Footnotes	20
Introduction to Application Guides	21
Cars & LCV Application Guide	22 - 360
Guarantee	361
Battery Characteristics & Fault Diagnosis	362 - 363
Battery Testing	364 - 371
Yu-Fit Battery Configurator	372 - 374
How a Battery Works	375 - 376
Understanding the Specifications	377 - 379
Health & Safety Information	380 - 382
All You Need to Know About Batteries	383 - 390
AGM & EFB Explained	391 - 392
Silver Statement	393
BER Statement	393
Material Safety Data	394 - 395
Terms & Conditions	396

Next Generation Automotive Battery Range - Micro Hybrid, Hybrid & Electric Vehicles Explained

AGM

START STOP PLUS

Features

- Approximately 360,000 starts
- For high specification Start/Stop vehicles
- Absorbed Glass Mat construction with no free acid
- Double lid (leak proof)
- VRLA
- Integrated flame arrestor
- OE Quality, Performance & Specification

Performance

Compared to Conventional Automotive Batteries

- +150% improved Dynamic Charge Acceptance (DCA)
- +200% increased cyclic durability

EFB

START STOP

Features

- Approximately 270,000 starts
- For lower specification Start/Stop vehicles
- Sealed tip/tilt double lid
 - Reduces water loss by up to 30%
 - VDA roll over test compliant*
- High charge acceptance envelope type separators and anti-sulphation technology
- Carbon/Lithium plate additives
- Integrated flame arrestor
- OE Quality, Performance & Specification

*German Association of the Automotive Industry

Performance

Compared to Conventional Automotive Batteries

- +170% improved Dynamic Charge Acceptance (DCA)
- +100% increased cyclic durability

AUXILIARY BATTERIES

Features

- 9 AGM auxiliary batteries
- 2 Flooded auxiliary batteries
- 3 AGM starter batteries

Fitment examples

- Toyota, Honda & Lexus Hybrids
- Mercedes E & S Class
- Volvo DRIVE
- BMW 7 series
- Mitsubishi & PSA Electric Vehicle

Conventional Car & LCV Battery Range Explained

GOLD HIGH PERFORMANCE

Features

- Approximately 50,000 starts
- Sealed tip/tilt double lid
 - Reduces water loss by up to 30%
 - VDA roll over test compliant*
- Calcium/Calcium plates
- State of Charge Indicator (SOC)
- Integrated carrying handle & flame arrestor
- OE Quality, Performance & Specification

*German Association of the Automotive Industry

Performance

- Up to 35% increase in cranking power*

*GLD063 350 CCA GLD063 480 CCA

SILVER

Features

- Approximately 30,000 starts
- Sealed tip/tilt double lid
 - Reduces water loss by up to 30%
 - VDA roll over test compliant*
- Calcium/Calcium plates
- Integrated carrying handle & flame arrestor
- State of Charge Indicator (SOC)
- OE Quality, Performance & Specification

*German Association of the Automotive Industry

Performance

- Up to 20% increase in cranking power*

*SLV063 350 CCA SLV063 425 CCA

BRONZE

Features

- Approximately 20,000 starts
- Remote flame arrestor*
- Central venting*
- Integrated carrying handle*
- Calcium/Calcium plates
- OE Quality, Performance & Specification

*Excludes BRZ038, BRZ048 & BRZ049

Commercial Vehicle Range Explained

COMMERCIAL DEEP CYCLE GLASS MAT

Features

- Increased service life over SHD
- Ultimate deep cycle capabilities
- Glass mat separators*
- Vibrolock plate fixing*
- Vibration Resistant - V3 (EN50342.1 A1 2011)
- OE Quality, Performance & Specification

*Improved resistance to vibration and deep cycle capabilities over HD and SHD

COMMERCIAL SUPER HEAVY DUTY

Features

- Advanced plate design
- Increased service life over HD
- Deep cycle capabilities
- Vibration Resistant - V2 (EN50342.1 A1 2011)
- OE Quality, Performance & Specification

Performance

- Up to 30% increase in cranking power over Cargo HD*

*GS-629HD 815 CCA v GS-629SHD 1050 CCA

COMMERCIAL HEAVY DUTY

Features

- Advanced plate design
- Deep cycle capabilities
- Vibration Resistant - V2 (EN50342.1 A1 2011)
- OE Quality, Performance & Specification

Leisure, Marine & Garden Range Explained

LEISURE CARAVAN & MOTOR HOMES

Features

- Caravan/leisure use
- Long storage life
- Deep cycle
- State of Charge Indicator (SOC)
- Enhanced safety venting
- Integrated flame arrestor

MARINE BOATS & WATERCRAFT

Features

- Marine & leisure craft use
- Dual terminal
- Sealed lid (Leak/spill proof tip-tilt)
- Vibrolock plate fixing*
- Deep cycle
- 45° tilt angle
- State of Charge Indicator (SOC)
- Enhanced safety venting
- Integrated flame arrestor

*Improved resistance to vibration

GARDEN MACHINERY

Features

- Powered gardening equipment use
 - Ride on mowers etc.

Classic 6V, Pro-Spec, Motorcycle & Powersports Explained

CLASSIC 6V

Features

- Deep cycle capability
- Vibration resistant hard rubber case
- OE Quality, Performance & Specification

PRO-SPEC

Features

- Deep cycle
- Easy maintenance vent caps
- Glass Mat/porus rubber separator*
- Three terminal types available
- Special lid/case design**
- Enhanced life cycle over competitors

*Resists corrosion and reduces electrical resistance

**Prevents short circuits from active material shedding

Fitment examples

- Electric vehicles (golf carts/mobility)
- Warehouse equipment (fork lifts/access platforms)

MOTORCYCLE & POWERSPORTS BATTERIES

Features

- World's number one powersports battery
- 100% vehicle parc coverage
- Exact fit not 'will-fit'
- Original Equipment for all major Motorcycle, ATV, Jet Ski and Snowmobile manufacturers

Smart Chargers, Yu-Fit & MDX Testers Explained

AUTOMOTIVE & MOTORCYCLE BATTERY CHARGERS

Features

- Intelligent (SMART) charging
- Reverse connection protection
- Spark proof connection
- Safe on-vehicle charging
- Suitable for new technology batteries*
- Up to 8 charging phases

*AGM and EFB

BATTERY CONFIGURATION TOOLING

New technology Micro hybrid vehicles equipped with emission control systems may require replacement battery configuration.

Battery configuration can be carried out using the new GS Yu-Fit battery configuration tool.

Use of the GS Yu-Fit allows the provision of a complete battery replacement solution by reducing battery replacement costs, customer inconvenience, enhancing the services provided by aftermarket battery distributors.

BATTERY ANALYSERS

Yuasa's new range of automotive and motorcycle battery analysers ensure the most up-to-date and accurate test results.

A custom made solution that enables potential cost savings and increased revenues. Test more batteries and sell more batteries.

Battery Specifications

Footnotes

Footnote Type	Footnote Number	Footnote Description
Brake System	1	Regenerative braking
Braking / Drive Dynamics	2	For vehicles with ABS
Catalytic Converter	3	For vehicles with catalyst
Climate Zones	4	For cold climates
Country Version	5	Great Britain
Driver Position	6	For right-hand drive vehicles
	7	For left-hand drive vehicles
Note	8	Check terminal layout (0 vs. 1) due to possible changes in specification
	9	OE specification = AGM battery. Only replace with AGM, as recommended
	10	OE specification = EFB battery. Only replace with EFB, as recommended
	11	The factory originally fitted a choice of two batteries, check installation
	12	Auxiliary battery used for engine starting
	13	Auxiliary battery used for vehicle loads (not engine starting). In some cases a motorcycle battery is used
	14	JIS small terminal required (T3). Remove terminal adapters supplied with battery
	15	DIN to Ford terminal adapter required - Yuasa PN 23294631
	16	OE specification = US Group sized battery. Clamping/wiring may need to be modified to fit equivalent European battery type
	17	RHD vehicles. LHD vehicles found to be using equivalent battery with opposing terminal layout
	18	Jaguar XJS. Not necessary to refit original cover manifold. If still fitted, frame adjustment may be required
	19	Left-hand drive vehicles
Number of Doors	20	Mazda parts required: Tray BG62-56-032A, Clamp NAY1-56-03XA, Bolt W001-38-518A
	21	2
	22	3
	23	4
Special Purpose Vehicle	24	5
	25	For police vehicles
Transmission Type	26	Automatic Transmission
Vehicle Equipment	27	For vehicles with air conditioning
	28	For vehicles with brake energy recovery
	29	For vehicles with start-stop function
	30	For vehicles without brake energy recovery
	31	For vehicles without start-stop function
	32	For vehicles with starter and auxiliary battery
Vehicle Production Country	33	Japan
	34	Europe
	35	Great Britain
	36	Spain
	37	France
Vehicle Trim Level	38	Alternative fitment
	39	With Efficient Dynamics
	40	Without Efficient Dynamics
	41	Facelift
	42	Twin Battery
	43	Single battery
	44	Grey import
Wheelbase	45	Long Wheelbase
Quantity	47	2
	48	1 or 2
	49	1 of 2
	50	2 of 2

Fuel Types

Fuel Code	Types	Fuel Code	Types
B	Bi-Fuel	H	Diesel/Electro
E	Electric		Petrol/Electric
F	Flexfuel		Petrol/Electro
G	CNG	M	Mixture
	Gas		Petrol/Bioethanol
	LPG		Petrol/CNG
	Natural Gas		Petrol/Ethanol
			Petrol/LPG
			Petrol/Natural Gas (CNG)
			Petrol/Petroleum Gas (LPG)

Introduction to Application Guides

- It is a legal requirement that a battery is securely fitted to a vehicle.
- It is also important that any heat shields or protective enclosures fitted to the vehicle from new by the vehicle manufacturer are always replaced when the battery is changed. The heat shields are fitted to protect the battery from excess heat and dirt that could possibly reduce the life of the battery.
- The catalogue shows the “recommended” type or types for particular vehicles. In some cases batteries from different ranges are recommended, but in other cases, batteries from only one range are recommended.
- If only a GS Silver range battery is recommended, you must not sell a customer a battery from the GS Bronze range, as these will not be suitable. The fitment will be correct, but the battery will not have sufficient power to start the car under all conditions and so the customer will be dissatisfied.
- Similarly if an AGM/EFB battery is recommended for a vehicle, only a battery of the same technology should be fitted as a replacement. AGM and EFB batteries are designed with greater demands in mind and deemed essential by vehicle manufacturers to meet the specific electrical requirements of the vehicle.
- There is no problem in fitting a higher specification battery within the same range to a vehicle. There is a myth that a more powerful battery can damage the starter motor or that the alternator will not be able to charge the battery; these are wrong. A more powerful battery will start the vehicle over a wider range of conditions and will have a longer life as it will not be worked so hard. This clearly benefits the customer and should be offered as an option to the customer, especially if the vehicle is believed to be subject to heavy usage or additional equipment has been fitted to the vehicle.
- In some cases the battery tray on the vehicle will allow a longer more powerful battery to be fitted. This is not a problem providing that the battery hold-down will secure the battery and the battery does not foul the underside of the bonnet causing damage or a short circuit. With European vehicles, a series of holes may be tapped into the body in white to allow different sized batteries to be fitted for different specifications; always ensure that the battery is clamped using the central holddowns on the battery.
- Under new consumer legislation, offering a recommendation for a vehicle that is not listed in this catalogue will make you legally responsible if a problem should occur. We recommend that you write on the receipt: “Sold as a non catalogue fitment at the customer’s own risk.”

Further advice on older classic fitments not included in the catalogue can be sort by contacting:

Yuasa Technical +44 (0) 1793 833555
E mail enquiries@yuasaeurope.com

This will not affect the battery warranty with respect to faulty materials or workmanship.

While we make every effort to specify the correct battery for each application, we occasionally have some errors as a result of one of the following circumstances:

- Vehicles are sometimes made in different factories in different countries and these can sometimes be fitted with different types and sizes. This has been found to be the case with many Japanese vehicle manufacturers where originally, the vehicle was launched in the Far East market, then production of limited model ranges started later at European manufacturing sites. It can lead to similar specification vehicles having completely different sized batteries fitted. We have identified in the catalogue where we know of a multifit option being used on the same model.
- Vehicles can be “grey imports” generally from Japan or available through Car Supermarkets from Southern Europe. These often do not have the same batteries as those similar vehicles that are normally imported into the UK for UK climatic operation.
- Vehicle manufacturers sometimes change the type of battery during a production run, perhaps as the result of a supply problem with the original battery and/or on the occasion of a model face lift. Additionally high specification vehicles built for engineering trials are sold through dealership after development has been completed.
- New models are being released every week by the vehicle manufacturers, we attempt to keep our database up to date at all times, but this catalogue was current only at the date of printing. Please visit our website to download the latest version of this application guide. www.yuasaeurope.com

We recommend that old and new batteries should be compared prior to installation.

Guarantee

GS batteries sold as replacement product are guaranteed against premature failure due to manufacturing or material defects for a period of 12 months (from the date of purchase of the battery by the end-user).

GS distributors/resellers may offer an additional guarantee period at their discretion.

The guarantee period should be confirmed by the distributor to the purchaser at the time of purchase.

In the event of such a battery claim, the battery should be returned with proof of purchase to the original GS distributor/reseller for testing. Should the tests confirm a fault, then the battery will be exchanged free of charge.

- The distributor has the right to test and if necessary, charge the battery before agreeing to the claim
- This does not affect the statutory rights of the customer in any way
- The guarantee is valid only for the purchaser of the battery and is not transferable
- The guarantee period runs from the date of purchase of the original battery.

Important – Exclusions

This guarantee excludes batteries fitted as Original Equipment or used on the following applications:

Taxi Cabs	including private cars used as taxis or for private hire	6 months against faulty workmanship or materials
Cars (but not LCV or CV)	used on a 2 or 3 shift/day basis	6 months against faulty workmanship or materials
Ambulances		6 months against faulty workmanship or materials
Police Cars		6 months against faulty workmanship or materials
Fire Engines		6 months against faulty workmanship or materials
PSV (Passenger Service Vehicles)		6 months against faulty workmanship or materials
Trailers & Caravans		6 months against faulty workmanship or materials
Lawnmowers		6 months against faulty workmanship or materials
Electrically-Powered Wheelchairs		6 months against faulty workmanship or materials
Electrically-Powered Bicycles/Tricycles		6 months against faulty workmanship or materials
Electric Fences		6 months against faulty workmanship or materials
Televisions		6 months against faulty workmanship or materials
Golf Trolleys and Buggies		6 months against faulty workmanship or materials
Emergency Lighting		6 months against faulty workmanship or materials
Other non-automotive usage including standby		6 months against faulty workmanship or materials

This guarantee does not cover:

- Consequential loss
- Sulphation
- Wear and tear
- Deep cycling
- Overcharging
- Physical damage
- Incorrect application
- Overdischarging

The guarantee period is deemed to start for an:

- Original battery: from date of purchase
- Free replacement battery: from date of purchase of the original battery

This guarantee obligation excludes:

- Failure resulting from the wear and tear, misuse and negligence either before or during use. Examples are: overcharging, deep cycling, sulphation and undercharging
- Failure resulting from the use of any fluids other than distilled or deionised water, or from any action not recommended for GS batteries
- Use of a battery type on a vehicle for which it is not recommended, or on which it has been installed and commissioned incorrectly
- No guarantee claim will be actioned without a dated proof of purchase

Battery Characteristics & Fault Diagnosis

GS lead-acid batteries are built to the highest standards. They are manufactured, in most cases to correspond with or exceed the vehicle manufacturer's requirements and specifications.

Nevertheless, it should be clearly understood that:

A wet (filled) lead acid battery is "a live" product. Whether it is in storage or in service, it has a finite life. All batteries once filled will slowly self discharge. The higher the storage temperature and humidity of the storage area, the greater the rate of self discharge.

To ensure the batteries are not allowed to discharge to the point where they are damaged (sulphated) or so incapable of giving designed service life, regular checks of the recharge date label on the back of the battery, and voltage checks of batteries with less than 4 months remaining should be made. It is important to ensure good turn around of stock, first in, first out, especially with slow running stock of low volume lines. Batteries with a voltage of 12.35 Volts or below should be recharged immediately.

Recharging must not be effected by means of a rapid charger due to the inefficiencies when attempting to recharge a partially sulphated battery which leads to excessive gassing and damage to the active material grid bonds within the battery, which are critical to ensure battery life. Ideally use a recharge rate as stated in "recommended recharge rate and period" according to battery type and catalogue instructions. At the end of discharge, all cells should be gassing freely. It is clearly recommended that batteries are left to stand for a minimum of 3 hours after charging to ensure any gases trapped in the upper battery casings are allowed to diffuse into the atmosphere. If a battery has been recharged, the recharge date on the back label should be updated by 6 months after second recharge date by physically notching the label. (Note: a maximum of two recharges are allowed prior to sale, and product should not be sold a maximum of 9 months after the expiry of first recommended recharge date).

Battery Problems Non Manufacturing Defects

Physical Damage

If the battery is stored, handled or fitted incorrectly, if the connector's leads are hammered onto terminals, leads are not correctly fastened, the battery will have damage to casing and/or terminals. **This is not a manufacturing fault.**

* Note all batteries picked and dispatched from GS's UK warehouse are photographed prior to dispatch to ensure our shipping quality targets are met.

Sulphation

If a battery is allowed to stand in a discharged state either on or off a vehicle for a period of time, a chemical reaction takes place which will permanently impair the performance and life of the battery, this process is called "sulphation".

Sulphation can be seen as a fine white/grey coating on the positive plate and a non metallic lustre on the negative plate. In most cases this signifies the battery as not serviceable. Attempts to recharge batteries left in a discharged state, even at very low charge rates will lead to damage to the grid and active material interfaces and also sulphate deposits can be formed within the separators which produce dendritic shorts.

The damage can occur in storage or if the battery is installed on the vehicle (or equipment) that is not used for a period of time, for example tractor, motorcycle, boat, airport vehicle even a car or

truck that is stored with the battery connected can still damage the battery. This is because there is a permanent drain on the battery from items such as the alarm, clock, lights, etc left on which drag the battery down to its lowest possible state of charge. The longer the period left, the greater the sulphation builds up on the plates.

The sulphation hinders the efficiency of the electrochemical reactions within the battery between the active material of the plates and the acid. **This is not a manufacturing fault.**

Wear and Tear

As the battery is cycled, i.e. charged and discharged, the active materials within the battery plates are in motion in order to release the electricity stored by the battery. Every time the battery is charged and discharged a small amount of active material is permanently lost from the plates.

As the ultimate battery life is determined by many factors, such as temperature, battery operating state of charge, duty cycle, etc it is impossible to stipulate a minimum/maximum life expectancy in the field. This process of normal ageing will eventually cause the battery to lose capacity and it will come to the point where the battery can no longer start the vehicle or equipment. Modern fuel injected cars start much more quickly, typically using a surface discharge off the battery plates, hence the unexpected failure of the battery is more often than not seen when the battery is first put under stress, for example on a cold morning, or after a weekend stand. **This is not a manufacturing fault.**

It is always best to take the opportunity of free battery checks prior to the onset of cold weather or long airport parking periods.

Deep Cycling

As above, every time a battery is charge and discharge cycled a small amount of material is lost. If a battery is subjected to deep discharging (greater than 35%) and rapid charging the process is accelerated. Additionally if the recharge does not recover the discharge cycle in full, the battery will exhibit loss of performance and concentration of the acid can occur between plates which can lead to corrosion and loss of performance.

Even after recharging, the voltage will be low (under 12.4V) but if the cells acid gravities are checked they will generally be even across the battery. **This is not a manufacturing fault.**

Overcharging

If the alternator regulator is not set properly, or alternator voltage control circuit fails, then the battery can be subjected to an excessive charge.

