Version	Version Information	Date
-001	Original Issue.	11/94
-002	Added functions crotg, zrotg. Documented versions of functions ?her2k, ?symm, ?syrk, and ?syr2k not previously described. Pagination revised.	5/95
-003	Changed the title; former title: "Intel BLAS Library for the Pentium® Processor Reference Manual." Added functions ?rotm, ?rotmg and updated Appendix C.	1/96
-004	Documents Intel® Math Kernel library (Intel® MKL) release 2.0 with the parallelism capability. Information on parallelism has been added in Chapter 1 and in section "BLAS Level 3 Routines" in Chapter 2.	11/96
-005	Two-dimensional FFTs have been added. C interface has been added to both one- and two-dimensional FFTs.	8/97
-006	Documents Intel Math Kernel Library release 2.1. Sparse BLAS section has been added in Chapter 2.	1/98
-007	Documents Intel Math Kernel Library release 3.0. Descriptions of LAPACK routines (Chapters 4 and 5) and CBLAS interface (Appendix C) have been added. Quick Reference has been excluded from the manual; MKL 3.0 Quick Reference is now available in HTML format.	1/99
-008	Documents Intel Math Kernel Library release 3.2. Description of FFT routines have been revised. In Chapters 4 and 5 NAG names for LAPACK routines have been excluded.	6/99
-009	New LAPACK routines for eigenvalue problems have been added in chapter 5.	11/99
-010	Documents Intel Math Kernel Library release 4.0. Chapter 6 describing the VML functions has been added.	06/00
-011	Documents Intel Math Kernel Library release 5.1. LAPACK section has been extended to include the full list of computational and driver routines.	04/01
-6001	Documents Intel Math Kernel Library release 6.0 beta. New DFT interface and Vector Statistical Library functions have been added.	07/02
-6002	Documents Intel Math Kernel Library 6.0 beta update. DFT functions description has been updated. CBLAS interface description was extended.	12/02
-6003	Documents Intel Math Kernel Library 6.0 gold. DFT functions have been updated. Auxiliary LAPACK routines' descriptions were added to the manual.	03/03
-6004	Documents Intel Math Kernel Library release 6.1.	07/03
-6005	Documents Intel Math Kernel Library release 7.0 beta. Includes ScaLAPACK and sparse solver descriptions.	11/03
-017	Documents Intel MKL and Intel® Cluster MKL release 7.0 gold. Auxiliary ScaLAPACK and alternative sparse solver interface were added.	04/04

Version	Version Information	Date
-018	Documents Intel MKL and Intel® Cluster MKL release 8.0 beta. Sparse BLAS and DFTI sections were extended. New functionality was added: Sparse BLAS, Cluster DFTI, iterative sparse solver, multiple-precision arithmetic, interval linear solver, and convolution/correlation. Fortran95 interface to LAPACK functions was added.	03/05
-019	Documents Intel MKL and Intel® Cluster MKL release 8.0 gold. Fortran95 interface to BLAS and Sparse BLAS functions has been added.	08/05
-020	Documents Intel MKL and Intel Cluster MKL release 8.0.2. PARDISO functionality description has been extended with indefinite symmetric matrices pivoting.	03/06
-021	Documents Intel MKL and Intel Cluster MKL release 8.1 gold. Chapter 13 on Trigonometric Transform functions has been added. Information on specific features of Fortran-95 implementation for LAPACK routines has been reflected in a new Appendix E and the relevant subsection of Chapter 3.	03/06
-022	Documents Intel MKL and Intel Cluster MKL release 9.0 beta. Statistical Functions, Fourier Transform Functions (Cluster DFT) descriptions have been updated. Description of new VML functions, RCI Sparse Solvers, and Poisson solver have been added. Chapter 13 has been renamed to PDE Support. Code examples have been expanded.	05/06
-023	Documents Intel MKL and Intel Cluster MKL release 9.0 gold. Complex Interval Solvers have been added. Description of the old deprecated FFT functions have been removed.	09/06
-024	Documents Intel MKL and Intel Cluster MKL release 9.1 beta. Optimization Solvers Routines and Support Functions chapters have been added. Chapters on Sparse Solvers and Partial Differential Equations Support have been extended. LAPACK chapters have been partially updated to reflect LAPACK 3.1 version.	01/07
-025	Documents Intel MKL and Intel Cluster MKL release 9.1 gold. BLACS chapter has been added. Chapters on BLAS and FFT have been extended. LAPACK chapters have been additionally updated to reflect LAPACK 3.1 version. Description of BSR format has been added to Appendix A. New FFT examples have been added to Appendix C.	03/07

Appendix A: Linear Solvers Basics

Appendix B: Routine and Function Arguments

Appendix C: Code Examples

1 Overview

The Intel® Math Kernel Library (Intel® MKL) provides Fortran routines and functions that perform a wide variety of operations on vectors and matrices including sparse matrices and interval matrices. The library also includes discrete Fourier transform routines, as well as vector mathematical and vector statistical functions with Fortran and C interfaces.

The version of the library named Intel® Cluster MKL is a superset of Intel MKL and includes also ScaLAPACK software and Cluster DFT software for solving respective computational problems on distributed-memory parallel computers.

The Intel MKL enhances performance of the application programs that use it because the library has been optimized for latest generations of Intel® processors.

This chapter introduces the Intel Math Kernel Library and provides information about the organization of this manual.

About This Software

The Intel® Math Kernel Library includes the following groups of routines:

- Basic Linear Algebra Subprograms (BLAS):
  - vector operations
  - matrix-vector operations
  - matrix-matrix operations
- Sparse BLAS Level 1, 2, and 3 (basic operations on sparse vectors and matrices)
- LAPACK routines for solving systems of linear equations
- LAPACK routines for solving least-squares problems, eigenvalue and singular value problems, and Sylvester's equations
- Auxiliary and utility LAPACK routines
- ScaLAPACK computational, driver and auxiliary routines (for Intel Cluster MKL only)
- Direct and Iterative Sparse Solver routines
- Vector Mathematical Library (VML) functions for computing core mathematical functions on vector arguments (with Fortran and C interfaces)
- Vector Statistical Library (VSL): functions for generating vectors of pseudorandom numbers with different types of statistical distributions and for performing convolution and correlation computations

- General Discrete Fourier Transform Functions (DFT), providing fast computation of DFT via the Fast Fourier Transform (FFT) algorithms and having Fortran and C interfaces
- Cluster DFT functions (for Intel Cluster MKL only)
- Interval Solver routines for solving systems of interval linear equations
- Tools for solving partial differential equations - trigonometric transform routines and Poisson solver
- Optimization Solver routines for solving nonlinear least squares problems through the Trust-Region (TR) algorithms and computing Jacobi matrix by central differences
- GMP arithmetic functions.

For specific issues on using the library, please refer to the MKL Release Notes.

Technical Support

Intel MKL provides a product web site that offers timely and comprehensive product information, including product features, white papers, and technical articles. For the latest information, check: http://developer.intel.com/software/products/

Intel also provides a support web site that contains a rich repository of self help information, including getting started tips, known product issues, product errata, license information, user forums, and more (visit http://support.intel.com/support/performancetools/libraries/mkl).

Registering your product entitles you to one year of technical support and product updates through Intel® Premier Support. Intel Premier Support is an interactive issue management and communication web site providing these services:

- Submit issues and review their status.
- Download product updates anytime of the day.

To register your product, contact Intel, or seek product support, please visit: http://developer.intel.com/software/products/support.

BLAS Routines

BLAS routines and functions are divided into the following groups according to the operations they perform:

- BLAS Level 1 Routines and Functions perform operations of both addition and reduction on vectors of data. Typical operations include scaling and dot products.
- BLAS Level 2 Routines perform matrix-vector operations, such as matrix-vector multiplication, rank-1 and rank-2 matrix updates, and solution of triangular systems.

- BLAS Level 3 Routines perform matrix-matrix operations, such as matrix-matrix multiplication, rank-k update, and solution of triangular systems.

Starting from release 8.0, Intel® MKL also supports Fortran-95 interface to BLAS routines.

Sparse BLAS Routines

Sparse BLAS Level 1 Routines and Functions and Sparse BLAS Level 2 Routines and Level 3 routines and functions operate on sparse vectors and matrices. These routines perform vector operations similar to BLAS Level 1, 2, and 3 routines. Sparse BLAS routines take advantage of vector and matrix sparsity: they allow you to store only non-zero elements of vectors and matrices. Intel MKL also supports Fortran-95 interface to Sparse BLAS routines.

LAPACK Routines

The Intel® Math Kernel Library fully supports LAPACK 3.0 set of computational, driver, auxiliary and utility routines and partially supports LAPACK 3.1 routines - one computational routine (`?stemr`) and a number of auxiliary and utility routines.

The original versions of LAPACK from which that part of Intel MKL was derived can be obtained from http://www.netlib.org/lapack/index.html. The authors of LAPACK are E. Anderson, Z. Bai, C. Bischof, S. Blackford, J. Demmel, J. Dongarra, J. Du Croz, A. Greenbaum, S. Hammarling, A. McKenney, and D. Sorensen.

The LAPACK routines can be divided into the following groups according to the operations they perform:

- Routines for solving systems of linear equations, factoring and inverting matrices, and estimating condition numbers (see Chapter 3).
- Routines for solving least-squares problems, eigenvalue and singular value problems, and Sylvester's equations (see Chapter 4).
- Auxiliary and utility routines used to perform certain subtasks, common low-level computation or related tasks (see Chapter 5).

Starting from release 8.0, Intel MKL also supports Fortran-95 interface to LAPACK computational and driver routines. This interface provides an opportunity for simplified calls of LAPACK routines with fewer required arguments.

ScaLAPACK Routines

ScaLAPACK package (included with Intel® Cluster MKL only, see Chapter 6 and Chapter 7) runs on distributed-memory architectures and includes routines for solving systems of linear equations, solving linear least-squares problems, eigenvalue and singular value problems, as well as performing a number of related computational tasks.

The original versions of ScaLAPACK from which that part of Intel Cluster MKL was derived can be obtained from http://www.netlib.org/scalapack/index.html. The authors of ScaLAPACK are L. Blackford, J. Choi, A.Cleary, E. D'Azevedo, J. Demmel, I. Dhillon, J. Dongarra, S. Hammarling, G. Henry, A. Petitet, K.Stanley, D. Walker, and R. Whaley.

Intel Cluster MKL version of ScaLAPACK is optimized for Intel® processors and uses MPICH version of MPI as well as Imtel MPI.

Sparse Solver Routines

Direct sparse solver routines in Intel MKL (see Chapter 8) solve symmetric and symmetrically-structured sparse matrices with real or complex coefficients. For symmetric matrices, these Intel MKL subroutines can solve both positive definite and indefinite systems. Intel MKL includes the PARDISO* sparse solver interface as well as an alternative set of user callable direct sparse solver routines.

If you use the sparse solver PARDISO* from Intel MKL, please cite:

O.Schenk and K.Gärtner. Solving unsymmetric sparse systems of linear equations with PARDISO. J. of Future Generation Computer Systems, 20(3):475- 487, 2004.

Intel MKL provides also an iterative sparse solver (see Chapter 8) that uses sparse BLAS level 2 and 3 routines and works with different sparse data formats.

VML Functions

Vector Mathematical Library (VML) functions (see Chapter 9) include a set of highly optimized implementations of certain computationally expensive core mathematical functions (power, trigonometric, exponential, hyperbolic etc.) that operate on vectors of real and complex numbers.

Application programs that might significantly improve performance with VML include nonlinear programming software, integrals computation, and many others. VML provides interfaces both for FORTRAN and C languages.

Statistical Functions

Vector Statistical Library (VSL) contains two sets of functions (see Chapter 10):

- The first set includes a collection of pseudo- and quasi-random number generator subroutines implementing basic continuous and discrete distributions. To provide best performance, VSL subroutines use calls to highly optimized Basic Random Number Generators and a library of vector mathematical functions.
- The second set includes a collection of routines that implement a wide variety of convolution and correlation operations.

Fourier Transform Functions

The Intel® MKL multidimensional Discrete Fourier Transform functions with mixed radix support (see Chapter 11) provide uniformity of DFT computation and combine functionality with ease of use. Both Fortran and C interface specification are given. There is also a cluster version of DFT functions, which runs on distributed-memory architectures and is provided with Intel Cluster MKL package.

DFT functions provide fast computation via the Fast Fourier Transform (FFT) algorithms not only for lengths that are powers of 2 but also for 3, 5, 7, 11, and other radices.

Interval Solver Routines

Interval Solver routines included into Intel® MKL (see Chapter 12) can be used to solve interval systems of linear equations and related problems.

Partial Differential Equations Support

Intel® MKL provides tools for solving Partial Differential Equations (PDE) (see Chapter 13). These tools are Trigonometric Transform interface routines and Poisson Library.

The Trigonometric Transform routines may be helpful to users who implement their own solvers similar to the solver that the Poisson Library provides. The users can improve performance of their solvers by using fast sine, cosine, and staggered cosine transforms implemented in the Trigonometric Transform interface.

Poisson Library is designed for fast solving of simple Helmholtz, Poisson, and Laplace problems. The Trigonometric Transform interface, which underlies the solver, is based on Intel MKL DFT interface (refer to Chapter 11), optimized for Intel® processors.

Optimization Solvers Routines

Intel® MKL provides Optimization Solvers routines (see Chapter 14) that can be used to solve nonlinear least squares problems with or without linear (bound) constraints through the Trust-Region (TR) algorithms and compute Jacobi matrix by central differences.

See also Appendix A Optimization Solvers Basics for description of the basic notions of optimization solvers, nonlinear least square problems, and the TR algorithm.

Support Functions

Intel® MKL support functions (see Chapter 15) are used to support the operation of Intel MKL software and provide basic information on the library and library operation, such as the current library version, timing, setting and measuring of CPU frequency, error handling, and memory allocation.

BLACS Routines

Intel® Math Kernel Library implements routines from the BLACS (Basic Linear Algebra Communication Subprograms) package (see Chapter 16) that are used to support a linear algebra oriented message passing interface that may be implemented efficiently and uniformly across a large range of distributed memory platforms.

The original versions of BLACS from which that part of Intel MKL was derived can be obtained from http://www.netlib.org/blacs/index.html. The authors of BLACS are Jack Dongarra and R. Clint Whaley.

GMP Arithmetic Functions

Intel® MKL implementation of GMP arithmetic functions includes arbitrary precision arithmetic operations on integer numbers. The interfaces of such functions fully match the GNU Multiple Precision (GMP) Arithmetic Library.

Performance Enhancements

The Intel® Math Kernel Library has been optimized by exploiting both processor and system features and capabilities. Special care has been given to those routines that most profit from cache-management techniques. These especially include matrix-matrix operation routines such as `dgemm()`.

In addition, code optimization techniques have been applied to minimize dependencies of scheduling integer and floating-point units on the results within the processor.

The major optimization techniques used throughout the library include:

- Loop unrolling to minimize loop management costs.
- Blocking of data to improve data reuse opportunities.
- Copying to reduce chances of data eviction from cache.

- Data prefetching to help hide memory latency.
- Multiple simultaneous operations (for example, dot products in `dgemm`) to eliminate stalls due to arithmetic unit pipelines.
- Use of hardware features such as the SIMD arithmetic units, where appropriate.

These are techniques from which the arithmetic code benefits the most.

Parallelism

In addition to the performance enhancements discussed above, the Intel® MKL offers performance gains through parallelism provided by the symmetric multiprocessing performance (SMP) feature. You can obtain improvements from SMP in the following ways:

- One way is based on user-managed threads in the program and further distribution of the operations over the threads based on data decomposition, domain decomposition, control decomposition, or some other parallelizing technique. Each thread can use any of the Intel MKL functions because the library has been designed to be thread-safe.
- Another method is to use the FFT and BLAS level 3 routines. They have been parallelized and require no alterations of your application to gain the performance enhancements of multiprocessing. Performance using multiple processors on the level 3 BLAS shows excellent scaling. Since the threads are called and managed within the library, the application does not need to be recompiled thread-safe (see also Fortran-95 Interface Conventions in Chapter 2).
- Yet another method is to use `tuned LAPACK routines`. Currently these include the single- and double precision flavors of routines for `QR` factorization of general matrices, triangular factorization of general and symmetric positive-definite matrices, solving systems of equations with such matrices, as well as solving symmetric eigenvalue problems.

For instructions on setting the number of available processors for the BLAS level 3 and LAPACK routines, see the Intel® MKL User's Guide.

Platforms Supported

The Intel® Math Kernel Library includes Fortran routines and functions optimized for Intel® processor-based computers running operating systems that support multiprocessing. In addition to the Fortran interface, the Intel MKL includes a C-language interface for the Discrete Fourier transform functions, as well as for the Vector Mathematical Library and Vector Statistical Library functions. For hardware and software requirements to use Intel MKL, see MKL Release Notes.

About This Manual

This manual describes the routines and functions of the Intel® MKL and Intel® Cluster MKL. Each reference section describes a routine group typically consisting of routines used with four basic data types: single-precision real, double-precision real, single-precision complex, and double-precision complex.

Each routine group is introduced by its name, a short description of its purpose, and the calling sequence, or syntax, for each type of data with which each routine of the group is used. The following sections are also included:

Description	Describes the operation performed by routines of the group based on one or more equations. The data types of the arguments are defined in general terms for the group.
Input Parameters	Defines the data type for each parameter on entry, for example: *a* `REAL` for `saxpy` `DOUBLE PRECISION` for `daxpy`
Output Parameters	Lists resultant parameters on exit.

Audience for This Manual

The manual addresses programmers proficient in computational mathematics and assumes a working knowledge of the principles and vocabulary of linear algebra, mathematical statistics, and Fourier transforms.

Manual Organization

The manual contains the following chapters and appendixes:

Chapter 1	Overview. Introduces the Intel Math Kernel Library software, provides information on manual organization, and explains notational conventions.
Chapter 2	BLAS and Sparse BLAS Routines. Provides descriptions of BLAS and Sparse BLAS functions and routines.
Chapter 3	LAPACK Routines: Linear Equations. Provides descriptions of LAPACK routines for solving systems of linear equations and performing a number of related computational tasks: triangular factorization, matrix inversion, estimating the condition number of matrices.

Chapter 4	LAPACK Routines: Least Squares and Eigenvalue Problems. Provides descriptions of LAPACK routines for solving least-squares problems, standard and generalized eigenvalue problems, singular value problems, and Sylvester's equations.
Chapter 5	LAPACK Auxiliary and Utility Routines. Describes auxiliary and utility LAPACK routines that perform certain subtasks or common low-level computation.
Chapter 6	ScaLAPACK Routines. Describes ScaLAPACK computational and driver routines (software included with Intel Cluster MKL only).
Chapter 7	ScaLAPACK Auxiliary and Utility Routines. Describes ScaLAPACK auxiliary routines (software included with Intel Cluster MKL only).
Chapter 8	Sparse Solver Routines. Describes direct sparse solver routines that solve symmetric and symmetrically-structured sparse matrices. Also describes the iterative sparse solver routines.
Chapter 9	Vector Mathematical Functions. Provides descriptions of VML functions for computing elementary mathematical functions on vector arguments.
Chapter 10	Statistical Functions. Provides descriptions of VSL functions for generating vectors of pseudorandom numbers and for performing convolution and correlation operations.
Chapter 11	Fourier Transform Functions. Describes multidimensional functions for computing the Discrete Fourier Transform and cluster DFT functions (software included with Intel Cluster MKL only).
Chapter 12	Interval Linear Solvers. Describes routines that can be used to solve interval systems of linear equations and related problems.
Chapter 13	Partial Differential Equations Support. Describes Trigonometric Transform interface routines and Poisson Library implemented for solving Partial Differential Equations (PDE).
Chapter 14	Optimization Solvers Routines. Describes routines for solving optimization problems. These routines solve nonlinear least squares problems through the Trust-Region (TR) algorithms and compute Jacobi matrix by central differences.
Chapter 15	Support Functions. Describes functions that are used to support the operation of Intel MKL software, such as status information functions, timing and error handling functions.
Chapter 16	BLACS Routines. Describes Basic Linear Algebra Communication Subprograms that are used to support a linear algebra oriented message passing interface.
Appendix A	Linear Solvers Basics. Briefly describes the basic definitions and approaches used in linear algebra for solving systems of linear equations. Describes sparse data storage formats, as well as basic concepts of interval arithmetic.

Appendix B	Routine and Function Arguments. Describes the major arguments of the BLAS routines and VML functions: vector and matrix arguments.
Appendix C	Code Examples. Provides code examples of calling various Intel MKL functions and routines (BLAS, PARDISO, Direct and Iterative Sparse Solver, DFT, Cluster DFT, Intreval Linear Solvers, Trigonometric Transforms, and Poisson Library).
Appendix D	CBLAS Interface to the BLAS. Provides the C interface to the BLAS.
Appendix E	Specific Features of Fortran-95 Interfaces for LAPACK Routines. Provides the features of Intel MKL Fortran-95 interfaces for LAPACK routines in comparison with Netlib implementation.
Appendix F	Optimization Solvers Basics. Briefly describes the basic notions of optimization solvers, nonlinear least square problem, and Trust Region algorithm.

The manual also includes a Bibliography, Glossary and an Index.

Notational Conventions

This manual uses the following notational conventions:

- Routine name shorthand (`?ungqr` instead of `cungqr`/`zungqr`).
- Font conventions used for distinction between the text and the code.

Routine Name Shorthand

For shorthand, character codes are represented by a question mark "`?`" names of routine groups. The question mark is used to indicate any or all possible varieties of a function; for example:

`?swap`	Refers to all four data types of the vector-vector `?swap` routine: `sswap`, `dswap`, `cswap`, and `zswap`.

Font Conventions

The following font conventions are used:

`UPPERCASE COURIER`	Data type used in the discussion of input and output parameters for Fortran interface. For example, `CHARACTER*1`.
`lowercase courier`	Code examples: `a(k+i,j) = matrix(i,j)` and data types for C interface, for example, `const float*`

`lowercase courier mixed with UpperCase courier`	Function names for C interface, for example, `vmlSetMode`
`lowercase courier italic`	Variables in arguments and parameters discussion. For example, *`incx`*.
`*`	Used as a multiplication symbol in code examples and equations and where required by the Fortran syntax.

BLAS and Sparse BLAS Routines 2

This chapter contains descriptions of the BLAS and Sparse BLAS routines of the Intel® Math Kernel Library. The routine descriptions are arranged in several sections according to the BLAS level of operation:

- BLAS Level 1 Routines and Functions (vector-vector operations)
- BLAS Level 2 Routines (matrix-vector operations)
- BLAS Level 3 Routines (matrix-matrix operations)
- Sparse BLAS Level 1 Routines and Functions (vector-vector operations).
- Sparse BLAS Level 2 and Level 3 (matrix-vector and matrix-matrix operations)

Each section presents the routine and function group descriptions in alphabetical order by routine or function group name; for example, the `?asum` group, the `?axpy` group. The question mark in the group name corresponds to different character codes indicating the data type (`s`, `d`, `c`, and `z` or their combination); see Routine Naming Conventions.

When BLAS or Sparse BLAS routines encounter an error, they call the error reporting routine `xerbla`. To be able to view error reports, you must include `xerbla` in your code. A copy of the source code for `xerbla` is included in the library.

In BLAS Level 1 groups `i?amax` and `i?amin`, an "`i`" is placed before the character code and corresponds to the index of an element in the vector. These groups are placed in the end of the BLAS Level 1 section.

Routine Naming Conventions

BLAS routine names have the following structure:

<character code> <name> <mod> ( )

The <*character code*> is a character that indicates the data type:

`s`	real, single precision
`c`	complex, single precision
`d`	real, double precision
`z`	complex, double precision

Some routines and functions can have combined character codes, such as `sc` or `dz`.

For example, the function `scasum` uses a complex input array and returns a real value.

The <name> field, in BLAS level 1, indicates the operation type. For example, the BLAS level 1 routines ?dot, ?rot, ?swap compute a vector dot product, vector rotation, and vector swap, respectively.

In BLAS level 2 and 3, <name> reflects the matrix argument type:

ge	general matrix
gb	general band matrix
sy	symmetric matrix
sp	symmetric matrix (packed storage)
sb	symmetric band matrix
he	Hermitian matrix
hp	Hermitian matrix (packed storage)
hb	Hermitian band matrix
tr	triangular matrix
tp	triangular matrix (packed storage)
tb	triangular band matrix.

The <mod> field, if present, provides additional details of the operation. BLAS level 1 names can have the following characters in the <mod> field:

c	conjugated vector
u	unconjugated vector
g	Givens rotation.

BLAS level 2 names can have the following characters in the <mod> field:

mv	matrix-vector product
sv	solving a system of linear equations with matrix-vector operations
r	rank-1 update of a matrix
r2	rank-2 update of a matrix.

BLAS level 3 names can have the following characters in the <mod> field:

mm	matrix-matrix product
sm	solving a system of linear equations with matrix-matrix operations
rk	rank-k update of a matrix
r2k	rank-2k update of a matrix.

The examples below illustrate how to interpret BLAS routine names:

ddot	<d> <dot>: double-precision real vector-vector dot product
cdotc	<c> <dot> <c>: complex vector-vector dot product, conjugated
scasum	<sc> <asum>: sum of magnitudes of vector elements, single precision real output and single precision complex input
cdotu	<c> <dot> <u>: vector-vector dot product, unconjugated, complex
sgemv	<s> <ge> <mv>: matrix-vector product, general matrix, single precision
ztrmm	<z> <tr> <mm>: matrix-matrix product, triangular matrix, double-precision complex.

Sparse BLAS naming conventions are similar to those of BLAS level 1. For more information, see "Naming Conventions".

Fortran-95 Interface Conventions

Fortran-95 interface to BLAS and Sparse BLAS Level 1 routines is implemented through wrappers that call respective Fortran-77 routines. This interface uses such features of Fortran-95 as assumed-shape arrays and optional arguments to provide simplified calls to BLAS and Sparse BLAS Level 1 routines with fewer arguments.

The main conventions that are used in Fortran-95 interface are as follows:

- The names of arguments used in Fortran-95 call are typically the same as for the respective generic (Fortran-77) interface. However, to reduce the number of argument names used in the library, the following identity settings of formal argument names were made:

Generic Argument Name	Fortran-95 Argument Name
ap	*a*

  Note that these name changes of formal arguments have no impact on program semantics and follow the conventions of unification names.

- Input arguments such as array dimensions are not required in Fortran-95 and are skipped from the calling sequence. Array dimensions are reconstructed from the user data that must exactly follow the required array shape.

  Also, an argument can be skipped if its value is completely defined by the presence or absence of another argument in the calling sequence, and the restored value is the only meaningful value for the skipped argument.

- Arguments *incx* and *incy* are skipped. In all cases their values are assumed to be 1. One can obtain the effect of the values of *incx* and *incy* not being equal to 1 by using corresponding Fortran-95 feature: index incrementing may be directly established in actual arguments. Other possibility to obtain this effect is to use Fortran-77 call.
- Some generic arguments are declared as optional in Fortran-95 interface and may or may not be present in the calling sequence. An argument can be declared optional if it satisfies one of the following conditions:

  1. If an input argument can take only a few possible values, it can be declared as optional. The default value of such argument is typically set as the first value in the list and all exceptions to this rule are explicitly stated in the routine description.
  2. If an input argument has a natural default value, it can be declared as optional. The default value of such optional argument is set to its natural default value.

- Optional arguments are given in square brackets in Fortran-95 call syntax.

The concrete rules used for reconstructing the values of omitted optional parameters are specific for each routine and are detailed in the respective "Fortran-95 Notes" subsection given at the end of routine specification section. If this subsection is omitted, the Fortran-95 interface for the given routine does not differ from the corresponding Fortran-77 interface.

Note that this interface is not implemented in the current version of Sparse BLAS Level 2 and Level 3 routines. Fortran-95 interfaces for each these routines is given in the "Interfaces - Fortran-95" subsection at the end of the respective routine specification section.

Matrix Storage Schemes

Matrix arguments of BLAS routines can use the following storage schemes:

- Full storage: a matrix *A* is stored in a two-dimensional array *a*, with the matrix element a^{ij} stored in the array element *a*(*i*,*j*).
- Packed storage scheme allows you to store symmetric, Hermitian, or triangular matrices more compactly: the upper or lower triangle of the matrix is packed by columns in a one-dimensional array.
- Band storage: a band matrix is stored compactly in a two-dimensional array: columns of the matrix are stored in the corresponding columns of the array, and diagonals of the matrix are stored in rows of the array.

For more information on matrix storage schemes, see "Matrix Arguments" in Appendix B.

BLAS Level 1 Routines and Functions

BLAS Level 1 includes routines and functions, which perform vector-vector operations. Table 2-1 lists the BLAS Level 1 routine and function groups and the data types associated with them.

Table 2-1 BLAS Level 1 Routine Groups and Their Data Types

Routine or Function Group	Data Types	Description
?asum	s, d, sc, dz	Sum of vector magnitudes (functions)
?axpy	s, d, c, z	Scalar-vector product (routines)
?copy	s, d, c, z	Copy vector (routines)
?dot	s, d	Dot product (functions)
?sdot	sd, d	Dot product with extended precision (functions)
?dotc	c, z	Dot product conjugated (functions)
?dotu	c, z	Dot product unconjugated (functions)
?nrm2	s, d, sc, dz	Vector 2-norm (Euclidean norm) a normal or null vector(functions)
?rot	s, d, cs, zd	Plane rotation of points (routines)
?rotg	s, d, c, z	Givens rotation of points (routines)
?rotm	s, d	Modified plane rotation of points
?rotmg	s, d	Givens modified plane rotation of points
?scal	s, d, c, z, cs, zd	Vector scaling (routines)
?swap	s, d, c, z	Vector-vector swap (routines)
i?amax	s, d, c, z	Vector maximum value, absolute largest element of a vector, where *i* is an index to this value in the vector array (functions)

Routine or Function Group	Data Types	Description
i?amin	s, d, c, z	Vector minimum value, absolute smallest element of a vector, where *i* is an index to this value in the vector array (functions)
dcabs1	d	Absolute value of a double complex number *z*.

?asum

Computes the sum of magnitudes of the vector elements.

Syntax

Fortran 77:

```
res = sasum(n, x, incx )
res = scasum(n, x, incx )
res = dasum(n, x, incx )
res = dzasum(n, x, incx )
```

Fortran 95:

```
res = asum(x)
```

Description

The function ?asum function computes the sum of the magnitudes of elements of a real vector, or the sum of magnitudes of the real and imaginary parts of elements of a complex vector:

res = |*Rex* (*1*)| + |*Imx* (1)| + |*Rex*(2) | + |*Imx* (2)|+ ... + |*Rex* (*n*)| + |*Imx* (*n*)|

where *x* is a vector of order *n*.

Input Parameters

n	INTEGER. Specifies the order of vector *x*.
x	REAL for sasum DOUBLE PRECISION for dasum

COMPLEX for scasum
DOUBLE COMPLEX for dzasum

Array, DIMENSION at least (1 + (*n*-1)*abs(*incx*)).

incx INTEGER. Specifies the increment for the elements of *x*.

Output Parameters

res REAL for sasum
DOUBLE PRECISION for dasum
REAL for scasum
DOUBLE PRECISION for dzasum
Contains the sum of magnitudes of real and imaginary parts of all elements of the vector.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine asum interface are the following:

x Holds the array of size(*n*).

?axpy

Computes a vector-scalar product and adds the result to a vector.

Syntax

Fortran 77:

```
call saxpy(n, a, x, incx, y, incy)
call daxpy(n, a, x, incx, y, incy)
call caxpy(n, a, x, incx, y, incy)
call zaxpy(n, a, x, incx, y, incy)
```

Fortran 95:

```
call axpy(x, y [,a])
```

Description

The ?axpy routines perform a vector-vector operation defined as

y := *a***x* + *y*

where:

a is a scalar

x and *y* are vectors of order *n*.

Input Parameters

n	INTEGER. Specifies the order of vectors *x* and *y*.
a	REAL for saxpy DOUBLE PRECISION for daxpy COMPLEX for caxpy DOUBLE COMPLEX for zaxpy Specifies the scalar *a*.
x	REAL for saxpy DOUBLE PRECISION for daxpy COMPLEX for caxpy DOUBLE COMPLEX for zaxpy Array, DIMENSION at least (1 + (*n*-1)*abs(*incx*)).
incx	INTEGER. Specifies the increment for the elements of *x*.
y	REAL for saxpy DOUBLE PRECISION for daxpy COMPLEX for caxpy DOUBLE COMPLEX for zaxpy Array, DIMENSION at least (1 + (*n*-1)*abs(*incy*)).
incy	INTEGER. Specifies the increment for the elements of *y*.

Output Parameters

y	Contains the updated vector *y*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `axpy` interface are the following:

x	Holds the array of size(*n*).
y	Holds the array of size (*n*).
a	The default value is 1.

?copy

Copies vector to another vector.

Syntax

Fortran 77:

```
call scopy(n, x, incx, y, incy)
call dcopy(n, x, incx, y, incy)
call ccopy(n, x, incx, y, incy)
call zcopy(n, x, incx, y, incy)
```

Fortran 95:

```
call copy(x, y)
```

Description

The `?copy` routines perform a vector-vector operation defined as

y = *x*,

where *x* and *y* are vectors.

Input Parameters

n	`INTEGER`. Specifies the order of vectors *x* and *y*.

x	`REAL` for `scopy`
	`DOUBLE PRECISION` for `dcopy`
	`COMPLEX` for `ccopy`

	DOUBLE COMPLEX for zcopy Array, DIMENSION at least (1 + (*n*-1)*abs(*incx*)).
incx	INTEGER. Specifies the increment for the elements of *x*.
y	REAL for scopy DOUBLE PRECISION for dcopy COMPLEX for ccopy DOUBLE COMPLEX for zcopy Array, DIMENSION at least (1 + (*n*-1)*abs(*incy*)).
incy	INTEGER. Specifies the increment for the elements of *y*.

Output Parameters

y	Contains a copy of the vector *x* if *n* is positive. Otherwise, parameters are unaltered.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine copy interface are the following:

x	Holds the vector of length(*n*).
y	Holds the vector of length (*n*).

?dot

Computes a vector-vector dot product.

Syntax

Fortran 77:

```
res = sdot(n, x, incx, y, incy)
res = ddot(n, x, incx, y, incy)
```

Fortran 95:

```
res = dot(x, y)
```

Description

The ?dot functions perform a vector-vector reduction operation defined as

$$res = \sum (x * y),$$

where x and y are vectors.

Input Parameters

n	INTEGER. Specifies the order of vectors *x* and *y*.
x	REAL for sdot DOUBLE PRECISION for ddot Array, DIMENSION at least (1+(*n*-1)*abs(*incx*)).
incx	INTEGER. Specifies the increment for the elements of *x*.
y	REAL for sdot DOUBLE PRECISION for ddot Array, DIMENSION at least (1+(*n*-1)*abs(*incy*)).
incy	INTEGER. Specifies the increment for the elements of *y*.

Output Parameters

res	REAL for sdot DOUBLE PRECISION for ddot Contains the result of the dot product of *x* and *y*, if *n* is positive. Otherwise, *res* contains 0.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine dot interface are the following:

x	Holds the vector of length(*n*).
y	Holds the vector of length (*n*).

?sdot

Computes a vector-vector dot product with extended precision.

Syntax

Fortran 77:

```
res = sdsdot(n, sb, sx, incx, s y, incy)
res = dsdot(n, s x, incx, s y, incy)
```

Fortran 95:

```
res = sdot(sx, sy)
res = sdot(sx, sy, sb)
```

Description

The ?sdot functions compute the inner product of two vectors with extended precision. Both functions use extended precision accumulation of the intermediate results, but the function sdsdot outputs the final result in single precision, whereas the function dsdot outputs the double precision result. The function sdsdot also adds scalar value *sb* to the inner product.

Input Parameters

n	INTEGER. Specifies the number of elements in the input vectors *sx* and *sy*.
sb	REAL. Single precision scalar to be added to inner product (for the function sdsdot only).
sx, *sy*	REAL. Arrays, DIMENSION at least (1+(*n* –1)*abs(*incx*)) and (1+(*n*–1)*abs(*incy*)), respectively. Contain the input single precision vectors.
incx	INTEGER. Specifies the increment for the elements of *sx*.
incy	INTEGER. Specifies the increment for the elements of *sy*.

Output Parameters

res	REAL for sdsdot

DOUBLE PRECISION for dsdot
Contains the result of the dot product of *sx* and *sy* (with *sb* added for sdsdot), if *n* is positive. Otherwise, *res* contains *sb* for sdsdot and 0 for dsdot.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine sdot interface are the following:

sx	Holds the vector of length(*n*).
sy	Holds the vector of length(*n*).

NOTE. Note that scalar parameter *sb* is declared as a required parameter in Fortran-95 interface for the function sdot to distinguish between function flavors that output final result in different precision.

?dotc

Computes a dot product of a conjugated vector with another vector.

Syntax

Fortran 77:

```
res = cdotc(n, x, incx, y, incy )
res = zdotc(n, x, incx, y, incy )
```

Fortran 95:

```
res = dotc(x, y)
```

Description

The ?dotC functions perform a vector-vector operation defined as

$$res = \sum (conjg(x) * y))$$

where x and y are n-element vectors.

Input Parameters

n	INTEGER. Specifies the order of vectors x and y.
x	COMPLEX for cdotc DOUBLE COMPLEX for zdotc Array, DIMENSION at least (1 + (*n* –1)*abs(*incx*)).
incx	INTEGER. Specifies the increment for the elements of x.
y	COMPLEX for cdotc DOUBLE COMPLEX for zdotc Array, DIMENSION at least (1 + (*n* –1)*abs(*incy*)).
incy	INTEGER. Specifies the increment for the elements of y.

Output Parameters

res	COMPLEX for cdotc DOUBLE COMPLEX for zdotc Contains the result of the dot product of the conjugated x and unconjugated y, if n is positive. Otherwise, *res* contains 0.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine dotc interface are the following:

x	Holds the vector of length(n).
y	Holds the vector of length (n).

?dotu

Computes a vector-vector dot product.

Syntax

Fortran 77:

```
res = cdotu(n, x, incx, y, incy )
res = zdotu(n, x, incx, y, incy )
```

Fortran 95:

```
res = dotu(x, y)
```

Description

The ?dotu functions perform a vector-vector reduction operation defined as

$$res = \sum (x * y),$$

where x and y are n-element complex vectors.

Input Parameters

n	INTEGER. Specifies the order of vectors *x* and *y*.
x	COMPLEX for cdotu DOUBLE COMPLEX for zdotu Array, DIMENSION at least (1 + (*n* –1)*abs(*incx*)).
incx	INTEGER. Specifies the increment for the elements of *x*.
y	COMPLEX for cdotu DOUBLE COMPLEX for zdotu Array, DIMENSION at least (1 + (*n* –1)*abs(*incy*)).
incy	INTEGER. Specifies the increment for the elements of *y*.

Output Parameters

res	COMPLEX for cdotu DOUBLE COMPLEX for zdotu Contains the result of the dot product of *x* and *y*, if *n* is positive. Otherwise, *res* contains 0.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `dotu` interface are the following:

x	Holds the vector of length(*n*).
y	Holds the vector of length (*n*).

?nrm2

Computes the Euclidean norm of a vector.

Syntax

Fortran 77:

```
res = snrm2(n, x, incx )
res = dnrm2(n, x, incx )
res = scnrm2(n, x, incx )
res = dznrm2(n, x, incx )
```

Fortran 95:

```
res = nrm2(x)
```

Description

The `?nrm2` functions perform a vector reduction operation defined as

```
res  = | |x| |,
```

where:

x is a vector

res is a value containing the Euclidean norm of the elements of *x*.

Input Parameters

n	`INTEGER`. Specifies the order of vector *x*.
x	`REAL` for `snrm2`

DOUBLE PRECISION for dnrm2
COMPLEX for scnrm2
DOUBLE COMPLEX for dznrm2
Array, DIMENSION at least (1 + (*n* -1)*abs (*incx*)).

incx INTEGER. Specifies the increment for the elements of *x*.

Output Parameters

res REAL for snrm2
DOUBLE PRECISION for dnrm2
REAL for scnrm2
DOUBLE PRECISION for dznrm2
Contains the Euclidean norm of the vector *x*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine nrm2 interface are the following:

x Holds the vector of length(*n*).

?rot

Performs rotation of points in the plane.

Syntax

Fortran 77:

```
call srot(n, x, incx, y, incy, c, s )
call drot(n, x, incx, y, incy, c, s )
call csrot(n, x, incx, y, incy, c, s )
call zdrot(n, x, incx, y, incy, c, s )
```

Fortran 95:

```
call rot(x, y [,c] [,s])
```

Description

Given two complex vectors *x* and *y*, each vector element of these vectors is replaced as follows:

```
x(i) = c*x(i) + s*y(i)
y(i) =  c*y(i) -  s*x(i)
```

Input Parameters

n	INTEGER. Specifies the order of vectors *x* and *y*.
x	REAL for srot DOUBLE PRECISION for drot COMPLEX for csrot DOUBLE COMPLEX for zdrot Array, DIMENSION at least (1 + (*n* -1)*abs(*incx*)).
incx	INTEGER. Specifies the increment for the elements of *x*.
y	REAL for srot DOUBLE PRECISION for drot COMPLEX for csrot DOUBLE COMPLEX for zdrot Array, DIMENSION at least (1 + (*n* -1)*abs(*incy*)).
incy	INTEGER. Specifies the increment for the elements of *y*.
c	REAL for srot DOUBLE PRECISION for drot REAL for csrot DOUBLE PRECISION for zdrot A scalar.
s	REAL for srot DOUBLE PRECISION for drot REAL for csrot DOUBLE PRECISION for zdrot A scalar.

Output Parameters

x	Each element is replaced by *c***x* + *s***y*.
y	Each element is replaced by *c***y* - *s***x*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `rot` interface are the following:

x	Holds the vector of length(*n*).
y	Holds the vector of length (*n*).
c	The default value is 1.
s	The default value is 1.

?rotg

Computes the parameters for a Givens rotation.

Syntax

Fortran 77:

```
call srotg(a, b, c, s )
call drotg(a, b, c, s )
call crotg(a, b, c, s )
call zrotg(a, b, c, s )
```

Fortran 95:

```
call rotg(a, b, c, s)
```

Description

Given the cartesian coordinates `(a, b)` of a point `p`, these routines return the parameters *a*, *b*, *c*, and *s* associated with the Givens rotation that zeros the *y*–coordinate of the point.

See a more accurate LAPACK version `?lartg`.

Input Parameters

a	`REAL` for `srotg`
	`DOUBLE PRECISION` for `drotg`
	`COMPLEX` for `crotg`

DOUBLE COMPLEX for zrotg
Provides the *x*-coordinate of the point p.

b
REAL for srotg
DOUBLE PRECISION for drotg
COMPLEX for crotg
DOUBLE COMPLEX for zrotg
Provides the *y*-coordinate of the point p.

Output Parameters

a
Contains the parameter *r* associated with the Givens rotation.

b
Contains the parameter *z* associated with the Givens rotation.

c
REAL for srotg
DOUBLE PRECISION for drotg
REAL for crotg
DOUBLE PRECISION for zrotg
Contains the parameter *c* associated with the Givens rotation.

s
REAL for srotg
DOUBLE PRECISION for drotg
COMPLEX for crotg
DOUBLE COMPLEX for zrotg
Contains the parameter *s* associated with the Givens rotation.

?rotm

Performs rotation of points in the modified plane.

Syntax

Fortran 77:

```
call srotm(n, x, incx, y, incy, param )
call drotm(n, x, incx, y, incy, param )
```

Fortran 95:

```
call rotm(x, y [,param])
```

Description

Given two complex vectors *x* and *y*, each vector element of these vectors is replaced as follows:

*x(i) = H*x(i) + H*y(i)*

*y(i) = H*y(i) - H*x(i)*

where:

H is a modified Givens transformation matrix whose values are stored in the *param(2)* through *param(5)* array. See discussion on the *param* argument.

Input Parameters

n	INTEGER. Specifies the order of vectors *x* and *y*.
x	REAL for srotm DOUBLE PRECISION for drotm Array, DIMENSION at least (1 + (*n* -1)*abs(*incx*)).
incx	INTEGER. Specifies the increment for the elements of *x*.
y	REAL for srotm DOUBLE PRECISION for drotm Array, DIMENSION at least (1 + (*n* -1)*abs(*incy*)).
incy	INTEGER. Specifies the increment for the elements of *y*.
param	REAL for srotm DOUBLE PRECISION for drotm Array, DIMENSION 5. The elements of the *param* array are: *param(1)* contains a switch, *flag*. *param(2-5)* contain *h11*, *h21*, *h12*, and *h22*, respectively, the components of the array *H*. Depending on the values of *flag*, the components of *H* are set as follows:

$$flag = -1. : H = \begin{bmatrix} h11 & h12 \\ h21 & h22 \end{bmatrix}$$

$$flag = 0. : H = \begin{bmatrix} 1. & h12 \\ h21 & 1. \end{bmatrix}$$

$$flag = 1. : H = \begin{bmatrix} h11 & 1. \\ -1 & h22 \end{bmatrix}$$

$$flag = -2. : H = \begin{bmatrix} 1. & 0. \\ 0. & 1. \end{bmatrix}$$

In the above cases, the matrix entries of 1., -1., and 0. are assumed based on the last three values of *flag* and are not actually loaded into the *param* vector.

Output Parameters

x	Each element is replaced by *h11*x + h12*y*.
y	Each element is replaced by *h21*x + h22*y*.
H	Givens transformation matrix updated.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `rotm` interface are the following:

x	Holds the vector of length(*n*).
y	Holds the vector of length (*n*).
param	The default value for *param*(1) is -2.

?rotmg

Computes the modified parameters for a Givens rotation.

Syntax

Fortran 77:

```
call srotmg(d1, d2, x1, y1, param)
call drotmg(d1, d2, x1, y1, param)
```

Fortran 95:

```
call rotmg(x1, y1, param [, d1] [d2])
```

Description

Given cartesian coordinates (*x1*, *y1*) of an input vector, these routines compute the components of a modified Givens transformation matrix *H* that zeros the *y*-component of the resulting vector:

$$\begin{bmatrix} x \\ 0 \end{bmatrix} = H \begin{bmatrix} x1 \\ y1 \end{bmatrix}$$

Input Parameters

d1	REAL for srotmg DOUBLE PRECISION for drotmg Provides the updated scaling factor for the *x*-coordinate of the input vector (sqrt(*d1*)*x1*).
d2	REAL for srotmg DOUBLE PRECISION for drotmg

Provides the updated scaling factor for the *y*-coordinate of the input vector `(sqrt(d2)*y1)`.

x1
`REAL` for `srotmg`
`DOUBLE PRECISION` for `drotmg`
Provides the rotated *x*-coordinate of the input vector.

y1
`REAL` for `srotmg`
`DOUBLE PRECISION` for `drotmg`
Provides the *y*-coordinate of the input vector.

Output Parameters

param
`REAL` for `srotmg`
`DOUBLE PRECISION` for `drotmg`
Array, `DIMENSION` 5.
The elements of the *param* array are:
param(1) contains a switch, *flag*. *param(2-5)* contain *h11*, *h21*, *h12*, and *h22*, respectively, the components of the array *H*.
Depending on the values of *flag*, the components of *H* are set as follows:

$$flag = -1. : H = \begin{bmatrix} h11 & h12 \\ h21 & h22 \end{bmatrix}$$

$$flag = 0. : H = \begin{bmatrix} 1. & h12 \\ h21 & 1. \end{bmatrix}$$

$$flag = 1. : H = \begin{bmatrix} h11 & 1. \\ -1 & h22 \end{bmatrix}$$

$$flag = -2. : H = \begin{bmatrix} 1. & 0. \\ 0. & 1. \end{bmatrix}$$

In the above cases, the matrix entries of 1., -1., and 0. are assumed based on the last three values of *flag* and are not actually loaded into the *param* vector.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `rotmg` interface are the following:

d1	The default value is 1.
d2	The default value is 1.

?scal

Computes a vector by a scalar product.

Syntax

Fortran 77:

```
call sscal(n, a, x, incx )
call dscal(n, a, x, incx )
call cscal(n, a, x, incx )
call zscal(n, a, x, incx )
call csscal(n, a, x, incx )
call zdscal(n, a, x, incx )
```

Fortran 95:

```
call scal(x, a)
```

Description

The ?scal routines perform a vector-vector operation defined as

x = *a***x*

where:

a is a scalar, *x* is an *n*-element vector.

Input Parameters

n	INTEGER. Specifies the order of vector *x*.
a	REAL for sscal and csscal DOUBLE PRECISION for dscal and zdscal COMPLEX for cscal DOUBLE COMPLEX for zscal Specifies the scalar *a*.
x	REAL for sscal DOUBLE PRECISION for dscal COMPLEX for cscal and csscal DOUBLE COMPLEX for zscal and zdscal Array, DIMENSION at least (1 + (*n* –1)*abs(*incx*)).
incx	INTEGER. Specifies the increment for the elements of *x*.

Output Parameters

x	Overwritten by the updated vector x.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine scal interface are the following:

x	Holds the vector of length(*n*).

NOTE. Note that scalar parameter *a* is declared as a required parameter in Fortran-95 interface for the routine scal to distinguish between routine flavors that operate on different data types.

?swap

Swaps a vector with another vector.

Syntax

Fortran 77:

```
call sswap(n, x, incx, y, incy )
call dswap(n, x, incx, y, incy )
call cswap(n, x, incx, y, incy )
call zswap(n, x, incx, y, incy )
```

Fortran 95:

```
call swap(x, y)
```

Description

Given the two complex vectors *x* and *y*, the ?swap routines return vectors *y* and *x* swapped, each replacing the other.

Input Parameters

n	INTEGER. Specifies the order of vectors *x* and *y*.
x	REAL for sswap DOUBLE PRECISION for dswap COMPLEX for cswap DOUBLE COMPLEX for zswap Array, DIMENSION at least (1 + (*n* -1)*abs(*incx*)).
incx	INTEGER. Specifies the increment for the elements of *x*.
y	REAL for sswap DOUBLE PRECISION for dswap COMPLEX for cswap DOUBLE COMPLEX for zswap Array, DIMENSION at least (1 + (*n* -1)*abs(*incy*)).
incy	INTEGER. Specifies the increment for the elements of *y*.

Output Parameters

x	Contains the resultant vector *x*.
y	Contains the resultant vector *y*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `swap` interface are the following:

x	Holds the vector of length(*n*).
y	Holds the vector of length (*n*).

i?amax

Finds the element of a vector that has the largest absolute value.

Syntax

Fortran 77:

```
res = isamax(n, x, incx )
index = idamax(n, x, incx )
index = icamax(n, x, incx )
index = izamax(n, x, incx )
```

Fortran 95:

```
res = iamax(x)
```

Description

Given a vector *x*, the `i?amax` functions return the position of the vector element `x(i)` that has the largest absolute value for real flavors, or the largest sum `|Rex(i)|+|Imx(i)|` for complex flavors.

If *n* is not positive, `0` is returned.

If more than one vector element is found with the same largest absolute value, the index of the first one encountered is returned.

Input Parameters

n	INTEGER. Specifies the order of the vector *x*.
x	REAL for isamax DOUBLE PRECISION for idamax COMPLEX for icamax DOUBLE COMPLEX for izamax Array, DIMENSION at least (1+(*n*-1)*abs(*incx*)).
incx	INTEGER. Specifies the increment for the elements of *x*.

Output Parameters

index	INTEGER. Contains the position of vector element *x* that has the largest absolute value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine amax interface are the following:

x	Holds the vector of length (*n*).

i?amin

Finds the element of a vector that has the smallest absolute value.

Syntax

Fortran 77:

```
index = isamin(n, x, incx )
index = idamin(n, x, incx )
index = icamin(n, x, incx )
index = izamin(n, x, incx )
```

Fortran 95:

```
res = iamin(x)
```

Description

Given a vector *x*, the `i?amin` functions return the position of the vector element *x*(*i*) that has the smallest absolute value for real dlavors, or the smallest sum |Re*x*(*i*)|+|Im*x*(*i*)| for complex flavors.

If *n* is not positive, 0 is returned.

If more than one vector element is found with the same smallest absolute value, the index of the first one encountered is returned.

Input Parameters

n	INTEGER. On entry, *n* specifies the order of the vector *x*.
x	REAL for `isamin` DOUBLE PRECISION for `idamin` COMPLEX for `icamin` DOUBLE COMPLEX for `izamin` Array, DIMENSION at least `(1+(n-1)*abs(incx))`.
incx	INTEGER. Specifies the increment for the elements of *x*.

Output Parameters

index	INTEGER. Contains the position of vector element *x* that has the smallest absolute value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `amin` interface are the following:

x	Holds the vector of length (*n*).

dcabs1

Computes absolute value of double complex number.

Syntax

Fortran 77:

```
res = dcabs1(z)
```

Fortran 95:

```
res = dcabs1(z)
```

Description

The `dcabs1` is an auxiliary routine for a few BLAS Level 1 routines. This function performs an operation defined as

res=|Re(*z*)|+|Im(*z*)|,

where *z* is a scalar and *res* is a value containing the absolute value of a double complex number *z*.

Input Parameters

z	`DOUBLE COMPLEX` scalar.

Output Parameters

res	`DOUBLE PRECISION`. Contains the absolute value of a double complex number *z*.

BLAS Level 2 Routines

This section describes BLAS Level 2 routines, which perform matrix-vector operations. Table 2-2 lists the BLAS Level 2 routine groups and the data types associated with them.

Table 2-2 BLAS Level 2 Routine Groups and Their Data Types

Routine Groups	Data Types	Description
?gbmv	s, d, c, z	Matrix-vector product using a general band matrix

Routine Groups	Data Types	Description
?gemv	s, d, c, z	Matrix-vector product using a general matrix
?ger	s, d	Rank-1 update of a general matrix
?gerc	c, z	Rank-1 update of a conjugated general matrix
?geru	c, z	Rank-1 update of a general matrix, unconjugated
?hbmv	c, z	Matrix-vector product using a Hermitian band matrix

?tpsv	s, d, c, z	Linear solution of a triangular packed matrix
?trmv	s, d, c, z	Matrix-vector product using a triangular matrix
?trsv	s, d, c, z	Linear solution of a triangular matrix

?gbmv

Computes a matrix-vector product using a general band matrix

Syntax

Fortran 77:

```
call sgbmv(trans, m, n, kl, ku, alpha, a, lda, x, inxc, beta, y, incy )
call dgbmv(trans, m, n, kl, ku, alpha, a, lda, x, incx, beta, y, incy )
call cgbmv(trans, m, n, kl, ku, alpha, a, lda, x, incx, beta, y, incy )
call zgbmv(trans, m, n, kl, ku, alpha, a, lda, x, incx, beta, y, incy )
```

Fortran 95:

```
call gbmv(a, x, y [,kl][,m] [,alpha][,beta] [,trans])
```

Description

The ?gbmv routines perform a matrix-vector operation defined as

```
y := alpha*A*x + beta*y
```

or

```
y := alpha*A'*x + beta*y,
```

or

```
y := alpha *conjg(A')*x + beta*y,
```

where:

alpha and *beta* are scalars,

x and *y* are vectors,

A is an *m*-by-*n* band matrix, with *kl* sub-diagonals and *ku* super-diagonals.

Input Parameters

trans

CHARACTER*1. Specifies the operation to be performed, as follows:

***trans* value**	**Operation to be Performed**
N or n	*y* := *alpha***A***x* + *beta***y*
T or t	*y* := *alpha***A*'**x* + *beta***y*
C or c	*y* := *alpha* *conjg(*A*')**x* + *beta***y*

m

INTEGER. Specifies the number of rows of the matrix *A*. The value of *m* must be at least zero.

n

INTEGER. Specifies the number of columns of the matrix *A*. The value of *n* must be at least zero.

kl

INTEGER. Specifies the number of sub-diagonals of the matrix *A*.

The value of *kl* must satisfy $0 \le kl$.

ku

INTEGER. Specifies the number of super-diagonals of the matrix *A*.

The value of *ku* must satisfy $0 \le ku$.

alpha

REAL for sgbmv
DOUBLE PRECISION for dgbmv
COMPLEX for cgbmv
DOUBLE COMPLEX for zgbmv
Specifies the scalar *alpha*.

a

REAL for sgbmv
DOUBLE PRECISION for dgbmv
COMPLEX for cgbmv
DOUBLE COMPLEX for zgbmv
Array, DIMENSION (*lda*, *n*).
Before entry, the leading (*kl* + *ku* + 1) by *n* part of the array *a* must contain the matrix of coefficients. This matrix must be supplied column-by-column, with the leading

diagonal of the matrix in row (*ku* + 1) of the array, the first super-diagonal starting at position 2 in row *ku*, the first sub-diagonal starting at position 1 in row (*ku* + 2), and so on. Elements in the array *a* that do not correspond to elements in the band matrix (such as the top left *ku* by *ku* triangle) are not referenced.
The following program segment transfers a band matrix from conventional full matrix storage to band storage:

```
do 20, j = 1, n
 k = ku + 1 - j
   do 10, i = max(1, j-ku), min(m,
j+kl)
   a(k+i, j) = matrix(i,j)
 10 continue
20 continue
```

lda — INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least (*kl* + *ku* + 1).

x — REAL for sgbmv
DOUBLE PRECISION for dgbmv
COMPLEX for cgbmv
DOUBLE COMPLEX for zgbmv
Array, DIMENSION at least (1 + (*n* – 1)*abs(*incx*)) when *trans* = 'N' or 'n', and at least (1 + (*m* – 1)*abs(*incx*)) otherwise. Before entry, the incremented array *x* must contain the vector *x*.

incx — INTEGER. Specifies the increment for the elements of *x*. *incx* must not be zero.

beta — REAL for sgbmv
DOUBLE PRECISION for dgbmv
COMPLEX for cgbmv
DOUBLE COMPLEX for zgbmv
Specifies the scalar beta. When *beta* is equal to zero, then *y* need not be set on input.

y — REAL for sgbmv

	DOUBLE PRECISION for dgbmv COMPLEX for cgbmv DOUBLE COMPLEX for zgbmv Array, DIMENSION at least (1 +(*m* – 1)*abs(*incy*)) when *trans* = 'N' or 'n' and at least (1 +(*n* – 1)*abs(*incy*)) otherwise. Before entry, the incremented array *y* must contain the vector *y*.
incy	INTEGER. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.

Output Parameters

y	Overwritten by the updated vector *y*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gbmv interface are the following:

a	Holds the array *a* of size (*kl+ku+1*,*n*).
x	Holds the vector of length (*rx*), where *rx = n* if *trans = 'N'*, *rx = m* otherwise.
y	Holds the vector of length (*ry*), where *ry = m* if *trans = 'N'*, *ry = n* otherwise.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
kl	If omitted, assumed *kl= ku*.
ku	Restored as *ku= lda-kl-1*.
m	If omitted, assumed *m= n*.
alpha	The default value is 1.
beta	The default value is 1.

?gemv

Computes a matrix-vector product using a general matrix

Syntax

Fortran 77:

```
call sgemv(trans, m, n, alpha, a, lda, x, incx, beta, y, incy )
call dgemv(trans, m, n, alpha, a, lda, x, incx, beta, y, incy )
call cgemv(trans, m, n, alpha, a, lda, x, incx, beta, y, incy )
call zgemv(trans, m, n, alpha, a, lda, x, incx, beta, y, incy )
```

Fortran 95:

```
call gemv(a, x, y [,alpha][,beta] [,trans])
```

Description

The ?gemv routines perform a matrix-vector operation defined as

y := *alpha***A***x* + *beta***y*,

or

y := *alpha***A*'**x* + *beta***y*,

or

y := *alpha**conjg(*A*')**x* + *beta***y*,

where:

alpha and *beta* are scalars,

x and *y* are vectors,

A is an *m*-by-*n* matrix.

Input Parameters

trans CHARACTER*1. Specifies the operation to be performed, as follows:

***trans* value**	**Operation to be Performed**
N or n	*y* := *alpha***A***x* + *beta***y*

	`T` or `t` *y* := *alpha***A*'**x* + *beta***y* `C` or `c` *y* := *alpha* *conj(*A*')**x* + *beta***y*
m	`INTEGER`. Specifies the number of rows of the matrix *A*. The value of *m* must be at least zero.
n	`INTEGER`. Specifies the number of columns of the matrix *A*. The value of *n* must be at least zero.

alpha	`REAL` for `sgemv`
	`DOUBLE PRECISION` for `dgemv`
	`COMPLEX` for `cgemv`
	`DOUBLE COMPLEX` for `zgemv`
	Specifies the scalar *alpha*.

a	`REAL` for `sgemv`
	`DOUBLE PRECISION` for `dgemv`
	`COMPLEX` for `cgemv`
	`DOUBLE COMPLEX` for `zgemv`
	Array, `DIMENSION (`*lda*`, `*n*`)`. Before entry, the leading *m*-by-*n* part of the array *a* must contain the matrix of coefficients.

lda	`INTEGER`. Specifies the first dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least `max(1, `*m*`)`.

x	`REAL` for `sgemv`
	`DOUBLE PRECISION` for `dgemv`
	`COMPLEX` for `cgemv`
	`DOUBLE COMPLEX` for `zgemv`
	Array, `DIMENSION` at least `(1+(`*n*`-1)*abs(`*incx*`))` when *trans* = `'N'` or `'n'` and at least `(1+(`*m* `- 1)*abs(`*incx*`))` otherwise. Before entry, the incremented array *x* must contain the vector *x*.

incx	`INTEGER`. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.

beta	`REAL` for `sgemv`
	`DOUBLE PRECISION` for `dgemv`
	`COMPLEX` for `cgemv`
	`DOUBLE COMPLEX` for `zgemv`

	Specifies the scalar *beta*. When *beta* is set to zero, then *y* need not be set on input.
y	REAL for sgemv DOUBLE PRECISION for dgemv COMPLEX for cgemv DOUBLE COMPLEX for zgemv Array, DIMENSION at least (1 +(*m* – 1)*abs(*incy*)) when *trans* = 'N' or 'n' and at least (1 +(*n* – 1)*abs(*incy*)) otherwise. Before entry with non-zero *beta*, the incremented array *y* must contain the vector *y*.
incy	INTEGER. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.

Output Parameters

y	Overwritten by the updated vector *y*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gemv interface are the following:

a	Holds the matrix A of size (*m*,*n*).
x	Holds the vector of length (*rx*) where *rx* = *n* if *trans* = 'N', *rx* = *m* otherwise.
y	Holds the vector of length (*ry*) where *ry* = *m* if *trans* = 'N', *ry* = *n* otherwise.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
alpha	The default value is 1.
beta	The default value is 1.

?ger

Performs a rank-1 update of a general matrix.

Syntax

Fortran 77:

```
call sger(m, n, alpha, x, incx, y, incy, a, lda )
call dger(m, n, alpha, x, incx, y, incy, a, lda )
```

Fortran 95:

```
call ger(a, x, y [,alpha])
```

Description

The ?ger routines perform a matrix-vector operation defined as

*A := alpha*x*y'+ A*,

where:

alpha is a scalar,

x is an *m*-element vector,

y is an *n*-element vector,

A is an *m*-by-*n* matrix.

Input Parameters

m	INTEGER. Specifies the number of rows of the matrix *A*. The value of *m* must be at least zero.
n	INTEGER. Specifies the number of columns of the matrix *A*. The value of *n* must be at least zero.
alpha	REAL for sger DOUBLE PRECISION for dger Specifies the scalar *alpha*.
x	REAL for sger DOUBLE PRECISION for dger

	Array, DIMENSION at least (1 + (*m* - 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *m*-element vector *x*.
incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.
y	REAL for sger DOUBLE PRECISION for dger Array, DIMENSION at least (1 + (*n* - 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the *n*-element vector *y*.
incy	INTEGER. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.
a	REAL for sger DOUBLE PRECISION for dger Array, DIMENSION (*lda*, *n*). Before entry, the leading *m*-by-*n* part of the array *a* must contain the matrix of coefficients.
lda	INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least max(1, *m*).

Output Parameters

a	Overwritten by the updated matrix.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine ger interface are the following:

a	Holds the matrix A of size (*m*,*n*).
x	Holds the vector of length (*m*).
y	Holds the vector of length (*n*).
alpha	The default value is 1.

?gerc

Performs a rank-1 update (conjugated) of a general matrix.

Syntax

Fortran 77:

```
call cgerc(m, n, alpha, x, incx, y, incy, a, lda )
call zgerc(m, n, alpha, x, incx, y, incy, a, lda )
```

Fortran 95:

```
call gerc(a, x, y [,alpha])
```

Description

The ?gerc routines perform a matrix-vector operation defined as

```
A := alpha*x*conjg(y') + A,
```

where:

alpha is a scalar,

x is an *m*-element vector,

y is an *n*-element vector,

A is an *m*-by-*n* matrix.

Input Parameters

m	INTEGER. Specifies the number of rows of the matrix *A*. The value of *m* must be at least zero.
n	INTEGER. Specifies the number of columns of the matrix *A*. The value of *n* must be at least zero.
alpha	SINGLE PRECISION COMPLEX for cgerc DOUBLE PRECISION COMPLEX for zgerc Specifies the scalar *alpha*.
x	SINGLE PRECISION COMPLEX for cgerc DOUBLE PRECISION COMPLEX for zgerc

	Array, DIMENSION at least (1 + (*m* - 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *m*-element vector *x*.
incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.
y	COMPLEX for cgerc DOUBLE COMPLEX for zgerc Array, DIMENSION at least (1 + (*n* - 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the *n*-element vector *y*.
incy	INTEGER. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.
a	COMPLEX for cgerc DOUBLE COMPLEX for zgerc Array, DIMENSION (*lda*, *n*). Before entry, the leading *m*-by-*n* part of the array *a* must contain the matrix of coefficients.
lda	INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least max(1, *m*).

