre>
See Also:	MakeStarPoints, Polygon, RotatePoints, ZoomPoints

Name/Symbol: MakePulldown()

Description: Creates a pulldown list that can be used to select an option. The closed version is s always 20 pixels high. When opened, it will be by default 15 rows high, although this is made smaller if the pulldown is close to the bottom of the screen. A button is a custom object made from images and text. It has a property 'clickon' that is bound to 'Pulldown'

A closed pulldown will look like this:

20	
----	--

An open pulldown will look like this:

Usage:

MakePulldown(options,x,y,window,fontsize,width,selected)

The options argument is a list of options you want to appear. x and y are the coordinates of the upper left corner, window is the name of the window (or other graphical object) it appears on, fontsize is the size of the font, and width is the width of the pulldown in pixels. The selected argument is the initial selected list item.

Pulldown objects have a property .maxitems, that specify how many elements are displayed. If the list contains more than obj.maxitems, the pulldown will enable scrolling. A pulldown's click-on handler is by default bound to the 'Pulldown' function. When PullDown(obj,mousexy) is called, it will pop open the pulldown, allow for a new option to be selected, and return. It returns the index of the selected object, but the selected index can also be accessed using obj.selected. Example: See ui.pbl in the demo directory for examples of the use of pulldowns. Pulldowns are also used within the PEBL launcher for various purposes. A basic example is: options <- MakePulldownButton(["A",B","C"], 400,250,gWin,14,100,1) resp <- WaitForClickOntarget([options],[1]) CallFunction(options.clickon,[options,gClick])
See Also: PullDown(), DrawPulldown(), UpdatePulldown

Name/Symbol: MakeScrollBox()

Description: Creates a graphical object that displays and allows selection of a list of items, and scrolls if the text gets too big.

It has a property 'clickon' that is bound to 'ClickOnScrollBox'

A Scrolling textbox looks like this:

	The	num	bers	
1				ĥ
2				18
3				
4				
5				
6				
7				
1	3			
1	4			
1	5			
1	5			
1	7			
1	8			
1	9			
2	8			
2	9			
3	0			
3	1			1¥

Usage:

The list argument is a text block you want to display. header is a label. x and y are the coordinates of the upper left corner, window is the name of the window (or other graphical object) it appears on, fontsize is the size of the font, and width and height is the size of the scrollbox in pixels. selected indicates which option is selected, and this selection (accessed via .selected) is updated by users using ClickOnScrollBox, which is bound to the .clickon property. Several related function help update and draw a scrollbox. To

change the list or selected item, set the .list property to a new list or .selected to new selection and then call UpdateScrollBox. The function DrawScrollbox to manage redrawing drawing, and ClickOnScrollBox to handle interaction (this is bound to the .clickon property). .inside is bound to InsideTB A summary of important properties:

- selected: which item is selected
- numitems: How many items on the list
- maxoffset: The most lines that can be displayed
- list: the list of options
- inside: bound to InsideTB
- clickon: bound to ClickOnScrollBox
- Example: See ui.pbl in the demo directory for examples of the use of a scrolling text box

sb <- MakeScrollBox(Sequence(1,50,1),"The numbers",40,40,gWin,12,150,50

```
Draw()
resp <- WaitForClickOntarget([sb],[1])
CallFunction(sb.clickon,[sb,gClick])
#Alternately: ClickOnScrollbox(sb,gClick)</pre>
```

See Also: SetScrollingText MakeScrollingTextBox UpdateScrollBox DrawScrollBox ClickOnScrollBox

Name/Symbol: MakeScrollingTextBox()

Description: Creates a graphical object that displays a block of text, and scrolls if the text gets too big. It uses a Scrollbox as its base, but handles parsing the text into lines and hides the selection box. Thus, no 'selection' is displayed (although it actually exists), and a .text property is added to hold the text being displayed. It has a property 'clickon' that is bound to 'ClickOnScrollBox' A Scrolling textbox looks like this:

Usage:

The text argument is a text block you want to display. x and y are the coordinates of the upper left corner, window is the name of the window (or other graphical object) it appears on, fontsize is the size of the font, and width and height is the size of the scrolling textbox in pixels. linewrap, if non-zero, will parse the text layout so you see everything, breaking when the text gets to the end of the box, and on linebreaks. if 0, it will only break at explicit carriage returns.

Note that parsing text into the scrolling textbox is fairly fast, but you may need workarounds for to display extremely long files if you want high responsiveness.

Several related function help update and draw a scrolling textbox. To change the text, use SetScrollingText. Because a scrolling textbox is really just a scrollbox, you also use DrawScrollbox to manage drawing, and ClickOnScrollBox to handle interaction (this is bound to the .clickon property). .inside is bound to InsideTB

Example: See ui.pbl in the demo directory for examples of the use of a scrolling text box

```
SetScrollingText(textscroll,FileReadText("Uppercase.txt"))
Draw()
resp <- WaitForClickOntarget([textscroll],[1])
CallFunction(textscroll.clickon,[textscroll,gClick])</pre>
```

Chapter 8. Detailed Function and Keyword Reference			
See Also:	SetScrollingText MakeScrollBox UpdateScrollBox DrawScrollBox ClickOnScrollBox		
Name/Symbol:	MakeSineWave()		
Description:	Creates a sine wave that can be played using the Play() or Play-Background() functions. It will create a single-channel sound at 44100 bitrate, 16 bit precision.		
Usage:	<pre>MakeSineWave(<duration_in_ms>, <hz>, <amplitude>)</amplitude></hz></duration_in_ms></pre>		
	• The first argument specifies how long (in ms) the tone should be.		
	• The second argument specifies the frequency. Good values range between 100 and 2000.		
	• The third argument specifies the volume. It should be less than 1.0.		
Example:	##Make a sound that is 1000 ms, but just play 300 ms sound <- MakeSineWave(200, 220, 1000) PlayBackground(sound) Wait(300) Stop(sound)		
See Also:	<pre>PlayForeground(), PlayBackGround(), Stop()</pre>		
Name/Symbol:	MakeStarPoints()		
Description:	Creates a set of points that form a regular star. It can be transformed with functions like RotatePoints, or it can be used to create a graphical object with Polygon.		
	Note: MakeStarPoints returns a list:		
	[[x1, x2, x3,],[y1,y2,y3,]],		
	while Polygon() takes the X and Y lists independently.		
Usage:	<pre>MakeStarPoints(<outer_radius>, <inner_radius>,</inner_radius></outer_radius></pre>		

Example:	window <- MakeWindow() sp <- MakeStarPoints(50,20,10)
	<pre>star <- Polygon(200,200,First(sp),Nth(sp,2),</pre>
	AddObject(star,window) Draw()
See Also:	MakeNGonPoints, Polygon, RotatePoints, ZoomPoints

Name/Symbol: MakeTextBox()

$\mathbf{Description}:$	Creates a textbox in which to display text. Textboxes allow multiple lines of text to be rendered; automatically breaking the text into lines.
Usage:	MakeWindow(<text>,,<width>,<height>)</height></width></text>
Example:	<pre>font <-MakeFont("Vera.ttf", 1, 12, MakeColor("red"), MakeColor("green"), 1) tb <- MakeTextBox("This is the text in the textbox", font, 100, 250)</pre>
See Also:	<pre>MakeLabel(), GetText(), SetText(), SetCursorPosition(), GetCursorPosition(), SetEditable()</pre>

Name/Symbol: MakeWindow()

Description:	Creates a window to display things in. Background is specified by <color>.</color>
Usage:	MakeWindow(<color>)</color>
Example:	win <- MakeWindow() gWin <- MakeWindow("white")

See Also:

Name/Symbol: MakeTextList()

Description: This takes a list and creates a block of text with carriage returns, ensuring each item of the list is on its own line; it also requires an offset, skipping the first lines of the list. It is mostly a helper function used by Scrollbox objects to help format. It will make text out of the entire list, so you should be sure to cut off the end for efficiency if you only want to display some of the lines.

	Chapter 8. Detailed Function and Keyword Reference
TT	
Usage:	MakelextList([<list>], <list-offset>,<preduiter>)</preduiter></list-offset></list>
Example:	letters <- FileReadList("Uppercase.txt") out <- MakeTextList(letters,20,"")
	The above code will create the following:
	u
	V
	W
	x
	y
	Z
See Also:	ListToString

Name/Symbol: Match()

Description:	Returns a list of $0/1$, indicating which elements of <list> match <target></target></list>	
Usage:	Match(<list>,target)</list>	
Example:	<pre>x <- [1,2,3,3,2,2,1] Print(Match(x,1)) ##== [1,0,0,0,0,0,0,1] Print(Match(x,2)) ##== [0,1,0,0,1,1,0] Print(Match(x,3) ##== [0,0,1,1,0,0,0]</pre>	
See Also:	<pre>Filter(), Subset(), Lookup()</pre>	

Name/Symbol: Max()

Description:	Returns the largest of <list>.</list>
Usage:	Max(<list>)</list>
Example:	c <- [3,4,5,6] m <- Max(c) # m == 6
See Also:	<pre>Min(), Mean(), StDev()</pre>

Name/Symbol: MD5Sum()

Description: Computes MD5 sum of a text string. Returns blank if no string provided<list>.

Usage:	MD5Sum(<text>)</text>
Example:	<pre>Print(MD5Sum("")) #Return: d41d8cd98f00b204e9800998ecf8427e Print(MD5Sum("bananana")) #returns bb8e9af523e4aeffa88f1807fb2af9ce</pre>
	<pre>text <- FileReadText("test.pbl") Print(MD5Sum(text)) #returns: 3396a651bd3c96f9799ce02eecb48801; see similar example next</pre>
	Print(MD5File("test.pbl")) # returns 3396a651bd3c96f9799ce02eecb48801
	Print(MD5File("doesnotexist.txt")) #returns 0
See Also:	MD5File()
Name/Symbol:	MD5File()
Description:	Computes MD5 sum of a file. Returns blank if no string provided <list>.</list>
Usage:	MD5File(<filename>)</filename>
Example:	<pre>text <- FileReadText("test.pbl") Print(MD5Sum(text)) #returns: 3396a651bd3c96f9799ce02eecb48801; see similar example next</pre>
	Print(MD5File("test.pbl")) # returns 3396a651bd3c96f9799ce02eecb48801
	Print(MD5File("doesnotexist.txt")) #returns 0
	<pre>Print(MD5Sum("")) #Return: d41d8cd98f00b204e9800998ecf8427e Print(MD5Sum("bananana")) #returns bb8e9af523e4aeffa88f1807fb2af9ce</pre>
See Also:	MD5Sum()

Name/Symbol: Mean()

Description:	Returns the mean of the numbers in <list>.</list>
Usage:	Mean(<list-of-numbers>)</list-of-numbers>
Example:	c <- [3,4,5,6] m <- Mean(c) # m == 4.5
See Also:	<pre>Median(), Quantile(), StDev(), Min(), Max()</pre>

Name/Symbol: Median()

Description:	Returns the median of the numbers in <list>.</list>
Usage:	Median(<list-of-numbers>)</list-of-numbers>
Example:	c <- [3,4,5,6,7] m <- Median(c) # m == 5
See Also:	<pre>Mean(), Quantile(), StDev(), Min(), Max()</pre>

Name/Symbol: Merge()

Description:	Combines two lists, <lista> and <listb>, into a single list.</listb></lista>
Usage:	Merge(<lista>,<listb>)</listb></lista>
Example:	Merge([1,2,3],[8,9]) # == [1,2,3,8,9]
See Also:	[], Append(), List()

Name/Symbol: MessageBox()

Description:	Hides what is on the screen and presents a textbox with speci- fied message, with a button to click at the bottom to continue.
Usage:	MessageBox(<message>,<window>)</window></message>
Example:	gWin <- MakeWindow() MessageBox("Click below to begin.",gWin)
See Also:	GetEasyInput, EasyTextBox

Name/Symbol: Min()

Description: Returns the 'smallest' element of a list. Usage: Min(<list>) Example: c <- [3,4,5,6] m <- Min(c) # == 3 See Also: Max()

Name/Symbol: Mod()

Description:	Returns <num>, <mod>, or remainder of <num>/<mod></mod></num></mod></num>
Usage:	Mod(<num> <mod>)</mod></num>
Example:	Mod(34, 10) # == 4 Mod(3, 10) # == 3
See Also:	Div()

Name/Symbol: Move()

Description:	Moves an object to a specified location. Images and Labels are moved according to their center; TextBoxes are moved accord- ing to their upper left corner.
Usage:	Move(<object>, <x>, <y>)</y></x></object>
Example:	Move(label, 33, 100)
See Also:	MoveCorner(), MoveCenter(), .X and .Y properties.

