The actual Open Box product may differ in packaging and included accessories, but has been tested to ensure basic functionality. Checksum defects every time. Their driver utilities fail to operate correctly. It wont even function until you have DFI mail you an upgraded CMOS. And they ship in cardboard. What a state this is. It just died on me last week so I called up DFI customer service. I actually got real people each time I called and they helped me without asking me redundant questions. Then they gave me an RMA number with no questions asked. Now thats service! It just may be that this isnt their best quality board out there. Ill be getting a PCI express next time anyway. All arrived DOA. Dont even consider this board, youll never use it. RMAing to newegg. Havent been able to get in touch with DFI yet for RMA not sure about warranty period. Good board, just got a bad egg, I guess. BIOS, as shipped, doesnt support EM64T or any 6xx series or better processors need new BIOS chip from manufacturer. Newegg RMAed a replacement, though the replacements cable bags were opened and boards jumpers moved from their factory default positions, leading me to wonder if the replacement was used or a refurbished. However, the replacement does seem to work fine. Click here for more details. Secure shopping made faster. Check out with PayPal. I was impressed all the way around with the 875PT, from its performance at stock speeds to its overclock, this board was rock solid and a great performer. There are very few differences between the 875 and cheaper 865 chipset Intel's PAT technology, Integrated Gigabyte Ethernet in the SB, and most tests show a 25% performance boost across the board. So why did DFI choose the 875 chipset for the 875PT After talking with the great folks at DFI I was told that the 875PT was their initial offering into the "hybrid" board field, and that in fact they intend to release a 865 chipset based board for the LGA 775. Aside from that I was told that DFI feels that the 875 chipset offers better overclocking potential than the 865 chipset, and that along with the PAT and Gigabyte Ethernet would pique consumers interest in this market. I couldn't agree more! DFI bundles have always been top notch, and the accessories bundled in with the 875PT are no exception. Besides the usual manual, driver disk, etc, DFI included fluorescent orange rounded IDE and floppy cables, a sticker and badge set, a transport strap, A UV reactive sleeving kit for wiring, extra jumpers, WinDVD, and the Front X Drive Bay. The Front X drive bay is an odd duck, fitting into one of your case's 5.25 drive bays. The Front X panel has a set of four diagnostic lights for diagnosing system issues. Also included on the panel is a 1394b Firewire port, an optical SPDIF port, and finally an SATA port, for connecting an external SATA device something that will become very handy in the coming year with SATA taking over on a larger scale. As nice as this panel was, I was a bit shocked and a lot disappointed that there were no USB connectors at all included in the Front X Drive Bay. How useful is something like this actually going to be without a single USB connector. The page youre trying to reach is not here or has been removed. All Rights Reserved. The Pro875B is DFI's Canterwood offering in this big bundle, top performance line. With its orange and yellow UVreactive slots and connectors and great features, it's not only a great looking but also a great performing P4 solution. In a few short months, DFI went from a relatively unknown company to a household name. If you build it for enthusiasts, enthusiasts will come. And that's what DFI bet on, as well as the growing popularity of UV sensitive products. So far, the bet has paid off. More geeks than ever are checking for what DFI has cooking. The nForce2 and original Pro875 proved to be excellent performers and picked up quite a few awards. These features are pretty cool, so I recommend you check that link out if you are considering an LP board for your next purchase. Maybe it's because there's so much in the big, colorful box, or maybe it's because they are made for people who want to have fun. One thing is for sure; it's cool to get such a substantial package for your money. Here's what DFI includes with the LP Pro875B. The only thing that has changed in the bundle since the original LP boards were released is that now the FrontX device includes a four diagnostic LED unit. It still is one of the best bundles around.

