It takes about 30 minutes for the performance of electrical parts to stabilize. Please wait 30 minutes or more after the monitor power has been turned on, and then adjust the monitor.

Monitors should be set to a lower brightness to reduce changes in luminosity caused by long-term use and maintain a stable display.

When the screen image is changed after displaying the same image for extended periods of time, an afterimage may appear. Use the screen saver or power save function to avoid displaying the same image for extended periods of time.

Periodic cleaning is recommended to keep the monitor looking new and to prolong its operation lifetime (refer to [“Cleaning” \(page 4\)](#)).

The LCD panel is manufactured using high-precision technology. Although, missing pixels or lit pixels may appear on the LCD panel, this is not a malfunction. Percentage of effective dots: 99.9994% or higher.

The backlight of the LCD panel has a fixed lifetime. When the screen becomes dark or begins to flicker, please contact your local EIZO representative.

Do not press on the panel or edge of the frame strongly, as this may result in display malfunctions, such as interference patterns, etc. If pressure is continually applied to the panel, it may deteriorate or damage your panel. (If the pressure marks remain on the panel, leave the monitor with a black or white screen. The symptom may disappear.)

Do not scratch or press on the panel with any sharp objects, as this may result in damage to the panel. Do not attempt to brush with tissues as this may scratch the panel.

When the monitor is cold and brought into a room or the room temperature goes up quickly, dew condensation may occur on the interior and exterior surfaces of the monitor. In that case, do not turn the monitor on. Instead wait until the dew condensation disappears, otherwise it may cause some damage to the monitor.

Cleaning

Attention

- Chemicals such as alcohol and antiseptic solution may cause gloss variation, tarnishing, and fading of the cabinet or panel, and also quality deterioration of the image.
- Never use any thinner, benzene, wax, and abrasive cleaner, which may damage the cabinet or panel.

Note

- The optional ScreenCleaner is recommended for cleaning the cabinet and panel surface.

The stains on the cabinet and panel surface can be removed by moistening part of a soft cloth with water.

To use the monitor comfortably

- An excessively dark or bright screen may affect your eyes. Adjust the brightness of the monitor according to the environmental conditions.
- Staring at the monitor for a long time tires your eyes. Take a 10-minute rest every hour.

- Supports a resolution of 1600 × 1200
 - IPS panel with 89° horizontal and vertical viewing angles
 - Applicable to DisplayPort (applicable to 8 bit)
 - The FineContrast function allows the user to select the display mode optimum to the displayed image.
 - The Paper mode reproduces a printed paper effect on the monitor.
See “To select the display mode (FineContrast Mode)” (page 14).
 - The software “ScreenManager Pro for LCD (DDC/CI)” to adjust the screen using the mouse and keyboard is included.
See “1-3. EIZO LCD Utility Disk” (page 9).
 - EyeCare Filter
Texture of the paper is reproduced by displaying a translucent image in the foreground of the desktop.
By using this function with the Paper mode, the screen looks more like paper.
See “To select the display mode (FineContrast Mode)” (page 14).
 - Supports the power management software “EIZO EcoView NET”
For more information, refer to our web site (www.eizoglobal.com).
 - Power saving function
Suppressing the power consumption*1 reduces the carbon dioxide emissions. This product is equipped with power saving function.
 - Auto EcoView
The ambient light sensor on the front side of the monitor detects the environmental brightness to adjust the screen brightness automatically and comfortably. Excessively high brightness may increase power consumption and cause unwanted environmental effects. It may also lead to fatigue of your eyes. Use the Auto EcoView to reduce the brightness.
See “Auto EcoView” (page 29).
 - EcoView Optimizer 2
The monitor automatically adjusts the screen brightness according to the white level of the input signal. This function can reduce the power consumption while maintaining the brightness specified by the input signal.
See “EcoView Optimizer 2” (page 29).
- *1 Reference values:
- Maximum power consumption: 45 W (Brightness Max., when a USB device is connected, at default settings)
 - Standard power consumption: 12 W (100VAC, Brightness 120 cd/m², when no USB device is connected, at default settings)
 - Standard power consumption: 13 W (200VAC, Brightness 120 cd/m², when no USB device is connected, at default settings)
- Supports portrait and landscape formats
 - Displays HDCP (High-bandwidth Digital Protection) protected contents.

Note

- This monitor supports the portrait display. This function allows you to change the orientation of the Setting menu when using the monitor screen in vertical display position (see “3-3. Setting Orientation” (page 25)).
 - When using the monitor screen in a portrait position, the graphics board supporting portrait display is required. When placing the monitor in a portrait position, the settings of your graphics board need to be changed. Refer to the User’s Manual of the graphics board for details.

If a problem still remains after applying the suggested remedies, contact your local EIZO representative.