Output Parameters

a	Overwritten by the updated matrix.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gerc interface are the following:

a	Holds the matrix A of size (*m*,*n*).
x	Holds the vector of length (*m*).
y	Holds the vector of length (*n*).
alpha	The default value is 1.

?geru

Performs a rank-1 update (unconjugated) of a general matrix.

Syntax

Fortran 77:

```
call cgeru(m, n, alpha, x, incx, y, incy, a, lda )
call zgeru(m, n, alpha, x, incx, y, incy, a, lda )
```

Fortran 95:

```
call geru(a, x, y [,alpha])
```

Description

The ?geru routines perform a matrix-vector operation defined as

*A := alpha*x*y ' + A*,

where:

alpha is a scalar,

x is an *m*-element vector,

y is an *n*-element vector,

A is an *m*-by-*n* matrix.

Input Parameters

m	INTEGER. Specifies the number of rows of the matrix *A*. The value of *m* must be at least zero.
n	INTEGER. Specifies the number of columns of the matrix *A*. The value of *n* must be at least zero.
alpha	COMPLEX for cgeru DOUBLE COMPLEX for zgeru Specifies the scalar *alpha*.
x	COMPLEX for cgeru DOUBLE COMPLEX for zgeru

	Array, DIMENSION at least (1 + (*m* - 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *m*-element vector *x*.
incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.
y	COMPLEX for cgeru DOUBLE COMPLEX for zgeru Array, DIMENSION at least (1 + (*n* - 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the *n*-element vector *y*.
incy	INTEGER. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.
a	COMPLEX for cgeru DOUBLE COMPLEX for zgeru Array, DIMENSION (*lda*, *n*). Before entry, the leading *m*-by-*n* part of the array *a* must contain the matrix of coefficients.
lda	INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least max(1, *m*).

Output Parameters

a	Overwritten by the updated matrix.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine geru interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
x	Holds the vector of length (*m*).
y	Holds the vector of length (*n*).
alpha	The default value is 1.

?hbmv

Computes a matrix-vector product using a Hermitian band matrix.

Syntax

Fortran 77:

```
call chbmv(uplo, n, k, alpha, a, lda, x, incx, beta, y, incy )
call zhbmv(uplo, n, k, alpha, a, lda, x, incx, beta, y, incy )
```

Fortran 95:

```
call hbmv(a, x, y [,uplo][,alpha] [,beta])
```

Description

The ?hbmv routines perform a matrix-vector operation defined as

y := *alpha***A***x* + *beta***y*,

where:

alpha and *beta* are scalars,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* Hermitian band matrix, with *k* super-diagonals.

Input Parameters

uplo — CHARACTER*1. Specifies whether the upper or lower triangular part of the band matrix *A* is being supplied, as follows:

***uplo* value**	**Part of Matrix *A* Supplied**
U or u	The upper triangular part of matrix *A* is being supplied.
L or l	The lower triangular part of matrix *A* is being supplied.

n — INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.

k INTEGER. Specifies the number of super-diagonals of the matrix *A*.

The value of *k* must satisfy $0 \le k$.

alpha COMPLEX for chbmv
DOUBLE COMPLEX for zhbmv
Specifies the scalar *alpha*.

a COMPLEX for chbmv
DOUBLE COMPLEX for zhbmv
Array, DIMENSION (*lda*, *n*).
Before entry with *uplo* = 'U' or 'u', the leading (*k* + 1) by *n* part of the array *a* must contain the upper triangular band part of the Hermitian matrix. The matrix must be supplied column-by-column, with the leading diagonal of the matrix in row (*k* + 1) of the array, the first super-diagonal starting at position 2 in row *k*, and so on. The top left *k* by *k* triangle of the array *a* is not referenced.
The following program segment transfers the upper triangular part of a Hermitian band matrix from conventional full matrix storage to band storage:

```
do 20, j = 1, n
 m = k + 1 - j
 do 10, i = max(1, j - k), j
  a(m + i, j) = matrix(i, j)
 10 continue
20 continue
```

Before entry with *uplo* = 'L' or 'l', the leading (*k* + 1) by *n* part of the array *a* must contain the lower triangular band part of the Hermitian matrix, supplied column-by-column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right *k* by *k* triangle of the array *a* is not referenced.

The following program segment transfers the lower triangular part of a Hermitian band matrix from conventional full matrix storage to band storage:

```
do 20, j = 1, n
 m = 1 - j
 do 10, i = j, min( n, j + k )
  a( m + i, j ) = matrix( i, j )
 10 continue
20 continue
```

The imaginary parts of the diagonal elements need not be set and are assumed to be zero.

lda — INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least (*k* + 1).

x — COMPLEX for chbmv
DOUBLE COMPLEX for zhbmv
Array, DIMENSION at least (1 + (*n* – 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the vector *x*.

incx — INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.

beta — COMPLEX for chbmv
DOUBLE COMPLEX for zhbmv
Specifies the scalar *beta*.

y — COMPLEX for chbmv
DOUBLE COMPLEX for zhbmv
Array, DIMENSION at least (1 + (*n* – 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the vector *y*.

incy — INTEGER. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.

Output Parameters

y — Overwritten by the updated vector *y*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `hbmv` interface are the following:

a	Holds the array *a* of size (*k+1,n*).
x	Holds the vector of length (*n*).
y	Holds the vector of length (*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
alpha	The default value is 1.
beta	The default value is 1.

?hemv

Computes a matrix-vector product using a Hermitian matrix.

Syntax

Fortran 77:

```
call chemv(uplo, n, alpha, a, lda, x, incx, beta, y, incy )
call zhemv(uplo, n, alpha, a, lda, x, incx, beta, y, incy )
```

Fortran 95:

```
call hemv(a, x, y [,uplo][,alpha] [,beta])
```

Description

The `?hemv` routines perform a matrix-vector operation defined as

*y := alpha*A*x + beta*y*,

where:

alpha and *beta* are scalars,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* Hermitian matrix.

Input Parameters

uplo

CHARACTER*1. Specifies whether the upper or lower triangular part of the array *a* is to be referenced, as follows:

uplo value	Part of Array *a* To Be Referenced
U or u	The upper triangular part of array *a* is to be referenced.
L or l	The lower triangular part of array *a* is to be referenced.

n

INTEGER. Specifies the order of the matrix A. The value of *n* must be at least zero.

alpha

COMPLEX for chemv
DOUBLE COMPLEX for zhemv
Specifies the scalar *alpha*.

a

COMPLEX for chemv
DOUBLE COMPLEX for zhemv
Array, DIMENSION (*lda*, *n*).
Before entry with *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of *a* is not referenced. Before entry with *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular part of the Hermitian matrix and the strictly upper triangular part of *a* is not referenced.
The imaginary parts of the diagonal elements need not be set and are assumed to be zero.

lda

INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least max(1, *n*).

x

COMPLEX for chemv
DOUBLE COMPLEX for zhemv
Array, DIMENSION at least (1 + (*n* – 1)*abs(*incx*)).
Before entry, the incremented array *x* must contain the *n*-element vector *x*.

incx

INTEGER. Specifies the increment for the elements of *x*.

	The value of *incx* must not be zero.
beta	COMPLEX for chemv DOUBLE COMPLEX for zhemv Specifies the scalar *beta*. When *beta* is supplied as zero then *y* need not be set on input.
y	COMPLEX for chemv DOUBLE COMPLEX for zhemv Array, DIMENSION at least (1 + (*n* - 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the *n*-element vector *y*.
incy	INTEGER. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.

Output Parameters

y	Overwritten by the updated vector *y*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine hemv interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
x	Holds the vector of length (*n*).
y	Holds the vector of length (*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
alpha	The default value is 1.
beta	The default value is 1.

?her

Performs a rank-1 update of a Hermitian matrix.

Syntax

Fortran 77:

```
call cher(uplo, n, alpha, x, incx, a, lda )
call zher(uplo, n, alpha, x, incx, a, lda )
```

Fortran 95:

```
call her(a, x [,uplo] [, alpha])
```

Description

The ?her routines perform a matrix-vector operation defined as

A := *alpha***x**conjg(*x*') + *A*,

where:

alpha is a real scalar,

x is an *n*-element vector,

A is an *n*-by-*n* Hermitian matrix.

Input Parameters

uplo

CHARACTER*1. Specifies whether the upper or lower triangular part of the array *a* is to be referenced, as follows:

***uplo* value**	**Part of Array *a* To Be Referenced**
U or u	The upper triangular part of array *a* is to be referenced.
L or l	The lower triangular part of array *a* is to be referenced.

n

INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.

alpha

REAL for cher
DOUBLE PRECISION for zher
Specifies the scalar *alpha*.

x
COMPLEX for cher
DOUBLE COMPLEX for zher
Array, dimension at least (1 + (*n* - 1)*abs(*incx*)).
Before entry, the incremented array *x* must contain the *n*-element vector *x*.

incx
INTEGER. Specifies the increment for the elements of *x*.
The value of *incx* must not be zero.

a
COMPLEX for cher
DOUBLE COMPLEX for zher
Array, DIMENSION (*lda*, *n*).
Before entry with *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of *a* is not referenced.
Before entry with *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular part of the Hermitian matrix and the strictly upper triangular part of *a* is not referenced.
The imaginary parts of the diagonal elements need not be set and are assumed to be zero.

lda
INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least max(1, *n*).

Output Parameters

a
With *uplo* = 'U' or 'u', the upper triangular part of the array *a* is overwritten by the upper triangular part of the updated matrix.
With *uplo* = 'L' or 'l', the lower triangular part of the array *a* is overwritten by the lower triangular part of the updated matrix.
The imaginary parts of the diagonal elements are set to zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `her` interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
x	Holds the vector of length (*n*).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
alpha	The default value is 1.

?her2

Performs a rank-2 update of a Hermitian matrix.

Syntax

Fortran 77:

```
call cher2(uplo, n, alpha, x, incx, y, incy, a, lda )
call zher2(uplo, n, alpha, x, incx, y, incy, a, lda )
```

Fortran 95:

```
call her2(a, x, y [,uplo][,alpha])
```

Description

The `?her2` routines perform a matrix-vector operation defined as

A := *alpha* *x*conjg(*y*') + conjg(*alpha*)**y* *conjg(*x*') + *A*,

where:

alpha is a scalar,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* Hermitian matrix.

Input Parameters

uplo
CHARACTER*1. Specifies whether the upper or lower triangular part of the array *a* is to be referenced, as follows:

uplo value	Part of Array *a* To Be Referenced
U or u	The upper triangular part of array *a* is to be referenced.
L or l	The lower triangular part of array *a* is to be referenced.

n
INTEGER. Specifies the order of the matrix A. The value of *n* must be at least zero.

alpha
COMPLEX for cher2
DOUBLE COMPLEX for zher2
Specifies the scalar *alpha*.

x
COMPLEX for cher2
DOUBLE COMPLEX for zher2
Array, DIMENSION at least (1 + (*n* – 1)*abs(*incx*)).
Before entry, the incremented array *x* must contain the *n*-element vector *x*.

incx
INTEGER. Specifies the increment for the elements of *x*.
The value of *incx* must not be zero.

y
COMPLEX for cher2
DOUBLE COMPLEX for zher2
Array, DIMENSION at least (1 + (*n* – 1)*abs(*incy*)).
Before entry, the incremented array *y* must contain the *n*-element vector *y*.

incy
INTEGER. Specifies the increment for the elements of *y*.
The value of *incy* must not be zero.

a
COMPLEX for cher2
DOUBLE COMPLEX for zher2
Array, DIMENSION (*lda*, *n*).
Before entry with *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of *a* is not referenced.

Before entry with *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular part of the Hermitian matrix and the strictly upper triangular part of *a* is not referenced.
The imaginary parts of the diagonal elements need not be set and are assumed to be zero.

lda — INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least max(1, *n*).

Output Parameters

a — With *uplo* = 'U' or 'u', the upper triangular part of the array *a* is overwritten by the upper triangular part of the updated matrix.
With *uplo* = 'L' or 'l', the lower triangular part of the array *a* is overwritten by the lower triangular part of the updated matrix.
The imaginary parts of the diagonal elements are set to zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine her2 interface are the following:

a — Holds the matrix A of size (*n*,*n*).

x — Holds the vector of length (*n*).

y — Holds the vector of length (*n*).

uplo — Must be 'U' or 'L'. The default value is 'U'.

alpha — The default value is 1.

?hpmv

Computes a matrix-vector product using a Hermitian packed matrix.

Syntax

Fortran 77:

```
call chpmv(uplo, n, alpha, ap, x, incx, beta, y, incy )
call zhpmv(uplo, n, alpha, ap, x, incx, beta, y, incy )
```

Fortran 95:

```
call hpmv(a, x, y [,uplo][,alpha] [,beta])
```

Description

The ?hpmv routines perform a matrix-vector operation defined as

y := *alpha***A***x* + *beta***y*,

where:

alpha and *beta* are scalars,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* Hermitian matrix, supplied in packed form.

Input Parameters

uplo — CHARACTER*1. Specifies whether the upper or lower triangular part of the matrix *A* is supplied in the packed array *ap*, as follows:

***uplo* value**	**Part of Matrix *A* Supplied**
U or u	The upper triangular part of matrix *A* is supplied in *ap*.
L or l	The lower triangular part of matrix *A* is supplied in *ap*.

n — INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.

alpha — COMPLEX for chpmv

	DOUBLE COMPLEX for zhpmv Specifies the scalar *alpha*.
ap	COMPLEX for chpmv DOUBLE COMPLEX for zhpmv Array, DIMENSION at least ((*n**(*n* + 1))/2). Before entry with *uplo* = 'U' or 'u', the array *ap* must contain the upper triangular part of the Hermitian matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1, 1), *ap*(2) and *ap*(3) contain *a*(1, 2) and *a*(2, 2) respectively, and so on. Before entry with *uplo* = 'L' or 'l', the array *ap* must contain the lower triangular part of the Hermitian matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1, 1), *ap*(2) and *ap*(3) contain *a*(2, 1) and *a*(3, 1) respectively, and so on. The imaginary parts of the diagonal elements need not be set and are assumed to be zero.
x	COMPLEX for chpmv DOUBLE PRECISION COMPLEX for zhpmv Array, DIMENSION at least (1 +(*n* – 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.
incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.
beta	COMPLEX for chpmv DOUBLE COMPLEX for zhpmv Specifies the scalar *beta*. When *beta* is equal to zero then *y* need not be set on input.
y	COMPLEX for chpmv DOUBLE COMPLEX for zhpmv Array, DIMENSION at least (1 + (*n* – 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the *n*-element vector *y*.
incy	INTEGER. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.

Output Parameters

y	Overwritten by the updated vector *y*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `hpmv` interface are the following:

a	Holds the array *a* of size (*n*(n+1)/2*).
x	Holds the vector of length (*n*).
y	Holds the vector of length (*n*).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
alpha	The default value is 1.
beta	The default value is 1.

?hpr

Performs a rank-1 update of a Hermitian packed matrix.

Syntax

Fortran 77:

```
call chpr(uplo, n, alpha, x, incx, ap)
call zhpr(uplo, n, alpha, x, incx, ap)
```

Fortran 95:

```
call hpr(a, x [,uplo] [, alpha])
```

Description

The `?hpr` routines perform a matrix-vector operation defined as

A := *alpha*x**conjg(*x*') + *A*,

where:

alpha is a real scalar,

x is an *n*-element vector,

A is an *n*-by-*n* Hermitian matrix, supplied in packed form.

Input Parameters

uplo

CHARACTER*1. Specifies whether the upper or lower triangular part of the matrix *A* is supplied in the packed array *ap*, as follows:

***uplo* value**	**Part of Matrix *A* Supplied**
U or u	The upper triangular part of matrix *A* is supplied in *ap*.
L or l	The lower triangular part of matrix *A* is supplied in *ap*.

n

INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.

alpha

REAL for chpr
DOUBLE PRECISION for zhpr
Specifies the scalar *alpha*.

x

COMPLEX for chpr
DOUBLE COMPLEX for zhpr
Array, DIMENSION at least (1 + (*n* – 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.

incx

INTEGER. Specifies the increment for the elements of *x*. *incx* must not be zero.

ap

COMPLEX for chpr
DOUBLE COMPLEX for zhpr
Array, DIMENSION at least ((*n**(*n* + 1))/2). Before entry with *uplo* = 'U' or 'u', the array *ap* must contain the upper triangular part of the Hermitian matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1, 1), *ap*(2) and *ap*(3) contain *a*(1, 2) and *a*(2, 2) respectively, and so on.

Before entry with *uplo* = 'L' or 'l', the array *ap* must contain the lower triangular part of the Hermitian matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1, 1), *ap*(2) and *ap*(3) contain *a*(2, 1) and *a*(3, 1) respectively, and so on.
The imaginary parts of the diagonal elements need not be set and are assumed to be zero.

Output Parameters

ap — With *uplo* = 'U' or 'u', overwritten by the upper triangular part of the updated matrix.
With *uplo* = 'L' or 'l', overwritten by the lower triangular part of the updated matrix.
The imaginary parts of the diagonal elements are set to zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine hpr interface are the following:

a — Holds the array *a* of size (*n**(n+1)/2).

x — Holds the vector of length (*n*).

uplo — Must be 'U' or 'L'. The default value is 'U'.

alpha — The default value is 1.

?hpr2

Performs a rank-2 update of a Hermitian packed matrix.

Syntax

Fortran 77:

```
call chpr2(uplo, n, alpha, x, incx, y, incy, ap )
call zhpr2(uplo, n, alpha, x, incx, y, incy, ap )
```

Fortran 95:

```
call hpr2(a, x, y [,uplo][,alpha])
```

Description

The ?hpr2 routines perform a matrix-vector operation defined as

A := *alpha***x**conjg(*y*') + conjg(*alpha*)**y**conjg(*x*') + *A*,

where:

alpha is a scalar,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* Hermitian matrix, supplied in packed form.

Input Parameters

uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the matrix *A* is supplied in the packed array *ap*, as follows

***uplo* value**	**Part of Matrix *A* Supplied**
U or u	The upper triangular part of matrix *A* is supplied in *ap*.
L or l	The lower triangular part of matrix *A* is supplied in *ap*.

n	INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.
alpha	COMPLEX for chpr2 DOUBLE COMPLEX for zhpr2 Specifies the scalar *alpha*.
x	COMPLEX for chpr2 DOUBLE COMPLEX for zhpr2 Array, dimension at least (1 +(*n* – 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.
incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.
y	COMPLEX for chpr2

DOUBLE COMPLEX for zhpr2
Array, DIMENSION at least (1 +(*n* - 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the *n*-element vector *y*.

incy — INTEGER. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.

ap — COMPLEX for chpr2
DOUBLE COMPLEX for zhpr2
Array, DIMENSION at least ((*n**(*n* + 1))/2). Before entry with *uplo* = 'U' or 'u', the array *ap* must contain the upper triangular part of the Hermitian matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1,1), *ap*(2) and *ap*(3) contain *a*(1,2) and *a*(2,2) respectively, and so on.
Before entry with *uplo* = 'L' or 'l', the array *ap* must contain the lower triangular part of the Hermitian matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1,1), *ap*(2) and *ap*(3) contain *a*(2,1) and *a*(3,1) respectively, and so on.
The imaginary parts of the diagonal elements need not be set and are assumed to be zero.

Output Parameters

ap — With *uplo* = 'U' or 'u', overwritten by the upper triangular part of the updated matrix.
With *uplo* = 'L' or 'l', overwritten by the lower triangular part of the updated matrix.
The imaginary parts of the diagonal elements need are set to zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine hpr2 interface are the following:

a — Holds the array *a* of size (*n**(*n*+1)/2).

x	Holds the vector of length (*n*).
y	Holds the vector of length (*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
alpha	The default value is 1.

?sbmv

Computes a matrix-vector product using a symmetric band matrix.

Syntax

Fortran 77:

```
call ssbmv(uplo, n, k, alpha, a, lda, x, incx, beta, y, incy )
call dsbmv(uplo, n, k, alpha, a, lda, x, incx, beta, y, incy )
```

Fortran 95:

```
call sbmv(a, x, y [,uplo][,alpha] [,beta])
```

Description

The ?sbmv routines perform a matrix-vector operation defined as

y := *alpha***A***x* + *beta***y*,

where:

alpha and *beta* are scalars,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* symmetric band matrix, with *k* super-diagonals.

Input Parameters

uplo — CHARACTER*1. Specifies whether the upper or lower triangular part of the band matrix *A* is being supplied, as follows:

uplo value	Part of Matrix *A* Supplied
U or u	The upper triangular part of matrix *A* is supplied.

	`L` or `l` The lower triangular part of matrix *A* is supplied.
n	`INTEGER`. Specifies the order of the matrix *A*. The value of *n* must be at least zero.
k	`INTEGER`. Specifies the number of super-diagonals of the matrix *A*. The value of *k* must satisfy $0 \le k$.

alpha	`REAL` for `ssbmv`
	`DOUBLE PRECISION` for `dsbmv`
	Specifies the scalar *alpha*.

a	`REAL` for `ssbmv`
	`DOUBLE PRECISION` for `dsbmv`
	Array, `DIMENSION (lda, n)`. Before entry with *uplo* = `'U'` or `'u'`, the leading `(k + 1)` by *n* part of the array *a* must contain the upper triangular band part of the symmetric matrix, supplied column-by-column, with the leading diagonal of the matrix in row `(k + 1)` of the array, the first super-diagonal starting at position 2 in row *k*, and so on. The top left *k* by *k* triangle of the array *a* is not referenced.
	The following program segment transfers the upper triangular part of a symmetric band matrix from conventional full matrix storage to band storage:
	`do 20, j = 1, n`
	`m = k + 1 - j`
	`do 10, i = max( 1, j - k ), j`
	`a( m + i, j ) = matrix( i, j )`
	`10 continue`
	`20 continue`
	Before entry with *uplo* = `'L'` or `'l'`, the leading `(k + 1)` by *n* part of the array *a* must contain the lower triangular band part of the symmetric matrix, supplied column-by-column, with the leading diagonal of the matrix

in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right *k* by *k* triangle of the array *a* is not referenced.
The following program segment transfers the lower triangular part of a symmetric band matrix from conventional full matrix storage to band storage:

```
do 20, j = 1, n
  m = 1 - j
  do 10, i = j, min( n, j + k )
    a( m + i, j ) = matrix( i, j )
  10 continue
20 continue
```

lda — INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least (*k* + 1).

x — REAL for ssbmv
DOUBLE PRECISION for dsbmv
Array, DIMENSION at least (1 + (*n* – 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the vector *x*.

incx — INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.

beta — REAL for ssbmv
DOUBLE PRECISION for dsbmv
Specifies the scalar *beta*.

y — REAL for ssbmv
DOUBLE PRECISION for dsbmv
Array, DIMENSION at least (1 + (*n* – 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the vector *y*.

incy — INTEGER. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.

Output Parameters

y	Overwritten by the updated vector *y*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `sbmv` interface are the following:

a	Holds the array *a* of size (*k+1*,*n*).
x	Holds the vector of length (*n*).
y	Holds the vector of length (*n*).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
alpha	The default value is 1.
beta	The default value is 1.

?spmv

Computes a matrix-vector product using a symmetric packed matrix.

Syntax

Fortran 77:

```
call sspmv(uplo, n, alpha, ap, x, incx, beta, y, incy )
call dspmv(uplo, n, alpha, ap, x, incx, beta, y, incy )
```

Fortran 95:

```
call spmv(a, x, y [,uplo][,alpha] [,beta])
```

Description

The `?spmv` routines perform a matrix-vector operation defined as

*y := alpha*A*x + beta*y*,

where:

alpha and *beta* are scalars,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* symmetric matrix, supplied in packed form.

Input Parameters

uplo

CHARACTER*1. Specifies whether the upper or lower triangular part of the matrix *A* is supplied in the packed array *ap*, as follows:

***uplo* value**	**Part of Matrix *A* Supplied**
U or u	The upper triangular part of matrix *A* is supplied in *ap*.
L or l	The lower triangular part of matrix *A* is supplied in *ap*.

n

INTEGER. Specifies the order of the matrix *a*. The value of *n* must be at least zero.

alpha

REAL for sspmv
DOUBLE PRECISION for dspmv
Specifies the scalar *alpha*.

ap

REAL for sspmv
DOUBLE PRECISION for dspmv
Array, DIMENSION at least ((n*(n + 1))/2).
Before entry with *uplo* = 'U' or 'u', the array *ap* must contain the upper triangular part of the symmetric matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1,1), *ap*(2) and *ap*(3) contain *a*(1,2) and *a*(2, 2) respectively, and so on. Before entry with *uplo* = 'L' or 'l', the array *ap* must contain the lower triangular part of the symmetric matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1,1), *ap*(2) and *ap*(3) contain *a*(2,1) and *a*(3,1) respectively, and so on.

x

REAL for sspmv
DOUBLE PRECISION for dspmv
Array, DIMENSION at least (1 + (*n* - 1)*abs(*incx*)).
Before entry, the incremented array *x* must contain the *n*-element vector *x*.

incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.
beta	REAL for sspmv DOUBLE PRECISION for dspmv Specifies the scalar *beta*. When *beta* is supplied as zero, then *y* need not be set on input.
y	REAL for sspmv DOUBLE PRECISION for dspmv Array, DIMENSION at least (1 + (*n* - 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the *n*-element vector *y*.
incy	INTEGER. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.

Output Parameters

y	Overwritten by the updated vector *y*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine spmv interface are the following:

a	Holds the array *a* of size (*n*(n+1)/2).
x	Holds the vector of length (*n*).
y	Holds the vector of length (*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
alpha	The default value is 1.
beta	The default value is 1.

?spr

Performs a rank-1 update of a symmetric packed matrix.

Syntax

Fortran 77:

```
call sspr(uplo, n, alpha, x, incx, ap )
call dspr(uplo, n, alpha, x, incx, ap )
```

Fortran 95:

```
call spr(a, x [,uplo] [, alpha])
```

Description

The ?spr routines perform a matrix-vector operation defined as

a:= *alpha***x***x*'+ *A*,

where:

alpha is a real scalar,

x is an *n*-element vector,

A is an *n*-by-*n* symmetric matrix, supplied in packed form.

Input Parameters

uplo

CHARACTER*1. Specifies whether the upper or lower triangular part of the matrix *A* is supplied in the packed array *ap*, as follows:

***uplo* value**	**Part of Matrix *A* Supplied**
U or u	The upper triangular part of matrix *A* is supplied in *ap*.
L or l	The lower triangular part of matrix *A* is supplied in *ap*.

n

INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.

alpha

REAL for sspr

	DOUBLE PRECISION for dspr Specifies the scalar *alpha*.
x	REAL for sspr DOUBLE PRECISION for dspr Array, DIMENSION at least (1 + (*n* – 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.
incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.
ap	REAL for sspr DOUBLE PRECISION for dspr Array, DIMENSION at least ((*n**(*n* + 1))/2). Before entry with *uplo* = 'U' or 'u', the array *ap* must contain the upper triangular part of the symmetric matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1,1), *ap*(2) and *ap*(3) contain *a*(1,2) and *a*(2,2) respectively, and so on. Before entry with *uplo* = 'L' or 'l', the array *ap* must contain the lower triangular part of the symmetric matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1,1), *ap*(2) and *ap*(3) contain *a*(2,1) and *a*(3,1) respectively, and so on.

Output Parameters

ap	With *uplo* = 'U' or 'u', overwritten by the upper triangular part of the updated matrix. With *uplo* = 'L' or 'l', overwritten by the lower triangular part of the updated matrix.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine spr interface are the following:

a	Holds the array *a* of size (*n**(*n*+1)/2).
x	Holds the vector of length (*n*).

uplo	Must be 'U' or 'L'. The default value is 'U'.
alpha	The default value is 1.

?spr2

Performs a rank-2 update of a symmetric packed matrix.

Syntax

Fortran 77:

```
call sspr2(uplo, n, alpha, x, incx, y, incy, ap )
call dspr2(uplo, n, alpha, x, incx, y, incy, ap )
```

Fortran 95:

```
call spr2(a, x, y [,uplo][,alpha])
```

Description

The ?spr2 routines perform a matrix-vector operation defined as

A:= *alpha***x***y*'+ *alpha***y***x*' + *A*,

where:

alpha is a scalar,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* symmetric matrix, supplied in packed form.

Input Parameters

uplo — CHARACTER*1. Specifies whether the upper or lower triangular part of the matrix *A* is supplied in the packed array *ap*, as follows:

uplo value	Part of Matrix *A* Supplied
U or u	The upper triangular part of matrix *A* is supplied in *ap*.
L or l	The lower triangular part of matrix *A* is supplied in *ap*.

n INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.

alpha REAL for sspr2
DOUBLE PRECISION for dspr2
Specifies the scalar *alpha*.

x REAL for sspr2
DOUBLE PRECISION for dspr2
Array, DIMENSION at least (1 + (*n* - 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.

incx INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.

y REAL for sspr2
DOUBLE PRECISION for dspr2
Array, DIMENSION at least (1 + (*n* - 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the *n*-element vector *y*.

incy INTEGER. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.

ap REAL for sspr2
DOUBLE PRECISION for dspr2
Array, DIMENSION at least ((*n**(*n* + 1))/2). Before entry with *uplo* = 'U' or 'u', the array *ap* must contain the upper triangular part of the symmetric matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1,1), *ap*(2) and *ap*(3) contain *a*(1,2) and *a*(2,2) respectively, and so on.
Before entry with *uplo* = 'L' or 'l', the array *ap* must contain the lower triangular part of the symmetric matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1,1), *ap*(2) and *ap*(3) contain *a* (2,1) and *a*(3,1) respectively, and so on.

Output Parameters

ap With *uplo* = 'U' or 'u', overwritten by the upper triangular part of the updated matrix.

With *uplo* = 'L' or 'l', overwritten by the lower triangular part of the updated matrix.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine spr2 interface are the following:

a	Holds the array *a* of size (*n*(n+1)/2*).
x	Holds the vector of length (*n*).
y	Holds the vector of length (*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
alpha	The default value is 1.

?symv

Computes a matrix-vector product for a symmetric matrix.

Syntax

Fortran 77:

```
call ssymv(uplo, n, alpha, a, lda, x, incx, beta, y, incy )
call dsymv(uplo, n, alpha, a, lda, x, incx, beta, y, incy )
```

Fortran 95:

```
call symv(a, x, y [,uplo][,alpha] [,beta])
```

Description

The ?symv routines perform a matrix-vector operation defined as

*y := alpha*A*x + beta*y*,

where:

alpha and *beta* are scalars,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* symmetric matrix.

Input Parameters

uplo — CHARACTER*1. Specifies whether the upper or lower triangular part of the array *a* is to be referenced, as follows:

***uplo* value**	**Part of Array *a* To Be Referenced**
U or u	The upper triangular part of array *a* is to be referenced.
L or l	The lower triangular part of array *a* is to be referenced.

n — INTEGER. Specifies the order of the matrix *a*. The value of *n* must be at least zero.

alpha — REAL for ssymv
DOUBLE PRECISION for dsymv
Specifies the scalar *alpha*.

a — REAL for ssymv
DOUBLE PRECISION for dsymv
Array, DIMENSION (*lda*, *n*).
Before entry with *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular part of the symmetric matrix A and the strictly lower triangular part of *a* is not referenced. Before entry with *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular part of the symmetric matrix A and the strictly upper triangular part of *a* is not referenced.

lda — INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least max(1, *n*).

x — REAL for ssymv
DOUBLE PRECISION for dsymv
Array, DIMENSION at least (1 + (*n* – 1)*abs(*incx*)).
Before entry, the incremented array *x* must contain the *n*-element vector *x*.

incx — INTEGER. Specifies the increment for the elements of *x*.

	The value of *incx* must not be zero.
beta	REAL for ssymv DOUBLE PRECISION for dsymv Specifies the scalar *beta*. When *beta* is supplied as zero, then *y* need not be set on input.
y	REAL for ssymv DOUBLE PRECISION for dsymv Array, DIMENSION at least (1 + (*n* – 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the *n*-element vector *y*.
incy	INTEGER. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.

Output Parameters

y	Overwritten by the updated vector *y*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine symv interface are the following:

a	Holds the matrix A of size (*n*,*n*).
x	Holds the vector of length (*n*).
y	Holds the vector of length (*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
alpha	The default value is 1.
beta	The default value is 1.

?syr

Performs a rank-1 update of a symmetric matrix.

Syntax

Fortran 77:

```
call ssyr(uplo, n, alpha, x, incx, a, lda )
call dsyr(uplo, n, alpha, x, incx, a, lda )
```

Fortran 95:

```
call syr(a, x [,uplo] [, alpha])
```

Description

The ?syr routines perform a matrix-vector operation defined as

A := *alpha***x***x*' + *A* ,

where:

alpha is a real scalar,

x is an *n*-element vector,

A is an *n*-by-*n* symmetric matrix.

Input Parameters

uplo — CHARACTER*1. Specifies whether the upper or lower triangular part of the array *a* is to be referenced, as follows:

***uplo* value**	**Part of Array *a* To Be Referenced**
U or u	The upper triangular part of array *a* is to be referenced.
L or l	The lower triangular part of array *a* is to be referenced.

n — INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.

alpha — REAL for ssyr
DOUBLE PRECISION for dsyr

	Specifies the scalar *alpha*.
x	REAL for ssyr DOUBLE PRECISION for dsyr Array, DIMENSION at least (1 + (*n*–1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.
incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.
a	REAL for ssyr DOUBLE PRECISION for dsyr Array, DIMENSION (*lda*, *n*). Before entry with *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular part of the symmetric matrix *A* and the strictly lower triangular part of *a* is not referenced. Before entry with *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular part of the symmetric matrix *A* and the strictly upper triangular part of *a* is not referenced.
lda	INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least max(1, *n*).

Output Parameters

a	With *uplo* = 'U' or 'u', the upper triangular part of the array *a* is overwritten by the upper triangular part of the updated matrix. With *uplo* = 'L' or 'l', the lower triangular part of the array *a* is overwritten by the lower triangular part of the updated matrix.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine syr interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
x	Holds the vector of length (*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
alpha	The default value is 1.

?syr2

Performs a rank-2 update of symmetric matrix.

Syntax

Fortran 77:

```
call ssyr2(uplo, n, alpha, x, incx, y, incy, a, lda )
call dsyr2(uplo, n, alpha, x, incx, y, incy, a, lda )
```

Fortran 95:

```
call syr2(a, x, y [,uplo][,alpha])
```

Description

The ?syr2 routines perform a matrix-vector operation defined as

*A := alpha*x*y'+ alpha*y*x' + A*,

where:

alpha is a scalar,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* symmetric matrix.

Input Parameters

uplo — CHARACTER*1. Specifies whether the upper or lower triangular part of the array *a* is to be referenced, as follows:

uplo value	Part of Array *a* To Be Referenced
U or u	The upper triangular part of array *a* is to be referenced.

	`L` or `l` The lower triangular part of array *a* is to be referenced.
n	`INTEGER`. Specifies the order of the matrix *A*. The value of *n* must be at least zero.

alpha	`REAL` for `ssyr2`
	`DOUBLE PRECISION` for `dsyr2`
	Specifies the scalar *alpha*.

x	`REAL` for `ssyr2`
	`DOUBLE PRECISION` for `dsyr2`
	Array, `DIMENSION` at least `(1 + (n - 1)*abs(incx))`.
	Before entry, the incremented array *x* must contain the *n*-element vector *x*.

incx	`INTEGER`. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.

y	`REAL` for `ssyr2`
	`DOUBLE PRECISION` for `dsyr2`
	Array, `DIMENSION` at least `(1 + (n - 1)*abs(incy))`.
	Before entry, the incremented array *y* must contain the *n*-element vector *y*.

incy	`INTEGER`. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.

a	`REAL` for `ssyr2`
	`DOUBLE PRECISION` for `dsyr2`
	Array, `DIMENSION (lda, n)`.
	Before entry with *uplo* = `'U'` or `'u'`, the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of *a* is not referenced.
	Before entry with *uplo* = `'L'` or `'l'`, the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of *a* is not referenced.

lda	`INTEGER`. Specifies the first dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least `max(1, n)`.

Output Parameters

a	With *uplo* = 'U' or 'u', the upper triangular part of the array *a* is overwritten by the upper triangular part of the updated matrix. With *uplo* = 'L' or 'l', the lower triangular part of the array *a* is overwritten by the lower triangular part of the updated matrix.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine syr2 interface are the following:

a	Holds the matrix A of size (*n*,*n*).
x	Holds the vector *x* of length (*n*).
y	Holds the vector *y* of length (*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
alpha	The default value is 1.

?tbmv

Computes a matrix-vector product using a triangular band matrix.

Syntax

Fortran 77:

```
call stbmv(uplo, trans, diag, n, k, a, lda, x, incx )
call dtbmv(uplo, trans, diag, n, k, a, lda, x, incx )
call ctbmv(uplo, trans, diag, n, k, a, lda, x, incx )
call ztbmv(uplo, trans, diag, n, k, a, lda, x, incx )
```

Fortran 95:

```
call tbmv(a, x [,uplo] [, trans] [,diag])
```

Description

The ?tbmv routines perform one of the matrix-vector operations defined as

x := A*x, or x := A'*x, or x := conjg(A')*x,

where:

x is an n-element vector,

A is an n-by-n unit, or non-unit, upper or lower triangular band matrix, with (k +1) diagonals.

Input Parameters

uplo

CHARACTER*1. Specifies whether the matrix is an upper or lower triangular matrix, as follows:

***uplo* value**	**Matrix *A***
U or u	An upper triangular matrix.
L or l	A lower triangular matrix.

trans

CHARACTER*1. Specifies the operation to be performed, as follows:

***trans* value**	**Operation to be Performed**
N or n	x := A*x
T or t	x := A'*x
C or c	x := conjg(A')*x

diag

CHARACTER*1. Specifies whether or not A is unit triangular, as follows:

***diag* value**	**Matrix *a***
U or u	Matrix a is a unit triangular.
N or n	Matrix a is not a unit triangular.

n

INTEGER. Specifies the order of the matrix A. The value of n must be at least zero.

k

INTEGER. On entry with *uplo* = 'U' or 'u', k specifies the number of super-diagonals of the matrix A. On entry with *uplo* = 'L' or 'l', k specifies the number of sub-diagonals of the matrix a.

The value of k must satisfy $0 \le k$.

a

REAL for stbmv
DOUBLE PRECISION for dtbmv
COMPLEX for ctbmv
DOUBLE COMPLEX for ztbmv
Array, DIMENSION (*lda*, *n*).
Before entry with *uplo* = 'U' or 'u', the leading (*k* + 1) by *n* part of the array *a* must contain the upper triangular band part of the matrix of coefficients, supplied column-by-column, with the leading diagonal of the matrix in row (*k* + 1) of the array, the first super-diagonal starting at position 2 in row *k*, and so on. The top left *k* by *k* triangle of the array *a* is not referenced. The following program segment transfers an upper triangular band matrix from conventional full matrix storage to band storage:

```
              do 20, j = 1, n
               m = k + 1 - j
do 10, i = max(1, j - k), j
               a(m + i, j) = matrix(i, j)
          10 continue
         20 continue
```

Before entry with *uplo* = 'L' or 'l', the leading (*k* + 1) by *n* part of the array *a* must contain the lower triangular band part of the matrix of coefficients, supplied column-by-column, with the leading diagonal of the matrix in row1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right *k* by *k*

triangle of the array *a* is not referenced. The following program segment transfers a lower triangular band matrix from conventional full matrix storage to band storage:

```
do 20, j = 1, n
 m = 1 - j
      do 10, i = j, min(n, j + k)
   a(m + i, j) = matrix (i, j)
10 continue
20 continue
```

Note that when *diag* = 'U' or 'u', the elements of the array *a* corresponding to the diagonal elements of the matrix are not referenced, but are assumed to be unity.

lda — INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least (*k* + 1).

x — REAL for stbmv
DOUBLE PRECISION for dtbmv
COMPLEX for ctbmv
DOUBLE COMPLEX for ztbmv
Array, DIMENSION at least (1 + (*n* – 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.

incx — INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.

Output Parameters

x — Overwritten with the transformed vector *x*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine tbmv interface are the following:

a	Holds the array *a* of size (*k+1*,*n*).
x	Holds the vector of length (*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
diag	Must be 'N' or 'U'. The default value is 'N'.

?tbsv

Solves a system of linear equations whose coefficients are in a triangular band matrix.

Syntax

Fortran 77:

```
call stbsv(uplo, trans, diag, n, k, a, lda, x, incx )
call dtbsv(uplo, trans, diag, n, k, a, lda, x, incx )
call ctbsv(uplo, trans, diag, n, k, a, lda, x, incx )
call ztbsv(uplo, trans, diag, n, k, a, lda, x, incx )
```

Fortran 95:

```
call tbsv(a, x [,uplo] [, trans] [,diag])
```

Description

The ?tbsv routines solve one of the following systems of equations:

*A*x = b*, or *A'*x = b*, or conjg(*A'*)*x = b*,

where:

b and *x* are *n*-element vectors,

A is an *n*-by-*n* unit, or non-unit, upper or lower triangular band matrix, with (*k* + 1) diagonals.

The routine does not test for singularity or near-singularity.

Such tests must be performed before calling this routine.

Input Parameters

uplo

CHARACTER*1. Specifies whether the matrix *A* is an upper or lower triangular matrix, as follows:

***uplo* value**	**Matrix *A***
U or u	An upper triangular matrix.
L or l	A lower triangular matrix.

trans

CHARACTER*1. Specifies the operation to be performed, as follows:

***trans* value**	**Operation to be Performed**
N or n	*A***x* = *b*
T or t	*A*'**x* = *b*
C or c	conjg(*A*')**x* = *b*

diag

CHARACTER*1. Specifies whether or not *A* is unit triangular, as follows:

***diag* value**	**Matrix *A***
U or u	Matrix *A* is a unit triangular.
N or n	Matrix *A* is not a unit triangular.

n

INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.

k

INTEGER. On entry with *uplo* = 'U' or 'u', *k* specifies the number of super-diagonals of the matrix *A*. On entry with *uplo* = 'L' or 'l', *k* specifies the number of sub-diagonals of the matrix *A*.

The value of *k* must satisfy 0 ≤ *k*.

a

REAL for stbsv
DOUBLE PRECISION for dtbsv
COMPLEX for ctbsv
DOUBLE COMPLEX for ztbsv
Array, DIMENSION (*lda*, *n*).
Before entry with *uplo* = 'U' or 'u', the leading (*k* + 1) by *n* part of the array *a* must contain the upper triangular band part of the matrix of coefficients, supplied

column-by-column, with the leading diagonal of the matrix in row (*k* + 1) of the array, the first super-diagonal starting at position 2 in row *k*, and so on. The top left *k* by *k* triangle of the array *a* is not referenced.
The following program segment transfers an upper triangular band matrix from conventional full matrix storage to band storage:

```
do 20, j = 1, n
  m = k + 1 - j
  do 10, i = max(1, j - k), jl
    a(m + i, j) = matrix (i, j)
   10 continue
20 continue
```

Before entry with *uplo* = 'L' or 'l', the leading (*k* + 1) by *n* part of the array *a* must contain the lower triangular band part of the matrix of coefficients, supplied column-by-column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right *k* by *k* triangle of the array *a* is not referenced.
The following program segment transfers a lower triangular band matrix from conventional full matrix storage to band storage:

```
do 20, j = 1, n
   m = 1 - j
   do 10, i = j, min(n, j + k)
    a(m + i, j) = matrix (i, j)
  10 continue
20 continue
```

When *diag* = 'U' or 'u', the elements of the array *a* corresponding to the diagonal elements of the matrix are not referenced, but are assumed to be unity.

lda	INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least (*k* + 1).
x	REAL for stbsv DOUBLE PRECISION for dtbsv COMPLEX for ctbsv DOUBLE COMPLEX for ztbsv Array, DIMENSION at least (1 + (*n* – 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element right-hand side vector *b*.
incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.

Output Parameters

x	Overwritten with the solution vector *x*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine tbsv interface are the following:

a	Holds the array *a* of size (*k+1*,*n*).
x	Holds the vector of length (*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
diag	Must be 'N' or 'U'. The default value is 'N'.

?tpmv

Computes a matrix-vector product using a triangular packed matrix.

Syntax

Fortran 77:

```
call stpmv(uplo, trans, diag, n, ap, x, incx )
call dtpmv(uplo, trans, diag, n, ap, x, incx )
call ctpmv(uplo, trans, diag, n, ap, x, incx )
call ztpmv(uplo, trans, diag, n, ap, x, incx )
```

Fortran 95:

```
call tpmv(a, x [,uplo] [, trans] [,diag])
```

Description

The ?tpmv routines perform one of the matrix-vector operations defined as

x := *A***x*, or *x* := *A*'**x*, or *x* := conjg(*A*')**x*,

where:

x is an *n*-element vector,

A is an *n*-by-*n* unit, or non-unit, upper or lower triangular matrix, supplied in packed form.

Input Parameters

uplo — CHARACTER*1. Specifies whether the matrix *A* is an upper or lower triangular matrix, as follows:

uplo value	Matrix *A*
U or u	An upper triangular matrix.
L or l	A lower triangular matrix.

trans CHARACTER*1. Specifies the operation to be performed, as follows:

trans value	Operation To Be Performed
N or n	*x* := *A***x*
T or t	*x* := *A*'**x*
C or c	*x* := conjg(*A*')**x*

diag CHARACTER*1. Specifies whether or not *A* is unit triangular, as follows:

diag value	Matrix *A*
U or u	Matrix *A* is assumed to be unit triangular.
N or n	Matrix *A* is not assumed to be unit triangular.

n INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.

ap REAL for stpmv
DOUBLE PRECISION for dtpmv
COMPLEX for ctpmv
DOUBLE COMPLEX for ztpmv
Array, DIMENSION at least ((*n**(*n* + 1))/2). Before entry with *uplo* = 'U' or 'u', the array *ap* must contain the upper triangular matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1,1), *ap*(2) and *ap*(3) contain *a*(1,2) and *a*(2,2) respectively, and so on. Before entry with *uplo* = 'L' or 'l', the array *ap* must contain the lower triangular matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1,1), *ap*(2) and *ap*(3) contain *a*(2,1) and *a*(3,1) respectively, and so on. When *diag* = 'U' or 'u', the diagonal elements of *a* are not referenced, but are assumed to be unity.

x	REAL for stpmv DOUBLE PRECISION for dtpmv COMPLEX for ctpmv DOUBLE COMPLEX for ztpmv Array, DIMENSION at least (1 + (*n* - 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.
incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.

Output Parameters

x	Overwritten with the transformed vector *x*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine tpmv interface are the following:

a	Holds the array *a* of size (*n**(n+1)/2).
x	Holds the vector of length (*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
diag	Must be 'N' or 'U'. The default value is 'N'.

?tpsv

Solves a system of linear equations whose coefficients are in a triangular packed matrix.

Syntax

Fortran 77:

```
call stpsv(uplo, trans, diag, n, ap, x, incx )
call dtpsv(uplo, trans, diag, n, ap, x, incx )
call ctpsv(uplo, trans, diag, n, ap, x, incx )
call ztpsv(uplo, trans, diag, n, ap, x, incx )
```

Fortran 95:

```
call tpsv(a, x [,uplo] [, trans] [,diag])
```

Description

The ?tpsv routines solve one of the following systems of equations

*A*x = b*, or *A'*x = b*, or conj(*A'*)*x = b*,

where:

b and *x* are *n*-element vectors,

A is an *n*-by-*n* unit, or non-unit, upper or lower triangular matrix, supplied in packed form.

This routine does not test for singularity or near-singularity.

Such tests must be performed before calling this routine.

Input Parameters

uplo — CHARACTER*1. Specifies whether the matrix *A* is an upper or lower triangular matrix, as follows:

***uplo* value**	**Matrix *A***
U or u	An upper triangular matrix.
L or l	A lower triangular matrix.

trans — CHARACTER*1. Specifies the operation to be performed, as follows:

trans value	Operation To Be Performed
N or n	*A***x* = *b*
T or t	*A*'**x* = *b*
C or c	conjg(*A*')**x* = *b*

diag CHARACTER*1. Specifies whether or not the matrix *A* is unit triangular, as follows:

diag value	Matrix *A*
U or u	Matrix *A* is assumed to be unit triangular.
N or n	Matrix *A* is not assumed to be unit triangular.

n INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.

ap REAL for stpsv
DOUBLE PRECISION for dtpsv
COMPLEX for ctpsv
DOUBLE COMPLEX for ztpsv
Array, DIMENSION at least ((*n**(*n* + 1))/2). Before entry with *uplo* = 'U' or 'u', the array *ap* must contain the upper triangular matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1, +1), *ap*(2) and *ap*(3) contain *a*(1, 2) and *a*(2, 2) respectively, and so on.
Before entry with *uplo* = 'L' or 'l', the array *ap* must contain the lower triangular matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1, +1), *ap*(2) and *ap*(3) contain *a*(2, +1) and *a*(3, +1) respectively, and so on.
When *diag* = 'U' or 'u', the diagonal elements of *a* are not referenced, but are assumed to be unity.

x REAL for stpsv
DOUBLE PRECISION for dtpsv
COMPLEX for ctpsv
DOUBLE COMPLEX for ztpsv

	Array, DIMENSION at least (1 + (*n* - 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element right-hand side vector *b*.
incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.

Output Parameters

x	Overwritten with the solution vector *x*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine tpsv interface are the following:

a	Holds the array *a* of size (*n**(n+1)/2).
x	Holds the vector of length (*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
diag	Must be 'N' or 'U'. The default value is 'N'.

?trmv

Computes a matrix-vector product using a triangular matrix.

Syntax

Fortran 77:

```
call strmv(uplo, trans, diag, n, a, lda, x, incx )
call dtrmv(uplo, trans, diag, n, a, lda, x, incx )
call ctrmv(uplo, trans, diag, n, a, lda, x, incx )
call ztrmv(uplo, trans, diag, n, a, lda, x, incx )
```

Fortran 95:

```
call trmv(a, x [,uplo] [, trans] [,diag])
```

Description

The ?trmv routines perform one of the following matrix-vector operations defined as

x := *A***x*, or *x* := A'**x*, or *x* := conjg(*A*')**x*,

where:

x is an *n*-element vector,

A is an *n*-by-*n* unit, or non-unit, upper or lower triangular matrix.

Input Parameters

uplo — CHARACTER*1. Specifies whether the matrix *A* is an upper or lower triangular matrix, as follows:

***uplo* value**	**Matrix *A***
U or u	An upper triangular matrix.
L or l	A lower triangular matrix.

trans — CHARACTER*1. Specifies the operation to be performed, as follows:

***trans* value**	**Operation To Be Performed**
N or n	*x* := *A***x*
T or t	*x* := *A*'**x*
C or c	*x* := conjg(*A*')**x*

diag — CHARACTER*1. Specifies whether or not *A* is unit triangular, as follows:

***diag* value**	**Matrix *A***
U or u	Matrix *A* is assumed to be unit triangular.
N or n	Matrix *A* is not assumed to be unit triangular.

n — INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.

a — REAL for strmv

	DOUBLE PRECISION for dtrmv COMPLEX for ctrmv DOUBLE COMPLEX for ztrmv Array, DIMENSION (*lda*, *n*). Before entry with *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular matrix and the strictly lower triangular part of *a* is not referenced. Before entry with *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular matrix and the strictly upper triangular part of *a* is not referenced. When *diag* = 'U' or 'u', the diagonal elements of *a* are not referenced either, but are assumed to be unity.
lda	INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least max(1, *n*).
x	REAL for strmv DOUBLE PRECISION for dtrmv COMPLEX for ctrmv DOUBLE COMPLEX for ztrmv Array, DIMENSION at least (1 + (*n* – 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.
incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.

Output Parameters

x	Overwritten with the transformed vector *x*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine trmv interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
x	Holds the vector of length (*n*).

uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
diag	Must be 'N' or 'U'. The default value is 'N'.

?trsv

Solves a system of linear equations whose coefficients are in a triangular matrix.

Syntax

Fortran 77:

```
call strsv(uplo, trans, diag, n, a, lda, x, incx )
call dtrsv(uplo, trans, diag, n, a, lda, x, incx )
call ctrsv(uplo, trans, diag, n, a, lda, x, incx )
call ztrsv(uplo, trans, diag, n, a, lda, x, incx )
```

Fortran 95:

```
call trsv(a, x [,uplo] [, trans] [,diag])
```

Description

The ?trsv routines solve one of the systems of equations:

*A*x = b*, or *A'*x = b*, or conjg(*A'*)*x = b*,

where:

b and *x* are *n*-element vectors,

A is an *n*-by-*n* unit, or non-unit, upper or lower triangular matrix.

The routine does not test for singularity or near-singularity.

Such tests must be performed before calling this routine.

Input Parameters

uplo	CHARACTER*1. Specifies whether the matrix is an upper or lower triangular matrix, as follows:

	***uplo* value**	**Matrix *A***
	`U` or `u`	An upper triangular matrix.
	`L` or `l`	A lower triangular matrix.

trans `CHARACTER*1`. Specifies the operation to be performed, as follows:

***trans* value**	**Operation To Be Performed**
`N` or `n`	*A***x* = *b*
`T` or `t`	*A*'**x* = *b*
`C` or `c`	conjg(*A*')**x* = *b*

diag `CHARACTER*1`. Specifies whether or not *A* is unit triangular, as follows:

***diag* value**	**Matrix *a***
`U` or `u`	Matrix *a* is a unit triangular.
`N` or `n`	Matrix *a* is not a unit triangular.

n `INTEGER`. Specifies the order of the matrix *A*. The value of *n* must be at least zero.

a `REAL` for `strsv`
`DOUBLE PRECISION` for `dtrsv`
`COMPLEX` for `ctrsv`
`DOUBLE COMPLEX` for `ztrsv`
Array, `DIMENSION (`*lda*`,`*n*`)`. Before entry with *uplo* = `'U'` or `'u'`, the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular matrix and the strictly lower triangular part of *a* is not referenced. Before entry with *uplo* = `'L'` or `'l'`, the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular matrix and the strictly upper triangular part of *a* is not referenced. When *diag* = `'U'` or `'u'`, the diagonal elements of *a* are not referenced either, but are assumed to be unity.

lda `INTEGER`. Specifies the first dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least `max(1,` *n*`)`.

x `REAL` for `strsv`

	DOUBLE PRECISION for dtrsv COMPLEX for ctrsv DOUBLE COMPLEX for ztrsv Array, DIMENSION at least (1 + (*n* - 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element right-hand side vector *b*.
incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.

Output Parameters

x	Overwritten with the solution vector *x*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine trsv interface are the following:

a	Holds the matrix *a* of size (*n*,*n*).
x	Holds the vector of length (*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
diag	Must be 'N' or 'U'. The default value is 'N'.

BLAS Level 3 Routines

BLAS Level 3 routines perform matrix-matrix operations. Table 2-3 lists the BLAS Level 3 routine groups and the data types associated with them.

Table 2-3 BLAS Level 3 Routine Groups and Their Data Types

Routine Group	Data Types	Description
?gemm	s, d, c, z	Matrix-matrix product of general matrices
?hemm	c, z	Matrix-matrix product of Hermitian matrices

Routine Group	Data Types	Description
?herk	c, z	Rank-k update of Hermitian matrices
?her2k	c, z	Rank-2k update of Hermitian matrices
?symm	s, d, c, z	Matrix-matrix product of symmetric matrices
?syrk	s, d, c, z	Rank-k update of symmetric matrices
?symm	s, d, c, z	Rank-2k update of symmetric matrices
?trmm	s, d, c, z	Matrix-matrix product of triangular matrices
?trsm	s, d, c, z	Linear matrix-matrix solution for triangular matrices

Symmetric Multiprocessing Version of Intel® MKL

Many applications spend considerable time for executing BLAS level 3 routines. This time can be scaled by the number of processors available on the system through using the symmetric multiprocessing(SMP) feature built into the Intel MKL Library. The performance enhancements based on the parallel use of the processors are available without any programming effort on your part.

To enhance performance, the library uses the following methods:

- The operation of BLAS level 3 matrix-matrix functions permits to restructure the code in a way which increases the localization of data reference, enhances cache memory use, and reduces the dependency on the memory bus.
- Once the code has been effectively blocked as described above, one of the matrices is distributed across the processors to be multiplied by the second matrix. Such distribution ensures effective cache management which reduces the dependency on the memory bus performance and brings good scaling results.

?gemm

Computes a scalar-matrix-matrix product and adds the result to a scalar-matrix product.

Syntax

Fortran 77:

```
call sgemm(transa, transb, m, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call dgemm(transa, transb, m, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call cgemm(transa, transb, m, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call zgemm(transa, transb, m, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
```

Fortran 95:

```
call gemm(a, b, c [,transa][,transb] [,alpha][,beta])
```

Description

The ?gemm routines perform a matrix-matrix operation with general matrices. The operation is defined as

`C := alpha*op(A)*op(B) + beta*C`,

where:

`op(x)` is one of `op(x) = x`, or `op(x) = x'`, or `op(x) = conjg(x')`,

alpha and *beta* are scalars,

A, *B* and *C* are matrices:

`op(A)` is an *m*-by-*k* matrix,

`op(B)` is a *k*-by-*n* matrix,

C is an *m*-by-*n* matrix.

Input Parameters

transa	CHARACTER*1. Specifies the form of `op(A)` to be used in the matrix multiplication as follows:

transa value	Form of op(*a*)
N or n	op(*A*) = *A*
T or t	op(*A*) = *A*'
C or c	op(*A*) = conjg(*A*')

transb CHARACTER*1. Specifies the form of op(*B*) to be used in the matrix multiplication as follows:

transb value	Form of op(*b*)
N or n	op(*B*) = *B*
T or t	op(*B*) = *B*'
C or c	op(*B*) = conjg(*B*')

m INTEGER. Specifies the number of rows of the matrix op(*A*) and of the matrix *C*. The value of *m* must be at least zero.

n INTEGER. Specifies the number of columns of the matrix op(*B*) and the number of columns of the matrix *C*. The value of *n* must be at least zero.

k INTEGER. Specifies the number of columns of the matrix op(*A*) and the number of rows of the matrix op(*B*). The value of *k* must be at least zero.

alpha REAL for sgemm
DOUBLE PRECISION for dgemm
COMPLEX for cgemm
DOUBLE COMPLEX for zgemm
Specifies the scalar *alpha*.

a REAL for sgemm
DOUBLE PRECISION for dgemm
COMPLEX for cgemm
DOUBLE COMPLEX for zgemm
Array, DIMENSION (*lda*, *ka*), where *ka* is *k* when *transa*= 'N' or 'n', and is *m* otherwise. Before entry with *transa*= 'N' or 'n', the leading *m*-by-*k* part of the array *a* must contain the matrix *A*, otherwise the leading *k*-by-*m* part of the array *a* must contain the matrix *A*.

lda INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. When *transa*= 'N' or 'n', then *lda* must be at least max(1, *m*), otherwise *lda* must be at least max(1, *k*).

b REAL for sgemm
DOUBLE PRECISION for dgemm
COMPLEX for cgemm
DOUBLE COMPLEX for zgemm
Array, DIMENSION (*ldb*, *kb*), where *kb* is *n* when *transb* = 'N' or 'n', and is *k* otherwise. Before entry with *transb* = 'N' or 'n', the leading *k*-by-*n* part of the array *b* must contain the matrix *B*, otherwise the leading *n*-by-*k* part of the array *b* must contain the matrix *B*.

ldb INTEGER. Specifies the first dimension of *b* as declared in the calling (sub)program. When *transb* = 'N' or 'n', then *ldb* must be at least max(1, *k*), otherwise *ldb* must be at least max(1, *n*).

beta REAL for sgemm
DOUBLE PRECISION for dgemm
COMPLEX for cgemm
DOUBLE COMPLEX for zgemm
Specifies the scalar *beta*.
When *beta* is equal to zero, then *c* need not be set on input.

c REAL for sgemm
DOUBLE PRECISION for dgemm
COMPLEX for cgemm
DOUBLE COMPLEX for zgemm
Array, DIMENSION (*ldc*, *n*).
Before entry, the leading *m*-by-*n* part of the array *c* must contain the matrix *C*, except when *beta* is equal to zero, in which case *c* need not be set on entry.

ldc INTEGER. Specifies the first dimension of *c* as declared in the calling (sub)program. The value of *ldc* must be at least max(1, *m*).

Output Parameters

c	Overwritten by the *m*-by-*n* matrix (*alpha**op(*A*)*op(*B*) + *beta***C*).

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gemm interface are the following:

a	Holds the matrix *A* of size (*ma*,*ka*) where *ka* = *k* if *transa*= 'N', *ka* = *m* otherwise, *ma* = *m* if *transa*= 'N', *ma* = *k* otherwise.
b	Holds the matrix *B* of size (*mb*,*kb*) where *kb* = *n* if *transb* = 'N', *kb* = *k* otherwise, *mb* = *k* if *transb* = 'N', *mb* = *n* otherwise.
c	Holds the matrix *C* of size (*m*,*n*).
transa	Must be 'N', 'C', or 'T'. The default value is 'N'.
transb	Must be 'N', 'C', or 'T'. The default value is 'N'.
alpha	The default value is 1.
beta	The default value is 1.

?hemm

Computes a scalar-matrix-matrix product (either one of the matrices is Hermitian) and adds the result to scalar-matrix product.

Syntax

Fortran 77:

```
call chemm(side, uplo, m, n, alpha, a, lda, b, ldb, beta, c, ldc )
call zhemm(side, uplo, m, n, alpha, a, lda, b, ldb, beta, c, ldc )
```

Fortran 95:

```
call hemm(a, b, c [,side][,uplo] [,alpha][,beta])
```

Description

The ?hemm routines perform a matrix-matrix operation using Hermitian matrices. The operation is defined as

*C := alpha*A*B + beta*C*

or

*C := alpha*B*A + beta*C*,

where:

alpha and *beta* are scalars,

A is an Hermitian matrix,

B and *C* are *m*-by-*n* matrices.

Input Parameters

side CHARACTER*1. Specifies whether the Hermitian matrix *A* appears on the left or right in the operation as follows:

side value	Operation To Be Performed
L or l	*C := alpha*A*B + beta*C*
R or r	*C := alpha*B*A + beta*C*

uplo CHARACTER*1. Specifies whether the upper or lower triangular part of the Hermitian matrix *A* is to be referenced as follows:

uplo **value**	**Part of Matrix *A* To Be Referenced**
U or u	Only the upper triangular part of the Hermitian matrix is to be referenced.
L or l	Only the lower triangular part of the Hermitian matrix is to be referenced.

m INTEGER. Specifies the number of rows of the matrix *C*. The value of *m* must be at least zero.

n INTEGER. Specifies the number of columns of the matrix *C*. The value of *n* must be at least zero.

alpha COMPLEX for chemm
DOUBLE COMPLEX for zhemm
Specifies the scalar *alpha*.

a COMPLEX for chemm
DOUBLE COMPLEX for zhemm
Array, DIMENSION (*lda*,*ka*), where *ka* is *m* when *side* = 'L' or 'l' and is *n* otherwise. Before entry with *side* = 'L' or 'l', the *m*-by-*m* part of the array *a* must contain the Hermitian matrix, such that when *uplo* = 'U' or 'u', the leading *m*-by-*m* upper triangular part of the array *a* must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of *a* is not referenced, and when *uplo* = 'L' or 'l', the leading *m*-by-*m* lower triangular part of the array *a* must contain the lower triangular part of the Hermitian matrix, and the strictly upper triangular part of *a* is not referenced.
Before entry with *side* = 'R' or 'r', the *n*-by-*n* part of the array *a* must contain the Hermitian matrix, such that when *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of *a* is not referenced, and when *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular part of the

Hermitian matrix, and the strictly upper triangular part of *a* is not referenced. The imaginary parts of the diagonal elements need not be set, they are assumed to be zero.

lda — INTEGER. Specifies the first dimension of *a* as declared in the calling (sub) program. When *side* = 'L' or 'l' then *lda* must be at least max(1, *m*), otherwise *lda* must be at least max(1,*n*).

b — COMPLEX for chemm
DOUBLE COMPLEX for zhemm
Array, DIMENSION (*ldb*,*n*).
Before entry, the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.

ldb — INTEGER. Specifies the first dimension of *b* as declared in the calling (sub)program. The value of *ldb* must be at least max(1, *m*).

beta — COMPLEX for chemm
DOUBLE COMPLEX for zhemm
Specifies the scalar *beta*.
When *beta* is supplied as zero, then *c* need not be set on input.

c — COMPLEX for chemm
DOUBLE COMPLEX for zhemm
Array, DIMENSION (*c*, *n*). Before entry, the leading *m*-by-*n* part of the array *c* must contain the matrix *C*, except when *beta* is zero, in which case *c* need not be set on entry.

ldc — INTEGER. Specifies the first dimension of *c* as declared in the calling (sub)program. The value of *ldc* must be at least max(1, *m*).

