The two identical graphics cards, which are connected via the SLI bridge, will provide extreme performance allowing you to enjoy games with the most visual effects and the most graphics demanding multimedia utilities. Dual GPUs provide increased 3D graphics and doubles the graphics performance. The system board currently supports the physical layer of x1 and x16 lane widths. The x1 PCI Express lane supports transfer rate of 2.5 Gigabytes 250MBbps per second. <http://mosvag.ru/img/lib/bpt-system-300-manual.xml>

### • 1.0.

The PCI Express architecture also provides a high performance graphics infrastructure by doubling the capability of the existing AGP 8x designs over a x16 PCI Express lane that provides 4 Gigabytes per second transfer rate. CPU Overheat Protection CPU Overheat Protection has the capability of monitoring the CPU's temperature during system boot up. Once the CPU's temperature exceeded the temperature limit predefined by the CPU, the system will automatically shutdown. This preventive measure has been added to protect the CPU from damage and insure a safe computing environment. DDR Double Data Rate SDRAM DDR SDRAM is a type of SDRAM that doubles the data rate through reading and writing at both the rising and falling edge of each clock. This effectively doubles the speed of operation therefore doubling the speed of data transfer. 1CMOS Reloaded CMOS Reloaded is a technology that allows storing multiple userdefined BIOS settings by using the BIOS utility to save, load and name the settings. Winflash stalled at 40% ish updating the bios by the way, the rest of the screen went white, i thought the comp had crashed during flash, but about 15 secs later everything went back to normal and it said bios was successfully updated. Also what are the temps like PWMIC and chipset The graphic card does not pass over the chipset fan now. does it I currently have a DFI SLID and now have an ASUS A8N Premium sat at home ready to go in so I can fit my nv78 blocks. The actual Open Box product may differ in packaging and included accessories, but has been tested to ensure basic functionality. It died after 9 months and took my hard drive along with it. Now it corrupts any hard drive I put in it. Its called LanParty and I had to change a setting in BIOS from its default setting to allow me to connect to my home LAN. I built that computer 6 years ago. Its the one Im writing this review from right now. The only trouble I have EVER had with this computer was due to software issues, and they were pretty easy to fix. New egg rocks I recieved it A day early. Booted right up with out and fuss. Seemed like a great board ran smooth no lock ups. Then it would post but not boot so I replaced the 430 Watt Antec with a 620 WT Corsair.

Nothing changed, so I replaced the 80 Gig, WD HD with a new Seagate 320 Gig. It appears to be getting power to the board, drives and fans but wont post. It appears that DFI boards do not have any factory warranty and since it is over 30 days old I guess Im just out the bucks and the board. Plenty of options. Future upgrade path from Athlon64 to Athlon64 FX or X2. Online support by DFI is a joke. If you buy one of these be aware; using a PCIe video card you will have to turn it on in an odd way first time. That is the ONLY way you will get the video to init, otherwise you get a long beep followed by 3 fast beeps no video. Plenty of fan hookups and easy to navigate BIOS. Made overclocking my Athlon 64 X2 4600 from 2.4GHz to 2.64GHz pretty easy. Gonna increase it more as time goes on. I have never seen Standby break a motherboard beyond repair. I had it working, until I put the PC in standby. After trying to wake from standby, I got no POST. CMOS clear didnt fix it, removing the battery didnt fix it. No stability problems and lots of tweaking options in bios. Its layout is a great improvement by comparison and its support of the faster 939 socket CPUs make it an easy choice for those looking to build a killer fast system. [Click here for more details](#). Learn More The only thing you really lose out on is the extra accessories such as the FrontX and the case carrying straps. The first board we've looked at in this new series of products from DFI is the Lanparty UT nF4 SLID, which is a rather unusual SLI motherboard in several ways. The most obvious difference between the Lanparty UT nF4 SLID and the other SLI boards is the layout, as the CPU socket has been placed below the memory modules. There could potentially be problems with this layout with certain cases such as the SilverStone TJ06 and Enermax CS718S, which have a special cooling setup. This is only an issue with a few cases on the market, but it's worth highlighting. Instead DFI is using six blocks of jumpers that have to be moved to change to SLI mode. The problem with this is that the jumper blocks are quite hard to remove, even with the included tool. Rather than having the audio codec on the motherboard DFI have moved it to a small plugin module, attached to the motherboard via a set of pins. This is meant to reduce EMI interference and other kinds of noise that might be picked up.