If left unchecked the battery will overheat and will start to evaporate the electrolyte. The overcharging will accelerate the break up of the active material and grids and the battery will lose performance. Examination of the battery will typically show low acid level and usually a black coating on filler plugs and a strong smell. It is recommended that the alternator charging voltage is checked by a mechanic. **This is not a manufacturing fault.**

False Claim

In order to minimise fraudulent battery claims each GS battery has its own individual unique number found on the back label of the battery. It is recommended that this number is recorded on the proof or purchase at point of sale, to enable a double cross check to be made during the claim procedure. The label has been made tamperproof.

Battery Characteristics & Fault Diagnosis continued

Incorrect Application

The batteries recommended within this GS application list are equal to or above the original equipment specification. Fitting a smaller or less powerful battery will result in a shorter service life and earlier failure. The failure will normally be seen as deep cycling/premature wear and tear.

It should be noted that a vehicle fitted originally by manufacturer with an AGM battery should be replaced only with an AGM battery. Likewise, a vehicle originally fitted with an EFB battery should only be replaced by and EFB or AGM battery.

This is not a manufacturing fault.

Undercharging

Undercharging occurs if the battery is not receiving enough charge to return it to a full state of charge, this will slowly cause sulphation. This fault can occur if the car is being used only occasionally for short journeys, or for Start-Stop urban motoring. Undercharging will occur if alternator voltage is low (13.6-13.8 Volts), the alternator belt is loose or battery cables are worn and causing high resistance. If in doubt seek advice from an auto electrician.

Battery Problems Manufacturing Faults

Due to the high demands of the OEM market and the technical and manufacturing standards of GS batteries, the rate of genuine manufacturing faults is negligible.

Short Circuit/Dead Cell

Typically seen in a battery within 12 months' service life. One cell will show a dramatically lower acid specific gravity reading than the others. The problem cell will usually boil visibly under a high discharge, all other remaining cells will show a good specific gravity reading of 1.26 or above. Short circuit/dead cells seen in later life are usually associated with the recovery of a sulphated/overdischarged battery. It is possible to see variable acid specific gravities between cells if sulphation is the root cause.

Internal Break

The battery will have good specific gravity but no voltage reading. Check for any physical damage which may have caused an internal break.

SUMMARY

Providing the correct battery, in the right condition has been used in the right application, the number of battery problems encountered will be minimal. All batteries have a finite life (otherwise there would not be an aftermarket battery business), the life is governed by the conditions under which the battery operates. Battery failures caused by sulphation, wear and tear, deep cycling and physical damage are not manufacturing defects and are not covered by the GS guarantee. Under normal operating conditions, a battery cannot become discharged on its own. The reason can normally be traced back to:

- Malfunctioning alternator, regulator, or starter motor.
- Slipping (incorrectly adjusted alternator charging belt).
- Electrical fault e.g. interior boot/glove box lighting, ECU/sensor interface issues where vehicle does not go into "Sleep" after parking for more than 5 minutes, wiper motor fault.
- Excessive use of electrical consumers, air conditioning, stereo (incorrectly fitted direct to the battery) etc.

- Long standing time without recharge.
- Vehicle lighting and/or hazard flasher left on.

If a battery is consistently used/left in a discharged condition, it will eventually get to a state where it cannot be recovered by a controlled recharge. This is classified as deep discharge/undercharging and it is NOT a manufacturing fault. If a battery is continuously deeply discharged by Stop-Start motoring and heavy usage of vehicle consumer device and then not adequately recharged, it will lose its performance relatively quickly. This is called deep cycling/wear and tear and is not a manufacturing fault. Alternative battery technology, charging and handling solutions need to be found for these applications.

CCA Testing using Digital Conductance Battery Testers

There are many different types of hand held digital conductance tester on the market. They generally give a good indication of problems but the following points should always be taken into account.

- They are not a reliable method of checking the fully developed, cold cranking performance of a NEW battery, partially due to some of the health reading algorithms used. They are designed for the evaluation of testing of faulty or used batteries.
- Different makes of tester, and even different models can give different results.
- Different battery manufacturing design techniques can significantly effect the reading on one digital conductance tester as common algorithms have to be used. For example, batteries designed with more durability in mind tend to carry more material and higher density, this is usually reflected in a lower initial voltage, but longer discharge times. Digital testers can only determine realistically the initial internal resistance of the battery at the particular state of battery, not how much material is available. This can cause considerable difference between the indicated CCA data and the real CCA data obtained in a laboratory, under real current loads to the appropriate battery standard specified.
- CCA readings can be measured according to a number of international standard SAE, EN, DIN or IEC, Within the EN 50342: 2006 standard two requirements are listed: EN1 & EN2. Typical conductance testers are calibrated toward EN2 standard, however the ETN numbering system makes it difficult for the normal man to understand which standard is being used on the battery.
- The condition of battery cables and terminal connections can influence the reading on the hand held tester.
- A battery that is 2-3 years old may still be serviceable for a number of years to come, but because of "wear and tear" may only give a 75% health reading. Conversely a deep discharged battery (or partial internal break) can give a good reading on CCA scale, but on actual high rate or capacity check the battery is in a poor condition. Note: Testing in conjunction with a load tester should be considered where deep discharge may be failure option.

Overall the digital conductance tester gives the best indications of evaluating suspect or used batteries in the market today, but considerations should be made of above points whilst operating the meters.

Battery Testing

A. Visual Check

A1.0 Confirm warranty period applicable to the battery and its usage

- Warranty periods and exclusions are listed in catalogue
- A1.1 Confirm not fraudulent claim

Are warranty terms met?

- YES – Continue to A2.0
- NO – **Reject Claim**

A2.0 Does the battery leak?

- NO – Go to A4.0
- YES – Go to A3.0

A3.0 Can external damage be seen in the area of leak?

- NO – Continue go to A3.1
- YES – **Reject Claim**
 - Determine cause of damage

A3.1 Has the battery been overfilled by the customer?

- NO – **Accept Claim**
- YES – **Reject Claim**

A4.0 Are the end walls of battery badly swollen?

- NO – Continue to section B, battery testing
- YES – **Reject Claim**
 - Suspect overdischarge/overcharging
 - Sulphation is not a manufacturing defect

B0. GS Warranty Test

The GS Warranty Test is a testing type on the GS Midtronics MDX617 (P) digital tester. This test type has been developed specifically for GS products in warranty situations.

GS MIDTRONICS MDX617 (P)

1. Select 'GS Warranty Test'*
2. Select application, then battery type
3. Select battery standard 'SAE'*

***IMPORTANT – Any GS battery presented for warranty testing with the MDX617 (P) MUST be tested using the 'GS Warranty Test' type and the 'SAE' battery standard.**

4. Enter CCA rating of battery (shown on label of battery)
 - a. For Marine and Leisure Batteries use 4 x 20hr capacity
e.g. 100Ah Marine Battery test @ 400A
5. Press ENTER to test

GOOD BATTERY

- **Reject Claim**
 - Battery is fully charged and ready to use

GOOD + RECHARGE

- **Reject Claim**
 - Recharge battery, then ready to use

CHARGE + RETEST

- Charge battery, then test again
- If same result appears after charging
- **Reject Claim**
 - The battery has been subjected to excessive charge/discharging cycling during service
 - Check vehicle electrical system for defects
 - Check any non OEM fitted electrical consumers
 - Check for extreme service usage, (minicabs, delivery vehicles)
 - Service life can be significantly reduced by electrical load/charging imbalance and stop/start driving. These are not manufacturing defects

REPLACE ADVISED

- **Reject Claim**
 - Battery has lost performance due to external factors
 - The battery has lost significantly its original performance

BAD CELL – REPLACE

- **Accept Claim**
 - Battery is defective; replace battery under terms and conditions of warranty
 - Note, if repeated claim from one fleet user, further investigation of battery usage is required especially if the battery is over discharging and overcharging

CHECK CONNECTION / NO DISPLAY

- Check tester leads (another battery) and ensure terminals are clean
- Switch off all electrical consumers when testing the battery if still fitted to the vehicle
- Check battery voltage with multimeter, if below 9.00 Volts but above 0.50 Volts then recharge/retest
- If same result appears after charging then
- **Reject Claim**
 - The battery is unserviceable due to over discharge and sulphation

If battery voltage = 0.50 Volts or less with multimeter, then

- **Accept Claim**
 - Battery is defective – replace under warranty

Battery Testing continued

B1. Digital Testing – All Batteries

Due to an increasing number of sealed, totally maintenance free batteries in the market place, acid specific gravity readings can not always be taken, therefore we recommend a test using a recognised digital conductance tester (Midtronics/Bosch BAT121). Battery terminals should be clean to ensure a meaningful result. In the absence of specialist conductance testers, section A. Visual Check and section C. High Rate Test should be used.

MIDTRONICS

1. Select the SAE Testing mode (Select Warranty mode on GS MDX617-627 if used, see page 368).
2. Enter 70% of the SAE rating of the battery (shown on the label of battery).
 - a. For Marine and Leisure Batteries use 4 x 20hr capacity e.g. 100Ah Marine Battery test @ 400A.
3. Continue to test.
 - a. For earlier 415 model, there is no automatic temperature compensation, every °C drop below 20°C equates to approximately 4A loss in Midtronic reading.

GOOD BATTERY

- **Reject Claim**
 - Battery is fully charged and ready to use

GOOD + RECHARGE

- **Reject Claim**
 - Recharge battery, then ready to use

CHARGE + RETEST

- Charge battery, then test again
- If same result appears after charging
- **Reject Claim**
 - The battery has been subjected to excessive charge / discharging cycling during service
 - Check vehicle electrical system for defects
 - Check any non OEM fitted electrical consumers
 - Check for extreme service usage, (minicabs, delivery vehicles)
 - Service life can be significantly reduced by electrical load/charging imbalance and stop/start driving**These are not manufacturing defects.**

REPLACE BATTERY

- **Reject Claim**
 - Battery has lost performance due to external factors
 - The battery has lost significantly its original performance
 - The battery has lost performance due to external factors, such as overcharging, undercharging, deep cycling, wear and tear**These are not manufacturing defects.**

BAD CELL BATTERY

- **Accept Claim**
 - Battery is defective, replace battery under terms and conditions of warranty
 - Note, if repeated claim from one fleet user, further investigation of battery usage is required especially if the battery is overdischarging and overcharging

CHECK CONNECTION/NO DISPLAY

- Check tester leads (another battery) and ensure terminals are clean
- Switch off all electrical consumers when testing the battery if still fitted to vehicle
- Check battery voltage with multimeter, if below 9.00 Volts but above 0.50 Volts then recharge/retest
- If same result appears after charging then

- **Reject Claim**
- The battery is unserviceable due to over discharge and sulphation

If battery voltage = 0.50 Volts or less with multimeter, then

- **Accept Claim**
 - Battery is defective – replace under warranty

BOSCH BAT121/131

1. Select the SAE or EN1 mode
2. Enter 65% of the rating of the battery (shown on the label of the battery).
 - a. For Marine and Leisure Batteries use 90% of (4 x 20 hour capacity shown on top label of battery)
3. Continue to test
 - a. Adjust for temperature
 - b. Note: Readings between Bosch and Midtronic tester vary significantly, hence recommended use of 90% rating for Bosch tester

GOOD BATTERY

- **Reject Claim**
 - Battery is fully charged and ready to use

GOOD + RECHARGE

- **Reject Claim**
 - Recharge battery, then ready to use

CHARGE + RETEST

- Charge battery, then test again
- If same result appears after charging
- **Reject Claim**
 - The battery has been subjected to excessive charge / discharging cycling during service
 - Check vehicle electrical system for defects
 - Check any non OEM fitted electrical consumers
 - Check for extreme service usage, (minicabs, delivery vehicles)
 - Service life can be significantly reduced by electrical load/charging imbalance and stop/start driving**These are not manufacturing defects.**

REPLACE BATTERY/UNSERVICEABLE

- **Reject Claim**
 - Battery has lost performance due to external factors
 - The battery has lost significantly its original performance
 - The battery has lost performance due to external factors, such as overcharging, undercharging, deep cycling, wear and tear**These are not manufacturing defects.**

REPLACE BATTERY/CELL SHORT CIRCUIT

- **Accept Claim**
 - Battery is defective, replace battery under terms and conditions of warranty
 - Note, if repeated claim from one fleet user, further investigation of battery usage required especially if the battery is overdischarging and overcharging

TEST NOT POSSIBLE/CHECK CONNECTION

- Check tester leads (another battery) and ensure terminals are clean
- Switch off all electrical consumers when testing the battery if still fitted to the vehicle
- Check battery voltage with multimeter, if voltage > 0.50 Volts. Disconnect battery from vehicle then recharge/retest

NO DISPLAY

- Confirm battery voltage = 0.50 Volts or less with multimeter
- **Accept Claim**

Battery Testing continued

B2. Specific Acid Gravity Testing – Battery with Removable Vent Plugs

In a good battery the specific acid gravity (sg) should be the same in all cells. The expected tolerance between all 6 cells is 0.03g/cc (e.g. range of 1.26g/cc to 1.29g/cc).

- After charging a flat battery, insufficient charging may lead to insufficient mixing of acid above the plates. Using a multimeter, confirm the stabilised measured voltage matches the voltage calculated from the specific acid gravity measurement
- (Average measured specific acid gravity +0.84) x 6 should be equal to the measured voltage using a digital multimeter. If not, continue to recharge the battery

Acid Gravity 15°C 1.25-1.28 g/cc battery condition fully charged – proceed with test

Acid Gravity 15°C 1.20-1.25g/cc battery partially charged – charge before proceeding

Acid Gravity 15°C less than 1.20g/cc battery low state of charge – charge immediately, the battery may or may not recover, subject to period battery left in this low state of charge

B2.1 Has one cell a lower acid gravity than others?

- *Example 1.26, 1.25, 1.25, 1.26, 1.26, 1.15*
- YES – **Accept Claim**
 - Replace battery under terms and conditions of warranty
- NO
 - Continue to B2.2

B2.2 Is the electrolyte dark brown and/or evidence of excessive water consumption/topping up?

- YES – **Reject Claim**
 - Damaged caused by overcharging
This is not a manufacturing fault. Check voltage regulator on vehicle.
- NO
 - Continue to B2.3

B2.3 If the specific acid gravity is the same in all cells but reading lower than 1.25g/cc, charge the battery.

- Is the battery charge acceptance able to achieve the recommended recharge current, (see catalogue) after 1-2 hours after commencing charging?
- NO – **Reject Claim**
 - Battery badly sulphated due to deep discharging or undercharging
This is not a manufacturing fault. Check the vehicle charging system (fan belt tension, alternator regulator).
- YES
 - Complete the recommended recharge
 - Continue to B2.4

B2.4 Is the specific acid gravity the same in all cells and above 1.25g/cc?

- NO
 - All cells even but less than 1.24g/cc, then extend recharge by 6 hours
 - If one cell has a lower specific acid gravity than others go back to B2.1
- YES
 - Continue to C High Rate Discharge Testing

C. High Rate Discharge Testing

This test should only be carried out if battery voltage > 12.5 Volts, otherwise recharge battery according to recommended recharge rates and period (see catalogue)

C1.0 Is the High Rate Discharge Test indicating GOOD Battery?

- YES
 - **Reject Claim**
- NO
 - Continue to C2.0

C2.0 Was end of discharge test showing immediate drop to 0 Volts?

- YES
 - **Accept Claim** (subject to no visual damage to battery)
Manufacturing defect – internal connection break. Replace battery under terms and conditions of warranty.
- NO – End of test showed 1.0 Volts to 9.0 Volts
 - **Reject Claim**
This is not a manufacturing defect. Service deterioration.

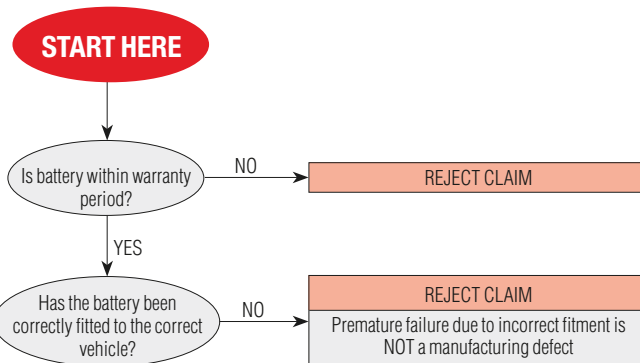

WHEN TO USE A DIGITAL TESTER	Voltage Check	CCA vs. Rating	Fault and Condition
NEW BATTERY EVALUATION (Before installation)	YES	NO*	YES
WARRANTY CLAIM TEST (After installation)	YES	YES	YES
BATTERY HEALTH CHECK (After installation)	YES	YES	YES

* See Digital Conductance Testers Explained

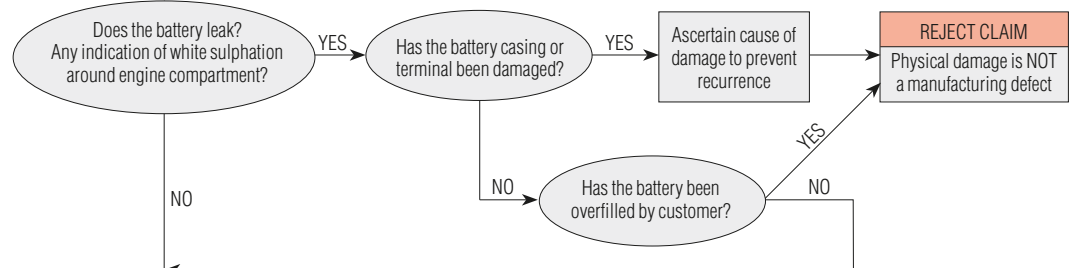

Note: If the battery has been identified as over discharged, then attempt to recharge, however if the battery has been left in low state of charge for period of time, recovery is less likely due to the deposition of large crystal sulphate formation in the plates and in the separators which will lead to grid damage and soft short circuits in the separator during attempts to recharge.