The PC Transpo carrying harness fits in with the LAN party theme perfectly, and the FrontX front bay device is very practical and provides easy access to frequently used ports. While installing components, I ran into no issues or annoyances. One issue that some people might have though is the location of the CDin and AUXin connectors. They are very close to the PCI slots and could be

bothersome to deal with if a user has many expansion cards and chooses to use these connectors. I don't see it being an issue for most users though, since you don't even need to plug in a CDROM's audio cable these days. Click the thumbnail below to see a closeup of the board. The floppy and PATA RAID connections are located in this area of the board, along with two SATA connections, the CMOS battery and Intel's ICH5R southbridge chip. Two of the Pro875B's 3pin fan headers are also located in this area, although you can only see one in the pic. I'm happy to report that because of the AGP slot and DIMM locations, RAM can be uninstalled and installed without removing the video card first at least with the 9800 XT I was using. The Pro875B's are of course UVreactive orange to match the rest of the UVreactive theme of the board. In this pic, you can see the CDin and AUXin jacks that I referred to earlier. Adjacent to them is the game port header, to which you can connect the included game port bracket. Along the right edge of this image, you can see another 3pin fan header. The heatsink is very close to both the AGP slot and one corner of the CPU cooler retaining bracket. I doubt this will cause a problem for many users, but it's worth noting nonetheless. The Quick Installation Guide should be helpful to newbies jumping into their first or second install. It will also function as a good reference for all users to quickly find where things are laid out on the board. I used it several times while installing components.

I encountered no issues while installing the Intel LAN and chipset drivers, CMedia audio drivers and various included utilities. The orange looks awesome it doesn't hurt that it happens to be my favorite color. Most of these settings are found in the Genie BIOS screen. In a nutshell, CMOS Reloaded allows the user to save BIOS configurations, name those configurations and easily reload them. With the latest BIOS versions, the LP Pro875B offers the ability to save four configurations. While some users may not find much utility in such a feature, many tweekers might enjoy the benefits of CMOS Reloaded. Switching between these two settings would be considerably easier and take much less time than manually changing each BIOS option each time. I compared the Pro875B to DFI's Infinity 865PE with PAT enabled. PAT, in case you forgot or aren't aware, is Intel's Performance Acceleration Technology and was intended by Intel to be a feature only on Canterwood or 875 motherboards. Most companies figured out a way to allow users to enable PAT on their Springdale or 865 boards though. Therefore, a Springdale board with PAT enabled will perform on par with a Canterwood board. So, in all these benchmarks, both boards have PAT and HT HyperThreading enabled. The max stable overclock I achieved was 250 MHz or 1GHz frontside bus FSB. This was with a FSBDRAM clock ration of 11, so while the FSB was at 250MHz, the DDR was clocked to 500MHz. I'm not sure if it was the board or processor holding me back, but I'm pretty sure it was one or the other. I'm leaning towards the processor since I've heard many cases where the Pro875B gets to 275MHz. It's one of the few boards that can hit this extreme overclock. I did get the system to boot at 260MHz 11, but it wasn't stable for very long. Here are the specs of the test system. This is completely attributable to the PAT function being enabled on the 865PE. Without it, the Pro875B would mop the floor with the Infinity board.

<http://echoploda.com/images/Daewoo-Skid-Steer-Manual.pdf>

The Pro875B put up some very respectable numbers in these tests. The Pro875B performs virtually the same as the 865PE but shows a nice boost when overclocked. Once again, it was as stable at 250MHz FSB as it was at the default 200MHz. So, there's no reason not to overclock the Pro875B to get those extra frames. Overall, it's been a very positive experience working with the Pro875B. This board includes many unique features, such as the onboard power and reset switches, CMOS Reloaded, gigabit LAN, 5.1 audio, PATA and SATA RAID and of course the UVreactive sockets and slots. As if the features weren't already enough, DFI throws in a LAN partyoriented bundle to really drive the theme home. This bundle includes a PC transporting harness PC Transpo, UVreactive round cables, FrontX and other goodies. It's one of the best feature sets and bundles around. You get