<http://dumaxsrl.com/images/Dagr-Tm-Manual.pdf>

However, I have to admit that my untrained ears didn't pick up any more noise on other SLI boards than it did with the DFI Karajan module. The Realtek ALC850 AC97 audio codec might hold back the full potential of DFI's audio setup as it is not the best audio codec on the market partly because it's not HD compliant. How significant that is at the moment is hard to tell, but I have heard whispers about PCI Express soundcards needing a x4 slot to work properly so there might have been some wisdom here on DFI's side. The x4 slot though only works in x4 mode when SLI is enabled. If you're not familiar with how PCI Express bandwidth works this can be tricky to explain so bear with me. The nForce 4 SLI chipset has a total of 20 data lanes at its disposal. In nonSLI mode on the Lanparty UT nF4 SLID this is split up into one x1 slot, one x2 slot and one x16, meaning that the x4 slot only operates in x1 mode, as there's only one lane of bandwidth left available to it. The x1 slot is then disabled. However, the board does have plenty of onboard features to make up for this. Integrated Gigabit Ethernet is also part of the nForce4 SLI chipset and this comes with a built in hardware firewall. A second Gigabit Ethernet controller from Marvell is connected via the PCI bus, but this is not compatible with the builtin firewall. DFI has also added FireWire 400 to the mix with a single port around the back and a header for a second port available. There is a header on the board for a serial port, so this could be bought as an upgrade option, but there's no such option for a parallel port. A couple of interesting and useful features that DFI has equipped the Lanparty UT nF4 SLID with are four small debug LEDs that works in a similar fashion to MSI's DLED modules. These make it much easier to test that the system is working when you're tinkering around inside your case.

<http://parsbaft.com/images/Dah-1500I-Manual.pdf>

There are also plenty of fan headers spread around the board although the location of a couple of them could do with a rethink. If you're using SLI you need to connect either a Molex or a floppy connector to one of the two power connectors on the board. Being given a choice to use one or the other is rather unusual, but it might make it easier to route the cables from your PSU. Two spare USB headers are also available for front mounted USB ports on your case. The power connectors are grouped together at the upper front part of the boards and all the MOSFETs are covered by some solid looking heatsinks. The only complaint here would be that the case connectors aren't colour coded but at least they're clearly labelled. Two rounded IDE cables, a rounded floppy cable, two SATA cables, a SATA power splitter, the jumper removal tool, an SLI bridge connector and the Karajan audio module is all you get. There are also a couple of loose sheets of paper in the box with errata. This allows you to save up to four different BIOS settings which can be easily accessed and changed between, something that is very likely going to appeal to the overclockers out there. You

could use one highly overclocked setting for gaming and one regular setting for when your doing critical work and stability is imperative. DFI has also implemented another overclocking feature that enables you to increase the memory voltage above 3.2V, when most boards don't go beyond 2.9V. This could potentially damage your memory modules, so obviously this is done on your own risk. The BIOS that shipped with the board we received was an early one and didn't work with our tests, which a later BIOS corrected. I recommend that you ensuring the board has the latest BIOS after you build your PC. Our test bed consisted of an AMD Athlon 64 FX55 processor, 1GB of Crucial Ballistix PC3200 DDR memory, a Maxtor MaxLine III 250GB hard drive and two nVidia GeForce 6800GT graphics.

The Lanparty UT nF4 SLID scored an overall score of 217 in SYSMark 2004 cards in SLI. Moving on to PCMark 05 it managed an overall score of 4317, slightly disappointing. On the other hand the 3D scores are nothing but impressive in SLI mode and I have no complaints at all here. You can have a closer look at those numbers on the results page. DFI obviously go after a very specific niche market with the LanParty and LanParty UT series of boards, and while they have the Infinity series for the boards with more plain presentation and no UVreactive components on the boards, theres currently no Infinity nForce4 product. Thats not to say a knowledgeable buyer for a large system builder wont know that the LanParty UT boards are worth looking at, regardless of looks or packaging, but it may be a reason. Id like to see board makers offer a data cable count to match the number of ports available on boards, since SATA cables are overpriced by online vendors, even more so by bricks and mortar stores and drives are rarely bundled with them.