A. Visual Check

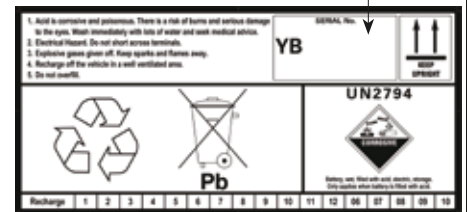

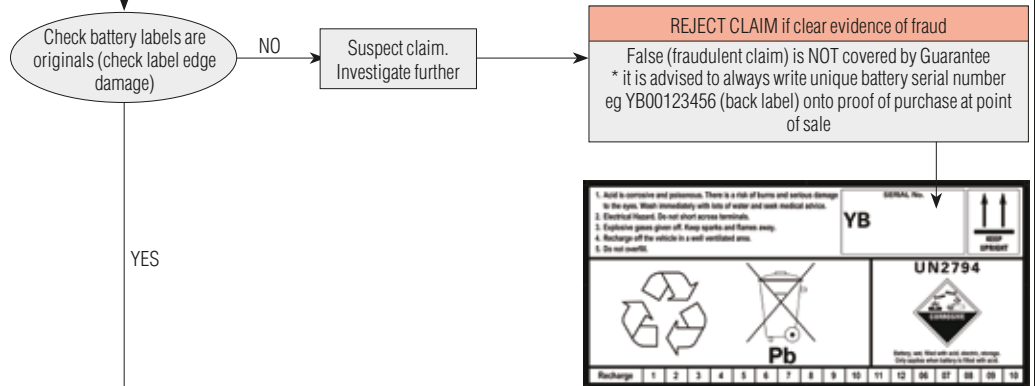

A1.0 Warranty Period

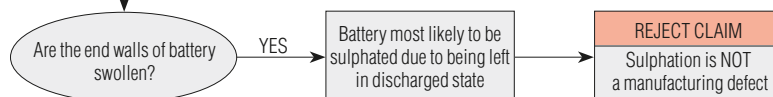

A2.0/A3.0 Damage

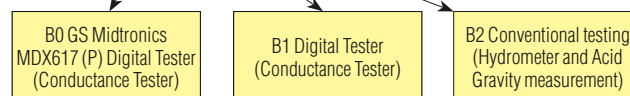

A1.1 False Claim

A4.0 Overdischarged & Overcharged

Testing Choice

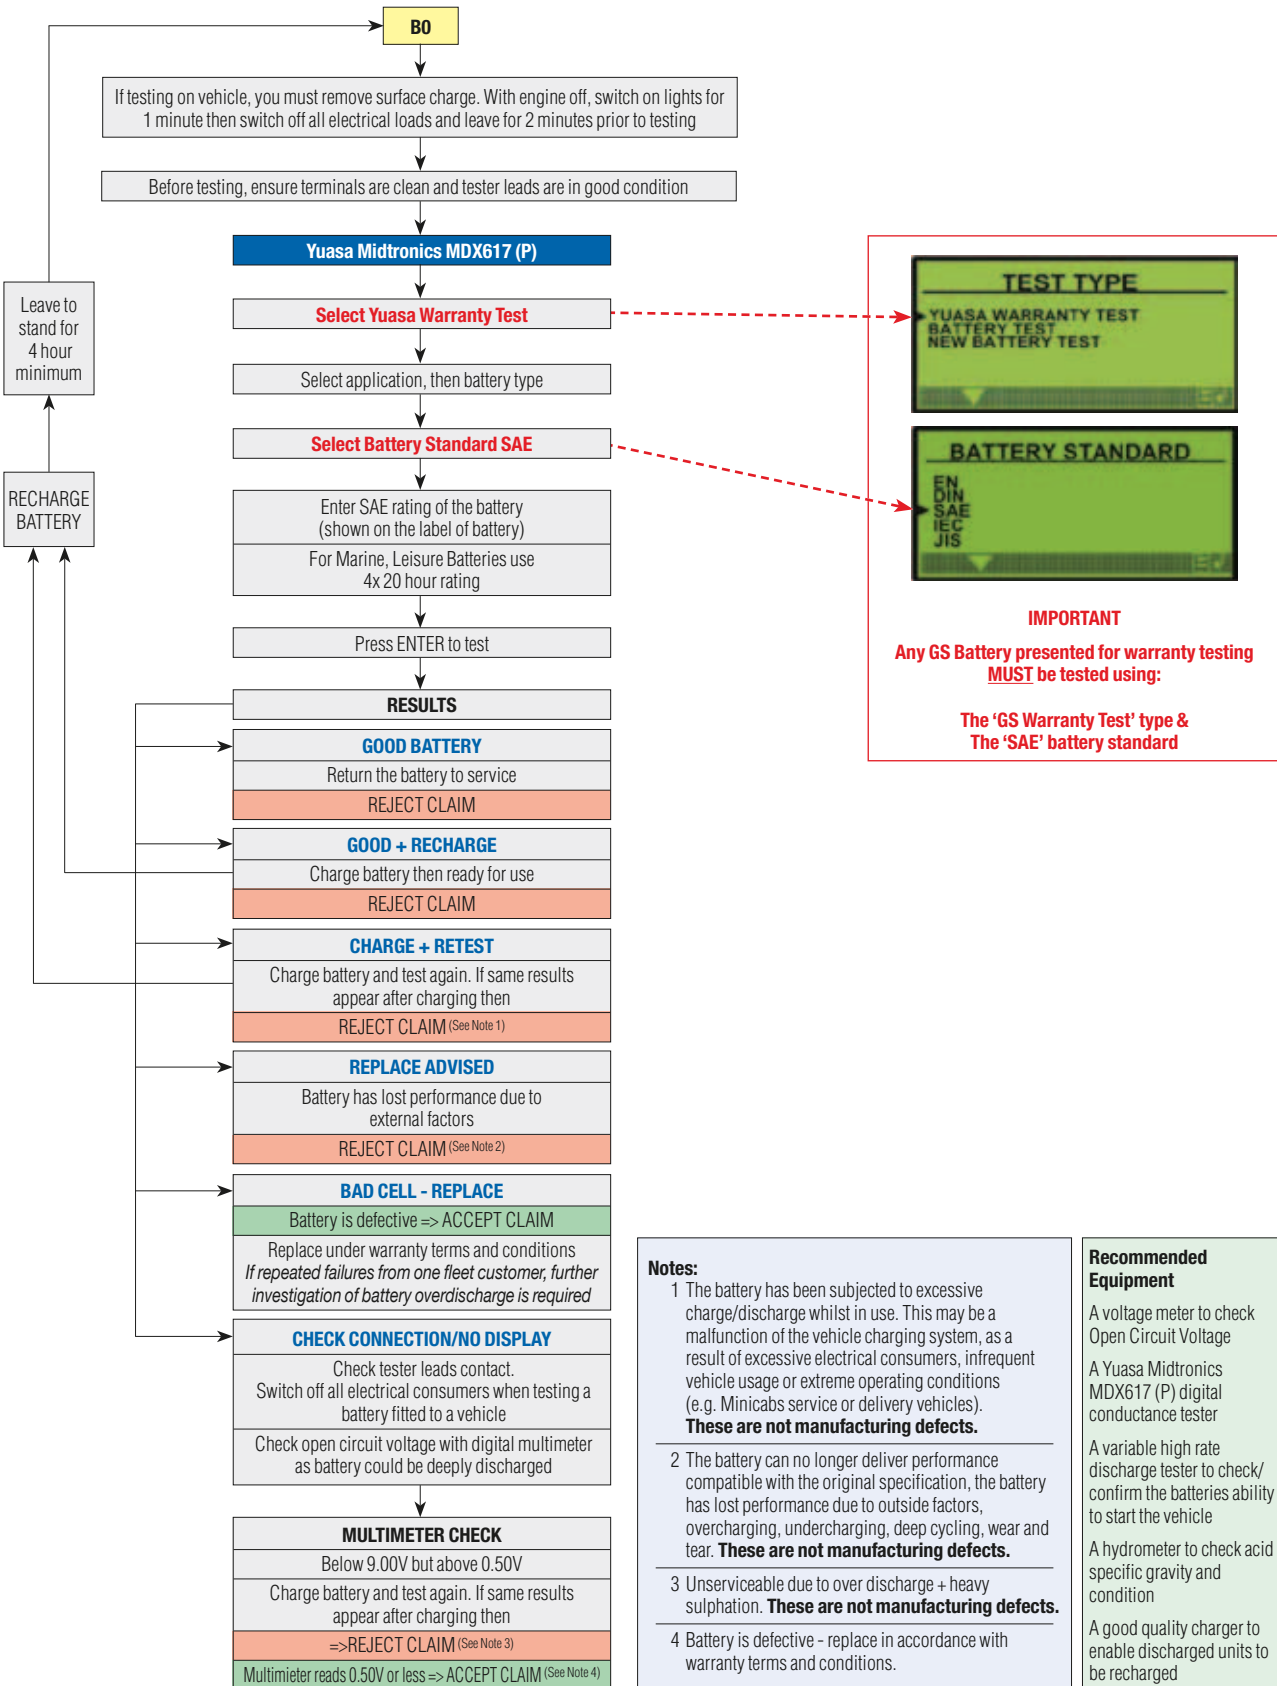

B0. GS Warranty Test

B0. Using Yuasa Midtronics MDX617 (P) digital tester – batteries without removable vent plugs

This procedure is specific to the 'Yuasa Warranty Test' on the Yuasa Midtronics MDX617 (P) digital conductance tester.

If using standard Midtronics Test (battery test) mode on this tester, go directly to procedure B1.

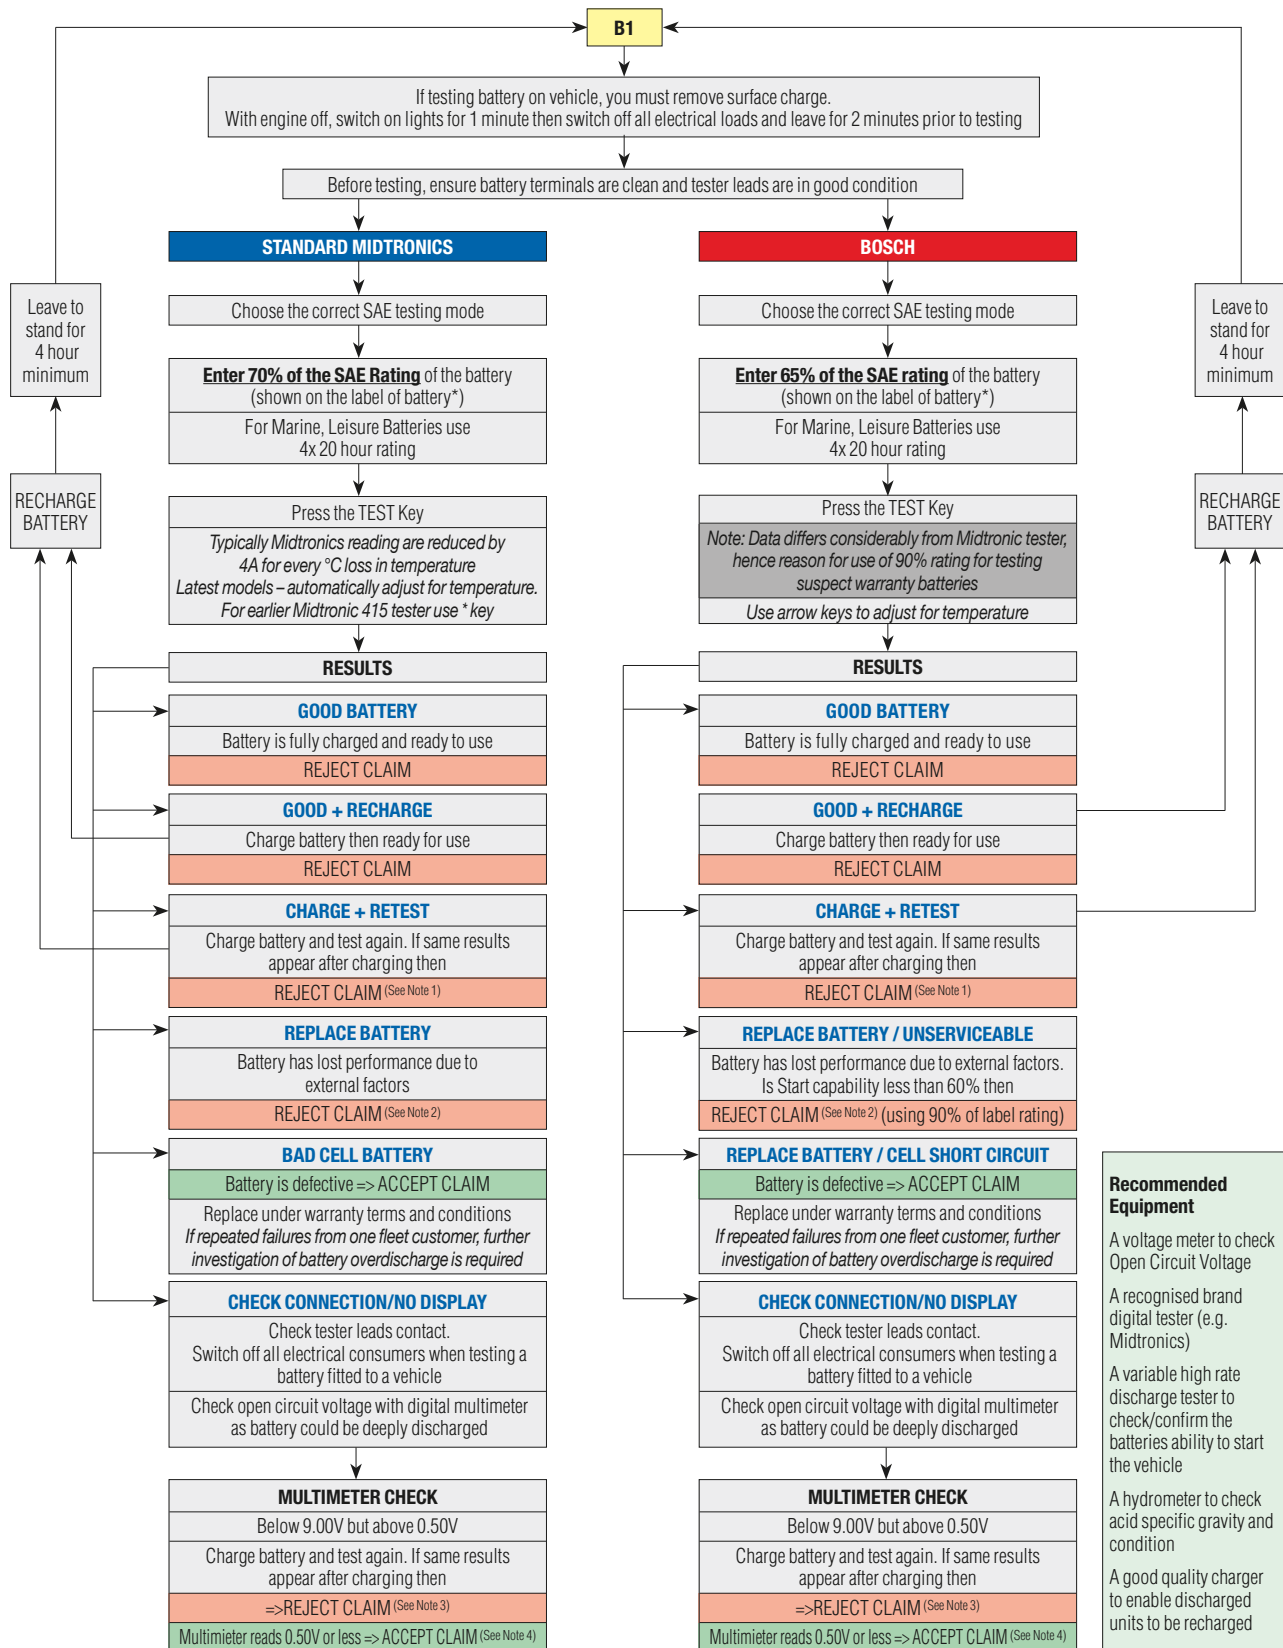

For other recognised testers e.g. Standard Midtronics or Bosch 121, go directly to procedure B1.

B1. Testing the Battery – Recognised Testers

B1 Using Recognised Digital Tester – batteries without removable vent plugs

We recommend that a test is carried out with a recognised digital tester, for example Midtronic or Bosch Type 121 tester. In the absence of specialised testing equipment perform a high rate discharge test (go directly to procedure B2).

Notes:

For explanation of notes 1, 2, 3 and 4, please refer to notes on page 177.

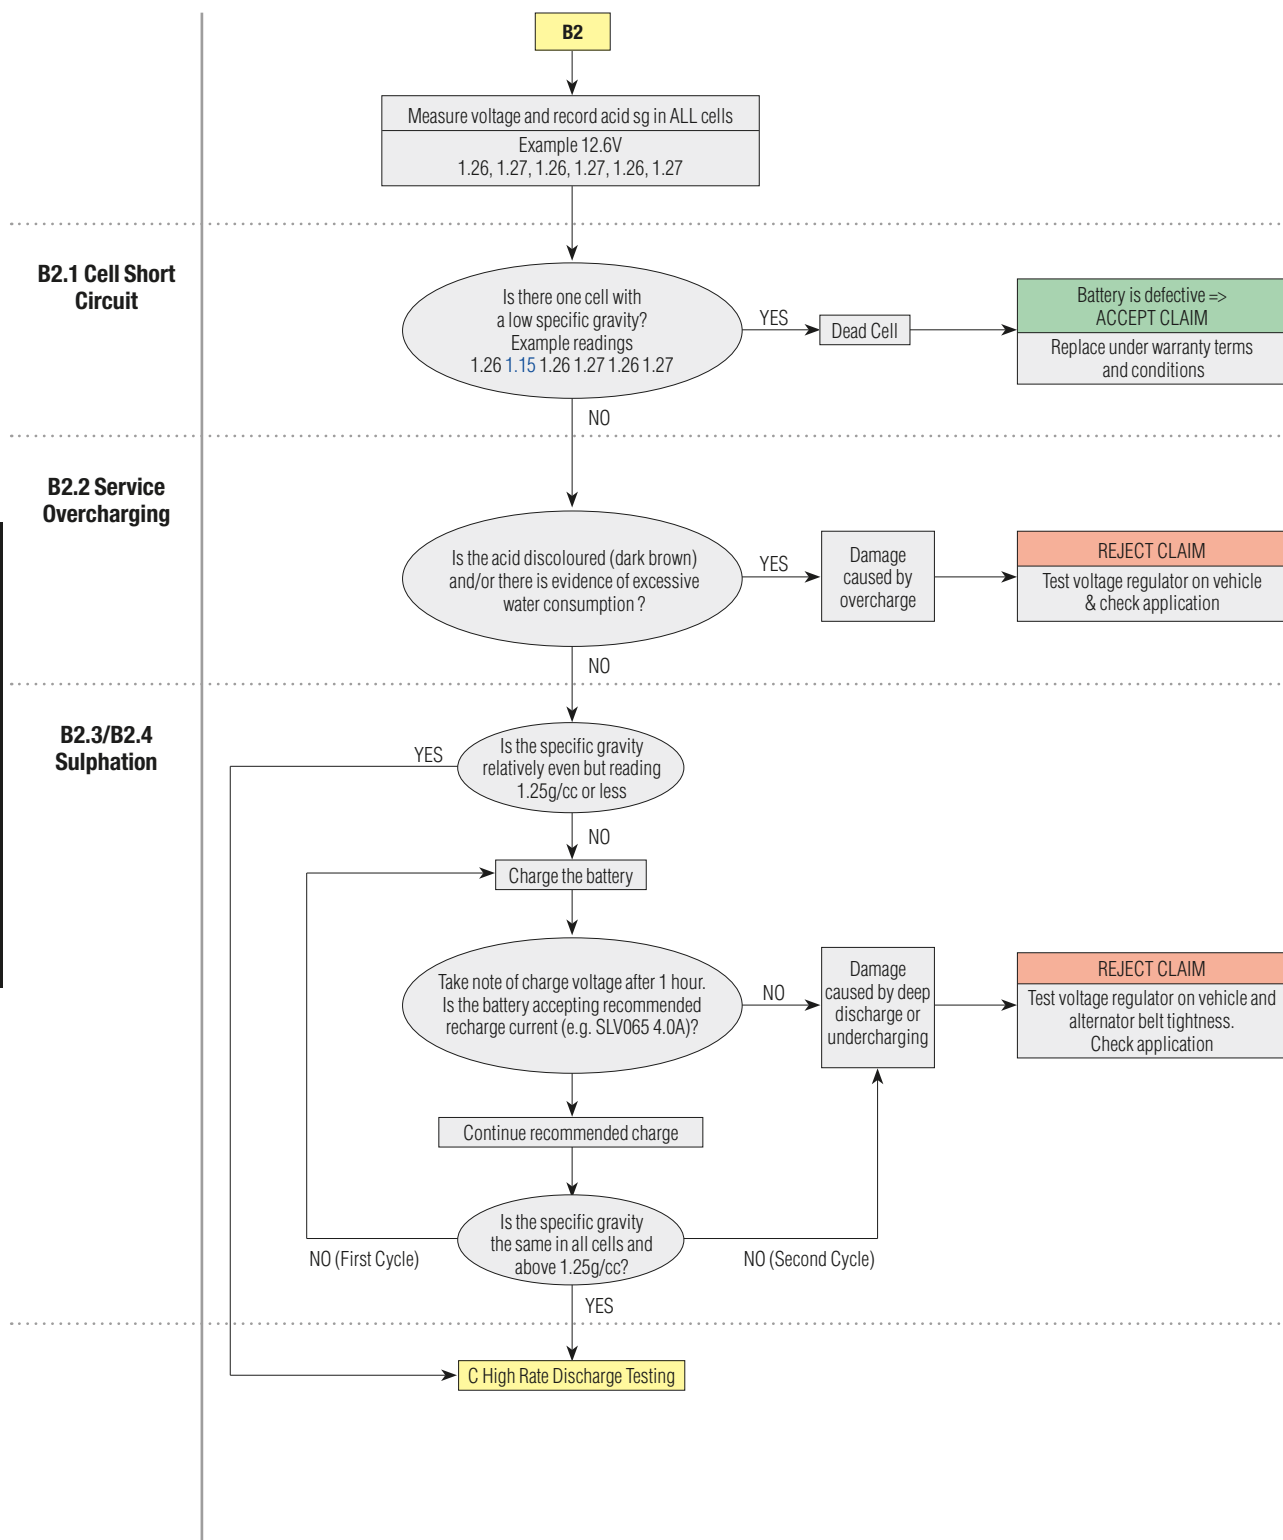

* The adjustment in test inputs detailed in these procedures (70% Midtronics & 65% Bosch) has been determined through extensive testing of GS batteries. They take into account the normal wear and tear of product under typical service conditions.