Name/Symbol: MoveCenter()

Description:	Moves a TextBox to a specified location according to its center, instead of its upper left corner.
Usage:	MoveCenter(<object>, <x>, <y>)</y></x></object>
Example:	MoveCenter(TextBox, 33, 100)
See Also:	Move(), MoveCenter(), .X and .Y properties

Name/Symbol:	MoveCorner()
--------------	--------------

Description:	Moves a label or image to a specified location according to its upper left corner, instead of its center.
Usage:	MoveCorner(<object>, <x>, <y>)</y></x></object>
Example:	MoveCorner(label, 33, 100)
See Also:	Move(), MoveCenter(), .X and .Y properties

Name/Symbol: MoveObject()

Description:	Calls the function named by the .move property of a custom object. Useful if a custom object has complex parts that need to be moved; you can bind .move to a custom move function and then call it (and anything else) using MoveObject. MoveObject will fall back on a normal move, so you can handle movement
Usage	of many built-in objects with it
Example:	

##This overrides buttons placement at the center: done <- MakeButton("QUIT",400,250,gWin,150) done.move <- "MoveCorner" MoveObject(done, 100,100)

See Also: Inside(), Move ClickOn, DrawObject

8.14

 \mathbf{N}

Name/Symbol: NonOverlapLayout

Description: Creates a set of num points in a xy range, that have a (soft) minimum tolerance of 'tol' between points. That is, to the extent possible, the returned points will have a minumum distance between them of <tol>. This may not be possible or be very difficult, and so after a limited number of attempts (by default, 100), the algorithm will return the current configuration, which may have some violations of the minimum tolerance rule, but it will usually be fairly good.

> The algorithm works by initializing with a random set of points, then computing a pairwise distance matrix between all points, finding the closest two points, and resampling one of them until its minumum distance is larger than the current. Thus, each internal iteration uniformly improves (or keeps the configuration the same), and the worst points are reconfigured first, so that even if a configuration that does not satisfy the constraints, it will usually be very close.

> Internally, the function (located in pebl-lib/Graphics.pbl) has a variable that controls how many steps are taken, called "limit", which is set to 100. For very compacted or very large iterations, this limit can be increased by editing the file or making a copy of the function.

The function usually returns fairly quickly, so it can often be used real-time between trials. However, for complex enough configurations, it can take on the order of seconds; furthermore, more complex configurations might take longer than less complex configurations, which could represent a potential confound (if more complex stimuli have longer ISIs). Users should thus consider creating the configurations when the test is initialized, or created prior to the study and then saved out to a file for later use.

```
Usage:
              NonOverlapLayout(<xmin>,<xmax>,<ymin>,<ymax>,<tol>,<num>)
Example:
              Example PEBL Program using NonoverlapLayout:
              define Start(p)
               {
                 win <- MakeWindow()</pre>
                 ## Make 25 points in a square in the middle
                 ## of the screen, a minimum of 50 pixels apart.
                 ## This is too compact, but it will be OK.
                 points <- NonOverlapLayout(100,300,200,400,50,25)</pre>
                 circs <- []
                 ##This should non-overlapping circles of radius 25
                 loop(i,points)
                  {
                      tmp <- Circle(First(i),Second(i),25,</pre>
                                     MakeColor("blue"),0)
                      AddObject(tmp,win)
                      circs <- Append(circs,tmp)</pre>
                  }
                 rect1 <- Square(200,300,200,MakeColor("black"),0)</pre>
                 rect2 <- Square(600,300,200,MakeColor("black"),0)</pre>
                 AddObject(rect1,win)
                 AddObject(rect2,win)
                 ##Reduce the tolerance: this one should be bettter
                 points <- NonOverlapLayout(500,700,200,400,50,15)</pre>
                 ##This should non-overlapping circles of radius 15
                 loop(i,points)
                  {
                      tmp <- Circle(First(i),Second(i),</pre>
                                     15,MakeColor("blue"),0)
                      AddObject(tmp,win)
                 circs <- Append(circs,tmp)</pre>
                  }
                 Draw()
                 WaitForAnyKeyPress()
              }
```

The output of the above program is shown below. Even for the left configuration, which is too compact (and which takes a couple seconds to run), the targets are fairly well distributed.

See Also: LayoutGrid()

Name/Symbol: not

Description:	Logical not
Usage:	
Example:	

See Also: and, or

Name/Symbol: NormalDensity()

Description: Computes density of normal standard distribution

Usage: NormalDensity(<x>)

Example:

 Print(NormalDensity(-100))
 # 1.8391e-2171

 Print(NormalDensity(-2.32635))
 #5.97

 Print(NormalDensity(0))
 #0.398942

Print(NormalDensity(1.28155)) #.90687
Print(NormalDensity(1000)) #inf

See Also: RandomNormal(), CumNormInv()

Name/Symbol: Nth()

Description: Extracts the Nth item from a list. Indexes from 1 upwards. Last() provides faster access than Nth() to the end of a list, which must walk along the list to the desired position.Usage: Nth(<list>, <index>) Example: a <- ["a","b","c","d"] Print(Nth(a,3)) # == 'c'

See Also: First(), Last()

Name/Symbol: NthRoot()

Description: <num> to the power of 1/<root>. Usage: NthRoot(<num>, <root>) Example: See Also:

8.15

0

Name/Symbol: OpenCOMPort Description: This opens a COM/Serial port Usage: OpenCOMPort(<portnum>,<baud>) Example: See Also: COMPortGetByte, COMPortSendByte, OpenPPort, SetPPortMode, GetPPortMode

Name/Symbol: OpenJoystick

Description:	This opens an available joystick, as specified by its index. The returned object can then be used in to access the state of the joystick. It takes an integer argument, and for the most part, if you have a single joystick attached to your system, you will use OpenJoystick(1). If you want to use a second joystick, use OpenJoystick(2), and so on.
Usage:	OpenJoystick()
Example:	See joysticktest.pbl in the demo directory
See Also:	GetNumJoysticks(), OpenJoystick(), GetNumJoystickAxes() GetNumJoystickBalls() GetNumJoystickButtons() Get-

GetNumJoystickBalls(), GetNumJoystickButtons(), GetJoystickHats() NumJoystickHats() GetJoystickAxisState(), GetJoystickHat-State(), GetJoystickButtonState()

Name/Symbol: OpenNetworkListener()

Description: Creates a network object that listens on a particular port, and is able to accept incoming connections. You can the nuse CheckForNetworkConnections to accept incoming connections. This is an alternative to the WaitForNetworkConnection function that allows more flexibility (and allows updating the during waiting for the connection).

Usage: net <- OpennetworkListener(port)

Example:	<pre>network <- OpenNetworkListener(4444) time <- GetTime() while(not connected and (GetTime() < time + 5000)) { connected <- CheckForNetwokConnection(network) }</pre>
See Also:	CheckForNetworkConnection(), Getdata(), WaitForNetworkConnection(), CloseNetwork()
Name/Symbol:	OpenSubMenus()
Description:	Used by ClickOnMenu to open, display a submenu and get a click.
Usage:	OpenSubMenus(obj,[x,y])
	THis function is bound to the .clickon property of a menu. It will open and display all the submenus, wait for a click, and execute the function called.
Example:	This creates a menu and awaits clicking on. More complete examples are available in ui.pbl. It requires that MyMessage is created somewhere
	<pre>menu1 <- MakeMenuItem("File",0,0,gWin,14,10,"MYMESSAGE")</pre>
	<pre>menu2<- MakeMenu("Edit",70,0,gWin,14,10, "MYMESSAGE")</pre>
	menus <- [menu1,menu2] opt <- WaitForClickOntarget(menu,[1,2]) ClickOnMenu(Nth(menus,opt),gClick)
See Also:	MakeMenu(), OpenSubMenus(), MakeMenuItem

Name/Symbol: or

Description: Logical or

Usage:

Example:

See Also: and, not Name/Symbol: OpenPPort Description: Opens a Parallel port, returning an object that can be used for parallel port communications. **OpenPPort(<name>)** The <name> argument can be one of: Usage: "LPT1", "LPT2", and "LPTX". Most likely, a parallel port will be configured to LPT1, but other configurations are sometimes possible. Example: See Also: COMPortGetByte, COMPortSendByte, OpenCOMPort, SetPPortMode, GetPPortMode Name/Symbol: Order() Description: Returns a list of indices describing the order of values by position, from min to max. Usage: Order(<list-of-numbers>) n <- [33,12,1,5,9] Example: o <- Order(n)</pre> Print(o) #should print [3,4,5,2,1] See Also: Rank()

Name/Symbol:	PausePlayback()	
Description:	Pauses a playing movie or audio stream. This is used for movies whose playback was initiated using StartPlayback, which then ran as background threads during a Wait() function.	
Usage:	PausePlayBack(movie)	
Example:	<pre>movie <- LoadMovie("movie.avi",gWin,640,480) PrintProperties(movie) Move(movie,20,20) Draw() StartPlayback(movie) Wait(500) #Play 500 ms of the movie. PausePlayback(movie) Wait(500)</pre>	
See Also:	LoadAudioFile(), LoadMovie(), PlayMovie(), StartPlayback()	
Name/Symbol:	PlayForeground()	
Description:	Plays the sound 'in the foreground'; does not return until the sound is complete.	
Usage:	PlayForeground(<sound>)</sound>	
Example:	sound <- MakeSineWave(200, 220, 1000) PlayForeground(sound)	
See Also:	PlayBackground(), Stop()	

Name/Symbol: PlayBackground()

Description:	Plays the sound 'in the background', returning immediately.
Usage:	PlayBackground(<sound>)</sound>
Example:	sound <- MakeSineWave(200, 220, 1000) PlayBackground(sound) Wait(300) Stop(sound)

See Also: PlayForeground(), Stop()

Name/Symbol: PlayMovie()

Description:	Plays the movie (or other multimedia file) loaded via either the
	LoadMovie or LoadAudioFile function. Note that this function-
	ality uses a different underlying system than the sound playing
	functions PlayBackground and PlayForeground, and they are
	not interchangeable.