5-1. No picture

Problem	Possible cause and remedy
1. No picture Power indicator does not light.	- Check whether the power cord is connected properly. - If the problem persists, turn off the monitor, and then turn it on again a few minutes later.
Power indicator is lighting blue.	Increase “Brightness”, “Contrast”, or “Gain” in the Setting menu (see “To perform advanced adjustments” (page 15)).
Power indicator is lighting orange.	- Switch the input signal with [S]. - Move the mouse or press any key on the keyboard. - Check whether the PC is turned on. - Depending on the PC and graphics board, the input signal is not detected and the monitor does not recover from the power saving mode. If the screen is not displayed even after moving the mouse or pressing any key on the keyboard, turn the monitor off and on using its power button. When the screen is displayed, execute the following procedure. The problem may be improved. - Press [P] to turn off the monitor. - Hold down [M] while pressing [P] to turn on the monitor. “x” is displayed on the menu title of “Information” of the Setting menu (see “6-4. Displaying Monitor Information” (page 38)). - Reboot the PC. To return to the previous setting, perform steps 1 to 3 again. <pre> Information (DVI) x ----- FexScan S2133 S/N: 0000001 Usage Time (h) 0 Input Signal 1600x1200 fH: 75.0kHz fV: 60.0 Hz fD: 162.0MHz </pre>
Power indicator is flashing orange.	The device that is connected using DisplayPort has a problem. Solve the problem, turn off the monitor, and then turn it on again. Refer to the User's Manual of the output device for further details.

Problem	Possible cause and remedy
2. The message below appears. The message shows that the input signal is out of the specified frequency range. Example: 	This message appears when the signal is not input correctly even when the monitor functions properly. - Check whether the PC is configured to meet the resolution and vertical scan frequency requirements of the monitor (see “2-1. Compatible Resolutions” (page 12)). - Reboot the PC. - Select an appropriate setting using the graphics board’s utility. Refer to the User’s Manual of the graphics board for details.

Problem	Possible cause and remedy
1. The screen is too bright or too dark.	- Use “Brightness” or “Contrast” in the Setting menu to adjust it. (The LCD monitor backlight has a limited life span. When the screen becomes dark or begins to flicker, contact your local EIZO representative.) - If the screen is too bright, turn on Auto EcoView. The monitor detects the environmental brightness to adjust the screen brightness automatically.
2. Characters are blurred.	- Check whether the PC is configured to meet the resolution and vertical scan frequency requirements of the monitor (see “2-1. Compatible Resolutions” (page 12)). - When an image is displayed with a resolution other than recommended, the characters or lines of the displayed image may blur. Use “Smoothing” and “Screen Size” in the Setting menu to adjust the display (see “To modify blurred characters / lines” (page 23), and “Screen Size Changing” (page 24)).

4. Green / red / blue / white dots or defective dots remain on the screen.	This is due to LCD panel characteristics and is not a failure.
5. Interference patterns or pressure marks remain on the screen.	Leave the monitor with a white or black screen. The symptom may disappear.
6. Noise appears on the screen.	- In the Setting menu, set “Overdrive” to “Off” (see “To set overdrive intensity” (page 18)). - When entering the HDCP signals, the normal images may not be displayed immediately.

5-3. Imaging problems (for digital only)

Problem	Possible cause and remedy									
1. The monitor configuration is changed to single under the multiple monitor configuration (when DisplayPort is connected).	- When two monitors are connected to one PC using DisplayPort, and the power to one of the monitors is turned off with the power button, the screen setting may be changed to the single monitor configuration. In such a case, enable the “DP HotPlug” function with the following procedures. Enabling this function may increase the power consumption. - Press  to turn off the monitor. - Hold down  while pressing  to turn on the monitor. Each time the operation enables / disables this function alternatively. The current setting status can be identified based on the color used to display the input port or signal error. <table><tr><th>Setting</th><th>Input port</th><th>Signal Error</th></tr><tr><td>Disable (default setting)</td><td></td><td></td></tr><tr><td>Enable</td><td></td><td></td></tr></table>	Setting	Input port	Signal Error	Disable (default setting)			Enable		
Setting	Input port	Signal Error								
Disable (default setting)										
Enable										

5-4. Imaging problems (for analog only)

Problem	Possible cause and remedy
1. Display position is incorrect. 	- Use “Position” in the Setting menu to correct the image position (see “To correct the screen position” (page 22)). - If the problem persists, use the graphics board’s utility if available to change the display position.
2. Vertical bars appear on the screen or a part of the image is flickering.  	Use “Clock” in the Setting menu to adjust it (see “To eliminate vertical bars” (page 21)).
3. Whole screen is flickering or blurring. 	Use “Phase” in the Setting menu to adjust it (see “To remove flickering or blurring” (page 22)).