Output Parameters

c — Overwritten by the *m*-by-*n* updated matrix.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine hemm interface are the following:

a	Holds the matrix *A* of size (*k*,*k*) where *k* = *m* if *side* = 'L', *k* = *n* otherwise.
b	Holds the matrix *B* of size (*m*,*n*).
c	Holds the matrix *C* of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
uplo	Must be 'U' or 'L'. The default value is 'U'.
alpha	The default value is 1.
beta	The default value is 1.

?herk

Performs a rank-n update of a Hermitian matrix.

Syntax

Fortran 77:

```
call cherk(uplo, trans, n, k, alpha, a, lda, beta, c, ldc )
call zherk(uplo, trans, n, k, alpha, a, lda, beta, c, ldc )
```

Fortran 95:

```
call herk(a, c [,uplo] [, trans] [,alpha][,beta])
```

Description

The ?herk routines perform a matrix-matrix operation using Hermitian matrices. The operation is defined as

C := *alpha***A**conjg(*A*') + *beta***C*,

or

C := *alpha**conjg(*A*')**A* + *beta***C*,

where:

alpha and *beta* are real scalars,

C is an *n*-by-*n* Hermitian matrix,

A is an *n*-by-*k* matrix in the first case and a *k*-by-*n* matrix in the second case.

Input Parameters

uplo

CHARACTER*1. Specifies whether the upper or lower triangular part of the array *c* is to be referenced as follows:

***uplo* value**	**Part of Array *c* To Be Referenced**
U or u	Only the upper triangular part of *c* is to be referenced.
L or l	Only the lower triangular part of *c* is to be referenced.

trans

CHARACTER*1. Specifies the operation to be performed as follows:

***trans* value**	**Operation to be Performed**
N or n	*C*:= *alpha***A**conjg(*A*')+*beta***C*
C or c	*C*:= *alpha**conjg(*A*')**A*+*beta***C*

n

INTEGER. Specifies the order of the matrix *C*. The value of *n* must be at least zero.

k

INTEGER. With *trans* = 'N' or 'n', *k* specifies the number of columns of the matrix *A*, and with *trans* = 'C' or 'c', *k* specifies the number of rows of the matrix *A*.
The value of *k* must be at least zero.

alpha

REAL for cherk
DOUBLE PRECISION for zherk
Specifies the scalar *alpha*.

a

COMPLEX for cherk
DOUBLE COMPLEX for zherk
Array, DIMENSION (*lda*, *ka*), where *ka* is *k* when *trans* = 'N' or 'n', and is *n* otherwise. Before entry with *trans* = 'N' or 'n', the leading *n*-by-*k* part of the array *a* must contain the matrix *a*, otherwise the leading *k*-by-*n* part of the array *a* must contain the matrix *A*.

lda	INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. When *trans* = 'N' or 'n', then *lda* must be at least max(1, *n*), otherwise *lda* must be at least max(1, *k*).
beta	REAL for cherk DOUBLE PRECISION for zherk Specifies the scalar *beta*.
c	COMPLEX for cherk DOUBLE COMPLEX for zherk Array, DIMENSION (*ldc*,*n*). Before entry with *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *c* must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of *c* is not referenced. Before entry with *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *c* must contain the lower triangular part of the Hermitian matrix and the strictly upper triangular part of *c* is not referenced. The imaginary parts of the diagonal elements need not be set, they are assumed to be zero.
ldc	INTEGER. Specifies the first dimension of *c* as declared in the calling (sub)program. The value of *ldc* must be at least max(1, *n*).

Output Parameters

c	With *uplo* = 'U' or 'u', the upper triangular part of the array *c* is overwritten by the upper triangular part of the updated matrix. With *uplo* = 'L' or 'l', the lower triangular part of the array *c* is overwritten by the lower triangular part of the updated matrix. The imaginary parts of the diagonal elements are set to zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine herk interface are the following:

a	Holds the matrix *A* of size (*ma*,*ka*) where *ka* = *k* if *transa*= 'N', *ka* = *n* otherwise, *ma* = *n* if *transa*= 'N', *ma* = *k* otherwise.
c	Holds the matrix *C* of size (*n*,*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N' or 'C'. The default value is 'N'.
alpha	The default value is 1.
beta	The default value is 1.

?her2k

Performs a rank-2k update of a Hermitian matrix.

Syntax

Fortran 77:

```
call cher2k(uplo, trans, n, k, alpha, a, lda, b, ldb, beta, c, ldc )
call zher2k(uplo, trans, n, k, alpha, a, lda, b, ldb, beta, c, ldc )
```

Fortran 95:

```
call her2k(a, b, c [,uplo][,trans] [,alpha][,beta])
```

Description

The ?her2k routines perform a rank-2k matrix-matrix operation using Hermitian matrices. The operation is defined as

C := *alpha***A**conjg(*B*') + conjg(*alpha*)**B**conjg(*A*') + *beta***C*,

or

C := *alpha* *conjg(*B*')*A* + conjg(*alpha*) *conjg(*A*')*B* + *beta*C*,

where:

alpha is a scalar and *beta* is a real scalar,

C is an *n*-by-*n* Hermitian matrix,

A and *B* are *n*-by-*k* matrices in the first case and *k*-by-*n* matrices in the second case.

Input Parameters

uplo — CHARACTER*1. Specifies whether the upper or lower triangular part of the array *c* is to be referenced as follows:

***uplo* value**	**Part of Array *c* To Be Referenced**
U or u	Only the upper triangular part of *c* is to be referenced.
L or l	Only the lower triangular part of *c* is to be referenced.

trans — CHARACTER*1. Specifies the operation to be performed as follows:

***trans* value**	**Operation to be Performed**
N or n	*C*:=*alpha**A**conjg(*B*') + *alpha**B**conjg(*A*') + *beta**C*
C or c	*C*:=*alpha**conjg(*A*')*B* + *alpha**conjg(*B*')*A* + *beta**C*

n — INTEGER. Specifies the order of the matrix *C*. The value of *n* must be at least zero.

k — INTEGER. With *trans* = 'N' or 'n', *k* specifies the number of columns of the matrix *A*, and with *trans* = 'C' or 'c', *k* specifies the number of rows of the matrix *A*.
The value of *k* must be at least equal to zero.

alpha — COMPLEX for cher2k
DOUBLE COMPLEX for zher2k
Specifies the scalar *alpha*.

a — COMPLEX for cher2k
DOUBLE COMPLEX for zher2k

Array, DIMENSION (*lda*, *ka*), where *ka* is *k* when *trans* = 'N' or 'n', and is *n* otherwise. Before entry with *trans* = 'N' or 'n', the leading *n*-by-*k* part of the array *a* must contain the matrix *A*, otherwise the leading *k*-by-*n* part of the array *a* must contain the matrix *A*.

lda — INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. When *trans* = 'N' or 'n', then *lda* must be at least max(1, *n*), otherwise *lda* must be at least max(1, *k*).

beta — REAL for cher2k
DOUBLE PRECISION for zher2k
Specifies the scalar *beta*.

b — COMPLEX for cher2k
DOUBLE COMPLEX for zher2k
Array, DIMENSION (*ldb*, *kb*), where *kb* is *k* when *trans* = 'N' or 'n', and is *n* otherwise. Before entry with *trans* = 'N' or 'n', the leading *n*-by-*k* part of the array *b* must contain the matrix *B*, otherwise the leading *k*-by-*n* part of the array *b* must contain the matrix *B*.

ldb — INTEGER. Specifies the first dimension of *b* as declared in the calling (sub)program. When *trans* = 'N' or 'n', then *ldb* must be at least max(1, *n*), otherwise *ldb* must be at least max(1, *k*).

c — COMPLEX for cher2k
DOUBLE COMPLEX for zher2k
Array, DIMENSION (*ldc*,*n*).
Before entry with *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *c* must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of *c* is not referenced.
Before entry with *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *c* must contain the lower triangular part of the Hermitian matrix and the strictly upper triangular part of *c* is not referenced.
The imaginary parts of the diagonal elements need not be set, they are assumed to be zero.

ldc	INTEGER. Specifies the first dimension of *c* as declared in the calling (sub)program. The value of *ldc* must be at least max(1, *n*).

Output Parameters

c	With *uplo* = 'U' or 'u', the upper triangular part of the array *c* is overwritten by the upper triangular part of the updated matrix. With *uplo* = 'L' or 'l', the lower triangular part of the array *c* is overwritten by the lower triangular part of the updated matrix. The imaginary parts of the diagonal elements are set to zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine her2k interface are the following:

a	Holds the matrix *A* of size (*ma*,*ka*) where *ka* = *k* if *trans* = 'N', *ka* = *n* otherwise, *ma* = *n* if *trans* = 'N', *ma* = *k* otherwise.
b	Holds the matrix *B* of size (*mb*,*kb*) where *kb* = *k* if *trans* = 'N', *kb* = *n* otherwise, *mb* = *n* if *trans* = 'N', *mb* = *k* otherwise.
c	Holds the matrix *C* of size (*n*,*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N' or 'C'. The default value is 'N'.
alpha	The default value is 1.
beta	The default value is 1.

?symm

Performs a scalar-matrix-matrix product(one matrix operand is symmetric) and adds the result to a scalar-matrix product.

Syntax

Fortran 77:

```
call ssymm(side, uplo, m, n, alpha, a, lda, b, ldb, beta, c, ldc )
call dsymm(side, uplo, m, n, alpha, a, lda, b, ldb, beta, c, ldc )
call csymm(side, uplo, m, n, alpha, a, lda, b, ldb, beta, c, ldc )
call zsymm(side, uplo, m, n, alpha, a, lda, b, ldb, beta, c, ldc )
```

Fortran 95:

```
call symm(a, b, c [,side][,uplo] [,alpha][,beta])
```

Description

The ?symm routines perform a matrix-matrix operation using symmetric matrices. The operation is defined as

*C := alpha*A*B + beta*C*,

or

*C := alpha*B*A + beta*C*,

where:

alpha and *beta* are scalars,

A is a symmetric matrix,

B and *C* are *m*-by-*n* matrices.

Input Parameters

side CHARACTER*1. Specifies whether the symmetric matrix *A* appears on the left or right in the operation as follows:

side value	Operation to be Performed
L or l	*Ac := alpha*A*B + beta*C*

	R or r	*c* := *alpha***B***A* + *beta***C*

uplo CHARACTER*1. Specifies whether the upper or lower triangular part of the symmetric matrix *A* is to be referenced as follows:

uplo **value**	**Part of Array *a* To Be Referenced**
U or u	Only the upper triangular part of the symmetric matrix is to be referenced.
L or l	Only the lower triangular part of the symmetric matrix is to be referenced.

m INTEGER. Specifies the number of rows of the matrix *C*. The value of *m* must be at least zero.

n INTEGER. Specifies the number of columns of the matrix *C*. The value of *n* must be at least zero.

alpha
REAL for ssymm
DOUBLE PRECISION for dsymm
COMPLEX for csymm
DOUBLE COMPLEX for zsymm
Specifies the scalar *alpha*.

a
REAL for ssymm
DOUBLE PRECISION for dsymm
COMPLEX for csymm
DOUBLE COMPLEX for zsymm
Array, DIMENSION (*lda*, *ka*), where *ka* is *m* when *side* = 'L' or 'l' and is *n* otherwise.
Before entry with *side* = 'L' or 'l', the *m*-by-*m* part of the array *a* must contain the symmetric matrix, such that when *uplo* = 'U' or 'u', the leading *m*-by-*m* upper triangular part of the array *a* must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of *a* is not referenced, and when *uplo* = 'L' or 'l', the leading *m*-by-*m* lower triangular part of the array *a* must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of *a* is not referenced.

Before entry with *side* = 'R' or 'r', the *n*-by-*n* part of the array *a* must contain the symmetric matrix, such that when *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of *a* is not referenced, and when *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of *a* is not referenced.

lda INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. When *side* = 'L' or 'l' then *lda* must be at least max(1, *m*), otherwise *lda* must be at least max(1, *n*).

b REAL for ssymm
DOUBLE PRECISION for dsymm
COMPLEX for csymm
DOUBLE COMPLEX for zsymm
Array, DIMENSION (*ldb*, *n*). Before entry, the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.

ldb INTEGER. Specifies the first dimension of *b* as declared in the calling (sub)program. The value of *ldb* must be at least max(1, *m*).

beta REAL for ssymm
DOUBLE PRECISION for dsymm
COMPLEX for csymm
DOUBLE COMPLEX for zsymm
Specifies the scalar *beta*.
When *beta* is set to zero, then *c* need not be set on input.

c REAL for ssymm
DOUBLE PRECISION for dsymm
COMPLEX for csymm
DOUBLE COMPLEX for zsymm
Array, DIMENSION (*ldc*,*n*). Before entry, the leading *m*-by-*n* part of the array *c* must contain the matrix *C*, except when beta is zero, in which case *c* need not be set on entry.

ldc	INTEGER. Specifies the first dimension of *c* as declared in the calling (sub)program. The value of *ldc* must be at least max(1, *m*).

Output Parameters

c	Overwritten by the *m*-by-*n* updated matrix.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine symm interface are the following:

a	Holds the matrix *A* of size (*k*,*k*) where *k* = *m* if *side* = 'L', *k* = *n* otherwise.
b	Holds the matrix *B* of size (*m*,*n*).
c	Holds the matrix *C* of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
uplo	Must be 'U' or 'L'. The default value is 'U'.
alpha	The default value is 1.
beta	The default value is 1.

?syrk

Performs a rank-n update of a symmetric matrix.

Syntax

Fortran 77:

```
call ssyrk(uplo, trans, n, k, alpha, a, lda, beta, c, ldc )
call dsyrk(uplo, trans, n, k, alpha, a, lda, beta, c, ldc )
call csyrk(uplo, trans, n, k, alpha, a, lda, beta, c, ldc )
call zsyrk(uplo, trans, n, k, alpha, a, lda, beta, c, ldc )
```

Fortran 95:

```
call syrk(a, c [,uplo] [, trans] [,alpha][,beta])
```

Description

The ?syrk routines perform a matrix-matrix operation using symmetric matrices. The operation is defined as

C := *alpha***A***A*' + *beta***C*,

or

C := *alpha***A*'**A* + *beta***C*,

where:

alpha and *beta* are scalars,

C is an *n*-by-*n* symmetric matrix,

A is an *n*-by-*k* matrix in the first case and a *k*-by-*n* matrix in the second case.

Input Parameters

uplo — CHARACTER*1. Specifies whether the upper or lower triangular part of the array *c* is to be referenced as follows:

uplo value	Part of Array *c* To Be Referenced
U or u	Only the upper triangular part of *c* is to be referenced.
L or l	Only the lower triangular part of *c* is to be referenced.

trans — CHARACTER*1. Specifies the operation to be performed as follows:

trans value	Operation to be Performed
N or n	*C* := *alpha***A***A*' + *beta***C*
T or t	*C* := *alpha***A*'**A* + *beta***C*
C or c	*C* := *alpha***A*'**A* + *beta***C*

n — INTEGER. Specifies the order of the matrix *C*. The value of *n* must be at least zero.

k	INTEGER. On entry with *trans* = 'N' or 'n', *k* specifies the number of columns of the matrix *a*, and on entry with *trans* = 'T' or 't' or 'C' or 'c', *k* specifies the number of rows of the matrix *a*. The value of *k* must be at least zero.
alpha	REAL for ssyrk DOUBLE PRECISION for dsyrk COMPLEX for csyrk DOUBLE COMPLEX for zsyrk Specifies the scalar *alpha*.
a	REAL for ssyrk DOUBLE PRECISION for dsyrk COMPLEX for csyrk DOUBLE COMPLEX for zsyrk Array, DIMENSION (*lda*,*ka*), where *ka* is *k* when *trans* = 'N' or 'n', and is *n* otherwise. Before entry with *trans* = 'N' or 'n', the leading *n*-by-*k* part of the array *a* must contain the matrix *A*, otherwise the leading *k*-by-*n* part of the array *a* must contain the matrix *A*.
lda	INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. When *trans* = 'N' or 'n', then *lda* must be at least max(1,*n*), otherwise *lda* must be at least max(1, *k*).
beta	REAL for ssyrk DOUBLE PRECISION for dsyrk COMPLEX for csyrk DOUBLE COMPLEX for zsyrk Specifies the scalar *beta*.
c	REAL for ssyrk DOUBLE PRECISION for dsyrk COMPLEX for csyrk DOUBLE COMPLEX for zsyrk Array, DIMENSION (*ldc*,*n*). Before entry with *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *c* must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of *c* is not referenced.

Before entry with *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *c* must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of *c* is not referenced.

ldc — INTEGER. Specifies the first dimension of *c* as declared in the calling (sub)program. The value of *ldc* must be at least max(1, *n*).

Output Parameters

c — With *uplo* = 'U' or 'u', the upper triangular part of the array *c* is overwritten by the upper triangular part of the updated matrix.
With *uplo* = 'L' or 'l', the lower triangular part of the array *c* is overwritten by the lower triangular part of the updated matrix.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine syrk interface are the following:

a — Holds the matrix *A* of size (*ma*,*ka*) where
ka = *k* if *transa*= 'N',
ka = *n* otherwise,
ma = *n* if *transa*= 'N',
ma = *k* otherwise.

c — Holds the matrix *C* of size (*n*,*n*).

uplo — Must be 'U' or 'L'. The default value is 'U'.

trans — Must be 'N', 'C', or 'T'.
The default value is 'N'.

alpha — The default value is 1.

beta — The default value is 1.

?syr2k

Performs a rank-2k update of a symmetric matrix.

Syntax

Fortran 77:

```
call ssyr2k(uplo, trans, n, k, alpha, a, lda, b, ldb, beta, c, ldc )
call dsyr2k(uplo, trans, n, k, alpha, a, lda, b, ldb, beta, c, ldc )
call csyr2k(uplo, trans, n, k, alpha, a, lda, b, ldb, beta, c, ldc )
call zsyr2k(uplo, trans, n, k, alpha, a, lda, b, ldb, beta, c, ldc )
```

Fortran 95:

```
call syr2k(a, b, c [,uplo][,trans] [,alpha][,beta])
```

Description

The ?syr2k routines perform a rank-2k matrix-matrix operation using symmetric matrices. The operation is defined as

C := *alpha***A***B*' + *alpha***B***A*' + *beta***C*,

or

C := *alpha***a*'**B* + *alpha***B*'**A* + *beta***C*,

where:

alpha and *beta* are scalars,

C is an *n*-by-*n* symmetric matrix,

A and *B* are *n*-by-*k* matrices in the first case, and *k*-by-*n* matrices in the second case.

Input Parameters

uplo — CHARACTER*1. Specifies whether the upper or lower triangular part of the array *c* is to be referenced as follows:

uplo value	Part of Array *c* To Be Referenced
U or u	Only the upper triangular part of *c* is to be referenced.

	L or l — Only the lower triangular part of *c* is to be referenced.
trans	CHARACTER*1. Specifies the operation to be performed as follows:

***trans* value**	**Operation to be Performed**
N or n	*C* := *alpha***A***B*'+*alpha***B***A*'+*beta***C*
T or t	*C* := *alpha***A*'**B* +*alpha***B*'**A* +*beta***C*
C or c	*C* := *alpha***A*'**B* +*alpha***B*'**A* +*beta***C*

n	INTEGER. Specifies the order of the matrix *C*. The value of *n* must be at least zero.
k	INTEGER. On entry with *trans* = 'N' or 'n', *k* specifies the number of columns of the matrices *A* and *B*, and on entry with *trans* = 'T' or 't' or 'C' or 'c', *k* specifies the number of rows of the matrices *A* and *B*. The value of *k* must be at least zero.
alpha	REAL for ssyr2k DOUBLE PRECISION for dsyr2k COMPLEX for csyr2k DOUBLE COMPLEX for zsyr2k Specifies the scalar *alpha*.
a	REAL for ssyr2k DOUBLE PRECISION for dsyr2k COMPLEX for csyr2k DOUBLE COMPLEX for zsyr2k Array, DIMENSION (*lda*,*ka*), where *ka* is *k* when *trans* = 'N' or 'n', and is *n* otherwise. Before entry with *trans* = 'N' or 'n', the leading *n*-by-*k* part of the array *a* must contain the matrix *A*, otherwise the leading *k*-by-*n* part of the array *a* must contain the matrix *A*.
lda	INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. When *trans* = 'N' or 'n', then *lda* must be at least max(1, *n*), otherwise *lda* must be at least max(1, *k*).

b	REAL for ssyr2k DOUBLE PRECISION for dsyr2k COMPLEX for csyr2k DOUBLE COMPLEX for zsyr2k Array, DIMENSION (*ldb, kb*) where *kb* is *k* when *trans* = 'N' or 'n' and is 'n' otherwise. Before entry with *trans* = 'N' or 'n', the leading *n*-by-*k* part of the array *b* must contain the matrix *B*, otherwise the leading *k*-by-*n* part of the array *b* must contain the matrix *B*.
ldb	INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. When *trans* = 'N' or 'n', then *ldb* must be at least max(1, *n*), otherwise *ldb* must be at least max(1, *k*).
beta	REAL for ssyr2k DOUBLE PRECISION for dsyr2k COMPLEX for csyr2k DOUBLE COMPLEX for zsyr2k Specifies the scalar *beta*.
c	REAL for ssyr2k DOUBLE PRECISION for dsyr2k COMPLEX for csyr2k DOUBLE COMPLEX for zsyr2k Array, DIMENSION (*ldc*, *n*). Before entry with *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *c* must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of *c* is not referenced. Before entry with *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *c* must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of *c* is not referenced.
ldc	INTEGER. Specifies the first dimension of *c* as declared in the calling (sub)program. The value of *ldc* must be at least max(1, *n*).

Output Parameters

c	With *uplo* = 'U' or 'u', the upper triangular part of the array *c* is overwritten by the upper triangular part of the updated matrix. With *uplo* = 'L' or 'l', the lower triangular part of the array *c* is overwritten by the lower triangular part of the updated matrix.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine syr2k interface are the following:

a	Holds the matrix *A* of size (*ma*,*ka*) where *ka* = *k* if *trans* = 'N', *ka* = *n* otherwise, *ma* = *n* if *trans* = 'N', *ma* = *k* otherwise.
b	Holds the matrix *B* of size (*mb*,*kb*) where *kb* = *k* if *trans* = 'N', *kb* = *n* otherwise, *mb* = *n* if *trans* = 'N', *mb* = *k* otherwise.
c	Holds the matrix *C* of size (*n*,*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
alpha	The default value is 1.
beta	The default value is 1.

?trmm

Computes a scalar-matrix-matrix product (one matrix operand is triangular).

Syntax

Fortran 77:

```
call strmm(side, uplo, transa, diag, m, n, alpha, a, lda, b, ldb )
call dtrmm(side, uplo, transa, diag, m, n, alpha, a, lda, b, ldb )
call ctrmm(side, uplo, transa, diag, m, n, alpha, a, lda, b, ldb )
call ztrmm(side, uplo, transa, diag, m, n, alpha, a, lda, b, ldb )
```

Fortran 95:

```
call trmm(a, b [,side] [, uplo] [,transa][,diag] [,alpha])
```

Description

The ?trmm routines perform a matrix-matrix operation using triangular matrices. The operation is defined as

B := *alpha**op(*A*)**B*

or

B := *alpha***B**op(*A*)

where:

alpha is a scalar,

B is an *m*-by-*n* matrix,

A is a unit, or non-unit, upper or lower triangular matrix

op(*A*) is one of op(*A*) = *A*, or op(A) = *A*', or op(*A*) = conjg(*A*').

Input Parameters

side — CHARACTER*1. Specifies whether op(*A*) multiplies *B* from the left or right in the operation as follows:

***side* value**	**Operation To Be Performed**
L or l	*B* := *alpha**op(*A*)**B*

	R or r *B* := *alpha***B**op(*A*)
uplo	CHARACTER*1. Specifies whether the matrix *A* is an upper or lower triangular matrix as follows:

***uplo* value**	**Matrix *A***
U or u	Matrix *A* is an upper triangular matrix.
L or l	Matrix A is a lower triangular matrix.

transa	CHARACTER*1. Specifies the form of op(*A*) to be used in the matrix multiplication as follows:

***transa* value**	**Form of op(*A*)**
N or n	op(*A*) = *A*
T or t	op(*A*) = *A*'
C or c	op(*A*) = conjg(*A*')

diag	CHARACTER*1. Specifies whether or not *A* is unit triangular as follows:

***diag* value**	**Matrix *A***
U or u	Matrix *A* is assumed to be unit triangular.
N or n	Matrix *A* is not assumed to be unit triangular.

m	INTEGER. Specifies the number of rows of *B*. The value of *m* must be at least zero.
n	INTEGER. Specifies the number of columns of *B*. The value of *n* must be at least zero.
alpha	REAL for strmm DOUBLE PRECISION for dtrmm COMPLEX for ctrmm DOUBLE COMPLEX for ztrmm Specifies the scalar *alpha*. When *alpha* is zero, then *a* is not referenced and *b* need not be set before entry.
a	REAL for strmm DOUBLE PRECISION for dtrmm COMPLEX for ctrmm

DOUBLE COMPLEX for ztrmm
Array, DIMENSION (*lda*,*k*), where *k* is *m* when *side* = 'L' or 'l' and is *n* when *side* = 'R' or 'r'. Before entry with *uplo* = 'U' or 'u', the leading *k* by *k* upper triangular part of the array *a* must contain the upper triangular matrix and the strictly lower triangular part of *a* is not referenced. Before entry with *uplo* = 'L' or 'l', the leading *k* by *k* lower triangular part of the array *a* must contain the lower triangular matrix and the strictly upper triangular part of *a* is not referenced.
When *diag* = 'U' or 'u', the diagonal elements of *a* are not referenced either, but are assumed to be unity.

lda — INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. When *side* = 'L' or 'l', then *lda* must be at least max(1, *m*), when *side* = 'R' or 'r', then *lda* must be at least max(1, *n*).

b — REAL for strmm
DOUBLE PRECISION for dtrmm
COMPLEX for ctrmm
DOUBLE COMPLEX for ztrmm
Array, DIMENSION (*ldb*,*n*).
Before entry, the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.

ldb — INTEGER. Specifies the first dimension of *b* as declared in the calling (sub)program. The value of *ldb* must be at least max(1, *m*).

Output Parameters

b — Overwritten by the transformed matrix.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine trmm interface are the following:

a — Holds the matrix *A* of size (*k*,*k*) where

	k = *m* if *side* = 'L', *k* = *n* otherwise.
b	Holds the matrix *B* of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
uplo	Must be 'U' or 'L'. The default value is 'U'.
transa	Must be 'N', 'C', or 'T'. The default value is 'N'.
diag	Must be 'N' or 'U'. The default value is 'N'.
alpha	The default value is 1.

?trsm

Solves a matrix equation (one matrix operand is triangular).

Syntax

Fortran 77:

```
call strsm(side, uplo, transa, diag, m, n, alpha, a, lda, b, ldb )
call dtrsm(side, uplo, transa, diag, m, n, alpha, a, lda, b, ldb )
call ctrsm(side, uplo, transa, diag, m, n, alpha, a, lda, b, ldb )
call ztrsm(side, uplo, transa, diag, m, n, alpha, a, lda, b, ldb )
```

Fortran 95:

```
call trsm(a, b [,side] [, uplo] [,transa][,diag] [,alpha])
```

Description

The ?trsm routines solve one of the following matrix equations:

op(*A*)**X* = *alpha***B*,

or

*X**op(*A*) = *alpha***B*,

where:

alpha is a scalar,

X and *B* are *m*-by-*n* matrices,

A is a unit, or non-unit, upper or lower triangular matrix

op(*A*) is one of op(*A*) = *A*, or op(*A*) = *A*', or op(*A*) = conjg(*A*').

The matrix *B* is overwritten by the solution matrix *X*.

Input Parameters

side CHARACTER*1. Specifies whether op(*A*) appears on the left or right of *X* for the operation to be performed as follows:

***side* value**	**Operation To Be Performed**
L or l	op(*A*)**X* = *alpha***B*
R or r	*X*op(*A*) = *alpha***B*

uplo CHARACTER*1. Specifies whether the matrix *A* is an upper or lower triangular matrix as follows:

***uplo* value**	**Matrix *A***
U or u	Matrix *A* is an upper triangular matrix.
L or l	Matrix *A* is a lower triangular matrix.

transa CHARACTER*1. Specifies the form of op(*a*) to be used in the matrix multiplication as follows:

***transa* value**	**Form of op(*a*)**
N or n	op(*A*) = *A*
T or t	op(*A*) = *A*'
C or c	op(*A*) = conjg(*A*')

diag CHARACTER*1. Specifies whether or not the matrix *A* is unit triangular as follows:

***diag* value**	**Matrix *A***
U or u	Matrix *A* is assumed to be unit triangular.
N or n	Matrix *A* is not assumed to be unit triangular.

m INTEGER. Specifies the number of rows of *B*. The value of *m* must be at least zero.

n INTEGER. Specifies the number of columns of *B*. The value of *n* must be at least zero.

alpha REAL for strsm
DOUBLE PRECISION for dtrsm
COMPLEX for ctrsm
DOUBLE COMPLEX for ztrsm
Specifies the scalar *alpha*.
When *alpha* is zero, then *a* is not referenced and *b* need not be set before entry.

a REAL for strsm
DOUBLE PRECISION for dtrsm
COMPLEX for ctrsm
DOUBLE COMPLEX for ztrsm
Array, DIMENSION (*lda*, *k*), where *k* is *m* when *side* = 'L' or 'l' and is *n* when *side* = 'R' or 'r'. Before entry with *uplo* = 'U' or 'u', the leading *k* by *k* upper triangular part of the array *a* must contain the upper triangular matrix and the strictly lower triangular part of *a* is not referenced. Before entry with *uplo* = 'L' or 'l', the leading *k* by *k* lower triangular part of the array *a* must contain the lower triangular matrix and the strictly upper triangular part of *a* is not referenced.
When *diag* = 'U' or 'u', the diagonal elements of *a* are not referenced either, but are assumed to be unity.

lda INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. When *side* = 'L' or 'l', then *lda* must be at least max(1, *m*), when *side* = 'R' or 'r', then *lda* must be at least max(1, *n*).

b REAL for strsm
DOUBLE PRECISION for dtrsm
COMPLEX for ctrsm
DOUBLE COMPLEX for ztrsm
Array, DIMENSION (*ldb*, *n*). Before entry, the leading *m*-by-*n* part of the array *b* must contain the right-hand side matrix *B*.

ldb	INTEGER. Specifies the first dimension of *b* as declared in the calling (sub)program. The value of *ldb* must be at least max(1, +*m*).

Output Parameters

b	Overwritten by the solution matrix *X*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine trsm interface are the following:

a	Holds the matrix *A* of size (*k*,*k*) where *k* = *m* if *side* = 'L', *k* = *n* otherwise.
b	Holds the matrix *B* of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
uplo	Must be 'U' or 'L'. The default value is 'U'.
transa	Must be 'N', 'C', or 'T'. The default value is 'N'.
diag	Must be 'N' or 'U'. The default value is 'N'.
alpha	The default value is 1.

Sparse BLAS Level 1 Routines and Functions

This section describes Sparse BLAS Level 1, an extension of BLAS Level 1 included in the Intel® Math Kernel Library beginning with the Intel MKL release 2.1. Sparse BLAS Level 1 is a group of routines and functions that perform a number of common vector operations on sparse vectors stored in compressed form.

Sparse vectors are those in which the majority of elements are zeros. Sparse BLAS routines and functions are specially implemented to take advantage of vector sparsity. This allows you to achieve large savings in computer time and memory. If *nz* is the number of non-zero vector elements, the computer time taken by Sparse BLAS operations will be *O*(*nz*).

Vector Arguments

Compressed sparse vectors. Let a be a vector stored in an array, and assume that the only non-zero elements of a are the following:

$a(k_1), a(k_2), a(k_3) \ldots a(k_{nz}),$

where nz is the total number of non-zero elements in a.

In Sparse BLAS, this vector can be represented in compressed form by two FORTRAN arrays, x (values) and $indx$ (indices). Each array has nz elements:

$x(1)=a(k_1), x(2)=a(k_2), \ldots x(nz)= a(k_{nz}),$

$indx(1)=k_1, indx(2)=k_2, \ldots indx(nz)= k_{nz}.$

Thus, a sparse vector is fully determined by the triple (nz, x, $indx$). If you pass a negative or zero value of nz to Sparse BLAS, the subroutines do not modify any arrays or variables.

Full-storage vectors. Sparse BLAS routines can also use a vector argument fully stored in a single FORTRAN array (a full-storage vector). If y is a full-storage vector, its elements must be stored contiguously: the first element in $y(1)$, the second in $y(2)$, and so on. This corresponds to an increment $incy = 1$ in BLAS Level 1. No increment value for full-storage vectors is passed as an argument to Sparse BLAS routines or functions.

Naming Conventions

Similar to BLAS, the names of Sparse BLAS subprograms have prefixes that determine the data type involved: s and d for single- and double-precision real; c and z for single- and double-precision complex respectively.

If a Sparse BLAS routine is an extension of a "dense" one, the subprogram name is formed by appending the suffix i (standing for indexed) to the name of the corresponding "dense" subprogram. For example, the Sparse BLAS routine `saxpyi` corresponds to the BLAS routine `saxpy`, and the Sparse BLAS function `cdotci` corresponds to the BLAS function `cdotc`.

Routines and Data Types

Routines and data types supported in the Intel MKL implementation of Sparse BLAS are listed in Table 2-4 .

Table 2-4 Sparse BLAS Routines and Their Data Types

Routine/Function	Data Types	Description
?axpyi	s, d, c, z	Scalar-vector product plus vector (routines)
?doti	s, d	Dot product (functions)
?dotci	c, z	Complex dot product conjugated (functions)
?dotui	c, z	Complex dot product unconjugated (functions)
?gthr	s, d, c, z	Gathering a full-storage sparse vector into compressed form *nz*, *x*, *indx* (routines)
?gthrz	s, d, c, z	Gathering a full-storage sparse vector into compressed form and assigning zeros to gathered elements in the full-storage vector (routines)
?roti	s, d	Givens rotation (routines)
?sctr	s, d, c, z	Scattering a vector from compressed form to full-storage form (routines)

BLAS Level 1 Routines That Can Work With Sparse Vectors

The following BLAS Level 1 routines will give correct results when you pass to them a compressed-form array *x*(with the increment *incx*=1):

?asum	sum of absolute values of vector elements
?copy	copying a vector
?nrm2	Euclidean norm of a vector
?scal	scaling a vector
i?amax	index of the element with the largest absolute value for real flavors, or the largest sum |Re*x*(*i*)|+|Im*x*(*i*)| for complex flavors.
i?amin	index of the element with the smallest absolute value for real flavors, or the smallest sum |Re*x*(*i*)|+|Im*x*(*i*)| for complex flavors.

The result *i* returned by i?amax and i?amin should be interpreted as index in the compressed-form array, so that the largest (smallest) value is *x*(*i*); the corresponding index in full-storage array is *indx*(*i*).

You can also call ?roti to compute the parameters of Givens rotation and then pass these parameters to the Sparse BLAS routines ?roti.

?axpyi

Adds a scalar multiple of compressed sparse vector to a full-storage vector.

Syntax

Fortran 77:

```
call saxpyi(nz, a, x, indx, y)
call daxpyi(nz, a, x, indx, y)
call caxpyi(nz, a, x, indx, y)
call zaxpyi(nz, a, x, indx, y)
```

Fortran 95:

```
call axpyi(x, indx, y [, a])
```

Description

The ?axpyi routines perform a vector-vector operation defined as

y := *a***x* + *y*

where:

a is a scalar,

x is a sparse vector stored in compressed form,

y is a vector in full storage form.

The ?axpyi routines reference or modify only the elements of *y* whose indices are listed in the array *indx*.

The values in *indx* must be distinct.

Input Parameters

nz	INTEGER. The number of elements in *x* and *indx*.
a	REAL for saxpyi DOUBLE PRECISION for daxpyi

	COMPLEX for caxpyi DOUBLE COMPLEX for zaxpyi Specifies the scalar *a*.
x	REAL for saxpyi DOUBLE PRECISION for daxpyi COMPLEX for caxpyi DOUBLE COMPLEX for zaxpyi Array, DIMENSION at least *nz*.
indx	INTEGER. Specifies the indices for the elements of *x*. Array, DIMENSION at least *nz*.
y	REAL for saxpyi DOUBLE PRECISION for daxpyi COMPLEX for caxpyi DOUBLE COMPLEX for zaxpyi Array, DIMENSION at least max(*indx(i)*).

Output Parameters

y	Contains the updated vector *y*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine axpyi interface are the following:

x	Holds the vector of length (*nz*).
indx	Holds the vector of length (*nz*).
y	Holds the vector of length (*nz*).
a	The default value is 1.

?doti

Computes the dot product of a compressed sparse real vector by a full-storage real vector.

Syntax

Fortran 77:

```
res = sdoti(nz, x, indx, y )
res = ddoti(nz, x, indx, y )
```

Fortran 95:

```
res = doti(x, indx, y)
```

Description

The ?doti functions return the dot product of *x* and *y* defined as

```
x(1)*y(indx(1)) + x(2)*y(indx(2)) +...+ x(nz)*y(indx(nz))
```

where the triple (*nz*, *x*, *indx*) defines a sparse real vector stored in compressed form, and *y* is a real vector in full storage form. The functions reference only the elements of *y* whose indices are listed in the array *indx*. The values in *indx* must be distinct.

Input Parameters

nz	INTEGER. The number of elements in *x* and *indx* .
x	REAL for sdoti DOUBLE PRECISION for ddoti Array, DIMENSION at least *nz*.
indx	INTEGER. Specifies the indices for the elements of *x*. Array, DIMENSION at least *nz*.
y	REAL for sdoti DOUBLE PRECISION for ddoti Array, DIMENSION at least max(*indx(i)*).

Output Parameters

res	REAL for sdoti DOUBLE PRECISION for ddoti

Contains the dot product of *x* and *y*, if *nz* is positive. Otherwise, *res* contains 0.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine doti interface are the following:

x	Holds the vector of length (*nz*).
indx	Holds the vector of length (*nz*).
y	Holds the vector of length (*nz*).

?dotci

Computes the conjugated dot product of a compressed sparse complex vector with a full-storage complex vector.

Syntax

Fortran 77:

```
res = cdotci(nz, x, indx, y )
res = zdotci(nz, x, indx, y )
```

Fortran 95:

```
res = dotci(x, indx, y)
```

Description

The ?dotci functions return the dot product of *x* and *y* defined as

conjg(*x*(1))**y*(*indx*(1)) + ... + conjg(*x*(*nz*))**y*(*indx*(*nz*))

where the triple (*nz*, *x*, *indx*) defines a sparse complex vector stored in compressed form, and *y* is a real vector in full storage form. The functions reference only the elements of *y* whose indices are listed in the array *indx*. The values in *indx* must be distinct.

Input Parameters

nz	INTEGER. The number of elements in *x* and *indx* .
x	COMPLEX for cdotci DOUBLE COMPLEX for zdotci Array, DIMENSION at least *nz*.
indx	INTEGER. Specifies the indices for the elements of *x*. Array, DIMENSION at least *nz*.
y	COMPLEX for cdotci DOUBLE COMPLEX for zdotci Array, DIMENSION at least max(*indx(i)*).

Output Parameters

res	COMPLEX for cdotci DOUBLE COMPLEX for zdotci Contains the conjugated dot product of *x* and *y*, if *nz* is positive. Otherwise, *res* contains 0.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine dotci interface are the following:

x	Holds the vector of length (*nz*).
indx	Holds the vector of length (*nz*).
y	Holds the vector of length (*nz*).

?dotui

Computes the dot product of a compressed sparse complex vector by a full-storage complex vector.

Syntax

Fortran 77:

```
res = cdotui(nz, x, indx, y )
res = zdotui(nz, x, indx, y )
```

Fortran 95:

```
res = dotui(x, indx, y)
```

Description

The ?dotui functions return the dot product of *x* and *y* defined as

x(1)**y*(*indx*(1)) + *x*(2)**y*(*indx*(2)) +...+ *x*(*nz*)**y*(*indx*(*nz*))

where the triple (*nz*, *x*, *indx*) defines a sparse complex vector stored in compressed form, and *y* is a real vector in full storage form. The functions reference only the elements of *y* whose indices are listed in the array *indx*. The values in *indx* must be distinct.

Input Parameters

nz	INTEGER. The number of elements in *x* and *indx* .
x	COMPLEX for cdotui DOUBLE COMPLEX for zdotui Array, DIMENSION at least *nz*.
indx	INTEGER. Specifies the indices for the elements of *x*. Array, DIMENSION at least *nz*.
y	COMPLEX for cdotui DOUBLE COMPLEX for zdotui Array, DIMENSION at least max(*indx(i)*).

Output Parameters

res	COMPLEX for cdotui DOUBLE COMPLEX for zdotui

Contains the dot product of *x* and *y*, if *nz* is positive. Otherwise, *res* contains 0.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine dotui interface are the following:

x	Holds the vector of length (*nz*).
indx	Holds the vector of length (*nz*).
y	Holds the vector of length (*nz*).

?gthr

Gathers a full-storage sparse vector's elements into compressed form.

Syntax

Fortran 77:

```
call sgthr(nz, y, x, indx )
call dgthr(nz, y, x, indx )
call cgthr(nz, y, x, indx )
call zgthr(nz, y, x, indx )
```

Fortran 95:

```
res = gthr(x, indx, y)
```

Description

The ?gthr routines gather the specified elements of a full-storage sparse vector *y* into compressed form(*nz*, *x*, *indx*). The routines reference only the elements of *y* whose indices are listed in the array *indx*:

x(*i*) = *y*(*indx*(*i*)), for *i*=1,2,... +*nz*.

Input Parameters

nz	INTEGER. The number of elements of *y* to be gathered.
indx	INTEGER. Specifies indices of elements to be gathered. Array, DIMENSION at least *nz*.
y	REAL for sgthr DOUBLE PRECISION for dgthr COMPLEX for cgthr DOUBLE COMPLEX for zgthr Array, DIMENSION at least max(*indx(i)*).

Output Parameters

x	REAL for sgthr DOUBLE PRECISION for dgthr COMPLEX for cgthr DOUBLE COMPLEX for zgthr Array, DIMENSION at least *nz*. Contains the vector converted to the compressed form.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gthr interface are the following:

x	Holds the vector of length (*nz*).
indx	Holds the vector of length (*nz*).
y	Holds the vector of length (*nz*).

?gthrz

Gathers a sparse vector's elements into compressed form, replacing them by zeros.

Syntax

Fortran 77:

```
call sgthrz(nz, y, x, indx )
call dgthrz(nz, y, x, indx )
call cgthrz(nz, y, x, indx )
call zgthrz(nz, y, x, indx )
```

Fortran 95:

```
res = gthrz(x, indx, y)
```

Description

The ?gthrz routines gather the elements with indices specified by the array *indx* from a full-storage vector *y* into compressed form (*nz*, *x*, *indx*) and overwrite the gathered elements of *y* by zeros. Other elements of *y* are not referenced or modified (see also ?gthr).

Input Parameters

nz	INTEGER. The number of elements of *y* to be gathered.
indx	INTEGER. Specifies indices of elements to be gathered. Array, DIMENSION at least *nz*.
y	REAL for sgthrz DOUBLE PRECISION for dgthrz COMPLEX for cgthrz DOUBLE COMPLEX for zgthrz Array, DIMENSION at least max(*indx(i)*).

Output Parameters

x	REAL for sgthrz DOUBLE PRECISION for d gthrz COMPLEX for cgthrz

	DOUBLE COMPLEX for zgthrz Array, DIMENSION at least *nz*. Contains the vector converted to the compressed form.
y	The updated vector *y*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gthrz interface are the following:

x	Holds the vector of length (*nz*).
indx	Holds the vector of length (*nz*).
y	Holds the vector of length (*nz*).

?roti

Applies Givens rotation to sparse vectors one of which is in compressed form.

Syntax

Fortran 77:

```
call sroti(nz, x, indx, y, c, s)
call droti(nz, x, indx, y, c, s)
```

Fortran 95:

```
call roti(x, indx, y [, c] [,s])
```

Description

The ?roti routines apply the Givens rotation to elements of two real vectors, *x* (in compressed form *nz*, *x*, *indx*) and *y* (in full storage form):

```
x(i) = c*x(i) + s*y(indx(i))
y(indx(i)) = c*y(indx(i))- s*x(i)
```

The routines reference only the elements of *y* whose indices are listed in the array *indx*. The values in *indx* must be distinct.

Input Parameters

nz	INTEGER. The number of elements in *x* and *indx*.
x	REAL for sroti DOUBLE PRECISION for droti Array, DIMENSION at least *nz*.
indx	INTEGER. Specifies the indices for the elements of *x*. Array, DIMENSION at least *nz*.
y	REAL for sroti DOUBLE PRECISION for droti Array, DIMENSION at least max(*indx(i)*).
c	A scalar: REAL for sroti DOUBLE PRECISION for droti.
s	A scalar: REAL for sroti DOUBLE PRECISION for droti.

Output Parameters

x and *y*	The updated arrays.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine roti interface are the following:

x	Holds the vector of length (*nz*).
indx	Holds the vector of length (*nz*).
y	Holds the vector of length (*nz*).
c	The default value is 1.
s	The default value is 1.

?sctr

Converts compressed sparse vectors into full storage form.

Syntax

Fortran 77:

```
call ssctr(nz, x, indx, y )
call dsctr(nz, x, indx, y )
call csctr(nz, x, indx, y )
call zsctr(nz, x, indx, y )
```

Fortran 95:

```
call sctr(x, indx, y)
```

Description

The ?sctr routines scatter the elements of the compressed sparse vector (*nz*, *x*, *indx*) to a full-storage vector *y*. The routines modify only the elements of *y* whose indices are listed in the array *indx*:

y(*indx*(*i*) = *x*(*i*), for *i*=1,2,... +*nz*.

Input Parameters

nz	INTEGER. The number of elements of *x* to be scattered.
indx	INTEGER. Specifies indices of elements to be scattered. Array, DIMENSION at least *nz*.
x	REAL for ssctr DOUBLE PRECISION for dsctr COMPLEX for csctr DOUBLE COMPLEX for zsctr Array, DIMENSION at least *nz*. Contains the vector to be converted to full-storage form.

Output Parameters

y	REAL for ssctr

DOUBLE PRECISION for dsctr
COMPLEX for csctr
DOUBLE COMPLEX for zsctr
Array, DIMENSION at least max(*indx(i)*).
Contains the vector *y* with updated elements.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine sctr interface are the following:

x	Holds the vector of length (*nz*).
indx	Holds the vector of length (*nz*).
y	Holds the vector of length (*nz*).

Sparse BLAS Level 2 and Level 3

This section describes Sparse BLAS Level 2 and Level 3 included in the Intel® Math Kernel Library. Sparse BLAS Level 2 is a group of routines and functions that perform operations on a sparse matrix and dense vectors. Sparse BLAS Level 3 is a group of routines and functions that perform operations on a sparse matrix and a dense matrices.

Sparse matrix is a matrix in which the majority of elements are zeros. Intel MKL sparse BLAS routines and functions are specially implemented to take advantage of matrix sparsity. This allows to achieve large savings in computer time and memory. The sparse BLAS routines can be considered as building blocks for "Iterative Sparse Solvers based on Reverse Communication Interface (RCI ISS)" in Chapter 8 of the manual.

Naming Conventions in Sparse BLAS Level 2 and Level 3

Each Sparse BLAS routine has a six- or eight-characters base name preceding with the prefix mkl_ (mkl_cspblas_ for routines with simplified interface and zero-based indexing). The routines with standard interfaces have six-characters base names, the routines with simplified interfaces have eight-characters base names in accordance with the templates:

```
mkl<character code> <data> <operation>( )
```

or

```
mkl<character code> <data> <mtype> <operation>( )
```

```
mkl_cspblas_<character code> <data> <mtype> <operation>( )
```

The <character code> is a character that indicates the data type:

s	real, single precision
c	complex, single precision
d	real, double precision
z	complex, double precision

NOTE. Current version of the Intel MKL Sparse BLAS supports only real data with double precision.

The <data> field indicates the data structure of the sparse matrix (see section Sparse Matrix Data Structures):

coo	coordinate format
csr	compressed sparse row format and its variations
csc	compressed sparse column format and its variations
dia	diagonal format
sky	skyline storage format
bsr	block sparse row format and its variations

The <operation> field indicates the type of operation.

mv	matrix-vector product (Level 2)
mm	matrix-matrix product (Level 3)
sm	solving a single triangular system (Level 2)
sm	solving triangular systems with multiple right-hand sides (Level 3)

An optional field <mtype> indicates a matrix type and used in the routines with simplified interfaces:

ge	sparse representation of a general matrix
sy	sparse representation of the upper or lower triangle of a symmetric matrix
tr	sparse representation of a triangular matrix

Sparse Matrix Data Structures

In the current version of Intel MKL sparse BLAS Level 2 and Level 3 the following point entry [Duff86] sparse matrix data structures are supported:

- compressed sparse row format(CSR) and its variation;
- compressed sparse column format(CSC);
- coordinate format;
- diagonal format;
- skyline storage format.
- block sparse row format(BSR) and its variations.

For more information on matrix storage schemes, see "Sparse Storage Formats for Sparse BLAS Levels 2-3" in Appendix A.

Routines and Supported Operations

This section describes two main types of routines and supported operations. The following notations are used here:

A - is a sparse matrix;

B and *C* - are dense matrices;

D - is a diagonal scaling matrix;

x and *y* - are dense vectors;

alpha and *beta* - are scalars;

op(*A*) is one of the possible operations:

op(*A*) = *A*;

op(*A*) = *A*' - transpose of *A*;

op(*A*) = conj(*A*') - conjugated transpose of *A*.

Complete list of all routines is given in the Table 2-9 .

Routines with Standard Interface

Intel MKL Sparse BlAS routines support the following operations:

Level 2.

- computing a sparse matrix-dense vector product:
  `y := alpha*op(A)*x + beta*y`
- solving a single triangular system:
  `y := alpha*inv(op(A))*x`

Level 3.

- computing a sparse matrix-dense matrix product:
  `C := alpha*op(A)*B + beta*C`
- solving a sparse triangular system with multiple right-hand sides:
  `C := alpha*inv(op(A))*B`

These routines have native interface that differs from the interface used in the NIST Sparse BLAS library [Rem05]. Detailed consideration of these differences can be found in the section Interface Consideration.

Routines with Simplified Interface

Some software packages and libraries (PARDISO package used in the Intel MKL, Sparskit 2 [Saad94], Compaq Extended Math Library (CXML)[CXML01]) use different (early) variation of the CSR format and support only level 2 operations with simplified interfaces. Intel MKL provides a set of level 2 routines with similar simplified interfaces. Each of these routines operates on a matrix of the fixed type. The following operations are supported:

`y :=op(A)*x` (general and symmetric matrices)

`y := inv(op(A))*x` (triangular matrices)

Matrix type is indicated by the field <*mtype*> in the routine name (see section Naming Conventions in Sparse BLAS Level 2 and Level 3).

The detail consideration of interfaces for these routines is given in the Interface Consideration section.

These routines can operate only with four sparse data storage formats, specifically:

CSR format in variation accepted in `PARDISO` and `CXML`;

DIA format accepted in `CXML`;

COO format.

BSR format.

Note that routines in both groups described above use the same computational kernel routines that work with certain internal data structures.

Interface Consideration

Differences Between Intel MKL and NIST Interfaces

The Intel MKL Sparse BLAS Level 3 routines have the following standard interfaces:

`mkl_xyyymm(transa, m, n, k, alpha, matdescra, arg(A), b, ldb, beta, c, ldc)`, for matrix-matrix product;

`mkl_xyyysm(transa, m, n, alpha, matdescra, arg(A), b, ldb, c, ldc)`, for triangular solvers with multiple right-hand sides.

Here `x` denotes data type, and *yyy* - sparse matrix data structure (storage format).

The analogous NIST Sparse BLAS (NSB) library routines have the following interfaces:

`xyyymm(transa, m, n, k, alpha, descra, arg(A), b, ldb, beta, c, ldc, work, lwork)`, for matrix-matrix product;

`xyyysm(transa, m, n, unitd, dv, alpha, descra, arg(A), b, ldb, beta, c, ldc, work, lwork)`, for triangular solvers with multiple right-hand sides.

Some similar arguments are used in both libraries. The argument *transa* indicates how to operate with the matrix and is slightly different in the NSB library (see Table 2-5). The arguments *m* and *k* are the number of rows and column in the matrix *A*, respectively, *n* is the number of columns in the matrix *C*. The arguments *alpha* and *beta* are scalar *alpha* and *beta* respectively. (*beta* is not used in the Intel MKL triangular solvers.) The arguments *b* and *c* are rectangular arrays with the first dimension *ldb* and *ldc*, respectively. The symbol `arg(A)` denotes the list of arguments that describe the sparse representation of *A*.

Table 2-5 Parameter *transa*

	MKL interface	NSB interface	Operation
data type	CHARACTER*1	INTEGER	
value	N or n	0	`op(A) = A`

MKL interface	NSB interface	Operation
T or t	1	op(*A*) = *A*'
C or c	2	op(*A*) = *A*'

The argument *matdescra* describes the relevant characteristics of the matrix *A*.

It corresponds to the argument *descra* from NSB library (see Table 2-6 for more details).

Table 2-6 Possible Values of the Parameter *matdescra* (*descra*)

	MKL interface		NSB interface	Matrix characteristics
	one-based indexing	zero-based indexing		
data type	CHARACTER	Char	INTEGER	
1st element	*matdescra*(1)	*Matdescra*[0]	*descra*(1)	matrix structure
value	G	G	0	general
	S	S	1	symmetric (*A* = *A*')
	H	H	2	Hermitian (*A*=conjg(*A*'))
	T	T	3	triangular
	A	A	4	skew(anti)-symmetric (*A*=-*A*')
	D	D	5	diagonal
2nd element	*matdescra*(2)	*Matdescra*[1]	*descra*(2)	upper/lower triangular indicator
value	L	L	1	lower
	U	U	2	upper
3rd element	*matdescra*(3)	*Matdescra*[2]	*descra*(3)	main diagonal type

	MKL interface		NSB interface	Matrix characteristics
value	N	N	0	non-unit
	U	U	1	unit
4th element	*matdescra*(4)	*Matdescra*[3]		type of indexing
value	F			one-based indexing
		C		zero-based indexing

Note that *matdescra* has some specifics in the Intel MKL routines. In particular, for routines that perform matrix-matrix and matrix-vector multiplication, they are as follows:

for general matrices (*matdescra*(1)='G', values of *matdescra*(2) and *matdescra*(3) are ignored;

for skew-symmetrical matrices (*matdescra*(1)='A', values of *matdescra*(3) are ignored;

for diagonal matrices (*matdescra*(1)='D', values of *matdescra*(2) are ignored;

If *matdescra*(1) is not set to 'G' or 'T', and *matdescra*(2) and *matdescra*(3) are not defined, then the following default values are assigned: *matdescra*(2)='L' and *matdescra*(3)='N';

matdescra(1)='G' is not supported for the routines operating with the skyline storage format.

For triangular solvers if *matdescra*(1)='D', then *matdescra*(2) is ignored.

For triangular solvers Intel MKL supports only *matdescra*(1)=T,D;

For both multiplication routines and triangular solvers when *matdescra*(3)='U', and the sparse matrix is not in the skyline format, then non-zero diagonal elements can be stored in the sparse representation even if they are non-unit; when the sparse matrix is in the skyline format, the diagonal elements must be stored in the sparse representation even if they are zero.

The current version of NSB library supports only *descra*(1) for matrix-matrix multiplication; *descra*(2), *descra*(3) are supported for triangular solvers only if *descra*(1)=3.

The argument *work* is a work array, and *lwork* is its dimension.

These arguments are not used in the Intel MKL.

The arguments *unitd* and *dv* are used only in NSB triangular solvers. First of them indicates whether or not the diagonal matrix *D* is unitary. If *unitd*=1, *D* is the identity matrix. The linear array *dv* contains the diagonal scaling matrix *D* if the argument *unitd* = 2 (the rows of *A* are scaled) or *unitd* = 3 (the columns of *A* are scaled).

Simplified Interfaces

The Intel MKL Sparse BLAS Level 2 routines with simplified interfaces have the following interfaces (x denotes data type, and *yyy* - sparse matrix storage format):

one-based indexing

mkl_xyyygemv(*transa*, *m*, arg(*A*), *x*, *y*), matrix-vector product for general sparse matrices;

mkl_xyyysymv(*uplo*, *transa*, *m*, arg(*A*), *x*, *y*), matrix-vector product for symmetrical sparse matrix;

mkl_xyyytrsv(*uplo*, *transa*, *diag*, *m*, arg(*A*), *x*, *y*) solution of the systems of equations with a sparse triangular matrix.

zero-based indexing

mkl_cspblas_xyyygemv(*transa*, *m*, arg(*A*), *x*, *y*), matrix-vector product for general sparse matrices;

mkl_cspblas_xyyysymv(*uplo*, *transa*, *m*, arg(*A*), *x*, *y*), matrix-vector product for symmetrical sparse matrix;

mkl_cspblas_xyyytrsv(*uplo*, *transa*, *diag*, *m*, arg(*A*), *x*, *y*) solution of the systems of equations with a sparse triangular matrix.

The argument *transa* indicates how to operate with the matrix (see Table 2-5). The argument *uplo* specifies whether an upper or low triangle of the sparse matrix will be considered. The argument *diag* specifies whether *A* is a unit triangular or not. The arguments *m* is the number of rows in the matrix *A*. The arg(*A*) denotes the list of arguments that describe the sparse representation of *A*.

The array *x* contains the input vector, and the array *y* contains the result of the performed operation.

Note that all routines for matrix-vector multiplication are able to extract triangles and/or a main diagonal from a sparse representation of the matrix *A*.

Operations with Partial Matrices

One of the distinctive feature of the Intel MKL Sparse BLAS routines is a possibility to perform operations only on certain parts (triangles and main diagonal) of the input sparse matrix specifying the parameter *matdescra*. Assume that the sparse matrix *A* can be decomposed as

A = L + D + U

where *L* is the strict lower triangle of *A*, *U* is the strict upper triangle of *A*, *D* is the main diagonal.

Table 2-7 shows correspondence between the output matrix for matrix-matrix multiplication routines and values of *matdescra* for real sparse matrix *A*. Analogous correspondence exists for matrix-vector multiplication routines.

Table 2-7 Correspondence Between Output Matrix and Values of *matdescra* (Routines for Matrix-Matrix Multiplication)

matdescra(1)	matdescra(2)	matdescra(3)	Output Matrix
G	ignored	ignored	*alpha**op(*A*)**B* + *beta***C*
S or H	L	N	*alpha**op(*L+D+L'*)**B* + *beta***C*

T	U	N	*alpha**inv(op(*U*+*U*))**B*
T	U	U	*alpha**inv(op(*U*+*U*))**B*
D	ignored	N	*alpha**inv(*D*)**B*
D	ignored	U	*alpha***B*

Restrictions for Triangular Solver Routines

There are important restrictions for all Intel MKL triangular solvers, specifically:

Column indices for the compressed sparse row format must be sorted in increasing order for each row;

Row indices for the compressed sparse column format must be sorted in increasing order for each column;

For the diagonal format, elements of the array containing the diagonal numbers of the non-zero diagonals of a sparse matrix must be sorted in increasing order.

Sparse BLAS Level 2 and Level 3 Routines.

Table 2-9 lists the sparse BLAS Level 2 and Level 3 routines described in more detail later in this section.

Table 2-9 Sparse BLAS Level 2 and Level 3 Routines

Routine/Function	Description
Level 2	
mkl_dcsrmv	Computes matrix - vector product of a sparse matrix stored in the CSR format.
mkl_dcsrgemv	Computes matrix - vector product of a sparse general matrix stored in the CSR format (PARDISO variation)
mkl_dcsrsymv	Computes matrix - vector product of a sparse symmetrical matrix stored in the CSR format (PARDISO variation)
mkl_cspblas_dcsrsymv	Computes matrix - vector product of a sparse symmetrical matrix stored in the CSR format (PARDISO variation) with zero-based indexing
mkl_dcscmv	Computes matrix - vector product for a sparse matrix in CSC format.
mkl_dcoomv	Computes matrix - vector product for a sparse matrix in the coordinate format.
mkl_dcoogemv	Computes matrix - vector product of a sparse general matrix stored in the coordinate format.
mkl_dcoosymv	Computes matrix - vector product of a sparse symmetrical matrix stored in the coordinate format.
mkl_ddiamv	Computes matrix - vector product of a sparse matrix stored in the diagonal format.
mkl_ddiagemv	Computes matrix - vector product of a sparse general matrix stored in the diagonal format.
mkl_ddiasymv	Computes matrix - vector product of a sparse symmetrical matrix stored in the diagonal format.
mkl_dskymv	Computes matrix - vector product for a sparse matrix in the skyline storage format.
mkl_dbsrmv	Computes matrix - vector product of a sparse matrix stored in the BSR format.

Routine/Function	Description
mkl_dbsrsymv	Computes matrix - vector product of a sparse symmetrical matrix stored in the BSR format (PARDISO variation).
mkl_cspblas_dbsrsymv	Computes matrix - vector product of a sparse symmetrical matrix stored in the BSR format (PARDISO variation) with zero-based indexing.
mkl_dcsrsv	Solves a system of linear equations for a sparse matrix in the CSR format.
mkl_dcsrtrsv	Triangular solvers with simplified interface for a sparse matrix in the CSR format (PARDISO variation).
mkl_dcscsv	Solves a system of linear equations for a sparse matrix in the compressed sparse column format.
mkl_dcoosv	Solves a system of linear equations for a sparse matrix in the coordinate format.
mkl_dcootrsv	Triangular solvers with simplified interface for a sparse matrix in the coordinate format.
mkl_ddiasv	Solves a system of linear equations for a sparse matrix in the diagonal format.
mkl_ddiatrsv	Triangular solvers with simplified interface for a sparse matrix in the diagonal format.
mkl_dskysv	Solves a system of linear equations for a sparse matrix in the skyline format.
Level 3	
mkl_dcsrmm	Computes matrix - matrix product of a sparse matrix stored in the compressed sparse row format
mkl_dcscmm	Computes matrix - matrix product of a sparse matrix stored in the compressed sparse column format
mkl_dcoomm	Computes matrix - matrix product of a sparse matrix stored in the coordinate format.

Routine/Function	Description
mkl_ddiamm	Computes matrix - matrix product of a sparse matrix stored in the diagonal format.
mkl_dskymm	Computes matrix - matrix product of a sparse matrix stored in the skyline storage format.
mkl_dcsrsm	Solves a system of linear matrix equations for a sparse matrix in the CSR format.
mkl_dcscsm	Solves a system of linear matrix equations for a sparse matrix in the CSC format.
mkl_dcoosm	Solves a system of linear matrix equations for a sparse matrix in the coordinate format.
mkl_ddiasm	Solves a system of linear matrix equations for a sparse matrix in the diagonal format.
mkl_dskysm	Solves a system of linear matrix equations for a sparse matrix stored in the skyline storage format.

mkl_dcsrmv

Computes matrix - vector product of a sparse matrix stored in the CSR format.

Syntax

Fortran:

```
call mkl_dcsrmv(transa, m, k, alpha, matdescra, val, indx, pntrb, pntre, x, beta, y)
```

C:

```
mkl_dcsrmv(&transa, &m, &k, &alpha, matdescra, val, indx, pntrb, pntre, x, &beta, y);
```

Description

The mkl_dcsrmv routine performs a matrix-vector operation defined as

*y := alpha*A*x + beta*y*

or

*y := alpha*A'*x + beta*y*,

where:

alpha and *beta* are scalars,

x and *y* are vectors,

A is an *m*-by-*k* sparse matrix in the CSR format, *A'* is the transpose of *A*.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the Fortran 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation to be performed. If *transa* = 'N' or 'n', the matrix-vector product is computed as *y := alpha*A*x + beta*y* If *transa* = 'T' or 't' or 'C' or 'c', the matrix-vector product is computed as *y := alpha*A'*x + beta*y*,
m	INTEGER. Number of rows of the matrix *A*.
k	INTEGER. Number of columns of the matrix *A*.
alpha	REAL*8. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in the Table 2-6 .
val	REAL*8. Array containing non-zero elements of the matrix *A*. Its length is *pntre*(m – *pntrb*(1). Refer to *values* array description in CSR Format for more details.
indx	INTEGER. Array containing the column indices for each non-zero element of the matrix *A*.Its length is equal to length of the *val* array.

	Refer to *columns* array description in CSR Format for more details.
pntrb	INTEGER. Array of length *m*, contains row indices, such that *pntrb*(*i*) – *pntrb*(1)+1 is the first index of row *i* in the arrays *val* and *indx*. Refer to *pointerb* array description in CSR Format for more details.
pntre	INTEGER. Array of length *m*, contains row indices, such that *pntre*(*i*) – *pntrb*(1) is the last index of row *i* in the arrays *val* and *indx*. Refer to *pointerE* array description in CSR Format for more details.
x	REAL*8. Array, DIMENSION at least *k* if *transa* = 'N' or 'n' and at least *m* otherwise. Before entry, the array *x* must contain the vector *x*.
beta	REAL*8. Specifies the scalar *beta*.
y	REAL*8. Array, DIMENSION at least *m* if *transa* = 'N' or 'n' and at least *k* otherwise. Before entry, the array *y* must contain the vector *y*.

Output Parameters

y	Overwritten by the updated vector *y*.

