

Software User Manual

November 2017

Version 1.1

INTRODUCTION

Soyal Access Control Systems use Tokens and/or Cards to provide users with access to doors. Each Token/Card within the system will have a unique user number which they are identified to during programming. Within the software additional user details can be stored, this will include token/card allocated to the user, the access rights of the user number and details such as Name, Department etc as required. See page 3 for examples.

Your installer will have set up Time Zones and Door Groups if you have requested them. Each Token or Card within a system is associated to a unique User Number, by selecting the relevant User Number the access rights of the associated Token or Card can be set and modified.

As a user of the 701 Client software you will have been provided with a Login Name and Password by your installer. Your Login Name and Password will enable you to amend the access rights of Users and to allocate Users to specific Door Groups or Time Zones if available. Your Login Name and Password will also provide access to Daily Transaction Records which store all transactions for all doors on a day by day basis.

Please Note

Any changes made in the 701 Client software will not be implemented until the revised data is downloaded to the controller(s) see page 12.

Once a system is configured and operating it is not advisable turn off the computer or disconnect the interface (USB or Ethernet) as this will stop communication to the controllers. If the communication is interrupted when it is re-established there may be a period where the software runs very slowly. This is because the software will be updating with all of the events that have taken place at each controller whilst the interface has been disconnected.

701 Client can be minimised and will continue to run in the background if required.

Once a system is configured and controllers have been updated all controllers will function as stand alone devices if for any reason the network connection fails.

Door controllers have limits for the number of users that can be stored. For most systems this will be 1024 users. More complex systems can have higher numbers of users.

USER NUMBER EXAMPLES

USER No	Site Code	Card Code	Name	Validity
00000	00000	00000		Not In Use
00001	00100	10500	Fred Bloggs	In Use
00002	00100	10501	George Jones	In Use
00003	00000	00000	-	Not In Use
00004	00100	10502	Mary Jones	In Use
00005	00000	00000	-	Not In Use
00006	00000	00000		Not In Use
ļ	ļ	Ļ		Ļ
01023	00000	00000		Not In Use

Always add additional cards/tokens into empty user numbers. If you are adding a batch of sequential cards/tokens always check that all of the user numbers that will be included in the batch are not in use. i.e. if you are adding 50 cards/tokens in sequence from user number 00022 you will need to check that user numbers 00022 to 00071 are not in use.

The site code is the first 5 digits, the card code is the next 5 digits. The site code and card code will not show any leading zeros when entered into the User Card Edit screen for example site code 00012, card code 00102 will display as site code 12, card code 102 in the User Card Edit screen.

P Tick the "Lock" box, this locks the screen on a live system to enable adding, editing or
deleting of tokens. If the screen is unlocked, it will jump to the user number of every val
Select the relevant User Number with the up and down arrows (see page 2&3)
4 Input the token number in the two boxes, the token number is made up of a Site Code
and a Card Code. The Site Code goes in the left hand box and the Card Code goes in the right hand box (see page 3)
5 Select Card Only with the drop down arrow.
6 Select relevant Time Zone if set, if not required leave as default which is "ALL"
Select relevant Door Group if set, if not required leave as default which is "ALL"
• Enter Name of User if required.
showing " Dep_00" and "Dep2_00" and type in the required name.
0 Click Save.
If multiple cards/tokens are to be installed refer to Page 7 Otherwise when all card/token modifications are complete and saved click exit then proceed to download the revise data to the controller(s) See page 12

COPYING USER DETAILS

Multiple sequential Tokens can be added by entering the details of the lowest numbered Token and copying the details into the database using the Card Copy function.

Click on the "Tools" button with the User Card Edit window open.

2 Select "Card Copy" from the drop down menu, the following window will open.

Enter the Start and End Addresses. The Start Address is the User Number of the Token to be copied, the End Address is the User Number of the final Token to be added. For example, If the Token to be copied is entered as User Number 14, and 20 Tokens need to be programmed, the Start Address is 14 and the End Address is 33.

4 Select the parameters as shown, leaving User Name unticked.

G Click "<u>Y</u>ES", the Tokens will be copied into the database and the window will close.