B2. Testing the Battery

B2 Conventional Testing – batteries with removable vent plugs

Notes:

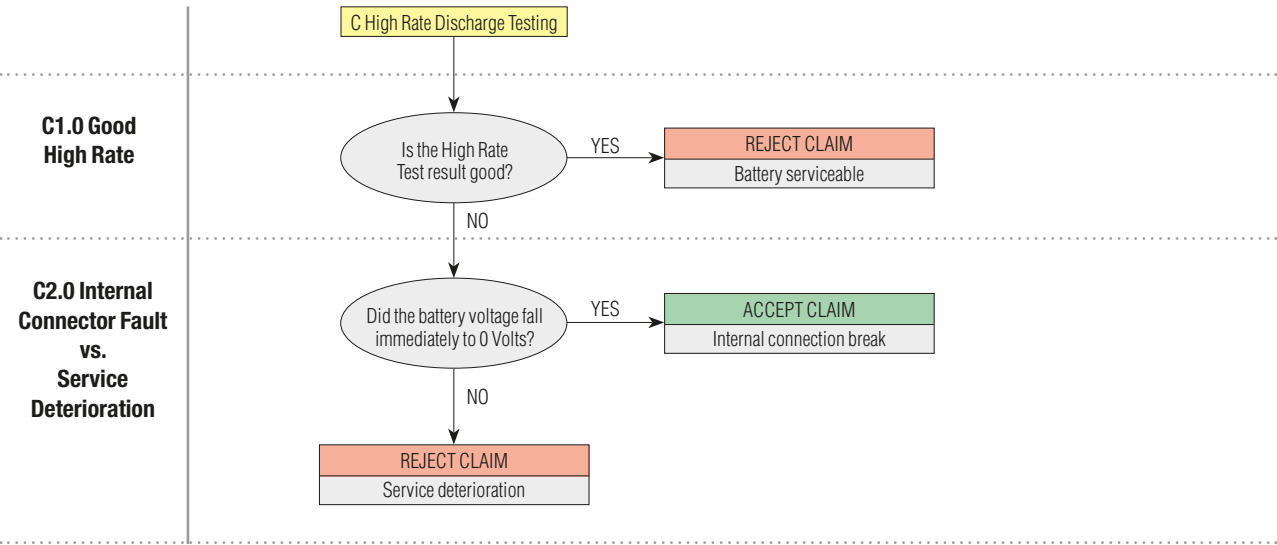

In a good battery, the specific gravity (sg) reading should be the same in all cells.
The expected tolerance between all 6 cells is 0.03g/cc (e.g. range 1.26g/cc min, 1.29g/cc max).
When charging the battery always follow the instructions supplied with the charger.
After charging a flat battery, insufficient charging may lead to insufficient acid mixing of the electrolyte above the plates.
Using a multimeter, confirm stabilised measured voltage matches the voltage calculated from specific acid gravity measurement
(Average sg + 0.84) x 6 should be equal to measured voltage if the acid is sufficiently mixed.

C. Testing the Battery

C1 High Rate Discharge Testing

(Battery must be greater than 12.5 Volts before commencing C High Rate Testing)

Notes:

If the battery is identified as over discharged, then attempt to recharge, however if the battery has been left in a low state of charge for a long period there is less chance of recovery and subsequent deposition of sulphate within the separators will lead to soft short circuits. Battery may be undercharged or overcharged due to faults within the vehicle electrical system This is not a fault of the battery and the vehicle electrical system should be checked.

GS Yu-Fit Battery Configuration Tool

Introduction

With the introduction of new CO₂ production control systems such as smart charging and Idle Start-Stop (ISS) it is essential that the vehicle has the correct battery type and specification installed.

An increasing number of automotive manufacturers have introduced systems that now require a replacement battery is correctly configured to the vehicle after installation.

Failure to configure the correct specification battery could result in:

- Undercharging or overcharging of the battery resulting in damage which is not covered by the manufacturer's warranty
- Loss of the ISS CO₂ production control system functionality
- Possible loss of non-critical vehicle system functions

Battery configuration prevents incorrect battery charging, ensures the correct operation of the ISS CO₂ production control system and prevents the loss of non-critical vehicle systems.

The GS Yu-Fit battery configuration tool allows the configuration process to be carried out on a growing number of vehicles equipped with new technology smart charge and ISS systems.

The configuration process therefore:

- Informs the vehicle that a new battery has been installed
- Informs the charging system of the new battery characteristics
- Ensures the vehicle uses the correct charging parameters for the new battery

GS Yu-Fit Registration

Before you can use the GS Yu-Fit Battery Configuration Tool it must be registered.

To register you must first download the GS Yu-Fit application suite using the link at the foot of the GS Workshop battery finder web site located at <http://batterylookup.gs-battery.com>

Once the application suite has been successfully installed follow the on-screen instructions to complete the registration process.

By registering the product you will be able to take advantage of the following:

- Product and technical updates via email
- Notification of application updates for the GS Yu-Fit

Attach your GS Yu-Fit unique PIN & Serial Number sticker here.

GS Yu-Fit PIN & Serial Number

GS Yu-Fit Battery Configuration Tool continued

GS Yu-Fit Navigation

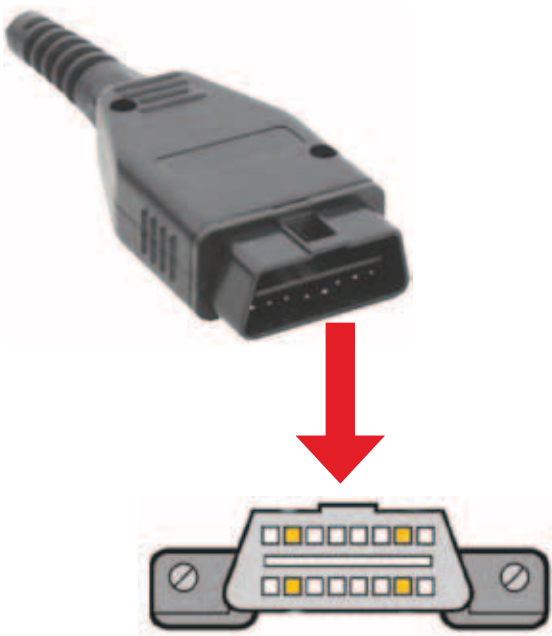

Navigation around the OLED display screen is controlled using the multi-functional key pad which consists of:

- Four arrow buttons (Up, Down, Left & Right)
- OK button
- ESC button

GS Yu-Fit Connection

Once the vehicle battery has been replaced the GS Yu-Fit battery configuration tool should be connected to the vehicle via the 16 Pin J1962 EOBD diagnostic plug.

GS Yu-Fit LCD Icons

Diagnostic/Vehicle Selection

Select this to enter Vehicle Specific Serial Diagnostics function.

System Setup

Select this to configure the various settings of the GS Yu-Fit.

Information

Select this to display software and hardware information.

Selecting the System Setup icon displays the System Setup Menu which allows the GS Yu-Fit user to adjust settings and carry out system tests if required.

Clock

Select this to view and if necessary set the date and time.

Garage/Workshop Information

Select this to display your user details. These can be edited using the PC suite.

Volume

Select this to turn the sounder ON or OFF.

Test

Select this to carry out hardware tests on the GS Yu-Fit if requested by Technical Support.

Language Selection

Select this to change the language used by the GS Yu-Fit.

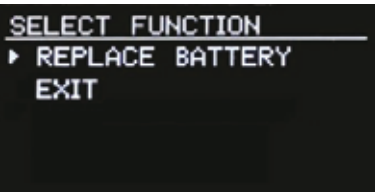

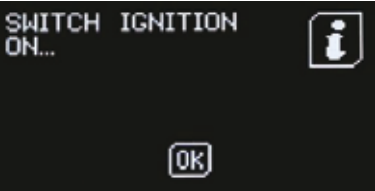

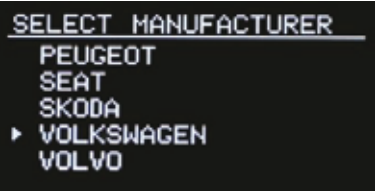

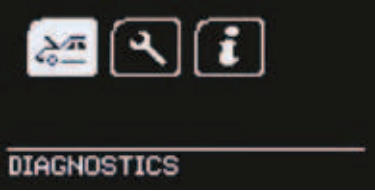

Back

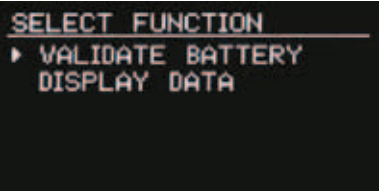

Select this to return to the previous menu.

GS Yu-Fit Battery Configuration Tool continued

GS Yu-Fit Battery Configuration Procedure

Select the VALIDATE BATTERY option from the SELECT FUNCTION menu, confirm with 'OK' and wait for the function to initialise.

NOTE:
The battery configuration procedure that the GS Yu-Fit is capable of varies, dependent on the vehicle manufacturer and sophistication of the systems installed on the vehicle.

Vehicles allowing limited access with the GS Yu-Fit will only allow the configuration of the correct specification replacement battery.

Vehicles allowing enhanced access with the GS Yu-Fit will allow the configuration of either correct /incorrect specification replacement batteries.

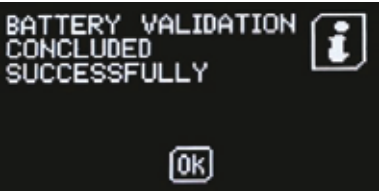

Based on this, the number of configuration steps may also vary and the level of information required to carry out a successful battery configuration procedure will differ and may include:

- Is the new battery equivalent to the old one in both technology and performance?
- The name of the battery manufacturer
- The technology of the new battery
- The Ah capacity of the new battery

WARNING:
ALWAYS ENSURE THAT THE CORRECT TYPE AND SPECIFICATION OF BATTERY IS INSTALLED ON THE VEHICLE

Select and confirm the correct battery data with OK.

Wait for any fault codes to be cleared and conformation that the battery configuration process has been successfully concluded before turning OFF the ignition and disconnecting the GS Yu-Fit from the vehicle.

How a Battery Works

What is a Battery?

A battery is a device for storing electrical energy in a chemical form, and then releasing it as direct current in a controlled way.

All types of batteries contain a positive and a negative electrode immersed in an electrolyte, the whole assembly being within a container.

Most GS batteries are lead-acid batteries, which means that they have positive and negative electrodes made of lead compounds in a dilute sulphuric acid electrolyte.

Lead-acid batteries are secondary batteries, which means that they can be recharged after they have been discharged. Primary batteries can be discharged only once and then have to be thrown away; examples are some types of torch and radio batteries.

How a GS Battery Works

The positive electrode is made of lead dioxide and the negative electrode is made of porous lead.

When an electrical load (for example lights or a starter-motor) is connected across the battery, a current flows through the electrolyte in the battery and through the external load. This causes the battery to discharge, which results in the chemical composition of both the electrodes changing to lead sulphate.

A battery can be charged by putting a current through the battery from an outside source of electricity such as an alternator, dynamo or charging unit. This converts the lead sulphate back to the original materials of lead dioxide and porous lead.

As the battery becomes charged, the electricity begins to decompose (hydrolyse) the water in the electrolyte into its constituent elements of hydrogen and oxygen, which are released as gas. This is why a battery gases when it is charged.

What is a Battery Made Of?

Grids

As the positive and negative electrodes are made of weak materials, they need a mechanical support which is provided by a grid made from a lead alloy; lead on its own would be too soft.

In addition to providing a support for the electrodes (the active material), the grid also conducts electricity from the electrodes to the outside load.

Electrodes

The electrodes are initially made from a mixture of lead oxide and lead sulphate. This is converted into lead dioxide in the positive plate and porous lead in the negative plate when the battery is initially charged.

The negative electrode also contains small amounts of additives to give the battery a good discharge performance at low temperatures to improve starting.

The combination of grid and electrode is normally called a **plate**.

Electrolyte

The electrolyte is dilute sulphuric acid. This acts as a conductor to transport electrical ions between the positive and negative plates when the battery is being charged or discharged.

The acid also takes part in the discharge as the sulphate ions react chemically at the electrodes to produce lead sulphate.

Separator

The separator is an insulator placed between the positive and negative plates to prevent them shorting together.

The separator needs to be microporous with very small holes to allow the ions to flow through the separator from one plate to another. It also needs to be able to resist the high temperatures and strongly acidic oxidising conditions that occur in a battery.

Most modern separators are made of microporous polyethylene, which has the right properties to meet the demanding conditions within the battery.

Container and Lid

These are normally made of polypropylene, which is a light but strong plastic. Unlike some plastics, it does not become brittle when it is cold, and so can resist knocks during handling. It is not attacked by acid and it can also withstand the fluids (petrol, diesel, brake-fluid, antifreeze) normally found on a vehicle.

What Makes a Battery Maintenance-Free?

30 years ago, batteries lost water at a high rate, and motorists were advised to check the acid level as one of their weekly checks; modern maintenance-free batteries need no water addition throughout their life under normal operating conditions. Incidentally, during the same period, battery life has doubled from 2 years to 4-5 years.

In the past, battery grids were made of an alloy of lead with 10 per cent of antimony; the purpose of the antimony was to give rigidity as pure lead would be too soft on its own. Unfortunately, some of the antimony dissolved in the acid and resulted in the battery losing water.

With improvements in battery technology, we have been able to reduce the antimony content from 10 per cent to 1.5 per cent, and this reduction has resulted in batteries that are low maintenance, needing only yearly attention.

The latest improvement has been the use of 0.1 per cent of calcium as a hardening agent in grids in place of antimony; this causes less contamination of the acid and much reduced water loss, making the battery maintenance-free so no water needs to be added during its operational life.

How a Battery Works continued

Service Problems

Overcharge

Modern car charging systems allow only a small current to flow into the battery when it is fully charged. If there is a fault in the alternator, a much higher current will pass through the battery all the time that the car is running. This current will cause the battery to lose water rapidly, destroying the maintenance free characteristics of the battery, and will also reduce the life of the battery by damaging the positive grids.

A dark brown/black colour on the bottoms of the vent-plugs is a strong sign of overcharge.

If an alternator (non Start-Stop vehicle) has a voltage above 14.8 Volts at normal temperatures, this is a generally sign that the charging system is faulty. The common diode fault in the rectifier will see charging voltages of 16.0 Volts at the battery, the alternator should be repaired immediately to prevent any further damage to the battery.

Note with latest Start-Stop vehicles with Brake Energy Regeneration, higher voltages (15.2 Volts) are used to maximise charging efficiencies and reduce alternator charging periods.

Deep Cycling

Modern charging systems keep the battery in a high state-of-charge while the car is running under most operating conditions. However, the battery will discharge under abnormal conditions or if the car is allowed to stand with a load on, for example, lights. On modern cars when parked, there is normally a constant drain on the battery caused by such components as the computer, alarm system, clock etc, and this will cause the battery to become discharged. Depending on the vehicle, this can take weeks or months.

Vehicle batteries are designed to accept some cycles of discharge and recharge, but are not designed for applications in which there are constant cycles of charge and discharge (deep cycling). Leisure Batteries have been designed for these types of application, and have a special construction to enable them to be deep cycled on a continuing basis.

Continual deep cycling of vehicle batteries will cause failure as the positive active material will gradually fall to the bottom of the battery, reducing the ability of the plates to store electricity.

A large number of small black/brown particles in the electrolyte are a strong indication that the battery has been deep cycled.

Sulphation

Sulphation is a normal part of the operation of a battery and occurs whenever a battery is discharged. When the battery is recharged, the sulphation (lead sulphate) is changed back into active material.

If a battery is left flat for a period of time, this sulphation slowly changes its form into one that cannot be changed back into active material on charging, so, after charge, the battery will not return to give its original performance. If the sulphation is bad enough, the car will not start. This is the problem normally referred to as sulphation.

Undercharge

Undercharge occurs if the battery is not receiving enough charge to return it to a full state-of-charge; this will slowly cause sulphation. This fault can occur if the car is being used only occasionally for short journeys, or for Start-Stop urban motoring. Undercharge will also occur if the alternator voltage is in the region of 13.6 - 13.8 Volts .

Patented Sealed Post

Heat Sealed Case to Cover

protects against seepage and corrosion – bonded unit gives extra strength.

Polypropylene Cover and Container

Special Separator

makes the battery spill-proof. Valve regulated design eliminates water loss and the need to refill with acid.

Safety Valve Flame/Arrestor

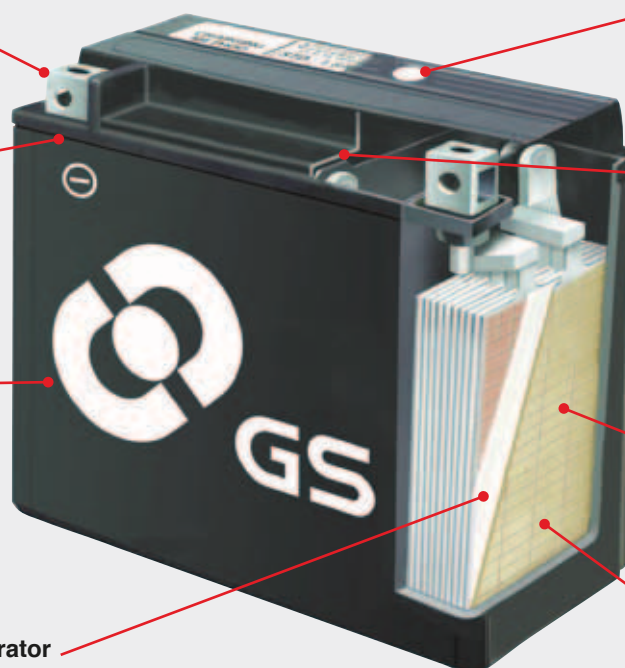

Thru-Partition Construction

provides shorter current path with less resistance than “over the partition” construction – you get more cranking power when you need it!

Special Active Material

is compounded to withstand vibration, prolong battery life and dependability.

Special Grid Design

Understanding the Specifications

GS Number

GS battery part numbers are based on the BBMS (British Battery Manufacturers Society) standard which has been used and understood by the UK aftermarket business for many years.

DIN Number 72310 1988

The DIN (German Industrial Standard) Part Number system traditionally used within Europe, but replaced by ETN number system.

e.g. 560.49

- 1st digit – Voltage
 - 1-2 = 6 Volt battery
 - 5-7 = 12 Volt battery
- 2nd & 3rd digits – Nominal capacity
 - 560 = 60Ah @ 20 hour rate
 - 660 = 160Ah @ 20 hour rate
- 4th & 5th digits – unique code number referencing battery performance and features

The DIN numbering system is still used, more within Europe to identify battery types.