Interfaces

Fortran 77:

```
SUBROUTINE mkl_dcsrmv(transa, m, k, alpha, matdescra, val, indx,
 pntrb, pntre, x, beta, y)
  CHARACTER*1   transa
  CHARACTER     matdescra(*)
```

```
INTEGER        m, k
INTEGER        indx(*), pntrb(m), pntre(m)
REAL*8         alpha, beta
REAL*8         val(*), x(*), y(*)
```

C:

```
void mkl_dcsrmv(char *transa, int *m, int *k, double *alpha, char *matdescra,
 double *val, int *indx, int *pntrb, int *pntre, double *x, double *beta,
double *y);
```

mkl_dcsrgemv

Computes matrix - vector product of a sparse general matrix stored in the CSR format (PARDISO variation).

Syntax

Fortran:

```
call mkl_dcsrgemv(transa, m, a, ia, ja, x, y)
```

C:

```
mkl_dcsrgemv(&transa, &m, a, ia, ja, x, y);
```

Description

The `mkl_dcsrgemv` routine performs a matrix-vector operation defined as

`y := A*x`

or

`y := A'*x`,

where:

`x` and `y` are vectors,

`A` is an `m`-by-`m` sparse square matrix in the CSR format (PARDISO variation), `A'` is the transpose of `A`.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the Fortran 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation to be performed. If *transa* = 'N' or 'n', the matrix-vector product is computed as *y* := *A*x* If *transa* = 'T' or 't' or 'C' or 'c', the matrix-vector product is computed as *y* := *A'*x*,
m	INTEGER. Number of rows of the matrix *A*.
a	REAL*8. Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.
ia	INTEGER. Array of length *m* + 1, containing indices of elements in the array *a*, such that *ia*(*i*) is the index in the array *a* of the first non-zero element from the row *i*. The value of the last element *ia*(*m* + 1)−1 is equal to the number of non-zeros plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.
ja	REAL*8. Array containing the column indices for each non-zero element of the matrix *A*. Its length is equal to the length of the array *a*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.
x	REAL*8. Array, DIMENSION is *m*. Before entry, the array *x* must contain the vector *x*.

Output Parameters

y	REAL*8. Array, DIMENSION at least *m*. On exit, the array *y* must contain the vector *y*.

Interfaces

Fortran 77:

```
SUBROUTINE mkl_dcsrgemv(transa, m, a, ia, ja, x, y)
   CHARACTER*1  transa
   INTEGER      m
   INTEGER      ia(*), ja(*)
   REAL*8       a(*), x(*), y(*)
```

C:

```
void mkl_dcsrgemv(char *transa, int *m, double *a, int *ia, int *ja, double
 *x, double *y);
```

mkl_dcsrsymv

Computes matrix - vector product of a sparse symmetrical matrix stored in the CSR format (PARDISO variation).

Syntax

Fortran:

```
call mkl_dcsrsymv(uplo, m, a, ia, ja, x, y)
```

C:

```
mkl_dcsrsymv(&uplo, &m, a, ia, ja, x, y);
```

Description

The `mkl_dcsrsymv` routine performs a matrix-vector operation defined as

y := *A*x*

or

y := *A'*x*,

where:

x and *y* are vectors,

A is an upper or lower triangle of the symmetrical sparse matrix in the CSR format (PARDISO variation), *A'* is the transpose of *A*.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the Fortran 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

uplo	CHARACTER*1. Specifies whether the upper or low triangle of the matrix *A* is considered. If *uplo* = 'U' or 'u', the upper triangle of the matrix *A* is used. If *uplo* = 'L' or 'l', the low triangle of the matrix *A* is used.
m	INTEGER. Number of rows of the matrix *A*.
a	REAL*8. Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.
ia	INTEGER. Array of length *m* + 1, containing indices of elements in the array *a*, such that *ia(i)* is the index in the array *a* of the first non-zero element from the row *i*. The value of the last element *ia(m* + 1)–1 is equal to the number of non-zeros plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.
ja	REAL*8. Array containing the column indices for each non-zero element of the matrix *A*. Its length is equal to the length of the array *a*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.
x	REAL*8. Array, DIMENSION is *m*. Before entry, the array *x* must contain the vector *x*.

Output Parameters

y	REAL*8. Array, DIMENSION at least *m*. On exit, the array *y* must contain the vector *y*.

Interfaces

Fortran 77:

```
SUBROUTINE mkl_dcsrsymv(uplo, m, a, ia, ja, x, y)
   CHARACTER*1  uplo
   INTEGER      m
   INTEGER      ia(*), ja(*)
   REAL*8       a(*), x(*), y(*)
```

C:

```
void mkl_dcsrsymv(char *uplo, int *m, double *a, int *ia, int *ja, double
*x, double *y);
```

mkl_cspblas_dcsrsymv

Computes matrix - vector product of a sparse symmetrical matrix stored in the CSR format (PARDISO variation) with zero-based indexing.

Syntax

Fortran:

```
call mkl_cspblas_dcsrsymv(uplo, m, a, ia, ja, x, y)
```

C:

```
mkl_cspblas_dcsrsymv(&uplo, &m, a, ia, ja, x, y);
```

Description

The mkl_cspblas_dcsrsymv routine performs a matrix-vector operation defined as

*y := A*x*

or

y := *A*'**x*,

where:

x and *y* are vectors,

A is an upper or lower triangle of the symmetrical sparse matrix in the CSR format (PARDISO variation) with zero-based indexing, *A*' is the transpose of *A*.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the Fortran 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

uplo	CHARACTER*1. Specifies whether the upper or low triangle of the matrix *A* is considered. If *uplo* = 'U' or 'u', the upper triangle of the matrix *A* is used. If *uplo* = 'L' or 'l', the low triangle of the matrix *A* is used.
m	INTEGER. Number of rows of the matrix *A*.
a	REAL*8. Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.
ia	INTEGER. Array of length *m* + 1, containing indices of elements in the array *a*, such that *ia*(*i*) is the index in the array *a* of the first non-zero element from the row *i*. The value of the last element *ia*(*m* + 1) is equal to the number of non-zeros. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.
ja	REAL*8. Array containing the column indices for each non-zero element of the matrix *A*. Its length is equal to the length of the array *a*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.
x	REAL*8.

Array, DIMENSION is *m*.
Before entry, the array *x* must contain the vector *x*.

Output Parameters

y REAL*8.
Array, DIMENSION at least *m*.
On exit, the array *y* must contain the vector *y*.

Interfaces

Fortran 77:

```
SUBROUTINE mkl_cspblas_dcsrsymv(uplo, m, a, ia, ja, x, y)
   CHARACTER*1  uplo
   INTEGER      m
   INTEGER      ia(*), ja(*)
   REAL*8       a(*), x(*), y(*)
```

C:

```
void mkl_cspblas_dcsrsymv(char *uplo, int *m, double *a, int *ia, int *ja,
double *x, double *y);
```

mkl_dcscmv

Computes matrix - vector product for a sparse matrix in the compressed sparse column format.

Syntax

Fortran:

```
call mkl_dcscmv(transa, m, k, alpha, matdescra, val, indx, pntrb, pntre, x,
beta, y)
```

C:

```
mkl_dcscmv(&transa, &m, &k, &alpha, matdescra, val, indx, pntrb, pntre, x,
&beta, y);
```

Description

The mkl_dcscmv routine performs a matrix-vector operation defined as

*y := alpha*A*x + beta*y*

or

*y := alpha*A'*x + beta*y*,

where:

alpha and *beta* are scalars,

x and *y* are vectors,

A is an *m*-by-*k* sparse matrix in compressed sparse column format, *A'* is the transpose of *A*.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the Fortran 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation to be performed. If *transa* = 'N' or 'n', the matrix-vector product is computed as *y := alpha*A*x + beta*y* If *transa* = 'T' or 't' or 'C' or 'c', the matrix-vector product is computed as *y := alpha*A'*x + beta*y*,
m	INTEGER. Number of rows of the matrix *A*.
k	INTEGER. Number of columns of the matrix *A*.
alpha	REAL*8. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in the Table 2-6 .
val	REAL*8. Array containing non-zero elements of the matrix *A*. Its length is *pntre*(*k*) – *pntrb*(1). Refer to *values* array description in CSC Format for more details.
indx	INTEGER. Array containing the row indices for each non-zero element of the matrix *A*.Its length is equal to length of the *val* array.

	Refer to *rows* array description in CSC Format for more details.
pntrb	INTEGER. Array of length *k*, contains row indices, such that *pntrb*(*i*) – *pntrb*(1)+1 is the starting index of column *i* in the arrays *val* and *indx*. Refer to *pointerb* array description in CSC Format for more details.
pntre	INTEGER. Array of length *k*, contains row indices, such that *pntre*(*i*) – *pntrb*(1) is the last index of column *i* in the arrays *val* and *indx*. Refer to *pointerE* array description in CSC Format for more details.
x	REAL*8. Array, DIMENSION at least *k* if *transa* = 'N' or 'n' and at least *m* otherwise. Before entry, the array *x* must contain the vector *x*.
beta	REAL*8. Specifies the scalar *beta*.
y	REAL*8. Array, DIMENSION at least *m* if *transa* = 'N' or 'n' and at least *k* otherwise. Before entry, the array *y* must contain the vector *y*.

Output Parameters

y	Overwritten by the updated vector *y*.

Interfaces

Fortran 77:

```
SUBROUTINE mkl_dcscmv(transa, m, k, alpha, matdescra, val, indx, pntrb,
pntre, x, beta, y)

  CHARACTER*1   transa

  CHARACTER     matdescra(*)
```

```
INTEGER        m, k, ldb, ldc
INTEGER        indx(*), pntrb(m), pntre(m)
REAL*8         alpha, beta
REAL*8         val(*), x(*), y(*)
```

C:

```
void mkl_dcscmv(char *transa, int *m, int *k, double *alpha, char *matdescra,
 double *val, int *indx, int *pntrb, int *pntre, double *x, double *beta,
double *y);
```

mkl_dcoomv

Computes matrix - vector product for a sparse matrix in the coordinate format.

Syntax

Fortran:

```
call mkl_dcoomv(transa, m, k, alpha, matdescra, val, rowind, colind, nnz, x,
beta, y)
```

C:

```
mkl_dcoomv(&transa, &m, &k, &alpha, matdescra, val, rowind, colind, &nnz, x,
&beta, y);
```

Description

The `mkl_dcoomv` routine performs a matrix-vector operation defined as

*y := alpha*A*x + beta*y*

or

*y := alpha*A'*x + beta*y*,

where:

alpha and *beta* are scalars,

x and *y* are vectors,

A is an *m*-by-*k* sparse matrix in compressed coordinate format, *A'* is the transpose of *A*.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the Fortran 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation to be performed. If *transa* = 'N' or 'n', the matrix-vector product is computed as *y* := *alpha*A*x* + *beta*y* If *transa* = 'T' or 't' or 'C' or 'c', the matrix-vector product is computed as *y* := *alpha*A'*x* + *beta*y*,
m	INTEGER. Number of rows of the matrix *A*.
k	INTEGER. Number of columns of the matrix *A*.
alpha	REAL*8. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in the Table 2-6 .
val	REAL*8. Array of length *nnz*, contains non-zero elements of the matrix *A* in the arbitrary order. Refer to *values* array description in Coordinate Format for more details.
rowind	INTEGER. Array of length *nnz*, contains the row indices for each non-zero element of the matrix *A*. Refer to *rows* array description in Coordinate Format for more details.
colind	INTEGER. Array of length *nnz*, contains the column indices for each non-zero element of the matrix *A*. Refer to *columns* array description in Coordinate Format for more details.
nnz	INTEGER. Specifies the number of non-zero element of the matrix *A*. Refer to *nnz* description in Coordinate Format for more details.
x	REAL*8. Array, DIMENSION at least *k* if *transa* = 'N' or 'n' and at least *m* otherwise. Before entry, the array *x* must contain the vector *x*.
beta	REAL*8. Specifies the scalar *beta*.

y	REAL*8. Array, DIMENSION at least *m* if *transa* = 'N' or 'n' and at least *k* otherwise. Before entry, the array *y* must contain the vector *y*.

Output Parameters

y	Overwritten by the updated vector *y*.

Interfaces

Fortran 77:

```
SUBROUTINE mkl_dcoomv(transa, m, k, alpha, matdescra, val, rowind, colind,
nnz, x, beta, y)

  CHARACTER*1   transa

  CHARACTER     matdescra(*)

  INTEGER       m, k, nnz

  INTEGER       rowind(*), colind(*)

  REAL*8        alpha, beta

  REAL*8        val(*), x(*), y(*)
```

C:

```
void mkl_dcoomv(char *transa, int *m, int *k, double *alpha, char *matdescra,
 double  *val, int *rowind, int *colind, int *nnz, double *x, double *beta,
 double *y);
```

mkl_dcoogemv

Computes matrix - vector product of a sparse general matrix stored in the coordinate format.

Syntax

Fortran:

```
call mkl_dcoogemv(transa, m, val, rowind, colind, nnz, x, y)
```

C:

```
mkl_dcoogemv(&transa, &m, val, rowind, colind, &nnz, x, y);
```

Description

The `mkl_dcoogemv` routine performs a matrix-vector operation defined as

y := *A***x*

or

y := *A*'**x*,

where:

x and *y* are vectors,

A is an *m*-by-*m* sparse square matrix in the coordinate format, *A*' is the transpose of *A*.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the Fortran 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation to be performed. If *transa* = 'N' or 'n', the matrix-vector product is computed as *y* := *A***x* If *transa* = 'T' or 't' or 'C' or 'c', the matrix-vector product is computed as *y* := *A*'**x*,
m	INTEGER. Number of rows of the matrix *A*.
val	REAL*8. Array of length *nnz*, contains non-zero elements of the matrix *A* in the arbitrary order. Refer to *values* array description in Coordinate Format for more details.
rowind	INTEGER. Array of length *nnz*, contains the row indices for each non-zero element of the matrix *A*. Refer to *rows* array description in Coordinate Format for more details.
colind	INTEGER. Array of length *nnz*, contains the column indices for each non-zero element of the matrix *A*. Refer to *columns* array description in Coordinate Format for more details.

nnz	INTEGER. Specifies the number of non-zero element of the matrix *A*. Refer to *nnz* description in Coordinate Format for more details.
x	REAL*8. Array, DIMENSION is *m*. Before entry, the array *x* must contain the vector *x*.

Output Parameters

y	REAL*8. Array, DIMENSION at least *m*. On exit, the array *y* must contain the vector *y*.

Interfaces

Fortran 77:

```
SUBROUTINE mkl_dcoogemv(transa, m, val, rowind, colind, nnz, x, y)

  CHARACTER*1   transa

  INTEGER       m, nnz

  INTEGER       rowind(*), colind(*)

  REAL*8        val(*), x(*), y(*)
```

C:

```
void mkl_dcoogemv(char *transa, int *m, double  *val, int *rowind, int
*colind, int *nnz, double *x, double *y);
```

mkl_dcoosymv

Computes matrix - vector product of a sparse symmetrical matrix stored in the coordinate format.

Syntax

Fortran:

```
call mkl_dcoosymv(uplo, m, val, rowind, colind, nnz, x, y)
```

C:

```
mkl_dcoosymv(&uplo, &m, val, rowind, colind, &nnz, x, y);
```

Description

The `mkl_dcoosymv` routine performs a matrix-vector operation defined as

y := *A***x*

or

y := *A*'**x*,

where:

x and *y* are vectors,

A is an upper or lower triangle of the symmetrical sparse matrix in the coordinate format, *A*' is the transpose of *A*.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the Fortran 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

uplo	CHARACTER*1. Specifies whether the upper or low triangle of the matrix *A* is considered. If *uplo* = 'U' or 'u', the upper triangle of the matrix *A* is used. If *uplo* = 'L' or 'l', the low triangle of the matrix *A* is used.
m	INTEGER. Number of rows of the matrix *A*.
val	REAL*8. Array of length *nnz*, contains non-zero elements of the matrix *A* in the arbitrary order. Refer to *values* array description in Coordinate Format for more details.
rowind	INTEGER. Array of length *nnz*, contains the row indices for each non-zero element of the matrix *A*. Refer to *rows* array description in Coordinate Format for more details.

colind	INTEGER. Array of length *nnz*, contains the column indices for each non-zero element of the matrix *A*. Refer to *columns* array description in Coordinate Format for more details.
nnz	INTEGER. Specifies the number of non-zero element of the matrix *A*. Refer to *nnz* description in Coordinate Format for more details.
x	REAL*8. Array, DIMENSION is *m*. Before entry, the array *x* must contain the vector *x*.

Output Parameters

y	REAL*8. Array, DIMENSION at least *m*. On exit, the array *y* must contain the vector *y*.

Interfaces

Fortran 77:

```
SUBROUTINE mkl_dcoosymv(uplo, m, val, rowind, colind, nnz, x, y)
  CHARACTER*1   uplo
  INTEGER       m, nnz
  INTEGER       rowind(*), colind(*)
  REAL*8        val(*), x(*), y(*)
```

C:

```
void mkl_dcoosymv(char *uplo, int *m, double  *val, int *rowind, int *colind,
 int *nnz, double *x, double *y);
```

mkl_ddiamv

Computes matrix - vector product for a sparse matrix in the diagonal format.

Syntax

Fortran:

```
call mkl_ddiamv(transa, m, k, alpha, matdescra, val, lval, idiag, ndiag, x, beta, y)
```

C:

```
mkl_ddiamv(&transa, &m, &k, &alpha, matdescra, val, &lval, idiag, &ndiag, x, &beta, y);
```

Description

The `mkl_ddiamv` routine performs a matrix-vector operation defined as

`y := alpha*A*x + beta*y`

or

`y := alpha*A'*x + beta*y`,

where:

alpha and *beta* are scalars,

x and *y* are vectors,

A is an *m*-by-*k* sparse matrix stored in the diagonal format, *A'* is the transpose of *A*.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the Fortran 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation to be performed. If *transa* = 'N' or 'n', the matrix-vector product is computed as *y* := *alpha*A*x* + *beta*y*, If *transa* = 'T' or 't' or 'C' or 'c', the matrix-vector product is computed as *y* := *alpha*A'*x* + *beta*y*.
m	INTEGER. Number of rows of the matrix *A*.

k	INTEGER. Number of columns of the matrix *A*.
alpha	REAL*8. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in the Table 2-6 .
val	REAL*8. Two-dimensional array of size *lval* by *ndiag*, contains non-zero diagonals of the matrix *A*. Refer to *values* array description in Diagonal Storage Scheme for more details.
lval	INTEGER. Leading dimension of *val*, *lval* ≥min(*m*, *k*). Refer to *lval* description in Diagonal Storage Scheme for more details.
idiag	INTEGER. Array of length *ndiag*, contains the distances between main diagonal and each non-zero diagonals in the matrix *A*. Refer to *distance* array description in Diagonal Storage Scheme for more details.
ndiag	INTEGER. Specifies the number of non-zero diagonals of the matrix *A*.
x	REAL*8. Array, DIMENSION at least *k* if *transa* = 'N' or 'n', and at least *m* otherwise. Before entry, the array *x* must contain the vector *x*.
beta	REAL*8. Specifies the scalar *beta*.
y	REAL*8. Array, DIMENSION at least *m* if *transa* = 'N' or 'n', and at least *k* otherwise. Before entry, the array *y* must contain the vector *y*.

Output Parameters

y	Overwritten by the updated vector *y*.

Interfaces

Fortran 77:

```
SUBROUTINE mkl_ddiamv(transa, m, k, alpha, matdescra, val, lval, idiag,
ndiag, x, beta, y)

  CHARACTER*1    transa

  CHARACTER      matdescra(*)

  INTEGER        m, k, lval, ndiag

  INTEGER       idiag(*)

  REAL*8         alpha, beta

  REAL*8         val(lval,*), x(*), y(*)
```

C:

```
void mkl_ddiamv(char *transa, int *m, int *k, double *alpha, char *matdescra,
 double  *val, int *lval, int *idiag, int *ndiag, double *x, double *beta,
double *y);
```

mkl_ddiagemv

Computes matrix - vector product of a sparse general matrix stored in the diagonal format.

Syntax

Fortran:

```
call mkl_ddiagemv(transa, m, val, lval, idiag, ndiag, x, y)
```

C:

```
mkl_ddiagemv(&transa, &m, val, &lval, idiag, &ndiag, x, y);
```

Description

The `mkl_ddiagemv` routine performs a matrix-vector operation defined as

y := *A*x*

or

y := *A*'**x*,

where:

x and *y* are vectors,

A is an *m*-by-*m* sparse square matrix in the diagonal storage format, *A*' is the transpose of *A*.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the Fortran 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation to be performed. If *transa* = 'N' or 'n', the matrix-vector product is computed as *y* := *A***x* If *transa* = 'T' or 't' or 'C' or 'c', the matrix-vector product is computed as *y* := *A*'**x*,
m	INTEGER. Number of rows of the matrix *A*.
val	REAL*8. Two-dimensional array of size *lval* by *ndiag*, contains non-zero diagonals of the matrix *A*. Refer to *values* array description in Diagonal Storage Scheme for more details.
lval	INTEGER. Leading dimension of *val*, *lval*≥min(*m*, *k*). Refer to *lval* description in Diagonal Storage Scheme for more details.
idiag	INTEGER. Array of length *ndiag*, contains the distances between main diagonal and each non-zero diagonals in the matrix *A*. Refer to *distance* array description in Diagonal Storage Scheme for more details.
ndiag	INTEGER. Specifies the number of non-zero diagonals of the matrix *A*.
x	REAL*8. Array, DIMENSION is *m*. Before entry, the array *x* must contain the vector *x*.

Output Parameters

y	REAL*8. Array, DIMENSION at least *m*. On exit, the array *y* must contain the vector *y*.

Interfaces

Fortran 77:

```
SUBROUTINE mkl_ddiagemv(transa, m, val, lval, idiag, ndiag, x, y)
  CHARACTER*1   transa
  INTEGER       m, lval, ndiag
  INTEGER      idiag(*)
  REAL*8        val(lval,*), x(*), y(*)
```

C:

```
void mkl_ddiagemv(char *transa, int *m, double  *val, int *lval, int *idiag,
 int *ndiag, double *x, double *y);
```

mkl_ddiasymv

Computes matrix - vector product of a sparse symmetrical matrix stored in the diagonal format.

Syntax

Fortran:

```
call mkl_ddiasymv(uplo, m, val, lval, idiag, ndiag, x, y)
```

C:

```
mkl_ddiasymv(&uplo, &m, val, &lval, idiag, &ndiag, x, y);
```

Description

The mkl_ddiasymv routine performs a matrix-vector operation defined as

*y := A*x*

or

y := *A*'**x*,

where:

x and *y* are vectors,

A is an upper or lower triangle of the symmetrical sparse matrix, *A*' is the transpose of *A*.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the Fortran 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

uplo	CHARACTER*1. Specifies whether the upper or low triangle of the matrix *A* is considered. If *uplo* = 'U' or 'u', the upper triangle of the matrix *A* is used. If *uplo* = 'L' or 'l', the low triangle of the matrix *A* is used.
m	INTEGER. Number of rows of the matrix *A*.
val	REAL*8. Two-dimensional array of size *lval* by *ndiag*, contains non-zero diagonals of the matrix *A*. Refer to *values* array description in Diagonal Storage Scheme for more details.
lval	INTEGER. Leading dimension of *val*, *val*, *lval* ≥min(*m*, *k*). Refer to *lval* description in Diagonal Storage Scheme for more details.
idiag	INTEGER. Array of length *ndiag*, contains the distances between main diagonal and each non-zero diagonals in the matrix *A*. Refer to *distance* array description in Diagonal Storage Scheme for more details.
ndiag	INTEGER. Specifies the number of non-zero diagonals of the matrix *A*.
x	REAL*8. Array, DIMENSION is *m*. Before entry, the array *x* must contain the vector *x*.

Output Parameters

y	REAL*8. Array, DIMENSION at least *m*. On exit, the array *y* must contain the vector *y*.

Interfaces

Fortran 77:

```
SUBROUTINE mkl_ddiasymv(uplo, m, val, lval, idiag, ndiag, x, y)
  CHARACTER*1   uplo
  INTEGER       m, lval, ndiag
  INTEGER      idiag(*)
  REAL*8        val(lval,*), x(*), y(*)
```

C:

```
void mkl_ddiasymv(char *uplo, int *m, double  *val, int *lval, int *idiag,
int *ndiag, double *x, double *y);
```

mkl_dskymv

Computes matrix - vector product for a sparse matrix in the skyline storage format.

Syntax

Fortran:

```
call mkl_dskymv(transa, m, k, alpha, matdescra, val, pntr, x, beta, y)
```

C:

```
mkl_dskymv(&transa, &m, &k, &alpha, matdescra, val, pntr, x, &beta, y);
```

Description

The mkl_dskymv routine performs a matrix-vector operation defined as

*y := alpha*A*x + beta*y*

or

y := *alpha***A*'**x* + *beta***y*,

where:

alpha and *beta* are scalars,

x and *y* are vectors,

A is an *m*-by-*k* sparse matrix stored using the skyline storage scheme, *A*' is the transpose of *A*.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the Fortran 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation to be performed. If *transa* = 'N' or 'n', the matrix-vector product is computed as *y* := *alpha***A***x* + *beta***y* If *transa* = 'T' or 't' or 'C' or 'c', the matrix-vector product is computed as *y* := *alpha***A*'**x* + *beta***y*,
m	INTEGER. Number of rows of the matrix *A*.
k	INTEGER. Number of columns of the matrix *A*.
alpha	REAL*8. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in the Table 2-6 .
val	REAL*8. Array containing the set of elements of the matrix *A* in the skyline profile form. If *matdescrsa*(2)= 'L', then *val* contains elements from the low triangle of the matrix *A*. If *matdescrsa*(2)= 'U', then *val* contains elements from the upper triangle of the matrix *A*. Refer to *values* array description in Skyline Storage Scheme for more details.
pntr	INTEGER. Array of length (*m*+*m*) for lower triangle, and (*k*+*k*) for upper triangle.

	It contains the indices specifying in the *val* the positions of the first element in each row (column) of the matrix *A*. Refer to *pointers* array description in Skyline Storage Scheme for more details.
x	REAL*8. Array, DIMENSION at least *k* if *transa* = 'N' or 'n' and at least *m* otherwise. Before entry, the array *x* must contain the vector *x*.
beta	REAL*8. Specifies the scalar *beta*.
y	REAL*8. Array, DIMENSION at least *m* if *transa* = 'N' or 'n' and at least *k* otherwise. Before entry, the array *y* must contain the vector *y*.

Output Parameters

y	Overwritten by the updated vector *y*.

Interfaces

Fortran 77:

```
SUBROUTINE mkl_dskymv(transa, m, k, alpha, matdescra, val, pntr, x, beta,
y)

  CHARACTER*1   transa

  CHARACTER     matdescra(*)

  INTEGER       m, k

  INTEGER       pntr(*)

  REAL*8        alpha, beta

  REAL*8        val(*), x(*), y(*)
```

C:

```
void mkl_dskymv (char *transa, int *m, int *k, double *alpha, char *matdescra,
 double  *val, int *pntr, double *x, double *beta, double *y);
```

mkl_dbsrmv

Computes matrix - vector product of a sparse matrix stored in the BSR format.

Syntax

Fortran:

```
call mkl_dbsrmv(transa, m, k, lb, alpha, matdescra, val, indx, pntrb, pntre, x, beta, y)
```

C:

```
mkl_dbsrmv(&transa, &m, &k, &lb, &alpha, matdescra, val, indx, pntrb, pntre, x, &beta, y);
```

Description

The `mkl_dbsrmv` routine performs a matrix-vector operation defined as

`y := alpha*A*x + beta*y`

or

`y := alpha*A'*x + beta*y`,

where:

alpha and *beta* are scalars,

x and *y* are vectors,

A is an *m*-by-*k* block sparse matrix in the BSR format, *A'* is the transpose of *A*.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the Fortran 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation to be performed. If *transa* = 'N' or 'n', the matrix-vector product is computed as *y* := *alpha*A*x* + *beta*y* If *transa* = 'T' or 't' or 'C' or 'c', the matrix-vector product is computed as *y* := *alpha*A'*x* + *beta*y*,
m	INTEGER. Number of block rows of the matrix *A*.

k	INTEGER. Number of block columns of the matrix *A*.
lb	INTEGER. Size of the block in the matrix *A*.
alpha	REAL*8. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in the Table 2-6 .
val	REAL*8. Array containing elements of non-zero blocks of the matrix *A*. Its length is equal to the number number of non-zero blocks in the matrix *A* multiplied by *lb***lb*. Refer to *values* array description in BSR Format for more details.
indx	INTEGER. Array containing the column indices for each non-zero block in the matrix *A*. Its length is equal to the number of non-zero blocks in the matrix *A*. Refer to *columns* array description in BSR Format for more details.
pntrb	INTEGER. Array of length *m*. For one-based indexing: this array contains row indices, such that *pntrb*(*i*) – *pntrb*(1)+1 is the first index of block row *i* in the array *indx*. For zero-based indexing: this array contains row indices, such that *pntrb*(*i*) – *pntrb*(0) is the first index of block row *i* in the array *indx* Refer to *pointerB* array description in BSR Format for more details.
pntre	INTEGER. Array of length *m*. For one-based intexing this array contains row indices, such that *pntre*(*i*) – *pntrb*(1) is the last index of block row *i* in the array *indx*. For zero-based intexing this array contains row indices, such that *pntre*(*i*) – *pntrb*(0)–1 is the last index of block row *i* in the array *indx*. Refer to *pointerE* array description in BSR Format for more details.
x	REAL*8.

	Array, DIMENSION at least (*k***lb*) if *transa* = 'N' or 'n', and at least (*m***lb*) otherwise. Before entry, the array *x* must contain the vector *x*.
beta	REAL*8. Specifies the scalar *beta*.
y	REAL*8. Array, DIMENSION at least (*m***lb*) if *transa* = 'N' or 'n', and at least (*k***lb*) otherwise. Before entry, the array *y* must contain the vector *y*.

Output Parameters

y	Overwritten by the updated vector *y*.

Interfaces

Fortran 77:

```
SUBROUTINE mkl_dbsrmv(transa, m, k, lb, alpha, matdescra, val, indx,
 pntrb, pntre, x, beta, y)
  CHARACTER*1   transa
  CHARACTER     matdescra(*)

  INTEGER       m, k, lb
  INTEGER       indx(*), pntrb(m), pntre(m)
  REAL*8        alpha, beta
  REAL*8        val(*), x(*), y(*)
```

C:

```
void mkl_dbsrmv(char *transa, int *m, int *k, int *lb, double *alpha, char
*matdescra,
 double *val, int *indx, int *pntrb, int *pntre, double *x, double *beta,
double *y);
```

mkl_dbsrsymv

Computes matrix - vector product of a sparse symmetrical matrix stored in the BSR format (PARDISO variation).

Syntax

Fortran:

```
call mkl_dbsrsymv(uplo, m, lb, a, ia, ja, x, y)
```

C:

```
mkl_dbsrsymv(&uplo, &m, &lb, a, ia, ja, x, y);
```

Description

The `mkl_dbsrsymv` routine performs a matrix-vector operation defined as

`y := A*x`

or

`y := A'*x`,

where:

`x` and `y` are vectors,

`A` is an upper or lower triangle of the symmetrical sparse matrix in the BSR format (PARDISO variation), `A'` is the transpose of `A`.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the Fortran 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

uplo	`CHARACTER*1`. Specifies whether the upper or low triangle of the matrix `A` is considered. If `uplo = 'U'` or `'u'`, the upper triangle of the matrix `A` is used. If `uplo = 'L'` or `'l'`, the low triangle of the matrix `A` is used.

m	INTEGER. Number of block rows of the matrix *A*.
lb	INTEGER. Size of the block in the matrix *A*.
a	REAL*8. Array containing elements of non-zero blocks of the matrix *A*. Its length is equal to the number of non-zero blocks in the matrix *A* multiplied by *lb*lb*. Refer to *values* array description in BSR Format for more details.
ia	INTEGER. Array of length *(m + 1)*, containing indices of block in the array *a*, such that *ia(i)* is the index in the array *a* of the first non-zero element from the row *i*. The value of the last element *ia(m + 1)* is equal to the number of non-zero blocks plus one. Refer to *rowIndex* array description in BSR Format for more details.
ja	REAL*8. Array containing the column indices for each non-zero block in the matrix *A*. Its length is equal to the number of non-zero blocks of the matrix *A*. Refer to *columns* array description in BSR Format for more details.
x	REAL*8. Array, DIMENSION *(m*lb)*. Before entry, the array *x* must contain the vector *x*.

Output Parameters

y	REAL*8. Array, DIMENSION at least *(m*lb)*. On exit, the array *y* must contain the vector *y*.

Interfaces

Fortran 77:

```
SUBROUTINE mkl_dbsrsymv(uplo, m, lb, a, ia, ja, x, y)
   CHARACTER*1  uplo
   INTEGER      m, lb
   INTEGER      ia(*), ja(*)
   REAL*8       a(*), x(*), y(*)
```

C:

```
void mkl_dbsrsymv(char *uplo, int *m, int *lb, double *a, int *ia, int *ja,
 double *x, double *y);
```

mkl_cspblas_dbsrsymv

Computes matrix - vector product of a sparse symmetrical matrix stored in the BSR format (PARDISO variation) with zero-based indexing.

Syntax

Fortran:

```
call mkl_cspblas_dbsrsymv(uplo, m, lb, a, ia, ja, x, y)
```

C:

```
mkl_cspblas_dbsrsymv(&uplo, &m, &lb, a, ia, ja, x, y);
```

Description

The `mkl_cspblas_dbsrsymv` routine performs a matrix-vector operation defined as

`y := A*x`

or

`y := A'*x`,

where:

`x` and `y` are vectors,

`A` is an upper or lower triangle of the symmetrical sparse matrix in the BSR format (PARDISO variation) with zero-based indexing, `A'` is the transpose of `A`.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the Fortran 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

uplo	`CHARACTER*1`. Specifies whether the upper or low triangle of the matrix `A` is considered.

If *uplo* = 'U' or 'u', the upper triangle of the matrix *A* is used.
If *uplo* = 'L' or 'l', the low triangle of the matrix *A* is used.

m — INTEGER. Number of block rows of the matrix *A*.

lb — INTEGER. Size of the block in the matrix *A*.

a — REAL*8. Array containing elements of non-zero blocks of the matrix *A*. Its length is equal to the number of non-zero blocks in the matrix *A* multiplied by *lb***lb*. Refer to *values* array description in BSR Format for more details.

ia — INTEGER. Array of length (*m* + 1), containing indices of block in the array *a*, such that *ia*(*i*) is the index in the array *a* of the first non-zero element from the row *i*. The value of the last element *ia*(*m* + 1) is equal to the number of non-zero blocks plus one. Refer to *rowIndex* array description in BSR Format for more details.

ja — REAL*8. Array containing the column indices for each non-zero block in the matrix *A*.
Its length is equal to the number of non-zero blocks of the matrix *A*. Refer to *columns* array description in BSR Format for more details.

x — REAL*8.
Array, DIMENSION (*m***lb*).
Before entry, the array *x* must contain the vector *x*.

Output Parameters

y — REAL*8.
Array, DIMENSION at least (*m***lb*).
On exit, the array *y* must contain the vector *y*.

Interfaces

Fortran 77:

```
SUBROUTINE mkl_cspblas_dbsrsymv(uplo, m, lb, a, ia, ja, x, y)
   CHARACTER*1  uplo
   INTEGER      m, lb
   INTEGER      ia(*), ja(*)
   REAL*8       a(*), x(*), y(*)
```

C:

```
void mkl_cspblas_dbsrsymv(char *uplo, int *m, int *lb, double *a, int *ia,
int *ja, double *x, double *y);
```

mkl_dcsrsv

Solves a system of linear equations for a sparse matrix in the CSR format.

Syntax

Fortran:

```
call mkl_dcsrsv(transa, m, alpha, matdescra, val, indx, pntrb, pntre, x, y)
```

C:

```
mkl_dcsrsv(&transa, &m, &alpha, matdescra, val, indx, pntrb, pntre, x, y);
```

Description

The `mkl_dcsrsv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix in the CSR format:

y := *alpha**inv(*A*)**x*

or

y := *alpha**inv(*A*')**x*,

where:

alpha is scalar, *x* and *y* are vectors, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A'* is the transpose of *A*.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the Fortran 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation to be performed. If *transa* = 'N' or 'n', *y* := *alpha**inv(*A*)**x* If *transa* = 'T' or 't' or 'C' or 'c', *y* := *alpha**inv(*A'*)**x*,
m	INTEGER. Number of columns of the matrix *A*.
alpha	REAL*8. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in the Table 2-6 .
val	REAL*8. Array containing non-zero elements of the matrix *A*. Its length is *pntre*(*m*) – *pntrb*(1). Refer to *values* array description in CSR Format for more details.
indx	INTEGER. Array containing the column indices for each non-zero element of the matrix *A*.Its length is equal to length of the *val* array. Refer to *columns* array description in CSR Format for more details.
pntrb	INTEGER. Array of length *m*, contains row indices, such that *pntrb*(*i*) – *pntrb*(1)+1 is the starting index of row *i* in the arrays *val* and *indx*. Refer to *pointerb* array description in CSR Format for more details.
pntre	INTEGER. Array of length *m*, contains row indices, such that *pntre*(*i*) – *pntrb*(1) is the last index of row *i* in the arrays *val* and *indx*. Refer to *pointerE* array description in CSR Format for more details.
x	REAL*8. Array, DIMENSION at least *m*.

	Before entry, the array *x* must contain the vector *x*. The elements are accessed with unit increment.
y	REAL*8. Array, DIMENSION at least *m*. Before entry, the array *y* must contain the vector *y*. The elements are accessed with unit increment.

Output Parameters

y	Contains solution vector *x*.

Interfaces

Fortran 77:

```
SUBROUTINE mkl_dcsrsv(transa, m, alpha, matdescra, val, indx, pntrb, pntre,
 x, y)

  CHARACTER*1   transa

  CHARACTER     matdescra(*)

  INTEGER       m

  INTEGER       indx(*), pntrb(m), pntre(m)

  REAL*8        alpha

  REAL*8        val(*)

  REAL*8        x(*), y(*)
```

C:

```
void mkl_dcsrsv(char *transa, int *m, double *alpha, char *matdescra, double
 *val, int *indx, int *pntrb, int *pntre, double *x, double *y);
```

mkl_dcsrtrsv

Triangular solvers with simplified interface for a sparse matrix in the CSR format (PARDISO variation).

Syntax

Fortran:

```
call mkl_dcsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
```

C:

```
mkl_dcsrtrsv(&uplo, &transa, &diag, &m, a, ia, ja, x, y);
```

Description

The `mkl_dcsrtrsv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix stored in the CSR format accepted in PARDISO:

`A*y = x`

or

`A'*y = x`,

where:

`x` and `y` are vectors,

`A` is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, `A'` is the transpose of `A`.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the Fortran 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

uplo	`CHARACTER*1`. Specifies whether the upper or low triangle of the matrix `A` is considered. If `uplo = 'U'` or `'u'`, the upper triangle of the matrix `A` is used. If `uplo = 'L'` or `'l'`, the low triangle of the matrix `A` is used.

transa	CHARACTER*1. Specifies the operation to be performed. If *transa* = 'N' or 'n', *A*y* = *x* If *transa* = 'T' or 't' or 'C' or 'c', *A'*y* = *x*,
diag	CHARACTER*1. Specifies whether *A* is a unit triangular or not. If *diag* = 'U' or 'u', *A* is assumed to be a unit triangular. If *diag* = 'N' or 'n', *A* is not assumed to be a unit triangular.
m	INTEGER. Number of rows of the matrix *A*.
a	REAL*8. Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.
ia	INTEGER. Array of length *m* + 1, containing indices of elements in the array *a*, such that *ia*(*i*) is the index in the array *a* of the first non-zero element from the row *i*. The value of the last element *ia*(*m* + 1)–1 is equal to the number of non-zeros plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.
ja	REAL*8. Array containing the column indices for each non-zero element of the matrix *A*. Its length is equal to the length of the array *a*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.
x	REAL*8. Array, DIMENSION is *m*. Before entry, the array *x* must contain the vector *x*.

Output Parameters

y	REAL*8. Array, DIMENSION at least *m*. Contains the vector *y*.

Interfaces

Fortran 77:

```
SUBROUTINE mkl_dcsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
   CHARACTER*1  uplo, transa, diag
   INTEGER      m
   INTEGER      ia(*), ja(*)
   REAL*8       a(*), x(*), y(*)
```

C:

```
void mkl_dcsrtrsv(char *uplo, char *transa, char *diag, int *m, double *a,
int *ia, int *ja, double *x, double *y);
```

mkl_dcscsv

Solves a system of linear equations for a sparse matrix in the CSC format.

Syntax

Fortran:

```
call mkl_dcscsv(transa, m, alpha, matdescra, val, indx, pntrb, pntre, x, y)
```

C:

```
mkl_dcscsv(&transa, &m, &alpha, matdescra, val, indx, pntrb, pntre, x, y);
```

Description

The `mkl_dcsrsv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix in the CSC format:

y := *alpha**inv(*A*)**x*

or

y := *alpha**inv(*A*')* *x*,

where:

alpha is scalar, *x* and *y* are vectors, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A'* is the transpose of *A*.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the Fortran 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation to be performed. If *transa* = 'N' or 'n', *y* := *alpha**inv(*A*)**x* If *transa*= 'T' or 't' or 'C' or 'c', *y* := *alpha**inv(*A'*)* *x*,
m	INTEGER. Number of columns of the matrix *A*.
alpha	REAL*8. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in the Table 2-6 .
val	REAL*8. Array containing non-zero elements of the matrix *A*. Its length is *pntre*(*m*) – *pntrb*(1). Refer to *values* array description in CSC Format for more details.
indx	INTEGER. Array containing the column indices for each non-zero element of the matrix *A*. Its length is equal to length of the *val* array. Refer to *columns* array description in CSC Format for more details.
pntrb	INTEGER. Array of length *m*, contains row indices, such that *pntrb*(*i*) – *pntrb*(1)+1 is the starting index of row *i* in the arrays *val* and *indx*. Refer to *pointerb* array description in CSC Format for more details.
pntre	INTEGER. Array of length *m*, contains row indices, such that *pntre*(*i*) – *pntrb*(1) is the last index of row *i* in the arrays *val* and *indx*. Refer to *pointerE* array description in CSC Format for more details.
x	REAL*8. Array, DIMENSION at least *m*.

	Before entry, the array *x* must contain the vector *x*. The elements are accessed with unit increment.
y	REAL*8. Array, DIMENSION at least *m*. Before entry, the array *y* must contain the vector *y*. The elements are accessed with unit increment.

Output Parameters

y	Contains the solution vector *x*.

Interfaces

Fortran 77:

```
SUBROUTINE mkl_dcscsv(transa, m, alpha, matdescra, val, indx, pntrb, pntre,
 x, y)

  CHARACTER*1   transa

  CHARACTER     matdescra(*)

  INTEGER       m

  INTEGER       indx(*), pntrb(m), pntre(m)

  REAL*8        alpha

  REAL*8        val(*)

  REAL*8        x(*), y(*)
```

C:

```
void mkl_dcscsv(char *transa, int *m, double *alpha, char *matdescra, double
 *val, int *indx, int *pntrb, int *pntre, double *x, double *y);
```

mkl_dcoosv

Solves a system of linear equations for a sparse matrix in the coordinate format.

Syntax

Fortran:

```
call mkl_dcoosv(transa, m, k, alpha, matdescra, val, rowind, colind, nnz, x, y)
```

C:

```
mkl_dcoosv(&transa, &m, &k, &alpha, matdescra, val, rowind, colind, &nnz, x, y);
```

Description

The `mkl_dcoosv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix in the coordinate format:

`y := alpha*inv(A)*x`

or

`y := alpha*inv(A')*x`,

where:

alpha is scalar, *x* and *y* are vectors, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A'* is the transpose of *A*.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the Fortran 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation to be performed. If *transa* = 'N' or 'n', *y* := *alpha*inv(*A*)**x* If *transa* = 'T' or 't' or 'C' or 'c', *y* := *alpha*inv(*A'*)* *x*,
m	INTEGER. Number of rows of the matrix *A*.
alpha	REAL*8. Specifies the scalar *alpha*.

matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in the Table 2-6 .
val	REAL*8. Array of length *nnz*, contains non-zero elements of the matrix *A* in the arbitrary order. Refer to *values* array description in Coordinate Format for more details.
rowind	INTEGER. Array of length *nnz*, contains the row indices for each non-zero element of the matrix *A*. Refer to *rows* array description in Coordinate Format for more details.
colind	INTEGER. Array of length *nnz*, contains the column indices for each non-zero element of the matrix *A*. Refer to *columns* array description in Coordinate Format for more details.
nnz	INTEGER. Specifies the number of non-zero element of the matrix *A*. Refer to *nnz* description in Coordinate Format for more details.
x	REAL*8. Array, DIMENSION at least *m*. Before entry, the array *x* must contain the vector *x*. The elements are accessed with unit increment.
y	REAL*8. Array, DIMENSION at least *m*. Before entry, the array *y* must contain the vector *y*. The elements are accessed with unit increment.

Output Parameters

y	Contains solution vector *x*.

Interfaces

Fortran 77:

```
SUBROUTINE mkl_dcoosv(transa, m, alpha, matdescra, val, rowind, colind, nnz,
 x, y)
  CHARACTER*1    transa
  CHARACTER      matdescra(*)

  INTEGER        m, nnz
  INTEGER        rowind(*), colind(*)
  REAL*8         alpha
  REAL*8         val(*)
  REAL*8         x(*), y(*)
```

C:

```
void mkl_dcoosv(char *transa, int *m, double *alpha, char *matdescra, double
 *val, int *rowind, int *colind, int *nnz, double *x, double *y);
```

mkl_dcootrsv

Triangular solvers with simplified interface for a sparse matrix in the coordinate format.

Syntax

Fortran:

```
call mkl_dcootrsv(uplo, transa, diag, m, val, rowind, colind, nnz, x, y)
```

C:

```
mkl_dcootrsv(&uplo, &transa, &diag, &m, val, rowind, colind, &nnz, x, y);
```

Description

The `mkl_dcootrsv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix stored in the coordinate format:

$A*y = x$

or

*A'*y = x*,

where:

x and *y* are vectors,

A is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A'* is the transpose of *A*.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the Fortran 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

uplo	CHARACTER*1. Specifies whether the upper or low triangle of the matrix *A* is considered. If *uplo* = 'U' or 'u', the upper triangle of the matrix *A* is used. If *uplo* = 'L' or 'l', the low triangle of the matrix *A* is used.
transa	CHARACTER*1. Specifies the operation to be performed. If *transa* = 'N' or 'n', *A*y = x* If *transa* = 'T' or 't' or 'C' or 'c', *A'*y = x*,
diag	CHARACTER*1. Specifies whether or not *A* is a unit triangular or not. If *diag* = 'U' or 'u', *A* is assumed to be a unit triangular. If *diag* = 'N' or 'n', *A* is not assumed to be a unit triangular.
m	INTEGER. Number of rows of the matrix *A*.
val	REAL*8. Array of length *nnz*, contains non-zero elements of the matrix *A* in the arbitrary order. Refer to *values* array description in Coordinate Format for more details.
rowind	INTEGER. Array of length *nnz*, contains the row indices for each non-zero element of the matrix *A*. Refer to *rows* array description in Coordinate Format for more details.

colind	INTEGER. Array of length *nnz*, contains the column indices for each non-zero element of the matrix *A*. Refer to *columns* array description in Coordinate Format for more details.
nnz	INTEGER. Specifies the number of non-zero element of the matrix *A*. Refer to *nnz* description in Coordinate Format for more details.
x	REAL*8. Array, DIMENSION is *m*. Before entry, the array *x* must contain the vector *x*.

Output Parameters

y	REAL*8. Array, DIMENSION at least *m*. Contains the vector *y*.

Interfaces

Fortran 77:

```
SUBROUTINE mkl_dcootrsv(uplo, transa, diag, m, val, rowind, colind, nnz, x,
 y)

  CHARACTER*1   uplo, transa, diag

  INTEGER       m, nnz

  INTEGER       rowind(*), colind(*)

  REAL*8        val(*), x(*), y(*)
```

C:

```
void mkl_dcootrsv(char *uplo, char *transa, char *diag, int *m, double *alpha,
 char *matdescra, double  *val, int *rowind, int *colind, int *nnz, double
*x, double *y);
```

mkl_ddiasv

Solves a system of linear equations for a sparse matrix in the diagonal format.

Syntax

Fortran:

```
call mkl_ddiasv(transa, m, alpha, matdescra, val, lval, idiag, ndiag, x, y)
```

C:

```
mkl_ddiasv(&transa, &m, &alpha, matdescra, val, &lval, idiag, &ndiag, x, y);
```

Description

The `mkl_ddiasv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix stored in the diagonal format:

y := *alpha**inv(*A*)**x*

or

y := *alpha**inv(*A*')* *x*,

where:

alpha is scalar, *x* and *y* are vectors, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A'* is the transpose of *A*.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the Fortran 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation to be performed. If *transa* = 'N' or 'n', *y* := *alpha**inv(*A*)**x* If *transa* = 'T' or 't' or 'C' or 'c', *y* := *alpha**inv(*A'*)**x*,
m	INTEGER. Number of rows of the matrix *A*.
alpha	REAL*8. Specifies the scalar *alpha*.

matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in the Table 2-6 .
val	REAL*8. Two-dimensional array of size *lval* by *ndiag*, contains non-zero diagonals of the matrix *A*. Refer to *values* array description in Diagonal Storage Scheme for more details.
lval	INTEGER. Leading dimension of *val*, *lval*≥*m*. Refer to *lval* description in Diagonal Storage Scheme for more details.
idiag	INTEGER. Array of length *ndiag*, contains the distances between main diagonal and each non-zero diagonals in the matrix *A*. Refer to *distance* array description in Diagonal Storage Scheme for more details.
ndiag	INTEGER. Specifies the number of non-zero diagonals of the matrix *A*.
x	REAL*8. Array, DIMENSION at least *m*. Before entry, the array *x* must contain the vector *x*. The elements are accessed with unit increment.
y	REAL*8. Array, DIMENSION at least *m*. Before entry, the array *y* must contain the vector *y*. The elements are accessed with unit increment.

Output Parameters

y	Contains solution vector *x*.

Interfaces

Fortran 77:

```
SUBROUTINE mkl_ddiasv(transa, m, alpha, matdescra, val, lval, idiag, ndiag,
 x, y)
  CHARACTER*1    transa
  CHARACTER      matdescra(*)

  INTEGER        m, lval, ndiag
  INTEGER        indiag(*)
  REAL*8         alpha
  REAL*8         val(lval,*), x(*), y(*)
```

C:

```
void mkl_ddiasv(char *transa, int *m, double *alpha, char *matdescra, double
 *val, int *lval, int *idiag, int *ndiag, double *x, double *y);
```

mkl_ddiatrsv

Triangular solvers with simplified interface for a sparse matrix in the diagonal format.

Syntax

Fortran:

```
call mkl_ddiatrsv(uplo, transa, diag, m, val, lval, idiag, ndiag, x, y)
```

C:

```
mkl_ddiatrsv(&uplo, &transa, &diag, &m, val, &lval, idiag, &ndiag, x, y);
```

Description

The `mkl_ddiatrsv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix stored in the diagonal:

$A*y = x$

or

*A'*y = x*,

where:

x and *y* are vectors,

A is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A'* is the transpose of *A*.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the Fortran 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

uplo	CHARACTER*1. Specifies whether the upper or low triangle of the matrix *A* is considered. If *uplo* = 'U' or 'u', the upper triangle of the matrix *A* is used. If *uplo* = 'L' or 'l', the low triangle of the matrix *A* is used.
transa	CHARACTER*1. Specifies the operation to be performed. If *transa* = 'N' or 'n', then *A*y = x* If *transa* = 'T' or 't' or 'C' or 'c', then *A'*y = x*,
diag	CHARACTER*1. Specifies whether *A* is a unit triangular or not. If *diag* = 'U' or 'u', *A* is assumed to be a unit triangular. If *diag* = 'N' or 'n', *A* is not assumed to be a unit triangular.
m	INTEGER. Number of rows of the matrix *A*.
val	REAL*8. Two-dimensional array of size *lval* by *ndiag*, contains non-zero diagonals of the matrix *A*. Refer to *values* array description in Diagonal Storage Schemefor more details.
lval	INTEGER. Leading dimension of *val*, *lval*≥*m*. Refer to *lval* description in Diagonal Storage Scheme for more details.
idiag	INTEGER. Array of length *ndiag*, contains the distances between main diagonal and each non-zero diagonals in the matrix *A*.

	Refer to *distance* array description in Diagonal Storage Scheme for more details.
ndiag	INTEGER. Specifies the number of non-zero diagonals of the matrix *A*.
x	REAL*8. Array, DIMENSION is *m*. Before entry, the array *x* must contain the vector *x*.

Output Parameters

y	REAL*8. Array, DIMENSION at least *m*. Contains the vector *y*.

Interfaces

Fortran 77:

```
SUBROUTINE mkl_ddiatrsv(uplo, transa, diag, m, val, lval, idiag, ndiag, x,
y)

  CHARACTER*1   uplo, transa, diag

  INTEGER       m, lval, ndiag

  INTEGER       indiag(*)

  REAL*8        val(lval,*), x(*), y(*)
```

C:

```
void mkl_ddiatrsv(char *uplo, char *transa, char *diag, int *m, double  *val,
 int *lval, int *idiag, int *ndiag, double *x, double *y);
```

mkl_dskysv

Solves a system of linear equations for a sparse matrix in the skyline format.

Syntax

Fortran:

```
call mkl_dskysv(transa, m, alpha, matdescra, val, pntr, x, y)
```

C:

```
mkl_dskysv(&transa, &m, &alpha, matdescra, val, pntr, x, y);
```

Description

The `mkl_dskysv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix in the skyline storage format:

y := *alpha**inv(*A*)**x*

or

y := *alpha**inv(*A*')**x*,

where:

alpha is scalar, *x* and *y* are vectors, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A'* is the transpose of *A*.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the Fortran 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation to be performed. If *transa* = 'N' or 'n', then *y* := *alpha**inv(*A*)**x* If *transa* = 'T' or 't' or 'C' or 'c', then *y* := *alpha**inv(*A*')* *x*,
m	INTEGER. Number of rows of the matrix *A*.
alpha	REAL*8. Specifies the scalar *alpha*.

matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in the Table 2-6 .
val	REAL*8. Array containing the set of elements of the matrix *A* in the skyline profile form. If *matdescrsa*(2)= 'L', then *val* contains elements from the low triangle of the matrix *A*. If *matdescrsa*(2)= 'U', then *val* contains elements from the upper triangle of the matrix *A*. Refer to *values* array description in Skyline Storage Scheme for more details.
pntr	INTEGER. Array of length (*m*+*m*) for lower triangle, and (*k*+*k*) for upper triangle. It contains the indices specifying in the *val* the positions of the first element in each row (column) of the matrix *A*. Refer to *pointers* array description in Skyline Storage Scheme for more details.
x	REAL*8. Array, DIMENSION at least *m*. Before entry, the array *x* must contain the vector *x*. The elements are accessed with unit increment.
y	REAL*8. Array, DIMENSION at least *m*. Before entry, the array *y* must contain the vector *y*. The elements are accessed with unit increment.

Output Parameters

y	Contains solution vector *x*.

Interfaces

Fortran 77:

```
SUBROUTINE mkl_dskysv(transa, m, alpha, matdescra, val, pntr, x, y)
  CHARACTER*1   transa
  CHARACTER     matdescra(*)
```

```
INTEGER        m
INTEGER        pntr(*)
REAL*8         alpha
REAL*8         val(*), x(*), y(*)
```

C:

```
void mkl_dskysv(char *transa, int *m, double *alpha, char *matdescra, double
 *val, int *pntr, double *x, double *y);
```

mkl_dcsrmm

Computes matrix - matrix product of a sparse matrix stored in the CSR format.

Syntax

Fortran:

```
call mkl_dcsrmm(transa, m, n, k, alpha, matdescra, val, indx, pntrb, pntre,
b, ldb, beta, c, ldc)
```

C:

```
mkl_dcsrmm(&transa, &m, &n, &k, &alpha, matdescra, val, indx, pntrb, pntre,
b, &ldb, &beta, c, &ldc);
```

Description

The `mkl_dcsrmm` routine performs a matrix-matrix operation defined as

`C := alpha*A*B + beta*C`

or

`C := alpha*A'*B + beta*C`,

where:

alpha and *beta* are scalars,

B and *C* are dense matrices, *A* is an *m*-by-*k* sparse matrix in compressed sparse row format, *A'* is the transpose of *A*.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the Fortran 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation to be performed. If *transa* = 'N' or 'n', the matrix-matrix product is computed as *C* := *alpha*A*B* + *beta*C* If *transa* = 'T' or 't' or 'C' or 'c', the matrix-vector product is computed as *C* := *alpha*A'*B* + *beta*C*,
m	INTEGER. Number of rows of the matrix *A*.
n	INTEGER. Number of columns of the matrix *C*.
k	INTEGER. Number of columns of the matrix *A*.
alpha	REAL*8. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in the Table 2-6 .
val	REAL*8. Array containing non-zero elements of the matrix *A*. Its length is *pntre*(*m*) – *pntrb*(1). Refer to *values* array description in CSR Format for more details.
indx	INTEGER. Array containing the column indices for each non-zero element of the matrix *A*. Its length is equal to length of the *val* array. Refer to *columns* array description in CSR Format for more details.
pntrb	INTEGER. Array of length *m*, contains row indices, such that *pntrb*(*i*) – *pntrb*(1)+1 is the starting index of row *i* in the arrays *val* and *indx*. Refer to *pointerb* array description in CSR Format for more details.
pntre	INTEGER. Array of length *m*, contains row indices, such that *pntre*(*i*) – *pntrb*(1) is the last index of row *i* in the arrays *val* and *indx*. Refer to *pointerE* array description in CSR Format for more details.
b	REAL*8. Array, DIMENSION (*ldb*, *n*).

	Before entry with *transa*= 'N' or 'n', the leading *k*-by-*n* part of the array *b* must contain the matrix *B*, otherwise the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.
ldb	INTEGER. Specifies the first dimension of *b* as declared in the calling (sub)program.
beta	REAL*8. Specifies the scalar *beta*.
c	REAL*8. Array, DIMENSION (*ldc*, *n*). Before entry, the leading *m*-by-*n* part of the array *c* must contain the matrix *C*, otherwise the leading *k*-by-*n* part of the array *c* must contain the matrix *C*.
ldc	INTEGER. Specifies the first dimension of *c* as declared in the calling (sub)program.

Output Parameters

c	Overwritten by the matrix (*alpha***A***B* + *beta** *C*) or (*alpha***A*'**B* + *beta***C*).

Interfaces

Fortran 77:

```
SUBROUTINE mkl_dcsrmm(transa, m, n, k, alpha, matdescra, val, indx, pntrb,
pntre, b, ldb, beta, c, ldc)

  CHARACTER*1   transa
  CHARACTER     matdescra(*)

  INTEGER       m, n, k, ldb, ldc
  INTEGER       indx(*), pntrb(m), pntre(m)
  REAL*8        alpha, beta
  REAL*8        val(*), b(ldb,*), c(ldc,*)
```

C:

```
void mkl_dcsrmm(char *transa, int *m, int *n, int *k, double *alpha, char
*matdescra, double  *val, int *indx, int *pntrb, int *pntre, double *b, int
 *ldb, double *beta, double *c, int *ldc,);
```

mkl_dcscmm

Computes matrix-matrix product of a sparse matrix stored in the CSC format.

Syntax

Fortran:

```
call mkl_dcscmm(transa, m, n, k, alpha, matdescra, val, indx, pntrb, pntre,
b, ldb, beta, c, ldc)
```

C:

```
mkl_dcscmm(&transa, &m, &n, &k, &alpha, matdescra, val, indx, pntrb, pntre,
b, &ldb, &beta, c, &ldc);
```

Description

The `mkl_dcscmm` routine performs a matrix-matrix operation defined as

`C := alpha*A*B + beta*C`

or

`C := alpha*A'*B + beta*C`,

where:

`alpha` and `beta` are scalars,

`B` and `C` are dense matrices, `A` is an `m`-by-`k` sparse matrix in compressed sparse column format, `A'` is the transpose of `A`.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the Fortran 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

`transa`	`CHARACTER*1`. Specifies the operation to be performed.

	If *transa* = 'N' or 'n', the matrix-matrix product is computed as *C* := *alpha***A** *B* + *beta***C* If *transa* = 'T' or 't' or 'C' or 'c', the matrix-vector product is computed as *C* := *alpha***A*'**B* + *beta***C*,
m	INTEGER. Number of rows of the matrix *A*.
n	INTEGER. Number of columns of the matrix *C*.
k	INTEGER. Number of columns of the matrix *A*.
alpha	REAL*8. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in the Table 2-6 .
val	REAL*8. Array containing non-zero elements of the matrix *A*. Its length is *pntre*(*k*) – *pntrb*(1). Refer to *values* array description in CSC Format for more details.
indx	INTEGER. Array containing the row indices for each non-zero element of the matrix *A*.Its length is equal to length of the *val* array. Refer to *rows* array description in CSC Format for more details.
pntrb	INTEGER. Array of length *k*, contains row indices, such that *pntrb*(*i*) – *pntrb*(1)+1 is the starting index of column *i* in the arrays *val* and *indx*. Refer to *pointerb* array description in CSC Format for more details.
pntre	INTEGER. Array of length *k*, contains row indices, such that *pntre*(*i*) – *pntrb*(1) is the last index of column *i* in the arrays *val* and *indx*. Refer to *pointerE* array description in CSC Format for more details.
b	REAL*8. Array, DIMENSION (*ldb*, *n*). Before entry with *transa* = 'N' or 'n', the leading *k*-by-*n* part of the array *b* must contain the matrix *B*, otherwise the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.
ldb	INTEGER. Specifies the first dimension of *b* as declared in the calling (sub)program.

beta	REAL*8. Specifies the scalar *beta*.
c	REAL*8. Array, DIMENSION (*ldc*, *n*). Before entry, the leading *m*-by-*n* part of the array *c* must contain the matrix *C*, otherwise the leading *k*-by-*n* part of the array *c* must contain the matrix *C*.
ldc	INTEGER. Specifies the first dimension of *c* as declared in the calling (sub)program.

Output Parameters

c	Overwritten by the matrix (*alpha*A*B + beta* C*) or (*alpha*A'*B + beta*C*).

Interfaces

Fortran 77:

```
SUBROUTINE mkl_dcscmm(transa, m, n, k, alpha, matdescra, val, indx, pntrb,
pntre, b, ldb, beta, c, ldc)

  CHARACTER*1   transa

  CHARACTER     matdescra(*)

  INTEGER       m, n, k, ldb, ldc

  INTEGER       indx(*), pntrb(k), pntre(k)

  REAL*8        alpha, beta

  REAL*8        val(*), b(ldb,*), c(ldc,*)
```

C:

```
void mkl_dcscmm(char *transa, int *m, int *n, int *k, double *alpha, char
*matdescra, double  *val, int *indx, int *pntrb, int *pntre, double *b, int
 *ldb, double *beta, double *c, int *ldc);
```

mkl_dcoomm

Computes matrix-matrix product of a sparse matrix stored in the coordinate format.

Syntax

Fortran:

```
call mkl_dcoomm(transa, m, n, k, alpha, matdescra, val, rowind, colind, nnz, b, ldb, beta, c, ldc)
```

C:

```
mkl_dcoomm(&transa, &m, &n, &k, &alpha, matdescra, val, rowind, colind, &nnz, b, &ldb, &beta, c, &ldc);
```

Description

The `mkl_dcoomm` routine performs a matrix-matrix operation defined as

`C := alpha*A*B + beta*C`

or

`C := alpha*A'*B + beta*C`,

where:

alpha and *beta* are scalars,

B and *C* are dense matrices, *A* is an *m*-by-*k* sparse matrix in the coordinate format, *A'* is the transpose of *A*.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the Fortran 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation to be performed. If *transa* = 'N' or 'n', the matrix-matrix product is computed as *C* := *alpha*A*B* + *beta*C* If *transa* = 'T' or 't' or 'C' or 'c', the matrix-vector product is computed as *C* := *alpha*A'*B* + *beta*C*,
m	INTEGER. Number of rows of the matrix *A*.

n	INTEGER. Number of columns of the matrix *C*.
k	INTEGER. Number of columns of the matrix *A*.
alpha	REAL*8. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in the Table 2-6 .
val	REAL*8. Array of length *nnz*, contains non-zero elements of the matrix *A* in the arbitrary order. Refer to *values* array description in Coordinate Format for more details.
rowind	INTEGER. Array of length *nnz*, contains the row indices for each non-zero element of the matrix *A*. Refer to *rows* array description in Coordinate Format for more details.
colind	INTEGER. Array of length *nnz*, contains the column indices for each non-zero element of the matrix *A*. Refer to *columns* array description in Coordinate Format for more details.
nnz	INTEGER. Specifies the number of non-zero element of the matrix *A*. Refer to *nnz* description in Coordinate Format for more details.
b	REAL*8. Array, DIMENSION (*ldb*, *n*). Before entry with *transa* = 'N' or 'n', the leading *k*-by-*n* part of the array *b* must contain the matrix *B*, otherwise the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.
ldb	INTEGER. Specifies the first dimension of *b* as declared in the calling (sub)program.
beta	REAL*8. Specifies the scalar *beta*.
c	REAL*8. Array, DIMENSION (*ldc*, *n*). Before entry, the leading *m*-by-*n* part of the array *c* must contain the matrix *C*, otherwise the leading *k*-by-*n* part of the array *c* must contain the matrix *C*.

ldc	INTEGER. Specifies the first dimension of *c* as declared in the calling (sub)program.

