LP UT NF4 UltraD AMD FX53 G.SKILL 1x 1024 stick 2325 I recently got myself the above mentioned board, with two Gainward 7800GTX cards. The board installed perfectly, and I managed to run all the necessary installations and benchmarks. Then I decided to load the latest nonmodified bios on the site, and all of a sudden my machine doesn't want to boot Windows. It should be an E3 Venice Core, with halved L2 Cache, or do i have the wrong informations With Athlon 64 this problem not exist. Try to send an email to dfi directly or go to [www.dfistreet.com](http://www.dfistreet.com), maybe there they can help u! Good luck! There you will find the latest official bios for the motherboard. <http://www.aim4fitness.co.uk/userfiles/files/bpm-studio-manual-espa-ol.xml>

The history of this site goes back to 1996 when I was taking my first steps on the internet. Gradually the site grew to what it is now. With all of the features, included goodies, and overclocking options, it's not hard to see why. What makes that fact most impressive is that DFI only started competing for the enthusiast's dollar two years ago when it first introduced the now hugely popular LANPARTY line. The company has only gained momentum over the past couple years and shows no signs of slowing down as it continues to produce some of the best performing and overclocking boards for all mainstream chipsets. The LANPARTY line isn't all about performance and features though. DFI also wants to lead in the bundle department, and it does just that by offering one of the biggest bunch of goodies available in any retail motherboard package. Recent reviews show that DFI continues to flex its muscle in all the right ways to leave users satisfied and then some. But, it's time for us to do our own evaluation and review of the new LANPARTY flagship board, the LANPARTY NF4 SLIDR, one of the most featurepacked boards ever created. The LP NF4 SLIDR is of course no exception. This board boasts eight SATA ports four courtesy of the nForce4 chip and four via Silicon Image's Sil 3114 chip, RAID nVRAID allows arrays to span across SATA and PATA drives, nVIDIA ActiveArmor nForce4 hardware firewall, dual gigabit LAN, 8channel audio with Karajan daughter card, onboard power and reset buttons, CMOS Reloaded and more. You can read more details about the features,

specs and package contents below. Heck, I've been following DFI's progress with the LANPARTY motherboards ever since they were introduced a couple years ago, and I'm still shocked by how much they manage to throw in. To hold all the goodies, you get one of the biggest motherboard boxes ever made, but don't worry, DFI throws in a handle so you can actually manage to carry the box to your installation

destination. <http://www.bucklandandchippingpc.org.uk/userfiles/bpm-studio-manual.xml>

All kidding aside, it is a nice bundle, and DFI has made a few changes to it in the last several months. Another noticeable change is that the included FrontX device is now black instead of beige. The FrontX parts included are much different from the first couple LANPARTY boards that were released. It's an interesting assortment; I'd really like to see a USB 2.0 part included in there like in the older packages. It is true that most newer cases include USB 2.0 ports up front, but if you have an older case that you really like, this FrontX kit will be no help in getting USB 2.0 to the front of your system. But, you can of course always buy other FrontX parts at FrontX.com. Fitting in perfectly with the LAN party theme, DFI continues to throw in the PC Transpo carrying harness. This was included to make removing the SLI jumpers easier. I'll get to that a little later. As a result, the DIMM slots are to the left of instead of above the CPU socket. I can't think of any inherent disadvantages to doing it this way, and overall, DFI has done a good job laying out the LP NF4 SLIDR. Only the corner with the nForce4 MCP is really busy, which you can see in the first picture below. The second picture shows the back or bottom of the board. I just happened to flip it over and noticed what appears to be a custom socket 939 backplate. I've never seen one like the one DFI uses anyway. I'm not sure that this cooler is much quieter than some other chip coolers I've seen, but it does look pretty cool. Plus, the magnetic levitation design should decrease wear and tear on the cooler over time, which hopefully equates to longer life. The rather large heatsinks cover and help cool the MOSFETs. The interesting jumper set in the very corner of the board is an enthusiast-oriented feature for sure. Switching this jumper, referred to as "DRAM 4V Select," allows users to increase memory voltage up to 4V.

You better know what you're doing if you even think about upping your DRAM voltage anywhere near those levels. This could pose problems with larger coolers used in conjunction with taller memory modules, but I was able to install the beefy Thermalright XP90 heatsink and Corsair XMS PRO modules without a problem. I wouldn't call it an ideal installation though. This is where the Karajan audio card would be installed. You can see a couple more fan headers here. There are a total of five 3pin fan connectors, which is much better than the three fan connectors on the Foxconn nForce4 Ultra mainboard I reviewed here recently. If you look closely at the second image below, you can see the two rows of jumpers in between the two PCI Express x16 slots. This is how DFI chose to implement switching between SLI and single video card mode. How you have the jumpers set affects how each slot functions. In other words, the jumper configuration dictates the lane widths assigned to each of the PCI Express slots the first four slots, starting from the left. In this case, you see one picture without the Karajan audio card installed and one with it installed. Just as with that board the Foxconn NF4UK8AA8EKRS, longer video cards will hover over the main chip's HSF. Additionally, that area at the end of a longer card will tend to get pretty crowded if you have SATA cables, USB header wires and a floppy cable plugged in. The main thing worth noting here is that any heatsink that hangs over towards or above the DIMM slots may limit the height of your memory modules, which is only an issue with Corsair's PRO and XPERT modules right now I believe. Not that these modules can't be used with the LP NF4 SLIDR; it's just not the optimal setup when a beefy heatsink is utilized. The positive side of the DIMM slots being where they are is that you won't have to remove your video card to remove your memory as is the case with so many other motherboards.