ETN Number

The ETN (European Type Number) was introduced to replace the DIN Number in the course of Europeanisation of battery standards. The ETN is a combination of the DIN numbering system which facilitates the change over and gives further technical details.

The introduction of ETN system has lead to nearly 2000 part numbers being issued during its formal control period up to 2006 and therefore can lead to added confusion if cross referencing of part numbers is required without the formal number index records. The control of number issue by Eurobat was disbanded in 2006 and subsequently issued numbers are now difficult to understand as no formal central records are kept and issued. The 9 digit ETN offers additional information to the DIN numbering system.

e.g. 536 046 030

- 1st digit – Voltage – 1-2 = 6 Volt battery, 5-7 12 Volt battery
- 2nd and 3rd digits – nominal capacity
 - 560 = 60Ah @ 20 hour rate
 - 660 = 160Ah @ 20 hour rate
- 4th, 5th and 6th digits – unique code number
 - 5th and 6th digit can refer back sometimes to older battery design and original DIN number (4th and 5th digits)
 - Unique code number giving details of endurance level, cold cranking performance level, vibration level, lid terminal and hold-down details
- 7th, 8th and 9th digits – Cold Cranking Performance
 - There are 2 different EN rating EN1 and the EN2
 - This can cause confusion, as is unclear to the end user which standard is used, especially with the use of digital conductance testers which can not currently test to both standards.
 - Details to which specification the battery is supplied to is hidden within the unique code number.

Cold Cranking Performance (Amps)

The Cold Cranking Performance (CCA) measures the starting performance of the battery. In simple terms, the higher the CCA, the easier it will be to start the vehicle.

SAE (J537 Jun 1994 American Standard)

This is the starting test according to the SAE (Society of Automotive Engineers). The test specifies that the battery at a temperature of -18°C will deliver a current equal to the Cold Cranking Amps for 30 seconds with the voltage staying above 7.2 Volts (3.6 Volts for a 6 Volt battery).

Although subject to battery design, an approximation of SAE to DIN CCA relationship is: $SAE = (DIN \times 1.5) + 40$.

Battery performance drops off quickly with temperature, so this test is a good check of a battery's starting ability as with 10s voltage of EN rating and its need to support 30 seconds to 7.2 Volts gives a good view of high rate capacity capability of the battery.

DIN (German Industrial Standard at -18°C)

Again as with SAE the test is carried out at -18°C. The fully charged battery is discharged to 6 Volts with the rated test current. The voltage must be at least 9.0 Volts after 30 seconds and the time to achieve 6 Volts must be at least 150 seconds.

Although subject to battery design an approximation of DIN to SAE CCA relationship is: $DIN = (SAE - 40) \times 0.66$

Since the introduction of modern fuel injected vehicles and the need for fast starting, the DIN standard has lost favour amongst automotive vehicle manufacturers. However, it does give a clear relationship with the amount of materials used within the battery, but not startability.

IEC (International Electro Technical Commission) (IEC 60095-1 Nov 2006)

Again as the SAE, EN and DIN tests the test is performed at -18°C. After a rest period of up to 24 hours after preparation according to 6.2 of standard, the battery is placed in a cooling chamber with air circulation at a temperature of -18°C +/- 1°C until the temperature of the middle cell has reached -18°C +/- 1°C. The battery is then discharged according to the standard and is required to meet a voltage of 7.5 Volts after 10 seconds and 7.2 Volts after 30 seconds, the battery is then rested for 20+/- 1 seconds after which the battery is discharged at 60% of original current and terminated at 6.0 Volts Time t_6 Volts (stage 2) $> = 40$ second is optional according to table 7 of the standard. The IEC standard has a relationship between the SAE and IEN1 standard and for GS batteries the SAE value can be assumed to equal IEC.

Understanding the Specifications continued

EN (EN50342.1 A1 Nov 2011 Item 5.3)

The test also is performed at -18°C. The EN requirement is however split into two levels EN1 and EN2.

EN1 - The battery is required to meet a voltage of 7.5 Volts after 10 seconds and after 10 seconds rest, the battery is further discharged @ 0.6 x original current and is required to complete 73s in the second stage giving a total combined discharge period of 90 seconds (assume initial period equates to (10s/0.6) 16.7 seconds.

EN2 As EN1 except that the second discharge period to 6.0 Volts should achieve 133 seconds giving a total time of 150 seconds. The discharge currents relationship to meet both designs is very much subject to battery design and can vary from manufacturer to manufacturers and design to design, however as an overview of our benchmarking work at GS of competitor batteries the relationship between EN1 and EN2 is:
EN2 = 0.85% to 0.92% EN1

Due to this relationship, we usually display SAE as our standard to minimise confusion.

JIS (D5301: 1999)

The Japanese Industrial Standard test is carried out at -15°C. The automotive batteries are usually tested at either 150A or 300A with different 10s /30s voltage and durability requirement to 6 Volts. For European applications we believe this does not give as clear a view to the customer of battery startability and is rarely shown and used within the European aftermarket.

Marine Cranking (MCA)

This Marine Cranking Test is based on SAE CCA requirement but carried out at the higher temperature of 0°C, usually indicated on batteries as CA (Cranking Amps) or MCA (Marine Cranking Amps) rather than CCA (Cold Cranking Amps). The cranking current (CA/ MCA) is typically 25% higher than the corresponding SAE CCA marked battery. It is advised that this should be checked with respect to any Marine related cranking current enquires.

The number of automotive battery standards in the world market's are numerous, GS currently use the SAE CCA standard as a norm to hopefully give a clear balanced representation of battery cranking performance between startability and starting endurance.

According to EU1103: 2010 Capacity Marking Directive GS use 20hr and EN1 CCA as specified in EN50342.1 A1 2011. Please note due to algorithm issues in existing Impedance testers on the market – all testing on GS batteries should follow the old SAE algorithm (not EN or IEC as ranges are still specified against obsolete versions of the standard).

Reserve Capacity Minutes (EN50342.1 A1 Nov 2011 Item 5.2)

The Reserve Capacity is the amount of time in minutes that a battery at 25°C can deliver a current of 25 Amps until the voltage drops to 10.50 Volts (5.25 Volts for a 6 Volt battery).

25 Amps represents a typical electrical load on a car under normal running conditions, so the Reserve Capacity gives an indication of the time that a vehicle with a normal electrical load will run with a broken alternator or fan-belt. This is a good, practical test.

Obviously, the more electrical accessories you turn off, the further you can drive the car.

Aside: Reserve Capacity was originally used to give an indication of the capacity of the battery if the then charging system (dynamo) failed and the duration of driving time left after charging warning light first appeared. With the greater dependability of modern vehicle charging systems the direct usefulness of reserve capacity to the automotive user has dropped, but does show the relative drop off in battery performance as the discharge current is increased.

Ampere-Hour Capacity at 20 Hour Rate (Ah) (EN50342.1 A1 Nov 2011 Item 5.1)

The Ampere-Hour Capacity measures the total amount of electricity stored in a battery.

An Ampere-Hour represents the amount of electricity when a current of 1 Ampere passes for 1 hour.

The Ampere-Hour Capacity varies with the rate at which the battery is discharged; the slower the discharge, the greater the amount of electricity that the battery will deliver.

The Ampere-Hour Capacity is the amount of electricity that a battery will deliver during 20 hours before the voltage falls to 10.50 Volts. For example, a 60Ah battery will deliver a current of 3A for 20 hours.

Recommended Charge Rate (Amps)

This is the recommended current for charging batteries with a constant-current charger.

For more details, see Section G of 'All You Need To Know About Batteries' in this catalogue.

Dimensions – Length (mm)

This is the dimension over the longest part of the battery, including the hold-down if fitted.

Dimensions – Width (mm)

This is the dimension over the widest part of the battery, including the hold-down if fitted.

Understanding the Specifications continued

Dimensions – Height (mm)

This is the overall height of the battery to the tops of the terminals if these are proud of the lid.

Weight with Acid (kg)

This is the average weight of the battery as supplied.

Cell Layout

See the diagram on page 13 showing cell layouts and polarity.

Terminal

The diagram on page 14 shows the types of terminal fitted to each type of battery.

Container Features

The diagram on page 13 shows information about container hold-downs and other features.

Handles

A ● in this column shows that the battery is fitted with carrying handles.

End-Venting

There are now several batteries in the range that have end-venting, rather than the normal venting through the individual vent-plugs.

A ● in this column shows that the battery is fitted with end-venting at the negative end.

The battery is fitted with a gassing outlet according to EN60095-2 + EN50342.2 2007 item 5.5.3 and Figure 10 to allow repote venting of the battery.

State of Charge Indicator

A clever floating ball and prism device fitted to one cell of the battery to give a quick visual guide to battery state of charge and electrolyte level within the battery. If concerns noted, it should be used as advice to seeking further engineering support.

Japanese/Korean True-Fit

A ● in this column shows that the battery has the same dimensions, features and performance-level as an original Japanese battery.

Lid Features

An indication of lid design feature which may be specific to vehicle fitment:

- Block – T shaped lid feature to give recessed area for terminals, and for European type sufficient for top clamping according to IEC 60095-2 and EN50342.2 007 item 5.5.1.
 - Flat – Flat lid feature with no raised plugs which could interfere with manufacturers top clamp frame.
 - Raised plugs – Raised vent plug design sitting above the top face of the lid.
-

Semi-Traction Features

A ● in this column shows that the battery has Japanese/Korean True-Fit features. These make the battery suitable for applications in which there is some cycling (e.g. vehicles with tail-lifts).

Health & Safety Information

Handling and the proper use of Lead Acid Batteries are not hazardous providing sensible precautions are observed, appropriate facilities are available and personnel have been given adequate training.

In accordance with the Consumer Protection Act 1987, the purpose of this guide is to:

1. Indicate the main hazards which may arise
2. Outline the precautions to be taken to minimise such hazards
3. Indicate the emergency actions to be taken in the event of the occurrence of a hazard

A - Label Information

The following symbols are being used on all batteries and mean the following:

	Note operating instructions
	Shield eyes – eye protection must be worn
	Keep away from children
	Battery acid – corrosive and poisonous
	No smoking – no naked flames – no sparks
	Explosive gases
Pb	Contains lead
	Never dispose of as domestic waste – take to a designated waste reclamation site
	Battery is recyclable – follow local recycling & reclaiming procedures

B - Battery Acid

The Hazard

Batteries contain Sulphuric Acid which may leak for various reasons. Also acid may be given off as droplets and/or spray/mist during recharge.

Sulphuric Acid is a corrosive and poisonous liquid which will cause burns and irritation to the skin and eyes and could severely damage clothing.

Refer to Health & Safety Executive Guidance Note EH40 for the latest occupational exposure limits for acid mist in air.

Precautions

- Always handle batteries with care
- Never overfill with acid
- Always store upright
- Never allow children access to a battery
- Always charge in a well ventilated area
- Never allow battery vents to become blocked
- Always wear eye protection
- Always wear protective clothing

Accident or Emergency Action and Treatment

Skin contact –

Immediately soak the affected area with copious amounts of clean water, remove any contaminated clothing and seek medical attention if irritation persists.

Eye contact –

Immediately irrigate eyes for at least 10 minutes with clean water, seek medical attention.

Ingestion –

Immediately drink as much water as possible – do NOT induce vomiting, seek urgent medical attention.

Spillages –

For small spillages wash away with large quantities of water. For larger volumes dispose of in suitable acid resistant containers, clearly labelled – see section H.

Health & Safety Information continued

C - Electrical Energy

The Hazard

Accidental short circuit of battery terminals by a conductive object, such as a metal tool or item of jewellery etc. may generate sufficient heat to cause severe burns, create arcing or cause any metal to melt and splash.

Severe electrical shocks may be received from faulty mains electrical charging equipment and during the recharge of high voltage battery systems or the recharge of a number of batteries connected in series i.e. 5 or more 12 Volt batteries in series = 60 Volt nominal.

Precautions

Always remove metal objects from hands, wrists & neck e.g. rings, bracelets, watches & necklaces.

Always, when working on vehicle electrical systems, disconnect the battery, but before disconnection :

- Switch off all electrical loads
- Refer to vehicle manufacturer's handbook
- Make the first disconnection and the last reconnection the earth point as far from the battery as possible

Always take great care to avoid shorting the live terminal to earth.

Never place tools or metal objects near to or on top of a battery.

Accident or Emergency Action and Treatment

Burns

Apply a dry sterile dressing and seek medical treatment.

Electric Shock

Approach person with care. If the individual is clear of the conductor then, with caution, switch off equipment or break the current. If the individual is still attached to the conductor do not touch with bare hands. If possible use a suitable insulating material e.g. wood, rubber, plastic or rolled paper, to detach the conductor from the victim. If necessary, summon assistance then give artificial respiration until it arrives.

- Always wait at least 5 minutes after ceasing recharge before disconnection
- Always take care to ensure that cables and connections are handled in a way that avoids accidental sparking

Never smoke near a battery

Never allow naked flames near a battery

Never create sparks near a battery

Accident or Emergency Action and Treatment

Seek medical advice as appropriate to injury.

In an explosion acid will have been sprayed and ejected and plastic & metal parts may have caused severe lacerations.

E - Jump Starting

The Hazard

Use of an incorrect procedure when "jump starting" a vehicle could result in a battery explosion, fire and burns to the individual as well as damage to the vehicle electrical system.

Precautions

Always follow the correct procedure as defined in the vehicle manufacturers handbook.

In the absence of this information, for a negatively earthed vehicle:

1. Make sure the vehicles are not touching and that the ignition in both vehicles is turned off. Ensure both vehicles are in neutral or "park".
2. Connect the positive (red) cable from positive terminal on one vehicle battery to positive terminal on the other vehicle battery.
3. Connect the negative (black) cable to the negative terminal of the vehicle with the "flat" battery – keeping clear from fuel lines and brake pipes.
4. Connect the negative cable to the negative terminal of the current supplying vehicle, or to an earthed point on the vehicle away from the battery e.g. engine casing.
5. Ensure all connections are tight and away from moving or rotating components.
6. Start the engine of the vehicle with the "good" battery and allow to run for one minute.
7. Start the engine of the vehicle with the "flat" battery and allow to run for at least one minute.
8. Stop the engine of the vehicle with the "good" battery.
9. Remove the cables in the opposite order keeping them well away from any moving or rotating components on the vehicle.

D - Emission of Gases

The Hazard

Hydrogen gas emitted during charging is explosive at concentration levels above 4%. Hydrogen & oxygen gases are both evolved during battery recharging. These gases may also be emitted at other times, for example, if the battery is moved or shaken.

Precautions

- Always charge in a well ventilated area
- Always ensure the charging leads are correctly fitted before switching on the mains
- Always ensure the mains is switched off before disconnecting the charging leads
- Always use eye protection and protective clothing

Health & Safety Information continued

Accident or Emergency Action and Treatment

Seek medical advice as appropriate to the injury.

F - Weight

The Hazard

Batteries are awkward and heavy to handle resulting in possible strains to the human body as well as potential for dropping the battery, with resultant acid spillage, injury etc.

Precautions

Always use correct lifting procedures to minimise strain to the human body.

Always use lifting handle or lifting ledges if available on the battery.

Accident or Emergency Action and Treatment

Seek medical advice as appropriate to the injury. Remember that acid may have been spilled.

G - Repairing of Damaged Batteries

No attempt should ever be made to renovate or repair a damaged battery.

This work involves all of the hazards detailed in sections A to F above and should only be carried out by suitably trained personnel with appropriate facilities and in accordance with the manufacturer's instructions.

H - Disposal of Batteries & Associated Waste

All spent batteries and waste arising from spillages and fires must be disposed of in conformance with the Environmental Protection Act, the Special Waste Regulations 1996 and the Environmental Protection (Duty of Care) Regulations 1991.

GS offer a complete battery disposal service.
For further information please contact us at:

Tel: +44 (0) 1793 833555

Email: enquiries@yuasaeurope.com

I - Fire

Since batteries contain combustible materials, the local Fire Authority should be consulted where a quantity of batteries are stored together.

J - Safety Data Sheet

More detailed Health & Safety information is available MATERIAL SAFETY DATA – Batteries, Wet, Filled with Acid, on page 393 - 394.

K - REACH Regulation (EC) No 1907/2006

Registration, Evaluation, Authorisation and Restriction of Chemicals

Industry is required by REACH to evaluate and manage the risks posed by chemicals, and to provide safety information to product users.

Information on up-to-date additions to the Substances of Very High Concern (SVHC) Candidate List is available from the ECHA (European Chemicals Agency) web site: www.echa.europa.eu

GS's compliance information is available on request.
Enquiries should be directed to:

- Tel: +44 (0) 1793 833555
 - Email: enquiries@yuasaeurope.com
-

All You Need To Know About Batteries

Date Coding of batteries for stock rotation purposes

Fitting Date	1	2	3	4	5	6	7	8	9	10	11	12	2010	2011	2012	2013
1. Sulphuric acid (38%) is corrosive and poisonous. There is a risk of burns and serious damage to the eyes. Wash immediately with lots of water and seek medical advice. 2. Electrical Hazard. Do not short across terminals. 3. Explosive gases given off. Keep sparks and flames away. 4. Recharge off the vehicle in a well ventilated area. 5. Do not overfill.																
SERIAL No. YB12345678 Record No. on customer receipt UN 2794 CORROSIVE 8 Battery, wet, filled with acid, electric, storage. Only applies when battery is filled with acid. Pb KEEP UPRIGHT																
Recharge Due	1	2	3	4	5	6	7	8	9	10	11	12	2011	2012	2013	2014

A - Storage

- Always rotate your stock. Practice FIFO (First In, First Out). Batteries slowly lose their charge, and good stock-rotation stops batteries going flat in storage and makes sure that the customer buys a good battery.
On the back of the battery. There is a label showing the expected period before the battery will require recharging. This makes it easy to identify the oldest and newest batteries in stock. Please use the recharge date to ensure that the oldest batteries leave your stock first. Recharge date is only an indication of recharge period as self discharge is subject to storage conditions.
- Store batteries in a cool, dry, well-ventilated area.
- Protect batteries from excessive heat. (Heat causes batteries to lose charge more quickly, and excessive heat can damage batteries).
- Store batteries in an upright position. (To stop them falling over or leaking).
- Do not stack batteries on top of other batteries. (To avoid scratching, and tearing labels. To avoid damaging terminals that stand proud of the lid).
- Store shrink-wrapped batteries up to 3 high. (Any higher and there is a risk of them falling over and injuring people).
- Do not remove any seals from dry-charged batteries until you are ready to commission the battery by filling it with acid. (The seal preserves the charge in the battery. If it is broken, air will enter and cause the battery to lose charge).
- Store batteries on racks or on pallets, not on the floor. (Small stones or sharp points on a concrete floor can damage the base of the battery and cause leakage).
- Make sure handles are left in the flat (down) position. Upright handles are more likely to be damaged.

Before handling, charging or installing batteries, please understand and comply with the precautions given in 'Health and Safety Information' in this catalogue.

B - Maintenance of Stock Handling and Recharging of Batteries

WET-Charged Batteries

- Batteries should be installed ideally within 15 months after manufacture. The voltage should be (worse case higher than 12.25 Volts) ideally higher than 12.4 Volts at the time of installation.
- Batteries require recharging when the voltage has dropped below 12.4 Volts due to extended warehouse storage. All safety precautions should be undertaken prior to recharging batteries.
See charging instruction section in catalogue for further details.
If a battery has been recharged, the recharge date on the back label should be updated by 6 months after second recharge date by physically notching the label. (Note: A maximum of two recharges are allowed prior to sale, and product should not be sold a maximum of 9 months after the expiry of first recommended recharge date).
- 2.1 A voltage check should be carried out as a matter of course, both to identify older stock and highlight batteries requiring recharge.
- 2.2 Use a digital voltmeter/multimeter with a minimum of 2 figure resolution (eg 12.76 Volts).
- 2.3 Scrap any batteries below 11.0 Volts (these batteries will have developed sulphation that cannot be completely reversed by charging and so will not give the expected performance and life to the customer).
- 2.4 Note Digital Conductance testers (such as Midtronics and/or Bosch BAT121) are:
 - NOT designed for the testing of new batteries.
 - Digital battery testers are not designed to check the fully developed cold cranking performance of a new battery.
 - They are designed purely for the testing and evaluation of faulty or used batteries.
 - Any CCA/state of health reading from the test on a new battery CANNOT be a reliable guide as to specification of the battery.
 - See comments on Digital Conductance testers.