Output Parameters

c	Overwritten by the matrix (*alpha*A*B + beta*C*) or (*alpha*A'*B + beta*C*).

Interfaces

Fortran 77:

```
SUBROUTINE mkl_dcoomm(transa, m, n, k, alpha, matdescra, val, rowind, colind,
 nnz, b, ldb, beta, c, ldc)

  CHARACTER*1    transa

  CHARACTER      matdescra(*)

  INTEGER        m, n, k, ldb, ldc, nnz

  INTEGER        rowind(*), colind(*)

  REAL*8         alpha, beta

  REAL*8         val(*), b(ldb,*), c(ldc,*)
```

C:

```
void mkl_dcoomm(char *transa, int *m, int *n, int *k, double *alpha, char
*matdescra, double  *val, int *rowind, int *colind, int *nnz, double *b, int
 *ldb, double *beta, double *c, int *ldc);
```

mkl_ddiamm

Computes matrix-matrix product of a sparse matrix stored in the diagonal format.

Syntax

Fortran:

```
call mkl_ddiamm(transa, m, n, k, alpha, matdescra, val, lval, idiag, ndiag,
b, ldb, beta, c, ldc)
```

C:

```
mkl_ddiamm(&transa, &m, &n, &k, &alpha, matdescra, val, &lval, idiag, &ndiag,
b, &ldb, &beta, c, &ldc);
```

Description

The `mkl_ddiamm` routine performs a matrix-matrix operation defined as

`C := alpha*A*B + beta*C`

or

`C := alpha*A'*B + beta*C`,

where:

alpha and *beta* are scalars,

B and *C* are dense matrices, *A* is an *m*-by-*k* sparse matrix in the diagonal format, *A'* is the transpose of *A*.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the Fortran 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation to be performed. If *transa* = 'N' or 'n', the matrix-matrix product is computed as *C* := *alpha*A*B* + *beta*C*, If *transa* = 'T' or 't' or 'C' or 'c', the matrix-vector product is computed as *C* := *alpha*A'*B* + *beta*C*.
m	INTEGER. Number of rows of the matrix *A*.
n	INTEGER. Number of columns of the matrix *C*.
k	INTEGER. Number of columns of the matrix *A*.
alpha	REAL*8. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in the Table 2-6 .

val	REAL*8. Two-dimensional array of size *lval* by *ndiag*, contains non-zero diagonals of the matrix *A*. Refer to *values* array description in Diagonal Storage Scheme for more details.
lval	INTEGER. Leading dimension of *val*, *lval*≥min(*m*, *k*). Refer to *lval* description in Diagonal Storage Scheme for more details.
idiag	INTEGER. Array of length *ndiag*, contains the distances between main diagonal and each non-zero diagonals in the matrix *A*. Refer to *distance* array description in Diagonal Storage Scheme for more details.
ndiag	INTEGER. Specifies the number of non-zero diagonals of the matrix *A*.
b	REAL*8. Array, DIMENSION (*ldb*, *n*). Before entry with *transa* = 'N' or 'n', the leading *k*-by-*n* part of the array *b* must contain the matrix *B*, otherwise the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.
ldb	INTEGER. Specifies the first dimension of *b* as declared in the calling (sub)program.
beta	REAL*8. Specifies the scalar *beta*.
c	REAL*8. Array, DIMENSION (*ldc*, *n*). Before entry, the leading *m*-by-*n* part of the array *c* must contain the matrix *C*, otherwise the leading *k*-by-*n* part of the array *c* must contain the matrix *C*.
ldc	INTEGER. Specifies the first dimension of *c* as declared in the calling (sub)program.

Output Parameters

c	Overwritten by the matrix (*alpha***A***B* + *beta***C*) or (*alpha***A*'**B* + *beta***C*).

Interfaces

Fortran 77:

```
SUBROUTINE mkl_ddiamm(transa, m, n, k, alpha, matdescra, val, lval, idiag,
ndiag, b, ldb, beta, c, ldc)

  CHARACTER*1    transa

  CHARACTER      matdescra(*)

  INTEGER        m, n, k, ldb, ldc, lval, ndiag

  INTEGER       idiag(*)

  REAL*8         alpha, beta

  REAL*8         val(lval,*), b(ldb,*), c(ldc,*)
```

C:

```
void mkl_ddiamm(char *transa, int *m, int *n, int *k, double *alpha, char
*matdescra, double *val, int *lval, int *idiag, int *ndiag, double *b, int
*ldb, double *beta, double *c, int *ldc);
```

mkl_dskymm

Computes matrix-matrix product of a sparse matrix stored using the skyline storage scheme.

Syntax

Fortran:

```
call mkl_dskymm(transa, m, n, k, alpha, matdescra, val, pntr, b, ldb, beta,
c, ldc)
```

C:

```
mkl_dskymm(&transa, &m, &n, &k, &alpha, matdescra, val, pntr, b, &ldb, &beta,
c, &ldc);
```

Description

The `mkl_dskymm` routine performs a matrix-matrix operation defined as

```
C := alpha*A*B + beta*C
```

or

C := *alpha***A*'**B* + *beta***C*,

where:

alpha and *beta* are scalars,

B and *C* are dense matrices, *A* is an *m*-by-*k* sparse matrix in the skyline storage format, *A*' is the transpose of *A*.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the Fortran 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation to be performed. If *transa* = 'N' or 'n', the matrix-matrix product is computed as *C* := *alpha***A***B* + *beta***C*, If *transa* = 'T' or 't' or 'C' or 'c', the matrix-vector product is computed as *C* := *alpha***A*'**B* + *beta***C*,
m	INTEGER. Number of rows of the matrix *A*.
n	INTEGER. Number of columns of the matrix *C*.
k	INTEGER. Number of columns of the matrix *A*.
alpha	REAL*8. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in the Table 2-6 .
val	REAL*8. Array containing the set of elements of the matrix *A* in the skyline profile form. If *matdescrsa*(2)= 'L', then *val* contains elements from the low triangle of the matrix *A*. If *matdescrsa*(2)= 'U', then *val* contains elements from the upper triangle of the matrix *A*. Refer to *values* array description in Skyline Storage Schemefor more details.
pntr	INTEGER. Array of length (*m*+*m*) for lower triangle, and (*k*+*k*) for upper triangle.

	It contains the indices specifying in the *val* the positions of the first element in each row (column) of the matrix *A*. Refer to *pointers* array description in Skyline Storage Scheme for more details.
b	REAL*8. Array, DIMENSION (*ldb*, *n*). Before entry with *transa* = 'N' or 'n', the leading *k*-by-*n* part of the array *b* must contain the matrix *B*, otherwise the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.
ldb	INTEGER. Specifies the first dimension of *b* as declared in the calling (sub)program.
beta	REAL*8. Specifies the scalar *beta*.
c	REAL*8. Array, DIMENSION (*ldc*, *n*). Before entry, the leading *m*-by-*n* part of the array *c* must contain the matrix *C*, otherwise the leading *k*-by-*n* part of the array *c* must contain the matrix *C*.
ldc	INTEGER. Specifies the first dimension of *c* as declared in the calling (sub)program.

Output Parameters

c	Overwritten by the matrix (*alpha*A*B + beta*C*) or (*alpha*A'*B + beta*C*).

Interfaces

Fortran 77:

```
SUBROUTINE mkl_dskymm(transa, m, n, k, alpha, matdescra, val, pntr, b, ldb,
 beta, c, ldc)

  CHARACTER*1   transa

  CHARACTER     matdescra(*)
```

```
INTEGER        m, n, k, ldb, ldc
INTEGER        pntr(*)
REAL*8         alpha, beta
REAL*8         val(*), b(ldb,*), c(ldc,*)
```

C:

```
void mkl_dskymm(char *transa, int *m, int *n, int *k, double *alpha, char
*matdescra, double *val, int *pntr, double *b, int *ldb, double *beta, double
 *c, int *ldc);
```

mkl_dcsrsm

Solves a system of linear matrix equations for a sparse matrix in the CSR format.

Syntax

Fortran:

```
call mkl_dcsrsm(transa, m, n, alpha, matdescra, val, indx, pntrb, pntre, b,
ldb, c, ldc)
```

C:

```
mkl_dcsrsm(&transa, &m, &n, &alpha, matdescra, val, indx, pntrb, pntre, b,
&ldb, c, &ldc);
```

Description

The `mkl_dcsrsm` routine solves a system of linear equations with matrix-matrix operations for a sparse matrix in the CSR format:

`C := alpha*inv(A)*B`

or

`C := alpha*inv(A')*B`,

where:

alpha is scalar, *B* and *C* are dense matrices, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A'* is the transpose of *A*.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the Fortran 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation to be performed. If *transa* = 'N' or 'n', the matrix-matrix product is computed as *C* := *alpha**inv(*A*)**B* If *transa* = 'T' or 't' or 'C' or 'c', the matrix-vector product is computed as *C* := *alpha**inv(*A*')**B*,
m	INTEGER. Number of columns of the matrix *A*.
n	INTEGER. Number of columns of the matrix *C*.
alpha	REAL*8. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in the Table 2-6 .
val	REAL*8. Array containing non-zero elements of the matrix *A*. Its length is *pntre*(*m*) – *pntrb*(1). Refer to *values* array description in CSR Format for more details.
indx	INTEGER. Array containing the column indices for each non-zero element of the matrix *A*.Its length is equal to length of the *val* array. Refer to *columns* array description in CSR Format for more details.
pntrb	INTEGER. Array of length *m*, contains row indices, such that *pntrb*(*i*) – *pntrb*(1)+1 is the starting index of row *i* in the arrays *val* and *indx*. Refer to *pointerb* array description in CSR Format for more details.
pntre	INTEGER. Array of length *m*, contains row indices, such that *pntre*(*i*) – *pntrb*(1) is the last index of row *i* in the arrays *val* and *indx*. Refer to *pointerE* array description in CSR Format for more details.
b	REAL*8. Array, DIMENSION (*ldb*, *n*).

	Before entry the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.
ldb	INTEGER. Specifies the first dimension of *b* as declared in the calling (sub)program.
ldc	INTEGER. Specifies the first dimension of *c* as declared in the calling (sub)program.

Output Parameters

c	REAL*8. Array, DIMENSION (*ldc*, *n*). The leading *m*-by-*n* part of the array *c* contains the output matrix *C*.

Interfaces

Fortran 77:

```
SUBROUTINE mkl_dcsrsm(transa, m, n, alpha, matdescra, val, indx, pntrb,
pntre, b, ldb, c, ldc)

  CHARACTER*1   transa

  CHARACTER     matdescra(*)

  INTEGER       m, n, ldb, ldc

  INTEGER       indx(*), pntrb(m), pntre(m)

  REAL*8        alpha

  REAL*8        val(*), b(ldb,*), c(ldc,*)
```

C:

```
void mkl_dcsrsm(char *transa, int *m, int *n, double *alpha, char *matdescra,
 double *val, int *indx, int *pntrb, int *pntre, double *b, int *ldb, double
 *c, int *ldc);
```

mkl_dcscsm

Solves a system of linear matrix equations for a sparse matrix in the CSC format.

Syntax

Fortran:

```
call mkl_dcscsm(transa, m, n, alpha, matdescra, val, indx, pntrb, pntre, b, ldb, c, ldc)
```

C:

```
mkl_dcscsm(&transa, &m, &n, &alpha, matdescra, val, indx, pntrb, pntre, b, &ldb, c, &ldc);
```

Description

The `mkl_dcscsm` routine solves a system of linear equations with matrix-matrix operations for a sparse matrix in the CSC format:

`C := alpha*inv(A)*B`

or

`C := alpha*inv(A')*B`,

where:

alpha is scalar, *B* and *C* are dense matrices, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A'* is the transpose of *A*.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the Fortran 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation to be performed. If *transa* = 'N' or 'n', the matrix-matrix product is computed as *C* := *alpha**inv(*A*)**B* If *transa* = 'T' or 't' or 'C' or 'c', the matrix-vector product is computed as *C* := *alpha**inv(*A'*)**B*,
m	INTEGER. Number of columns of the matrix *A*.

n	INTEGER. Number of columns of the matrix *C*.
alpha	REAL*8. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in the Table 2-6 .
val	REAL*8. Array containing non-zero elements of the matrix *A*. Its length is *pntre*(*m*) – *pntrb*(1). Refer to *values* array description in CSC Format for more details.
indx	INTEGER. Array containing the row indices for each non-zero element of the matrix *A*. Its length is equal to length of the *val* array. Refer to *rows* array description in CSC Format for more details.
pntrb	INTEGER. Array of length *k*, contains row indices, such that *pntrb*(*i*) – *pntrb*(1)+1 is the starting index of column *i* in the arrays *val* and *indx*. Refer to *pointerb* array description in CSC Format for more details.
pntre	INTEGER. Array of length *k*, contains row indices, such that *pntre*(*i*) – *pntrb*(1) is the last index of column *i* in the arrays *val* and *indx*. Refer to *pointerE* array description in CSC Format for more details.
b	REAL*8. Array, DIMENSION (*ldb*, *n*). Before entry the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.
ldb	INTEGER. Specifies the first dimension of *b* as declared in the calling (sub)program.
ldc	INTEGER. Specifies the first dimension of *c* as declared in the calling (sub)program.

Output Parameters

c	REAL*8. Array, DIMENSION (*ldc*, *n*). The leading *m*-by-*n* part of the array *c* contains the output matrix *C*.

Interfaces

Fortran 77:

```
SUBROUTINE mkl_dcscsm(transa, m, n, alpha, matdescra, val, indx, pntrb,
pntre, b, ldb, c, ldc)

  CHARACTER*1    transa

  CHARACTER      matdescra(*)

  INTEGER        m, n, ldb, ldc

  INTEGER        indx(*), pntrb(m), pntre(m)

  REAL*8         alpha

  REAL*8         val(*), b(ldb,*), c(ldc,*)
```

C:

```
void mkl_dcscsm(char *transa, int *m, int *n, double *alpha, char *matdescra,
 double *val, int *indx, int *pntrb, int *pntre, double *b, int *ldb, double
 *c, int *ldc);
```

mkl_dcoosm

Solves a system of linear matrix equations for a sparse matrix in the coordinate format.

Syntax

Fortran:

```
call mkl_dcoosm(transa, m, n, alpha, matdescra, val, rowind, colind, nnz, b,
ldb, c, ldc)
```

C:

```
mkl_dcoosm(&transa, &m, &n, &alpha, matdescra, val, rowind, colind, &nnz, b,
&ldb, c, &ldc);
```

Description

The mkl_dcoosm routine solves a system of linear equations with matrix-matrix operations for a sparse matrix in the coordinate format:

C := *alpha**inv(*A*)**B*

or

C := *alpha**inv(*A*')**B*,

where:

alpha is scalar, *B* and *C* are dense matrices, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A*' is the transpose of *A*.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the Fortran 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation to be performed. If *transa* = 'N' or 'n', the matrix-matrix product is computed as *C* := *alpha**inv(*A*)**B* If *transa* = 'T' or 't' or 'C' or 'c', the matrix-vector product is computed as *C* := *alpha**inv(*A*')**B*,
m	INTEGER. Number of rows of the matrix *A*.
n	INTEGER. Number of columns of the matrix *C*.
alpha	REAL*8. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in the Table 2-6 .
val	REAL*8. Array of length *nnz*, contains non-zero elements of the matrix *A* in the arbitrary order. Refer to *values* array description in Coordinate Format for more details.
rowind	INTEGER. Array of length *nnz*, contains the row indices for each non-zero element of the matrix *A*. Refer to *rows* array description in Coordinate Format for more details.

colind	INTEGER. Array of length *nnz*, contains the column indices for each non-zero element of the matrix *A*. Refer to *columns* array description in Coordinate Format for more details.
nnz	INTEGER. Specifies the number of non-zero element of the matrix *A*. Refer to *nnz* description in Coordinate Format for more details.
b	REAL*8. Array, DIMENSION (*ldb*, *n*). Before entry the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.
ldb	INTEGER. Specifies the first dimension of *b* as declared in the calling (sub)program.
ldc	INTEGER. Specifies the first dimension of *c* as declared in the calling (sub)program.

Output Parameters

c	REAL*8. Array, DIMENSION (*ldc*, *n*). The leading *m*-by-*n* part of the array *c* contains the output matrix *C*.

Interfaces

Fortran 77:

```
SUBROUTINE mkl_dcoosm(transa, m, n, alpha, matdescra, val, rowind, colind,
nnz, b, ldb, c, ldc)

  CHARACTER*1    transa

  CHARACTER      matdescra(*)

  INTEGER        m, n, ldb, ldc, nnz

  INTEGER        rowind(*), colind(*)

  REAL*8         alpha

  REAL*8         val(*), b(ldb,*), c(ldc,*)
```

C:

```
void mkl_dcoosm(char *transa, int *m, int *n, double *alpha, char *matdescra,
 double *val, int *rowind, int *colind, int *nnz, double *b, int *ldb, double
 *c, int *ldc);
```

mkl_ddiasm

Solves a system of linear matrix equations for a sparse matrix in the diagonal format.

Syntax

Fortran:

```
call mkl_ddiasm(transa, m, n, alpha, matdescra, val, lval, idiag, ndiag, b,
ldb, c, ldc)
```

C:

```
mkl_ddiasm(&transa, &m, &n, &alpha, matdescra, val, &lval, idiag, &ndiag, b,
&ldb, c, &ldc);
```

Description

The `mkl_ddiasm` routine solves a system of linear equations with matrix-matrix operations for a sparse matrix in the diagonal format:

`C := alpha*inv(A)*B`

or

`C := alpha*inv(A')*B`,

where:

alpha is scalar, *B* and *C* are dense matrices, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A'* is the transpose of *A*.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the Fortran 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation to be performed.

	If *transa* = 'N' or 'n', the matrix-matrix product is computed as *C* := *alpha**inv(*A*)**B*, If *transa* = 'T' or 't' or 'C' or 'c', the matrix-vector product is computed as *C* := *alpha**inv(*A*')**B*.
m	INTEGER. Number of rows of the matrix *A*.
n	INTEGER. Number of columns of the matrix *C*.
alpha	REAL*8. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in the Table 2-6 .
val	REAL*8. Two-dimensional array of size *lval* by *ndiag*, contains non-zero diagonals of the matrix *A*. Refer to *values* array description in Diagonal Storage Scheme for more details.
lval	INTEGER. Leading dimension of *val*, *lval*≥*m*. Refer to *lval* description in Diagonal Storage Scheme for more details.
idiag	INTEGER. Array of length *ndiag*, contains the distances between main diagonal and each non-zero diagonals in the matrix *A*. Refer to *distance* array description in Diagonal Storage Scheme for more details.
ndiag	INTEGER. Specifies the number of non-zero diagonals of the matrix *A*.
b	REAL*8. Array, DIMENSION (*ldb*, *n*). Before entry the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.
ldb	INTEGER. Specifies the first dimension of *b* as declared in the calling (sub)program.
ldc	INTEGER. Specifies the first dimension of *c* as declared in the calling (sub)program.

Output Parameters

c	REAL*8. Array, DIMENSION (*ldc*, *n*).

The leading *m*-by-*n* part of the array *c* contains the matrix *C*.

Interfaces

Fortran 77:

```
SUBROUTINE mkl_ddiasm(transa, m, n, alpha, matdescra, val, lval, idiag,
ndiag, b, ldb, c, ldc)

  CHARACTER*1    transa

  CHARACTER      matdescra(*)

  INTEGER        m, n, ldb, ldc, lval, ndiag

  INTEGER       idiag(*)

  REAL*8         alpha

  REAL*8         val(lval,*), b(ldb,*), c(ldc,*)
```

C:

```
void mkl_ddiasm(char *transa, int *m, int *n, double *alpha, char *matdescra,
 double *val, int *lval, int *idiag, int *ndiag, double *b, int *ldb, double
 *c, int *ldc);
```

mkl_dskysm

Solves a system of linear matrix equations for a sparse matrix stored using the skyline storage scheme.

Syntax

Fortran:

```
call mkl_dskysm(transa, m, n, alpha, matdescra, val, pntr, b, ldb, c, ldc)
```

C:

```
mkl_dskysm(&transa, &m, &n, &alpha, matdescra, val, pntr, b, &ldb, c, &ldc);
```

Description

The mkl_dskysm routine solves a system of linear equations with matrix-matrix operations for a sparse matrix in the skyline storage format:

C := *alpha**inv(*A*)**B*

or

C := *alpha**inv(*A*')**B*,

where:

alpha is scalar, *B* and *C* are dense matrices, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A*' is the transpose of *A*.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the Fortran 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation to be performed. If *transa* = 'N' or 'n', the matrix-matrix product is computed as *C* := *alpha**inv(*A*)**B*, If *transa* = 'T' or 't' or 'C' or 'c', the matrix-vector product is computed as *C* := *alpha**inv(*A*')**B*,
m	INTEGER. Number of rows of the matrix *A*.
n	INTEGER. Number of columns of the matrix *C*.
alpha	REAL*8. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in the Table 2-6 .
val	REAL*8. Array containing the set of elements of the matrix *A* in the skyline profile form. If *matdescrsa*(2)= 'L', then *val* contains elements from the low triangle of the matrix *A*. If *matdescrsa*(2)= 'U', then *val* contains elements from the upper triangle of the matrix *A*. Refer to *values* array description in Skyline Storage Scheme for more details.

pntr	INTEGER. Array of length (*m*+*m*). It contains the indices specifying in the *val* the positions of the first non-zero element of each *i*-row (column) of the matrix *A* such that *pointers*(*i*)- *pointers*(1)+1. Refer to *pointers* array description in Skyline Storage Scheme for more details.
b	REAL*8. Array, DIMENSION (*ldb*, *n*). Before entry the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.
ldb	INTEGER. Specifies the first dimension of *b* as declared in the calling (sub)program.
ldc	INTEGER. Specifies the first dimension of *c* as declared in the calling (sub)program.

Output Parameters

c	REAL*8. Array, DIMENSION (*ldc*, *n*). The leading *m*-by-*n* part of the array *c* contains the matrix *C*.

Interfaces

Fortran 77:

```
SUBROUTINE mkl_dskysm(transa, m, n, alpha, matdescra, val, pntr, b, ldb, c,
 ldc)
  CHARACTER*1    transa
  CHARACTER      matdescra(*)
  INTEGER        m, n, ldb, ldc
  INTEGER        pntr(*)
  REAL*8         alpha
  REAL*8         val(*), b(ldb,*), c(ldc,*)
```

C:

```
void mkl_dskysm(char *transa, int *m, int *n, double *alpha, char *matdescra,
 double *val, int *pntr, double *b, int *ldb, double *c, int *ldc,);
```

LAPACK Routines: Linear Equations

3

This chapter describes the Intel® Math Kernel Library implementation of routines from the LAPACK package that are used for solving systems of linear equations and performing a number of related computational tasks. The library includes LAPACK routines for both real and complex data. Routines are supported for systems of equations with the following types of matrices:

- general
- banded
- symmetric or Hermitian positive-definite (both full and packed storage)
- symmetric or Hermitian positive-definite banded
- symmetric or Hermitian indefinite (both full and packed storage)
- symmetric or Hermitian indefinite banded
- triangular (both full and packed storage)
- triangular banded
- tridiagonal.

For each of the above matrix types, the library includes routines for performing the following computations:

- factoring the matrix (except for triangular matrices)
- equilibrating the matrix
- solving a system of linear equations
- estimating the condition number of a matrix
- refining the solution of linear equations and computing its error bounds
- inverting the matrix.

To solve a particular problem, you can call two or more computational routines or call a corresponding driver routine that combines several tasks in one call, such as `?gesv` for factoring and solving. For example, to solve a system of linear equations with a general matrix, call `?getrf` (*LU* factorization) and then `?getrs` (computing the solution). Then, call `?gerfs` to refine the solution and get the error bounds. Alternatively, use the driver routine `?gesvx` that performs all these tasks in one call.

WARNING. LAPACK routines expect that input matrices do not contain `INF` or `NaN` values. When input data is inappropriate for LAPACK, problems may arise, including possible hangs.

Starting from release 8.0, Intel MKL along with Fortran-77 interface to LAPACK computational and driver routines also supports Fortran-95 interface which uses simplified routine calls with shorter argument lists. The syntax section of the routine description gives the calling sequence for Fortran-95 interface immediately after Fortran-77 calls.

Routine Naming Conventions

To call each routine introduced in this chapter from the Fortran-77 program, you can use the LAPACK name.

LAPACK names are listed in Table 3-1 and Table 3-2 , and have the structure `?yyzzz` or `?yyzz`, which is described below.

The initial symbol `?` indicates the data type:

`s`	real, single precision
`c`	complex, single precision
`d`	real, double precision
`z`	complex, double precision

The second and third letters `yy` indicate the matrix type and storage scheme:

`ge`	general
`gb`	general band
`gt`	general tridiagonal
`po`	symmetric or Hermitian positive-definite
`pp`	symmetric or Hermitian positive-definite (packed storage)
`pb`	symmetric or Hermitian positive-definite band
`pt`	symmetric or Hermitian positive-definite tridiagonal
`sy`	symmetric indefinite
`sp`	symmetric indefinite (packed storage)
`he`	Hermitian indefinite
`hp`	Hermitian indefinite (packed storage)
`tr`	triangular
`tp`	triangular (packed storage)
`tb`	triangular band

For computational routines, the last three letters `zzz` indicate the computation performed:

trf	form a triangular matrix factorization
trs	solve the linear system with a factored matrix
con	estimate the matrix condition number
rfs	refine the solution and compute error bounds
tri	compute the inverse matrix using the factorization
equ	equilibrate a matrix.

For example, the sgetrf routine performs the triangular factorization of general real matrices in single precision; the corresponding routine for complex matrices is cgetrf.

For driver routines, the names can end with –sv (meaning a simple driver), or with –svx (meaning an expert driver).

Names of the LAPACK computational and driver routines for Fortran-95 interface in Intel MKL are the same as Fortran-77 names but without the first letter that indicates the data type. For example, the name of the routine that performs triangular factorization of general real matrices in Fortran-95 interface is getrf. Different data types are handled through defining a specific internal parameter that refers to a module block with named constants for single and double precision.

Fortran-95 Interface Conventions

Fortran-95 interface to LAPACK is implemented through wrappers that call respective Fortran-77 routines. This interface uses such features of Fortran-95 as assumed-shape arrays and optional arguments to provide simplified calls to LAPACK routines with fewer arguments.

The main conventions for Fortran-95 interface are as follows:

- The names of arguments used in Fortran-95 call are typically the same as for the respective generic (Fortran-77) interface. However, to reduce the number of argument names used in the library, Fortran-95 interface uses the following identity settings of formal argument names:

Generic Argument Name	Fortran-95 Argument Name
ap	*a*
ab	*a*
afb	*af*

Generic Argument Name	Fortran-95 Argument Name
afp	*af*
bp	*b*
bb	*b*
selctg	*select*

Note that these name changes of formal arguments have no impact on program semantics and follow the unification conventions.

- Input arguments such as array dimensions are not required in Fortran-95 and are skipped from the calling sequence. Array dimensions are reconstructed from the user data that must exactly follow the required array shape.

  Another type of generic arguments that are skipped in Fortran-95 interface are arguments that represent workspace arrays (such as *work*, *rwork*, and so on). The only exception are cases when workspace arrays return significant information on output.

  An argument can also be skipped if its value is completely defined by the presence or absence of another argument in the calling sequence, and the restored value is the only meaningful value for the skipped argument.
- Some generic arguments are declared as optional in Fortran-95 interface and may or may not be present in the calling sequence. An argument can be declared optional if it satisfies one of the following conditions:
  - If the argument value is completely defined by the presence or absence of another argument in the calling sequence, it can be declared as optional. The difference from the skipped argument in this case is that the optional argument can have some meaningful values that are distinct from the value reconstructed by default. For example, if some argument (like *jobz*) can take only two values and one of these values directly implies the use of another argument, then the value of *jobz* can be uniquely reconstructed from the actual presence or absence of this second argument, and *jobz* can be omitted.
  - If an input argument can take only a few possible values, it can be declared as optional. The default value of such argument is typically set as the first value in the list and all exceptions to this rule are explicitly stated in the routine description.
  - If an input argument has a natural default value, it can be declared as optional. The default value of such optional argument is set to its natural default value.
- Argument *info* is declared as optional in Fortran-95 interface. If it is present in the calling sequence, the value assigned to *info* is interpreted as follows:

  - If this value is more than -1000, its meaning is the same as in Fortran-77 routine.
  - If this value is equal to -1000, it means that there is not enough work memory.
  - If this value is equal to -1001, incompatible arguments are present in the calling sequence.

- Optional arguments are given in square brackets in Fortran-95 call syntax.

"Fortran-95 Notes" subsection at the end of the topic describing each routine details concrete rules for reconstructing the values of omitted optional parameters.

MKL Fortran-95 Interfaces for LAPACK Routines vs. Netlib Implementation

The following list presents general digressions of Intel MKL LAPACK-95 implementation from the Netlib analog:

- Intel® MKL Fortran-95 interfaces are provided for pure procedures.
- Names of interfaces do not contain `LA_` prefix.
- An optional array argument always has the `target` attribute.
- Functionality of MKL LAPACK-95 wrapper is close to FORTRAN-77 original implementation in `getrf`, `gbtrf`, and `potrf` interfaces.
- If *jobz* argument value specifies presence or absence of *z* argument, then *z* is always declared as optional and *jobz* is restored depending on whether *z* is present or not. It is not always so in the Netlib version (see "Modified Netlib Interfaces" in Appendix E).
- To avoid double error checking, processing of *info* parameter is limited to checking of allocated memory and disarranging of optional parameters.
- If an argument that is present in the list of arguments completely defines another argument, the latter is always declared as optional.

You can transform an application that uses the Netlib LAPACK interfaces to ensure its work with Intel MKL interfaces by meeting two conditions:

a. The application is correct, that is, unambiguous, compiler-independent, and contains no errors.

b. Each routine name denotes only one specific routine. If any routine name in the application coincides with a name of the original Netlib routine (for example, after removing `LA_` prefix) but denotes a routine different from that Netlib original routine, this name should be modified through context replacement.

You should transform your application in the following five cases (see Appendix E for specific differences of individual interfaces):

1. When using Netlib routines that differ from the Intel MKL routines only by the `LA_` prefix or in the array attribute target. The only transformation required in this case is context name replacement. See "Interfaces Identical to Netlib" in Appendix E for details.

2. When using Netlib routines that differ from the Intel MKL routines by the `LA_` prefix, the `target` array attribute, and the names of formal arguments. In the case of positional passing of arguments, no additional transformation except context name replacement is required. In the case of the key passing of arguments, in addition to the context name replacement the names of mismatching keys should also be modified. See "Interfaces with Replaced Argument Names" in Appendix E for details.
3. When using Netlib routines that differ from the Intel MKL routines by the `LA_` prefix, the `target` array attribute, sequence of the arguments, arguments missing in MKL but present in Netlib and, vice versa, present in MKL but missing in Netlib. Remove the differences in sequence and range of the arguments in process of all the transformations specified in items 2 and 3. See "Modified Netlib Interfaces" in Appendix E for details.
4. When using `getrf`, `gbtrf`, and `potrf` interfaces, that is, new functionality implemented in MKL but unavailable in Netlib source. To overcome the differences, build the desired functionality explicitly with MKL means or create a new subroutine with the new functionality, using specific MKL interfaces corresponding to LAPACK-77 routines. You can call the latter routines directly but using new MKL interfaces is preferable. See "Interfaces Absent From Netlib" and "Interfaces of New Functionality"in Appendix E for details.

   Note that if the transformed application calls `getrf`, `gbtrf` or `potrf` without controlling arguments *rcond* and *norm*, just context replacement is enough in modifying the calls into MKL interfaces, as described in point 1 above. Netlib functionality is preserved in such cases.
5. When using Netlib auxiliary routines. In this case, call a corresponding subroutine directly, using MKL LAPACK-77 interfaces.

You can transform your application as follows:

1. Make sure conditions a. and b. are met.
2. Select Netlib LAPACK-95 calls. For each call do the following:
   - Select the case of digression and do the required transformations.
   - Revise results to eliminate unneeded code or data, which may appear after several identical calls.
3. Make sure the transformations are correct and complete.

Matrix Storage Schemes

LAPACK routines use the following matrix storage schemes:

- `Full storage`: a matrix *A* is stored in a two-dimensional array *a*, with the matrix element a_{ij} stored in the array element *a*(*i*,*j*).

- Packed storage scheme allows you to store symmetric, Hermitian, or triangular matrices more compactly: the upper or lower triangle of the matrix is packed by columns in a one-dimensional array.
- Band storage: an m-by-n band matrix with kl sub-diagonals and ku superdiagonals is stored compactly in a two-dimensional array ab with $kl+ku+1$ rows and n columns. Columns of the matrix are stored in the corresponding columns of the array, and diagonals of the matrix are stored in rows of the array.

In Chapters 4 and 5 , arrays that hold matrices in packed storage have names ending in p; arrays with matrices in band storage have names ending in b.

For more information on matrix storage schemes, see "Matrix Arguments" in Appendix B.

Mathematical Notation

Descriptions of LAPACK routines use the following notation:

$Ax = b$	A system of linear equations with an n-by-n matrix $A = \{a_{ij}\}$, a right-hand side vector $b = \{b_i\}$, and an unknown vector $x = \{x_i\}$.
$AX = B$	A set of systems with a common matrix A and multiple right-hand sides. The columns of B are individual right-hand sides, and the columns of X are the corresponding solutions.
$\|x\|$	the vector with elements $\|x_i\|$ (absolute values of x_i).
$\|A\|$	the matrix with elements $\|a_{ij}\|$ (absolute values of a_{ij}).
$\|\|x\|\|_\infty = \max_i \|x_i\|$	The infinity-norm of the vector x.
$\|\|A\|\|_\infty = \max_i \Sigma_j \|a_{ij}\|$	The infinity-norm of the matrix A.
$\|\|A\|\|_1 = \max_j \Sigma_i \|a_{ij}\|$	The one-norm of the matrix A. $\|\|A\|\|_1 = \|\|A^T\|\|_\infty = \|\|A^H\|\|_\infty$
$\kappa(A) = \|\|A\|\| \ \|\|A^{-1}\|\|$	The condition number of the matrix A.

Error Analysis

In practice, most computations are performed with rounding errors. Besides, you often need to solve a system $Ax = b$, where the data (the elements of A and b) are not known exactly. Therefore, it is important to understand how the data errors and rounding errors can affect the solution x.

Data perturbations. If x is the exact solution of $Ax = b$, and $x + \delta x$ is the exact solution of a perturbed problem $(A + \delta A)x = (b + \delta b)$, then

$$\frac{\|\delta x\|}{\|x\|} \leq \kappa(A)\left(\frac{\|\delta A\|}{\|A\|} + \frac{\|\delta b\|}{\|b\|}\right),$$

where

$$\kappa(A) = \|A\|\,\|A^{-1}\|.$$

In other words, relative errors in A or b may be amplified in the solution vector x by a factor $\kappa(A) = ||A||\ ||A^{-1}||$ called the condition number of A.

Rounding errors have the same effect as relative perturbations $c(n)\varepsilon$ in the original data. Here ε is the machine precision, and $c(n)$ is a modest function of the matrix order n. The corresponding solution error is

$||\delta x||/||x|| \leq c(n)\kappa(A)\varepsilon$. (The value of $c(n)$ is seldom greater than $10n$.)

Thus, if your matrix A is ill-conditioned (that is, its condition number $\kappa(A)$ is very large), then the error in the solution x is also large; you may even encounter a complete loss of precision. LAPACK provides routines that allow you to estimate $\kappa(A)$ (see Routines for Estimating the Condition Number) and also give you a more precise estimate for the actual solution error (see Refining the Solution and Estimating Its Error).

Computational Routines

Table 3-1 lists the LAPACK computational routines (Fortran-77 and Fortran-95 interfaces) for factorizing, equilibrating, and inverting real matrices, estimating their condition numbers, solving systems of equations with real matrices, refining the solution, and estimating its error. Table 3-2 lists similar routines for complex matrices. Respective routine names in Fortran-95 interface are without the first symbol (see Routine Naming Conventions).

Table 3-1 Computational Routines for Systems of Equations with Real Matrices

Matrix type, storage scheme	Factorize matrix	Equilibrate matrix	Solve system	Condition number	Estimate error	Invert matrix
general	?getrf	?geequ	?getrs	?gecon	?gerfs	?getri
general band	?gbtrf	?gbequ	?gbtrs	?gbcon	?gbrfs	
general tridiagonal	?gttrf		?gttrs	?gtcon	?gtrfs	
symmetric positive-definite	?potrf	?poequ	?potrs	?pocon	?porfs	?potri
symmetric positive-definite, packed storage	?pptrf	?ppequ	?pptrs	?ppcon	?pprfs	?pptri
symmetric positive-definite, band	?pbtrf	?pbequ	?pbtrs	?pbcon	?pbrfs	
symmetric positive-definite, tridiagonal	?pttrf		?pttrs	?ptcon	?ptrfs

triangular band			?tbtrs	?tbcon	?tbrfs	

In the table above, ? stands for c (single precision complex) or z (double precision complex) for Fortran-77 interface.

Routines for Matrix Factorization

This section describes the LAPACK routines for matrix factorization. The following factorizations are supported:

- *LU* factorization
- Cholesky factorization of real symmetric positive-definite matrices
- Cholesky factorization of Hermitian positive-definite matrices
- Bunch-Kaufman factorization of real and complex symmetric matrices
- Bunch-Kaufman factorization of Hermitian matrices.

You can compute:

- the *LU* factorization using full and band storage of matrices
- the Cholesky factorization using full, packed, and band storage
- the Bunch-Kaufman factorization using full and packed storage.

?getrf

Computes the LU factorization of a general m-by-n matrix.

Syntax

Fortran 77:

```
call sgetrf(  m, n, a, lda, ipiv, info )
call dgetrf( m, n, a, lda, ipiv, info )
call cgetrf( m, n, a, lda, ipiv, info )
call zgetrf( m, n, a, lda, ipiv, info )
```

Fortran 95:

```
call getrf( a [,ipiv] [,info] )
```

Description

The routine computes the *LU* factorization of a general *m*-by-*n* matrix *A* as

*A = P*L*U*,

where *P* is a permutation matrix, *L* is lower triangular with unit diagonal elements (lower trapezoidal if *m* > *n*) and *U* is upper triangular (upper trapezoidal if *m* < *n*). Usually *A* is square (*m* = *n*), and both *L* and *U* are triangular. The routine uses partial pivoting, with row interchanges.

Input Parameters

m	INTEGER. The number of rows in the matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns in *A*; *n* ≥ 0.
a	REAL for sgetrf DOUBLE PRECISION for dgetrf COMPLEX for cgetrf DOUBLE COMPLEX for zgetrf. Array, DIMENSION (*lda*,*). Contains the matrix *A*. The second dimension of *a* must be at least max(1, *n*).
lda	INTEGER. The first dimension of array *a*.

Output Parameters

a	Overwritten by *L* and *U*. The unit diagonal elements of *L* are not stored.
ipiv	INTEGER. Array, DIMENSION at least max(1,min(*m*, *n*)). The pivot indices: row *i* was interchanged with row *ipiv*(*i*).
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, u_{ii} is 0. The factorization has been completed, but *U* is exactly singular. Division by 0 will occur if you use the factor *U* for solving a system of linear equations.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `getrf` interface are as follows:

a	Holds the matrix A of size (m, n).
ipiv	Holds the vector of length $\min(m, n)$.

Application Notes

The computed L and U are the exact factors of a perturbed matrix $A + E$, where

$$|E| \leq c(\min(m,n))\varepsilon P|L||U|$$

$c(n)$ is a modest linear function of n, and ε is the machine precision.

The approximate number of floating-point operations for real flavors is

$(2/3)n^3$	If $m = n$,
$(1/3)n^2(3m-n)$	If $m > n$,
$(1/3)m^2(3n-m)$	If $m < n$.

The number of operations for complex flavors is four times greater.

After calling this routine with $m = n$, you can call the following:

?getrs	to solve $A*x = B$ or $A^TX = B$ or $A^HX = B$
?gecon	to estimate the condition number of A
?getri	to compute the inverse of A.

?gbtrf

Computes the LU factorization of a general m-by-n band matrix.

Syntax

Fortran 77:

```
call sgbtrf(  m, n, kl, ku, ab, ldab, ipiv, info )
call dgbtrf( m, n, kl, ku, ab, ldab, ipiv, info  )
call cgbtrf( m, n, kl, ku, ab, ldab, ipiv, info )
call zgbtrf( m, n, kl, ku, ab, ldab, ipiv, info  )
```

Fortran 95:

```
call gbtrf(  a [,kl] [,m] [,ipiv] [,info] )
```

Description

The routine forms the *LU* factorization of a general *m*-by-*n* band matrix *A* with *kl* non-zero subdiagonals and *ku* non-zero superdiagonals. Usually *A* is square (*m* = *n*), and then

*A = P*L*U*,

where *P* is a permutation matrix; *L* is lower triangular with unit diagonal elements and at most *kl* non-zero elements in each column; *U* is an upper triangular band matrix with *kl* + *ku* superdiagonals. The routine uses partial pivoting, with row interchanges (which creates the additional *kl* superdiagonals in *U*).

Input Parameters

m	INTEGER. The number of rows in matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns in matrix *A*; *n* ≥ 0.
kl	INTEGER. The number of subdiagonals within the band of *A*; *kl* ≥ 0.
ku	INTEGER. The number of superdiagonals within the band of *A*; *ku* ≥ 0.
ab	REAL for sgbtrf DOUBLE PRECISION for dgbtrf COMPLEX for cgbtrf DOUBLE COMPLEX for zgbtrf.

Array, DIMENSION (*ldab*,*). The array *ab* contains the matrix *A* in band storage (see Matrix Storage Schemes). The second dimension of *ab* must be at least max(1, *n*).

ldab INTEGER. The first dimension of the array *ab*. (*ldab* ≥ 2**kl* + *ku* + 1)

Output Parameters

ab Overwritten by *L* and *U*. The diagonal and *kl* + *ku* superdiagonals of *U* are stored in the first 1 + *kl* + *ku* rows of *ab*. The multipliers used to form *L* are stored in the next *kl* rows.

ipiv INTEGER.
Array, DIMENSION at least max(1,min(*m*, *n*)). The pivot indices: row *i* was interchanged with row *ipiv*(*i*).

info INTEGER. If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, u_{ii} is 0. The factorization has been completed, but *U* is exactly singular. Division by 0 will occur if you use the factor *U* for solving a system of linear equations.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gbtrf interface are as follows:

a Stands for argument *ab* in Fortan 77 interface. Holds the array *A* of size (2**kl*+*ku*+1,*n*).

ipiv Holds the vector of length min(*m*,*n*).

kl If omitted, assumed *kl* = *ku*.

ku Restored as *ku* = *lda*-2**kl*-1.

m If omitted, assumed *m* = *n*.

Application Notes

The computed *L* and *U* are the exact factors of a perturbed matrix *A* + *E*, where

$|E| \leq c(kl+ku+1)\ \varepsilon\ P|L||U|$

$c(k)$ is a modest linear function of k, and ε is the machine precision.

The total number of floating-point operations for real flavors varies between approximately $2n(ku+1)kl$ and $2n(kl+ku+1)kl$. The number of operations for complex flavors is four times greater. All these estimates assume that kl and ku are much less than $\min(m,n)$.

After calling this routine with $m = n$, you can call the following routines:

gbtrs	to solve $A*X = B$ or $A^T*X = B$ or $A^H*X = B$
gbcon	to estimate the condition number of A.

?gttrf

Computes the LU factorization of a tridiagonal matrix.

Syntax

Fortran 77:

```
call sgttrf( n, dl, d, du, du2, ipiv, info )
call dgttrf( n, dl, d, du, du2, ipiv, info )
call cgttrf( n, dl, d, du, du2, ipiv, info )
call zgttrf( n, dl, d, du, du2, ipiv, info )
```

Fortran 95:

```
call gttrf( dl, d, du, du2 [, ipiv] [,info] )
```

Description

The routine computes the LU factorization of a real or complex tridiagonal matrix A in the form $A = P*L*U$,

where P is a permutation matrix; L is lower bidiagonal with unit diagonal elements; and U is an upper triangular matrix with nonzeroes in only the main diagonal and first two superdiagonals. The routine uses elimination with partial pivoting and row interchanges.

Input Parameters

n	INTEGER. The order of the matrix A; $n \geq 0$.
dl, d, du	REAL for sgttrf

DOUBLE PRECISION for dgttrf
COMPLEX for cgttrf
DOUBLE COMPLEX for zgttrf.
Arrays containing elements of *A*.
The array *dl* of dimension (*n* – 1) contains the subdiagonal elements of *A*.
The array *d* of dimension *n* contains the diagonal elements of *A*.
The array *du* of dimension (*n* – 1) contains the superdiagonal elements of *A*.

Output Parameters

dl — Overwritten by the (*n*–1) multipliers that define the matrix *L* from the *LU* factorization of *A*.

d — Overwritten by the *n* diagonal elements of the upper triangular matrix *U* from the *LU* factorization of *A*.

du — Overwritten by the (*n*–1) elements of the first superdiagonal of *U*.

du2 — REAL for sgttrf
DOUBLE PRECISION for dgttrf
COMPLEX for cgttrf
DOUBLE COMPLEX for zgttrf.
Array, dimension (*n*–2). On exit, *du2* contains (*n*–2) elements of the second superdiagonal of *U*.

ipiv — INTEGER.
Array, dimension (*n*). The pivot indices: row *i* was interchanged with row *ipiv*(*i*).

info — INTEGER. If *info* = 0, the execution is successful.
If *info* = –*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, u_{ii} is 0. The factorization has been completed, but *U* is exactly singular. Division by zero will occur if you use the factor *U* for solving a system of linear equations.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gttrf interface are as follows:

dl	Holds the vector of length (*n*-1).
d	Holds the vectror of length (*n*).
du	Holds the vector of length (*n*-1).
du2	Holds the vector of length (*n*-2).
ipiv	Holds the vector of length (*n*).

Application Notes

?gbtrs	to solve *A*X = B* or $A^T*X = B$ or $A^H*X = B$
?gbcon	to estimate the condition number of *A*.

?potrf

Computes the Cholesky factorization of a symmetric (Hermitian) positive-definite matrix.

Syntax

Fortran 77:

```
call spotrf(  uplo, n, a, lda, info )
call dpotrf(  uplo, n, a, lda, info )
call cpotrf(  uplo, n, a, lda, info )
call zpotrf(  uplo, n, a, lda, info )
```

Fortran 95:

```
call potrf(  a [, uplo] [,info]  )
```

Description

This routine forms the Cholesky factorization of a symmetric positive-definite or, for complex data, Hermitian positive-definite matrix *A*:

$A = U^H*U$	if *uplo*='U'
$A = L*L^H$	if *uplo*='L',

where *L* is a lower triangular matrix and *U* is upper triangular.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of *A* is stored and how *A* is factored: If *uplo* = 'U', the array *a* stores the upper triangular part of the matrix *A*, and *A* is factored as U^H*U. If *uplo* = 'L', the array *a* stores the lower triangular part of the matrix *A*; *A* is factored as $L*L^H$.
n	INTEGER. The order of matrix *A*; $n \geq 0$.
a	REAL for spotrf DOUBLE PRECISION for dpotrf COMPLEX for cpotrf DOUBLE COMPLEX for zpotrf. Array, DIMENSION (*lda*,*). The array *a* contains either the upper or the lower triangular part of the matrix *A* (see *uplo*). The second dimension of *a* must be at least max(1, *n*).
lda	INTEGER. The first dimension of *a*.

Output Parameters

a	The upper or lower triangular part of *a* is overwritten by the Cholesky factor *U* or *L*, as specified by *uplo*.
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite, and the factorization could not be completed. This may indicate an error in forming the matrix *A*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine potrf interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

If *uplo* = 'U', the computed factor *U* is the exact factor of a perturbed matrix *A* + *E*, where

$$|E| \le c(n)\varepsilon |U^H||U|, |e_{ij}| \le c(n)\varepsilon\sqrt{a_{ii}a_{jj}}$$

c(*n*) is a modest linear function of *n*, and ε is the machine precision.

A similar estimate holds for *uplo* = 'L'.

The total number of floating-point operations is approximately $(1/3)n^3$ for real flavors or $(4/3)n^3$ for complex flavors.

After calling this routine, you can call the following routines:

?potrs	to solve *A*X* = *B*
?pocon	to estimate the condition number of *A*
?potri	to compute the inverse of *A*.

?pptrf

Computes the Cholesky factorization of a symmetric (Hermitian) positive-definite matrix using packed storage.

Syntax

Fortran 77:

```
call spptrf( uplo, n, ap, info )
call dpptrf( uplo, n, ap, info )
call cpptrf( uplo, n, ap, info )
call zpptrf( uplo, n, ap, info )
```

Fortran 95:

```
call pptrf( a [, uplo] [,info] )
```

Description

This routine forms the Cholesky factorization of a symmetric positive-definite or, for complex data, Hermitian positive-definite packed matrix *A*:

A = U^H**U* if *uplo*='U'

A = *L**L^H if *uplo*='L',

where *L* is a lower triangular matrix and *U* is upper triangular.

Input Parameters

uplo CHARACTER*1. Must be 'U' or 'L'.
Indicates whether the upper or lower triangular part of *A* is packed in the array *ap*, and how *A* is factored:
If *uplo* = 'U', the array *ap* stores the upper triangular part of the matrix *A*, and *A* is factored as U^H**U*.
If *uplo* = 'L', the array *ap* stores the lower triangular part of the matrix *A*; *A* is factored as *L**L^H.

n INTEGER. The order of matrix *A*; $n \geq 0$.

ap REAL for spptrf
DOUBLE PRECISION for dpptrf
COMPLEX for cpptrf
DOUBLE COMPLEX for zpptrf.
Array, DIMENSION at least max(1, *n*(*n*+1)/2). The array *ap* contains either the upper or the lower triangular part of the matrix *A* (as specified by *uplo*) in packed storage (see Matrix Storage Schemes).

Output Parameters

ap The upper or lower triangular part of *A* in packed storage is overwritten by the Cholesky factor *U* or *L*, as specified by *uplo*.

info INTEGER. If *info*=0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite, and the factorization could not be completed. This may indicate an error in forming the matrix *A*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `pptrf` interface are as follows:

a	Stands for argument *ap* in Fortran 77 interface. Holds the array *A* of size `(n*(n+1)/2)`.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

If *uplo* = `'U'`, the computed factor *U* is the exact factor of a perturbed matrix *A* + *E*, where

$$|E| \le c(n)\varepsilon |U^H||U|, |e_{ij}| \le c(n)\varepsilon\sqrt{a_{ii}a_{jj}}$$

$c(n)$ is a modest linear function of n, and ε is the machine precision.

A similar estimate holds for *uplo* = `'L'`.

The total number of floating-point operations is approximately $(1/3)n^3$ for real flavors and $(4/3)n^3$ for complex flavors.

After calling this routine, you can call the following routines:

`?pptrs`	to solve *A***X* = *B*
`?ppcon`	to estimate the condition number of *A*
`?pptri`	to compute the inverse of *A*.

?pbtrf

Computes the Cholesky factorization of a symmetric (Hermitian) positive-definite band matrix.

Syntax

Fortran 77:

```
call spbtrf( uplo, n, kd, ab, ldab, info )
call dpbtrf( uplo, n, kd, ab, ldab, info )
call cpbtrf( uplo, n, kd, ab, ldab, info )
call zpbtrf( uplo, n, kd, ab, ldab, info )
```

Fortran 95:

```
call pbtrf( a [, uplo] [,info] )
```

Description

This routine forms the Cholesky factorization of a symmetric positive- definite or, for complex data, Hermitian positive-definite band matrix A:

$A = U^T*U$ for real data, $A = U^H*U$ for complex data	if *uplo*='U'
$A = L*L^T$ for real data, $A = L*L^H$ for complex data	if *uplo*='L',

where L is a lower triangular matrix and U is upper triangular.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of A is stored in the array *ab*, and how A is factored: If *uplo* = 'U', the upper triangle of A is stored. If *uplo* = 'L', the lower triangle of A is stored.
n	INTEGER. The order of matrix A; $n \geq 0$.

kd	INTEGER. The number of superdiagonals or subdiagonals in the matrix *A*(*kd* ≥ 0).
ab	REAL for spbtrf DOUBLE PRECISION for dpbtrf COMPLEX for cpbtrf DOUBLE COMPLEX for zpbtrf. Array, DIMENSION (,*). The array *ap* contains either the upper or the lower triangular part of the matrix *A* (as specified by *uplo*) in band storage (see Matrix Storage Schemes). The second dimension of *ab* must be at least max(1, *n*).
ldab	INTEGER. The first dimension of the array *ab*. (*ldab* ≥ *kd* + 1)

Output Parameters

ap	The upper or lower triangular part of *A* (in band storage) is overwritten by the Cholesky factor *U* or *L*, as specified by *uplo*.
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite, and the factorization could not be completed. This may indicate an error in forming the matrix *A*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine pbtrf interface are as follows:

a	Stands for argument *ab* in Fortan 77 interface. Holds the array *A* of size (*kd*+1,*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

If *uplo* = 'U', the computed factor *U* is the exact factor of a perturbed matrix *A* + *E*, where

$$|E| \leq c(kd+1)\varepsilon |U^H||U|, |e_{ij}| \leq c(kd+1)\varepsilon \sqrt{a_{ii}a_{jj}}$$

$c(n)$ is a modest linear function of n, and ε is the machine precision.

A similar estimate holds for `uplo = 'L'`.

The total number of floating-point operations for real flavors is approximately $n(kd+1)^2$. The number of operations for complex flavors is 4 times greater. All these estimates assume that kd is much less than n.

After calling this routine, you can call the following routines:

?pbtrs	to solve `A*X = B`
?pbcon	to estimate the condition number of `A`.

?pttrf

Computes the factorization of a symmetric (Hermitian) positive-definite tridiagonal matrix.

Syntax

Fortran 77:

```
call spttrf( n, d, e, info )
call dpttrf( n, d, e, info )
call cpttrf( n, d, e, info )
call zpttrf( n, d, e, info )
```

Fortran 95:

```
call pttrf( d, e [,info] )
```

Description

This routine forms the factorization of a symmetric positive-definite or, for complex data, Hermitian positive-definite tridiagonal matrix `A`:

`A = L*D*L'`,

where `D` is diagonal and `L` is unit lower bidiagonal. The factorization may also be regarded as having the form `A = U'*D*U`, where `D` is unit upper bidiagonal.

Input Parameters

n	INTEGER. The order of the matrix *A*; *n* ≥ 0.
d	REAL for sptrf, cpttrf DOUBLE PRECISION for dpttrf, zpttrf. Array, dimension (*n*). Contains the diagonal elements of *A*.
e	REAL for sptrf DOUBLE PRECISION for dpttrf COMPLEX for cpttrf DOUBLE COMPLEX for zpttrf. Array, dimension (*n* -1). Contains the subdiagonal elements of *A*.

Output Parameters

d	Overwritten by the *n* diagonal elements of the diagonal matrix *D* from the *L*D*L'* factorization of *A*.
e	Overwritten by the (*n* – 1) off-diagonal elements of the unit bidiagonal factor *L* or *U* from the factorization of *A*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = –*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite; if *i* < *n*, the factorization could not be completed, while if *i* = *n*, the factorization was completed, but *d*(*n*) ≤ 0.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine pttrf interface are as follows:

d	Holds the vector of length (*n*).
e	Holds the vector of length (*n*-1).

?sytrf

Computes the Bunch-Kaufman factorization of a symmetric matrix.

Syntax

Fortran 77:

```
call ssytrf( uplo, n, a, lda, ipiv, work, lwork, info )
call dsytrf( uplo, n, a, lda, ipiv, work, lwork, info )
call csytrf( uplo, n, a, lda, ipiv, work, lwork, info )
call zsytrf( uplo, n, a, lda, ipiv, work, lwork, info )
```

Fortran 95:

```
call sytrf( a [, uplo] [,ipiv]  [, info] )
```

Description

This routine forms the Bunch-Kaufman factorization of a symmetric matrix:

if *uplo*='U', *A* = $P*U*D*U^T*P^T$

if *uplo*='L', *A* = $P*L*D*L^T*P^T$,

where *A* is the input matrix, *P* is a permutation matrix, *U* and *L* are upper and lower triangular matrices with unit diagonal, and *D* is a symmetric block-diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks. *U* and *L* have 2-by-2 unit diagonal blocks corresponding to the 2-by-2 blocks of *D*.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of *A* is stored and how *A* is factored: If *uplo* = 'U', the array *a* stores the upper triangular part of the matrix *A*, and *A* is factored as $P*U*D*U^T*P^T$. If *uplo* = 'L', the array *a* stores the lower triangular part of the matrix *A*, and *A* is factored as $P*L*D*L^T*P^T$.
n	INTEGER. The order of matrix *A*; $n \geq 0$.

a	REAL for ssytrf DOUBLE PRECISION for dsytrf COMPLEX for csytrf DOUBLE COMPLEX for zsytrf. Array, DIMENSION (*lda*,*). The array *a* contains either the upper or the lower triangular part of the matrix *A* (see *uplo*). The second dimension of *a* must be at least max(1, *n*).
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
work	Same type as *a*. A workspace array, dimension at least max(1,*lwork*).
lwork	INTEGER. The size of the *work* array (*lwork* ≥ *n*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

a	The upper or lower triangular part of *a* is overwritten by details of the block-diagonal matrix *D* and the multipliers used to obtain the factor *U* (or *L*).
work(1)	If *info*=0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). Contains details of the interchanges and the block structure of *D*. If *ipiv*(*i*) = *k* >0, then d_{ii} is a 1-by-1 block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column. If *uplo* = 'U' and *ipiv*(*i*) =*ipiv*(*i*-1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*–1, and (*i*–1)-th row and column of *A* was interchanged with the *m*-th row and column. If *uplo* = 'L' and *ipiv*(*i*) =*ipiv*(*i*+1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*+1, and (*i*+1)-th row and column of *A* was interchanged with the *m*-th row and column.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = –*i*, the *i*–th parameter had an illegal value.

If *info* = *i*, d_{ii} is 0. The factorization has been completed, but *D* is exactly singular. Division by 0 will occur if you use *D* for solving a system of linear equations.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `sytrf` interface are as follows:

a	holds the matrix *A* of size (*n*, *n*)
ipiv	holds the vector of length (*n*)
uplo	must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

For better performance, try using *lwork* = *n*blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the `blocked algorithm`.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The 2-by-2 unit diagonal blocks and the unit diagonal elements of *U* and *L* are not stored. The remaining elements of *U* and *L* are stored in the corresponding columns of the array *a*, but additional row interchanges are required to recover *U* or *L* explicitly (which is seldom necessary).

If *ipiv*(*i*) = *i* for all *i* =1...*n*, then all off-diagonal elements of *U* (*L*) are stored explicitly in the corresponding elements of the array *a*.

If *uplo* = 'U', the computed factors *U* and *D* are the exact factors of a perturbed matrix *A* + *E*, where

$|E| \leq c(n)\varepsilon\ P|U||D||U^T|P^T$

$c(n)$ is a modest linear function of n, and ε is the machine precision. A similar estimate holds for the computed *L* and *D* when *uplo* = 'L'.

The total number of floating-point operations is approximately $(1/3)n^3$ for real flavors or $(4/3)n^3$ for complex flavors.

After calling this routine, you can call the following routines:

?sytrs	to solve *A*X = B*
?sycon	to estimate the condition number of *A*
?sytri	to compute the inverse of *A*.

?hetrf

Computes the Bunch-Kaufman factorization of a complex Hermitian matrix.

Syntax

Fortran 77:

```
call chetrf( uplo, n, a, lda, ipiv, work, lwork, info )
call zhetrf( uplo, n, a, lda, ipiv, work, lwork, info )
```

Fortran 95:

```
call hetrf( a [, uplo] [,ipiv] [,info] )
```

Description

This routine forms the Bunch-Kaufman factorization of a Hermitian matrix:

if *uplo*='U', $A = P*U*D*U^H*P^T$

if *uplo*='L', $A = P*L*D*L^H*P^T$,

where A is the input matrix, P is a permutation matrix, U and L are upper and lower triangular matrices with unit diagonal, and D is a Hermitian block-diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks. U and L have 2-by-2 unit diagonal blocks corresponding to the 2-by-2 blocks of D.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of A is stored and how A is factored: If *uplo* = 'U', the array *a* stores the upper triangular part of the matrix A, and A is factored as $P*U*D*U^H*P^T$. If *uplo* = 'L', the array *a* stores the lower triangular part of the matrix A, and A is factored as $P*L*D*L^H*P^T$.
n	INTEGER. The order of matrix A; $n \geq 0$.
a, *work*	COMPLEX for chetrf DOUBLE COMPLEX for zhetrf. Arrays, DIMENSION *a*(*lda*,*), *work*(*). The array *a* contains the upper or the lower triangular part of the matrix A (see *uplo*). The second dimension of *a* must be at least max(1, *n*). *work*(*) is a workspace array of dimension at least max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
lwork	INTEGER. The size of the *work* array ($lwork \geq n$). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

a	The upper or lower triangular part of *a* is overwritten by details of the block-diagonal matrix D and the multipliers used to obtain the factor U (or L).
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
ipiv	INTEGER.

	Array, DIMENSION at least max(1, *n*). Contains details of the interchanges and the block structure of *D*. If *ipiv*(*i*) = *k* > 0, then d_{ii} is a 1-by-1 block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column. If *uplo* = 'U' and *ipiv*(*i*) = *ipiv*(*i*-1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*–1, and the (*i*–1)-th row and column of *A* was interchanged with the *m*-th row and column. If *uplo* = 'L' and *ipiv*(*i*) = *ipiv*(*i*+1) = –*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*+1, and the (*i*+1)-th row and column of *A* was interchanged with the *m*-th row and column.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = –*i*, the *i*-th parameter had an illegal value. If *info* = *i*, d_{ii} is 0. The factorization has been completed, but *D* is exactly singular. Division by 0 will occur if you use *D* for solving a system of linear equations.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine hetrf interface are as follows:

a	holds the matrix *A* of size (*n*, *n*)
ipiv	holds the vector of length (*n*)
uplo	must be 'U' or 'L'. The default value is 'U'.

Application Notes

This routine is suitable for Hermitian matrices that are not known to be positive-definite. If *A* is in fact positive-definite, the routine does not perform interchanges, and no 2-by-2 diagonal blocks occur in *D*.

For better performance, try using *lwork* = *n***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = –1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The 2-by-2 unit diagonal blocks and the unit diagonal elements of *U* and *L* are not stored. The remaining elements of *U* and *L* are stored in the corresponding columns of the array *a*, but additional row interchanges are required to recover *U* or *L* explicitly (which is seldom necessary).

If *ipiv*(*i*) = *i* for all *i* =1...*n*, then all off-diagonal elements of *U* (*L*) are stored explicitly in the corresponding elements of the array *a*.

If *uplo* = 'U', the computed factors *U* and *D* are the exact factors of a perturbed matrix *A* + *E*, where

$|E| \leq c(n)\varepsilon P|U||D||U^T|P^T$

$c(n)$ is a modest linear function of n, and ε is the machine precision.

A similar estimate holds for the computed *L* and *D* when *uplo* = 'L'.

The total number of floating-point operations is approximately $(4/3)n^3$.

After calling this routine, you can call the following routines:

?hetrs	to solve *A***X* = *B*
?hecon	to estimate the condition number of *A*
?hetri	to compute the inverse of *A*.

?sptrf

Computes the Bunch-Kaufman factorization of a symmetric matrix using packed storage.

Syntax

Fortran 77:

```
call ssptrf( uplo, n, ap, ipiv, info )
call dsptrf( uplo, n, ap, ipiv, info )
call csptrf( uplo, n, ap, ipiv, info )
call zsptrf( uplo, n, ap, ipiv, info )
```

Fortran 95:

```
call sptrf( a [,uplo] [,ipiv]  [,info] )
```

Description

This routine forms the Bunch-Kaufman factorization of a symmetric matrix A using packed storage:

if $uplo$='U', $A = P*U*D*U^T*P^T$

if $uplo$='L', $A = P*L*D*L^T*P^T$,

where P is a permutation matrix, U and L are upper and lower triangular matrices with unit diagonal, and D is a symmetric block-diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks. U and L have 2-by-2 unit diagonal blocks corresponding to the 2-by-2 blocks of D.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of A is packed in the array ap and how A is factored: If $uplo$ = 'U', the array ap stores the upper triangular part of the matrix A, and A is factored as $P*U*D*U^T*P^T$. If $uplo$ = 'L', the array ap stores the lower triangular part of the matrix A, and A is factored as $P*L*D*L^T*P^T$.
n	INTEGER. The order of matrix A; $n \geq 0$.

ap REAL for ssptrf
DOUBLE PRECISION for dsptrf
COMPLEX for csptrf
DOUBLE COMPLEX for zsptrf.
Array, DIMENSION at least max(1, *n*(*n*+1)/2). The array *ap* contains the upper or the lower triangular part of the matrix *A* (as specified by *uplo*) in packed storage (see Matrix Storage Schemes).