Usage:	PlayMovie(movie)		
Example:	movie <- LoadMo PrintProperties Move(movie,20,20 movie.volume <- status <- EasyLa Draw() PlayMovie(movie)	vie("movie.avi",; (movie))) .1 abel("Demo Movie)	gWin,640,480) Player",300,25,gWin,22)
See Also:	LoadAudioFile(), PausePlayback()	LoadMovie(),	<pre>StartPlayback(),</pre>

Name/Symbol: Plus

Description:	Creates a polygon in the shape of a plus sign. Arguments in- clude position in window.
	• <x> and <y> is the position of the center</y></x>
	• <size> or the size of the plus sign in pixels</size>
	• <width> thickness of the plus</width>
	• <color> is a color object (not just the name)</color>
	Like other drawn objects, the plus must then be added to the window to appear.
Usage:	<pre>Plus(x,y,size,width,color)</pre>
Example:	win <- MakeWindow() p1 <- Plus(100,100,80,15,MakeColor("red")) AddObject(p1,win) Draw()
See Also:	<pre>BlockE(), Polygon(), MakeStarPoints(), MakeNGonPoints()</pre>

Name/Symbol: Polygon

Description:	Creates a polygon in the shape of the points specified by <xpoints>, <ypoints>. The lists <xpoints> and <ypoints> are adjusted by <x> and <y>, so they should be relative to 0, not the location you want the points to be at.</y></x></ypoints></xpoints></ypoints></xpoints>
	Like other drawn objects, the polygon must then be added to the window to appear.
Usage:	<pre>Polygon(<x>,<y>,<xpoints>,<ypoints>, <color>,<filled>)</filled></color></ypoints></xpoints></y></x></pre>
Example:	<pre>win <- MakeWindow() #This makes a T xpoints <- [-10,10,10,20,20,-20,-20,-10] ypoints <- [-20,-20,40,40,50,50,40,40] p1 <- Polygon(100,100,xpoints, ypoints,</pre>
See Also:	<pre>BlockE(), Bezier(), MakeStarPoints(), MakeNGonPoints()</pre>
Name/Symbol:	PopUpEntryBox()
Description:	Creates a small text-entry box at a specified location
Usage:	<pre>PopuUpEntryBox(<text>,<win>,[x,y])</win></text></pre>
Example:	<pre>subnum <- PopUpEntryBox("Enter particpant code",gWin,[100,100])</pre>
See Also:	MessageBox GetEasyInput, PopUpMessageBox

Name/Symbol: PopUpMessageBox()

made.

 Description: Creates a small 300x200 information box at the current cursor location, but also adjusts so it is on the screen. It must be dismissed by clicking the 'OK' button.
 Usage: PopuUpMessageBox(<text>,<win>) Note that the function puts the box on the screen at the current mouse position. If you want control over where it goes, you need to use SetMouseCursorPosition immediately before the box is

Example:	subnum <- PopUpMessageBox("There has been an error.",gWin)	
See Also:	MessageBox GetEasyInput, PopUpEntryBox	
Name/Symbol:	Print()	
Description:	Prints <value> to stdout (the console [Linux] or the file stdout.txt [Windows]), and then appends a newline afterwards.</value>	
Usage:	Print(<value>)</value>	
Example:	Print("hello world") Print(33 + 43) x <-Print("Once")	
See Also:	<pre>Print_(), FilePrint()</pre>	
Name/Symbol:	Pow()	
Description:	Raises or lowers <num> to the power of <pow>.</pow></num>	
Usage:	Pow(<num>, <pow>)</pow></num>	
Example:	Pow(2,6) # == 64 Pow(5,0) # == 1	

See Also:

Name/Symbol: Print()

Description:	Prints <value> to stdout (the console [Linux] or the file stdout.txt [Windows]), and then appends a newline afterwards.</value>
Usage:	Print(<value>)</value>
Example:	Print("hello world") Print(33 + 43) x <-Print("Once")
See Also:	<pre>Print_(), FilePrint()</pre>

```
Name/Symbol: PrintProperties()
Description:
              Prints .properties/values for any complex object. These include
              textboxes, fonts, colors, images, shapes, etc. Mostly useful as a
              debugging tool.
Usage:
              PrintProperties(<object>)
Example:
                  win <- MakeWindow()</pre>
                  tb <- EasyTextbox("one",20,20,win,22,400,80)
                 PrintProperties(tb)
              ##Output:
               _____
              [CURSORPOS]: 0
               [EDITABLE]: 0
              [HEIGHT]: 80
               [ROTATION]: 0
              [TEXT]: one
               [VISIBLE]: 1
              [WIDTH]: 400
              [X]: 20
              [Y]: 20
              [ZOOMX]: 1
              [ZOOMY]: 1
               _____
See Also:
              Print()
Name/Symbol: Print_()
Description:
              Prints <value> to stdout; doesn't append a newline afterwards.
Usage:
              Print_(<value>)
Example:
              Print_("This line")
              Print_(" ")
              Print_("and")
```

prints out: 'This line and Another line'

Print_(" ")

Print("Another line")

See Also: Print(), FilePrint()

Name/Symbol: PrintList()

Description: Prints a list, without the ','s or [] characters. Puts a carriage return at the end. Returns a string that was printed. If a list contains other lists, the printing will wrap multiple lines and the internal lists will be printed as normal. To avoid this, try PrintList(Flatten(list)).

Usage: PrintList(<list>) Example: PrintList([1,2,3,4,5,5,5]) ## ## Produces: ##1 2 3 4 5 5 5 PrintList([[1,2],[3,4],[5,6]]) #Produces: # [1,2] #,[3,4] #,[5,6] PrintList(Flatten([[1,2],[3,4],[5,6]])) #Produces: # 1 2 3 4 5 6 See Also: Print(), Print_(), FilePrint(), FilePrint_(), FilePrintList(),

Name/Symbol: PropertyExists

Description:	Tests whether a particular named property exists. This works for custom or built-in objects. This is important to check prop- erties that might not exist, because trying to GetProperty of a non-existent property will cause a fatal error.
Usage:	out <- PropertyExists(obj,property)
Example:	obj <- MakeCustomObject("myobject") obj.taste <- "buttery" obj.texture <- "creamy" SetProperty(obj,"flavor","tasty")
	list <- GetPropertyList(obj)

```
loop(i,list)
{
    if(PropertyExists(obj,i)
        {
            Print(i + ": " + GetProperty(obj,i))
        }
    }
}
```

```
See Also: GetPropertyList, GetProperty, SetProperty
MakeCustomObject, PrintProperties
```

```
Name/Symbol: Pulldown()
```

Description:	This handles making a new selection on a pulldown box.
Usage:	Pulldown(object, [x,y])
	This function is typically the primary way of interacting with a pulldown box. It will have the effect of opening the pull- down box, waiting for the user to select a new option, and then changing the selected option to whatever they click on.
Example:	See demo ui.pbl for examples of the use of pulldowns. Pulldowns are also used within the PEBL launcher for various purposes. A basic example is:
	options <- MakePulldownButton(["A",B","C"],400,250,gWin,14,100,1) resp <- WaitForClickOntarget([options],[1]) newvalue <- Pulldown(options,gClick)
See Also:	MakePullDown(), DrawPulldown(), UpdatePulldown

Name/Symbol: PushButton

Description: Animates a button-pushing. It takes a button created using the MakeButton function and will animate a downclick when the mouse is down, and release when the mouse is unclicked. To conform with general object handlers, it requires specifying a mouse click position, which could be [0,0], or gclick. This function is bound to the property 'clickon' of any button, allowing you to handle mouse clicks universally for many different objects.

Chapter 8. Detailed Function and Keyword Reference

Usage:	PushButton(button, xylist)
Example:	The following creates a button, waits for you to click on it, and animates a button press
	<pre>done <- MakeButton("QUIT",400,250,gWin,150) resp <- WaitForClickOntarget([done],[1]) PushButton(done,[0,0])</pre>
	To handle multiple buttons, you can do:
	done <- MakeButton("QUIT",400,250,gWin,150) ok <- MakeButton("OK",400,250,gWin,150)
	<pre>resp <- 2 while (resp != 1) { Draw() resp <- WaitForClickOntarget([done,ok],[1,2]) obj <- Nth([done,ok],resp) CallFunction(obj.clickon,[obj,gClick]) }</pre>

See Also: MakeCheckBox()

Name/Symbol: PushOnEnd

Description: Pushes an item onto the end of a list, modifying the list itself. Note: PushOnEnd is a more efficient replacement for Append(). Unlike Append, it will modify the original list as a side effect, so the following works:

PushOnEnd(list, item)

There is no need to set the original list to the result of PushOn-End, like you must do with Append. However, it does in fact work, and incurs only a slight overhead, so that Append can often be replaced with PushOnEnd without worry.

list <- PushOnEnd(list, item)</pre>

Usage: PushOnEnd(<list>, <item>)

$8.17 \quad \mathrm{Q}$

Name/Symbol: Quantile()

Description:	Returns the <code><num></num></code> quantile of the numbers in <code><list>. <num></num></list></code> should be between 0 and 100
Usage:	Quantile(<list>, <num>)</num></list>
Example:	<pre>##Find 75th percentile to use as a threshold. thresh <- Quantile(rts,75)</pre>

See Also: StDev(), Median(), Mean(), Max(), Min()

8.18 R

Name/Symbol:	RadToDeg()
Description:	Converts <rad></rad> radians to degrees.
Usage:	RadToDeg(<rad>)</rad>
Example:	
See Also:	<pre>DegToRad(), Tan(), Cos(), Sin(), ATan(), ASin(), ACos()</pre>

Name/Symbol: Random()

Description:	Returns a random number between 0 and 1.
Usage:	Random()
Example:	a <- Random()
See Also:	Random(),RandomBernoulli(),RandomBinomial(),RandomDiscrete(),RandomExponential(),RandomLogistic(),RandomLogNormal(),RandomNormal(),RandomUniform(),RandomizeTimer(),SeedRNG()

Name/Symbol:	RandomBernoulli()
--------------	-------------------

Description:	Returns 0 with probability (1-) and 1 with probability .		
Usage:	RandomBernoulli()		
Example:	RandomBernoulli(.3)		
See Also:	Random(), RandomBernoulli(), RandomBinomial, RandomDiscrete(), RandomExponential(), RandomLogistic(), RandomLogNormal(), RandomNormal(), RandomUniform(), RandomizeTimer(), SeedRNG()		

Name/Symbol: RandomBinomial

Description:	Returns a random number according to the Binomial distribution with probability $\langle p \rangle$ and repetitions $\langle n \rangle$, i.e., the number
	of Bernoulli trials that succeed out of <n> attempts.</n>

Usage: RandomBinomial(<n>)

See Also: Random(), RandomBernoulli(), RandomBinomia RandomDiscrete(), RandomExponential(RandomLogistic(), RandomLogNormal(), RandomNormal() RandomUniform(), RandomizeTimer(), SeedRNG()	Example:	RandomBinomial(.3	, 10) # returns	number	from	0 to	10
	See Also:	Random(), Ran RandomDiscrete(), RandomLogistic(), RandomUniform(), F	domBernoulli(), RandomLogNorma andomizeTimer()	Ra Random 1(), Ra , SeedRN	andomB Expone andomN IG()	inomi ntial ormal	.al, _(), L(),

Name/Symbol: RandomDiscrete()