DRY-Charged Batteries: Maintenance of Stock

Sales of dry-charged batteries within our range is very limited, usually for specialist markets and hence not listed in this catalogue.

- If you keep the batteries cool and dry, and do not remove the seal, dry-charged batteries do not need any other attention.
- The maximum storage time of dry-charged batteries before they are commissioned by filling with acid is 24 months.
- If the seal is damaged, the batteries should be wetted up immediately and the product then treated as WET-CHARGED batteries.

All You Need To Know About Batteries continued

C - DRY Charge Batteries: Commissioning

1. Only commission a dry-charged battery when it is needed for a customer.
2. If fitted, remove and discard any sealing plugs, tape or foil.
3. If fitted, remove and keep normal vent-plugs and terminal covers (usually red and black).
4. For filling, use battery-grade dilute sulphuric acid of specific gravity 1.270 – 1.280 at 25°C conforming to BS3031 or better. (Note: contaminated acid with impurities can seriously damage the life of the battery, in some cases reducing this to a few days. Do not use acid from old batteries).
5. The temperature of the acid and the battery should both be at room-temperature in the range 15-30°C.
6. Fill each cell with acid to a level of 3-6mm above the tops of the separators. Fill each cell one after the other and complete the filling in one operation.
7. Leave the battery for 20-30 minutes and then measure the open-circuit voltage. If it is below 12.50 Volts, charge the battery. (See Section G). If it is above 12.50 Volts, adjust the acid-levels to the correct operating levels with dilute sulphuric acid of specific gravity 1.270-1.280. See Section D.
8. Fit the normal vent-plugs and terminal covers.
9. Wash the battery with hot water and dry it.
10. Note that performance checks on newly-commissioned dry-charged batteries with modern electronic digital testers using conductance technology are not recommended. Examples are testers supplied by Midtronics or Bosch. The results can be misleading until the battery has undergone some service use.

D - Electrolyte-Levels (Acid-Levels) in Service

Notes: Please read before adjusting acid-levels.

- Do not top up to the maximum levels a battery that needs charging. (Levels rise on charging). However, if the levels are below the tops of the separators, top up with distilled or deionised water until the separators are just covered.
 - Adjust levels to the maximum levels only after the battery has stood for at least an hour after charging.
 - Never overfill a battery. (The acid may come out of the vent-plugs when the battery is being charged).
 - Use only distilled or deionised water for topping up. (Sulphuric acid should never be used except for the initial filling of a battery). Do not use bottled mineral water (impurities within the water will increase water loss and battery self discharge).
1. When the battery is in service, the electrolyte levels should be checked and adjusted to the levels given below.
 2. If the battery has a maximum level line on the side of the container, fill to this maximum level.

3. If there is no maximum line, but there are filling tubes projecting from the bottom of the lid, fill to the bottom of the tubes.
4. If there is not a maximum line nor filling tubes in polypropylene batteries, fill to 7mm (0.25 inches) below the bottom edge of the lid-skirt.
5. If there are no filling tubes in hard-rubber batteries, fill to 15mm (0.5 inches) above the tops of the separators.

E - Selecting the Correct Battery for the Application

Car and Commercial Vehicle (CV) Batteries

1. Select the specified battery from the Application Section of this catalogue.
2. On 24 Volt systems, or when 2 off 12 Volt batteries are fitted in parallel, both batteries should be replaced at the same time. Failure to do this will result in a greatly reduced battery life for the new battery that has been fitted.

When batteries are joined in series, the negative terminal of one battery is connected to the positive terminal of the other, giving a total voltage of 24 Volts. The Ampere-hour capacity of the system is the same as that of the individual batteries.

When batteries are joined in parallel, the positive terminals of the 2 batteries are connected together, and the negative terminals of the 2 batteries are also connected together. The voltage of the system remains unchanged at 12 Volts, but the Ampere-hour capacity of the system is double that of the individual batteries.

Leisure Batteries

1. Use the battery with the performance and size recommended by the equipment supplier.
2. We recommend that a Leisure Battery in a medium cyclic application should be sized so that it is not normally discharged to more than 50 per cent state-of-charge. This will ensure that the battery gives a good life. The life of a battery regularly discharged by 50 percent is about 5 times that of a battery regularly discharged to 100 per cent. For example, a load of 4A for 10 hours will discharge a battery by 30Ah. If this represents 50 per cent state-of-charge, we would recommend a 80Ah battery.

Marine Batteries

1. The Marine Battery range has been designed with greater cyclic durability than the Leisure range and principally designed for hotel load usages on boats.
2. The Marine Battery range has been designed with sealed lid to exceed the 55° duration requirement according to item 5.10 of EN50342.1 A1 2011.

All You Need To Know About Batteries continued

F - Removing Batteries and Installing Batteries on Vehicles

Removing Batteries

Caution: Newly introduced vehicles with CO₂ reduction technologies (Start-Stop, Regenerative Braking, etc.) may require reprogramming of the vehicle's Battery Management System. This is necessary to facilitate a reset of on-board charging parameters for the new AGM battery. Please refer to the 'GS Yu-Fit Battery Configuration Tool' section of this guide for further information.

1. It is good practice to tell the customer that, while you will do your best to keep the memory settings, it is possible these might be lost.
2. Make sure the hand-brake is on, and that the car is in neutral or park. Switch off all electrical loads and remove the ignition key from the car. Note: On some cars, the doors will lock when the battery is disconnected so this is why the key should be removed from the car. Also switch off any non-factory-fitted alarms.
3. Check that the cigar lighter is still working. If not, turn the ignition key to the auxiliary position. Install a Computer Memory Saver (CMS).
4. Disconnect the earth-connector first. (This is normally the negative on modern vehicles). This can result in the loss of memory settings; please refer to the vehicle handbook.
5. Disconnect the live-connector second. If a CMS is used, the connector will still remain live after it has been disconnected. To prevent the connector shorting against the car, place an insulator such as a rubber glove over the connector.
6. Remove the hold-down clamps.

Preparation of a Battery for Fitting

1. Check that the battery has the correct polarity for the vehicle.
2. Check that the battery has the correct height for the vehicle. (If a battery is too high, it can short out on the bonnet or the bottom of a seat, or it can damage the bonnet).
3. It is good practice to place the old and new battery side by side to compare polarities, hold-downs and performance-levels. Some batteries have hold-downs at both the sides and ends. Only the ones used for securing the battery on the vehicle need to be checked.
4. Check that the battery is clean and dry.
5. Check that the vent-plugs or manifolds are firmly in position.
6. Check that the battery has a voltage above 12.40 Volts. If not, charge the battery or use another that has a voltage above 12.40 Volts.
7. Ensure the 2 terminal caps are still fitted at this stage.

Preparation of the Vehicle

1. Clear away any items on the battery-tray which might damage the battery. (Placing a heavy battery on a piece of sharp grit can puncture the bottom of the battery).
2. Check that the connectors, the hold-down clamps and the tray are clean and corrosion-free. (If there is any corrosion, hot water will instantly remove this). If there is severe corrosion which might affect the stability of the battery or has affected other parts of the engine compartment, have the vehicle checked by an authorised distributor.

3. Check that the alternator drive-belt tension is correct. Refer to the vehicle handbook or service manual.
4. It is recommended that the electrical system, and particularly the charging system, of the vehicle be checked to make sure it is operating correctly. Refer to the vehicle handbook or service manual.

Installing the Battery

1. Fit and tighten the hold-down clamps. These should be tight enough to secure the battery and not allow it to move. DO NOT OVERTIGHTEN.
2. Connect the live-connector first to the correct battery-terminal (normally the positive) after removing the terminal cap. DO NOT OVERTIGHTEN.
3. Connect the earth-connector to the other terminal after removing the terminal cap. DO NOT OVERTIGHTEN.
4. Place the 2 terminal caps on the old battery that has been removed from the vehicle to avoid the possibility of short-circuits.
5. Replace onto the new battery any components that have been taken from the old battery such as exhaust tubes, vent-elbows, terminal covers, removable hold-down strips (widgets) etc.
6. The use of petroleum-jelly (Vaseline) is not necessary on modern polypropylene batteries, but there is no disadvantage in using it. Smear lightly on the terminals. It is still recommended for hard-rubber batteries. Do not use grease.
7. Remove the CMS.
8. Start the engine.
9. For non-automotive applications, install the battery in line with the equipment-supplier's recommendation.

G - Charging Off-Vehicle

Note: Please read before charging batteries

- Do NOT charge a battery if its temperature is below 3°C as the electrolyte may have frozen.
- Charging the battery on the vehicle is not recommended.
- Refer to Section F for information about removing the battery from the vehicle.
- 'Sealed and AGM' vehicle batteries should be charged only on constant potential chargers or 'smart' chargers. Do not charge on constant current chargers or boost chargers.

'Sealed' vehicle batteries do not allow any access to the electrolyte, and so cannot be topped up. There are no removable vent-plugs or manifolds. The battery is able to vent gases through breathing holes, and so it is not strictly sealed.
- A new, unused battery with a voltage below 11.00 Volts should be scrapped and not charged. See Section B.

All You Need To Know About Batteries continued

General Procedure for All Types of Chargers

This section gives common information for all types of chargers. The sections below give details for different types of charger.

1. Check the electrolyte-levels in all the cells. If these are below the tops of the separators, top up with distilled or deionised water to the tops of the separators. Do not fill to a higher level before charging, but adjust the levels after charging. See Section D.
2. If you are using a constant-current charger or a boost-charger, remove the vent-plugs or manifolds before charging. (See below). There is no need to remove the vent-plugs or manifolds if you are using a constant-potential or a 'smart' charger.
3. Check that the charger is switched off.
4. When fitting the charger to the battery, connect the positive lead to the positive terminal and the negative lead to the negative terminal.
5. Switch on the charger. See below for the correct charging conditions depending on your type of charger.
6. Stop charging if the battery begins to gas freely (some gassing is normal during the last stages of charging) or if the battery temperature rises above 50°C.
7. Switch off the charger.
8. It is good practice to wait for about 20 minutes for the gases to clear before removing the leads from the battery as some chargers remain 'live' and can cause a spark.
9. Check the electrolyte-levels in all the cells and top up if necessary. See Section D.
10. Refit vent-plugs or manifolds if these have been removed.
11. Wash the battery with hot water and dry it.
12. Note. Many customers severely underestimate the amount of time necessary to charge a flat battery. This results in customers returning batteries saying that they have charged the battery but that it is still not holding charge.

Types of Charger and How to Use These.

There are many types of charger available; their working principles and the procedure for using these is given below.

Index

Section	Charger Type
1	Constant Current Chargers.
2	Constant Potential Chargers.
3	Modified Constant Potential Chargers.
4	'Smart' Chargers.
5	Boost Chargers.

1. CONSTANT CURRENT CHARGERS.

These maintain a fixed, constant, preset current throughout the charging period irrespective of the battery on-charge voltage. Do not charge AGM batteries on a constant current charger.

Charging Procedure with Constant Current Chargers

- A. Ideally, charge each battery on a separate charger unit. If this is not possible, charge batteries in series. We do not recommend charging batteries in parallel because it is not possible to control the amount of current passing through each battery.
- If batteries in different states-of-charge are being charged in series, each battery should be removed as soon as it is charged. (If you wait until the last battery is charged, some of the batteries will be overcharged).
- B. Measure the open-circuit voltage of the battery. To obtain a stable voltage, the battery should not have been used or charged for a minimum of 3 hours before checking the voltage.
- C. Charge the battery at the recommended charge rate (See Battery Specifications section of the catalogue). If you cannot set the recommended rate, extend or reduce the charging time on a pro rata basis.

For example, if the recommendation is to charge the battery at 4.0A for 6 hours ($24\text{Ah} = 4.0 \times 6$), charge the battery for 12 hours if you can only set the charger at 2.0A ($24\text{Ah} = 2.0 \times 12$).

- D. Charge the battery for the number of hours shown in the table below depending on the open-circuit voltage.

For example, if the battery has a voltage of 12.16 Volts, charge it for 10 hours at the recommended charge rate.

OPEN-CIRCUIT VOLTAGE (V)	CHARGING TIME (HOURS)
Above 12.40	4
12.31 – 12.40	6
12.21 – 12.30	8
12.11 – 12.20	10
12.01 – 12.10	12
11.91 – 12.00	14
11.81 – 11.90	16
11.71 – 11.80	18
11.00 – 11.70	20
Below 11.00	See paragraph E below

- E. If you are charging a battery below 11.00 Volts (overdischarged) that has been in service, a specialised charger capable of providing a very high charging voltage may be necessary, and the recommended current may not be obtainable at first. In this case, monitor the current and adjust as necessary during the charge.

If a battery has become overdischarged, it will have lost both life and performance because of irreversible sulphation. Charging may reduce further its potential life.

All You Need To Know About Batteries continued

2. CONSTANT POTENTIAL CHARGERS.

These maintain a fixed, constant, preset voltage throughout the charging period. The current cannot be set and will fall as the battery state-of-charge increases.

Charging Procedure with Constant Potential and Modified Constant Potential Chargers

- A. These chargers are normally designed to charge one battery at a time.
- B. Stop charging when the battery is gassing freely and the battery-voltage shows no increase over a period of at least 2 hours.
- C. Note: The majority of constant potential chargers are incapable of charging a severely over-discharged (below 11.00 Volt) battery in a realistic period of time. A minimum of 24 hours is normal.
It might be impossible to charge an overdischarged battery.

3. MODIFIED CONSTANT POTENTIAL CHARGERS.

The majority of commercial chargers, particularly home-chargers, are of this type, and allow neither the voltage nor the current to be preset.

Charging Procedure with Modified Constant Potential Chargers

- A. Use the same procedure as for Constant Potential Chargers in the paragraph above.

4. 'SMART' CHARGERS.

The latest generation of chargers is able to check the battery condition, and to supply automatically a controlled charge that will charge the battery in the fastest time without damaging it and without overcharging it at the end of the charge. Some 'smart' chargers have a special setting for all-calcium batteries and will charge these from flat, which most other chargers are unable to do.

Charging Procedure with 'Smart' Chargers

- A. Follow the manufacturer's instructions.
- B. These chargers should be able to charge overdischarged (below 11.00 Volt) batteries. Note that some have a special setting for all-calcium batteries.

5. BOOST CHARGERS.

These provide a very high initial current, and are used mainly to put some charge into a flat battery when it is needed urgently by the customer. The current falls as the battery state-of-charge increases, and the battery temperature is monitored to make sure it does not overheat.

Charging Procedure with Boost Chargers

- A. Boost charging is not recommended except in exceptional circumstances eg a stranded customer, as this will reduce battery life, especially if a battery is boost-charged more than once.

- B. Never boost-charge any battery that is below 11.00 Volts as it will be too sulphated to accept a charge; scrap the battery or charge normally.
- C. Only use a boost-charger that limits the charging voltage to a maximum of 14.2 Volts and that has a temperature monitor.
- D. Follow carefully the charger-manufacturer's instructions.

H - Checking Battery Performance

1. ELECTRONIC TESTERS USING CONDUCTANCE TECHNOLOGY.

1. The latest generation of testers is digital. Examples are Midtronics and Bosch testers. These will give an immediate decision on about 80 per cent of batteries in service, including flat ones. In the remaining 20 per cent of cases, the batteries need recharging before testing.
2. These testers show whether the battery is in a good, charged condition, whether it is discharged or whether it needs replacing.
3. Note: This is the preferred method of checking batteries as it does not take any charge out of the battery. It is also easier, quicker and safer.

2. DIGITAL CONDUCTANCE TESTERS EXPLAINED.

As reported by most battery manufacturers, some confusion has been created within the battery industry regarding the apparent performance of batteries after tests conducted with digital conductance testers (e.g. Midtronics, Bosch BAT121 being the most common types currently on the market).

It is important that the purpose of these tester is clearly understood.

Digital conductance battery testers are not designed to check the Cold Cranking Performance of a new battery.

They are purely designed for testing and evaluation of suspect or used batteries. Any CCA or state of health reading from the test CANNOT be a reliable guide as to the specification of the battery.

The BCI and European EN standard as a testing benchmark for manufacturing process.

GS Batteries (part of the GS Yuasa Corporation) is one of the largest manufacturers worldwide of lead-acid automotive batteries and its batteries are designed to confirm to the internationally recognised standards.

For example, the initial performance testing procedure according to the EN50342.1 A1 Nov 2011 requires a minimum of 12 working days of testing and significant resources in equipment to validate batteries. All GS branded batteries sold into the market and regularly audit tested to ensure conformance to the relevant standard.

The EN 50342 standard has created further confusion in the market by listed two conformance level standard for high rate cold cranking performance which are not clear to the end user without full access to the ETN part number listing.

All You Need To Know About Batteries continued

EN1 Test @ -18°C 10s to 7.5 Volts, 10 seconds rest than 60% of current to 6 Volts where time should be greater than 73s.

EN2 Test @ -18°C 10s to 7.5 Volts, 10 seconds rest than 60% of current to 6 Volts where time should be greater than 133s.

The rating of the battery obviously varies subject to battery design, but for example a battery rated at 1000A according to EN1, could only be rated at 920A according to EN2. The information of which standard the battery is rated is currently held within the ETN number e.g. 550 034 050

550 = > 12 Volt 50Ah battery

034 = > Is a specific number to that battery which gives details of lid type, life, vibration resistance and also whether the battery conforms to EN1 or EN2 high rate

050 = > High rate current in this case 500A

There are currently nearly 2000 individual battery numbers listed on the ETN data base by different battery manufacturers and users. This currently makes it unclear to the customer to what rating the battery is capable of meeting EN1 or EN2 without access to the listing.

In order to minimise confusion, GS currently use the longer established American BCI SAE rating for cold cranking amps which is the current to deliver 30 seconds to 7.2 Volts at a temperature of -18°C. This is seen as a fairer comparison to give a balanced view of the batteries durability and starting performance.

The Evolution of the Conductance Tester into the Market

In the last ten years, comparatively inexpensive conductance meters have entered the market which are able to determine the specific internal resistance of an automotive battery using the principles of the AC Wheatstone bridge (which you may remember from school days). The clear advantage of these devices is that they are portable, easily operated, no sparking risks from carrying out traditional high rate load “drop” test and deliver results in just a few seconds.

Disadvantages

The disadvantage of the conductance tester is that they all use a standard algorithm (program) to estimate the CCA reading from the measured internal resistance reading. The values given by these meters are not comparable with those determined using the laboratory test equipment where batteries are physical discharged under real high discharge load, at a temperature of -18°C. Due to differences in battery designs it is not possible to give a perfect relationship between internal resistance and actual performance in the laboratory.

Laboratory testing shows that the algorithm used in conductance testers penalises batteries where the battery design has been optimised (with heavier high density, fine porosity plates) for durability/cyclic endurance than those designs optimised for high rate performance.

For the evaluation of new factory fresh batteries different readings can be seen depending on the manufacturers plate design and acid density. Even significantly different readings can be obtained between different brands of tester. Expanded plates give a higher reading than a cast plate, as the cast plate has a full frame construction for improved conductivity. The grid size can be reduced and made thicker to access the active materials toward the bottom of the plate. This design difference for example has a difference on the conductance readings where the tester

correlates to the CCA reading based on a standard formula. The testing of new batteries is more complex as testing under the EN50342 standard requires the battery to be conditioned after a number of cycles which alter the conductance of the paste and hence causes more variation in tester data produced.