great performance to boot. I found the Pro875B to be a very easy overclocker, at least up to 250MHz frontside bus FSB. Either the board or CPU was keeping me from getting higher, and I'm not sure which. If you aren't into overclocking, this board will easily make you happy with its topnotch performance. That might seem high, but it really isn't once you consider the features, bundle, performance and fact that it's one of the best P4 boards and packages you can get. I recommend it without hesitation to newbies and enthusiasts alike. The laptop I am looking at today, ASUS ROG Zephyrus G15, is another challenger to the old partnership. Please try a different number. If you have questions or would like further support, please contact our support department. No problem! The Crucial X8 and X6 offer incredible SSD performance through a convenient USB interface. No problem! The Crucial X8 and X6 offer incredible SSD performance through a convenient USB interface. Inquiries only please. Thanks. But often its a tough job to find versions for them, especially for vendors like DFI, EPoX and so on. For EPoX I couldnt find a good source at all. And maybe hwbot can host them He sent me this link. Unfortunately none of the sources behind the link worked but due to his hint I knew what to look for. Now I have about 10 biosversions for this board and lots of other DFIboards are supported. But only AMDbased ones. So still looking for bios for Intelbased DFIboards. But its a good start. I can save any bios I have on my boards. The files are out there, you just have to find them. I use them as draw to my own site. You can always message me if youre looking for a particular bios. Chances are I have it. Sad if this is true but I will go thru my old drives im unorganized. as i found a old mobo site that had pentium bioss and other such bios.Moved them to a private server long ago, accessible only on my say so. I saw only the information my eyes wanted to see. Thanks again for the hint! The last 5 are not in my collection. Moved them to a private server long ago, accessible only on my say so. I dont actually need the newest version, just to know if any newer version supports an 8.5 multiplier because my CPU is limited by the multiplier there is no way to change it to a.5 The board is a Lanparty DK P35T2 it is identical to the DK p35T2RS except that it uses an ICH9 PCH instead of the ICH9R, is missing 2 sata ports and may be missing a few odds and ends here and there. FIY, there is no actual picture i could find for the DK P35T2. All discontinued listings for it have the DK P35T2RS picture. Paste as plain text instead Display as a link instead Clear editor Upload or insert images from URL. This product is not for sale. It is shown here for configuration purposes only.

Snapdragon 8cx Snapdragon 8cx Wolfenstein ET is a free, standalone multiplayer game that is based on the original Return to Castle Wolfenstein that was released a few years back. It uses a heavily modified version of the Quake III engine, which makes it a very easytouse benchmarking tool. Running this test with a highend graphics card, at these minimal settings, isolates processor and memory performance without being limited by the graphics subsystem. The 925XT2 posted a framerate about 5 frames per second higher than the 875PT, our roughly 3.7% higher. When we tested these systems with UT 2004, we ensured that all of them were being benchmarked with the exact same ingame settings and graphical options and we dropped the resolution and detail levels to isolate CPU and memory performance. This time the DFI LANPARTY 875PT was the top performer, posting a framerate about 2 FPS, or 1.6%, higher than the LANPARTY 925XT2. The contents. Select Your Operating System, download zipped files, and then proceed to manually install them. Recommended if Dfi Lanparty 875p T is the only driver on your PC you wish to update. Password Don't have a password. Please register, and get one. It turns out that we werent Youll find pictures of the modules we tested below Most of my decisions about computer hardware is based on your very helpful articles.I purchased the Gigabyte 8KNXP and Hyperx 3200, to my disappointment they are not compatible. Kingston has ignored all emails about this problem. I would not recommend any of their products if using this motherboard.

This article, this website very useful. In my favorites. YV Excellent! Also when will we see a similar test on the NForce2 boards In my country, only kingston and twinmos are available and unfortunately, hyperx is a lot more expensive than twinmos! DDRII is on the near horizon BUT will it be the answer for superfast compatible memory.What happens with greater than 1GB.What does the graph show. It has numbers at the end of the bars e.g. 339.6 what is it a measurement of. Is a larger number better or worse I want to open a window so badly.Sign up now.