Description:	Returns a random integer between 1 and the argument (inclu- sive), each with equal probability. If the argument is a floating- point value, it will be truncated down; if it is less than 1, it will return 1, and possibly a warning message.
Usage:	RandomDiscrete(<num>)</num>
Example:	<pre># Returns a random integer between 1 and 30: RandomDiscrete(30)</pre>
See Also:	Random(),RandomBernoulli(),RandomBinomial,RandomDiscrete(),RandomExponential(),RandomLogistic(),RandomLogNormal(),RandomNormal(),RandomUniform(),RandomizeTimer(),SeedRNG()

$Name/Symbol: \ensuremath{\mathtt{RandomExponential()}}$

Description:	Returns a random number according to exponential distribution with mean <mean> (or decay 1/mean).</mean>		
Usage:	RandomExponential(<mean>)</mean>		
Example:	RandomExponential(100)		
See Also:	Random(), RandomBernoulli(), RandomBinomial, RandomDiscrete(), RandomLogistic(), RandomLogNormal(), RandomNormal(), RandomUniform(), RandomizeTimer, SeedRNG()		

 $Name/Symbol: \ensuremath{\texttt{RandomizeTimer()}}$

Description:	Seeds the RNG with the current time.
Usage:	RandomizeTimer()
Example:	RandomizeTimer() x <- Random()

See Also:	Random(),	RandomBernoulli(),	RandomBinomia	1,
	RandomDiscrete	(),	RandomExponential(),
	RandomLogistic	(), RandomLogNorma	al(), RandomNormal(),
	RandomUniform(), SeedRNG()		

Description:	Returns a random with parameter	$f(x) = \exp(x)/(1 + \exp(x))$	$\begin{array}{l} \text{logistic distribution} \\ \mathbf{p}(\mathbf{x})) \end{array}$
Usage:	RandomLogistic	:()	
Example:	RandomLogistic	(.3)	
See Also:	Random(), RandomDiscrete RandomLogNorma RandomizeTimer	RandomBernoulli(), e(), Ran ll(), RandomNormal(), r, SeedRNG()	RandomBinomial, domExponential(), RandomUniform(),

Name/Symbol: RandomLogNormal()

Description: Returns a random number according to the log-normal distribution with parameters <median> and <spread>. Generated by calculating median*exp(spread*RandomNormal(0,1)). <spread> is a shape parameter, and only affects the variance as a function of the median; similar to the coefficient of variation. A value near 0 is a sharp distribution (.1-.3), larger values are more spread out; values greater than 2 make little difference in the shape.

Usage:	RandomLogNor	<pre>rmal(<median>, <spread>)</spread></median></pre>	
Example:	RandomLogNor	rmal(5000, .1)	
See Also:	Random(), RandomDiscre RandomLogist RandomizeTim	RandomBernoulli(), ete(), Ran sic(), RandomNormal(), mer, SeedRNG()	RandomBinomial, ndomExponential(), RandomUniform(),

Name/Symbol: RandomNormal()

Description: Returns a random number according to the standard normal distribution with <mean> and <stdev>.

Usage: RandomNormal(<mean>, <stdev>)

Example:

See Also:	Random(),	RandomBernoul	li(),	RandomBinomial,
	RandomDiscre	ete(),	Ran	<pre>domExponential(),</pre>
	RandomLogist	<pre>tic(), RandomLogN</pre>	<pre>Iormal(),</pre>	RandomUniform(),
	RandomizeTir	<pre>ner, SeedRNG()</pre>		

Name/Symbol: RandomUniform()

Description:	Returns a random floating-point number between 0 and <num>.</num>
Usage:	RandomUniform(<num>)</num>
Example:	
See Also:	Random(), RandomBernoulli(), RandomBinomial, RandomDiscrete(), RandomExponential(), RandomLogistic(), RandomLogNormal(), RandomNormal(), RandomizeTimer(), SeedRNG()

Name/Symbol: Rank()

Description:	Returns a list of numbers describing the rank of each position, from min to max. The same as calling $Order(Order(x))$.
Usage:	Rank(<list-of-numbers>)</list-of-numbers>
Example:	<pre>n <- [33,12,1,5,9] o <- Rank(n) Print(o) #should print [5,4,1,2,3]</pre>
See Also:	Order()

Name/Symbol: ReadCSV()

Description:	Reads a comma-separated value file into a nested list. Need not be named with a .csv extension. It should properly strip quotes from cells, and not break entries on commas embedded within quoted text.
Usage:	ReadCSV(<filename>)</filename>
Example:	table <- ReadCSV("datafile.csv")
See Also:	<pre>FileReadTable(), FileReadList, StripQuotes</pre>

Name/Symbol: Rectangle()

Description: Creates a rectangle for graphing at x,y with size dx and dy. Rectangles are only currently definable oriented in horizontal/vertical directions. A rectangle must be added to a parent widget before it can be drawn; it may be added to widgets other than a base window. The properties of rectangles may be changed by accessing their properties directly, including the FILLED property which makes the object an outline versus a filled shape.

```
Usage: Rectangle(<x>, <y>, <dx>, <dy>, <color>)
```

Example:

r <- Rectangle(30,30,20,10, MakeColor(green)) AddObject(r, win) Draw()

See Also: Circle(), Ellipse(), Square(), Line()

Name/Symbol: ReflectPoints

Description:	Takes a set of points (defined in a joined list $[[x1,x2,x3,],[y1,y2,y3,]]$ and reflects them around the vertical axis $x=0$, returning a similar $[[x],[y]]$ list. Identical to ZoomPoints(pts,-1,1)
Usage:	ReflectPoints(<points>)</points>
Example:	<pre>points <- [[1,2,3,4],[20,21,22,23]] newpoints <- ReflectPoints(points)</pre>
See Also:	ZoomPoints(), RotatePoints

Name/Symbol: RegisterEvent()

- Description: Adds an event to the event loop. This function is currently experimental, and its usage may change in future versions of PEBL.
- Usage: USAGE CURRENTLY UNDOCUMENTED

Example:
Chapter 8. Detailed Function and Keyword Reference

See Also: ClearEventLoop(), StartEventLoop()

Name/Symbol:	RemoveFile()		
Description:	Removes a file from the file system.		
Usage:	RemoveObject(<filename>)</filename>		
Example:	<pre>tmpfile <- FileOpenWrite("tmp.txt") FilePrint(tmpfile,Random()) FileClose(tmpfile) text <- FileReadText("tmp.txt") RemoveFile("tmp.txt")</pre>		
See Also:			
See Also:	<pre>GetDirectoryListing(), FileExists(), IsDirectory(), MakeDirectory()</pre>		

Name/Symbol: RemoveObject()

Description:	Removes a child widget from a parent. Useful if you are adding a local widget to a global window inside a loop. If you do not remove the object and only Hide() it, drawing will be slug- gish. Objects that are local to a function are removed automat- ically when the function terminates, so you do not need to call RemoveObject() on them at the end of a function.
Usage:	RemoveObject(<object>, <parent>)</parent></object>

Example:

See Also:

Name/Symbol: RemoveSubset()

Description:	Removes a subset of elements from a list. Creates a new list, and does not affect the original		
Usage:	RemoveSubset(<list1>,<list-of-element-indices>])</list-of-element-indices></list1>		
Example:	list1 <- [1,2,2,4,5] list2 <- RemoveSubset(list1,[2,3]) Print(list1) #[1,2,2,4,5] Print(list2) #[1,4,5]		

"potato", "potato", "potato"]

See Also: Merge(), Insert(), Rest()

Name/Symbol: Repeat()

Description: Makes and returns a list by repeating <object> <n> times. Has no effect on the object. Repeat will not make new copies of the object. If you later change the object, you will change every object in the list.Usage: Repeat(<object>, <n>) Example: x <- "potato" y <- repeat(x, 10) Print(y) # produces ["potato", "potato", "potato", "potato", "potato", "potato",

See Also: RepeatList()

Name/Symbol: RepeatList()

Description:	Makes a longer list by repeating a shorter list $\langle n \rangle$ times. Has no effect on the list itself, but changes made to objects in the new list will also affect the old list.
Usage:	RepeatList(<list>, <n>)</n></list>
Example:	RepeatList([1,2],3) # == [1,2,1,2,1,2]
See Also:	<pre>Repeat(), Merge(), []</pre>

Name/Symbol: Replace()

Description: Creates a copy of a (possibly nested) list in which items matching some list are replaced for other items. <template> can be any data structure, and can be nested. <replacementList> is a list containing two-item list pairs: the to-be-replaced item and to what it should be transformed. Note: replacement searches the entire <replacementList> for matches. If multiple keys are identical, the item will be replaced with the last item that matches.

Usage: Replace(<template>,<replacementList>)

Example:

```
x <- ["a","b","c","x"]
rep <- [["a","A"],["b","B"],["x","D"]]
Print(Replace(x,rep))
# Result: [A, B, c, D]
See Also: ReplaceChar()
```

Name/Symbol: ReplaceChar()

Description:	Substitutes <char2> for <char> in <string>. Useful for saving subject entry data in a file; replacing spaces with some other character. The second argument can either be a character to match, or a list of characters to match, in which case they all get replaced with the third argument.</string></char></char2>	
Usage:	ReplaceChar(<string>,<char>,<char2>) ReplaceChar(<string>,[<chara>, <charb>],<char2>)</char2></charb></chara></string></char2></char></string>	
Example:	<pre>x <- ["Sing a song of sixpence"] rep <- ReplaceChar(x," ", "_") Print(rep) # Result: Sing_a_song_of_sixpence x <- ["sing a song of sixpence"] rep <- ReplaceChar(x,["s","x"], "p") Drint(rep)</pre>	
	# Result: ping a pong of pippence	
See Also:	<pre>for list items: Replace() , \SplitString(),</pre>	

Name/Symbol: ResetCanvas()

Description: Resets a canvas, so that anything drawn onto it is erased and returned to its background color. Implemented by resetting the background color to itself:

canvas.color <- canvas.</pre>

The function does not return the canvas, but has the side effect of resetting it.