For this reason, GS and other major battery manufacturers recommend that the confirmation of the compliance of unused batteries to the EN or BCI can only be determined using laboratory testing and that digital conductance tester are not suitable to evaluate the performance of new unused batteries.

Conductance testers are designed to measure the internal resistance of the battery. The tester's effectiveness on a deeply discharged battery is less effective as although a good starting current figure can be indicated and the vehicle will start, it does not indicate that the 20 hour capacity of the battery may be as low as 10-30% due to repetitive operation in low states of charge. It is suggested that if this is suspected, the battery should be tested after the lights have been left on for 15 minutes without the engine running.

3. OPEN-CIRCUIT VOLTAGE AND HIGH-RATE DISCHARGE TESTERS.

1. Measure the open-circuit voltage of the battery using a digital voltmeter or a multimeter. To obtain a stable voltage, the battery should not have been used or charged for a minimum of 3 hours before checking the voltage.
2. If the voltage is below 12.40 Voltage, charge the battery in accordance with Section G.

Note: This type of tester will only give an accurate result on a fully-charged battery. A common mistake is to use this type of tester on a discharged battery, and to judge that the battery is faulty if a cell is seen to ‘boil’. A ‘boiling’ cell on a flat battery does not mean that the battery is faulty.

3. Apply a current-load equal to half the SAE CCA Cold Cranking Amps for 15 seconds. For example, discharge a 600A battery at 300A. Observe the voltage during this time and record the voltage after 15 seconds. You will find the CCA in the Battery Specifications section of the catalogue or on the label. Use an approved, calibrated tester.
4. If the voltage after 15 seconds is stable and above 9.60 Volts, the battery is in a satisfactory condition with no faults.
5. If the voltage is below 9.60 Volts after 15 seconds and it is unstable, normally falling quickly, the battery should be replaced.

4. ‘DROP TESTERS’.

1. ‘Drop testers’ have 2 spikes that are pressed into the tops of the battery terminals and a simple voltmeter to check the discharge voltage.
2. We do not recommend the use of these testers as:
 - They are potentially unsafe to use as most types produce a spark when the spikes are first pressed into the terminals.
 - The discharge rate is similar for all sizes of battery, and so they do not give a good indication of battery-condition.
 - They give misleading results on discharged batteries.

All You Need To Know About Batteries continued

I - Maintenance in Service

General

1. Always refer to the information contained in the handbook or brochure supplied with the vehicle or equipment.

Definition of Maintenance-Free

1. Our starter batteries for cars and commercial vehicles conform to the relevant sections of EN50342.1 A1 Nov 2011 for maintenance-free characteristics.

This means that in normal vehicle applications in temperate climate operation, it is not necessary to add water.

2. Our batteries are designed to be topped up with water if water should be lost owing to, for example, a charging system fault, prolonged operation in hot climates, excessive off-vehicle charging etc.
3. Note: The term maintenance-free applies only when the battery is used in an approved automotive or commercial vehicle application.

Definition of Low Maintenance

1. Low maintenance batteries in normal vehicle applications in temperate climate operation need water-addition only at yearly intervals.
2. Our batteries are designed to be topped up with water if water should be lost owing to, for example, a charging system fault, prolonged operation in hot climates, excessive off-vehicle charging etc.
3. Note: The term low maintenance applies only when the battery is used in an approved commercial vehicle application.

Battery Maintenance in Automotive Applications

1. Carry out the checks below at the recommended vehicle service intervals.
2. Check the electrolyte-level and top up with water if necessary. See Section D for details about how to do this. (As explained above, it should not be necessary to add water unless the battery has encountered exceptional conditions).
3. Check that the battery is clean and dry and that the vents are not obstructed.
4. Check that the terminal-connectors and the hold-down clamps are securely connected and corrosion-free.
5. If the battery is on a vehicle that is not to be used for an extended period (more than 1 month), disconnect it from the vehicle. Refer to Section F for information about removing the battery from the vehicle. Modern cars have electrical accessories that slowly discharge the battery even when the ignition key has been removed.

Some accessories such as alarms, trackers, and phones can cause a battery to become discharged in a few weeks.

6. Fully charge the battery before storage and give it a refreshing charge every 3 months. See Section G.

Battery Maintenance in Non-Automotive Traction and Deep Discharge Applications

1. Typical applications are lawnmowers, electric wheelchairs, caravans etc. The Leisure Battery range is recommended for these applications; standard vehicle batteries are not suitable.
2. Ensure that the battery is always kept in as high a state-of-charge as possible. Always recharge immediately after use.
3. Check the electrolyte-levels on a regular basis dependent upon use. Charging batteries regularly on a non-vehicle charging system may result in a higher rate of water-loss.
4. Check that the battery is clean and dry and that the vents are not obstructed.
5. If the battery is not to be used for an extended period (more than 1 month), fully charge it before storage, and give it a refreshing charge every 3 months. See Section G.

Battery Maintenance in Non-Automotive Float Applications

1. Typical applications are motor-generators, stand-by applications etc. The Leisure Battery range is recommended for these applications; standard vehicle batteries are not suitable.
2. Batteries used in these applications should be changed every 2 years or more frequently. (Continuous charging, even from a well-controlled charging system, will result in internal degradation of the battery. This could result in the battery not giving its predicted output when required even though the battery appears to be fully-charged).
3. Ensure that the battery is always kept in as high a state-of-charge as possible without causing excessive overcharge. Always recharge immediately after use.
4. Check the electrolyte-level on a regular basis dependent upon use, but not less frequently than monthly. Charging batteries continuously on a non-vehicle charging system may result in a higher rate of water-loss.
5. Check that the battery is clean and dry and that the vents are not obstructed.
6. If the battery is not to be used for an extended period (more than 1 month), fully charge it before storage, and give it a refreshing charge every 3 months. See Section G.
7. Best practice is to define a regular maintenance-routine, and to record the results.
This should include such variables as the amount of water added to each cell, specific gravities in each cell, battery voltage etc.

Use of Battery Additives

1. We do not recommend the use of battery additives.
2. The use of these invalidates the guarantee.

Important information for Battery Distributors, Retailers and Service Managers

START - STOP VEHICLES IMPORTANT WARNING! BATTERY REPLACEMENT

With growing EU legal requirements on vehicle manufacturers to reduce CO₂ exhaust emissions, an increasing number of vehicles are being fitted with Start-Stop, Alternator Energy Management and Brake Energy Recuperation technology. In order to support these technologies and emissions savings, vehicle designers require new battery technologies in the electrical system for:

- i) Extended operation in lower states of charge
- ii) Acceptance of current from brake regeneration
- iii) Greater cycle life to support the vehicles electrical system when the vehicle is stopped and the alternator is not charging

AGM technology (AGM000 series) for vehicles with the most severe requirements for reducing emissions

EFB technology (EFB000 series) for vehicles with intermediate requirements for reducing emissions

For the aftermarket replacement of the original equipment battery, **IT IS ESSENTIAL to replace batteries with like-for-like technology**, i.e. if vehicle is fitted with an original equipment AGM or EFB technology battery, it should be replaced with the recommended GS AGM or EFB battery of equivalent size.

Caution!

If a vehicle was registered after 2008, and the battery has clearly been replaced in the past, it is essential that the GS vehicle fitment guide is checked to determine if an AGM/EFB battery was originally fitted. It is important to explain to customers that fitting a battery of incorrect technology to a vehicle will cause issues.

If a standard flooded battery is fitted to a Start-Stop vehicle, it will most definitely fail very early. Depending on driving patterns, failure could be within 2-4 months of installation. This type of battery failure will lead to loss of vehicle functions (including Start-Stop). It will also mean inconvenience for the customer and dissatisfaction with the replacement battery.

AGM & EFB Explained

GS AGM

- **Improved active mass efficiency, through better absorption of the acid**
- **Increased lifespan due to minimal active material shedding due to battery design**
- **Higher cold start values**
- **Totally maintenance free – zero water consumption**
- **Spill proof/leak proof**
- **Designed to meet latest OEM vehicle demands**
- **Compatible with sensitive electronic equipment**
- **AGM technology now factory fitted to numerous luxury cars and “Stop-Start” vehicle where increased AGM battery features are required**

GS's world leading motorcycle and industrial AGM (absorbent glass mat) technology comes to the automotive market. The GS automotive AGM battery has been engineered to meet the growing extreme power demands of recently introduced vehicles now starting to enter the European aftermarket. GS's automotive AGM experience comes from vehicles such as the Mazda MX5 and the famous Toyota Prius and has now been launched for European vehicle battery designs.

The new GS AGM European 096 and 019 sized batteries provide reliable starting whilst coping with the extreme power needs of the modern vehicle. Laboratory evaluation is boasting 4-5 times the cyclic durability of standard conventional flooded product and typically 16% higher starting power, even at lower temperatures. Increased reaction surface area ensures increased energy densities for faster engine rotation during starting and therefore maximising fuel efficiency.

The AGM batteries utilise the same absorbent glass mat technology as used in GS Motorcycle and Industrial batteries which have been on the market for over 44 years (1965). This absorbent glass mat absorbs the battery's acid, enabling a more efficient use of the cell's volume without the need for electrolyte reservoirs, as needed with conventional flooded batteries. The absorbent glass mat gives a number of key benefits to the design of the lead acid battery:

- Within normal operating conditions, the use of the individual cell valve design and glass mat plate separation ensures gas recombination occurs and ensures that no water is lost therefore negating the need for electrolyte reservoirs and freeing the user from maintenance.
- One way venting system providing partial pressure in each cell ensuring 100% leak proof and safe handling.
- The acid absorption of the glass mat means that the battery packs can be operated under higher pressures than conventional flooded batteries this has benefits including significantly prolonging battery cycle durability by minimising paste shedding.
- The increased pack pressures of the AGM battery increase the batteries resistance to vibration.
- More reaction surface area ensuring higher starting capacity within the same footprint as conventional flooded batteries.

Frequently Asked Questions

Q. What are the differences between flooded and AGM lead-acid batteries?

- A. See above, AGM batteries are built using a glass mat separator which enable all the electrolyte required by the battery to be stored within the glass mat, also allowing any gasses given off during charging to be recombined into water meaning that the batteries are totally maintenance-free. The design benefits of the glass mat over conventional flooded batteries enable the battery pack to operate under higher pressure without the fear of insufficient electrolyte between the plates, leading to the step change in durability offered by AGM batteries over flooded. The quality of the glass mat is a critical item in ensuring the optimum life of the battery versus its application. This experience has been gained by GS from over 44 years experience in the field using this technology. The automotive application battery designs are balanced with greater high rate starting performance and cycle life for the increased service/technological requirements of modern vehicle designs.

Q. What are the differences between GEL and AGM (starved) batteries?

- A. Both are recombinant batteries (i.e. under normal operating conditions they recombine the gases given off during charging to form water) and both are classified as sealed valve regulated.

The major difference is that in the AGM, the electrolyte is fully soaked into a special absorbed glass mat separator which immobilises the acid, whereas in the GEL batteries the acid is mixed with Silica to form a GEL also immobilising the acid. The benefits of AGM over GEL are that with the use of absorbed glass mat, the battery pack can be operated under a greater operating pressure so improving cyclic durability. With GEL, similar pack pressure can not be used so durability is usually provided by increased paste density which is good for life but not as good for high rate startability performance as required for automotive applications.

Q. Why is charging voltage so critical to both GEL and AGM batteries?

- A. Charge voltage is critical with these types of batteries as both are recombinant batteries. This means that the oxygen that is normally produced on the positive plate in all lead acid batteries recombines with hydrogen given off by the negative plate. The recombination of the hydrogen and oxygen produces water, which recycles back to the battery acid, therefore the battery is maintenance free and does not need topping up.

The sealing vent used in the design ensures that a positive internal pressure is maintained to ensure the recombination of the gases occur and not allow the cell to dry out and fail.

AGM & EFB Explained continued

In addition, the valve must safely release any excess pressure that may be produced during overcharging (e.g. alternator rectifier fault), otherwise the cell would be irreversibly damaged. The excessive pressure that the valve is releasing is both hydrogen and oxygen which can not recombined within the battery so breaks the cycle, net result is that battery would eventually dry out.

It must be noted that an AGM battery must never be opened once it leaves the factory, as sulphation could occur on the plates leading to an irreversible loss in performance.

Gel batteries are more critical to correct charging as overcharge can lead to the gel being irreversibly damaged, AGM are not subject to this failure mode and hence are more suitable for automotive use.

Q. Can I store my AGM battery in my garage during the winter or will it freeze?

- A. As with flooded batteries, providing the batteries are kept in a charged state, batteries can be stored without any fears of freezing.

Q. Can I store my AGM battery on the garage floor?

- A. Many people have the impression that when batteries sit on concrete the energy “leaks out”, the truth is that you can let any modern battery sit on concrete without fear of harm or accelerated self discharge.

This myth stems from the days of the old wooden/glass case batteries, where damp floors led to water soaking up into outer wooden cases causing swelling of the wood. In fact with modern batteries in hard plastic cases, concrete is generally an excellent surface on which to store a battery. The key issue is that the floor should not have any sharp objects which may damage the battery casing; there are no electrochemical reasons.

Q. Do AGM batteries have a memory?

- A. No, this is only a function of Nickel Alkaline Battery system such as Nickel cadmium.

EFB Explained

Also known as AFB (Advanced Flooded Battery) and ECM (Enhanced-Cycling-Mat)

GS EFB (Enhanced Flooded Battery)

- Designed to meet the latest OEM vehicle demands
- EFB technology is now factory fitted to numerous entry level Start-Stop vehicles
- Increased dynamic charge current acceptance over standard wet-flooded batteries (+170%), due to improved design including special Carbon additives and high charge acceptance envelope type separators
- Increased cyclic durability over standard wet-flooded batteries (+100%)
- Sealed tip/tilt double lid with integrated flame arrestor

Improved flooded battery technology, increasingly referred to as EFB technology in the market, offers a cost effective solution for entry level Start-Stop vehicles. EU emissions targets for these vehicles are lower than those set for higher performance models. This has led to manufacturers developing a battery technology that meets the demands of Start-Stop operation in a higher state of charge than expected from AGM technology, but lower than that expected from standard wet-flooded starter batteries.

To meet the growing demand for OEM specification EFB technology in the European aftermarket, GS has introduced 11 new EFB battery types with the launch of the EFB000 Start-Stop range. This range comprises 5 European (DIN) and 6 Japanese (JIS) battery sizes to maximise coverage of vehicles in the UK parc.

In addition to Start-Stop, GS EFB batteries are well suited to use in demanding applications. In repetitive deep discharge scenarios, such as those common to Police vehicles and Taxis, EFB technology offers improved cyclic durability, when compared to premium wet-flooded batteries.

Frequently Asked Questions

Q. What are the differences between standard flooded and EFB batteries?

- A. EFB batteries are an enhanced version of standard wet-flooded technology. The primary benefits of EFB technology are improved charge acceptance and greater cyclic durability when operating in a reduced state of charge (typical of Stop-Start applications). As an approximation, EFB batteries will provide 85,000 engine starts, compared to 30,000 starts from standard flooded product.

Q. What are the differences between EFB and AGM batteries?

- A. EFB batteries have been introduced as a lower tier option to AGM batteries in terms of performance and durability. EFB technology relies on improvements to existing flooded technology through the addition of carbon additives in the plate manufacturing process. AGM batteries benefit from the inclusion of unique design features not found in wet-flooded batteries. These include glass mat separators, recombinant lid technology and higher pack pressures to facilitate improved cyclic lifespan. AGM batteries are better suited to meeting the demands of higher specification vehicles that include one or more of the following technologies: Start-Stop, Regenerative Braking and Passive Boost.

Q. Can I store my EFB battery in my garage over winter or will it freeze?

- A. Providing that the battery is kept in a charged state, it can be stored without any fears of freezing.

Q. Can I store my EFB battery on a garage floor?

- A. You can let any modern battery sit on concrete without fear of harm or accelerated self-discharge. Concrete is generally an excellent surface on which to store a battery. The key issue is that the floor should not have any sharp objects which may damage the battery casing; there are no electrochemical reasons.

Q. Do EFB batteries have a memory?

- A. No, this is only a function of Nickel Alkaline Battery systems such as Nickel cadmium.

Silver Statement

Information Regarding the use of Silver Calcium Batteries

Ford introduced silver calcium batteries worldwide for their vehicles in 1997 together with a smart charging system. They told their dealers that these batteries must be replaced only with other silver calcium batteries as the life of normal lead antimony batteries would be drastically reduced if these were used for replacement. This of course, implies that GS batteries must not be used.

- GS calcium and calcium/calcium batteries can be used on all Ford vehicles giving a life that is at least as good as recommended Ford replacement batteries in the UK market.
- GS automotive batteries are equally suitable for Ford vehicles made before 1997.
- Calcium and calcium/calcium batteries are used by all major vehicle manufacturers as they are maintenance-free under normal operating conditions. In addition within the UK, no extremes of climatic temperature are experienced and water loss is not an issue for any GS battery. GS has had many years of supplying these batteries to the aftermarket since the introduction of Ford silver calcium batteries back in 1997.
- Grids are still made of lead. Typically less than 0.1% of calcium is needed to give strength (note calcium is added to the grid alloy in both calcium and hybrid batteries). Some customers think that calcium batteries are completely different to lead acid batteries, but they just represent another generation of the lead acid battery.

Ford gave the following reasons for using only silver calcium batteries in their recent cars, but GS automotive batteries with their modern technology more than meet the specification.

- Charge voltage tolerance increased from 14.4 Volts to 14.8 Volts.
 - GS calcium and calcium/calcium offer the same tolerance to this increase in charging voltage within the UK market.
- Cold cranking power increased by approximately 10%.
 - GS batteries generally give better starting performance than the batteries fitted by the vehicle manufacturers.

Average battery life has increased to about 6 years in the UK market due to a combination of battery technology and improved car electrical systems.

In summary, you can fit a GS battery to any Ford car (i.e. recommended catalogue model fitment) with the complete assurance that it will give first time starting and trouble free motoring.

This bulletin should help you to reply to customers who are concerned about using a GS battery to replace a Ford silver calcium battery.

If you need any further information please contact us.

BER Statement

Certificate of Part Quality

SUBJECT: EU REGULATION; DEMAND OF CONFIRMATION EU 330/2010 ITEMS 19 & 20

According to paragraphs 19 & 20 of the supplementary guidelines for EU regulation No. 330/2010 on vertical restraints in agreement for the sales and repair of motor vehicles and the sale of automotive replacement parts from 28th May 2010, superseding the previous EU regulation No. 1400/2002 of 31st July 2002.

The Lead Acid Automotive SLI batteries supplied by Yuasa Battery Sales (UK) Ltd. comply with requirements for vehicle spare parts with regards to 'Matched Quality' requirements, particular for use in the context of maintenance and repairs in 'authorised garages'.

The quality of our original parts, where specified, is equal to the quality of the components used in the construction of the vehicle where specified by the specific vehicle constructor.

Our 'matching quality parts' where specified, are produced respecting the specification and product standard of the manufacturer.

This certificate replaces the former certificate referring to the EU regulation 1400/2002.

Product: AGM and Wet Flooded Lead-Acid Batteries

1. COMPANY: Yuasa Battery Sales (UK) Ltd
Unit 13 Hunts Rise
South Marston Park
Swindon
Wiltshire
SN3 4TG
Telephone: +44 (0) 1793 833555

2. GENERAL COMPOSITION:

Lead, lead compounds and <35% sulphuric acid in a polypropylene or hard rubber case.