Output Parameters

ap The upper or lower triangle of *A* (as specified by *uplo*) is overwritten by details of the block-diagonal matrix *D* and the multipliers used to obtain the factor *U* (or *L*).

ipiv INTEGER.
Array, DIMENSION at least max(1, *n*). Contains details of the interchanges and the block structure of *D*. If *ipiv*(*i*) = *k* > 0, then d_{ii} is a 1-by-1 block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column.
If *uplo* = 'U' and *ipiv*(*i*) = *ipiv*(*i*-1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*–1, and the (*i*–1)-th row and column of *A* was interchanged with the *m*-th row and column.
If *uplo* = 'L' and *ipiv*(*i*) = *ipiv*(*i*+1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*+1, and the (*i*+1)-th row and column of *A* was interchanged with the *m*-th row and column.

info INTEGER. If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, d_{ii} is 0. The factorization has been completed, but *D* is exactly singular. Division by 0 will occur if you use *D* for solving a system of linear equations.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine sptrf interface are as follows:

a stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n**(*n*+1)/2).

ipiv	holds the vector of length (*n*).
uplo	must be 'U' or 'L'. The default value is 'U'.

Application Notes

The 2-by-2 unit diagonal blocks and the unit diagonal elements of *U* and *L* are not stored. The remaining elements of *U* and *L* overwrite elements of the corresponding columns of the matrix *A*, but additional row interchanges are required to recover *U* or *L* explicitly (which is seldom necessary).

If *ipiv*(*i*) = *i* for all *i* = 1...*n*, then all off-diagonal elements of *U* (*L*) are stored explicitly in packed form.

If *uplo* = 'U', the computed factors *U* and *D* are the exact factors of a perturbed matrix *A* + *E*, where

$$|E| \leq c(n)\varepsilon\ P|U||D||U^T|P^T$$

$c(n)$ is a modest linear function of n, and ε is the machine precision. A similar estimate holds for the computed *L* and *D* when *uplo* = 'L'.

The total number of floating-point operations is approximately $(1/3)n^3$ for real flavors or $(4/3)n^3$ for complex flavors.

After calling this routine, you can call the following routines:

?sptrs	to solve *A*X* = *B*
?spcon	to estimate the condition number of *A*
?sptri	to compute the inverse of *A*.

?hptrf

Computes the Bunch-Kaufman factorization of a complex Hermitian matrix using packed storage.

Syntax

Fortran 77:

```
call chptrf( uplo, n, ap, ipiv, info )
call zhptrf( uplo, n, ap, ipiv, info )
```

Fortran 95:

```
call hptrf( a [,uplo] [,ipiv] [,info] )
```

Description

This routine forms the Bunch-Kaufman factorization of a Hermitian matrix using packed storage:

if *uplo*='U', $A = P*U*D*U^H*P^T$

if *uplo*='L', $A = P*L*D*L^H*P^T$,

where A is the input matrix, P is a permutation matrix, U and L are upper and lower triangular matrices with unit diagonal, and D is a Hermitian block-diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks. U and L have 2-by-2 unit diagonal blocks corresponding to the 2-by-2 blocks of D.

Input Parameters

uplo — CHARACTER*1. Must be 'U' or 'L'.
Indicates whether the upper or lower triangular part of A is packed and how A is factored:
If *uplo* = 'U', the array *ap* stores the upper triangular part of the matrix A, and A is factored as $P*U*D*U^H*P^T$.
If *uplo* = 'L', the array *ap* stores the lower triangular part of the matrix A, and A is factored as $P*L*D*L^H*P^T$.

n — INTEGER. The order of matrix A; $n \geq 0$.

ap — COMPLEX for chptrf
DOUBLE COMPLEX for zhptrf.
Array, DIMENSION at least max(1, $n(n+1)/2$). The array *ap* contains the upper or the lower triangular part of the matrix A (as specified by *uplo*) in packed storage (see Matrix Storage Schemes).

Output Parameters

ap — The upper or lower triangle of A (as specified by *uplo*) is overwritten by details of the block-diagonal matrix D and the multipliers used to obtain the factor U (or L).

ipiv — INTEGER.

	Array, DIMENSION at least max(1, *n*). Contains details of the interchanges and the block structure of *D*. If *ipiv*(*i*) = *k* > 0, then d_{ii} is a 1-by-1 block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column. If *uplo* = 'U' and *ipiv*(*i*) = *ipiv*(*i*-1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*–1, and the (*i*–1)-th row and column of *A* was interchanged with the *m*–th row and column. If *uplo* = 'L' and *ipiv*(*i*) = *ipiv*(*i*+1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*+1, and the (*i*+1)-th row and column of *A* was interchanged with the *m*-th row and column.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = –*i*, the *i*-th parameter had an illegal value. If *info* = *i*, d_{ii} is 0. The factorization has been completed, but *D* is exactly singular. Division by 0 will occur if you use *D* for solving a system of linear equations.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine hptrf interface are as follows:

a	Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n**(*n*+1)/2).
ipiv	Holds the vector of length (*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The 2-by-2 unit diagonal blocks and the unit diagonal elements of *U* and *L* are not stored. The remaining elements of *U* and *L* are stored in the corresponding columns of the array *a*, but additional row interchanges are required to recover *U* or *L* explicitly (which is seldom necessary).

If *ipiv*(*i*) = *i* for all *i* = 1...*n*, then all off-diagonal elements of *U* (*L*) are stored explicitly in the corresponding elements of the array *a*.

If *uplo* = 'U', the computed factors *U* and *D* are the exact factors of a perturbed matrix *A* + *E*, where

$|E| \leq c(n)\varepsilon P|U||D||U^T|P^T$

$c(n)$ is a modest linear function of n, and ε is the machine precision.

A similar estimate holds for the computed L and D when *uplo* = 'L'.

The total number of floating-point operations is approximately $(4/3)n^3$.

After calling this routine, you can call the following routines:

?hptrs	to solve *A*X = B*
?hpcon	to estimate the condition number of *A*
?hptri	to compute the inverse of *A*.

Routines for Solving Systems of Linear Equations

This section describes the LAPACK routines for solving systems of linear equations. Before calling most of these routines, you need to factorize the matrix of your system of equations (see Routines for Matrix Factorization in this chapter). However, the factorization is not necessary if your system of equations has a triangular matrix.

?getrs

Solves a system of linear equations with an LU-factored square matrix, with multiple right-hand sides.

Syntax

Fortran 77:

```
call sgetrs( trans, n, nrhs, a, lda, ipiv, b, ldb, info )
call dgetrs( trans, n, nrhs, a, lda, ipiv, b, ldb, info )
call cgetrs( trans, n, nrhs, a, lda, ipiv, b, ldb, info )
call zgetrs( trans, n, nrhs, a, lda, ipiv, b, ldb, info )
```

Fortran 95:

```
call getrs( a, ipiv, b [, trans] [,info] )
```

Description

This routine solves for X the following systems of linear equations:

*A*X = B* if *trans*='N',

$A^T*X = B$	if *trans*='T',
$A^H*X = B$	if *trans*='C' (for complex matrices only).

Before calling this routine, you must call ?getrf to compute the *LU* factorization of *A*.

Input Parameters

trans	CHARACTER*1. Must be 'N' or 'T' or 'C'. Indicates the form of the equations: If *trans* = 'N', then *A*X* = *B* is solved for *X*. If *trans* = 'T', then $A^T*X = B$ is solved for *X*. If *trans* = 'C', then $A^H*X = B$ is solved for *X*.
n	INTEGER. The order of *A*; the number of rows in *B*(*n* ≥ 0).
nrhs	INTEGER. The number of right-hand sides; *nrhs* ≥ 0.
a, *b*	REAL for sgetrs DOUBLE PRECISION for dgetrs COMPLEX for cgetrs DOUBLE COMPLEX for zgetrs. Arrays: *a*(*lda*,*), *b*(*ldb*,*). The array *a* contains *LU* factorization of matrix *A* resulting from the call of ?getrf . The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *a* must be at least max(1,*n*), the second dimension of *b* at least max(1,*nrhs*).
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). The *ipiv* array, as returned by ?getrf.

Output Parameters

b	Overwritten by the solution matrix *X*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `getrs` interface are as follows:

a	Holds the matrix A of size (n, n).
b	Holds the matrix B of size (n, $nrhs$).
ipiv	Holds the vector of length (n).
trans	Must be `'N'`, `'C'`, or `'T'`. The default value is `'N'`.

Application Notes

For each right-hand side b, the computed solution is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$|E| \leq c(n)\varepsilon P|L||U|$

$c(n)$ is a modest linear function of n, and ε is the machine precision.

If x_0 is the true solution, the computed solution x satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \leq c(n)\, cond\,(A, x)\varepsilon$$

where $\text{cond}(A,x) = \| |A^{-1}||A| |x| \|_\infty / \|x\|_\infty \leq \|A^{-1}\|_\infty \|A\|_\infty = \kappa_\infty(A)$.

Note that $\text{cond}(A,x)$ can be much smaller than $\kappa_\infty(A)$; the condition number of A^T and A^H might or might not be equal to $\kappa_\infty(A)$.

The approximate number of floating-point operations for one right-hand side vector b is $2n^2$ for real flavors and $8n^2$ for complex flavors.

To estimate the condition number $\kappa_\infty(A)$, call `?gecon`.

To refine the solution and estimate the error, call `?gerfs`.

?gbtrs

Solves a system of linear equations with an LU-factored band matrix, with multiple right-hand sides.

Syntax

Fortran 77:

```
call sgbtrs( trans, n, kl, ku, nrhs, ab, ldab, ipiv, b, ldb, info )
call dgbtrs( trans, n, kl, ku, nrhs, ab, ldab, ipiv, b, ldb, info )
call cgbtrs( trans, n, kl, ku, nrhs, ab, ldab, ipiv, b, ldb, info )
call zgbtrs( trans, n, kl, ku, nrhs, ab, ldab, ipiv, b, ldb, info )
```

Fortran 95:

```
call gbtrs( a, b, ipiv,  [, kl] [, trans] [, info] )
```

Description

This routine solves for X the following systems of linear equations:

$A*X = B$	if *trans*='N',
$A^T*X = B$	if *trans*='T',
$A^H*X = B$	if *trans*='C' (for complex matrices only).

Here A is an LU-factored general band matrix of order n with kl non-zero subdiagonals and ku nonzero superdiagonals. Before calling this routine, call ?gbtrf to compute the LU factorization of A.

Input Parameters

trans	CHARACTER*1. Must be 'N' or 'T' or 'C'.
n	INTEGER. The order of A; the number of rows in B; $n \geq 0$.
kl	INTEGER. The number of subdiagonals within the band of A; $kl \geq 0$.
ku	INTEGER. The number of superdiagonals within the band of A; $ku \geq 0$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
ab, *b*	REAL for sgbtrs

DOUBLE PRECISION for dgbtrs
COMPLEX for cgbtrs
DOUBLE COMPLEX for zgbtrs.
Arrays: *ab*(*ldab*,*), *b*(*ldb*,*).
The array *ab* contains the matrix *A* in band storage (see Matrix Storage Schemes).
The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations.
The second dimension of *ab* must be at least max(1, *n*), and the second dimension of *b* at least max(1,*nrhs*).

ldab — INTEGER. The leading dimension of the array *ab*; *ldab* ≥ 2**kl* + *ku* +1.

ldb — INTEGER. The leading dimension of *b*; *ldb* ≥ max(1, *n*).

ipiv — INTEGER. Array, DIMENSION at least max(1, *n*). The *ipiv* array, as returned by ?gbtrf.

Output Parameters

b — Overwritten by the solution matrix *X*.

info — INTEGER. If *info*=0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gbtrs interface are as follows:

a — Stands for argument *ab* in Fortan 77 interface. Holds the array *A* of size (2**kl*+*ku*+1,*n*).

b — Holds the matrix *B* of size (*n*, *nrhs*).

ipiv — Holds the vector of length min(*m*, *n*).

kl — If omitted, assumed *kl* = *ku*.

ku — Restored as *lda*-2**kl*-1.

trans — Must be 'N', 'C', or 'T'. The default value is 'N'.

Application Notes

For each right-hand side b, the computed solution is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$|E| \leq c(kl + ku + 1)\varepsilon \ P|L||U|$

$c(k)$ is a modest linear function of k, and ε is the machine precision.

If x_0 is the true solution, the computed solution x satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \leq c(kl + ku + 1)\, cond\,(A, x)\varepsilon$$

where $cond(A, x) = \| |A^{-1}||A|\,|x|\,\|_\infty / \|x\|_\infty \leq \|A^{-1}\|_\infty \|A\|_\infty = \kappa_\infty(A)$.

Note that $cond(A, x)$ can be much smaller than $\kappa_\infty(A)$; the condition number of A^T and A^H might or might not be equal to $\kappa_\infty(A)$.

The approximate number of floating-point operations for one right-hand side vector is $2n(ku + 2kl)$ for real flavors. The number of operations for complex flavors is 4 times greater. All these estimates assume that kl and ku are much less than $\min(m,n)$.

To estimate the condition number $\kappa_\infty(A)$, call ?gbcon.

To refine the solution and estimate the error, call ?gbrfs.

?gttrs

Solves a system of linear equations with a tridiagonal matrix using the LU factorization computed by ?gttrf.

Syntax

Fortran 77:

```
call sgttrs( trans, n, nrhs, dl, d, du, du2, ipiv, b, ldb, info )
call dgttrs( trans, n, nrhs, dl, d, du, du2, ipiv, b, ldb, info )
call cgttrs( trans, n, nrhs, dl, d, du, du2, ipiv, b, ldb, info )
call zgttrs( trans, n, nrhs, dl, d, du, du2, ipiv, b, ldb, info )
```

Fortran 95:

```
call gttrs( dl, d, du, du2, b, ipiv [, trans] [,info] )
```

Description

This routine solves for X the following systems of linear equations with multiple right hand sides:

$A*X = B$	if *trans*='N',
$A^T*X = B$	if *trans*='T',
$A^H*X = B$	if *trans*='C' (for complex matrices only).

Before calling this routine, you must call ?gttrf to compute the LU factorization of A.

Input Parameters

trans	CHARACTER*1. Must be 'N' or 'T' or 'C'. Indicates the form of the equations: If *trans* = 'N', then $A*X = B$ is solved for X. If *trans* = 'T', then $A^T*X = B$ is solved for X. If *trans* = 'C', then $A^H*X = B$ is solved for X.
n	INTEGER. The order of A; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides, that is, the number of columns in B; $nrhs \geq 0$.

dl,*d*,*du*,*du2*,*b*	REAL for sgttrs DOUBLE PRECISION for dgttrs COMPLEX for cgttrs DOUBLE COMPLEX for zgttrs. Arrays: *dl*(*n* -1), *d*(*n*), *du*(*n* -1), *du2*(*n* -2), *b*(*ldb*,*nrhs*). The array *dl* contains the (*n* - 1) multipliers that define the matrix *L* from the *LU* factorization of *A*. The array *d* contains the *n* diagonal elements of the upper triangular matrix *U* from the *LU* factorization of *A*. The array *du* contains the (*n* - 1) elements of the first superdiagonal of *U*. The array *du2* contains the (*n* - 2) elements of the second superdiagonal of *U*. The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations.
ldb	INTEGER. The leading dimension of *b*; *ldb* ≥ max(1, *n*).
ipiv	INTEGER. Array, DIMENSION (*n*). The *ipiv* array, as returned by ?gttrf.

Output Parameters

b	Overwritten by the solution matrix *X*.
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gttrs interface are as follows:

dl	Holds the vector of length (*n*-1).
d	Holds the vector of length (*n*).
du	Holds the vector of length (*n*-1).
du2	Holds the vector of length (*n*-2).
b	Holds the matrix *B* of size (*n*, *nrhs*).

ipiv	Holds the vector of length (n).
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.

Application Notes

For each right-hand side b, the computed solution is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$|E| \leq c(n)\varepsilon\ P|L||U|$

$c(n)$ is a modest linear function of n, and ε is the machine precision.

If x_0 is the true solution, the computed solution x satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \leq c(kl + ku + 1)\, cond\,(A, x)\varepsilon$$

where $cond(A, x) = || |A^{-1}||A|\ |x|\ ||_\infty / ||x||_\infty \leq ||A^{-1}||_\infty\ ||A||_\infty = \kappa_\infty(A)$.

Note that $cond(A, x)$ can be much smaller than $\kappa_\infty(A)$; the condition number of A^T and A^H might or might not be equal to $\kappa_\infty(A)$.

The approximate number of floating-point operations for one right-hand side vector b is $7n$ (including n divisions) for real flavors and $34n$ (including $2n$ divisions) for complex flavors.

To estimate the condition number $\kappa_\infty(A)$, call ?gtcon.

To refine the solution and estimate the error, call ?gtrfs.

?potrs

Solves a system of linear equations with a Cholesky-factored symmetric (Hermitian) positive-definite matrix.

Syntax

Fortran 77:

```
call spotrs( uplo, n, nrhs, a, lda, b, ldb, info )
call dpotrs( uplo, n, nrhs, a, lda, b, ldb, info )
call cpotrs( uplo, n, nrhs, a, lda, b, ldb, info )
call zpotrs( uplo, n, nrhs, a, lda, b, ldb, info )
```

Fortran 95:

```
call potrs( a, b [,uplo] [, info] )
```

Description

This routine solves for X the system of linear equations $A*X = B$ with a symmetric positive-definite or, for complex data, Hermitian positive-definite matrix A, given the Cholesky factorization of A:

$A = U^T*U$ for real data, $A = U^H*U$ for complex data	If $uplo$ = 'U'
$A = L*L^T$ for real data, $A = L*L^H$ for complex data	If $uplo$ = 'L',

where L is a lower triangular matrix and U is upper triangular. The system is solved with multiple right-hand sides stored in the columns of the matrix B.

Before calling this routine, you must call ?potrf to compute the Cholesky factorization of A.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates how the input matrix A has been factored: If $uplo$ = 'U', the upper triangle of A is stored.

If *uplo* = 'L', the lower triangle of *A* is stored.

n — INTEGER. The order of matrix *A*; *n* ≥ 0.

nrhs — INTEGER. The number of right-hand sides (*nrhs* ≥ 0).

a, *b* — REAL for spotrs
DOUBLE PRECISION for dpotrs
COMPLEX for cpotrs
DOUBLE COMPLEX for zpotrs.
Arrays: *a*(*lda*,*), *b*(*ldb*,*).
The array *a* contains the factor *U* or *L* (see *uplo*).
The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations.
The second dimension of *a* must be at least max(1,*n*), the second dimension of *b* at least max(1,*nrhs*).

lda — INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).

ldb — INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

Output Parameters

b — Overwritten by the solution matrix *X*.

info — INTEGER. If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine potrs interface are as follows:

a — Holds the matrix *A* of size (*n*, *n*).

b — Holds the matrix *B* of size (*n*, *nrhs*).

uplo — Must be 'U' or 'L'. The default value is 'U'.

Application Notes

If `uplo = 'U'`, the computed solution for each right-hand side b is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$|E| \leq c(n)\varepsilon \ |U^H||U|$

$c(n)$ is a modest linear function of n, and ε is the machine precision.

A similar estimate holds for `uplo = 'L'`. If x_0 is the true solution, the computed solution x satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \leq c(n)\, cond\,(A, x)\varepsilon$$

where $\text{cond}(A, x) = \| |A^{-1}||A|\,|x| \|_\infty / \|x\|_\infty \leq \|A^{-1}\|_\infty \|A\|_\infty = \kappa_\infty(A)$.

Note that $\text{cond}(A, x)$ can be much smaller than $\kappa_\infty(A)$. The approximate number of floating-point operations for one right-hand side vector b is $2n^2$ for real flavors and $8n^2$ for complex flavors.

To estimate the condition number $\kappa_\infty(A)$, call `?pocon`.

To refine the solution and estimate the error, call `?porfs`.

?pptrs

Solves a system of linear equations with a packed Cholesky-factored symmetric (Hermitian) positive-definite matrix.

Syntax

Fortran 77:

```
call spptrs( uplo, n, nrhs, ap, b, ldb, info )
call dpptrs( uplo, n, nrhs, ap, b, ldb, info )
call cpptrs( uplo, n, nrhs, ap, b, ldb, info )
call zpptrs( uplo, n, nrhs, ap, b, ldb, info )
```

Fortran 95:

```
call pptrs( a, b [,uplo] [,info] )
```

Description

This routine solves for X the system of linear equations $A*X = B$ with a packed symmetric positive-definite or, for complex data, Hermitian positive-definite matrix A, given the Cholesky factorization of A:

$A = U^T*U$ for real data, $A = U^H*U$ for complex data	If $uplo$ = 'U'
$A = L*L^T$ for real data, $A = L*L^H$ for complex data	If $uplo$ = 'L',

where L is a lower triangular matrix and U is upper triangular. The system is solved with multiple right-hand sides stored in the columns of the matrix B.

Before calling this routine, you must call ?pptrf to compute the Cholesky factorization of A.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates how the input matrix A has been factored: If $uplo$ = 'U', the upper triangle of A is stored. If $uplo$ = 'L', the lower triangle of A is stored.
n	INTEGER. The order of matrix A; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides ($nrhs \geq 0$).
ap, *b*	REAL for spptrs DOUBLE PRECISION for dpptrs COMPLEX for cpptrs DOUBLE COMPLEX for zpptrs. Arrays: $ap(*)$, $b(ldb,*)$ The dimension of ap must be at least max(1,n(n+1)/2). The array ap contains the factor U or L, as specified by $uplo$, in packed storage (see Matrix Storage Schemes).

	The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1, *nrhs*).
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

Output Parameters

b	Overwritten by the solution matrix *X*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine pptrs interface are as follows:

a	Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n**(*n*+1)/2).
b	Holds the matrix *B* of size (*n*, *nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

If *uplo* = 'U', the computed solution for each right-hand side *b* is the exact solution of a perturbed system of equations (*A* + *E*)*x* = *b*, where

$|E| \leq c(n)\varepsilon \ |U^H||U|$

$c(n)$ is a modest linear function of n, and ε is the machine precision.

A similar estimate holds for *uplo* = 'L'.

If x_0 is the true solution, the computed solution x satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \leq c(n)\, cond\,(A, x)\varepsilon$$

where $\mathrm{cond}(A, x) = \| \, |A^{-1}||A| \, |x| \, \|_\infty / \|x\|_\infty \le \|A^{-1}\|_\infty \|A\|_\infty = \kappa_\infty(A)$.

Note that $\mathrm{cond}(A, x)$ can be much smaller than $\kappa_\infty(A)$.

The approximate number of floating-point operations for one right-hand side vector b is $2n^2$ for real flavors and $8n^2$ for complex flavors.

To estimate the condition number $\kappa_\infty(A)$, call ?ppcon.

To refine the solution and estimate the error, call ?pprfs.

?pbtrs

Solves a system of linear equations with a Cholesky-factored symmetric (Hermitian) positive-definite band matrix.

Syntax

Fortran 77:

```
call spbtrs( uplo, n, kd, nrhs, ab, ldab, b, ldb, info )
call dpbtrs( uplo, n, kd, nrhs, ab, ldab, b, ldb, info )
call cpbtrs( uplo, n, kd, nrhs, ab, ldab, b, ldb, info )
call zpbtrs( uplo, n, kd, nrhs, ab, ldab, b, ldb, info )
```

Fortran 95:

```
call pbtrs( a, b [,uplo] [,info] )
```

Description

This routine solves for real data a system of linear equations $A*X = B$ with a symmetric positive-definite or, for complex data, Hermitian positive-definite band matrix A, given the Cholesky factorization of A:

$A = U^T*U$ for real data, $A = U^H*U$ for complex data	If uplo='U'

$A = L*L^T$ for real data, $A = L*L^H$ for complex data	If *uplo*='L',

where L is a lower triangular matrix and U is upper triangular. The system is solved with multiple right-hand sides stored in the columns of the matrix B.

Before calling this routine, you must call ?pbtrf to compute the Cholesky factorization of A in the band storage form.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates how the input matrix A has been factored: If *uplo* = 'U', the upper triangular factor is stored in *ab*. If *uplo* = 'L', the lower triangular factor is stored in *ab*.
n	INTEGER. The order of matrix A; $n \geq 0$.
kd	INTEGER. The number of superdiagonals or subdiagonals in the matrix A; $kd \geq 0$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
ab, *b*	REAL for spbtrs DOUBLE PRECISION for dpbtrs COMPLEX for cpbtrs DOUBLE COMPLEX for zpbtrs. Arrays: *ab*(*ldab*,*), *b*(*ldb*,*). The array *ab* contains the Cholesky factor, as returned by the factorization routine, in band storage form. The array *b* contains the matrix B whose columns are the right-hand sides for the systems of equations. The second dimension of *ab* must be at least max(1, *n*), and the second dimension of *b* at least max(1,*nrhs*).
ldab	INTEGER. The first dimension of the array *ab*; *ldab* ≥ *kd* +1.
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

Output Parameters

b	Overwritten by the solution matrix X.

info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine pbtrs interface are as follows:

a	Stands for argument *ab* in Fortan 77 interface. Holds the array *A* of size (*kd*+1, *n*).
b	Holds the matrix *B* of size (*n*, *nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For each right-hand side *b*, the computed solution is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$|E| \le c(kd + 1)\varepsilon\ P|U^H||U|$ or $|E| \le c(kd + 1)\varepsilon\ P|L^H||L|$

$c(k)$ is a modest linear function of k, and ε is the machine precision.

If x_0 is the true solution, the computed solution x satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \le c(kd + 1)\, cond\,(A, x)\varepsilon$$

where $cond(A, x) = \| |A^{-1}||A|\,|x|\,\|_\infty / \|x\|_\infty \le \|A^{-1}\|_\infty \|A\|_\infty = \kappa_\infty(A)$.

Note that $cond(A, x)$ can be much smaller than $\kappa_\infty(A)$.

The approximate number of floating-point operations for one right-hand side vector is $4n*kd$ for real flavors and $16n*kd$ for complex flavors.

To estimate the condition number $\kappa_\infty(A)$, call ?pbcon.

To refine the solution and estimate the error, call ?pbrfs.

?pttrs

Solves a system of linear equations with a symmetric (Hermitian) positive-definite tridiagonal matrix using the factorization computed by ?pttrf.

Syntax

Fortran 77:

```
call spttrs( n, nrhs, d, e, b, ldb, info )
call dpttrs( n, nrhs, d, e, b, ldb, info )
call cpttrs( uplo, n, nrhs, d, e, b, ldb, info )
call zpttrs( uplo, n, nrhs, d, e, b, ldb, info )
```

Fortran 95:

```
call pttrs( d, e, b [,info] )
call pttrs( d, e, b [,uplo]  [,info] )
```

Description

This routine solves for *X* a system of linear equations *A*X = B* with a symmetric (Hermitian) positive-definite tridiagonal matrix *A*. Before calling this routine, call ?pttrf to compute the *L*D*L'* for real data and the *L*D*L'* or *U'*D*U* factorization of *A* for complex data.

Input Parameters

uplo	CHARACTER*1. Used for cpttrs/zpttrs only. Must be 'U' or 'L'. Specifies whether the superdiagonal or the subdiagonal of the tridiagonal matrix *A* is stored and how *A* is factored: If *uplo* = 'U', the array *e* stores the superdiagonal of *A*, and *A* is factored as *U'*D*U*. If *uplo* = 'L', the array *e* stores the subdiagonal of *A*, and *A* is factored as *L*D*L'*.
n	INTEGER. The order of *A*; *n* ≥ 0.
nrhs	INTEGER. The number of right-hand sides, that is, the number of columns of the matrix *B*; *nrhs* ≥ 0.
d	REAL for spttrs, cpttrs

DOUBLE PRECISION for dpttrs, zpttrs.
Array, dimension (*n*). Contains the diagonal elements of the diagonal matrix *D* from the factorization computed by ?pttrf.

e, *b*
REAL for spttrs
DOUBLE PRECISION for dpttrs
COMPLEX for cpttrs
DOUBLE COMPLEX for zpttrs.
Arrays: *e*(*n* -1), *b*(*ldb*, *nrhs*).
The array *e* contains the (*n* - 1) off-diagonal elements of the unit bidiagonal factor *U* or *L* from the factorization computed by ?pttrf (see *uplo*).
The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations.

ldb
INTEGER. The leading dimension of *b*; *ldb* ≥ max(1, *n*).

Output Parameters

b
Overwritten by the solution matrix *X*.

info
INTEGER. If *info*=0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine pttrs interface are as follows:

d
Holds the vector of length (*n*).

e
Holds the vector of length (*n*-1).

b
Holds the matrix *B* of size (*n*, *nrhs*).

uplo
Used in complex flavors only. Must be 'U' or 'L'. The default value is 'U'.

?sytrs

Solves a system of linear equations with a UDU- or LDL-factored symmetric matrix.

Syntax

Fortran 77:

```
call ssytrs( uplo, n, nrhs, a, lda, ipiv, b, ldb, info )
call dsytrs( uplo, n, nrhs, a, lda, ipiv, b, ldb, info )
call csytrs( uplo, n, nrhs, a, lda, ipiv, b, ldb, info )
call zsytrs( uplo, n, nrhs, a, lda, ipiv, b, ldb, info )
```

Fortran 95:

```
call sytrs( a, b, ipiv [,uplo] [,info] )
```

Description

This routine solves for X the system of linear equations $A*X = B$ with a symmetric matrix A, given the Bunch-Kaufman factorization of A:

if $uplo$='U', $A = P*U*D*U^T*P^T$

if $uplo$='L', $A = P*L*D*L^T*P^T$,

where P is a permutation matrix, U and L are upper and lower triangular matrices with unit diagonal, and D is a symmetric block-diagonal matrix. The system is solved with multiple right-hand sides stored in the columns of the matrix B. You must supply to this routine the factor U (or L) and the array $ipiv$ returned by the factorization routine ?sytrf.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates how the input matrix A has been factored: If $uplo$ = 'U', the array a stores the upper triangular factor U of the factorization $A = P*U*D*U^T*P^T$. If $uplo$ = 'L', the array a stores the lower triangular factor L of the factorization $A = P*L*D*L^T*P^T$.
n	INTEGER. The order of matrix A; $n \geq 0$.

nrhs	INTEGER. The number of right-hand sides; *nrhs* ≥ 0.
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). The *ipiv* array, as returned by ?sytrf.
a, *b*	REAL for ssytrs DOUBLE PRECISION for dsytrs COMPLEX for csytrs DOUBLE COMPLEX for zsytrs. Arrays: *a*(*lda*,*), *b*(*ldb*,*). The array *a* contains the factor *U* or *L* (see *uplo*). The array *b* contains the matrix *B* whose columns are the right-hand sides for the system of equations. The second dimension of *a* must be at least max(1,*n*), and the second dimension of *b* at least max(1,*nrhs*).
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

Output Parameters

b	Overwritten by the solution matrix *X*.
info	INTEGER. If *info*=0, the execution is successful. If *info* = *-i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine sytrs interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *nrhs*).
ipiv	Holds the vector of length (*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For each right-hand side b, the computed solution is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$|E| \le c(n)\varepsilon\ P|U||D||U^T|P^T$ or $|E| \le c(n)\varepsilon\ P|L||D||U^T|P^T$

$c(n)$ is a modest linear function of n, and ε is the machine precision.

If x_0 is the true solution, the computed solution x satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \le c(n)\, cond\,(A, x)\varepsilon$$

where $cond(A, x) = \| |A^{-1}||A|\,|x| \|_\infty / \|x\|_\infty \le \|A^{-1}\|_\infty \|A\|_\infty = \kappa_\infty(A)$.

Note that $cond(A, x)$ can be much smaller than $\kappa_\infty(A)$.

The total number of floating-point operations for one right-hand side vector is approximately $2n^2$ for real flavors or $8n^2$ for complex flavors.

To estimate the condition number $\kappa_\infty(A)$, call ?sycon.

To refine the solution and estimate the error, call ?syrfs.

?hetrs

Solves a system of linear equations with a UDU- or LDL-factored Hermitian matrix.

Syntax

Fortran 77:

```
call chetrs( uplo, n, nrhs, a, lda, ipiv, b, ldb, info )
call zhetrs( uplo, n, nrhs, a, lda, ipiv, b, ldb, info )
```

Fortran 95:

```
call hetrs( a, b, ipiv [, uplo] [,info] )
```

Description

This routine solves for *X* the system of linear equations *A*X = B* with a Hermitian matrix *A*, given the Bunch-Kaufman factorization of *A*:

if *uplo* = 'U' $A = P*U*D*U^H*P^T$

if *uplo* = 'L' $A = P*L*D*L^H*P^T$,

where *P* is a permutation matrix, *U* and *L* are upper and lower triangular matrices with unit diagonal, and *D* is a symmetric block-diagonal matrix. The system is solved with multiple right-hand sides stored in the columns of the matrix *B*. You must supply to this routine the factor *U* (or *L*) and the array *ipiv* returned by the factorization routine ?hetrf.

Input Parameters

uplo
CHARACTER*1. Must be 'U' or 'L'.
Indicates how the input matrix *A* has been factored:
If *uplo* = 'U', the array *a* stores the upper triangular factor *U* of the factorization *A* = $P*U*D*U^H*P^T$.
If *uplo* = 'L', the array *a* stores the lower triangular factor *L* of the factorization *A* = $P*L*D*L^H*P^T$.

n
INTEGER. The order of matrix *A*; $n \geq 0$.

nrhs
INTEGER. The number of right-hand sides; $nrhs \geq 0$.

ipiv
INTEGER.
Array, DIMENSION at least max(1, *n*).
The *ipiv* array, as returned by ?hetrf.

a, *b*
COMPLEX for chetrs
DOUBLE COMPLEX for zhetrs.
Arrays: *a*(*lda*,*), *b*(*ldb*,*).
The array *a* contains the factor *U* or *L* (see *uplo*).
The array *b* contains the matrix *B* whose columns are the right-hand sides for the system of equations.
The second dimension of *a* must be at least max(1,*n*), the second dimension of *b* at least max(1,*nrhs*).

lda
INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).

ldb
INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

Output Parameters

b	Overwritten by the solution matrix *X*.
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `hetrs` interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *nrhs*).
ipiv	Holds the vector of length (*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For each right-hand side b, the computed solution is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$|E| \le c(n)\varepsilon\ P|U||D||U^H|P^T$ or $|E| \le c(n)\varepsilon\ P|L||D||L^H|P^T$

$c(n)$ is a modest linear function of n, and ε is the machine precision.

If x_0 is the true solution, the computed solution x satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \le c(n)\, cond\,(A, x)\varepsilon$$

where $cond(A, x) = \| |A^{-1}||A|\,|x|\,\|_\infty / \|x\|_\infty \le \|A^{-1}\|_\infty \|A\|_\infty = \kappa_\infty(A)$.

Note that $cond(A, x)$ can be much smaller than $\kappa_\infty(A)$.

The total number of floating-point operations for one right-hand side vector is approximately $8n^2$.

To estimate the condition number $\kappa_\infty(A)$, call ?hecon.

To refine the solution and estimate the error, call ?herfs.

?sptrs

Solves a system of linear equations with a UDU- or LDL-factored symmetric matrix using packed storage.

Syntax

Fortran 77:

```
call ssptrs( uplo, n, nrhs, ap, ipiv, b, ldb, info )
call dsptrs( uplo, n, nrhs, ap, ipiv, b, ldb, info )
call csptrs( uplo, n, nrhs, ap, ipiv, b, ldb, info )
call zsptrs( uplo, n, nrhs, ap, ipiv, b, ldb, info )
```

Fortran 95:

```
call sptrs( a, b, ipiv [, uplo] [,info] )
```

Description

This routine solves for X the system of linear equations $A*X = B$ with a symmetric matrix A, given the Bunch-Kaufman factorization of A:

if uplo='U', $A = PUDU^TP^T$

if uplo='L', $A = PLDL^TP^T$,

where P is a permutation matrix, U and L are upper and lower packed triangular matrices with unit diagonal, and D is a symmetric block-diagonal matrix. The system is solved with multiple right-hand sides stored in the columns of the matrix B. You must supply the factor U (or L) and the array ipiv returned by the factorization routine ?sptrf.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates how the input matrix A has been factored:

If *uplo* = 'U', the array *ap* stores the packed factor *U* of the factorization *A* = *P*U*D*U^T*P^T*. If *uplo* = 'L', the array *ap* stores the packed factor *L* of the factorization *A* = *P*L*D*L^T*P^T*.

n — INTEGER. The order of matrix *A*; *n* ≥ 0.

nrhs — INTEGER. The number of right-hand sides; *nrhs* ≥ 0.

ipiv — INTEGER.
Array, DIMENSION at least max(1, *n*). The *ipiv* array, as returned by ?sptrf.

ap, *b* — REAL for ssptrs
DOUBLE PRECISION for dsptrs
COMPLEX for csptrs
DOUBLE COMPLEX for zsptrs.
Arrays: *ap*(*), *b*(*ldb*,*).
The dimension of *ap* must be at least max(1,*n*(*n*+1)/2). The array *ap* contains the factor *U* or *L*, as specified by *uplo*, in packed storage (see Matrix Storage Schemes).
The array *b* contains the matrix *B* whose columns are the right-hand sides for the system of equations. The second dimension of *b* must be at least max(1, *nrhs*).

ldb — INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

Output Parameters

b — Overwritten by the solution matrix *X*.

info — INTEGER. If *info*=0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine sptrs interface are as follows:

a — Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n**(*n*+1)/2).

b — Holds the matrix *B* of size (*n*, *nrhs*).

ipiv	Holds the vector of length (n).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

For each right-hand side b, the computed solution is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$|E| \le c(n)\varepsilon\ P|U||D||U^T|P^T$ or $|E| \le c(n)\varepsilon\ P|L||D||L^T|P^T$

$c(n)$ is a modest linear function of n, and ε is the machine precision.

If x_0 is the true solution, the computed solution x satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \le c(n)\ cond\ (A, x)\varepsilon$$

where $\mathrm{cond}(A, x) = \| |A^{-1}||A|\ |x|\ \|_\infty / \|x\|_\infty \le \|A^{-1}\|_\infty\ \|A\|_\infty = \kappa_\infty(A)$.

Note that $\mathrm{cond}(A, x)$ can be much smaller than $\kappa_\infty(A)$.

The total number of floating-point operations for one right-hand side vector is approximately $2n^2$ for real flavors or $8n^2$ for complex flavors.

To estimate the condition number $\kappa_\infty(A)$, call `?spcon`.

To refine the solution and estimate the error, call `?sprfs`.

?hptrs

Solves a system of linear equations with a UDU- or LDL-factored Hermitian matrix using packed storage.

Syntax

Fortran 77:

```
call chptrs( uplo, n, nrhs, ap, ipiv, b, ldb, info )
call zhptrs( uplo, n, nrhs, ap, ipiv, b, ldb, info )
```

Fortran 95:

```
call hptrs( a, b, ipiv [,uplo] [,info] )
```

Description

This routine solves for X the system of linear equations $A*X = B$ with a Hermitian matrix A, given the Bunch-Kaufman factorization of A:

if $uplo$='U', $A = P*U*D*U^H*P^T$

if $uplo$='L', $A = P*L*D*L^H*P^T$,

where P is a permutation matrix, U and L are upper and lower packed triangular matrices with unit diagonal, and D is a symmetric block-diagonal matrix. The system is solved with multiple right-hand sides stored in the columns of the matrix B.

You must supply to this routine the arrays ap (containing U or L)and $ipiv$ in the form returned by the factorization routine ?hptrf.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates how the input matrix A has been factored: If $uplo$ = 'U', the array ap stores the packed factor U of the factorization $A = P*U*D*U^H*P^T$. If $uplo$ = 'L', the array ap stores the packed factor L of the factorization $A = P*L*D*L^H*P^T$.
n	INTEGER. The order of matrix A; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \geq 0$.

ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). The *ipiv* array, as returned by ?hptrf.
ap, *b*	COMPLEX for chptrs DOUBLE COMPLEX for zhptrs. Arrays: *ap*(*), *b*(*ldb*,*). The dimension of *ap* must be at least max(1,*n*(*n*+1)/2). The array *ap* contains the factor *U* or *L*, as specified by *uplo*, in packed storage (see Matrix Storage Schemes). The array *b* contains the matrix *B* whose columns are the right-hand sides for the system of equations. The second dimension of *b* must be at least max(1, *nrhs*).
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

Output Parameters

b	Overwritten by the solution matrix *X*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine hptrs interface are as follows:

a	Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n**(*n*+1)/2).
b	Holds the matrix *B* of size (*n*, *nrhs*).
ipiv	Holds the vector of length (*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For each right-hand side *b*, the computed solution is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$|E| \le c(n)\varepsilon\ P|U||D||U^H|P^T$ or $|E| \le c(n)\varepsilon\ P|L||D||L^H|P^T$

$c(n)$ is a modest linear function of n, and ε is the machine precision.

If x_0 is the true solution, the computed solution x satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \leq c(n)\, cond\,(A, x)\varepsilon$$

where $cond(A,x) = \| |A^{-1}||A|\,|x| \|_\infty / \|x\|_\infty \leq \|A^{-1}\|_\infty \|A\|_\infty = \kappa_\infty(A)$.

Note that $cond(A,x)$ can be much smaller than $\kappa_\infty(A)$.

The total number of floating-point operations for one right-hand side vector is approximately $8n^2$ for complex flavors.

To estimate the condition number $\kappa_\infty(A)$, call ?hpcon.

To refine the solution and estimate the error, call ?hprfs.

?trtrs

Solves a system of linear equations with a triangular matrix, with multiple right-hand sides.

Syntax

Fortran 77:

```
call strtrs( uplo, trans, diag, n, nrhs, a, lda, b, ldb, info )
call dtrtrs( uplo, trans, diag, n, nrhs, a, lda, b, ldb, info )
call ctrtrs( uplo, trans, diag, n, nrhs, a, lda, b, ldb, info )
call ztrtrs( uplo, trans, diag, n, nrhs, a, lda, b, ldb, info )
```

Fortran 95:

```
call trtrs( a, b [,uplo] [, trans] [,diag] [,info] )
```

Description

This routine solves for X the following systems of linear equations with a triangular matrix A, with multiple right-hand sides stored in B:

$A*X = B$	if *trans*='N',
$A^T*X = B$	if *trans*='T',
$A^H*X = B$	if *trans*='C' (for complex matrices only).

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether A is upper or lower triangular: If *uplo* = 'U', then A is upper triangular. If *uplo* = 'L', then A is lower triangular.
trans	CHARACTER*1. Must be 'N' or 'T' or 'C'. If *trans* = 'N', then $A*X = B$ is solved for X. If *trans* = 'T', then $A^T*X = B$ is solved for X. If *trans* = 'C', then $A^H*X = B$ is solved for X.
diag	CHARACTER*1. Must be 'N' or 'U'. If *diag* = 'N', then A is not a unit triangular matrix. If *diag* = 'U', then A is unit triangular: diagonal elements of A are assumed to be 1 and not referenced in the array *a*.
n	INTEGER. The order of A; the number of rows in B; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
a, *b*	REAL for strtrs DOUBLE PRECISION for dtrtrs COMPLEX for ctrtrs DOUBLE COMPLEX for ztrtrs. Arrays: *a*(*lda*,*), *b*(*ldb*,*). The array *a* contains the matrix A. The array *b* contains the matrix B whose columns are the right-hand sides for the systems of equations. The second dimension of *a* must be at least max(1,*n*), the second dimension of *b* at least max(1,*nrhs*).
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).

ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

Output Parameters

b	Overwritten by the solution matrix *X*.
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `trtrs` interface are as follows:

a	Stands for argument *ap* in Fortan 77 interface. Holds the matrix *A* of size (*n**(*n*+1)/2).
b	Holds the matrix *B* of size (*n*, *nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
diag	Must be 'N' or 'U'. The default value is 'N'.

Application Notes

For each right-hand side *b*, the computed solution is the exact solution of a perturbed system of equations (*A* + *E*)*x* = *b*, where

$|E| \le c(n)\varepsilon\ |A|$

$c(n)$ is a modest linear function of n, and ε is the machine precision. If x_0 is the true solution, the computed solution x satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \le c(n)\ cond\ (A, x)\varepsilon \text{ provided } c(n)\ cond\ (A, x)\varepsilon < 1$$

where cond(*A*, *x*) = $|| |A^{-1}||A|\ |x|\ ||_\infty / ||x||_\infty \le ||A^{-1}||_\infty\ ||A||_\infty = \kappa_\infty(A)$.

Note that cond(A, x) can be much smaller than $\kappa_\infty(A)$; the condition number of A^T and A^H might or might not be equal to $\kappa_\infty(A)$.

The approximate number of floating-point operations for one right-hand side vector b is n^2 for real flavors and $4n^2$ for complex flavors.

To estimate the condition number $\kappa_\infty(A)$, call ?trcon.

To estimate the error in the solution, call ?trrfs.

?tptrs

Solves a system of linear equations with a packed triangular matrix, with multiple right-hand sides.

Syntax

Fortran 77:

```
call stptrs( uplo, trans, diag, n, nrhs, ap, b, ldb, info )
call dtptrs( uplo, trans, diag, n, nrhs, ap, b, ldb, info )
call ctptrs( uplo, trans, diag, n, nrhs, ap, b, ldb, info )
call ztptrs( uplo, trans, diag, n, nrhs, ap, b, ldb, info )
```

Fortran 95:

```
call tptrs( a, b [,uplo] [, trans] [,diag] [,info] )
```

Description

This routine solves for X the following systems of linear equations with a packed triangular matrix A, with multiple right-hand sides stored in B:

$A*X = B$	if *trans*='N',
$A^T*X = B$	if *trans*='T',
$A^H*X = B$	if *trans*='C' (for complex matrices only).

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether A is upper or lower triangular:

	If *uplo* = 'U', then *A* is upper triangular. If *uplo* = 'L', then *A* is lower triangular.
trans	CHARACTER*1. Must be 'N' or 'T' or 'C'. If *trans* = 'N', then *A*X* = *B* is solved for *X*. If *trans* = 'T', then $A^T*X = B$ is solved for *X*. If *trans* = 'C', then $A^H*X = B$ is solved for *X*.
diag	CHARACTER*1. Must be 'N' or 'U'. If *diag* = 'N', then *A* is not a unit triangular matrix. If *diag* = 'U', then *A* is unit triangular: diagonal elements are assumed to be 1 and not referenced in the array *ap*.
n	INTEGER. The order of *A*; the number of rows in *B*; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
ap, *b*	REAL for stptrs DOUBLE PRECISION for dtptrs COMPLEX for ctptrs DOUBLE COMPLEX for ztptrs. Arrays: *ap*(*), *b*(*ldb*,*). The dimension of *ap* must be at least max(1,*n*(*n*+1)/2). The array *ap* contains the matrix *A* in packed storage (see Matrix Storage Schemes). The array *b* contains the matrix *B* whose columns are the right-hand sides for the system of equations. The second dimension of *b* must be at least max(1, *nrhs*).
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

Output Parameters

b	Overwritten by the solution matrix *X*.
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine tptrs interface are as follows:

a	Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size *(n*(n+1)/2)*.
b	Holds the matrix *B* of size (*n*, *nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
diag	Must be 'N' or 'U'. The default value is 'N'.

Application Notes

For each right-hand side *b*, the computed solution is the exact solution of a perturbed system of equations *(A + E)x = b*, where

$|E| \leq c(n)\varepsilon\ |A|$

$c(n)$ is a modest linear function of n, and ε is the machine precision.

If x_0 is the true solution, the computed solution x satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \leq c(n)\, cond\,(A, x)\varepsilon \text{ provided } c(n)\, cond\,(A, x)\varepsilon < 1$$

where $cond(A, x) = \| |A^{-1}||A|\,|x|\,\|_\infty / \|x\|_\infty \leq \|A^{-1}\|_\infty \|A\|_\infty = \kappa_\infty(A)$.

Note that $cond(A, x)$ can be much smaller than $\kappa_\infty(A)$; the condition number of A^T and A^H might or might not be equal to $\kappa_\infty(A)$.

The approximate number of floating-point operations for one right-hand side vector b is n^2 for real flavors and $4n^2$ for complex flavors.

To estimate the condition number $\kappa_\infty(A)$, call ?tpcon.

To estimate the error in the solution, call ?tprfs.

?tbtrs

Solves a system of linear equations with a band triangular matrix, with multiple right-hand sides.

Syntax

Fortran 77:

```
call stbtrs( uplo, trans, diag, n, kd, nrhs, ab, ldab, b, ldb, info )
call dtbtrs( uplo, trans, diag, n, kd, nrhs, ab, ldab, b, ldb, info )
call ctbtrs( uplo, trans, diag, n, kd, nrhs, ab, ldab, b, ldb, info )
call ztbtrs( uplo, trans, diag, n, kd, nrhs, ab, ldab, b, ldb, info )
```

Fortran 95:

```
call tbtrs( a, b [,uplo] [, trans] [,diag] [,info] )
```

Description

This routine solves for X the following systems of linear equations with a band triangular matrix A, with multiple right-hand sides stored in B:

$A*X = B$	if *trans*='N',
$A^T*X = B$	if *trans*='T',
$A^H*X = B$	if *trans*='C' (for complex matrices only).

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether A is upper or lower triangular: If *uplo* = 'U', then A is upper triangular. If *uplo* = 'L', then A is lower triangular.
trans	CHARACTER*1. Must be 'N' or 'T' or 'C'. If *trans* = 'N', then $A*X = B$ is solved for X. If *trans* = 'T', then $A^T*X = B$ is solved for X. If *trans* = 'C', then $A^H*X = B$ is solved for X.
diag	CHARACTER*1. Must be 'N' or 'U'. If *diag* = 'N', then A is not a unit triangular matrix.

	If *diag* = 'U', then *A* is unit triangular: diagonal elements are assumed to be 1 and not referenced in the array *ab*.
n	INTEGER. The order of *A*; the number of rows in *B*; *n* ≥ 0.
kd	INTEGER. The number of superdiagonals or subdiagonals in the matrix *A*; *kd* ≥ 0.
nrhs	INTEGER. The number of right-hand sides; *nrhs* ≥ 0.
ab, *b*	REAL for stbtrs DOUBLE PRECISION for dtbtrs COMPLEX for ctbtrs DOUBLE COMPLEX for ztbtrs. Arrays: *ab*(*ldab*,*), *b*(*ldb*,*). The array *ab* contains the matrix *A* in band storage form. The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *ab* must be at least max(1, *n*), the second dimension of *b* at least max(1,*nrhs*).
ldab	INTEGER. The first dimension of *ab*; *ldab* ≥ *kd* + 1.
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

Output Parameters

b	Overwritten by the solution matrix *X*.
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine tbtrs interface are as follows:

a	Stands for the argument *ab* in Fortan 77 interface. Holds the array *A* of size (*kd*+1,*n*)
b	Holds the matrix *B* of size (*n*, *nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
diag	Must be 'N' or 'U'. The default value is 'N'.

Application Notes

For each right-hand side b, the computed solution is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$|E| \leq c(n)\varepsilon|A|$

$c(n)$ is a modest linear function of n, and ε is the machine precision. If x_0 is the true solution, the computed solution x satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \leq c(n)\, cond\,(A, x)\varepsilon \text{ provided } c(n)\, cond\,(A, x)\varepsilon < 1$$

where $cond(A, x) = \| |A^{-1}||A|\,|x|\,\|_\infty / \|x\|_\infty \leq \|A^{-1}\|_\infty \|A\|_\infty = \kappa_\infty(A)$.

Note that $cond(A, x)$ can be much smaller than $\kappa_\infty(A)$; the condition number of A^T and A^H might or might not be equal to $\kappa_\infty(A)$.

The approximate number of floating-point operations for one right-hand side vector b is $2n*kd$ for real flavors and $8n*kd$ for complex flavors.

To estimate the condition number $\kappa_\infty(A)$, call ?tbcon.

To estimate the error in the solution, call ?tbrfs.

Routines for Estimating the Condition Number

This section describes the LAPACK routines for estimating the condition number of a matrix. The condition number is used for analyzing the errors in the solution of a system of linear equations (see Error Analysis). Since the condition number may be arbitrarily large when the matrix is nearly singular, the routines actually compute the reciprocal condition number.

?gecon

Estimates the reciprocal of the condition number of a general matrix in the 1-norm or the infinity-norm.

Syntax

Fortran 77:

```
call sgecon( norm, n, a, lda, anorm, rcond, work, iwork, info )
call dgecon( norm, n, a, lda, anorm, rcond, work, iwork, info )
call cgecon( norm, n, a, lda, anorm, rcond, work, rwork, info )
call zgecon( norm, n, a, lda, anorm, rcond, work, rwork, info )
```

Fortran 95:

```
call gecon( a, anorm, rcond [,norm] [,info] )
```

Description

This routine estimates the reciprocal of the condition number of a general matrix A in the 1-norm or infinity-norm:

$$\kappa_1(A) = ||A||_1 ||A^{-1}||_1 = \kappa_\infty(A^T) = \kappa_\infty(A^H)$$

$$\kappa_\infty(A) = ||A||_\infty ||A^{-1}||_\infty = \kappa_1(A^T) = \kappa_1(A^H) .$$

Before calling this routine:

- compute *anorm* (either $||A||_1 = \max_j \sum_i |a_{ij}|$ or $||A||_\infty = \max_i \sum_j |a_{ij}|$)
- call ?getrf to compute the LU factorization of A.

Input Parameters

norm — CHARACTER*1. Must be '1' or 'O' or 'I'.
If *norm* = '1' or 'O', then the routine estimates the condition number of matrix A in 1-norm.
If *norm* = 'I', then the routine estimates the condition number of matrix A in infinity-norm.

n	INTEGER. The order of the matrix *A*; $n \geq 0$.
a, *work*	REAL for sgecon DOUBLE PRECISION for dgecon COMPLEX for cgecon DOUBLE COMPLEX for zgecon. Arrays: *a*(*lda*,*), *work*(*). The array *a* contains the *LU*-factored matrix *A*, as returned by ?getrf. The second dimension of *a* must be at least max(1,*n*). The array *work* is a workspace for the routine. The dimension of *work* must be at least max(1, 4*n) for real flavors and max(1, 2*n) for complex flavors.
anorm	REAL for single precision flavors. DOUBLE PRECISION for double precision flavors. The norm of the original matrix *A* (see Description).
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*).
rwork	REAL for cgecon DOUBLE PRECISION for zgecon. Workspace array, DIMENSION at least max(1, 2*n).

Output Parameters

rcond	REAL for single precision flavors. DOUBLE PRECISION for double precision flavors. An estimate of the reciprocal of the condition number. The routine sets *rcond* = 0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.
info	INTEGER. If *info*=0, the execution is successful. If *info* = –*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gecon interface are as follows:

a	Holds the matrix A of size (n, n).
norm	Must be '1', 'O', or 'I'. The default value is '1'.

Application Notes

The computed *rcond* is never less than r (the reciprocal of the true condition number) and in practice is nearly always less than $10r$. A call to this routine involves solving a number of systems of linear equations $A*x = b$ or $A^H*x = b$; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $2*n^2$ floating-point operations for real flavors and $8*n^2$ for complex flavors.

?gbcon

Estimates the reciprocal of the condition number of a band matrix in the 1-norm or the infinity-norm.

Syntax

Fortran 77:

```
call sgbcon( norm, n, kl, ku, ab, ldab, ipiv, anorm, rcond, work, iwork, info
)
call dgbcon( norm, n, kl, ku, ab, ldab, ipiv, anorm, rcond, work, iwork, info
)
call cgbcon( norm, n, kl, ku, ab, ldab, ipiv, anorm, rcond, work, rwork, info
)
call zgbcon( norm, n, kl, ku, ab, ldab, ipiv, anorm, rcond, work, rwork, info
)
```

Fortran 95:

```
call gbcon( a, ipiv, anorm, rcond [,kl] [,norm] [,info] )
```

Description

This routine estimates the reciprocal of the condition number of a general band matrix A in the 1-norm or infinity-norm:

$$\kappa_1(A) = ||A||_1||A^{-1}||_1 = \kappa_\infty(A^T) = \kappa_\infty(A^H)$$

$$\kappa_\infty(A) = ||A||_\infty||A^{-1}||_\infty = \kappa_1(A^T) = \kappa_1(A^H) \ .$$

Before calling this routine:

- compute *anorm* (either $||A||_1 = \max_j \Sigma_i |a_{ij}|$ or $||A||_\infty = \max_i \Sigma_j |a_{ij}|$)
- call ?gbtrf to compute the *LU* factorization of *A*.

Input Parameters

norm	CHARACTER*1. Must be '1' or 'O' or 'I'. If *norm* = '1' or 'O', then the routine estimates the condition number of matrix *A* in 1-norm. If *norm* = 'I', then the routine estimates the condition number of matrix *A* in infinity-norm.
n	INTEGER. The order of the matrix *A*; $n \geq 0$.
kl	INTEGER. The number of subdiagonals within the band of *A*; $kl \geq 0$.
ku	INTEGER. The number of superdiagonals within the band of *A*; $ku \geq 0$.
ldab	INTEGER. The first dimension of the array *ab*. ($ldab \geq 2*kl + ku + 1$).
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). The *ipiv* array, as returned by ?gbtrf.
ab, *work*	REAL for sgbcon DOUBLE PRECISION for dgbcon COMPLEX for cgbcon DOUBLE COMPLEX for zgbcon. Arrays: *ab*(*ldab*,*), *work*(*). The array *ab* contains the factored band matrix *A*, as returned by ?gbtrf. The second dimension of *ab* must be at least max(1,*n*). The array *work* is a workspace for the routine. The dimension of *work* must be at least max(1, 3*n) for real flavors and max(1, 2*n) for complex flavors.
anorm	REAL for single precision flavors. DOUBLE PRECISION for double precision flavors. The norm of the original matrix *A* (see Description).
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*).
rwork	REAL for cgbcon DOUBLE PRECISION for zgbcon. Workspace array, DIMENSION at least max(1, 2*n).

Output Parameters

rcond	REAL for single precision flavors. DOUBLE PRECISION for double precision flavors. An estimate of the reciprocal of the condition number. The routine sets *rcond* =0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gbcon interface are as follows:

a	Stands for argument *ab* in Fortan 77 interface. Holds the array *A* of size (2**kl*+*ku*+1,*n*).
ipiv	Holds the vector of length (*n*).
norm	Must be '1', 'O', or 'I'. The default value is '1'.
kl	If omitted, assumed *kl* = *ku*.
ku	Restored as *ku* = *lda*-2**kl*-1.

Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than 10*r*. A call to this routine involves solving a number of systems of linear equations *A***x* = *b* or A^H**x* = *b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately 2*n*(*ku* + 2*kl*) floating-point operations for real flavors and 8*n*(*ku* + 2*kl*) for complex flavors.

?gtcon

Estimates the reciprocal of the condition number of a tridiagonal matrix using the factorization computed by ?gttrf.

Syntax

Fortran 77:

```
call sgtcon( norm, n, dl, d, du, du2, ipiv, anorm, rcond, work, iwork, info )
call dgtcon( norm, n, dl, d, du, du2, ipiv, anorm, rcond, work, iwork, info )
call cgtcon( norm, n, dl, d, du, du2, ipiv, anorm, rcond, work, info )
call zgtcon( norm, n, dl, d, du, du2, ipiv, anorm, rcond, work, info )
```

Fortran 95:

```
call gtcon( dl, d, du, du2, ipiv, anorm, rcond [,norm] [,info] )
```

Description

This routine estimates the reciprocal of the condition number of a real or complex tridiagonal matrix A in the 1-norm or infinity-norm:

$\kappa_1(A) = ||A||_1||A^{-1}||_1$

$\kappa_\infty(A) = ||A||_\infty||A^{-1}||_\infty$

An estimate is obtained for $||A^{-1}||$, and the reciprocal of the condition number is computed as $rcond = 1 / (||A|| \; ||A^{-1}||)$.

Before calling this routine:

- compute *anorm* (either $||A||_1 = \max_j \Sigma_i |a_{ij}|$ or $||A||_\infty = \max_i \Sigma_j |a_{ij}|$)
- call ?gttrf to compute the LU factorization of A.

Input Parameters

norm CHARACTER*1. Must be '1' or 'O' or 'I'.

If *norm* = '1' or 'O', then the routine estimates the condition number of matrix *A* in 1-norm.
If *norm* = 'I', then the routine estimates the condition number of matrix *A* in infinity-norm.

n — INTEGER. The order of the matrix *A*; $n \geq 0$.

dl,*d*,*du*,*du2* — REAL for sgtcon
DOUBLE PRECISION for dgtcon
COMPLEX for cgtcon
DOUBLE COMPLEX for zgtcon.
Arrays: *dl*(*n* -1), *d*(*n*), *du*(*n* -1), *du2*(*n* -2).
The array *dl* contains the (*n* – 1) multipliers that define the matrix *L* from the *LU* factorization of *A* as computed by ?gttrf.
The array *d* contains the *n* diagonal elements of the upper triangular matrix *U* from the *LU* factorization of *A*.
The array *du* contains the (*n* - 1) elements of the first superdiagonal of *U*.
The array *du2* contains the (*n* - 2) elements of the second superdiagonal of *U*.

ipiv — INTEGER.
Array, DIMENSION (*n*). The array of pivot indices, as returned by ?gttrf.

anorm — REAL for single precision flavors.
DOUBLE PRECISION for double precision flavors.
The norm of the original matrix *A* (see Description).

work — REAL for sgtcon
DOUBLE PRECISION for dgtcon
COMPLEX for cgtcon
DOUBLE COMPLEX for zgtcon.
Workspace array, DIMENSION (2**n*).

iwork — INTEGER. Workspace array, DIMENSION (*n*). Used for real flavors only.

Output Parameters

rcond — REAL for single precision flavors.
DOUBLE PRECISION for double precision flavors.

	An estimate of the reciprocal of the condition number. The routine sets *rcond*=0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gtcon interface are as follows:

dl	Holds the vector of length (*n*-1).
d	Holds the vector of length (*n*).
du	Holds the vector of length (*n*-1).
du2	Holds the vector of length (*n*-2).
ipiv	Holds the vector of length (*n*).
norm	Must be '1', 'O', or 'I'. The default value is '1'.

Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than 10*r*. A call to this routine involves solving a number of systems of linear equations *A***x* = *b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors and $8n^2$ for complex flavors.

?pocon

Estimates the reciprocal of the condition number of a symmetric (Hermitian) positive-definite matrix.

Syntax

Fortran 77:

```
call spocon( uplo, n, a, lda, anorm, rcond, work, iwork, info )
call dpocon( uplo, n, a, lda, anorm, rcond, work, iwork, info )
call cpocon( uplo, n, a, lda, anorm, rcond, work, rwork, info )
call zpocon( uplo, n, a, lda, anorm, rcond, work, rwork, info )
```

Fortran 95:

```
call pocon( a, anorm, rcond [,uplo] [,info] )
```

Description

This routine estimates the reciprocal of the condition number of a symmetric (Hermitian) positive-definite matrix A:

$\kappa_1(A) = ||A||_1 \ ||A^{-1}||_1$ (since A is symmetric or Hermitian, $\kappa_\infty(A) = \kappa_1(A)$).

Before calling this routine:

- compute *anorm* (either $||A||_1 = \max_j \Sigma_i |a_{ij}|$ or $||A||_\infty = \max_i \Sigma_j |a_{ij}|$)
- call ?potrf to compute the Cholesky factorization of A.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates how the input matrix A has been factored: If *uplo* = 'U', the upper triangle of A is stored. If *uplo* = 'L', the lower triangle of A is stored.
n	INTEGER. The order of the matrix A; $n \geq 0$.
a, *work*	REAL for spocon DOUBLE PRECISION for dpocon COMPLEX for cpocon

DOUBLE COMPLEX for zpocon.
Arrays: *a*(*lda*,*), *work*(*).
The array *a* contains the factored matrix *A*, as returned by ?potrf. The second dimension of *a* must be at least max(1,*n*).
The array *work* is a workspace for the routine. The dimension of *work* must be at least max(1, 3**n*) for real flavors and max(1, 2**n*) for complex flavors.

lda — INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).

anorm — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
The norm of the original matrix *A* (see Description).

iwork — INTEGER. Workspace array, DIMENSION at least max(1, *n*).

rwork — REAL for cpocon
DOUBLE PRECISION for zpocon.
Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

rcond — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
An estimate of the reciprocal of the condition number. The routine sets *rcond* =0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.

info — INTEGER. If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine pocon interface are as follows:

a — Holds the matrix *A* of size (*n*, *n*).

uplo — Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than $10r$. A call to this routine involves solving a number of systems of linear equations *A*x = b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors and $8n^2$ for complex flavors.

?ppcon

Estimates the reciprocal of the condition number of a packed symmetric (Hermitian) positive-definite matrix.

Syntax

Fortran 77:

```
call sppcon( uplo, n, ap, anorm, rcond, work, iwork, info )
call dppcon( uplo, n, ap, anorm, rcond, work, iwork, info )
call cppcon( uplo, n, ap, anorm, rcond, work, rwork, info )
call zppcon( uplo, n, ap, anorm, rcond, work, rwork, info )
```

Fortran 95:

```
call ppcon( a, anorm, rcond [,uplo] [,info] )
```

Description

This routine estimates the reciprocal of the condition number of a packed symmetric (Hermitian) positive-definite matrix *A*:

$\kappa_1(A) = ||A||_1 \ ||A^{-1}||_1$ (since *A* is symmetric or Hermitian, $\kappa_\infty(A) = \kappa_1(A)$).