Usage: ResetCanvas(<list>)

Example:

```
#create a canvas, add pixel noise, then reset and repeat.
              define Start(p)
              {
                 gWin <- MakeWindow()
                 canvas <- MakeCanvas(100,100,MakeColor("black"))</pre>
                 AddObject(canvas,gWin); Move(canvas,300,300)
                 Draw()
                 white <- MakeColor("white")</pre>
                 ##add pixel noise
                 j <- 1
                 while(j < 5)
                  {
                 i <- 1
                 while(i < 200)
                  {
                    SetPixel(canvas,Round(Random()*100),
                              Round(Random()*100),white)
                    i <- i +1
                  }
                 Draw()
                 WaitForAnyKeyPress()
                 ResetCanvas(canvas)
                 Draw()
                 j <- j + 1
                 }
                 WaitForAnyKeyPress()
              }
See Also:
              +SetPixel()+, +MakeCanvas()+, +Draw()+
Name/Symbol: Rest()
Description:
              Returns the 'rest' of a list; a list minus its first element. If the
              list is empty or has a single member, it will return an empty
```

	list []. This is a very common function in LISP.		
Usage:	Rest(<list>)</list>		
Example:	x <- Sequence(1,5,1) y <- Rest(x) Print(rep) # Result: [2,3,4,5]		
See Also:	Insert()		

Name/Symbol:	RGBtoHSV()		
Description:	Converts a color object to HSV values. May be useful for com- puting color-space distances an so on. No HSVtoRGB is cur- rently implemented.		
Usage:	RGBtoHSV(<color>)</color>		
Example:	<pre>x <- RGBtoHSV(MakeColor("red))</pre>		
See Also:	MakeColor(), MakeColorRGB		
Name/Symbol:	return		
Description:	Enables a function to return a value.		
Usage:	<pre>define funcname() { return 0 }</pre>		
Example:			
See Also:			
Name/Symbol:	Rotate()		
Description:	Returns a list created by rotating a list by <n> items. The new list will begin with the <n+1>th item of the old list (modulo its length), and contain all of its items in order, jumping back to the beginning and ending with the <n>th item. Rotate(<list>,0) has no effect. Rotate does not modify the original list.</list></n></n+1></n>		
Usage:	Rotate(<list-of-items>, <n>)</n></list-of-items>		
Example:	Rotate([1,11,111],1) # == [11,111,1]		
See Also:	Transpose()		

Name/Symbol: RotatePoints

Description:	Takes a set of points (defined in a joined list [[x1,x2,x3,], [y1,y2,y3,] and rotates them <angle> degrees around the point [0,0], returning a similar [[x],[y]] list.</angle>
Usage:	ZoomPoints(<points>,<angle>)</angle></points>
Example:	points <- [[1,2,3,4],[20,21,22,23]] newpoints <- RotatePoints(points,10)
See Also:	ZoomPoints(), ReflectPoints

Name/Symbol: Round()

Description:	Rounds <num> to nearest integer, or if optional <precision> argument is included, to nearest $10^{-precision}$.</precision></num>	
Usage:	Round(<num>) Round(<num>,<precision>)</precision></num></num>	
Example:	Round(33.23) # == 33 Round(56.65) # == 57 Round(33.12234,2) # == 33.12 Round(43134.23,-2) # == 43100	
See Also:	<pre>Ceiling(), Floor(), AbsFloor(), ToInt()</pre>	

8.19

 \mathbf{S}

Name/Symbol:	Sample()		
Description:	Samples a single item from a list, returning it. It is a bit more convenient at times than $ShuffleN(list,1)$, which returns a list of length 1. Implemented as $First(ShuffleN(list,1))$		
Usage:	Sample(<list>)</list>		
Example:	Sample([1,1,1,2,2]) Sample([1,2,3,4,5,6,7])	<pre># Returns a single # Returns a single</pre>	number number
See Also:	SeedRNG(), SampleNWithReplacement(Sample()), Subset()	ChooseN(),

Name/Symbol: SampleN()

Description: Samples <number> items from list, returning a randomly- ordered list. Items are sampled without replacement, so once an item is chosen it will not be chosen again. If <number> is larger than the length of the list, the entire list is returned shuffled. It differs from ChooseN in that ChooseN returns items in the order they appeared in the originial list. It is implemented as Shuffle(ChooseN()).Usage: SampleN(<list>, <n>)

Example: SampleN([1,1,1,2,2], 5) # Returns 5 numbers SampleN([1,2,3,4,5,6,7], 3) # Returns 3 numbers See Also: ChooseN(), SampleNWithReplacement(), Subset()

Name/Symbol: SampleNWithReplacement()

Description: SampleNWithReplacement samples <number> items from <list>, replacing after each draw so that items can be sampled again. <number> can be larger than the length of the list. It has no side effects on its arguments.

Usage: SampleNWithReplacement(<list>, <number>)

Example:	<pre>x <- Sequence(1:100,1) SampleNWithReplacement(x, 10) # Produces 10 numbers between 1 and 100, possibly # repeating some.</pre>
See Also:	<pre>SampleN(), ChooseN(), Subset()</pre>

Name/Symbol: SetProperty

Description: Sets a a property of a custom object. This works for custom or built-in objects, but new properties can only be set on custom object. This function works essentially identically to the obj.property assignment, but it allows you to create property names from input. It is used extensively for the PEBL parameter setting.

Usage: SetProperty(obj,property, value)

```
Example:
                 obj <- MakeCustomObject("myobject")</pre>
                 obj.taste <- "buttery"</pre>
                 obj.texture <- "creamy"</pre>
                 SetProperty(obj,"flavor","tasty")
                 list <- GetPropertyList(obj)</pre>
                 loop(i,list)
                  {
                    if(PropertyExists(obj,i)
                     {
                       Print(i + ": " + GetProperty(obj,i))
                     }
                  }
See Also:
               GetProperty,
                                  PropertyExists,
                                                        GetPropertyList
               MakeCustomObject, PrintProperties
```

Name/Symbol: SDTBeta()

Description:	SDTBeta computes beta, as defined by signal detection theory.	
Usage:	<pre>SDTBeta(<hr/>, <far>)</far></pre>	
Example:	Print(SDTBeta(.1,.9)) Print(SDTBeta(.1,.5)) Print(SDTBeta(.5,.5))	#.67032 #.88692 #1

Print(SDTBeta(.8,.9)) #0.918612 Print(SDTBeta(.9,.95)) #0.954803 Name/Symbol: SaveAudioToWaveFile Description: Saves a buffer, recorded using the GetAudioInputBuffer, to a .way file for later analysis or archive. Usage: SaveAudioToWaveFile(filename, buffer) This will save a .wav file of a buffer that was recorded (e.g., using GetVocalResponseTime). See number-stroop.pbl in the stroop directory of the test battery and test audioin.pbl in demo/ $\,$ for examples. Example: gResponseBuffer <- MakeAudioInputBuffer(5000) resp0 <- GetVocalResponseTime(gResponseBuffer,.35, 200)</pre> SaveAudioToWaveFile("output.wav",gResponseBuffer) See Also: GetVocalResponseTime(), MakeAudioInputBuffer() See Also: SDTDPrime(), Name/Symbol: SDTDPrime() Description: SDTDPrime computes d-prime, as defined by signal detection theory. This is a measure of sensitivy based jointly on hit rate and false alarm rate. Usage: SDTDPrime(<hr>, <far>) Example: Print(SDTDPrime(.1,.9)) #2.56431 Print(SDTDPrime(.1,.5)) #1.28155 Print(SDTDPrime(.5,.5)) #0 Print(SDTDPrime(.8,.9)) #.43993 Print(SDTDPrime(.9,.95)) #.363302 See Also: SDTBeta(),

Name/Symbol: SetCheckbox()

Description:	This sets the .status property of a checkbox and draws it. Its state can also be updated using the the ClickCheckBox() function, which flips the current state.
Usage:	SetCheckBox(obj, value)
Example:	<pre>ok <- MakeCheckbox("OK?",400,250,gWin,150) Draw() SetCheckBox(ok,1) Draw() Wait(1000) SetCheckbox(ok,0) Draw() Wait(1000) Examples of its use can be found in demo ui.pbl</pre>
See Also:	<pre>MakeCheckBox(), ClickCheckBox()</pre>

Name/Symbol: SeedRNG()

Description:	Seeds the random number generator with <num> to reproduce a</num>
	random sequence. This function can be used cleverly to create
	a multi-session experiment: Start by seeding the RNG with a
	single number for each subject; generate the stimulus sequence,
	then extract the appropriate stimuli for the current block. Re-
	member to RandomizeTimer() afterward if necessary.

Usage: SeedRNG(<num>)

Example:	##This makes sure you get the same random order
	<pre>## across sessions for individual subjects.</pre>
	SeedRNG(gSubNum)
	<pre>stimTmp <- Sequence(1:100,1)</pre>
	stim <- Shuffle(stimTmp)
	RandomizeTimer()
See Also:	RandomizeTimer()

Name/Symbol: SendData()

Description: Sends data on network connection. Example of usage in demo/nim.pbl. You can only send text data.

Chapter 8	B. Detailed	Function	and Keyword	Reference
-----------	-------------	----------	-------------	-----------

Usage:	<pre>SendData(<network>,<data_as_string>)</data_as_string></network></pre>	
Example:	On 'server':	
	net <- WaitForNetworkConnection("localhost",1234) SendData(net,"Watson, come here. I need you.") CloseNetworkConnection(net)	
	On Client:	
	<pre>net <- ConnectToHost("localhost",1234) value <- GetData(net,20) Print(value) CloseNetworkConnection(net) ##should print out "Watson, come here. I need you."</pre>	
See Also:	ConnectToIP, ConnectToHost, WaitForNetworkConnection, GetData, ConvertIPString, CloseNetworkConnection	

Name/Symbol: SegmentsIntersect()

Description:	Determines whether two line segments, defined by four xy point pairs, intersect. Two line segments that share a corner return 0, although they could be considered to intersect.
	This function is defined in pebl-lib/Graphics.pbl
Usage:	<pre>SegmentsIntersect(x1,y1,x2,y2, a1,b1,a2,b2)</pre>
Example:	SegmentsIntersect(1,0,2,0, 1,2,2,2) #0
	<pre>#returns 0, though they share (1,0) SegmentsIntersect(1,0,2,0,</pre>

GetAngle3, ToRight

Name/Symbol: Sequence()

See Also:

Description:	Makes a sequence of nur sized increments. If <s than <start>, and if <s than <start>. If <star <end>, the last item in number to <end> in the</end></end></star </start></s </start></s 	nbers from <start> to <end> at <step>- tep> is positive, <end> must be larger step> is negative, <end> must be smaller ct> + n*<step> does not exactly equal the sequence will be the number closest direction of <start> (and thus <step>).</step></start></step></end></end></step></end></start>
Usage:	Sequence(<start>, <</start>	end>, <step>)</step>
Example:	Sequence(0,10,3) Sequence(0,10,1.5) Sequence(10,1,3) Sequence(10,0,-1)	<pre># == [0,3,6,9] # == [0,1.5,3,4.5, 6, 7.5, 9] # error # == [10,9,8,7,6,5,4,3,2,1]</pre>
See Also:	Repeat(), RepeatList	()

Name/Symbol: SetCursorPosition()

Description:	Moves the editing cur textbox.	rsor to a specified character]	position in a
Usage:	<pre>SetCursorPosition(<textbox>, <integer>)</integer></textbox></pre>		
Example:	SetCursorPosition(tb, 23)		
See Also:	SetEditable(), GetText()	GetCursorPosition(),	<pre>SetText(),</pre>

Name/Symbol: SetEditable()

Description:	Sets the "editable" status of the textbox. All this really does is turns on or off the cursor; editing must be done with the (currently unsupported) device function GetInput().
Usage:	SetEditable()
Example:	SetEditable(tb, 0) SetEditable(tb, 1)
See Also:	GetEditable()

Name/Symbol: SetElement()

Description:	Efficiently alter a specific item from a list. SetElement has length-constant access time, and so it can be efficient to pre- create a list structure and then populate it one-by-one.	
Usage:	<pre>SetElement(<list>, <index>, <value>)</value></index></list></pre>	
Example:	<pre>##Set a random subset of elements to their index: list <- Repeat(0,10) index <- 1 while(index <= 10) { if(Random()<.2) { SetElement(list,index,index) } index <- index + 1 }</pre>	
See Also:	Nth(), Append(), PushOnEnd()	
Name/Symbol:	SetFont()	
Description:	Resets the font of a textbox or label. Change will not appear until the next Draw() function is called. Can be used, for exam- ple, to change the color of a label to give richer feedback about correctness on a trial (see example below). Font can also be set by assigning to the object.font property of an object.	
Usage:	<pre>SetFont(<text-widget>,)</text-widget></pre>	

```
} else {
  SetText(label, "INCORRECT")
  SetFont(label, "fontRed)
  }
  Draw()
  SetText()
```

Name/Symbol:	SetMouseCursorPosition()	
Description:	Sets the current x,y coordinates of the n the mouse to that location immediately	nouse pointer, 'warping'
Usage:	<pre>SetMouseCursorPosition(<x>,<y></y></x></pre>)
Example:	##Set mouse to center of screen SetMouseCursorPosition(gVideoWi gVideoHe	: dth/2, ight/2)
See Also:	ShowCursor, SetMouseCursorPosition, GetMouseCu	WaitForMouseButton, rsorPosition

Name/Symbol: SetPixel(), SetPoint()

Description: Sets the pixel at x,y to a particular color. It can also be called using SetPoint(). SetPoint is primarily useful for images and canvases—labels and textboxes get re-rendered upon draw so any use of SetPixel will get overwritten when it gets drawn. It won't work on windows or shapes.

