This session was attended by 10 audio professionals. VENUE 110V course focuses on the essential skills required to operate a VENUE system in a live sound environment. Coverage includes system operation using both the VENUE DShow software and a VENUE control surface. Advanced students and working professionals may want to combine this course with VENUE 210V. This course is designed for live sound students and engineers with limited experience using a VENUE system. VENUE 201V course focuses on the core skills required to operate a VENUE system in a professional live sound environment. It provides comprehensive, hands-on training on a VENUE DShow or Profile control surface and covers system hardware and software configuration. This course is designed for advanced students and working professionals live sound engineers who have fundamental knowledge and experience using a VENUE system. Response from professionals who attended the course Osie Pinto, Head of Operations, Performance Audio, says, "The training gave insights I didn't know of initially. I have been working with Avid products like Venue, Profile and Sc48 for years. I have learned things that are not on the manual. It has also changed the way I work as I use short cuts and tricks nobody tells you about. The integration with Pro Tools, use of Pro Tools plugins and the audio quality has made the console dear to users in India as well and the 100 plus consoles in the Country bear testimony to this fact.

Learning the console using the Avid courses is the best way to come up to speed for anyone using the Venue consoles. The 100 level, as one can imagine, covers the basics of the technology, understanding the philosophy of the Venue way of working and introduces the student to the SC 48 console. One can start mixing a show after going through the 100 level course. The 200 level takes it a step further by going deeper into some of the unique features and covers tips and tricks while also going into detail about the larger consoles from the Avid Live Sound family. "I've seen this in a few different disciplines and for the most part they are just cash grabs. This is just product knowledge and considering the price of one of these consoles it should be included for two or three techs to all of the Soundcos that purchase one of them similar to when you buy a high end Porche. There are Certification courses which are valid, but they aren't limited to product knowledge. Line array concepts and rigging would be broader subjects that might warrant a course to get certified on, but a console I'm sure that most techs have walked up to digital consoles that they have never seen before in their lives and managed to get through a show, and there is also usually a local tech that uses the console regularly that you can turn to for questions. I can't wait to show up at a venue and be told that I can't mix because I'm not certified on brand x's console. I don't have ANY board certs, but I've mixed significant shows on Venue, Midas, Yamaha and Digico boards, and that's enough for most people. I got my last gig because the old engineer didn't know the venue at all, and I did. None of these boards are TOO hard to get into, my first time on the Venue about 2 years ago was a fly date, I was expecting an M7, but rental company said it wasn't available just before we left for the airport.

My options were the SC48 or an LS916, so I figured what the hell.<http://swampseafood.com/userfiles/bt-norstar-m7100-manual.xml>

I learned a lot from the offline editor, and had about an hour on the console before soundcheck. Did a 9 piece band, FOH and Mon with 7 mixes. I didn't get into many plugins or automation, but the show went fine and the console was easy enough to walk up to. Digico and Midas have a bit steeper learning curve, but they are still easy enough to do a basic mix if you have some digital experience. No way am I going to remember anything that someone tells me at 9am on a Monday in a nightclub where I would normally work until 3am I learned some cool tricks and tips, and as well Midas will offer your name to persons in your area looking for a certified tech. As we all know in the professional side of this business esp for freelance engineers, contacts can be the deciding factor between feast and famine. I'm glad that I got the chance to attend and look forward to the relationship I've begun with Midas. Price of the course free. Connectivity with Pro Tools is also facilitated over the Ethernet AVB network, with support for up to 128 channels of recording and playback over a single Cat5e cable. However, due to the architectural differences between systems and numbers of inputs and outputs supported, some files may require edits to fit a new system. While DShow, Profile, Mix Rack, and SC48 consoles run Windows XP Embedded and use the same TDM plugin architecture as Pro Tools HD, S3LX uses Avids newer HDX chipset for its mixing and AAX DSP plugin processing. Its also perfect in a live situation where you need to tweak the whole mix to adjust for ear fatigue. It includes all the controls you need for a quick and rough setting before you get into the details — and its quite possible you will find that Tilt was all your track needed to find its place in the mix. The Loudness curve does exactly what its supposed to as well. The innovative Tilt design was first featured on the Tonelux MP1a discrete mic preamp module and has been a godsend for engineers and producers that need to take control of their sound in a fast and effective manner. Go counterclockwise, and the opposite happens — the sound gets fatter and darker. Turn on or off the Loud switch to make the effect stronger or back to keep it more subtle. So by the twist of a single knob, you give your sound a basic and nice sounding frequency trimming. Finally, you will find a polarity reversal switch and a gain knob. See All you need for a basic rough setting of each and every channel. Softube's model of Tonelux Tilt also includes modeling of the transformer found in the Tonelux MP1a mic preamp. The transformer adds a subtle distortion for bass frequencies which fattens up the low end of a track. Click to learn more. Specific information available on each instruments page.