Although the manual neglects to mention it, the POST screen directs you to install one RAM module

in DIMM2 for single channel and two modules in DIMM2 and DIMM4 for dual channel mode. With the Karajan installed on the UT 915P, the Karajan card hits the rear 120mm fan, preventing the mainboard from sliding in for installation all the way. I'm glad to see that DFI listened to my concerns and resolved the problem. Configuring the LP NF4 SLIDR for an SLI video card setup is straightforward. You just move the jumpers in between the two PCI Express x16 slots from the 12 position to the 23 position. It might not be as "clean" and quick as other solutions, but it works just fine. DFI even includes a tool to help you get the job done. I installed a couple Leadtek GeForce 6600 GT cards on this board, and I have been quite pleased with the SLI performance. The path to tweaking fun is of course through the Genie BIOS screens, which offer a plethora of advanced options that could keep the most skilled overclocking busy for many hours. I switched the RAM to a better overclocking kit, the Corsair TWINX10243200XL. I ran some tests on the Foxconn board to see if the memory change impacted the results from that review much, and I found that the performance difference was negligible. The second difference in this test system is that I switched out the 6800 GT for two Leadtek 6600 GT's in SLI after running the same benchmarks from the Foxconn review. So, you will get to see the gaming performance of this board with a single 6800 GT and dual 6600 GT's. All three of the boards are based on the same PCB design and layout, which means their performance and overclocking abilities will be very similar. With that in mind, take a look at the fun MrIcee is having over at XtremeResources. The BSOD was indicating a memory problem, but the memory turned out to be just fine. Here are the settings I used when I hit 300. The Sandra tests show them performing almost exactly the same though.

<http://panoramakz.com/images/Daewoo-Wm1010Cc-Manual.pdf>

The SLI setup I used consisted of two Leadtek GeForce 6600 GT's. So, the comparison is of these three configurations the LP NF4 SLIDR with two 6600 GT's in SLI, the LP NF4 SLIDR with one 6800 GT and the Foxconn NF4UK8AA8EKRS with the same 6800 GT. Additionally, you can see that the two motherboards perform almost identically when using the 6800 GT. People are snatching up these boards as fast as they hit virtual store shelves, and I'd have to say they are smart for doing so. This package and the board's features are in a league of their own. The default performance is average, but the overclocking features and BIOS options are worth writing home about. Most users won't even know what all the options are for. I'm still trying to figure a lot of them out. It would actually be nice to be able to hide some of the more advanced options. As of today March 18, fifteen of the top twenty systems in the 3DMark05 hall of fame use DFI SLI systems! With an option for DIMM voltage up to 4V, a "FSB" clock up to 456MHz, CPU clock multipliers and plenty of memory dividers, DFI has made sure its board would come out on top and that its users' performance would as well. This board more than likely won't be your bottleneck when you try to squeeze out every ounce of power from your components. Kudos to DFI for putting together such an awesome package and well designed board. Yeah, it's expensive, but it's a fair price for what you get. If you don't need all the extra goodies in the bundle but want the same performance and overclocking potential, then go for one of DFI's LANPARTY UT nForce4 boards instead. You can't go wrong with DFI's current nForce4 lineup. The laptop I am looking at today, ASUS ROG Zephyrus G15, is another challenger to the old partnership. Doesnt even get as far as offering me the BIOS options etc. All Im stuck with is a very pretty Lanparty nF4 graphic and bugger all else happening. All of the fans are spinning up okay and I cant see anything obvious wrong with the mobo itself. Any ideas or anyone seen anything similar. Gotta say this is a first for me. Though Ive had a system with a bad processor that would POST when it had no ram. The manual hasnt proven hugely helpful but Ive made some progress. It would appear that