Usage: SetPixel(<x>,<y>,<color>) SetPoint(<x>,<y>,<color>)

Example:

See Also:

```
back <- MakeCanvas(50,50)
AddObject(back,gWin)
col <- MakeColor("green")
xy <- [[10,10],[10,11],[10,12],[10,13]]
loop(i,xy)
{
    SetPixel(First(i),Second(i),col)
}
Draw()</pre>
```

See Also: SetPoint, MakeGabor

Name/Symbol:	SetPPortMode
Description:	Sets a parallel port mode, either " <input/> " or " <output>".</output>
Usage:	<pre>SetPPortMode("<input/>")</pre>
Example:	
See Also:	COMPortGetByte, COMPortSendByte, OpenPPort OpenCOMPort, SetPPortMode, GetPPortState

$Name/Symbol: \verb"SetPPortState"$

Description:	Sets a parallel port state, using a list of 8 'bits' (1s or 0s).
Usage:	SetPPortState([0,0,0,0,0,0,0])
Example:	
See Also:	COMPortGetByte, COMPortSendByte, OpenPPort OpenCOMPort, SetPPortMode, GetPPortState

Name/Symbol: SetScrollingText()

Description:	This updates the text in a ScrollingTextBox. Because text must be parsed to be put into the box, you cannot just update the .text property, but instead should use this function.
Usage:	SetScrollingText(stb, newtext)
	Here, stb is a scrolling textbox created with MakeScrollingTextBox , and newtext is the new text you want to display.
Example:	See ui.pbl in the demo directory for examples of the use of a scrolling text box. A brief example follows:
	<pre>textscroll <- MakeScrollingTextBox("",200,50,gWin,12,</pre>
	<pre>SetScrollingText(textscroll,FileReadText("Uppercase.txt")) Draw()</pre>
	<pre>resp <- WaitForClickOntarget([textscroll],[1]) CallFunction(textscroll.clickon,[textscroll,gClick])</pre>

See Also: MakeScrollingTextBox MakeScrollBox UpdateScrollBox DrawScrollBox ClickOnScrollBox

Name/Symbol: SetText()

- Description: Resets the text of a textbox or label. Change will not appear until the next Draw() function is called. The object.text property can also be used to change text of an object, by doing: object.text <- "new text" Usage: SetText(<text-widget>, <text>) # Fixation Cross: Example: label <- MakeLabel(font, "+")</pre>
- SetText(label, "X") Wait(100) Draw() See Also: GetText(), SetFont()

Draw()

Name/Symbol: Show()

Sets a widget to visible, once it has been added to a parent Description: widget. This just changes the visibility property, it does not make the widget appear. The widget will not be displayed until the Draw() function is called. The .visible property of objects can also be used to hide or show the object.

Usage: Show(<object>)

Example:	<pre>window <- MakeWindow() image1 <- MakeImage("pebl.bmp") image2 <- MakeImage("pebl.bmp") AddObject(image1, window) AddObject(image2, window) Hide(image2) Draw() Wait(300) Show(image2) Draw()</pre>
See Also:	Hide()

Name/Symbol: ShowCursor()

Description:	Hides or shows the mouse cursor. Currently, the mouse is not
	used, but on some systems in some configurations, the mouse
	cursor shows up. Calling ShowCursor(0) will turn off the cur-
	sor, and ShowCursor(1) will turn it back on. Be sure to turn
	it on at the end of the experiment, or you may actually lose the
	cursor for good.

Usage:	ShowCursor(<value>)</value>
Usage.	SHOWCUI SOI ((varue/)

Example:	window <- MakeWindow() ShowCursor(0) ## Do experiment here ##
	## Turn mouse back on. ShowCursor(1)

See Also:

Name/Symbol: Shuffle()

Description:	Randomly shuffles	a list.		
Usage:	Shuffle(list)			
Example:	<pre>Print(Shuffle([: # Results might</pre>	1,2,3,4,5])) be anything, li	lke [5,3,2,1,4]	
See Also:	Sort(), ShuffleWithoutAd	SortBy(), djacents()	ShuffleRepe	eat(),

Name/Symbol: ShuffleRepeat()

Description:	Randomly shuffles <list>, repeating <n> times. Shuffles each iteration of the list separately, so you are guaranteed to go through all elements of the list before you get another. Returns a nested list.</n></list>
Usage:	<pre>ShuffleRepeat(<list>, <n>)</n></list></pre>
Example:	<pre>Print(ShuffleRepeat([1,2,3,4,5]),3) ## Results might be anything, like: ## [[5,3,2,1,4], [3,2,5,1,4], [1,4,5,3,2]] Typically, you will want to flatten before using:</pre>

	list <-	<pre>Flatten(ShuffleRepeat([1,2,</pre>	3], 5))
See Also:	Sort(), ShuffleW	<pre>SortBy(), ithoutAdjacents()</pre>	ShuffleRepeat(),

Name/Symbol: ShuffleWithoutAdjacents()

Description: Randomly shuffles <nested-list>, attempting to create a list where the nested elements do not appear adjacently in the new list. Returns a list that is flattened one level. It will always return a shuffled list, but it is not guaranteed to return one that has the non-adjecent structure specified, because this is sometimes impossible or very difficult to do randomly. Given small enough non-adjacent constraints with enough fillers, it should be able to find something satisfactory.

Usage: ShuffleWithoutAdjacents(<nested-list>)

```
Example:
              Print(ShuffleWithoutAdjacents([[1,2,3],
                                              [4,5,6],
                                              [7, 8, 9]])
              ## Example Output:
              ## [8, 5, 2, 7, 4, 1, 6, 9, 3]
              ## [7, 4, 8, 1, 9, 2, 5, 3, 6]
              ## Non-nested items are shuffled without constraint
              Print(ShuffleWithoutAdjacents([[1,2,3],
                                             11,12,13,14,15,16]))
              ## output: [13, 11, 2, 14, 3, 15, 1, 16, 12]
              ##
                         [13, 12, 2, 16, 15, 11, 1, 14, 3]
              ##
                         [11, 1, 15, 2, 12, 16, 14, 13, 3]
              ## Sometimes the constraints cannot be satisfied.
              ## 9 will always appear in position 2
              Print(ShuffleWithoutAdjacents([[1,2,3], 9])
              ## output: [3, 9, 1, 2]
              ##
                         [2, 9, 3, 1]
              ##
                         [3, 9, 2, 1]
See Also:
              Shuffle(),
                            Sort(),
                                       SortBy(),
                                                    ShuffleRepeat(),
              ShuffleWithoutAdjacents()
```

Name/Symbol: Sign()

Description: Returns +1 or -1, depending on sign of argument.

Chapter 8. Detailed Function and Keyword Reference

Usage:	Sign(<num>)</num>		
Example:	Sign(-332.1) Sign(65)	# == -1 # == 1	
See Also:	Abs()		
Name/Symbol:	SignalFatalEr	ror()	
Description:	- Stops PEBL an	d prints <message> to stderr.</message>	Useful for type-

Description.	checking in user-defined functions.
Usage:	SignalFatalError(<message>)</message>
Example:	
	<pre>If(not IsList(x)) { SignalFatalError("Tried to frobnicate a List.") } ##Prints out error message and ##line/filename of function</pre>
See Also:	Print()

Name/Symbol: Sin()

Description:	Sine of <deg> degrees.</deg>
Usage:	Sin(<deg>)</deg>
Example:	Sin(180) Sin(0)
See Also:	<pre>Cos(), Tan(), ATan(), ACos(), ATan()</pre>

Name/Symbol: Sort()

Description:	Sorts a list by its values from smallest to largest.
Usage:	Sort(<list>)</list>
Example:	Sort([3,4,2,1,5]) # == [1,2,3,4,5]
See Also:	<pre>SortBy(), Shuffle()</pre>

Name/Symbol:	SortBy()
Description:	Sorts a list by the values in another list, in ascending order.
Usage:	<pre>SortBy(<value-list>, <key-list>)</key-list></value-list></pre>
Example:	<pre>SortBy(["Bobby","Greg","Peter"], [3,1,2]) # == ["Greg","Peter","Bobby"]</pre>
See Also:	<pre>Shuffle(), Sort()</pre>

Name/Symbol: SplitString()

Description: Splits a string into tokens. <split> must be a string. If <split> is not found in <string>, a list containing the entire string is returned; if split is equal to "", the each letter in the string is placed into a different item in the list. Only the first character of <split> is used. IF you need a multicharacter split, you can use <SplitStringSlow>, which can handle multi-character splits but is relatively slower. This should not matter for short strings, but if you are using splitstring on long files, it could make a difference.

Usage: SplitString(<string>, <split>)

Example: SplitString("Everybody Loves a Clown", " ") # Produces ["Everybody", "Loves", "a", "Clown"] See Also: FindInString(), ReplaceChar, SplitStringSlow

Name/Symbol: SplitStringSlow()

Description: Splits a string into tokens. <split> must be a string. If <split> is not found in <string>, a list containing the entire string is returned; if split is equal to "", the each letter in the string is placed into a different item in the list. The entire text of <split> is used to tokenize, but as a consequence this function is relatively slow, and should be avoided if your string is longer than a few hundred characters.

Usage: SplitStringSlow(<string>, <split>)

Example:	<pre>SplitStringSlow("Everybody Loves a Clown", " ") # Produces ["Everybody", "Loves", "a", "Clown"] SplitStringSlow("she sells seashells", "ll") #produces ["she se","s seashe", "s"]</pre>				
See Also:	Splitstring FindInString(), ReplaceChar				
Name/Symbol:	Square()				
Description:	Creates a square for graphing at x,y with size <i>size</i> . Squares are only currently definable oriented in horizontal/vertical di- rections. A square must be added to a parent widget before it can be drawn; it may be added to widgets other than a base window. The properties of squares may be changed by accessing their properties directly, including the FILLED property which makes the object an outline versus a filled shape.				
Usage:	Ellipse(<x>, <y>, <size>, <color>)</color></size></y></x>				
Example:	s <- Square(30,30,20, MakeColor(green)) AddObject(s, win) Draw()				
See Also:	<pre>Circle(), Ellipse(), Rectangle(), Line()</pre>				
Name/Symbol:	Sqrt()				
Description:	Square root of <num>.</num>				
Usage:	Sqrt(<num>)</num>				
Example:	Sqrt(100) # == 10				
See Also:					

Name/Symbol: StartEventLoop()

Description: Starts the event loop with currently-registered events. This function is currently experimental, and its usage may change in future versions of PEBL.