Softube plugins are not tested in the nonlisted systems, but they most likely work as long as the system requirements are met. We cannot guarantee a solution for issues in unsupported systems. Therefore, for example, Pro Tools 10.x is no longer supported contact support for latest 32bit compatible instalers. Click here to read our policy. Update my browser now After nearly three years of development Digidesign, well known for its studio standard Pro Tools, has created a mixing console that represents an innovative design for mixing live sound. After nearly three years of development Digidesign, well known for its studio standard Pro Tools, has created a mixing console that represents an innovative design for mixing live sound. After nearly three years of development Digidesign, well known for its studio standard Pro Tools, has created a mixing console that represents an innovative design for mixing live sound. Venue delivers all of the convenience and flexibility of a digital mixing system, while providing some of the best possible audio performance and fidelity I've used in any console. It is ideal for touring sound, houses of worship, theaters and sound contractors. The console is equipped with 24 builtin graphic EQs and enough spare DSP power to run dozens of plugins. Each balanced input is handtrimmed during manufacture to maximize common mode noise rejection. The manual says the special "analog" mode accurately emulates the sonic characteristic of a "renowned" live sound console. I It features eight DCA Digitally Control Amplifier faders for convenient grouping of any inputs. There are 10 segment bicolor meters on every input channel and effects return channels, and six segment meters on input dynamics, providing good visual feedback.

They communicate directly with the DShow mix engine, allowing performers to adjust the relative level and stereo placement of elements in their monitor mix. Onstage location of the remote is ideal to ensure that mic signals are converted to digital close to the source, preserving maximum fidelity. Our first day started by the removal an existing Amek Recall console out of the sound booth which audio engineers Paul Swenson and Dave Wink told me had never been removed. After lifting that 600pound console up and out of a booth, we really appreciated putting in the Venue main and sidecar consoles at only 194 pounds. Digidesign's Jeff Priepot spent a day with me and the house audio staff, orienting us on the features of the console. The system we used was dualredundant so there was a backup for everything. Usually when mixing on a digital console, you must orient your input layout in layers or banks since you have less faders than actual inputs on large shows. The Venue console offers a layered topology for the channel banks, with a maximum of four layers deep. Unlike some digital consoles that require additional racks of traditional outboard processing, this console allows you to purchase whatever effect or EQ you want as a plugin such as Drawmer, Sony, Crane Song, TC Electronic and Eventide. Plugins eliminate the potential for hum, buzz and increased noise floor. Plugins can be inserted on individual or all channels desired, to free up outputs. One of the plugins offered is an analyzer called Troodon, which permits full RTA, transfer function, time alignment and impulse response display. Any signal can be routed directly to the analyzer without the need of a computer and patch cables. Having mixed in this room many times on other consoles, the transparency and realism in the sound of the mix was obvious. I mixed six sends of monitors from FOH and used the graphics onboard and was able to use a wireless notebook to make changes using Digidesign DShow software.

Now that is what I call the ability to make a board tape. The tracks were put on Layer B so I could listen the next day or even in my hotel room using an Mbox. If your show uses Pro Tools for playback to supplement the band, which is becoming commonplace, it is as easy as using the FireWire or HDx link. Digidesign's Venue has taken it one step further. With the future of sound reinforcement becoming so integrated with recording; i.e. Live Nation CDs after the show, and tracks being used more and more to supplement live bands the Venue is welldesigned for the future. If power, future expandability, and value are something you look for in a live sound console you should definitely check out the Digidesign Venue. Highly recommended. After nearly three years of development Digidesign, well known for its studio standard Pro Tools, has created a mixing console that represents an innovative design for mixing live sound. After nearly three years of development Digidesign, well known for its studio standard Pro Tools, has created a mixing console that represents an innovative design for mixing live sound. The Bus Assigns switches are the primary routing controls for the currently selected channel, letting you bus it directly to the Mains L—R bus or to any other mono or stereo group. Groups Assigns the Output Faders to Group levels. The selected snapshots are updated according to your changes and your choice of Absolute or Relative edit. Go to the Inputs page. In this mode, meter venuw is instantaneous, showing the true peak level of the metered signal. Toggling one channel from Off to On results in both channels switching On; toggling one of the linked channels from On to Off results in both channels switching Off. Page 70 Talkback Dim Level Sets the dim level, which is the amount of attenuation applied to the mix on the output bus when Talk back is activated. Previous Instantly recalls the snapshot prior to the most recently recalled snapshot.