When the "Card Copy" window closes the "User Card Edit" window will remain open. Either continue editing user card data or Save and Exit .

Users can be allowed access by Time Zones. This enables access only at certain times and can also be configured so that access is restricted by day or a combination of time and day. For example a cleaner could be allowed access only between Monday to Friday from 5:00 AM to 7:00 AM Your installer should have pre-installed Time Zones to reflect your Specified requirements.

Verify User Data ! 6 All On-line Deselect All
 Select the controllers to be updated (If it is all controllers click "All On-line") (3 Click "All Items" button. The green progress bars and percentage indicator will slowly increase. When the download has finished the window will close. If you do not wish to download data click Exit.

BACKING UP THE DATABASE

We would recommend backing up the database manually before any major changes are made and also on a regular schedule. Changes are stored within the 701 Client software automatically however a system crash or inadvertent deletion of data may render the software inoperable. Regular external backups will enable the system to be restored to the configuration at the time of the last backup. Before proceeding with the Backup process shown below create a folder in an appropriate location where the data is to be saved. We would recommend creating a folder on the desktop named "701 Client Backups" within that folder create additional folders with names that reflect the dates of the backups.

To back up the 701Client Data to an external source:

Select "Backup Re…" from the Setting menu. The screen below will then appear.

	C:\Users	s\m.fall\Desktop\70	1 Client Backup 040417\
	\checkmark	<u>B</u> ackup	<u>R</u> estore
	$\langle \rangle$	File <u>P</u> ath	<mark></mark> <u>Ex</u> it
Click on the button ma	arked File	e <u>P</u> ath.	

BACKING UP THE DATABASE

Use the "Browse for Folder" window to locate the folder created earlier for the backup data. Highlight the folder by left clicking once, then left click the OK button. The "Browse for Folder" window will then close.

The window below will then show the File Path i.e. C:\Users\m.fall\Desktop\701 Client Backup 040417\

The backup folder in this case has been named "701 Client Backup 040417"

DAILY EVENT LOGS

When 701 Client is started you will usually have the current daily Transaction Record displayed as shown below.

The controllers in the above example are as follows: Node ID=1 AR-727HB-RAY H Series 2 Door Controller - Controller 1, Doors 1 and 2 Node ID=2 AR-331EF E series Controller - Controller 2, Door 3 Node ID=3 AR-727H H Series Controller - Controller 3, Door 4 System Parameters (see Page 21) have been set for : Huge Door Group Mode and Show Detail Node Address. The transactions highlighted above show a valid User Token being presented to each reader and/or controller in turn. All of the data in the database has been downloaded to the connected controllers.										
Index 0002 shows a valid token gaining access on Controller 1 via the reader at Door 1 Index 0003 shows a valid token gaining access on Controller 1 via the reader at Door 2 Index 0004 shows a valid token gaining access on Controller 2 Door 3 via it's built in reader. Index 0005 shows a valid token gaining access on Controller 2 Door 3 via it's external WG reader. Index 0006 shows a valid token gaining access on Controller 3 Door 4 via it's built in reader. Index 0007 shows a valid token gaining access on Controller 3 Door 4 via it's external WG reader.										
A W con	A WG prefix in the Station column indicates an external WG reader connected to the controller.

The above examples show the messages associated with User 2 attempting to access each Door in turn. User 2 has been allocated to a Door Group that only enables access to Door 1 on Controller 1.

Door Groups function differently with different types of controllers.

Controllers 1 and 2 show a Door Group error where the User card is not valid for the door.

Controller 3 shows the User card as invalid and no user number is shown in the Num column, this is because this particular type of controller "suspends" the User card if it is not valid for the controller.

The above examples show messages associated with an unknown user attempting to access each door in turn.

The user has been added to controller 3 locally as user 4 but does not exist in the 701 Client User database.

This can be verified from the event log because an identity is only shown in the Num column for the controller at which it has been added manually.

All other controllers show the card detail but no User in the Num column.

Г

The above examples show messages associated with User 3 attempting to access each Door in turn.

User 3 has been allocated to a time zone that only allows access between 08:00 and 09:00 therefore any attempt to access with User card 3 will be reported as a Time zone error and access will not be granted.