Usage: StartEventLoop()

Example:

See Also: RegisterEvent(), ClearEventLoop()

Name/Symbol: StartPlayback()

Description: Initiates playback of a movie so that it will play in the background when a Wait() or WaitFor() function is called. This allows one to collect a response while playing a movie. The movie will not actually play until the event loop is started, typically with something like Wait().

Usage: StartPlayBack(movie)

Example: movie <- LoadMovie("movie.avi",gWin,640,480) PrintProperties(movie) Move(movie,20,20) Draw() StartPlayback(movie) Wait(500) #Play 500 ms of the movie. PausePlayback(movie) See Also: LoadAudioFile(), LoadMovie(), PlayMovie(), PausePlayback()

Name/Symbol: StDev()

Returns the standard deviation of <list>.</list>			
<pre>StDev(<list>)</list></pre>			
sd <- StDev([3,5,99,12,1.3,15])			
<pre>Min(), Max(), Mean(), Median(), Quantile(), Sum()</pre>			

Name/Symbol: Stop()

Description: Stops a sound playing in the background from playing. Calling Stop() on a sound object that is not playing should have no effect, but if an object is aliased, Stop() will stop the file. Note that sounds play in a separate thread, so interrupting the thread has a granularity up to the duration of the thread-switching quantum on your computer; this may be tens of milliseconds.

Usage: Stop(<sound-object>)

Example:	buzz <- LoadSound("buzz.wav")	
	PlayBackground(buzz)	
	Wait(50)	
	Stop(buzz)	
See Also:	<pre>PlayForeground(), PlayBackGround()</pre>	

Name/Symbol: StringLength()

 $\label{eq:Description:Description:Determines the length of a string, in characters.$

```
Usage: StringLength(<string>)
Example: StringLength("absolute") # == 8
StringLength(" spaces ") # == 12
StringLength("") # == 0
See Also: Length(), SubString()
```

Name/Symbol: StripQuotes()

Description:	Strips quotation marks from the outside of a string. Useful you are reading in data that is quoted.			
Usage:	StripQuotes(<text>)</text>			
Example:	text <- gQuote + "abcd" + gQuote Print(StripQuotes(text)) ## abcd Print(StripQuotes("aaa")) ##aaa			
See Also:	<pre>StripSpace()</pre>			

Name/Symbol: StripSpace()

Description:	Strips spaces from the start and end of a string. Useful for cleaning up input and such.	or
Usage:	<pre>StripSpaces(<text>)</text></pre>	
Example:	text <- " abcd " Print(StripSpace(text)) ## 'abcd' Print(StripSpace("aaa")) ## 'aaa'	
See Also:	StripQuotes()	

Name/Symbol: SubList()

Description:	Extracts a list from another list, by specifying beginning and end points of new sublist.
Usage:	<pre>SubList(<list>, <begin>, <end>)</end></begin></list></pre>
Example:	SubList([1,2,3,4,5,6],3,5) # == [3,4,5]
See Also:	<pre>SubSet(), ExtractListItems()</pre>

Name/Symbol: Subset()

Description:	Extracts a subset of items from another list, returning a new list that includes items from the original list only once and in their original orders. Item indices in the second argument that do not exist in the first argument are ignored. It has no side effects on its arguments.
Usage:	<pre>Subset(<list>, <list-of-indices>)</list-of-indices></list></pre>
Example:	Subset([1,2,3,4,5,6],[5,3,1,1]) # == [1,3,5] Subset([1,2,3,4,5], [23,4,2]) # == [2,4]
See Also:	<pre>SubList(), ExtractItems(), SampleN()</pre>

Name/Symbol: SubString()

Description:	Extracts a substring from a longer string.			
Usage:	<pre>SubString(<string>, <position>, <length>) If position is larger than the length of the string, an empty string is returned. If position + length exceeds the length of the string, a string from <position> to the last character of the string is returned.</position></length></position></string></pre>			
Example:	<pre>SubString("abcdefghijklmnop",3,5) # == "cdefg"</pre>			
See Also:				

Name/Symbol: Sum()

Description: Returns the sum of <list>. Usage: Sum(<list>) Example: sum <- StDev([3,5,99,12,1.3,15]) # == 135.3 See Also: Min(), Max(), Mean(), Median(), Quantile(), StDev()

Name/Symbol: SummaryStats()

Description:	Computes summary statistics for a data list, aggregated by la-
	bels in a condition list. For each condition (distinct label in
	the <cond> list), it will return a list with the following entries:</cond>
	<cond> <n> <median> <mean> <sd></sd></mean></median></n></cond>

Usage: SummaryStats(<data>,<cond>) Example: dat <- [1.1,1.2,1.3,2.1,2.2,2.3] cond <- [1,1,1,2,2,2] Print(SummaryStats(dat,cond))

Result:

[1,	З,	1.1,	1.2,	0.0816497]
,	[2,	, З,	2.1,	2.2,	0.0816497]
]					

See Also: StDev(), Min(), Max(), Mean(), Median(), Quantile(), Sum()

Name/Symbol: SystemCall()

Description:	Calls/runs another operating system command. Can also be used to launch another PEBL program. Useful to check Get- SystemType() before running.
	Note that the output of a command-line argument is generally not passed back into PEBL; just the function's return code, which is usually 0 on success or some other number on failure (depending upon the type of failure). Some uses might include:
Usage:	SystemCall("text-of-command") SystemCall("text-of-command","command-line-options")
Example:	<pre>if(GetSystemType() == "WINDOWS") { x <- SystemCall("dir input.txt") } else { x <- SystemCall("ls input.txt") } if(x <> 0)</pre>

```
{
   SignalFatalError("Expected file ["+
        "input.txt] does not exist")
}
```

See Also: GetSystemType()

8.20 T

Name/Symbol:	Tab()
Description:	Produces a tab character which can be added to a string. If displayed in a text box, it will use a 4-item tab stop.
Usage:	Tab(3)
Example:	Print("Number: " Tab(1) + number) Print("Value: " Tab(1) + value) Print("Size: " Tab(1) + size)
See Also:	Format(), CR()
Name/Symbol:	Tan()
Description:	Tangent of <deg> degrees.</deg>
Usage:	Tan(<deg>)</deg>
Example:	Tan(180)
See Also:	Cos(), Sin(), ATan(), ACos(), ATan()
Name/Symbol:	ThickLine()
Description:	Makes a thick line between two coordinates. This just creates a polygon object to serve as the line.
Usage:	ThickLine(<x1>,<y1>,<x2>,<y2>, <size-in-pixels>,<color>)</color></size-in-pixels></y2></x2></y1></x1>
Example:	
	a <- ThickLine(10,10,300,400,20, MakeColor("red")) AddObject(a,gWin) Draw()

See Also: Line(), Polygon()

Name/Symbol: TimeStamp()

Description:	Returns a string containing the date-and-time, formatted ac- cording to local conventions. Should be used for documenting the time-of-day and date an experiment was run, but not for keeping track of timing accuracy. For that, use GetTime().
Usage:	TimeStamp()
Example:	a <- TimeStamp() Print(a)
See Also:	GetTime()

Name/Symbol: ToInteger()

Description:	Rounds a number to an integer, changing internal representa- tion.
Usage:	ToInteger(<number>) ToInteger(<floating-point>) ToInteger(<string-as-number>)</string-as-number></floating-point></number>
Example:	ToInteger(33.332) # == 33 ToInteger("3213") # == 3213
See Also:	<pre>Round(), Ceiling(), AbsCeiling(), Floor(), AbsFloor()</pre>

Name/Symbol: ToFloat()

Description: Converts number to internal floating-point representation.

Usage: ToFloat(<number>)

Example:

See Also:

Name/Symbol: ToNumber()

Description: Converts a variant to a number. Most useful for character strings that are interpretable as a number, but may also work for other subtypes.

```
Usage: ToNumber(<string)
ToNumber(<number>)
```

Example:	<pre>a <- ToNumber("3232") Print(a + 1) # produces the output 3233.</pre>
See Also:	ToString(), ToFloat(), Round()

Name/Symbol: ToRight()

Description: Determines whether a point p3 is 'to the right' of a line segment defined by p1 to p2. Works essentially by computing the determinant.

Usage:	ToRight(<p1>,<p2>,<p3>)</p3></p2></p1>
Example:	<pre>a <- [100,0] b <- [100,100] c <- [150,50] ToRight(a,b,c) # returns 1; true ToRight(b,a,c) # returns 0; false</pre>

See Also: GetAngle() GetAngle3, SegmentsIntersect

Name/Symbol: ToString()

Description:	Converts value to a string representation. Most useful for numerical values. This conversion is done automatically when strings are combined with numbers.
Usage:	ToString(<number>) ToString(<string>)</string></number>
Example:	a <- ToString(333.232) Print(a + "111") # produces the output '333.232111'.
See Also:	ToString(), +.

Name/Symbol: TranslateKeyCode()

Description: Translates a code corresponding to a keyboard key into a keyboard value. This code is returned by some event/device polling functions.

Usage:

Example:

See Also:

Name/Symbol:	Transpose()
Description:	Transposes or "rotates" a list of lists. Each sublist must be of the same length.
Usage:	Transpose(<list-of-lists>)</list-of-lists>
Example:	Transpose([[1,11,111],[2,22,222], [3,33,333], [4,44,444]]) # == [[1,2,3,4],[11,22,33,44], # [111,222,333,444]]
See Also:	Rotate()

8.21 U

Name/Symbol: UpdatePulldown()

Description:	This changes the list being used in a Pulldown object. It tries to maintain the same selected option (matching the text of the previous selection), but if not found will select index 1. It calls DrawPullDown when complete, but a Draw() command must be issued before the pulldown changes will appear.
Usage:	UpdatePullDown(object, newlist)
Example:	options <- MakePulldownButton(["A",B","C"],400,250,gWin,14,100,3) Draw() WaitForAnyKeyPress()
	<pre>##This should add a fourth option but C should still be selected. UpdatePullDown(options,["A","B","C","D"]) Draw() WaitForAnyKeyPress()</pre>
See Also:	MakePullDown(), Pulldown(), DrawPulldown
Name/Symbol:	UpdateScrollbox()
Description:	This updates the layout of a ScrollBox. It should be used if you manually change the .list or .listoffset properties. It won't actually redraw the scrollbox (which is done by DrawScrollbox).
Usage:	UpdateScrollBox(sb)
	Here, sb is the scrollbox object.
Example:	See ui.pbl in the demo directory for examples of the use of a scrolling text box. A brief example follows:

```
sb <- MakeScrollBox(Sequence(1,50,1),"The numbers",40,40,gWin,12,150,5
Draw()
resp <- WaitForClickOntarget([sb],[1])
CallFunction(sb.clickon,[sb,gClick])
#Alternately: ClickOnScrollbox(sb,gClick)
##change the selected items
sb.list <- Sequence(sb.selected,sb.selected+50,1)
UpdateScrollbox(sb)
DrawScrollbox(sb)
Draw()
See Also: MakeScrollingTextBox MakeScrollBox DrawScrollBox
ClickOnScrollBox
```

Name/Symbol: Uppercase()

Description:	Changes a string to uppercase. Useful for testing user input against a stored value, to ensure case differences are not de- tected.
Usage:	Uppercase(<string>)</string>
Example:	Uppercase("POtaTo") # == "POTATO"
See Also:	Lowercase()

8.22 W

Name/Symbol:	Wait()
Description:	Waits the specified number of milliseconds, then returns.
Usage:	Wait(<time>)</time>
Example:	Wait(100) Wait(15)
See Also:	
Name/Symbol:	WaitForAllKeysUp()
Description:	Wait until all keyboard keys are in the up position. This includes numlock, capslock, etc.
Usage:	
Example:	
See Also:	
Name/Symbol:	WaitForAnyKeyDown()
Description:	Waits for any key to be detected in the down position. This includes numlock, capslock, etc, which can be locked in the down position even if they are not being held down. Will return immediately if a key is being held down before the function is called.
Usage:	
Example:	
See Also:	WaitForAnyKeyPress()
Name/Symbol:	WaitForAnyKeyDownWithTimeout()

Description: Waits until any key is detected in the down position, but will return after a specified number of milliseconds.