3. HAZARDS:

- Sulphuric acid is corrosive. It will cause burns and irritation to skin, eyes and respiratory tract.
- An explosive mixture of hydrogen and oxygen is given off during charging.
- Conductive objects in contact with live battery terminals can become hot enough to burn the skin. Sparks and molten metal may be ejected and could result in fire or explosion.

4. FIRST AID MEASURES:

INHALATION – Remove to fresh air, seek medical attention.

SKIN CONTACT – Immediately drench the affected area with clean water and remove any contaminated clothing. If any soreness or irritation persists seek medical advice.

EYE CONTACT – Immediately wash out the eyes with clean water for at least 10 minutes and always seek medical attention.

INGESTION – Do **NOT** induce vomiting. Make the patient drink as much water as possible and seek medical attention.

BURNS – Apply a sterile dressing and seek medical attention.

5. FIRE FIGHTING MEASURES:

EXTINGUISHING MEDIA – Dry powder, CO₂, water spray.

SPECIAL HAZARDS – Burning batteries will produce toxic fume from the lead, acid and case material.

PROTECTIVE EQUIPMENT – Self contained respiratory equipment must be worn when dealing with fires.

6. ACCIDENTAL RELEASE MEASURES:

- Evacuate people from the affected area. Stop all smoking, eliminate sources of ignition and wear full protective clothing and chemical grade eye protection before dealing with the situation.
- Use sand dams to confine the spread of liquid and to prevent entry into drains not intended for corrosive liquids. Cover spillage liberally with soda ash or sodium bicarbonate until neutralised. Mop up cautiously using plenty of water.

See **DISPOSAL CONSIDERATIONS** for information on disposal of residue from fire and spillages.

7. HANDLING AND STORAGE:

- Do not wear nylon clothing, use insulated tools and remove or cover rings and bracelets with insulating material when working on or handling batteries.
- Keep all sources of ignition away from batteries.
- NEVER short circuit the terminals to establish whether or not a battery is charged.
- Keep the electrolyte topped up to the correct level.
- Recharge batteries at the rate recommended by the manufacturer in a well ventilated area.
- Disconnect the battery before working on or near any exposed part of the vehicle electrical system.
- Store batteries upright in single layers in a well ventilated area, never obstruct the cell vents.
- Batteries are heavy; correct lifting techniques should be employed when lifting and handling.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION:

When there is a risk from acid splashes wear chemical goggles or a full face visor and acid proof protective clothing including gloves and boots.

Exposure to sulphuric acid mist generated during charging should be controlled by good natural ventilation or by local exhaust ventilation down to the current Occupational Exposure Standard given in HSE Guidance Note EH40.

Contact with lead is restricted to the battery terminals unless the case is damaged. Always wash the hands with soap and warm water after handling batteries.

9. PHYSICAL AND CHEMICAL PROPERTIES:

The lead and lead compounds are in the form of solids which can only be exposed if the battery case is damaged. Sulphuric acid is a corrosive liquid which can escape through the cell vents if the battery is tipped over.

10. STABILITY AND REACTIVITY:

Sulphuric acid will react violently with other acids, alkalis and oxidising agents. In some cases toxic fumes may be evolved. Chlorine gas is given off when sea water enters a lead-acid battery, top up with pure fresh water only.

11. TOXICOLOGICAL INFORMATION:

SKIN CONTACT – Sulphuric acid causes severe burns and tissue destruction.

EYE CONTACT – Sulphuric acid causes severe burns and tissue destruction.

INGESTION – Sulphuric acid causes severe corrosion of the mouth, throat and digestive tract.
– Lead and lead compounds are harmful if ingested.

INHALATION – Sulphuric acid mist generated during charging can irritate the nose, throat and upper respiratory tract.
– Lead can only be inhaled if released from the battery container and then reduced to a dry airborne dust. Prompt disposal of waste will prevent exposure by this route.
See **DISPOSAL CONSIDERATIONS**.

Material Safety Data – General* continued

*Full MSD sheets available on request from GS Technical Support

12. ECOLOGICAL INFORMATION:

Lead compounds and sulphuric acid will cause “harm” as defined in S29(5) of the Environmental Protection Act 1990.

13. DISPOSAL CONSIDERATIONS:

Damaged or spent batteries or residue from fires and spillages should be contained in closed acid proof receptacles, to prevent escape to the environment and disposed of as Special Waste.

See **REGULATORY INFORMATION**.

14. TRANSPORT INFORMATION:

AGM – VRLA BATTERIES

LAND Land Transport (ADR / RID)

- UN Number: UN2800
- ADR / RID Classification: Class 8
- Proper Shipping Name: BATTERIES, WET, NON-SPILLABLE electric storage
- Packing Group ADR: Not Assigned (NA)
- Label Required: Corrosive
- Tunnel Code: E
- ADR / RID: New and spent batteries are exempt from all ADR / RID (special provision 598)

SEA Sea Transport (IMDG Code)

- UN Number: UN2800
- Classification: Class 8
- Proper Shipping Name: BATTERIES, WET, NON-SPILLABLE electric storage
- Packing Group: 3
- EmS: F-A, S-B
- Label Required: Corrosive
- Special Provision 238; they are therefore exempt from all IMDG codes and are not regulated for sea transport.

AIR Air Transport (IATA-DGR)

- UN Number: UN2800
- Classification: Class 8
- Proper Shipping Name: BATTERIES, WET, NON-SPILLABLE electric storage
- Packing Group: 3
- Label Required: Corrosive
- Special Provision A48, A67, A164

WET-FLOODED (WET, FILLED WITH ACID):

LAND Land Transport (ADR / RID)

- UN Number: UN2794
- ADR / RID Classification: Class 8
- Proper Shipping Name: BATTERIES, WET, FILLED WITH ACID
- Packing Group ADR: Not Assigned (NA)
- Label Required: Corrosive
- Classification Code: C11
- ADR / RID: New and spent batteries are exempt from all ADR / RID (special provision 598)

SEA Sea Transport (IMDG Code)

- UN Number: UN2794
- Classification: Class 8
- Proper Shipping Name: BATTERIES, WET, FILLED WITH ACID
- Packing Group: 3
- EmS: F-A, S-B
- Label Required: Corrosive
- Special Provision 295

AIR Air Transport (IATA-DGR)

- UN Number: UN2794
- Classification: 8 - Corrosives
- Proper Shipping Name: BATTERIES, WET, FILLED WITH ACID
- Packing Group: 3
- Label Required: Corrosive

15. REGULATORY INFORMATION:

CHIP: No label required for supply.

For conveyance see **TRANSPORT INFORMATION**.

COSHH: Sulphuric acid mist – for Occupational Exposure Limit see HSE Guidance Note EH40.

LEAD: The repair of most automotive batteries is impracticable due to the materials and the type of construction used. In cases where repairs are possible, (e.g. the replacement of a traction battery cell), only competent persons should be allowed to undertake the work and reference should be made to the Control of Lead at Work Regulations 2002.

WASTE: All spent batteries and waste arising from spillages and fires must be disposed of in conformance with the Environmental Protection Act, the Special Waste Regulations 1996 and the Environmental Protection (Duty of Care) Regulations 1991.

Terms & Conditions

1. DEFINITIONS

In these Conditions of Sale all references to "the Seller" are to GS Batteries, all references to "the Buyer" are to the Person, Firm or Company by whom the order is given to the Seller and all reference to "goods" are to the goods which are the subject of the Order.

2. ENTIRE AGREEMENT

- a) All contracts for the sale of goods by the Seller shall be deemed to incorporate these Conditions which represent the complete agreement of the Seller and Buyer with regard to the goods except as otherwise specifically agreed in writing by the Seller. These Conditions shall override any Terms and Conditions stipulated, incorporated or referred to by the Buyer in any order correspondence, negotiations or any other way, unless otherwise agreed in writing under the hand of a Director of Yuasa Batteries
- b) Catalogues, price lists, advertisements and other published information are only indications of the type of products available and shall not form part of the contract of sale or any other contract with the Buyer nor be considered a collateral warranty or a representation inducing the same.

3. ACCEPTANCE

- No order whether oral or in writing is binding on the Seller until accepted in writing by the Seller unless the Sellers' quotation specifies that it is a bid in response to an invitation for bids in which event the order or award shall constitute acceptance of the bid in accordance with the bid terms
- b) Accepted orders are not subject to cancellation except upon
- i) the written approval of the Seller and
 - ii) the payment of a fair and equitable charge to the Seller based upon the actual cost incurred by the Seller in respect of the order to the date cancellation is received and approved.
- c) The Seller's catalogues price lists and quotations do not constitute offers made by the Seller.

4. PRICES/INVOICING

The goods will be invoiced at the price agreed or in the absence of agreement at the price specified in a valid quotation or the Seller's current price list. The Seller reserves the right by notice given at any time before delivery of the goods to vary the price of the goods as a result of unforeseen escalation of the price of any raw materials used in the manufacture of the goods. The Seller may invoice the Buyer at the earlier of the following dates: the date the goods are transported or the date the goods are ready for transport if they are held at the Seller's premises or carrier by instructions of the Buyer or for lack of transport instructions from the Buyer.

5. PAYMENT

Time of payment of the purchase price shall be the essence of all contracts for the sale of goods by the Seller. Unless otherwise agreed in writing all invoices on credit accounts are due for payment by the last day of the month following the month in which the goods are invoiced. Should the Buyer be in default of payment on the due date, the Seller may suspend and/or cancel any outstanding orders in addition to charging the Seller an interest charge of 2% per month on all overdue unpaid invoices.

6. RETENTION OF TITLE

The goods shall remain the property of the Seller as legal and equitable owner and no property in or title to the goods shall pass to the Buyer until their full price has been duly paid to the Seller. Failure to pay the purchase price as aforesaid when due, shall without prejudice to any other remedies the Seller may have, entitle the Seller to repossess the goods or so much thereof as the Seller may determine from any premises where they may be or to which they may be attached. For the purpose of repossessing the goods or any part thereof the Buyer hereby grants an irrevocable licence to the Seller, its employees or agents to enter upon such premises where the goods are stored, and the Buyer shall pay to the Seller the cost of removal and transport of the goods or any part thereof.

7. DESCRIPTIONS DRAWINGS SPECIFICATIONS

Any descriptive and forwarding specifications, drawings and particulars of weights and dimensions given to the Buyer, and the descriptions and illustrations contained in the Seller's catalogues, price lists and other advertising material are approximate only and intended merely to present a general guide of the goods described therein and none of these shall form part of the contract.

8. DESPATCH

Time of despatch shall not be the essence of the contract unless specifically agreed in writing by the Seller, in such event clause "Events Beyond the Control of the Seller" shall continue to apply. Any times and/or dates quoted for despatch shall be treated as estimates only and do not involve any contractual obligation.

9. DELIVERY/RISK

Unless otherwise expressly provided in writing all sales are ex works Unit 13 Hunts Rise, South Marston Park, Swindon, Wiltshire SN3 4TG, and delivery to the Buyer's premises, carrier or agent shall constitute delivery thereof to the Buyer and thereafter such goods shall be at the Buyer's risk. Any claim for delivery discrepancy must be notified in writing to the Seller within 48 hours of the date of delivery on the proof of delivery certificate. Claims for transit damage must be notified by telephone or facsimile to the Seller within 24 hours of receipt of goods followed by written confirmation within 4 working days.

10. PRODUCT PERFORMANCE

Any performance figures given by the Seller are based on test results only. Unless specifically agreed in writing the Seller accepts no liability if those figures are not attained by the Buyer. The Seller accepts no responsibility for the capacity, performance or length of life of the goods and for the suitability for the Buyer's purpose. All decisions in respect to suitability of use or uses are the responsibility of the Buyer.

11. WARRANTY

- a) The Seller warrants the goods against defects in workmanship and materials which become apparent within 12 months of the date of invoice of the goods to the Buyer (hereinafter called the warranty period).
- b) The Seller's obligation under this warranty is limited to repairing or at its option supplying on an exchange basis replacements for any defective goods or part or parts thereof and making good any defect or defects in the goods which may develop under normal and proper use within the warranty period or subject to the prior express written permission of the Seller paying for the cost of repair of any such defect or defects carried out by third parties.
- c) In the event of the Buyer becoming aware of a defect in goods during the warranty period the Buyer shall promptly supply the Seller with particulars of such defect, use its best endeavours to provide all information and particulars necessary to enable the Seller or its agents to verify the notified particulars and to ascertain the nature and cause of the defect claimed and shall afford the Seller and/or its agents full and proper access and facilities therefore and for making good the defect.
- d) The above warranty shall not apply to any defect in the goods where such defect is caused in whole or in part by
- i) The installation, storage, use, maintenance or repair of the goods in a manner reasonably considered by the Seller to be improper
 - ii) The Buyer and or any user of the goods or of products incorporating the goods and/or any third party called in by the Buyer and/or such user as aforesaid changing or adding to the goods without the express permission in writing of the Seller
- e) The Seller shall be under no liability whatsoever for any loss or damage which results from or is caused by erroneous information or lack of information supplied by the Buyer as to the Buyer's requirements in relation to the specification or use of the goods.
- f) The Seller shall be under no liability whatsoever to repair, replace or make good any loss which results from defects or depreciation caused by damage in transit in circumstances outside the Seller's control, wear and tear, accidents, neglect, misuse, dampness, abnormal temperature or other conditions or circumstances beyond the Seller's control as stipulated in clause "Events Beyond The Control of the Seller".
- g) When any defective goods are replaced upon an exchange basis or defective goods are repaired the provisions of this warranty clause shall apply to the replacement or repaired goods for the unexpired balance of the warranty period or the period of six months from the date of replacement or repair whichever is the longer.
- h) The above warranty provisions do not apply to any goods where it is impracticable or unsafe for the Seller to comply with the same.
- i) All liability under the warranty provisions ceases at the expiration of the warranty period.

12. EXCLUSIONS

- (a) Subject as provided in these Conditions of Sale and except where goods are sold to a person dealing as a consumer (within the meaning of the Unfair Contract Terms Act 1977) the Buyer shall be entitled to the benefit of the warranty on Condition 11 which is given in lieu of and replaces, excludes and extinguishes all and every condition or warranty whatsoever whether express or implied by statute, common law, trade usage, custom or otherwise to the fullest extent permitted by law.
- (b) Where goods are sold under a consumer transaction (as defined by the Consumer Transactions (Restrictions on Statements) Order 1976) the statutory rights of the Buyer are not affected by these Conditions.

13. EXTENT OF LIABILITY

Except in respect of death or personal injury caused by the Seller's negligence, or liability for defective products under the Consumer Protection Act 1987, the Seller shall not be liable to the Buyer by reason of any representation (unless fraudulent), or any implied warranty, condition or other term, or any duty at common law, or under the express terms of these Conditions, for loss of profit or for any indirect, special or consequential loss or damage, costs, expenses or other claims for compensation whatsoever (whether caused by the negligence of the Seller, its employees or agents or otherwise) which arise out of or in connection with the supply of goods (including any delay in supplying or any failure to supply goods in accordance with contract or all at all) or their use or resale by the Buyer, and the entire liability of the Seller under or in connection with any contract shall not exceed the price of the goods, except as expressly provided in these Terms.

14. INDEMNITY

The Buyer agrees to indemnify the Seller against any loss, damage, cost claims or expenses incurred by the Seller in respect of any liability established against the Seller by a third party arising out of or in connection with the contract of sale and/or any goods.

15. CHANGE IN BUYERS FINANCIAL CIRCUMSTANCES

If the Buyer makes any composition or arrangements with creditors, or being a company goes into liquidation whether voluntary or compulsory or being an individual or firm if he or any partner commits any act of bankruptcy or if a receiver is appointed in respect of any assets of the Buyer or if the Buyer fails duly to pay for any goods of the Seller or if the Seller considers in its absolute discretion that the financial circumstances of the Buyer do not justify any payment or credit terms or arrangement previously agreed the Seller may at its option either require payment in cash before despatch of goods remaining to be delivered or may cancel further deliveries or work without prejudice to any other rights or remedies of the Seller and the Buyer shall remain liable for completed and partially completed deliveries and work to the same extent as required under 3(b) of these Conditions in the event of cancellation.

16. HEALTH AND SAFETY

- a) The Buyer agrees only to use the goods for uses specified in the Seller's current sales literature or for other uses which the Seller has specifically notified in writing to the Buyer as being in the Seller's opinion free from risk to health and safety.
- b) The Buyer agrees to pay due regard to any information or advice relating to the use of goods which the Seller may at any time furnish to it and agrees that before the goods are used it will if requested by the Seller furnish the Seller with a written undertaking to take any steps which the Seller may specify with a view to ensuring that the goods will be safe and without risk to health when used.
- c) Any written undertaking given pursuant to paragraph (b) above shall be deemed to have effect as if it formed part of the contract of sale of goods.

17. EVENTS BEYOND THE CONTROL OF THE SELLER

- a) The Seller does not accept any liability incurred under the contract of sale of the goods wherever and to the extent to which the fulfilment of the Seller's obligation is prevented frustrated impeded and/or delayed as a consequence of any "force majeure" and/or any occurrence whatever beyond the control of the Seller such to include without prejudice to the generality of the foregoing:
- i) acts of God, fires, floods or other casualties;
 - ii) wars, riots, civic commotion, embargoes, governmental regulations or inability to obtain necessary materials from the Seller's usual sources of supply;
 - iii) shortage of transport facilities or delays in transit;
 - iv) existing or future strikes or other labour troubles affecting the performance hereof whether involving the Seller's employees or employees of others and regardless of the responsibility or fault on the part of the employers;
 - v) failure in whole or in part of power supplies.
- b) The Seller undertakes however to make every reasonable endeavour within its power to overcome difficulties arising in connection therewith but reserves the right to cancel suspend or vary its obligations under the contract of sale and in the event of shortages of such goods or of available resources for their production storage or delivery arising from any of the events or circumstances referred to in paragraph (a) of this Clause the Seller reserves the right to allocate as it may think fit its available goods and resources between customers with whom it has contractual obligations in respect thereof and shall not be obliged to purchase goods from third parties to make good such shortages.

18. DELIVERY BY INSTALMENTS

Each delivery or part delivery of any order shall be deemed to be sold under separate contract. Neither failure on the Seller's part to make any delivery or part delivery in accordance with these Conditions of Sale, nor any claim by the Buyer in respect of such delivery or part delivery shall entitle the Buyer to reject the balance of the order.

19. QUANTITIES

On all orders the Seller shall have the right to deliver and invoice for a quantity of goods greater or less than the exact quantity to conform to carton quantities.

20. ASSIGNMENT

The Buyer shall not assign or otherwise transfer any contract for the sale of goods by the Seller or any part thereof or any benefit or interest therein or thereunder without the prior written consent of the Seller. Any such attempted assignment or transfer by the Buyer without the written consent of the Seller is void.

21. WAIVER

The rights of the Seller shall not be prejudiced or restricted by an indulgence or forbearance extended to the Buyer and no waiver or any breach shall operate as a waiver of any subsequent breach.

22. SEVERABILITY

If any term or condition herein or part thereof is held to be invalid for any reason by any court or competent authority it is to that extent to be deemed removed from the contract of sale of goods without prejudice to the validity or other effectiveness of the remaining terms and conditions thereof.

23. ENGLISH LAW

The formation construction and performance of all contracts for the sale of goods by the Seller to the Buyer shall be governed in all respects by English Law. The Buyer and the Seller hereby agree to submit to the jurisdiction of the English Courts.

24. HEADINGS

The headings of these Conditions do not form part of the Conditions and shall not affect the interpretation thereof.

25. ORDER CANCELLATION

- a) Should an order be cancelled following the dispatch of goods then YBSUK have the right to charge for all carriage costs associated with supply and collection and additionally charge a 25% cost of invoice fee against the goods delivered.
- b) Prior to dispatch of goods a 15% administration charge will apply.
- c) Irrevocable orders will be charged at 100% of order value.