Before calling this routine:

- compute *anorm* (either $||A||_1 = \max_j \Sigma_i |a_{ij}|$ or $||A||_\infty = \max_i \Sigma_j |a_{ij}|$)
- call ?pptrf to compute the Cholesky factorization of *A*.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates how the input matrix *A* has been factored: If *uplo* = 'U', the upper triangle of *A* is stored. If *uplo* = 'L', the lower triangle of *A* is stored.
n	INTEGER. The order of the matrix *A*; $n \geq 0$.
ap, *work*	REAL for sppcon DOUBLE PRECISION for dppcon COMPLEX for cppcon DOUBLE COMPLEX for zppcon. Arrays: *ap*(*), *work*(*). The array *ap* contains the packed factored matrix *A*, as returned by ?pptrf. The dimension of *ap* must be at least max(1,*n*(*n*+1)/2). The array *work* is a workspace for the routine. The dimension of *work* must be at least max(1, 3**n*) for real flavors and max(1, 2**n*) for complex flavors.
anorm	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. The norm of the original matrix *A* (see Description).
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*).
rwork	REAL for cppcon DOUBLE PRECISION for zppcon. Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

rcond	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. An estimate of the reciprocal of the condition number. The routine sets *rcond* =0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `ppcon` interface are as follows:

a	Stands for the argument *ap* in Fortan 77 interface. Holds the array *A* of size `(n*(n+1)/2)`.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than $10r$. A call to this routine involves solving a number of systems of linear equations *A*x = b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors and $8n^2$ for complex flavors.

?pbcon

Estimates the reciprocal of the condition number of a symmetric (Hermitian) positive-definite band matrix.

Syntax

Fortran 77:

```
call spbcon( uplo, n, kd, ab, ldab, anorm, rcond, work, iwork, info )
call dpbcon( uplo, n, kd, ab, ldab, anorm, rcond, work, iwork, info )
call cpbcon( uplo, n, kd, ab, ldab, anorm, rcond, work, rwork, info )
call zpbcon( uplo, n, kd, ab, ldab, anorm, rcond, work, rwork, info )
```

Fortran 95:

```
call pbcon( a, anorm, rcond [,uplo] [,info] )
```

Description

This routine estimates the reciprocal of the condition number of a symmetric (Hermitian) positive-definite band matrix A:

$\kappa_1(A) = ||A||_1 \ ||A^{-1}||_1$ (since A is symmetric or Hermitian, $\kappa_\infty(A) = \kappa_1(A)$).

Before calling this routine:

- compute *anorm* (either $||A||_1 = \max_j \Sigma_i |a_{ij}|$ or $||A||_\infty = \max_i \Sigma_j |a_{ij}|$)
- call ?pbtrf to compute the Cholesky factorization of A.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates how the input matrix A has been factored: If *uplo* = 'U', the upper triangular factor is stored in *ab*. If *uplo* = 'L', the lower triangular factor is stored in *ab*.
n	INTEGER. The order of the matrix A; $n \geq 0$.
kd	INTEGER. The number of superdiagonals or subdiagonals in the matrix A; $kd \geq 0$.
ldab	INTEGER. The first dimension of the array *ab*. (*ldab* ≥ *kd* +1).
ab, *work*	REAL for spbcon DOUBLE PRECISION for dpbcon COMPLEX for cpbcon DOUBLE COMPLEX for zpbcon. Arrays: *ab*(*ldab*,*), *work*(*). The array *ab* contains the factored matrix A in band form, as returned by ?pbtrf. The second dimension of *ab* must be at least max(1, *n*). The array *work* is a workspace for the routine. The dimension of *work* must be at least max(1, 3*n) for real flavors and max(1, 2*n) for complex flavors.
anorm	REAL for single precision flavors. DOUBLE PRECISION for double precision flavors. The norm of the original matrix A (see Description).
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*).
rwork	REAL for cpbcon

DOUBLE PRECISION for zpbcon.
Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

rcond — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
An estimate of the reciprocal of the condition number. The routine sets *rcond* =0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.

info — INTEGER. If *info*=0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine pbcon interface are as follows:

a — Stands for argument *ab* in Fortan 77 interface. Holds the array *A* of size (*kd*+1,*n*).

uplo — Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than 10*r*. A call to this routine involves solving a number of systems of linear equations *A***x* = *b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately 4**n*(*kd* + 1) floating-point operations for real flavors and 16**n*(*kd* + 1) for complex flavors.

?ptcon

Estimates the reciprocal of the condition number of a symmetric (Hermitian) positive-definite tridiagonal matrix.

Syntax

Fortran 77:

```
call sptcon( n, d, e, anorm, rcond, work, info )
call dptcon( n, d, e, anorm, rcond, work, info )
call cptcon( n, d, e, anorm, rcond, work, info )
call zptcon( n, d, e, anorm, rcond, work, info )
```

Fortran 95:

```
call ptcon( d, e, anorm, rcond [,info] )
```

Description

This routine computes the reciprocal of the condition number (in the 1-norm) of a real symmetric or complex Hermitian positive-definite tridiagonal matrix using the factorization $A = L*D*L^T$ for real flavors and $A = L*D*L^H$ for complex flavors or $A = U^T*D*U$ for real flavors and $A = U^H*D*U$ for complex flavors computed by ?pttrf :

$\kappa_1(A) = ||A||_1 \; ||A^{-1}||_1$ (since A is symmetric or Hermitian, $\kappa_\infty(A) = \kappa_1(A)$).

The norm $||A^{-1}||$ is computed by a direct method, and the reciprocal of the condition number is computed as $rcond = 1 / (||A|| \; ||A^{-1}||)$.

Before calling this routine:

- compute *anorm* as $||A||_1 = \max_j \Sigma_i \; |a_{ij}|$
- call ?pttrf to compute the factorization of A.

Input Parameters

n	INTEGER. The order of the matrix A; $n \geq 0$.
d, *work*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors.

Arrays, dimension (*n*).
The array *d* contains the *n* diagonal elements of the diagonal matrix *D* from the factorization of *A*, as computed by ?pttrf ;
work is a workspace array.

e — REAL for sptcon
DOUBLE PRECISION for dptcon
COMPLEX for cptcon
DOUBLE COMPLEX for zptcon.
Array, DIMENSION (*n* -1).
Contains off-diagonal elements of the unit bidiagonal factor *U* or *L* from the factorization computed by ?pttrf .

anorm — REAL for single precision flavors.
DOUBLE PRECISION for double precision flavors.
The 1- norm of the original matrix *A* (see Description).

Output Parameters

rcond — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
An estimate of the reciprocal of the condition number. The routine sets *rcond* =0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gtcon interface are as follows:

d — Holds the vector of length (*n*).

e — Holds the vector of length (*n*-1).

Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than 10*r*. A call to this routine involves solving a number of systems of linear equations *A*x = b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately 4*n(kd + 1) floating-point operations for real flavors and 16*n(kd + 1) for complex flavors.

?sycon

Estimates the reciprocal of the condition number of a symmetric matrix.

Syntax

Fortran 77:

```
call ssycon( uplo, n, a, lda, ipiv, anorm, rcond, work, iwork, info )
call dsycon( uplo, n, a, lda, ipiv, anorm, rcond, work, iwork, info )
call csycon( uplo, n, a, lda, ipiv, anorm, rcond, work, info )
call zsycon( uplo, n, a, lda, ipiv, anorm, rcond, work, info )
```

Fortran 95:

```
call sycon( a, ipiv, anorm, rcond [,uplo] [,info] )
```

Description

This routine estimates the reciprocal of the condition number of a symmetric matrix *A*:

$\kappa_1(A) = ||A||_1 \; ||A^{-1}||_1$ (since *A* is symmetric, $\kappa_\infty(A) = \kappa_1(A)$).

Before calling this routine:

- compute *anorm* (either $||A||_1 = \max_j \Sigma_i |a_{ij}|$ or $||A||_\infty = \max_i \Sigma_j |a_{ij}|$)
- call ?sytrf to compute the factorization of *A*.

Input Parameters

uplo CHARACTER*1. Must be 'U' or 'L'.

Indicates how the input matrix *A* has been factored:
If *uplo* = 'U', the array *a* stores the upper triangular factor *U* of the factorization *A* = *P*U*D*U*^{T}**P*^{T}.
If *uplo* = 'L', the array *a* stores the lower triangular factor *L* of the factorization *A* = *P*L*D*L*^{T}**P*^{T}.

n — INTEGER. The order of matrix *A*; $n \geq 0$.

a, *work* — REAL for ssycon
DOUBLE PRECISION for dsycon
COMPLEX for csycon
DOUBLE COMPLEX for zsycon.
Arrays: *a*(*lda*,*), *work*(*).
The array *a* contains the factored matrix *A*, as returned by ?sytrf. The second dimension of *a* must be at least max(1,*n*).
The array *work* is a workspace for the routine.
The dimension of *work* must be at least max(1, 2**n*).

lda — INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).

ipiv — INTEGER. Array, DIMENSION at least max(1, *n*).
The array *ipiv*, as returned by ?sytrf.

anorm — REAL for single precision flavors.
DOUBLE PRECISION for double precision flavors.
The norm of the original matrix *A* (see Description).

iwork — INTEGER. Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

rcond — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
An estimate of the reciprocal of the condition number. The routine sets *rcond* =0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.

info — INTEGER. If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `sycon` interface are as follows:

a	Holds the matrix A of size (n, n).
ipiv	Holds the vector of length (n).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

The computed *rcond* is never less than r (the reciprocal of the true condition number) and in practice is nearly always less than $10r$. A call to this routine involves solving a number of systems of linear equations $A*x = b$; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors and $8n^2$ for complex flavors.

?hecon

Estimates the reciprocal of the condition number of a Hermitian matrix.

Syntax

Fortran 77:

```
call checon( uplo, n, a, lda, ipiv, anorm, rcond, work, info )
call zhecon( uplo, n, a, lda, ipiv, anorm, rcond, work, info )
```

Fortran 95:

```
call hecon( a, ipiv, anorm, rcond [,uplo] [,info] )
```

Description

This routine estimates the reciprocal of the condition number of a Hermitian matrix A:

$\kappa_1(A) = ||A||_1 \ ||A^{-1}||_1$ (since A is Hermitian, $\kappa_\infty(A) = \kappa_1(A)$).

Before calling this routine:

- compute *anorm* (either $||A||_1 = \max_j \Sigma_i |a_{ij}|$ or $||A||_\infty = \max_i \Sigma_j |a_{ij}|$)
- call ?hetrf to compute the factorization of *A*.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates how the input matrix *A* has been factored: If *uplo* = 'U', the array *a* stores the upper triangular factor *U* of the factorization *A* = *P*U*D*U^H*P^T*. If *uplo* = 'L', the array *a* stores the lower triangular factor *L* of the factorization *A* = *P*L*D*L^H*P^T*.
n	INTEGER. The order of matrix *A*; $n \geq 0$.
a, *work*	COMPLEX for checon DOUBLE COMPLEX for zhecon. Arrays: *a*(*lda*,*), *work*(*). The array *a* contains the factored matrix *A*, as returned by ?hetrf. The second dimension of *a* must be at least max(1,*n*). The array *work* is a workspace for the routine. The dimension of *work* must be at least max(1, 2**n*).
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). The array *ipiv*, as returned by ?hetrf.
anorm	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. The norm of the original matrix *A* (see Description).

Output Parameters

rcond	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. An estimate of the reciprocal of the condition number. The routine sets *rcond* =0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `hecon` interface are as follows:

a	Holds the matrix A of size (n, n).
ipiv	Holds the vector of length (n).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

The computed *rcond* is never less than r (the reciprocal of the true condition number) and in practice is nearly always less than $10r$. A call to this routine involves solving a number of systems of linear equations $A*x = b$; the number is usually 5 and never more than 11. Each solution requires approximately $8n^2$ floating-point operations.

?spcon

Estimates the reciprocal of the condition number of a packed symmetric matrix.

Syntax

Fortran 77:

```
call sspcon( uplo, n, ap, ipiv, anorm, rcond, work, iwork, info )
call dspcon( uplo, n, ap, ipiv, anorm, rcond, work, iwork, info )
call cspcon( uplo, n, ap, ipiv, anorm, rcond, work, info )
call zspcon( uplo, n, ap, ipiv, anorm, rcond, work, info )
```

Fortran 95:

```
call spcon( a, ipiv, anorm, rcond [,uplo] [,info] )
```

Description

This routine estimates the reciprocal of the condition number of a packed symmetric matrix A:

$\kappa_1(A) = ||A||_1 \; ||A^{-1}||_1$ (since A is symmetric, $\kappa_\infty(A) = \kappa_1(A)$).

Before calling this routine:

- compute *anorm* (either $||A||_1 = \max_j \Sigma_i |a_{ij}|$ or $||A||_\infty = \max_i \Sigma_j |a_{ij}|$)
- call ?sptrf to compute the factorization of *A*.

Input Parameters

uplo — CHARACTER*1. Must be 'U' or 'L'.
Indicates how the input matrix *A* has been factored:
If *uplo* = 'U', the array *ap* stores the packed upper triangular factor *U* of the factorization *A* = *P*U*D*U*^{T}**P*^{T}.
If *uplo* = 'L', the array *ap* stores the packed lower triangular factor *L* of the factorization *A* = *P*L*D*L*^{T}**P*^{T}.

n — INTEGER. The order of matrix *A*; *n* ≥ 0.

ap, *work* — REAL for sspcon
DOUBLE PRECISION for dspcon
COMPLEX for cspcon
DOUBLE COMPLEX for zspcon.
Arrays: *ap*(*), *work*(*).
The array *ap* contains the packed factored matrix *A*, as returned by ?sptrf. The dimension of *ap* must be at least max(1,*n*(*n*+1)/2).
The array *work* is a workspace for the routine.
The dimension of *work* must be at least max(1, 2*n).

ipiv — INTEGER. Array, DIMENSION at least max(1, *n*).
The array *ipiv*, as returned by ?sptrf.

anorm — REAL for single precision flavors.
DOUBLE PRECISION for double precision flavors.
The norm of the original matrix *A* (see Description).

iwork — INTEGER. Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

rcond — REAL for single precision flavors.
DOUBLE PRECISION for double precision flavors.

	An estimate of the reciprocal of the condition number. The routine sets *rcond* = 0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine spcon interface are as follows:

a	Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n**(*n*+1)/2).
ipiv	Holds the vector of length (*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than 10*r*. A call to this routine involves solving a number of systems of linear equations *A***x* = *b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors and $8n^2$ for complex flavors.

?hpcon

Estimates the reciprocal of the condition number of a packed Hermitian matrix.

Syntax

Fortran 77:

```
call chpcon( uplo, n, ap, ipiv, anorm, rcond, work, info )
call zhpcon( uplo, n, ap, ipiv, anorm, rcond, work, info )
```

Fortran 95:

```
call hpcon( a, ipiv, anorm, rcond [,uplo] [,info] )
```

Description

This routine estimates the reciprocal of the condition number of a Hermitian matrix A:

$\kappa_1(A) = ||A||_1 \ ||A^{-1}||_1$ (since A is Hermitian, $\kappa_\infty(A) = k_1(A)$).

Before calling this routine:

- compute *anorm* (either $||A||_1 = \max_j \Sigma_i |a_{ij}|$ or $||A||_\infty = \max_i \Sigma_j |a_{ij}|$)
- call ?hptrf to compute the factorization of A.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates how the input matrix A has been factored: If *uplo* = 'U', the array *ap* stores the packed upper triangular factor U of the factorization $A = P*U*D*U^T*P^T$. If *uplo* = 'L', the array *ap* stores the packed lower triangular factor L of the factorization $A = P*L*D*L^T*P^T$.
n	INTEGER. The order of matrix A; $n \geq 0$.
ap, *work*	COMPLEX for chpcon DOUBLE COMPLEX for zhpcon. Arrays: *ap*(*), *work*(*). The array *ap* contains the packed factored matrix A, as returned by ?hptrf. The dimension of *ap* must be at least max(1,n(n+1)/2). The array *work* is a workspace for the routine. The dimension of *work* must be at least max(1, 2*n).
ipiv	INTEGER. Array, DIMENSION at least max(1, n). The array *ipiv*, as returned by ?hptrf.
anorm	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. The norm of the original matrix A (see Description).

Output Parameters

rcond	REAL for single precision flavors. DOUBLE PRECISION for double precision flavors. An estimate of the reciprocal of the condition number. The routine sets *rcond* =0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine hbcon interface are as follows:

a	Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n**(*n*+1)/2).
ipiv	Holds the vector of length (*n*).

Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than 10*r*. A call to this routine involves solving a number of systems of linear equations *A***x* = *b*; the number is usually 5 and never more than 11. Each solution requires approximately $8n^2$ floating-point operations.

?trcon

Estimates the reciprocal of the condition number of a triangular matrix.

Syntax

Fortran 77:

```
call strcon( norm, uplo, diag, n, a, lda, rcond, work, iwork, info )
call dtrcon( norm, uplo, diag, n, a, lda, rcond, work, iwork, info )
call ctrcon( norm, uplo, diag, n, a, lda, rcond, work, rwork, info )
call ztrcon( norm, uplo, diag, n, a, lda, rcond, work, rwork, info )
```

Fortran 95:

```
call trcon( a, rcond [,uplo] [,diag] [,norm] [,info] )
```

Description

This routine estimates the reciprocal of the condition number of a triangular matrix A in either the 1-norm or infinity-norm:

$\kappa_1(A) = ||A||_1 \, ||A^{-1}||_1 = \kappa_\infty(A^T) = \kappa_\infty(A^H)$

$\kappa_\infty(A) = ||A||_\infty \, ||A^{-1}||_\infty = k_1(A^T) = \kappa_1(A^H)$.

Input Parameters

norm — CHARACTER*1. Must be '1' or 'O' or 'I'.
If *norm* = '1' or 'O', then the routine estimates the condition number of matrix A in 1-norm.
If *norm* = 'I', then the routine estimates the condition number of matrix A in infinity-norm.

uplo — CHARACTER*1. Must be 'U' or 'L'.
Indicates whether A is upper or lower triangular:
If *uplo* = 'U', the array *a* stores the upper triangle of A, other array elements are not referenced.
If *uplo* = 'L', the array *a* stores the lower triangle of A, other array elements are not referenced.

diag — CHARACTER*1. Must be 'N' or 'U'.

If *diag* = 'N', then *A* is not a unit triangular matrix.
If *diag* = 'U', then *A* is unit triangular: diagonal elements are assumed to be 1 and not referenced in the array *a*.

n — INTEGER. The order of the matrix *A*; $n \geq 0$.

a, *work* — REAL for strcon
DOUBLE PRECISION for dtrcon
COMPLEX for ctrcon
DOUBLE COMPLEX for ztrcon.
Arrays: *a*(*lda*,*), *work*(*).
The array *a* contains the matrix *A*. The second dimension of *a* must be at least max(1,*n*).
The array *work* is a workspace for the routine. The dimension of *work* must be at least max(1, 3**n*) for real flavors and max(1, 2**n*) for complex flavors.

lda — INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).

iwork — INTEGER. Workspace array, DIMENSION at least max(1, *n*).

rwork — REAL for ctrcon
DOUBLE PRECISION for ztrcon.
Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

rcond — REAL for single precision flavors.
DOUBLE PRECISION for double precision flavors.
An estimate of the reciprocal of the condition number. The routine sets *rcond* =0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.

info — INTEGER. If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `trcon` interface are as follows:

a	Holds the matrix A of size (n, n).
norm	Must be '1', 'O', or 'I'. The default value is '1'.
uplo	Must be 'U' or 'L'. The default value is 'U'.
diag	Must be 'N' or 'U'. The default value is 'N'.

Application Notes

The computed *rcond* is never less than r (the reciprocal of the true condition number) and in practice is nearly always less than $10r$. A call to this routine involves solving a number of systems of linear equations $A*x = b$; the number is usually 4 or 5 and never more than 11. Each solution requires approximately n^2 floating-point operations for real flavors and $4n^2$ operations for complex flavors.

?tpcon

Estimates the reciprocal of the condition number of a packed triangular matrix.

Syntax

Fortran 77:

```
call stpcon( norm, uplo, diag, n, ap, rcond, work, iwork, info )
call dtpcon( norm, uplo, diag, n, ap, rcond, work, iwork, info )
call ctpcon( norm, uplo, diag, n, ap, rcond, work, rwork, info )
call ztpcon( norm, uplo, diag, n, ap, rcond, work, rwork, info )
```

Fortran 95:

```
call tpcon( a, rcond [,uplo] [,diag] [,norm] [,info] )
```

Description

This routine estimates the reciprocal of the condition number of a packed triangular matrix A in either the 1-norm or infinity-norm:

$\kappa_1(A) = ||A||_1 \, ||A^{-1}||_1 = \kappa_\infty(A^T) = \kappa_\infty(A^H)$

$\kappa_\infty(A) = ||A||_\infty \, ||A^{-1}||_\infty = \kappa_1(A^T) = \kappa_1(A^H)$.

Input Parameters

norm	CHARACTER*1. Must be '1' or 'O' or 'I'. If *norm* = '1' or 'O', then the routine estimates the condition number of matrix *A* in 1-norm. If *norm* = 'I', then the routine estimates the condition number of matrix *A* in infinity-norm.
uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether *A* is upper or lower triangular: If *uplo* = 'U', the array *ap* stores the upper triangle of *A* in packed form. If *uplo* = 'L', the array *ap* stores the lower triangle of *A* in packed form.
diag	CHARACTER*1. Must be 'N' or 'U'. If *diag* = 'N', then *A* is not a unit triangular matrix. If *diag* = 'U', then *A* is unit triangular: diagonal elements are assumed to be 1 and not referenced in the array *ap*.
n	INTEGER. The order of the matrix *A*; $n \geq 0$.
ap, *work*	REAL for stpcon DOUBLE PRECISION for dtpcon COMPLEX for ctpcon DOUBLE COMPLEX for ztpcon. Arrays: *ap*(*), *work*(*). The array *ap* contains the packed matrix *A*. The dimension of *ap* must be at least max(1,*n*(*n*+1)/2). The array *work* is a workspace for the routine. The dimension of *work* must be at least max(1, 3**n*) for real flavors and max(1, 2**n*) for complex flavors.
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*).
rwork	REAL for ctpcon DOUBLE PRECISION for ztpcon. Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

rcond	REAL for single precision flavors. DOUBLE PRECISION for double precision flavors.

	An estimate of the reciprocal of the condition number. The routine sets *rcond* =0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine tpcon interface are as follows:

a	Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n**(*n*+1)/2).
norm	Must be '1', 'O', or 'I'. The default value is '1'.
uplo	Must be 'U' or 'L'. The default value is 'U'.
diag	Must be 'N' or 'U'. The default value is 'N'.

Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than 10*r*. A call to this routine involves solving a number of systems of linear equations *A***x* = *b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately n^2 floating-point operations for real flavors and $4n^2$ operations for complex flavors.

?tbcon

Estimates the reciprocal of the condition number of a triangular band matrix.

Syntax

Fortran 77:

```
call stbcon( norm, uplo, diag, n, kd, ab, ldab, rcond, work, iwork, info )
call dtbcon( norm, uplo, diag, n, kd, ab, ldab, rcond, work, iwork, info )
call ctbcon( norm, uplo, diag, n, kd, ab, ldab, rcond, work, rwork, info )
call ztbcon( norm, uplo, diag, n, kd, ab, ldab, rcond, work, rwork, info )
```

Fortran 95:

```
call tbcon( a, rcond [,uplo] [,diag] [,norm] [,info] )
```

Description

This routine estimates the reciprocal of the condition number of a triangular band matrix A in either the 1-norm or infinity-norm:

$\kappa_1(A) = ||A||_1 \, ||A^{-1}||_1 = \kappa_\infty(A^T) = \kappa_\infty(A^H)$

$\kappa_\infty(A) = ||A||_\infty \, ||A^{-1}||_\infty = \kappa_1(A^T) = \kappa_1(A^H)$.

Input Parameters

norm	CHARACTER*1. Must be '1' or 'O' or 'I'. If *norm* = '1' or 'O', then the routine estimates the condition number of matrix A in 1-norm. If *norm* = 'I', then the routine estimates the condition number of matrix A in infinity-norm.
uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether A is upper or lower triangular: If *uplo* = 'U', the array *ap* stores the upper triangle of A in packed form. If *uplo* = 'L', the array *ap* stores the lower triangle of A in packed form.
diag	CHARACTER*1. Must be 'N' or 'U'.

If *diag* = 'N', then *A* is not a unit triangular matrix.
If *diag* = 'U', then *A* is unit triangular: diagonal elements are assumed to be 1 and not referenced in the array *ab*.

n — INTEGER. The order of the matrix *A*; $n \geq 0$.

kd — INTEGER. The number of superdiagonals or subdiagonals in the matrix *A*; $kd \geq 0$.

ab, *work* — REAL for stbcon
DOUBLE PRECISION for dtbcon
COMPLEX for ctbcon
DOUBLE COMPLEX for ztbcon.
Arrays: *ab*(*ldab*,*), *work*(*).
The array *ab* contains the band matrix *A*. The second dimension of *ab* must be at least max(1,*n*). The array *work* is a workspace for the routine.
The dimension of *work* must be at least max(1, 3*n) for real flavors and max(1, 2*n) for complex flavors.

ldab — INTEGER. The first dimension of the array *ab*. (*ldab* ≥ *kd* +1).

iwork — INTEGER. Workspace array, DIMENSION at least max(1, *n*).

rwork — REAL for ctbcon
DOUBLE PRECISION for ztbcon.
Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

rcond — REAL for single precision flavors.
DOUBLE PRECISION for double precision flavors.
An estimate of the reciprocal of the condition number. The routine sets *rcond* =0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.

info — INTEGER. If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `tbcon` interface are as follows:

a	Stands for argument *ab* in Fortan 77 interface. Holds the array *A* of size (*kd*+1,*n*).
norm	Must be '1', 'O', or 'I'. The default value is '1'.
uplo	Must be 'U' or 'L'. The default value is 'U'.
diag	Must be 'N' or 'U'. The default value is 'N'.

Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than 10*r*. A call to this routine involves solving a number of systems of linear equations *A***x* = *b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately 2**n*(*kd* + 1) floating-point operations for real flavors and 8**n*(*kd* + 1) operations for complex flavors.

Refining the Solution and Estimating Its Error

This section describes the LAPACK routines for refining the computed solution of a system of linear equations and estimating the solution error. You can call these routines after factorizing the matrix of the system of equations and computing the solution (see Routines for Matrix Factorization and Routines for Solving Systems of Linear Equations).

?gerfs

Refines the solution of a system of linear equations with a general matrix and estimates its error.

Syntax

Fortran 77:

```
call sgerfs( trans, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, ferr,
berr, work, iwork, info )
call dgerfs( trans, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, ferr,
berr, work, iwork, info )
call cgerfs( trans, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, ferr,
berr, work, rwork, info )
call zgerfs( trans, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, ferr,
berr, work, rwork, info )
```

Fortran 95:

```
call gerfs( a, af, ipiv, b, x [,trans] [,ferr] [,berr] [,info] )
```

Description

This routine performs an iterative refinement of the solution to a system of linear equations $A*X = B$ or $A^T*X = B$ or $A^H*X = B$ with a general matrix A, with multiple right-hand sides. For each computed solution vector x, the routine computes the component-wise backward error β. This error is the smallest relative perturbation in elements of A and b such that x is the exact solution of the perturbed system:

$|\delta a_{ij}|/|a_{ij}| \le \beta|a_{ij}|$, $|\delta b_i|/|b_i| \le \beta |b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

Finally, the routine estimates the component-wise forward error in the computed solution $||x - x_e||_\infty/||x||_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine ?getrf
- call the solver routine ?getrs.

Input Parameters

trans	CHARACTER*1. Must be 'N' or 'T' or 'C'. Indicates the form of the equations: If *trans* = 'N', the system has the form *A*X* = *B*. If *trans* = 'T', the system has the form $A^T*X = B$. If *trans* = 'C', the system has the form $A^H*X = B$.
n	INTEGER. The order of the matrix *A*; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
a,*af*,*b*,*x*,*work*	REAL for sgerfs DOUBLE PRECISION for dgerfs COMPLEX for cgerfs DOUBLE COMPLEX for zgerfs. Arrays: *a*(*lda*,*) contains the original matrix *A*, as supplied to ?getrf. *af*(*ldaf*,*) contains the factored matrix *A*, as returned by ?getrf. *b*(*ldb*,*) contains the right-hand side matrix *B*. *x*(*ldx*,*) contains the solution matrix *X*. *work*(*) is a workspace array. The second dimension of *a* and *af* must be at least max(1, *n*); the second dimension of *b* and *x* must be at least max(1, *nrhs*); the dimension of *work* must be at least max(1, 3**n*) for real flavors and max(1, 2**n*) for complex flavors.
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).
ldaf	INTEGER. The first dimension of *af*; *ldaf* ≥ max(1, *n*).
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).
ldx	INTEGER. The first dimension of *x*; *ldx* ≥ max(1, *n*).
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). The *ipiv* array, as returned by ?getrf.
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*).
rwork	REAL for cgerfs DOUBLE PRECISION for zgerfs.

Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

x	The refined solution matrix *X*.
ferr, *berr*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays, DIMENSION at least max(1, *nrhs*). Contain the component-wise forward and backward errors, respectively, for each solution vector.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gerfs interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
af	Holds the matrix *AF* of size (*n*, *n*).
ipiv	Holds the vector of length (*n*).
b	Holds the matrix *B* of size (*n*, *nrhs*).
x	Holds the matrix *X* of size (*n*, *nrhs*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of $4n^2$ floating-point operations (for real flavors) or $16n^2$ operations (for complex flavors). In addition, each step of iterative refinement involves $6n^2$ operations (for real flavors) or $24n^2$ operations (for complex flavors); the number of iterations may range from 1 to 5. Estimating the forward

error involves solving a number of systems of linear equations $A*x = b$; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors or $8n^2$ for complex flavors.

?gbrfs

Refines the solution of a system of linear equations with a general band matrix and estimates its error.

Syntax

Fortran 77:

```
call sgbrfs( trans, n, kl, ku, nrhs, ab, ldab, afb, ldafb, ipiv, b, ldb, x,
ldx, ferr, berr, work, iwork, info )

call dgbrfs( trans, n, kl, ku, nrhs, ab, ldab, afb, ldafb, ipiv, b, ldb, x,
ldx, ferr, berr, work, iwork, info )

call cgbrfs( trans, n, kl, ku, nrhs, ab, ldab, afb, ldafb, ipiv, b, ldb, x,
ldx, ferr, berr, work, rwork, info )

call zgbrfs( trans, n, kl, ku, nrhs, ab, ldab, afb, ldafb, ipiv, b, ldb, x,
ldx, ferr, berr, work, rwork, info )
```

Fortran 95:

```
call gbrfs( a, af, ipiv, b, x [,kl] [,trans] [,ferr] [,berr] [,info] )
```

Description

This routine performs an iterative refinement of the solution to a system of linear equations $A*X = B$ or $A^T*X = B$ or $A^H*X = B$ with a band matrix A, with multiple right-hand sides. For each computed solution vector x, the routine computes the component-wise backward error β. This error is the smallest relative perturbation in elements of A and b such that x is the exact solution of the perturbed system:

$|\delta a_{ij}|/|a_{ij}| \le \beta|a_{ij}|$, $|\delta b_i|/|b_i| \le \beta|b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

Finally, the routine estimates the component-wise forward error in the computed solution $||x - x_e||_\infty / ||x||_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine ?gbtrf

- call the solver routine ?gbtrs.

Input Parameters

trans	CHARACTER*1. Must be 'N' or 'T' or 'C'. Indicates the form of the equations: If *trans* = 'N', the system has the form *A*X* = *B*. If *trans* = 'T', the system has the form A^T*X = *B*. If *trans* = 'C', the system has the form A^H*X = *B*.
n	INTEGER. The order of the matrix *A*; *n* ≥ 0.
kl	INTEGER. The number of sub-diagonals within the band of *A*; *kl* ≥ 0.
ku	INTEGER. The number of super-diagonals within the band of *A*; *ku* ≥ 0.
nrhs	INTEGER. The number of right-hand sides; *nrhs* ≥ 0.
ab,*afb*,*b*,*x*,*work*	REAL for sgbrfs DOUBLE PRECISION for dgbrfs COMPLEX for cgbrfs DOUBLE COMPLEX for zgbrfs. Arrays: *ab*(*ldab*,*) contains the original band matrix *A*, as supplied to ?gbtrf, but stored in rows from 1 to *kl* + *ku* + 1. *afb*(*ldafb*,*) contains the factored band matrix *A*, as returned by ?gbtrf. *b*(*ldb*,*) contains the right-hand side matrix *B*. *x*(*ldx*,*) contains the solution matrix *X*. *work*(*) is a workspace array. The second dimension of *ab* and *afb* must be at least max(1, *n*); the second dimension of *b* and *x* must be at least max(1, *nrhs*); the dimension of *work* must be at least max(1, 3**n*) for real flavors and max(1, 2**n*) for complex flavors.
ldab	INTEGER. The first dimension of *ab*.
ldafb	INTEGER. The first dimension of *afb* .
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).
ldx	INTEGER. The first dimension of *x*; *ldx* ≥ max(1, *n*).
ipiv	INTEGER.

	Array, DIMENSION at least max(1, *n*). The *ipiv* array, as returned by ?gbtrf.
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*).
rwork	REAL for cgbrfs DOUBLE PRECISION for zgbrfs. Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

x	The refined solution matrix *X*.
ferr, *berr*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays, DIMENSION at least max(1, *nrhs*). Contain the component-wise forward and backward errors, respectively, for each solution vector.
info	INTEGER. If *info* =0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gbrfs interface are as follows:

a	Stands for argument *ab* in Fortan 77 interface. Holds the array *A* of size (*kl*+*ku*+1, *n*).
af	Stands for argument *afb* in Fortan 77 interface. Holds the array *AF* of size (2**kl***ku*+1, *n*).
ipiv	Holds the vector of length (*n*).
b	Holds the matrix *B* of size (*n*, *nrhs*).
x	Holds the matrix *X* of size (*n*, *nrhs*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
kl	If omitted, assumed *kl* = *ku*.
ku	Restored as *ku* = *lda*-*kl*-1.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of $4n(kl + ku)$ floating-point operations (for real flavors) or $16n(kl + ku)$ operations (for complex flavors). In addition, each step of iterative refinement involves $2n(4kl + 3ku)$ operations (for real flavors) or $8n(4kl + 3ku)$ operations (for complex flavors); the number of iterations may range from 1 to 5. Estimating the forward error involves solving a number of systems of linear equations $A*x = b$; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors or $8n^2$ for complex flavors.

?gtrfs

Refines the solution of a system of linear equations with a tridiagonal matrix and estimates its error.

Syntax

Fortran 77:

```
call sgtrfs( trans, n, nrhs, dl, d, du, dlf, df, duf, du2, ipiv, b, ldb, x,
ldx, ferr, berr, work, iwork, info )
```

```
call dgtrfs( trans, n, nrhs, dl, d, du, dlf, df, duf, du2, ipiv, b, ldb, x,
ldx, ferr, berr, work, iwork, info )
```

```
call cgtrfs( trans, n, nrhs, dl, d, du, dlf, df, duf, du2, ipiv, b, ldb, x,
ldx, ferr, berr, work, rwork, info )
```

```
call zgtrfs( trans, n, nrhs, dl, d, du, dlf, df, duf, du2, ipiv, b, ldb, x,
ldx, ferr, berr, work, rwork, info )
```

Fortran 95:

```
call gtrfs( dl, d, du, dlf, df, duf, du2, ipiv, b, x [,trans] [,ferr] [,berr]
[,info] )
```

Description

This routine performs an iterative refinement of the solution to a system of linear equations $A*X = B$ or $A^T*X = B$ or $A^H*X = B$ with a tridiagonal matrix A, with multiple right-hand sides. For each computed solution vector x, the routine computes the component-wise backward error β. This error is the smallest relative perturbation in elements of A and b such that x is the exact solution of the perturbed system:

$|\delta a_{ij}|/|a_{ij}| \le \beta|a_{ij}|$, $|\delta b_i|/|b_i| \le \beta|b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

Finally, the routine estimates the component-wise forward error in the computed solution $||x - x_e||_\infty/||x||_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine ?gttrf
- call the solver routine ?gttrs.

Input Parameters

trans	CHARACTER*1. Must be 'N' or 'T' or 'C'. Indicates the form of the equations: If *trans* = 'N', the system has the form $A*X = B$. If *trans* = 'T', the system has the form $A^T*X = B$. If *trans* = 'C', the system has the form $A^H*X = B$.
n	INTEGER. The order of the matrix A; $n \ge 0$.
nrhs	INTEGER. The number of right-hand sides, that is, the number of columns of the matrix B; $nrhs \ge 0$.
dl,*d*,*du*,*dlf*, *df*,*duf*,*du2*,	REAL for sgtrfs DOUBLE PRECISION for dgtrfs COMPLEX for cgtrfs DOUBLE COMPLEX for zgtrfs.
b,*x*,*work*	Arrays: *dl*, dimension (n -1), contains the subdiagonal elements of A. *d*, dimension (n), contains the diagonal elements of A. *du*, dimension (n -1), contains the superdiagonal elements of A. *dlf*, dimension (n -1), contains the (n - 1) multipliers that define the matrix L from the LU factorization of A as computed by ?gttrf.

	df, dimension (*n*), contains the *n* diagonal elements of the upper triangular matrix *U* from the *LU* factorization of *A*. *duf*, dimension (*n* -1), contains the (*n* - 1) elements of the first superdiagonal of *U*. *du2*, dimension (*n* -2), contains the (*n* - 2) elements of the second superdiagonal of *U*. *b*(*ldb*,*nrhs*) contains the right-hand side matrix *B*. *x*(*ldx*,*nrhs*) contains the solution matrix *X*, as computed by ?gttrs. *work*(*) is a workspace array; the dimension of *work* must be at least max(1, 3**n*) for real flavors and max(1, 2**n*) for complex flavors.
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).
ldx	INTEGER. The first dimension of *x*; *ldx* ≥ max(1, *n*).
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). The *ipiv* array, as returned by ?gttrf.
iwork	INTEGER. Workspace array, DIMENSION (*n*). Used for real flavors only.
rwork	REAL for cgtrfs DOUBLE PRECISION for zgtrfs. Workspace array, DIMENSION (*n*). Used for complex flavors only.

Output Parameters

x	The refined solution matrix *X*.
ferr, *berr*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays, DIMENSION at least max(1,*nrhs*). Contain the component-wise forward and backward errors, respectively, for each solution vector.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gtrfs interface are as follows:

dl	Holds the vector of length (*n*-1).
d	Holds the vector of length (*n*).
du	Holds the vector of length (*n*-1).
dlf	Holds the vector of length (*n*-1).
df	Holds the vector of length (*n*).
duf	Holds the vector of length (*n*-1).
du2	Holds the vector of length (*n*-2).
ipiv	Holds the vector of length (*n*).
b	Holds the matrix *B* of size (*n*, *nrhs*).
x	Holds the matrix *X* of size (*n*, *nrhs*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.

?porfs

Refines the solution of a system of linear equations with a symmetric (Hermitian) positive-definite matrix and estimates its error.

Syntax

Fortran 77:

```
call sporfs( uplo, n, nrhs, a, lda, af, ldaf, b, ldb, x, ldx, ferr, berr,
work, iwork, info )

call dporfs( uplo, n, nrhs, a, lda, af, ldaf, b, ldb, x, ldx, ferr, berr,
work, iwork, info )

call cporfs( uplo, n, nrhs, a, lda, af, ldaf, b, ldb, x, ldx, ferr, berr,
work, rwork, info )

call zporfs( uplo, n, nrhs, a, lda, af, ldaf, b, ldb, x, ldx, ferr, berr,
work, rwork, info )
```

Fortran 95:

```
call porfs( a, af, b, x [,uplo] [,ferr] [,berr] [,info] )
```

Description

This routine performs an iterative refinement of the solution to a system of linear equations *A*X = B* with a symmetric (Hermitian) positive definite matrix *A*, with multiple right-hand sides. For each computed solution vector *x*, the routine computes the component-wise backward error β. This error is the smallest relative perturbation in elements of *A* and *b* such that *x* is the exact solution of the perturbed system:

$|\delta a_{ij}|/|a_{ij}| \le \beta|a_{ij}|$, $|\delta b_i|/|b_i| \le \beta|b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

Finally, the routine estimates the component-wise forward error in the computed solution $||x - x_e||_\infty/||x||_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine ?potrf
- call the solver routine ?potrs.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', the upper triangle of *A* is stored. If *uplo* = 'L', the lower triangle of *A* is stored.
n	INTEGER. The order of the matrix *A*; *n* ≥ 0.
nrhs	INTEGER. The number of right-hand sides; *nrhs* ≥ 0.
a,*af*,*b*,*x*,*work*	REAL for sporfs DOUBLE PRECISION for dporfs COMPLEX for cporfs DOUBLE COMPLEX for zporfs. Arrays: *a*(*lda*,*) contains the original matrix *A*, as supplied to ?potrf. *af*(*ldaf*,*) contains the factored matrix *A*, as returned by ?potrf. *b*(*ldb*,*) contains the right-hand side matrix *B*. *x*(*ldx*,*) contains the solution matrix *X*. *work*(*) is a workspace array. The second dimension of *a* and *af* must be at least max(1, *n*); the second dimension of *b* and *x* must be at least max(1, *nrhs*); the dimension of *work* must be at least max(1, 3**n*) for real flavors and max(1, 2**n*) for complex flavors.

lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).
ldaf	INTEGER. The first dimension of *af*; *ldaf* ≥ max(1, *n*).
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).
ldx	INTEGER. The first dimension of *x*; *ldx* ≥ max(1, *n*).
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*).
rwork	REAL for cporfs DOUBLE PRECISION for zporfs. Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

x	The refined solution matrix *X*.
ferr, *berr*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays, DIMENSION at least max(1, *nrhs*). Contain the component-wise forward and backward errors, respectively, for each solution vector.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine porfs interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
af	Holds the matrix *AF* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *nrhs*).
x	Holds the matrix *X* of size (*n*, *nrhs*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of $4n^2$ floating-point operations (for real flavors) or $16n^2$ operations (for complex flavors). In addition, each step of iterative refinement involves $6n^2$ operations (for real flavors) or $24n^2$ operations (for complex flavors); the number of iterations may range from 1 to 5. Estimating the forward error involves solving a number of systems of linear equations *A*x = b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors or $8n^2$ for complex flavors.

?pprfs

Refines the solution of a system of linear equations with a packed symmetric (Hermitian) positive-definite matrix and estimates its error.

Syntax

Fortran 77:

```
call spprfs( uplo, n, nrhs, ap, afp, b, ldb, x, ldx, ferr, berr, work, iwork, info )
call dpprfs( uplo, n, nrhs, ap, afp, b, ldb, x, ldx, ferr, berr, work, iwork, info )
call cpprfs( uplo, n, nrhs, ap, afp, b, ldb, x, ldx, ferr, berr, work, rwork, info )
call zpprfs( uplo, n, nrhs, ap, afp, b, ldb, x, ldx, ferr, berr, work, rwork, info )
```

Fortran 95:

```
call pprfs( a, af, b, x [,uplo] [,ferr] [,berr] [,info] )
```

Description

This routine performs an iterative refinement of the solution to a system of linear equations *A*X = B* with a packed symmetric (Hermitian)positive definite matrix *A*, with multiple right-hand sides. For each computed solution vector *x*, the routine computes the component-wise backward error β. This error is the smallest relative perturbation in elements of *A* and *b* such that *x* is the exact solution of the perturbed system:

$|\delta a_{ij}|/|a_{ij}| \le \beta|a_{ij}|$, $|\delta b_i|/|b_i| \le \beta|b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

Finally, the routine estimates the component-wise forward error in the computed solution $||x - x_e||_\infty/||x||_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine ?pptrf
- call the solver routine ?pptrs.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates how the input matrix *A* has been factored: If *uplo* = 'U', the upper triangle of *A* is stored. If *uplo* = 'L', the lower triangle of *A* is stored.
n	INTEGER. The order of the matrix *A*; $n \ge 0$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \ge 0$.
ap,*afp*,*b*,*x*,*work*	REAL for spprfs DOUBLE PRECISION for dpprfs COMPLEX for cpprfs DOUBLE COMPLEX for zpprfs. Arrays: *ap*(*) contains the original packed matrix *A*, as supplied to ?pptrf. *afp*(*) contains the factored packed matrix *A*, as returned by ?pptrf. *b*(*ldb*,*) contains the right-hand side matrix *B*. *x*(*ldx*,*) contains the solution matrix *X*. *work*(*) is a workspace array.

The dimension of arrays *ap* and *afp* must be at least max(1,*n*(*n*+1)/2); the second dimension of *b* and *x* must be at least max(1, *nrhs*); the dimension of *work* must be at least max(1, 3*n) for real flavors and max(1, 2*n) for complex flavors.

ldb INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

ldx INTEGER. The first dimension of *x*; *ldx* ≥ max(1, *n*).

iwork INTEGER. Workspace array, DIMENSION at least max(1, *n*).

rwork REAL for cpprfs
DOUBLE PRECISION for zpprfs.
Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

x The refined solution matrix *X*.

ferr, *berr* REAL for single precision flavors.
DOUBLE PRECISION for double precision flavors.
Arrays, DIMENSION at least max(1, *nrhs*). Contain the component-wise forward and backward errors, respectively, for each solution vector.

info INTEGER. If *info*=0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine pprfs interface are as follows:

a Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n**(*n*+1)/2).

af Stands for argument *apf* in Fortan 77 interface. Holds the array *AF* of size (*n**(*n*+1)/2).

b Holds the matrix *B* of size (*n*, *nrhs*).

x Holds the matrix *X* of size (*n*, *nrhs*).

ferr Holds the vector of length (*nrhs*).

berr Holds the vector of length (*nrhs*).

uplo Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of $4n^2$ floating-point operations (for real flavors) or $16n^2$ operations (for complex flavors). In addition, each step of iterative refinement involves $6n^2$ operations (for real flavors) or $24n^2$ operations (for complex flavors); the number of iterations may range from 1 to 5.

Estimating the forward error involves solving a number of systems of linear equations $A^*x = b$; the number of systems is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors or $8n^2$ for complex flavors.

?pbrfs

Refines the solution of a system of linear equations with a band symmetric (Hermitian) positive-definite matrix and estimates its error.

Syntax

Fortran 77:

```
call spbrfs( uplo, n, kd, nrhs, ab, ldab, afb, ldafb, b, ldb, x, ldx, ferr,
berr, work, iwork, info )

call dpbrfs( uplo, n, kd, nrhs, ab, ldab, afb, ldafb, b, ldb, x, ldx, ferr,
berr, work, iwork, info )

call cpbrfs( uplo, n, kd, nrhs, ab, ldab, afb, ldafb, b, ldb, x, ldx, ferr,
berr, work, rwork, info )

call zpbrfs( uplo, n, kd, nrhs, ab, ldab, afb, ldafb, b, ldb, x, ldx, ferr,
berr, work, rwork, info )
```

Fortran 95:

```
call pbrfs( a, af, b, x [,uplo] [,ferr] [,berr] [,info] )
```

Description

This routine performs an iterative refinement of the solution to a system of linear equations *A*X = B* with a symmetric (Hermitian) positive definite band matrix *A*, with multiple right-hand sides. For each computed solution vector *x*, the routine computes the component-wise backward error β. This error is the smallest relative perturbation in elements of *A* and *b* such that *x* is the exact solution of the perturbed system:

$|\delta a_{ij}|/|a_{ij}| \le \beta|a_{ij}|$, $|\delta b_i|/|b_i| \le \beta|b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

Finally, the routine estimates the component-wise forward error in the computed solution $||x - x_e||_\infty/||x||_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine ?pbtrf
- call the solver routine ?pbtrs.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates how the input matrix *A* has been factored: If *uplo* = 'U', the upper triangle of *A* is stored. If *uplo* = 'L', the lower triangle of *A* is stored.
n	INTEGER. The order of the matrix *A*; $n \ge 0$.
kd	INTEGER. The number of superdiagonals or subdiagonals in the matrix *A*; $kd \ge 0$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \ge 0$.
ab,*afb*,*b*,*x*,*work*	REAL for spbrfs DOUBLE PRECISION for dpbrfs COMPLEX for cpbrfs DOUBLE COMPLEX for zpbrfs. Arrays: *ab*(*ldab*,*) contains the original band matrix *A*, as supplied to ?pbtrf. *afb*(*ldafb*,*) contains the factored band matrix *A*, as returned by ?pbtrf. *b*(*ldb*,*) contains the right-hand side matrix *B*. *x*(*ldx*,*) contains the solution matrix *X*. *work*(*) is a workspace array.

	The second dimension of *ab* and *afb* must be at least max(1, *n*); the second dimension of *b* and *x* must be at least max(1, *nrhs*); the dimension of *work* must be at least max(1, 3*n) for real flavors and max(1, 2*n) for complex flavors.
ldab	INTEGER. The first dimension of *ab*; *ldab* ≥ *kd* + 1.
ldafb	INTEGER. The first dimension of *afb*; *ldafb* ≥ *kd* + 1.
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).
ldx	INTEGER. The first dimension of *x*; *ldx* ≥ max(1, *n*).
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*).
rwork	REAL for cpbrfs DOUBLE PRECISION for zpbrfs. Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

x	The refined solution matrix *X*.
ferr, *berr*	REAL for single precision flavors. DOUBLE PRECISION for double precision flavors. Arrays, DIMENSION at least max(1, *nrhs*). Contain the component-wise forward and backward errors, respectively, for each solution vector.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine pbrfs interface are as follows:

a	Stands for argument *ab* in Fortan 77 interface. Holds the array *A* of size (*kd*+1, *n*).
af	Stands for argument *afb* in Fortan 77 interface. Holds the array *AF* of size (*kd*+1, *n*).
b	Holds the matrix *B* of size (*n*, *nrhs*).
x	Holds the matrix *X* of size (*n*, *nrhs*).

ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of $8n*kd$ floating-point operations (for real flavors) or $32n*kd$ operations (for complex flavors). In addition, each step of iterative refinement involves $12n*kd$ operations (for real flavors) or $48n*kd$ operations (for complex flavors); the number of iterations may range from 1 to 5.

Estimating the forward error involves solving a number of systems of linear equations $A*x = b$; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $4n*kd$ floating-point operations for real flavors or $16n*kd$ for complex flavors.

?ptrfs

Refines the solution of a system of linear equations with a symmetric (Hermitian) positive-definite tridiagonal matrix and estimates its error.

Syntax

Fortran 77:

```
call sptrfs( n, nrhs, d, e, df, ef, b, ldb, x, ldx, ferr, berr, work, info )
call dptrfs( n, nrhs, d, e, df, ef, b, ldb, x, ldx, ferr, berr, work, info )
call cptrfs( uplo, n, nrhs, d, e, df, ef, b, ldb, x, ldx, ferr, berr, work,
rwork, info )
call cptrfs( uplo, n, nrhs, d, e, df, ef, b, ldb, x, ldx, ferr, berr, work,
rwork, info )
```

Fortran 95:

```
call ptrfs( d, df, e, ef, b, x [,ferr] [,berr] [,info] )
call ptrfs( d, df, e, ef, b, x [,uplo] [,ferr] [,berr] [,info] )
```

Description

This routine performs an iterative refinement of the solution to a system of linear equations *A*X = B* with a symmetric (Hermitian) positive definite tridiagonal matrix *A*, with multiple right-hand sides. For each computed solution vector *x*, the routine computes the component-wise backward error β. This error is the smallest relative perturbation in elements of *A* and *b* such that *x* is the exact solution of the perturbed system:

$|\delta a_{ij}| / |a_{ij}| \le \beta |a_{ij}|$, $|\delta b_i| / |b_i| \le \beta |b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

Finally, the routine estimates the component-wise forward error in the computed solution $||x - x_e||_\infty / ||x||_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine ?pttrf
- call the solver routine ?pttrs.

Input Parameters

uplo	CHARACTER*1. Used for complex flavors only. Must be 'U' or 'L'. Specifies whether the superdiagonal or the subdiagonal of the tridiagonal matrix *A* is stored and how *A* is factored: If *uplo* = 'U', the array *e* stores the superdiagonal of *A*, and *A* is factored as U^H*D*U. If *uplo* = 'L', the array *e* stores the subdiagonal of *A*, and *A* is factored as $L*D*L^H$.
n	INTEGER. The order of the matrix *A*; $n \ge 0$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \ge 0$.
d, *df*, *rwork*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors Arrays: *d*(*n*), *df*(*n*), *rwork*(*n*). The array *d* contains the *n* diagonal elements of the tridiagonal matrix *A*. The array *df* contains the *n* diagonal elements of the diagonal matrix *D* from the factorization of *A* as computed by ?pttrf. The array *rwork* is a workspace array used for complex flavors only.
e,*ef*,*b*,*x*,*work*	REAL for sptrfs DOUBLE PRECISION for dptrfs

COMPLEX for cptrfs
DOUBLE COMPLEX for zptrfs.
Arrays: e(n -1), ef(n -1), b(ldb,nrhs), x(ldx,nrhs), work(*).
The array e contains the (n - 1) off-diagonal elements of the tridiagonal matrix A (see uplo).
The array ef contains the (n - 1) off-diagonal elements of the unit bidiagonal factor U or L from the factorization computed by ?pttrf (see uplo).
The array b contains the matrix B whose columns are the right-hand sides for the systems of equations.
The array x contains the solution matrix X as computed by ?pttrs.
The array work is a workspace array. The dimension of work must be at least 2*n for real flavors, and at least n for complex flavors.

ldb — INTEGER. The leading dimension of b; ldb ≥ max(1, n).

ldx — INTEGER. The leading dimension of x; ldx ≥ max(1, n).

Output Parameters

x — The refined solution matrix X.

ferr, *berr* — REAL for single precision flavors.
DOUBLE PRECISION for double precision flavors.
Arrays, DIMENSION at least max(1, nrhs). Contain the component-wise forward and backward errors, respectively, for each solution vector.

info — INTEGER.
If info = 0, the execution is successful.
If info = -i, the i-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine ptrfs interface are as follows:

d — Holds the vector of length (n).

df — Holds the vector of length (n).

e — Holds the vector of length (n-1).

ef	Holds the vector of length (*n*-1).
b	Holds the matrix *B* of size (*n*,*nrhs*).
x	Holds the matrix *X* of size (*n*,*nrhs*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Used in complex flavors only. Must be 'U' or 'L'. The default value is 'U'.

?syrfs

Refines the solution of a system of linear equations with a symmetric matrix and estimates its error.

Syntax

Fortran 77:

```
call ssyrfs( uplo, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, ferr,
berr, work, iwork, info )
call dsyrfs( uplo, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, ferr,
berr, work, iwork, info )
call csyrfs( uplo, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, ferr,
berr, work, rwork, info )
call zsyrfs( uplo, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, ferr,
berr, work, rwork, info )
```

Fortran 95:

```
call syrfs( a, af, ipiv, b, x [,uplo] [,ferr] [,berr] [,info] )
```

Description

This routine performs an iterative refinement of the solution to a system of linear equations *A*X = B* with a symmetric full-storage matrix *A*, with multiple right-hand sides. For each computed solution vector *x*, the routine computes the component-wise backward error β. This error is the smallest relative perturbation in elements of *A* and *b* such that *x* is the exact solution of the perturbed system:

$|\delta a_{ij}| / |a_{ij}| \le \beta |a_{ij}|$, $|\delta b_i| / |b_i| \le \beta |b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

Finally, the routine estimates the component-wise forward error in the computed solution $||x - x_e||_\infty / ||x||_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine ?sytrf
- call the solver routine ?sytrs.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', the upper triangle of *A* is stored. If *uplo* = 'L', the lower triangle of *A* is stored.
n	INTEGER. The order of the matrix *A*; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
a,*af*,*b*,*x*,*work*	REAL for ssyrfs DOUBLE PRECISION for dsyrfs COMPLEX for csyrfs DOUBLE COMPLEX for zsyrfs. Arrays: *a*(*lda*,*) contains the original matrix *A*, as supplied to ?sytrf. *af*(*ldaf*,*) contains the factored matrix *A*, as returned by ?sytrf. *b*(*ldb*,*) contains the right-hand side matrix *B*. *x*(*ldx*,*) contains the solution matrix *X*. *work*(*) is a workspace array. The second dimension of *a* and *af* must be at least max(1, *n*); the second dimension of *b* and *x* must be at least max(1, *nrhs*); the dimension of *work* must be at least max(1, 3**n*) for real flavors and max(1, 2**n*) for complex flavors.
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).
ldaf	INTEGER. The first dimension of *af*; *ldaf* ≥ max(1, *n*).
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).
ldx	INTEGER. The first dimension of *x*; *ldx* ≥ max(1, *n*).
ipiv	INTEGER.

	Array, DIMENSION at least max(1, *n*). The *ipiv* array, as returned by ?sytrf.
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*).
rwork	REAL for csyrfs DOUBLE PRECISION for zsyrfs. Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

x	The refined solution matrix *X*.
ferr, *berr*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays, DIMENSION at least max(1, *nrhs*). Contain the component-wise forward and backward errors, respectively, for each solution vector.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine syrfs interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
af	Holds the matrix *AF* of size (*n*, *n*).
ipiv	Holds the vector of length (*n*).
b	Holds the matrix *B* of size (*n*, *nrhs*).
x	Holds the matrix *X* of size (*n*, *nrhs*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of $4n^2$ floating-point operations (for real flavors) or $16n^2$ operations (for complex flavors). In addition, each step of iterative refinement involves $6n^2$ operations (for real flavors) or $24n^2$ operations (for complex flavors); the number of iterations may range from 1 to 5. Estimating the forward error involves solving a number of systems of linear equations $A*x = b$; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors or $8n^2$ for complex flavors.

?herfs

Refines the solution of a system of linear equations with a complex Hermitian matrix and estimates its error.

Syntax

Fortran 77:

```
call cherfs( uplo, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, ferr,
berr, work, rwork, info )
call zherfs( uplo, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, ferr,
berr, work, rwork, info )
```

Fortran 95:

```
call herfs( a, af, ipiv, b, x [,uplo] [,ferr] [,berr] [,info] )
```

Description

This routine performs an iterative refinement of the solution to a system of linear equations $A*X = B$ with a complex Hermitian full-storage matrix A, with multiple right-hand sides. For each computed solution vector x, the routine computes the component-wise backward error β. This error is the smallest relative perturbation in elements of A and b such that x is the exact solution of the perturbed system:

$|\delta a_{ij}|/|a_{ij}| \le \beta|a_{ij}|$, $|\delta b_i|/|b_i| \le \beta|b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

Finally, the routine estimates the component-wise forward error in the computed solution $||x - x_e||_\infty/||x||_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine ?hetrf

- call the solver routine ?hetrs.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', the upper triangle of *A* is stored. If *uplo* = 'L', the lower triangle of *A* is stored.
n	INTEGER. The order of the matrix *A*; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
a,*af*,*b*,*x*,*work*	COMPLEX for cherfs DOUBLE COMPLEX for zherfs. Arrays: *a*(*lda*,*) contains the original matrix *A*, as supplied to ?hetrf. *af*(*ldaf*,*) contains the factored matrix *A*, as returned by ?hetrf. *b*(*ldb*,*) contains the right-hand side matrix *B*. *x*(*ldx*,*) contains the solution matrix *X*. *work*(*) is a workspace array. The second dimension of *a* and *af* must be at least max(1, *n*); the second dimension of *b* and *x* must be at least max(1, *nrhs*); the dimension of *work* must be at least max(1, 2*n).
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).
ldaf	INTEGER. The first dimension of *af*; *ldaf* ≥ max(1, *n*).
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).
ldx	INTEGER. The first dimension of *x*; *ldx* ≥ max(1, *n*).
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). The *ipiv* array, as returned by ?hetrf.
rwork	REAL for cherfs DOUBLE PRECISION for zherfs. Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

x	The refined solution matrix *X*.
ferr, *berr*	REAL for cherfs

DOUBLE PRECISION for zherfs.
Arrays, DIMENSION at least max(1, *nrhs*). Contain the component-wise forward and backward errors, respectively, for each solution vector.

info — INTEGER. If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine herfs interface are as follows:

a — Holds the matrix *A* of size (*n*, *n*).

af — Holds the matrix *AF* of size (*n*, *n*).

ipiv — Holds the vector of length (*n*).

b — Holds the matrix *B* of size (*n*, *nrhs*).

x — Holds the matrix *X* of size (*n*, *nrhs*).

ferr — Holds the vector of length (*nrhs*).

berr — Holds the vector of length (*nrhs*).

uplo — Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of $16n^2$ operations. In addition, each step of iterative refinement involves $24n^2$ operations; the number of iterations may range from 1 to 5.

Estimating the forward error involves solving a number of systems of linear equations *A***x* = *b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $8n^2$ floating-point operations.

The real counterpart of this routine is ?ssyrfs/?dsyrfs

?sprfs

Refines the solution of a system of linear equations with a packed symmetric matrix and estimates the solution error.

Syntax

Fortran 77:

```
call ssprfs( uplo, n, nrhs, ap, afp, ipiv, b, ldb, x, ldx, ferr, berr, work, iwork, info )
call dsprfs( uplo, n, nrhs, ap, afp, ipiv, b, ldb, x, ldx, ferr, berr, work, iwork, info )
call csprfs( uplo, n, nrhs, ap, afp, ipiv, b, ldb, x, ldx, ferr, berr, work, rwork, info )
call zsprfs( uplo, n, nrhs, ap, afp, ipiv, b, ldb, x, ldx, ferr, berr, work, rwork, info )
```

Fortran 95:

```
call sprfs( a, af, ipiv, b, x [,uplo] [,ferr] [,berr] [,info] )
```

Description

This routine performs an iterative refinement of the solution to a system of linear equations `A*X = B` with a packed symmetric matrix `A`, with multiple right-hand sides. For each computed solution vector `x`, the routine computes the `component-wise backward error` β. This error is the smallest relative perturbation in elements of `A` and `b` such that `x` is the exact solution of the perturbed system:

$|\delta a_{ij}|/|a_{ij}| \le \beta|a_{ij}|$, $|\delta b_i|/|b_i| \le \beta|b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

Finally, the routine estimates the `component-wise forward error` in the computed solution $||x - x_e||_\infty/||x||_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine `?sptrf`
- call the solver routine `?sptrs`.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', the upper triangle of *A* is stored. If *uplo* = 'L', the lower triangle of *A* is stored.
n	INTEGER. The order of the matrix *A*; *n* ≥ 0.
nrhs	INTEGER. The number of right-hand sides; *nrhs* ≥ 0.
ap,*afp*,*b*,*x*,*work*	REAL for ssprfs DOUBLE PRECISION for dsprfs COMPLEX for csprfs DOUBLE COMPLEX for zsprfs. Arrays: *ap*(*) contains the original packed matrix *A*, as supplied to ?sptrf. *afp*(*) contains the factored packed matrix *A*, as returned by ?sptrf. *b*(*ldb*,*) contains the right-hand side matrix *B*. *x*(*ldx*,*) contains the solution matrix *X*. *work*(*) is a workspace array. The dimension of arrays *ap* and *afp* must be at least max(1, *n*(*n*+1)/2); the second dimension of *b* and *x* must be at least max(1, *nrhs*); the dimension of *work* must be at least max(1, 3**n*) for real flavors and max(1, 2**n*) for complex flavors.
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).
ldx	INTEGER. The first dimension of *x*; *ldx* ≥ max(1, *n*).
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). The *ipiv* array, as returned by ?sptrf.
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*).
rwork	REAL for csprfs DOUBLE PRECISION for zsprfs. Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

x	The refined solution matrix *X*.
ferr, *berr*	REAL for single precision flavors. DOUBLE PRECISION for double precision flavors.

	Arrays, DIMENSION at least max(1, *nrhs*). Contain the component-wise forward and backward errors, respectively, for each solution vector.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine sprfs interface are as follows:

a	Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n**(*n*+1)/2).
af	Stands for argument *afp* in Fortan 77 interface. Holds the array *AF* of size (*n**(*n*+1)/2).
ipiv	Holds the vector of length (*n*).
b	Holds the matrix *B* of size (*n*, *nrhs*).
x	Holds the matrix *X* of size (*n*, *nrhs*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of $4n^2$ floating-point operations (for real flavors) or $16n^2$ operations (for complex flavors). In addition, each step of iterative refinement involves $6n^2$ operations (for real flavors) or $24n^2$ operations (for complex flavors); the number of iterations may range from 1 to 5.

Estimating the forward error involves solving a number of systems of linear equations *A***x* = *b*; the number of systems is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors or $8n^2$ for complex flavors.

?hprfs

Refines the solution of a system of linear equations with a packed complex Hermitian matrix and estimates the solution error.