Usage: WaitForAnyKeyDownWithTimeout(<time>)

Example:

See Also:

Name/Symbol: WaitForClickOnTarget()

Description: Allows you to specify a list of graphical objects in <objectlist> and awaits a click on any one of them, returning the corresponding key in <keylist>. Also, sets the global variable gClick which saves the location of the click, if you need it for something else.

```
x <- WaitForClickOnTarget(<objectlist>,<keylist>)
Usage:
Example:
                 resp <- Sequence(1,5,1)</pre>
                 objs <- []
                 loop(i,resp)
                 {
                   tmp <- EasyLabel(i +". ",</pre>
                             100+50*i,100,gWin,25)
                   objs <- Append(objs, tmp)</pre>
                 }
                 Draw()
                 click <- WaitForClickOnTarget(objs,resp)</pre>
                 Print("You clicked on " + click)
                 Print("Click location: [" + First(gClick) +
                       ", " + Second(gClick) + "]")
```

See Also:

Name/Symbol: WaitForClickOnTargetWithTimeout()

Description: Allows you to specify a list of graphical objects in <objectlist> and awaits a click on any one of them, returning the corresponding key in <keylist>. Also, sets the global variable gClick which saves the location of the click, if you need it for something else. The function will return after the specified time limit.

> If no response is made by timeout, the text <timeout> will be returned (instead of the corresponding keylist element), and gClick will be set to [-1, -1].

> This function can also be useful to dynamically update some visual object while waiting for a response. Give timeout some small number (below 50 ms, as low as 1-5), and loop over this repeatedly until a 'proper' response is given, redrawing a timer or other dynamic visual element each time.

Usage:	<pre>x <- WaitForClickOnTarget(<objectlist>,<keylist>,<timeout-in-ms>)</timeout-in-ms></keylist></objectlist></pre>
Example:	<pre>resp <- Sequence(1,5,1) objs <- [] loop(i,resp) {</pre>
	<pre>tmp <- EasyLabel(1 +". ",</pre>
	Draw() Click <- WaitForClickOnTargetWithTimeout(objs,resp,3000) Print("You clicked on " + click)
	<pre>Print("Click location: [" + First(gClick) + ", " + Second(gClick) + "]")</pre>
See Also:	WaitForDownClick(), WaitForMouseButton()
Name/Symbol:	WaitForDownClick()
Description:	Will wait until the mouse button is clicked down. Returns the same 4-tuple as WaitForMouseButton:
	<pre>[xpos, ypos, button id [1-3], "<pressed>" or "<released>"]</released></pressed></pre>
	but the last element will always be <pressed></pressed> . Useful as a 'click mouse to continue' probe.
Usage:	WaitForDownClick()
Example:	<pre>x <- WaitForDownClick() Print("Click location: [" + First(x) + ", " + Second(x) + "]")</pre>
See Also:	WaitForClickOnTarget(), WaitForMouseButton()

Name/Symbol: WaitForKeyListDown()

Description: Returns when any one of the keys specified in the argument is down. If a key is down when called, it will return immediately.

Usage: WaitForKeyListDown(<list-of-keys>)

Example: WaitForKeyListDown(["a","z"]) See Also: Name/Symbol: WaitForListKeyPressWithTimeout() Description: Returns when any one of the keys specified in the argument is pressed, or when the timeout has elapsed; whichever comes first. Will only return on a new keyboard/timeout events, and so a previously pressed key will not trip this function, unlike WaitForKeyListDown(). The <style> parameter is currently unused, but may be deployed in the future for differences in how or when things should be returned. Returns the value of the pressed key. If the function terminates by exceeding the <timeout>, it will return the string ["<timeout>"]. Usage: WaitForListKeyPressWithTimeout(<list-of-keys>, <timeout>,<style>) t-of-keys> can include text versions of many keys. See Chapter 4, section "Keyboard Entry" for complete list of keynames. Example: x <- WaitForListKeyPressWithTimeout(["a","z"],</pre> 2000.1) if(IsList(x)) { Print("Did Not Respond.") } See Also: WaitForKeyListDown, WaitForListKeyPress, WaitForKeyPressWithTimeout

Name/Symbol: WaitForListKeyPress()

Description: Returns when any one of the keys specified in the argument is pressed. Will only return on a new keyboard event, and so a previously pressed key will not trip this function, unlike WaitForKeyListDown() Returns a string indicating the value of the keypress.

```
Usage: WaitForListKeyPress(<list-of-keys>)
```

Example: WaitForListKeyPress(["a","z"])

See Also: WaitForKeyListDown, WaitForListKeyPressWithTimeout
N /C h - l.						
Name/Symbol:	WaitForKeyPress()					
Description:	Waits for a keypress event that matche of this function is preferred over WaitF the state of the key. Returns the value	a keypress event that matches the specified key. Usage ction is preferred over WaitForKeyDown(), which tests of the key. Returns the value of the key pressed.				
Usage:	WaitForKeyPress(<key>)</key>					
Example:						
See Also:	WaitForAnyKeyPress(), WaitForListKeyPress()	WaitForKeyRelease(),				
Name/Symbol:	WaitForKeyUp()					
Description:						
Usage:						
Example:						
See Also:						
Name/Symbol:	WaitForMouseButton()					
Description:	Waits for a mouse click event to occur. and returns a 4-tuple list, indicating:	This takes no arguments,				

```
[xpos,
               ypos,
               button id [1-3],
               "<pressed>" or "<released>"]
Usage:
                 WaitForMouseButton()
Example:
              ## Here is how to wait for a mouse down-click
               continue <- 1
               while(continue)
               {
                   x <- WaitForMouseButton()</pre>
                   if(Nth(x,4)=="<pressed>")
                    {
                        continue <- 0
                    }
               }
               Print("Clicked")
```

See Also:	ShowCursor, W SetMouseCursorPosition,G	aitForMouseButtonWithTimeout etMouseCursorPosition
Name/Symbol:	WaitForMouseButtonWithTi	meout()
Description:	Waits for a mouse click ever reached. This takes a single When clicked, it returns a 4-	ent to occur, or a timeout to be argument: timeout delay in ms. tuple list, indicating:
	[xpos, ypos, button id [1-3], " <pressed>" or "<releas< td=""><td>ed>"]</td></releas<></pressed>	ed>"]
	when not click and timeou [timeout]	nt is reached, it returns a list:
Usage:	WaitForMouseButtonWit	hTimeOut()
Example:	## Here is how to wait f	or a mouse down-click
	<pre>continue <- 1 while(continue) { x <- WaitForMouseBu if(First(x)=="<time 0="" 1="" <-="" continue="" else="" is="" pre="" print("clicked")<="" print("time="" {="" }=""></time></pre>	ttonWithTimeout() out>") "+GetTime())
See Also:	ShowCursor, GetMouseCursorPosition	SetMouseCursorPosition,

Name/Symbol: WaitForNetworkConnection()

Description: Listens on a port, waiting until another computer or process connects. Return a network object that can be used for communication.

Usage: WaitForNetworkConnection(<port>)

Example:	See nim.pbl for example of two	o-way network connection	1.
	net <- WaitForNetworkCon dat <- GetData(net,20) Print(dat) CloseNetworkConnection()	nnection(1234) net)	
See Also:	ConnectToHost, C WaitForNetworkConnection, CloseNetworkConnection	onnectToIP, Go SendData, ConvertIPS	etData, String,

Name/Symbol: while

Description: 'while' is a keyword, and so is part of the syntax, not a function per se. It executes the code inside the {} brackets until the test inside the () executes as false. This can easily lead to an infinite loop if conditions are not met. Also, there is currently no break statement to allow execution to halt early. Unlike some other languages, PEBL requires that the {} be present.

Usage:

G-	while(<test expression="">) { code line 1 code line 2 }</test>
Example:	<pre>i <- 1 while(i <= 10) { Print(i) i <- i + 1 } # prints out the numbers 1 through 10</pre>
See Also:	loop(), { }

Name/Symbol: WritePNG()

Description: WritePNG() creates a graphic file of the screen or a widget on the screen. It can also be given an arbitrary widget. For the most part, widgets added to other widgets will be captured fine, but sometimes polygons and shapes added to other widgets may not appear in the output png.

```
Usage:
                x <- WritePNG("screen1.png",gWin)</pre>
                ## Use like this to create an animated screencast
                  define DrawMe()
                   {
                     pname <- "fileout"+ZeroPad(gid,5)+".png"</pre>
                     Draw()
                     WritePNG(pname,gWin)
                   }
                  define Start(p)
                  {
                    gid <- 1
                    gWin <- MakeWindow()
                    img <- MakeImage("pebl.png")</pre>
                    AddObject(img,gWin)
                    while(gid < 100)</pre>
                     {
                        Move(img,RandomDiscrete(800),
                                  RandomDiscrete(600))
                        DrawMe()
                        gid <- gid + 1
                     }
                  }
```

8.23 Z

Name/Symbol: ZeroPad

Description:	Takes a number and pads it v point so that its length is equal a positive integer and less than	with zeroes left of the decimal to <size>. Argument must be ten digits. Returns a string.</size>
Usage:	ZeroPad(<number>, <lengt]< td=""><td>h>)</td></lengt]<></number>	h>)
Example:	Print(ZeroPad(33,5)) Print(ZeroPad(123456,6)) Print(ZeroPad(1,8))	# "00033" #"123456" #"00000001"
See Also:	Format()	

Name/Symbol: ZoomPoints

Description:	Takes a set of points (defined in a joined list $[[x1,x2,x3,],[y1,y2,y3,]]$ and adjusts them in the x and v direction independently, returning a similar $[[x],[y]]$ list.
	Note: The original points should be centered at zero, because the get adjusted relative to zero, not relative to their center.
Usage:	ZoomPoints(points, <xzoom>,<yzoom>)</yzoom></xzoom>
Example:	points <- [[1,2,3,4],[20,21,22,23]] newpoints <- ZoomPoints(points,2,.5) ##Produces [[2,4,6,8],[10,11.5,11,11.5]]
See Also:	RotatePoints(), ReflectPoints

Color Name Reference

In PEBL, around 750 colors can be accessed by name, using the MakeColor() function. Each name or corresponds to a specific RGB value. The following table provides examples of the particular color names, RGB values, and the obtained shade produced by PEBL.

Color Name	\mathbf{Red}	\mathbf{Green}	Blue	Example
ALICE BLUE	240	248	255	
ALICEBLUE	240	248	255	
ANTIQUE WHITE	250	235	215	
ANTIQUEWHITE	250	235	215