the problem is my iPod nano. Im not sure I quite understand how but if the nano is attached to the cable it wont boot. Hangs where I said in the BIOS. No matter what other combo of USB devices I use its fine but as soon as the nano is added to the mix or even if the nano is the only device it hangs on reboot. If the cables in and the nano is unplugged its fine. If I plug the ipod in after booting its fine. This all feels very weird. Click to expand. Shame I didnt link the two. Winflash stalled at 40% ish updating the bios by the way, the rest of the screen went white, i thought the comp had crashed during flash, but about 15 secs later everything went back to normal and it said bios was successfully updated. Also what are the temps like PWMIC and chipset The graphic card does not pass over the chipset fan now. does it I currently have a DFI SLID and now have an ASUS A8N Premium sat at home ready to go in so I can fit my nv78 blocks. If only I had waited a week! AAAARGH! You will have to install xp sp2 on your computer then flash your bios from that i guess. Download appropriate driver for DFI LANPARTY UT nF4 UltraD for your operating system from our website. E Processor We also included the DFI LANParty nF4 SLIDR in our SLI roundup in nForce4 SLI Roundup Painful and Rewarding. This is significant because the designs of the Ultra and SLI versions of the DFI are exactly the same. Both board layouts are essentially the same the only difference is the SLI chipset on the SLI and Ultra chipset on the Ultra. As we detailed in Morphing nForce4 Ultra into nForce4 SLI, the SLI and Ultra chipsets are exactly the same, with the SLI features turned on in the SLI chipset.

NVIDIA has modified the nForce4 chipset, making it more difficult to convert the Ultra to nF4, but the principles are still the same. For more information on the features or layout of the DFI, please refer to any of these aforementioned reviews. Like the Biostar, the DFI has a unique feature among nForce4 Ultra motherboards. Since the Ultra version is identical to the SLI version, even down to using the same BIOS, the Ultra version also features two PCIe x16 slots. If the board is modified to SLI, the SLI becomes a fullblown SLI board. In Ultra clothing without the mod, the DFI LANParty UT nF4 UltraD supports one or two video cards operating independently. The last thing I want is one or TWO more tiny fans just on the mobo to worry about failing. Not some guys, but ALL ones have better result in chaintec and abit with a lower multiplier. But the deeper I looked into the review, the better job you seemed to have done, so sorry if I implied you didnt try very hard. I ALWAYS test manual HTT dividers I know should work for certain 11 memory clocks as well as Auto HTT if it is an available option. We did check each board with an X2. That is the ONLY reason we tested and used

very recent Beta BIOS. Also there are 2 other very recent Chaintech reviews at other websites who had test results almost equal to what I found on the Chaintech, so there are at least 2 other Chaintechs loose with less than stirring overclocking. In the end, as I stated in the review, the Chaintech is a decent board, but at about the same price as the Epox, with poorer overclocking results, it was hard to give it an Editors Choice this time around. The results found in this roundup should remove anyones concern that we get cherry boards from manufacturers. I am a good overclocker, and very experienced in air overclocking and memory overclocking. What I got from these boards on air is all they could do with the TCCD memory that is all but standard test memory for motherboards these days.

The capabilities of the memory we used is also well known and I tweaked for TCCD if settings were available if the board was not doing well at stock memory settings and our normal test timings. I don't think you come to AnandTech for a survey of what other websites or Forums found, because I find overclockers are notorious at exaggerating what they can reach with overlocks. We try to provide a consistent test environment for overclocking that will give repeatable overclocking results. Results, of course, always vary board to board, but having said that, OC results are usually pretty consistent on better boards from sample to sample. I want to open a window so badly. Sign up now. If this has not happened, without a manual Dfi LANPARTY NF4 SLIDR Bios 1.05 driver installation your device may not work properly or may not use all of its features. Download the Dfi LANPARTY NF4 SLIDR Bios 1.05 driver and install it on your computer if the device still is not working properly, read the information further down the site about the Dfi device from the BIOS category. There you will find helpful tips on how to install the Dfi LANPARTY NF4 SLIDR Bios 1.05 driver. You will also learn why it is so important to have current Dfi drivers. It is worth noting that in order for the automatic update to work, the computer must be connected to the Internet perhaps when connecting the Dfi device the computer temporarily did not have the Internet connection or a WiFi signal was weak making it impossible to download the Dfi LANPARTY NF4 SLIDR Bios 1.05 driver. To make sure, disconnect now and reconnect the Dfi device again, and maybe this time the driver will be downloaded. Just download the Dfi LANPARTY NF4 SLIDR Bios 1.05 driver and start the installation keeping in mind that the Dfi device must be at the same time connected to the computer. After the installation of the Dfi LANPARTY NF4 SLIDR Bios 1.05 driver, the device should work properly. Without current Dfi LANPARTY NF4 SLIDR Bios 1.

05 drivers there is a greater risk of the device malfunction, of the reduction in security, and there is a possibility of the total damage of the Dfi device. Manufacturers from time to time issue new versions of the Dfi LANPARTY NF4 SLIDR Bios 1.05 software, repairing the errors they find that may cause problems with the Dfi devices. Therefore, if you notice that a new version of the Dfi LANPARTY NF4 SLIDR Bios 1.05 driver is available, you should install it immediately.