3. The auto adjustment function does not work.	• This function does not work during digital signal input. • This function is intended for use on the Macintosh and on AT-compatible PC running Windows. It does not work properly when an image is displayed only on a part of the screen (command prompt window, for example) or when a black background (wallpaper, etc.) is in use. • This function does not work correctly with some graphics boards.
4. USB devices connected to the monitor do not work.	• Check whether the USB cable is connected correctly (see “6-3. Making Use of USB (Universal Serial Bus)” (page 37)). • Change the USB port to another one. If the PC or peripheral devices works correctly by changing the USB port, contact your local EIZO representative. (Refer to the manual of the PC for details.) • Reboot the PC. • If the peripheral devices work correctly when the PC and peripheral devices are connected directly, please contact your local EIZO representative. • Check whether the PC and OS are USB compliant. (For USB compliance of the respective devices, consult their manufacturers.) • Check the PC’s BIOS setting for USB when using Windows. (Refer to the manual of the PC for details.)

Chapter 7 Glossary

Clock

The analog signal input monitor needs to reproduce a clock of the same frequency as the dot clock of the graphics system in use, when the analog signal is converted to a digital signal for image display. This is called clock adjustment. If the clock pulse is not set correctly, some vertical bars appear on the screen.

DDC/CI (Display Data Channel/Command Interface)

VESA provides the standardization for the interactive communication of the setting information, etc. between a PC and the monitor.

DICOM (Digital Imaging and Communication in Medicine)

The DICOM standard was developed by the American College of Radiology and the National Electrical Manufacturer's Association of the USA.

The DICOM compatible device connection enables to transfer the medical image and information. The DICOM, Part 14 document defines the digital, grayscale medical image display.

DisplayPort

This is the interface standard for image signals standardized in accordance with VESA. It was developed

with the aim of replacing the conventional DVI and analog interfaces, and it can transmit high resolution

signals and sound signals, which DVI does not support. It also supports 10-bit color, copyright protection

technology, long cables, etc. The standard size and mini size connectors have been standardized.

DVI (Digital Visual Interface)

DVI is a digital interface standard. DVI allows direct transmission of the PC's digital data without loss.

This adopts the TMDS transmission system and DVI connectors. There are two types of DVI connectors. One is a DVI-D connector for digital signal input only. The other is a DVI-I connector for both digital and analog signal inputs.

DVI DMPM (DVI Digital Monitor Power Management)

DVI DMPM is a digital interface power saving function. The "Monitor ON (operating mode)" and "Active Off (power saving mode)" are indispensable for DVI DMPM as the monitor's power mode.

Gain

This is used to adjust each color parameter for red, green and blue. An LCD monitor displays the color by the light passing through the panel color filter. Red, green and blue are the three primary colors. All the colors on the screen are displayed by combining these three colors. The color tone can be changed by adjusting the light intensity (volume) passing through each color's filter.

Gamma

Generally, the monitor brightness varies nonlinearly with the input signal level, which is called "Gamma Characteristic". A small gamma value produces a low-contrast image, while a large gamma value produces a highcontrast image.

HDCP (High-bandwidth Digital Content Protection)

Digital signal coding system developed to copy-protect the digital contents, such as video, music, etc.

This helps to transmit the digital contents safely by coding the digital contents sent via the DVI or HDMI connector on the output side and decoding them on the input side.

Any digital contents cannot be reproduced if both of the equipments on the output and input sides are not applicable to HDCP system.

Overdrive

This technology enhances response speed by increasing the potential difference at the time of motion of liquid-crystal pixels, and it is used for liquid-crystal TV sets and others in general. It provides clear-cut three-dimensional display with little afterimage, by improving response speed of the intermediate gradation range that frequently appears in moving images.

Phase

Phase means the sampling timing to convert the analog input signal to a digital signal. Phase adjustment is made to adjust the timing. It is recommended that phase adjustment be made after the clock is adjusted correctly.

Range Adjustment

Range adjustment controls the signal output levels to display every color gradation. It is recommended that range adjustment be made before color adjustment.

Resolution

The LCD panel consists of numerous pixels of specified size, which are illuminated to form images. This monitor consists of horizontal 1600 pixels and 1200 vertical pixels. At a resolution of 1600 × 1200, all pixels are illuminated as a full screen (1:1).

sRGB (Standard RGB)

International standard for color reproduction and color space among peripheral devices (such as monitors, printers, digital cameras, scanners). As a form of simple color matching for the Internet, colors can be displayed using tones close to those of the transmission and reception devices.

Temperature

Color temperature is a method to measure the white color tone, generally indicated in degrees Kelvin. The screen becomes reddish at a low temperature, and bluish at a high temperature, like the flame temperature.

5000 K: Slightly reddish white

6500 K: White referred to as daylight-balanced color

9300 K: Slightly bluish white

TMDS (Transition Minimized Differential Signaling)

A signal transmission system for digital interface.

VESA DPM (Video Electronics Standards Association - Display Power Management)

VESA specifications achieve increased energy efficiency for computer monitors. This involves standardization of signals sent from the computer (graphics board).

DPM defines the status of signals transmitted between the computer and monitor.