The CD has all the drivers you'll need, along with nTune for tweaking the mainboard and there seems to be a CMOS Reloaded manual to show you the ins and outs of that part of the DFI's BIOS. Which leads me on nicely to that part of the examination. Something went wrong. Learn more opens in a new window or tab This amount is subject to change until you make payment. listed on this website. DFI uses the same PCB for all nForce4 models. This assures that the overclocking capabilities of all the nForce4 boards are the same. In fact, all boards use the same BIOS. The 3 DFI nForce4 models are The two LANParty UT models are identical except one uses the SLI Chipset and the other uses nF4 Ultra. Details on this mod are available at Morphing nForce4 Ultra into nForce4 SLI. The board is the same except it is based on the Ultra chipset instead of SLI and the UltraD does not have the additional 4 SATA ports provided by the Silicon Image 3114. You still get the UV cables, and even the same Karajan Audio Module. The missing accessories are the system carrier, FrontX which will be very important to some and cable sheathing. If performance is what matters to you, then you can choose any of the new DFI nForce4 boards and then decide what additional features and accessories matter to you. However, we wish that DFI had been able to use the High Definition ALC880 or a similar chip instead of the more common ALC850. The Karajan Module isolates audio for best signal to noise ratio and high definition chip benefits most from this isolation. This 8channel audio codec is fully AC 97 2.

3 compliant and features 16bit 8channel audio and autojack sensing with support for a full range of analog and digital IO. The Karajan Module includes both SPDIF in and out coaxial connectors on the rear IO panel. There is also an onboard SPDIF connector for an optical cable. The back panel also includes PS2 mouse and keyboard, 1 standard Firewire IEEE1394a, 6 USB, and two RJ45 Gigabit Ethernet. There are no rear ports for a Parallel Printer or serial devices, but there is an onboard header for an external serial device an IR header. DualChannel 1 is DIMMs 1 and 3, and DualChannel 2 is DIMMs 2 and 4. DFI specifies support for both ECC and nonECC unbuffered memory. Contacts at DFI advise that best overclocking is achieved with the dualchannel DIMMs in Sockets 2 and 4. Unfortunately my experiences with this board have been miserable. Im going to try to RMA it. Ive built about a dozen systems and have never had so many problems. I suppose I just got a bad board, but this has soured my opinion of DFI a bit. Any recommendations for an alternate I worked real hard to get the first Lan Party NFII A to work then rmad it and got the NFII B Ultra. Same story. Too many issues of incompatibilities between bios versions and other hardware used with the boards. I dont know if its DFIs fault or Nvideas but either way your left with a defective system The DFI, Gigabyte, and MSI are all 2slot bridge designs and interchangeable. The Asus A8NSLI is a 3slot design, and is longer than the other bridges. No one has received shipments yet of the new revised nF4 Ultra chipset that can not be modded, but they are expecting the first shipments soon. Yes, the BIOS does have a CAS 1.5 option. My only concern with DFI is the layout. I have a Koolance Case and I like to minimize the amount of cables in the open. Not too sure how that would work in this situation. Is there anyone who has this board with a koolance setup I want to open a window so badly. Sign up now.

Best motherboard I have ever owned. There's plenty of CPU and chipset voltage to go around too. I didn't update bios

but it is a good thing to do, had some video card probs, but that was not mobo. Dual Gigabit Ethernet is certainly a nice feature to have, nf4 lanparty motherboard it seems a little excessive. Having the record for the most nf4 lanparty motherboard and problems. That chipset also happens to be responsible for most of the board's features. The tiny PCB's are hard to align on the other boards and the holding nf4 lanparty motherboard are not always easy to negotiate. NZXT does addition by subtraction with its Hseries cases.

This means the product will ship as received by the manufacturer, sealed, with all advertised components, and with the manufacturer warranty. This board is an excellent buy for the money, and the fact it can easily be modded to support sli and raid is just icing on the cake. Another benefit of rotating the memory to the top of nf4 lanparty motherboard board is a much cleaner area around the IDE and 24 pin power connectors. SATA connectors are to the right of the nF4 chipset and the magnetic levitation fan. This means that the product has been used, may show clear signs of use and may be missing minor accessories, but remain nf4 lanparty motherboard good condition. There's plenty of room around the CPU socket for standard Athlon 64 heat sinks, but gargantuan coolers like Zalman's CNPS may interfere with taller memory modules, especially those with winkyblink lights. Being a tester, it makes things much nf4 lanparty motherboard to manage on a test bench. How do I find out the price. Aside from pure aesthetics, the layout of this board is incredibly clean.