Syntax

Fortran 77:

```
call chprfs( uplo, n, nrhs, ap, afp, ipiv, b, ldb, x, ldx, ferr, berr, work, rwork, info )
call zhprfs( uplo, n, nrhs, ap, afp, ipiv, b, ldb, x, ldx, ferr, berr, work, rwork, info )
```

Fortran 95:

```
call hprfs( a, af, ipiv, b, x [,uplo] [,ferr] [,berr] [,info] )
```

Description

This routine performs an iterative refinement of the solution to a system of linear equations $A*X = B$ with a packed complex Hermitian matrix A, with multiple right-hand sides. For each computed solution vector x, the routine computes the component-wise backward error β. This error is the smallest relative perturbation in elements of A and b such that x is the exact solution of the perturbed system:

$|\delta a_{ij}|/|a_{ij}| \le \beta|a_{ij}|$, $|\delta b_i|/|b_i| \le \beta|b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

Finally, the routine estimates the component-wise forward error in the computed solution $||x - x_e||_\infty/||x||_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine ?hptrf
- call the solver routine ?hptrs.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', the upper triangle of A is stored. If *uplo* = 'L', the lower triangle of A is stored.

n	INTEGER. The order of the matrix *A*; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
ap,*afp*,*b*,*x*,*work*	COMPLEX for chprfs DOUBLE COMPLEX for zhprfs. Arrays: *ap*(*) contains the original packed matrix *A*, as supplied to ?hptrf. *afp*(*) contains the factored packed matrix *A*, as returned by ?hptrf. *b*(*ldb*,*) contains the right-hand side matrix *B*. *x*(*ldx*,*) contains the solution matrix *X*. *work*(*) is a workspace array. The dimension of arrays *ap* and *afp* must be at least max(1,*n*(*n*+1)/2); the second dimension of *b* and *x* must be at least max(1,*nrhs*); the dimension of *work* must be at least max(1, 2*n).
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).
ldx	INTEGER. The first dimension of *x*; *ldx* ≥ max(1, *n*).
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). The *ipiv* array, as returned by ?hptrf.
rwork	REAL for chprfs DOUBLE PRECISION for zhprfs. Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

x	The refined solution matrix *X*.
ferr, *berr*	REAL for chprfs. DOUBLE PRECISION for zhprfs. Arrays, DIMENSION at least max(1,*nrhs*). Contain the component-wise forward and backward errors, respectively, for each solution vector.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `hprfs` interface are as follows:

a	Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n**(*n*+1)/2).
af	Stands for argument *afp* in Fortan 77 interface. Holds the array *AF* of size (*n**(*n*+1)/2).

x	Holds the matrix *X* of size (*n*,*nrhs*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of $16n^2$ operations. In addition, each step of iterative refinement involves $24n^2$ operations; the number of iterations may range from 1 to 5.

Estimating the forward error involves solving a number of systems of linear equations *A***x* = *b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $8n^2$ floating-point operations.

The real counterpart of this routine is `?ssprfs`/`?dsprfs`.

?trrfs

Estimates the error in the solution of a system of linear equations with a triangular matrix.

Syntax

Fortran 77:

```
call strrfs( uplo, trans, diag, n, nrhs, a, lda, b, ldb, x, ldx, ferr, berr,
work, iwork, info )
call dtrrfs( uplo, trans, diag, n, nrhs, a, lda, b, ldb, x, ldx, ferr, berr,
work, iwork, info )
call ctrrfs( uplo, trans, diag, n, nrhs, a, lda, b, ldb, x, ldx, ferr, berr,
work, rwork, info )
call ztrrfs( uplo, trans, diag, n, nrhs, a, lda, b, ldb, x, ldx, ferr, berr,
work, rwork, info )
```

Fortran 95:

```
call trrfs( a, b, x [,uplo] [,trans] [,diag] [,ferr] [,berr] [,info] )
```

Description

This routine estimates the errors in the solution to a system of linear equations $A*X = B$ or $A^T*X = B$ or $A^H*X = B$ with a triangular matrix A, with multiple right-hand sides. For each computed solution vector x, the routine computes the component-wise backward error β. This error is the smallest relative perturbation in elements of A and b such that x is the exact solution of the perturbed system:

$|\delta a_{ij}|/|a_{ij}| \le \beta|a_{ij}|$, $|\delta b_i|/|b_i| \le \beta|b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

The routine also estimates the component-wise forward error in the computed solution $||x - x_e||_\infty/||x||_\infty$ (here x_e is the exact solution).

Before calling this routine, call the solver routine ?trtrs.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether A is upper or lower triangular:

	If *uplo* = 'U', then *A* is upper triangular. If *uplo* = 'L', then *A* is lower triangular.
trans	CHARACTER*1. Must be 'N' or 'T' or 'C'. Indicates the form of the equations: If *trans* = 'N', the system has the form *A*X = B*. If *trans* = 'T', the system has the form $A^T*X = B$. If *trans* = 'C', the system has the form $A^H*X = B$.
diag	CHARACTER*1. Must be 'N' or 'U'. If *diag* = 'N', then *A* is not a unit triangular matrix. If *diag* = 'U', then *A* is unit triangular: diagonal elements of *A* are assumed to be 1 and not referenced in the array *a*.
n	INTEGER. The order of the matrix *A*; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
a, *b*, *x*, *work*	REAL for strrfs DOUBLE PRECISION for dtrrfs COMPLEX for ctrrfs DOUBLE COMPLEX for ztrrfs. Arrays: *a*(*lda*,*) contains the upper or lower triangular matrix *A*, as specified by *uplo*. *b*(*ldb*,*) contains the right-hand side matrix *B*. *x*(*ldx*,*) contains the solution matrix *X*. *work*(*) is a workspace array. The second dimension of *a* must be at least max(1,*n*); the second dimension of *b* and *x* must be at least max(1,*nrhs*); the dimension of *work* must be at least max(1,3*n) for real flavors and max(1,2*n) for complex flavors.
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).
ldx	INTEGER. The first dimension of *x*; *ldx* ≥ max(1, *n*).
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*).
rwork	REAL for ctrrfs DOUBLE PRECISION for ztrrfs. Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

ferr, *berr*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays, DIMENSION at least max(1, *nrhs*). Contain the component-wise forward and backward errors, respectively, for each solution vector.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine trrfs interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *nrhs*).
x	Holds the matrix *X* of size (*n*, *nrhs*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
diag	Must be 'N' or 'U'. The default value is 'N'.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

A call to this routine involves, for each right-hand side, solving a number of systems of linear equations *A***x* = *b*; the number of systems is usually 4 or 5 and never more than 11. Each solution requires approximately n^2 floating-point operations for real flavors or $4n^2$ for complex flavors.

?tprfs

Estimates the error in the solution of a system of linear equations with a packed triangular matrix.

Syntax

Fortran 77:

```
call stprfs( uplo, trans, diag, n, nrhs, ap, b, ldb, x, ldx, ferr, berr, work, iwork, info )
call dtprfs( uplo, trans, diag, n, nrhs, ap, b, ldb, x, ldx, ferr, berr, work, iwork, info )
call ctprfs( uplo, trans, diag, n, nrhs, ap, b, ldb, x, ldx, ferr, berr, work, rwork, info )
call ztprfs( uplo, trans, diag, n, nrhs, ap, b, ldb, x, ldx, ferr, berr, work, rwork, info )
```

Fortran 95:

```
call tprfs( a, b, x [,uplo] [,trans] [,diag] [,ferr] [,berr] [,info] )
```

Description

This routine estimates the errors in the solution to a system of linear equations $A*X = B$ or $A^T*X = B$ or $A^H*X = B$ with a packed triangular matrix A, with multiple right-hand sides. For each computed solution vector x, the routine computes the component-wise backward error β. This error is the smallest relative perturbation in elements of A and b such that x is the exact solution of the perturbed system:

$|\delta a_{ij}|/|a_{ij}| \le \beta|a_{ij}|$, $|\delta b_i|/|b_i| \le \beta|b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

The routine also estimates the component-wise forward error in the computed solution $||x - x_e||_\infty / ||x||_\infty$ (here x_e is the exact solution).

Before calling this routine, call the solver routine ?tptrs.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether A is upper or lower triangular:

	If *uplo* = 'U', then *A* is upper triangular. If *uplo* = 'L', then *A* is lower triangular.
trans	CHARACTER*1. Must be 'N' or 'T' or 'C'. Indicates the form of the equations: If *trans* = 'N', the system has the form *A*X* = *B*. If *trans* = 'T', the system has the form $A^T*X = B$. If *trans* = 'C', the system has the form $A^H*X = B$.
diag	CHARACTER*1. Must be 'N' or 'U'. If *diag* = 'N', *A* is not a unit triangular matrix. If *diag* = 'U', *A* is unit triangular: diagonal elements of *A* are assumed to be 1 and not referenced in the array *ap*.
n	INTEGER. The order of the matrix *A*; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
ap, *b*, *x*, *work*	REAL for stprfs DOUBLE PRECISION for dtprfs COMPLEX for ctprfs DOUBLE COMPLEX for ztprfs. Arrays: *ap*(*) contains the upper or lower triangular matrix *A*, as specified by *uplo*. *b*(*ldb*,*) contains the right-hand side matrix *B*. *x*(*ldx*,*) contains the solution matrix *X*. *work*(*) is a workspace array. The dimension of *ap* must be at least max(1,*n*(*n*+1)/2); the second dimension of *b* and *x* must be at least max(1,*nrhs*); the dimension of *work* must be at least max(1,3**n*) for real flavors and max(1,2**n*) for complex flavors.
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).
ldx	INTEGER. The first dimension of *x*; *ldx* ≥ max(1, *n*).
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*).
rwork	REAL for ctprfs DOUBLE PRECISION for ztprfs. Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

ferr, *berr*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays, DIMENSION at least max(1, *nrhs*). Contain the component-wise forward and backward errors, respectively, for each solution vector.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine tprfs interface are as follows:

a	Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n**(*n*+1)/2).
b	Holds the matrix *B* of size (*n*,*nrhs*).
x	Holds the matrix *X* of size (*n*,*nrhs*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
diag	Must be 'N' or 'U'. The default value is 'N'.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

A call to this routine involves, for each right-hand side, solving a number of systems of linear equations *A***x* = *b*; the number of systems is usually 4 or 5 and never more than 11. Each solution requires approximately n^2 floating-point operations for real flavors or $4n^2$ for complex flavors.

?tbrfs

Estimates the error in the solution of a system of linear equations with a triangular band matrix.

Syntax

Fortran 77:

```
call stbrfs( uplo, trans, diag, n, kd, nrhs, ab, ldab, b, ldb, x, ldx, ferr, berr, work, iwork, info )
call dtbrfs( uplo, trans, diag, n, kd, nrhs, ab, ldab, b, ldb, x, ldx, ferr, berr, work, iwork, info )
call ctbrfs( uplo, trans, diag, n, kd, nrhs, ab, ldab, b, ldb, x, ldx, ferr, berr, work, rwork, info )
call ztbrfs( uplo, trans, diag, n, kd, nrhs, ab, ldab, b, ldb, x, ldx, ferr, berr, work, rwork, info )
```

Fortran 95:

```
call tbrfs( a, b, x [,uplo] [,trans] [,diag] [,ferr] [,berr] [,info] )
```

Description

This routine estimates the errors in the solution to a system of linear equations $A*X = B$ or $A^T*X = B$ or $A^H*X = B$ with a triangular band matrix A, with multiple right-hand sides. For each computed solution vector x, the routine computes the component-wise backward error β. This error is the smallest relative perturbation in elements of A and b such that x is the exact solution of the perturbed system:

$|\delta a_{ij}|/|a_{ij}| \le \beta|a_{ij}|$, $|\delta b_i|/|b_i| \le \beta|b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

The routine also estimates the component-wise forward error in the computed solution $||x - x_e||_\infty/||x||_\infty$ (here x_e is the exact solution).

Before calling this routine, call the solver routine ?tbtrs.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether A is upper or lower triangular:

If *uplo* = 'U', then *A* is upper triangular.
If *uplo* = 'L', then *A* is lower triangular.

trans — CHARACTER*1. Must be 'N' or 'T' or 'C'.
Indicates the form of the equations:
If *trans* = 'N', the system has the form *A*X* = *B*.
If *trans* = 'T', the system has the form $A^T*X = B$.
If *trans* = 'C', the system has the form $A^H*X = B$.

diag — CHARACTER*1. Must be 'N' or 'U'.
If *diag* = 'N', *A* is not a unit triangular matrix.
If *diag* = 'U', *A* is unit triangular: diagonal elements of *A* are assumed to be 1 and not referenced in the array *ab*.

n — INTEGER. The order of the matrix *A*; $n \geq 0$.

kd — INTEGER. The number of super-diagonals or sub-diagonals in the matrix *A*; $kd \geq 0$.

nrhs — INTEGER. The number of right-hand sides; $nrhs \geq 0$.

ab, *b*, *x*, *work* — REAL for stbrfs
DOUBLE PRECISION for dtbrfs
COMPLEX for ctbrfs
DOUBLE COMPLEX for ztbrfs.
Arrays:
ab(*ldab*,*) contains the upper or lower triangular matrix *A*, as specified by *uplo*, in band storage format.
b(*ldb*,*) contains the right-hand side matrix *B*.
x(*ldx*,*) contains the solution matrix *X*.
work(*) is a workspace array.
The second dimension of *a* must be at least max(1,*n*); the second dimension of *b* and *x* must be at least max(1,*nrhs*). The dimension of *work* must be at least max(1,3**n*) for real flavors and max(1,2**n*) for complex flavors.

ldab — INTEGER. The first dimension of the array *ab*; $ldab \geq kd + 1$.

ldb — INTEGER. The first dimension of *b*; $ldb \geq \max(1, n)$.

ldx — INTEGER. The first dimension of *x*; $ldx \geq \max(1, n)$.

iwork — INTEGER. Workspace array, DIMENSION at least max(1, *n*).

rwork — REAL for ctbrfs

DOUBLE PRECISION for ztbrfs.
Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

ferr, *berr*	REAL for single precision flavors. DOUBLE PRECISION for double precision flavors. Arrays, DIMENSION at least max(1, *nrhs*). Contain the component-wise forward and backward errors, respectively, for each solution vector.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine tbrfs interface are as follows:

a	Stands for argument *ab* in Fortan 77 interface. Holds the array *A* of size (*kd*+1, *n*).
b	Holds the matrix *B* of size (*n*, *nrhs*).
x	Holds the matrix *X* of size (*n*, *nrhs*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
diag	Must be 'N' or 'U'. The default value is 'N'.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

A call to this routine involves, for each right-hand side, solving a number of systems of linear equations *A***x* = *b*; the number of systems is usually 4 or 5 and never more than 11. Each solution requires approximately 2*n***kd* floating-point operations for real flavors or 8*n***kd* operations for complex flavors.

Routines for Matrix Inversion

It is seldom necessary to compute an explicit inverse of a matrix. In particular, do not attempt to solve a system of equations $Ax = b$ by first computing A^{-1} and then forming the matrix-vector product $x = A^{-1}b$. Call a solver routine instead (see Routines for Solving Systems of Linear Equations); this is more efficient and more accurate.

However, matrix inversion routines are provided for the rare occasions when an explicit inverse matrix is needed.

?getri

Computes the inverse of an LU-factored general matrix.

Syntax

Fortran 77:

```
call sgetri( n, a, lda, ipiv, work, lwork, info )
call dgetri( n, a, lda, ipiv, work, lwork, info )
call cgetri( n, a, lda, ipiv, work, lwork, info )
call zgetri( n, a, lda, ipiv, work, lwork, info )
```

Fortran 95:

```
call getri( a, ipiv [,info] )
```

Description

This routine computes the inverse `inv(A)` of a general matrix *A*. Before calling this routine, call `?getrf` to factorize *A*.

Input Parameters

n	`INTEGER`. The order of the matrix *A*; $n \geq 0$.

a, *work*	`REAL` for `sgetri`
	`DOUBLE PRECISION` for `dgetri`
	`COMPLEX` for `cgetri`
	`DOUBLE COMPLEX` for `zgetri`.

	Arrays: *a*(*lda*,*), *work*(*). *a*(*lda*,*) contains the factorization of the matrix *A*, as returned by ?getrf: *A* = *P***L***U*. The second dimension of *a* must be at least max(1,*n*). *work*(*) is a workspace array of dimension at least max(1,*lwork*).
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). The *ipiv* array, as returned by ?getrf.
lwork	INTEGER. The size of the *work* array; *lwork* ≥ *n*. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See Application Notes below for the suggested value of *lwork*.

Output Parameters

a	Overwritten by the *n*-by-*n* matrix inv(*A*).
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the *i*-th diagonal element of the factor *U* is zero, *U* is singular, and the inversion could not be completed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine getri interface are as follows:

a	Holds the matrix *A* of size (*n*,*n*).
ipiv	Holds the vector of length (*n*).

Application Notes

For better performance, try using *lwork* = *n*blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = –1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = –1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed inverse *X* satisfies the following error bound:

$$|XA - I| \leq c(n)\varepsilon|X|P|L||U|,$$

where $c(n)$ is a modest linear function of n; ε is the machine precision; I denotes the identity matrix; P, L, and U are the factors of the matrix factorization $A = P*L*U$.

The total number of floating-point operations is approximately $(4/3)n^3$ for real flavors and $(16/3)n^3$ for complex flavors.

?potri

Computes the inverse of a symmetric (Hermitian) positive-definite matrix.

Syntax

Fortran 77:

```
call spotri( uplo, n, a, lda, info )
call dpotri( uplo, n, a, lda, info )
call cpotri( uplo, n, a, lda, info )
call zpotri( uplo, n, a, lda, info )
```

Fortran 95:

```
call potri( a [,uplo] [,info] )
```

Description

This routine computes the inverse `inv(A)` of a symmetric positive definite or, for complex flavors, Hermitian positive-definite matrix `A`. Before calling this routine, call `?potrf` to factorize `A`.

Input Parameters

uplo	`CHARACTER*1`. Must be `'U'` or `'L'`. Indicates whether `A` is upper or lower triangular: If `uplo = 'U'`, then `A` is upper triangular. If `uplo = 'L'`, then `A` is lower triangular.
n	`INTEGER`. The order of the matrix `A`; $n \geq 0$.

a	`REAL` for `spotri`
	`DOUBLE PRECISION` for `dpotri`
	`COMPLEX` for `cpotri`
	`DOUBLE COMPLEX` for `zpotri`.
	Array `a(lda,*)`. Contains the factorization of the matrix `A`, as returned by `?potrf`.
	The second dimension of `a` must be at least `max(1, n)`.

lda	`INTEGER`. The first dimension of `a`; $lda \geq \max(1, n)$.

Output Parameters

a	Overwritten by the n-by-n matrix `inv(A)`.
info	`INTEGER`. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the *i*-th diagonal element of the Cholesky factor (and therefore the factor itself) is zero, and the inversion could not be completed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `potri` interface are as follows:

a	Holds the matrix A of size (n, n).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

The computed inverse X satisfies the following error bounds:

$$||XA - I||_2 \le c(n)\varepsilon\kappa_2(A), \quad ||AX - I||_2 \le c(n)\varepsilon\kappa_2(A),$$

where $c(n)$ is a modest linear function of n, and ε is the machine precision; I denotes the identity matrix.

The 2-norm $||A||_2$ of a matrix A is defined by $||A||_2 = max_{x \cdot x=1}(Ax \cdot Ax)^{1/2}$, and the condition number $\kappa_2(A)$ is defined by $\kappa_2(A) = ||A||_2 \, ||A^{-1}||_2$.

The total number of floating-point operations is approximately $(2/3)n^3$ for real flavors and $(8/3)n^3$ for complex flavors.

?pptri

Computes the inverse of a packed symmetric (Hermitian) positive-definite matrix

Syntax

Fortran 77:

```
call spptri( uplo, n, ap, info )
call dpptri( uplo, n, ap, info )
call cpptri( uplo, n, ap, info )
call zpptri( uplo, n, ap, info )
```

Fortran 95:

```
call pptri( a [,uplo] [,info] )
```

Description

This routine computes the inverse `inv(A)` of a symmetric positive definite or, for complex flavors, Hermitian positive-definite matrix `A` in `packed` form. Before calling this routine, call `?pptrf` to factorize `A`.

Input Parameters

uplo	`CHARACTER*1`. Must be `'U'` or `'L'`. Indicates whether the upper or lower triangular factor is stored in *ap*: If *uplo* = `'U'`, then the upper triangular factor is stored. If *uplo* = `'L'`, then the lower triangular factor is stored.
n	`INTEGER`. The order of the matrix *A*; *n* ≥ 0.

ap	`REAL` for `spptri`
	`DOUBLE PRECISION` for `dpptri`
	`COMPLEX` for `cpptri`
	`DOUBLE COMPLEX` for `zpptri`.
	Array, `DIMENSION` at least max(1, *n*(*n*+1)/2).
	Contains the factorization of the packed matrix *A*, as returned by `?pptrf`.
	The dimension *ap* must be at least max(1,*n*(*n*+1)/2).

Output Parameters

ap	Overwritten by the packed *n*-by-*n* matrix `inv(A)`.
info	`INTEGER`. If *info* = `0`, the execution is successful. If *info* = `-i`, the *i*-th parameter had an illegal value. If *info* = *i*, the *i*-th diagonal element of the Cholesky factor (and therefore the factor itself) is zero, and the inversion could not be completed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `pptri` interface are as follows:

a	Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size `(n*(n+1)/2)`.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

The computed inverse *X* satisfies the following error bounds:

$$||XA - I||_2 \le c(n)\varepsilon\kappa_2(A), \quad ||AX - I||_2 \le c(n)\varepsilon\kappa_2(A),$$

where $c(n)$ is a modest linear function of n, and ε is the machine precision; I denotes the identity matrix.

The 2-norm $||A||_2$ of a matrix A is defined by $||A||_2 = max_{x \cdot x=1}(Ax \cdot Ax)^{1/2}$, and the condition number $\kappa_2(A)$ is defined by $\kappa_2(A) = ||A||_2 \, ||A^{-1}||_2$.

The total number of floating-point operations is approximately $(2/3)n^3$ for real flavors and $(8/3)n^3$ for complex flavors.

?sytri

Computes the inverse of a symmetric matrix.

Syntax

Fortran 77:

```
call ssytri( uplo, n, a, lda, ipiv, work, info )
call dsytri( uplo, n, a, lda, ipiv, work, info )
call csytri( uplo, n, a, lda, ipiv, work, info )
call zsytri( uplo, n, a, lda, ipiv, work, info )
```

Fortran 95:

```
call sytri( a, ipiv [,uplo] [,info] )
```

Description

This routine computes the inverse `inv(A)` of a symmetric matrix *A*. Before calling this routine, call `?sytrf` to factorize *A*.

Input Parameters

uplo — `CHARACTER*1`. Must be `'U'` or `'L'`.
Indicates how the input matrix *A* has been factored:
If *uplo* = `'U'`, the array *a* stores the Bunch-Kaufman factorization $A = P*U*D*U^T*P^T$.
If *uplo* = `'L'`, the array *a* stores the Bunch-Kaufman factorization $A = P*L*D*L^T*P^T$.

n — `INTEGER`. The order of the matrix *A*; $n \geq 0$.

a, *work* — `REAL` for `ssytri`
`DOUBLE PRECISION` for `dsytri`
`COMPLEX` for `csytri`
`DOUBLE COMPLEX` for `zsytri`.
Arrays:
a`(`*lda*`,*)` contains the factorization of the matrix *A*, as returned by `?sytrf`.
The second dimension of *a* must be at least `max(1,`*n*`)`.
work`(*)` is a workspace array.

	The dimension of *work* must be at least max(1,2*n).
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). The *ipiv* array, as returned by ?sytrf.

Output Parameters

a	Overwritten by the *n*-by-*n* matrix inv(*A*).
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the *i*-th diagonal element of *D* is zero, *D* is singular, and the inversion could not be completed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine sytri interface are as follows:

a	Holds the matrix *A* of size (*n*,*n*).
ipiv	Holds the vector of length (*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed inverse *X* satisfies the following error bounds:

$$|D*U^T*P^T*X*P*U - I| \le c(n)\varepsilon(|D||U^T|P^T|X|P|U| + |D||D^{-1}|)$$

for *uplo* = 'U', and

$$|D*L^T*P^T*X*P*L - I| \le c(n)\varepsilon(|D||L^T|P^T|X|P|L| + |D||D^{-1}|)$$

for *uplo* = 'L'. Here $c(n)$ is a modest linear function of *n*, and ε is the machine precision; *I* denotes the identity matrix.

The total number of floating-point operations is approximately $(2/3)n^3$ for real flavors and $(8/3)n^3$ for complex flavors.

?hetri

Computes the inverse of a complex Hermitian matrix.

Syntax

Fortran 77:

```
call chetri( uplo, n, a, lda, ipiv, work, info )
call zhetri( uplo, n, a, lda, ipiv, work, info )
```

Fortran 95:

```
call hetri( a, ipiv [,uplo] [,info] )
```

Description

This routine computes the inverse `inv(A)` of a complex Hermitian matrix `A`. Before calling this routine, call `?hetrf` to factorize `A`.

Input Parameters

uplo	`CHARACTER*1`. Must be `'U'` or `'L'`. Indicates how the input matrix `A` has been factored: If `uplo = 'U'`, the array `a` stores the Bunch-Kaufman factorization $A = P*U*D*U^H*P^T$. If `uplo = 'L'`, the array `a` stores the Bunch-Kaufman factorization $A = P*L*D*L^H*P^T$.
n	`INTEGER`. The order of the matrix `A`; $n \geq 0$.
a, *work*	`COMPLEX` for `chetri` `DOUBLE COMPLEX` for `zhetri`. Arrays: `a(lda,*)` contains the factorization of the matrix `A`, as returned by `?hetrf`. The second dimension of `a` must be at least `max(1,n)`. `work(*)` is a workspace array. The dimension of `work` must be at least `max(1,n)`.
lda	`INTEGER`. The first dimension of `a`; $lda \geq \max(1, n)$.
ipiv	`INTEGER`.

Array, DIMENSION at least max(1, *n*). The *ipiv* array, as returned by ?hetrf.

Output Parameters

a	Overwritten by the *n*-by-*n* matrix inv(*A*).
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the *i*-th diagonal element of *D* is zero, *D* is singular, and the inversion could not be completed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine hetri interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
ipiv	Holds the vector of length (*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed inverse *X* satisfies the following error bounds:

$$|D*U^H*P^T*X*P*U - I| \le c(n)\varepsilon(|D||U^H|P^T|X|P|U| + |D||D^{-1}|)$$

for *uplo* = 'U', and

$$|D*L^H*P^T*X*P*L - I| \le c(n)\varepsilon(|D||L^H|P^T|X|P|L| + |D||D^{-1}|)$$

for *uplo* = 'L'. Here $c(n)$ is a modest linear function of *n*, and ε is the machine precision; *I* denotes the identity matrix.

The total number of floating-point operations is approximately $(2/3)n^3$ for real flavors and $(8/3)n^3$ for complex flavors.

The real counterpart of this routine is ?sytri.

?sptri

Computes the inverse of a symmetric matrix using packed storage.

Syntax

Fortran 77:

```
call ssptri( uplo, n, ap, ipiv, work, info )
call dsptri( uplo, n, ap, ipiv, work, info )
call csptri( uplo, n, ap, ipiv, work, info )
call zsptri( uplo, n, ap, ipiv, work, info )
```

Fortran 95:

```
call sptri( a, ipiv [,uplo] [,info] )
```

Description

This routine computes the inverse inv(*A*) of a packed symmetric matrix *A*. Before calling this routine, call ?sptrf to factorize *A*.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates how the input matrix *A* has been factored: If *uplo* = 'U', the array *ap* stores the Bunch-Kaufman factorization $A = P*U*D*U^T*P^T$. If *uplo* = 'L', the array *ap* stores the Bunch-Kaufman factorization $A = P*L*D*L^T*P^T$.
n	INTEGER. The order of the matrix *A*; $n \geq 0$.
ap, *work*	REAL for ssptri DOUBLE PRECISION for dsptri COMPLEX for csptri DOUBLE COMPLEX for zsptri. Arrays: *ap*(*) contains the factorization of the matrix *A*, as returned by ?sptrf. The dimension of *ap* must be at least max(1,*n*(*n*+1)/2). *work*(*) is a workspace array.

The dimension of *work* must be at least max(1,*n*).

ipiv INTEGER.
Array, DIMENSION at least max(1, *n*). The *ipiv* array, as returned by ?sptrf.

Output Parameters

ap Overwritten by the *n*-by-*n* matrix inv(*A*) in packed form.

info INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, the *i*-th diagonal element of *D* is zero, *D* is singular, and the inversion could not be completed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine sptri interface are as follows:

a Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n**(*n*+1)/2).

ipiv Holds the vector of length (*n*).

uplo Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed inverse *X* satisfies the following error bounds:

$$|D*U^T*P^T*X*P*U - I| \le c(n)\varepsilon(|D||U^T|P^T|X|P|U| + |D||D^{-1}|)$$

for *uplo* = 'U', and

$$|D*L^T*P^T*X*P*L - I| \le c(n)\varepsilon(|D||L^T|P^T|X|P|L| + |D||D^{-1}|)$$

for *uplo* = 'L'. Here $c(n)$ is a modest linear function of n, and ε is the machine precision; I denotes the identity matrix.

The total number of floating-point operations is approximately $(2/3)n^3$ for real flavors and $(8/3)n^3$ for complex flavors.

?hptri

Computes the inverse of a complex Hermitian matrix using packed storage.

Syntax

Fortran 77:

```
call chptri( uplo, n, ap, ipiv, work, info )
call zhptri( uplo, n, ap, ipiv, work, info )
```

Fortran 95:

```
call hptri( a, ipiv [,uplo] [,info] )
```

Description

This routine computes the inverse `inv(A)` of a complex Hermitian matrix `A` using packed storage. Before calling this routine, call `?hptrf` to factorize `A`.

Input Parameters

uplo	`CHARACTER*1`. Must be `'U'` or `'L'`. Indicates how the input matrix `A` has been factored: If `uplo = 'U'`, the array `ap` stores the packed Bunch-Kaufman factorization $A = P*U*D*U^H*P^T$. If `uplo = 'L'`, the array `ap` stores the packed Bunch-Kaufman factorization $A = P*L*D*L^H*P^T$.
n	`INTEGER`. The order of the matrix `A`; $n \geq 0$.
ap, *work*	`COMPLEX` for `chptri` `DOUBLE COMPLEX` for `zhptri`. Arrays: `ap(*)` contains the factorization of the matrix `A`, as returned by `?hptrf`. The dimension of `ap` must be at least `max(1,n(n+1)/2)`. `work(*)` is a workspace array. The dimension of `work` must be at least `max(1,n)`.
ipiv	`INTEGER`. Array, `DIMENSION` at least `max(1, n)`. The `ipiv` array, as returned by `?hptrf`.

Output Parameters

ap	Overwritten by the *n*-by-*n* matrix `inv(A)`.
info	`INTEGER`. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the *i*-th diagonal element of *D* is zero, *D* is singular, and the inversion could not be completed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `hptri` interface are as follows:

a	Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n**(*n*+1)/2).
ipiv	Holds the vector of length (*n*).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

The computed inverse *X* satisfies the following error bounds:

$$|D*U^H*P^T*X*P*U - I| \le c(n)\varepsilon(|D||U^H|P^T|X|P|U| + |D||D^{-1}|)$$

for *uplo* = `'U'`, and

$$|D*L^H*P^T*X*PL - I| \le c(n)\varepsilon(|D||L^H|P^T|X|P|L| + |D||D^{-1}|)$$

for *uplo* = `'L'`. Here $c(n)$ is a modest linear function of *n*, and ε is the machine precision; *I* denotes the identity matrix.

The total number of floating-point operations is approximately $(2/3)n^3$ for real flavors and $(8/3)n^3$ for complex flavors.

The real counterpart of this routine is `?sptri`.

?trtri

Computes the inverse of a triangular matrix.

Syntax

Fortran 77:

```
call strtri( uplo, diag, n, a, lda, info )
call dtrtri( uplo, diag, n, a, lda, info )
call ctrtri( uplo, diag, n, a, lda, info )
call ztrtri( uplo, diag, n, a, lda, info )
```

Fortran 95:

```
call trtri( a [,uplo] [,diag] [,info] )
```

Description

This routine computes the inverse `inv(A)` of a triangular matrix *A*.

Input Parameters

uplo — `CHARACTER*1`. Must be `'U'` or `'L'`.
Indicates whether *A* is upper or lower triangular:
If *uplo* = `'U'`, then *A* is upper triangular.
If *uplo* = `'L'`, then *A* is lower triangular.

diag — `CHARACTER*1`. Must be `'N'` or `'U'`.
If *diag* = `'N'`, then *A* is not a unit triangular matrix.
If *diag* = `'U'`, *A* is unit triangular: diagonal elements of *A* are assumed to be 1 and not referenced in the array *a*.

n — `INTEGER`. The order of the matrix *A*; $n \geq 0$.

a — `REAL` for `strtri`
`DOUBLE PRECISION` for `dtrtri`
`COMPLEX` for `ctrtri`
`DOUBLE COMPLEX` for `ztrtri`.
Array: `DIMENSION (,*)`.
Contains the matrix *A*.
The second dimension of *a* must be at least `max(1,n)`.

lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).

Output Parameters

a	Overwritten by the *n*-by-*n* matrix inv(*A*).
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the *i*-th diagonal element of *A* is zero, *A* is singular, and the inversion could not be completed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine trtri interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
diag	Must be 'N' or 'U'. The default value is 'N'.

Application Notes

The computed inverse *X* satisfies the following error bounds:

$$|XA - I| \le c(n)\varepsilon\ |X||A|$$

$$|XA - I| \le c(n)\varepsilon\ |A^{-1}||A||X|,$$

where $c(n)$ is a modest linear function of n; ε is the machine precision; I denotes the identity matrix.

The total number of floating-point operations is approximately $(1/3)n^3$ for real flavors and $(4/3)n^3$ for complex flavors.

?tptri

Computes the inverse of a triangular matrix using packed storage.

Syntax

Fortran 77:

```
call stptri( uplo, diag, n, ap, info )
call dtptri( uplo, diag, n, ap, info )
call ctptri( uplo, diag, n, ap, info )
call ztptri( uplo, diag, n, ap, info )
```

Fortran 95:

```
call tptri( a [,uplo] [,diag] [,info] )
```

Description

This routine computes the inverse `inv(A)` of a packed triangular matrix `A`.

Input Parameters

uplo	`CHARACTER*1`. Must be `'U'` or `'L'`. Indicates whether `A` is upper or lower triangular: If *uplo* = `'U'`, then `A` is upper triangular. If *uplo* = `'L'`, then `A` is lower triangular.
diag	`CHARACTER*1`. Must be `'N'` or `'U'`. If *diag* = `'N'`, then `A` is not a unit triangular matrix. If *diag* = `'U'`, `A` is unit triangular: diagonal elements of `A` are assumed to be 1 and not referenced in the array *ap*.
n	`INTEGER`. The order of the matrix `A`; $n \geq 0$.

ap	`REAL` for `stptri`
	`DOUBLE PRECISION` for `dtptri`
	`COMPLEX` for `ctptri`
	`DOUBLE COMPLEX` for `ztptri`.
	Array, `DIMENSION` at least `max(1,n(n+1)/2)`.
	Contains the packed triangular matrix A.

Output Parameters

ap	Overwritten by the packed *n*-by-*n* matrix `inv(A)` .
info	`INTEGER`. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the *i*-th diagonal element of *A* is zero, *A* is singular, and the inversion could not be completed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `tptri` interface are as follows:

a	Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n**(*n*+1)/2).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
diag	Must be `'N'` or `'U'`. The default value is `'N'`.

Application Notes

The computed inverse *X* satisfies the following error bounds:

$$|XA - I| \leq c(n)\varepsilon\ |X||A|$$

$$|X - A^{-1}| \leq c(n)\varepsilon\ |A^{-1}||A||X|,$$

where $c(n)$ is a modest linear function of n; ε is the machine precision; I denotes the identity matrix.

The total number of floating-point operations is approximately $(1/3)n^3$ for real flavors and $(4/3)n^3$ for complex flavors.

Routines for Matrix Equilibration

Routines described in this section are used to compute scaling factors needed to equilibrate a matrix. Note that these routines do not actually scale the matrices.

?geequ

Computes row and column scaling factors intended to equilibrate a matrix and reduce its condition number.

Syntax

Fortran 77:

```
call sgeequ( m, n, a, lda, r, c, rowcnd, colcnd, amax, info )
call dgeequ( m, n, a, lda, r, c, rowcnd, colcnd, amax, info )
call cgeequ( m, n, a, lda, r, c, rowcnd, colcnd, amax, info )
call zgeequ( m, n, a, lda, r, c, rowcnd, colcnd, amax, info )
```

Fortran 95:

```
call geequ( a, r, c [,rowcnd] [,colcnd] [,amax] [,info] )
```

Description

This routine computes row and column scalings intended to equilibrate an m-by-n matrix A and reduce its condition number. The output array r returns the row scale factors and the array c the column scale factors. These factors are chosen to try to make the largest element in each row and column of the matrix B with elements $b_{ij}=r(i)*a_{ij}*c(j)$ have absolute value 1.

See ?laqge auxiliary function that uses scaling factors computed by ?geequ.

Input Parameters

m	INTEGER. The number of rows of the matrix A; $m \geq 0$.
n	INTEGER. The number of columns of the matrix A; $n \geq 0$.
a	REAL for sgeequ DOUBLE PRECISION for dgeequ COMPLEX for cgeequ DOUBLE COMPLEX for zgeequ. Array: DIMENSION (*lda*,*). Contains the m-by-n matrix A whose equilibration factors are to be computed. The second dimension of *a* must be at least max(1,*n*).

lda INTEGER. The leading dimension of *a*; *lda* ≥ max(1, *m*).

Output Parameters

r, *c* REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Arrays: *r*(*m*), *c*(*n*).
If *info* = 0, or *info* > *m*, the array *r* contains the row scale factors of the matrix *A*.
If *info* = 0 , the array *c* contains the column scale factors of the matrix *A*.

rowcnd REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
If *info* = 0 or *info* > *m*, *rowcnd* contains the ratio of the smallest *r*(i) to the largest *r*(i).

colcnd REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
If *info* = 0, *colcnd* contains the ratio of the smallest *c*(i) to the largest *c*(i).

amax REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Absolute value of the largest element of the matrix *A*.

info INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i* and

i ≤ *m*, the *i*-th row of *A* is exactly zero;
i > *m*, the (*i*-*m*)th column of *A* is exactly zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine geequ interface are as follows:

a Holds the matrix *A* of size (*m*, *n*).

r Holds the vector of length (*m*).

c	Holds the vector of length (*n*).

Application Notes

All the components of *r* and *c* are restricted to be between SMLNUM = smallest safe number and BIGNUM= largest safe number. Use of these scaling factors is not guaranteed to reduce the condition number of *A* but works well in practice.

If *rowcnd* ≥ 0.1 and *amax* is neither too large nor too small, it is not worth scaling by *r*.

If *colcnd* ≥ 0.1, it is not worth scaling by *c*.

If *amax* is very close to overflow or very close to underflow, the matrix *A* should be scaled.

?gbequ

Computes row and column scaling factors intended to equilibrate a band matrix and reduce its condition number.

Syntax

Fortran 77:

```
call sgbequ( m, n, kl, ku, ab, ldab, r, c, rowcnd, colcnd, amax, info )
call dgbequ( m, n, kl, ku, ab, ldab, r, c, rowcnd, colcnd, amax, info )
call cgbequ( m, n, kl, ku, ab, ldab, r, c, rowcnd, colcnd, amax, info )
call zgbequ( m, n, kl, ku, ab, ldab, r, c, rowcnd, colcnd, amax, info )
```

Fortran 95:

```
call gbequ( a, r, c [,kl] [,rowcnd] [,colcnd] [,amax] [,info] )
```

Description

This routine computes row and column scalings intended to equilibrate an *m*-by-*n* band matrix *A* and reduce its condition number. The output array *r* returns the row scale factors and the array *c* the column scale factors. These factors are chosen to try to make the largest element in each row and column of the matrix *B* with elements b_{ij}=r(i)*a_{ij}*c(j) have absolute value 1.

See ?laqgb auxiliary function that uses scaling factors computed by ?gbequ.

Input Parameters

m	INTEGER. The number of rows of the matrix *A*; *m* ≥ 0.
n	INTEGER. The number of columns of the matrix *A*; *n* ≥ 0.
kl	INTEGER. The number of subdiagonals within the band of *A*; *kl* ≥ 0.
ku	INTEGER. The number of superdiagonals within the band of *A*; *ku* ≥ 0.
ab	REAL for sgbequ DOUBLE PRECISION for dgbequ COMPLEX for cgbequ DOUBLE COMPLEX for zgbequ. Array, DIMENSION (*ldab*,*). Contains the original band matrix *A* stored in rows from 1 to *kl* + *ku* + 1. The second dimension of *ab* must be at least max(1,*n*);
ldab	INTEGER. The leading dimension of *ab*; *ldab* ≥ *kl*+*ku*+1.

Output Parameters

r, *c*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays: *r*(*m*), *c*(*n*). If *info* = 0, or *info* > *m*, the array *r* contains the row scale factors of the matrix *A*. If *info* = 0 , the array *c* contains the column scale factors of the matrix *A*.
rowcnd	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. If *info* = 0 or *info* > *m*, *rowcnd* contains the ratio of the smallest *r*(i) to the largest *r*(i).
colcnd	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. If *info* = 0, *colcnd* contains the ratio of the smallest *c*(i) to the largest *c*(i).
amax	REAL for single precision flavors DOUBLE PRECISION for double precision flavors.

	Absolute value of the largest element of the matrix *A*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i* and *i* ≤ *m*, the *i*-th row of *A* is exactly zero; *i* > *m*, the (*i*-*m*)th column of *A* is exactly zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gbequ interface are as follows:

a	Stands for argument *ab* in Fortan 77 interface. Holds the array *A* of size (*kl*+*ku*+1, *n*).
r	Holds the vector of length (*m*).
c	Holds the vector of length (*n*).
kl	If omitted, assumed *kl* = *ku*.
ku	Restored as *ku* = *lda*-*kl*-1.

Application Notes

All the components of *r* and *c* are restricted to be between SMLNUM = smallest safe number and BIGNUM= largest safe number. Use of these scaling factors is not guaranteed to reduce the condition number of *A* but works well in practice.

If *rowcnd* ≥ 0.1 and *amax* is neither too large nor too small, it is not worth scaling by *r*.

If *colcnd* ≥ 0.1, it is not worth scaling by *c*.

If *amax* is very close to overflow or very close to underflow, the matrix *A* should be scaled.

?poequ

Computes row and column scaling factors intended to equilibrate a symmetric (Hermitian) positive definite matrix and reduce its condition number.

Syntax

Fortran 77:

```
call spoequ( n, a, lda, s, scond, amax, info )
call dpoequ( n, a, lda, s, scond, amax, info )
call cpoequ( n, a, lda, s, scond, amax, info )
call zpoequ( n, a, lda, s, scond, amax, info )
```

Fortran 95:

```
call poequ( a, s [,scond] [,amax] [,info] )
```

Description

This routine computes row and column scalings intended to equilibrate a symmetric (Hermitian) positive-definite matrix A and reduce its condition number (with respect to the two-norm). The output array s returns scale factors computed as

$$s(i) = \frac{1}{\sqrt{a_{i,i}}}$$

These factors are chosen so that the scaled matrix B with elements b_{ij}=s(i)*a_{ij}*s(j) has diagonal elements equal to 1.

This choice of s puts the condition number of B within a factor n of the smallest possible condition number over all possible diagonal scalings.

See ?laqsy auxiliary function that uses scaling factors computed by ?poequ.

Input Parameters

n	INTEGER. The order of the matrix A; $n \geq 0$.

a	REAL for spoequ DOUBLE PRECISION for dpoequ COMPLEX for cpoequ DOUBLE COMPLEX for zpoequ. Array: DIMENSION (*lda*,*). Contains the *n*-by-*n* symmetric or Hermitian positive definite matrix *A* whose scaling factors are to be computed. Only diagonal elements of *A* are referenced. The second dimension of *a* must be at least max(1,*n*).
lda	INTEGER. The leading dimension of *a*; *lda* ≥ max(1, *m*).

Output Parameters

s	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Array, DIMENSION (*n*). If *info* = 0, the array *s* contains the scale factors for *A*.
scond	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. If *info* = 0, *scond* contains the ratio of the smallest *s*(i) to the largest *s*(i).
amax	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Absolute value of the largest element of the matrix *A*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the *i*-th diagonal element of *A* is nonpositive.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine poequ interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
s	Holds the vector of length (*n*).

Application Notes

If *scond* ≥ 0.1 and *amax* is neither too large nor too small, it is not worth scaling by *s*.

If *amax* is very close to overflow or very close to underflow, the matrix *A* should be scaled.

?ppequ

Computes row and column scaling factors intended to equilibrate a symmetric (Hermitian) positive definite matrix in packed storage and reduce its condition number.

Syntax

Fortran 77:

```
call sppequ( uplo, n, ap, s, scond, amax, info )
call dppequ( uplo, n, ap, s, scond, amax, info )
call cppequ( uplo, n, ap, s, scond, amax, info )
call zppequ( uplo, n, ap, s, scond, amax, info )
```

Fortran 95:

```
call ppequ( a, s [,scond] [,amax] [,uplo] [,info] )
```

Description

This routine computes row and column scalings intended to equilibrate a symmetric (Hermitian) positive definite matrix *A* in packed storage and reduce its condition number (with respect to the two-norm). The output array *s* returns scale factors computed as

$$s(i) = \frac{1}{\sqrt{a_{i,i}}}$$

These factors are chosen so that the scaled matrix *B* with elements b_{ij}=s(i)*a_{ij}*s(j) has diagonal elements equal to 1.

This choice of *s* puts the condition number of *B* within a factor *n* of the smallest possible condition number over all possible diagonal scalings.

See ?laqsp auxiliary function that uses scaling factors computed by ?ppequ.

Input Parameters

uplo — CHARACTER*1. Must be 'U' or 'L'.
Indicates whether the upper or lower triangular part of *A* is packed in the array *ap*:
If *uplo* = 'U', the array *ap* stores the upper triangular part of the matrix *A*.
If *uplo* = 'L', the array *ap* stores the lower triangular part of the matrix *A*.

n — INTEGER. The order of matrix *A*; *n* ≥ 0.

ap — REAL for sppequ
DOUBLE PRECISION for dppequ
COMPLEX for cppequ
DOUBLE COMPLEX for zppequ.
Array, DIMENSION at least max(1,*n*(*n*+1)/2). The array *ap* contains the upper or the lower triangular part of the matrix *A* (as specified by *uplo*) in packed storage (see Matrix Storage Schemes).

Output Parameters

s — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION (*n*).
If *info* = 0, the array *s* contains the scale factors for *A*.

scond — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
If *info* = 0, *scond* contains the ratio of the smallest *s*(i) to the largest *s*(i).

amax — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Absolute value of the largest element of the matrix *A*.

info — INTEGER.
If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, the *i*-th diagonal element of *A* is nonpositive.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine ppequ interface are as follows:

a	Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n**(*n*+1)/2).
s	Holds the vector of length (*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

If *scond* ≥ 0.1 and *amax* is neither too large nor too small, it is not worth scaling by *s*.

If *amax* is very close to overflow or very close to underflow, the matrix *A* should be scaled.

?pbequ

Computes row and column scaling factors intended to equilibrate a symmetric (Hermitian) positive-definite band matrix and reduce its condition number.

Syntax

Fortran 77:

```
call spbequ( uplo, n, kd, ab, ldab, s, scond, amax, info )
call dpbequ( uplo, n, kd, ab, ldab, s, scond, amax, info )
call cpbequ( uplo, n, kd, ab, ldab, s, scond, amax, info )
call zpbequ( uplo, n, kd, ab, ldab, s, scond, amax, info )
```

Fortran 95:

```
call pbequ( a, s [,scond] [,amax] [,uplo] [,info] )
```

Description

This routine computes row and column scalings intended to equilibrate a symmetric (Hermitian) positive definite matrix *A* in packed storage and reduce its condition number (with respect to the two-norm). The output array *s* returns scale factors computed as

$$s(i) = \frac{1}{\sqrt{a_{i,i}}}$$

These factors are chosen so that the scaled matrix *B* with elements b_{ij}=*s*(i)**a*$_{ij}$**s*(j) has diagonal elements equal to 1. This choice of *s* puts the condition number of *B* within a factor *n* of the smallest possible condition number over all possible diagonal scalings.

See ?laqsb auxiliary function that uses scaling factors computed by ?pbequ.

Input Parameters

uplo
CHARACTER*1. Must be 'U' or 'L'.
Indicates whether the upper or lower triangular part of *A* is packed in the array *ab*:
If *uplo* = 'U', the array *ab* stores the upper triangular part of the matrix *A*.
If *uplo* = 'L', the array *ab* stores the lower triangular part of the matrix *A*.

n
INTEGER. The order of matrix *A*; *n* ≥ 0.

kd
INTEGER. The number of superdiagonals or subdiagonals in the matrix *A*; *kd* ≥ 0.

ab
REAL for spbequ
DOUBLE PRECISION for dpbequ
COMPLEX for cpbequ
DOUBLE COMPLEX for zpbequ.
Array, DIMENSION (*ldab*,*).
The array *ap* contains either the upper or the lower triangular part of the matrix *A* (as specified by *uplo*) in band storage (see Matrix Storage Schemes).
The second dimension of *ab* must be at least max(1, *n*).

ldab	INTEGER. The leading dimension of the array *ab*; *ldab* ≥ *kd* +1.

Output Parameters

s	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Array, DIMENSION (*n*). If *info* = 0, the array *s* contains the scale factors for *A*.
scond	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. If *info* = 0, *scond* contains the ratio of the smallest *s*(i) to the largest *s*(i).
amax	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Absolute value of the largest element of the matrix *A*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the *i*-th diagonal element of *A* is nonpositive.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine pbequ interface are as follows:

a	Stands for argument *ab* in Fortan 77 interface. Holds the array *A* of size (*kd*+1, *n*).
s	Holds the vector of length (*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

If *scond* ≥ 0.1 and *amax* is neither too large nor too small, it is not worth scaling by *s*.

If *amax* is very close to overflow or very close to underflow, the matrix *A* should be scaled.

Driver Routines

Table 3-3 lists the LAPACK driver routines for solving systems of linear equations with real or complex matrices.

Table 3-3 Driver Routines for Solving Systems of Linear Equations

Matrix type, storage scheme	Simple Driver	Expert Driver
general	?gesv	?gesvx
general band	?gbsv	?gbsvx
general tridiagonal	?gtsv	?gtsvx
symmetric/Hermitian positive-definite	?posv	?posvx
symmetric/Hermitian positive-definite, storage	?ppsv	?ppsvx
symmetric/Hermitian positive-definite, band	?pbsv	?pbsvx
symmetric/Hermitian positive-definite, tridiagonal	?ptsv	?ptsvx
symmetric/Hermitian indefinite	?sysv/?hesv	?sysvx/?hesvx
symmetric/Hermitian indefinite, packed storage	?spsv/?hpsv	?spsvx/?hpsvx

In this table ? stands for s (single precision real), d (double precision real), c (single precision complex), or z (double precision complex). In the description of ?gesv routine ? stands for combined character codes ds and zc for the mixed precision subroutines.

?gesv

Computes the solution to the system of linear equations with a square matrix A and multiple right-hand sides.

Syntax

Fortran 77:

```
call sgesv( n, nrhs, a, lda, ipiv, b, ldb, info )
call dgesv( n, nrhs, a, lda, ipiv, b, ldb, info )
call cgesv( n, nrhs, a, lda, ipiv, b, ldb, info )
call zgesv( n, nrhs, a, lda, ipiv, b, ldb, info )
call dsgesv( n, nrhs, a, lda, ipiv, b, ldb, x, ldx, work, swork, iter, info
)
call zcgesv( n, nrhs, a, lda, ipiv, b, ldb, x, ldx, work, swork, iter, info
)
```

Fortran 95:

```
call gesv( a, b [,ipiv] [,info] )
```

Description

This routine solves for *X* the system of linear equations *A*X = B*, where *A* is an *n*-by-*n* matrix, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

The *LU* decomposition with partial pivoting and row interchanges is used to factor *A* as *A = P*L*U*, where *P* is a permutation matrix, *L* is unit lower triangular, and *U* is upper triangular. The factored form of *A* is then used to solve the system of equations *A*X = B*.

The dsgesv and zcgesv are mixed precision iterative refinement subroutines for exploiting fast single precision hardware. They first attempt to factorize the matrix in single precision (dsgesv) or single complex precision (zcgesv) and use this factorization within an iterative refinement procedure to produce a solution with double precision (dsgesv) / double complex precision (zcgesv) normwise backward error quality (see below). If the approach fails the method switches to a double precision or double complex precision factorization respectively and solve.

The iterative refinement is not going to be a winning strategy if the ratio single precision performance over double precision performance is too small. A reasonable strategy should take the number of right-hand sides and the size of the matrix into account. This might be done with a call to `ilaenv` in the future. At present, iterative refinement is implemented.

The iterative refinement process is stopped if

```
iter > itermax
```

or for all the `RHS`:

```
RNRM < SQRT(N)*XNRM*ANRM*EPS*BWDMAX,
```

where

- `iter` is the number of the current iteration in the iterativerefinement process
- `RNRM` is the infinity-norm of the residual
- `XNRM` is the infinity-norm of the solution
- `ANRM` is the infinity-operator-norm of the matrix *A*
- `EPS` is the machine epsilon returned by `dlamch` ('Epsilon').

The values `itermax` and `BWDMAX` are fixed to 30 and 1.0D+00 respectively.

Input Parameters

n	`INTEGER`. The number of linear equations, that is, the order of the matrix *A*; $n \geq 0$.
nrhs	`INTEGER`. The number of right-hand sides, that is, the number of columns of the matrix *B*; $nrhs \geq 0$.

a, *b*	`REAL` for `sgesv`
	`DOUBLE PRECISION` for `dgesv` and `dsgesv`
	`COMPLEX` for `cgesv`
	`DOUBLE COMPLEX` for `zgesv` and `zcgesv`.
	Arrays: *a*(*lda*,*), *b*(*ldb*,*).
	The array *a* contains the *n*-by-*n* coefficient matrix *A*.
	The array *b* contains the *n*-by-*nrhs* matrix of right hand side matrix *B*.
	The second dimension of *a* must be at least `max(1, n)`, the second dimension of *b* at least `max(1, nrhs)`.

lda INTEGER. The leading dimension of the array *a*; *lda* ≥ max(1, *n*).

ldb INTEGER. The leading dimension of the array *b*; *ldb* ≥ max(1, *n*).

ldx INTEGER. The leading dimension of the array *x*; *ldx* ≥ max(1, *n*).

work DOUBLE PRECISION for dsgesv
DOUBLE COMPLEX for zcgesv.
Workspace array, DIMENSION (*n***nrhs*). This array is used to hold the residual vectors.

swork SINGLE PRECISION for dsgesv
COMPLEX for zcgesv.
Workspace array, DIMENSION (*n**(*n*+*nrhs*)). This array is used to use the single precision matrix and the right-hand sides or solutions in single precision.

Output Parameters

a Overwritten by the factors *L* and *U* from the factorization of *A = P*L*U*; the unit diagonal elements of *L* are not stored.
If iterative refinement has been successfully used (*info*= 0 and *iter* ≥ 0, see description below), then *A* is unchanged.
If double precision factorization has been used (*info*= 0 and *iter* < 0, see description below), then the array *A* contains the factors *L* and *U* from the factorization *A = P*L*U*; the unit diagonal elements of *L* are not stored.

b Overwritten by the solution matrix *X*.

ipiv INTEGER.
Array, DIMENSION at least max(1, *n*). The pivot indices that define the permutation matrix *P*; row *i* of the matrix was interchanged with row *ipiv*(i). Corresponds to the single precision factorization (if *info*= 0 and *iter* ≥ 0) or the double precision factorization (if *info*= 0 and *iter* < 0).

x DOUBLE PRECISION for dsgesv
DOUBLE COMPLEX for zcgesv.
Array, DIMENSION (*ldx*, *nrhs*). If *info* = 0, contains the *n*-by-*nrhs* solution matrix *X*.

iter INTEGER.

If *iter* < 0: iterative refinement has failed, double precision factorization has been performed

- If *iter* = -1: taking into account machine parameters, *n*, *nrhs*, it is a priori not worth working in single precision
- If *iter* = -2: overflow of an entry when moving from double to single precision
- If *iter* = -3: failure of sgetrf
- If *iter* = -31: stop the iterative refinement after the 30th iteration.

If *iter* > 0: iterative refinement has been sucessfully used. Returns the number of iterations.

info INTEGER. If *info*=0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, *U*(*i*, *i*) (computed in double precision for mixed precision subroutines) is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution could not be computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gesv interface are as follows:

a Holds the matrix *A* of size (*n*, *n*).

b Holds the matrix *B* of size (*n*, *nrhs*).

ipiv Holds the vector of length (*n*).

NOTE. Fortran 95 Interface is so far not available for the mixed precision subroutines dsgesv/zcgesv.

?gesvx

Computes the solution to the system of linear equations with a square matrix A and multiple right-hand sides, and provides error bounds on the solution.

Syntax

Fortran 77:

```
call sgesvx( fact, trans, n, nrhs, a, lda, af, ldaf, ipiv, equed, r, c, b,
ldb, x, ldx, rcond, ferr, berr, work, iwork, info )

call dgesvx( fact, trans, n, nrhs, a, lda, af, ldaf, ipiv, equed, r, c, b,
ldb, x, ldx, rcond, ferr, berr, work, iwork, info )

call cgesvx( fact, trans, n, nrhs, a, lda, af, ldaf, ipiv, equed, r, c, b,
ldb, x, ldx, rcond, ferr, berr, work, rwork, info )

call zgesvx( fact, trans, n, nrhs, a, lda, af, ldaf, ipiv, equed, r, c, b,
ldb, x, ldx, rcond, ferr, berr, work, rwork, info )
```

Fortran 95:

```
call gesvx( a, b, x [,af] [,ipiv] [,fact] [,trans] [,equed] [,r] [,c] [,ferr]
[,berr] [,rcond] [,rpvgrw] [,info] )
```

Description

This routine uses the *LU* factorization to compute the solution to a real or complex system of linear equations *A*X = B*, where *A* is an *n*-by-*n* matrix, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?gesvx performs the following steps:

1. If *fact* = 'E', real scaling factors *r* and *c* are computed to equilibrate the system:

trans = 'N': *diag*(*r*)**A***diag*(*c*)*inv(*diag*(*c*))**X* = *diag*(*r*)**B*

trans = 'T': $(diag(r)*A*diag(c))^{T}$*inv(*diag*(*r*))**X* = *diag*(*c*)**B*

trans = 'C': $(diag(r)*A*diag(c))^{H}$*inv(*diag*(*r*))**X* = *diag*(*c*)**B*

Whether or not the system will be equilibrated depends on the scaling of the matrix *A*, but if equilibration is used, *A* is overwritten by *diag(r)*A*diag(c)* and *B* by *diag(r)*B* (if *trans*='N') or *diag(c)*B* (if *trans* = 'T' or 'C').

2. If *fact* = 'N' or 'E', the *LU* decomposition is used to factor the matrix *A* (after equilibration if *fact* = 'E') as *A* = *P*L*U*, where *P* is a permutation matrix, *L* is a unit lower triangular matrix, and *U* is upper triangular.
3. If some $U_{i,i}$= 0, so that *U* is exactly singular, then the routine returns with *info* = *i*. Otherwise, the factored form of *A* is used to estimate the condition number of the matrix *A*. If the reciprocal of the condition number is less than machine precision, *info* = *n* + 1 is returned as a warning, but the routine still goes on to solve for *X* and compute error bounds as described below.
4. The system of equations is solved for *X* using the factored form of *A*.
5. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.
6. If equilibration was used, the matrix *X* is premultiplied by *diag(c)* (if *trans* = 'N') or *diag(r)* (if *trans* = 'T' or 'C') so that it solves the original system before equilibration.

Input Parameters

fact
CHARACTER*1. Must be 'F', 'N', or 'E'.
Specifies whether or not the factored form of the matrix *A* is supplied on entry, and if not, whether the matrix *A* should be equilibrated before it is factored.
If *fact* = 'F': on entry, *af* and *ipiv* contain the factored form of *A*. If *equed* is not 'N', the matrix *A* has been equilibrated with scaling factors given by *r* and *c*.

a, *af*, and *ipiv* are not modified.
If *fact* = 'N', the matrix *A* will be copied to *af* and factored.
If *fact* = 'E', the matrix *A* will be equilibrated if necessary, then copied to *af* and factored.

trans
CHARACTER*1. Must be 'N', 'T', or 'C'.
Specifies the form of the system of equations:
If *trans* = 'N', the system has the form *A*X* = *B* (No transpose).
If *trans* = 'T', the system has the form A^T*X = *B* (Transpose).
If *trans* = 'C', the system has the form A^H*X = *B* (Conjugate transpose).

n INTEGER. The number of linear equations; the order of the matrix *A*; *n* ≥ 0.

nrhs INTEGER. The number of right hand sides; the number of columns of the matrices *B* and *X*; *nrhs* ≥ 0.

a,*af*,*b*,*work* REAL for sgesvx
DOUBLE PRECISION for dgesvx
COMPLEX for cgesvx
DOUBLE COMPLEX for zgesvx.
Arrays: *a*(*lda*,*), *af*(*ldaf*,*), *b*(*ldb*,*), *work*(*).
The array *a* contains the matrix *A*. If *fact* = 'F' and *equed* is not 'N', then *A* must have been equilibrated by the scaling factors in *r* and/or *c*. The second dimension of *a* must be at least max(1,*n*).
The array *af* is an input argument if *fact* = 'F'. It contains the factored form of the matrix *A*, that is, the factors *L* and *U* from the factorization *A* = *P*L*U* as computed by ?getrf. If *equed* is not 'N', then *af* is the factored form of the equilibrated matrix *A*. The second dimension of *af* must be at least max(1,*n*).
The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1, *nrhs*).
work(*) is a workspace array. The dimension of *work* must be at least max(1,4*n) for real flavors, and at least max(1,2*n) for complex flavors.

lda INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).

ldaf INTEGER. The first dimension of *af*; *ldaf* ≥ max(1, *n*).

ldb INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

ipiv INTEGER.
Array, DIMENSION at least max(1, *n*). The array *ipiv* is an input argument if *fact* = 'F'. It contains the pivot indices from the factorization *A* = *P*L*U* as computed by ?getrf; row *i* of the matrix was interchanged with row *ipiv*(*i*).

equed CHARACTER*1. Must be 'N', 'R', 'C', or 'B'.
equed is an input argument if *fact* = 'F'. It specifies the form of equilibration that was done:

	If *equed* = 'N', no equilibration was done (always true if *fact* = 'N'). If *equed* = 'R', row equilibration was done and *A* has been premultiplied by *diag*(*r*). If *equed* = 'C', column equilibration was done and *A* has been postmultiplied by *diag*(*c*). If *equed* = 'B', both row and column equilibration was done; *A* has been replaced by *diag*(*r*)**A***diag*(*c*).
r, *c*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays: *r*(*n*), *c*(*n*). The array *r* contains the row scale factors for *A*, and the array *c* contains the column scale factors for *A*. These arrays are input arguments if *fact* = 'F' only; otherwise they are output arguments. If *equed* = 'R' or 'B', *A* is multiplied on the left by *diag*(*r*); if *equed* = 'N' or 'C', *r* is not accessed. If *fact* = 'F' and *equed* = 'R' or 'B', each element of *r* must be positive. If *equed* = 'C' or 'B', *A* is multiplied on the right by *diag*(*c*); if *equed* = 'N' or 'R', *c* is not accessed. If *fact* = 'F' and *equed* = 'C' or 'B', each element of *c* must be positive.
ldx	INTEGER. The first dimension of the output array *x*; *ldx* ≥ max(1, *n*).
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*); used in real flavors only.
rwork	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Workspace array, DIMENSION at least max(1, 2**n*); used in complex flavors only.

Output Parameters

x	REAL for sgesvx DOUBLE PRECISION for dgesvx COMPLEX for cgesvx DOUBLE COMPLEX for zgesvx.

Array, DIMENSION (*ldx*,*).
If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X* to the original system of equations. Note that *A* and *B* are modified on exit if *equed* ≠ 'N', and the solution to the equilibrated system is:
diag(*C*)$^{-1}$**X*, if *trans* = 'N' and *equed* = 'C' or 'B'; *diag*(*R*)$^{-1}$**X*, if *trans* = 'T' or 'C' and *equed* = 'R' or 'B'. The second dimension of *x* must be at least max(1,*nrhs*).

a — Array *a* is not modified on exit if *fact* = 'F' or 'N', or if *fact* = 'E' and *equed* = 'N'. If *equed* ≠ 'N', *A* is scaled on exit as follows:
equed = 'R': *A* = *diag*(*R*)**A*
equed = 'C': *A* = *A***diag*(*c*)
equed = 'B': *A* = *diag*(*R*)**A***diag*(*c*).

af — If *fact* = 'N' or 'E', then *af* is an output argument and on exit returns the factors *L* and *U* from the factorization *A* = *PLU* of the original matrix *A* (if *fact* = 'N') or of the equilibrated matrix *A* (if *fact* = 'E'). See the description of *a* for the form of the equilibrated matrix.

b — Overwritten by *diag*(*r*)**B* if *trans* = 'N' and *equed* = 'R' or 'B'; overwritten by *diag*(*c*)**B* if *trans* = 'T' and *equed* = 'C' or 'B'; not changed if *equed* = 'N'.

r, *c* — These arrays are output arguments if *fact* ≠ 'F'. See the description of *r*, *c* in Input Arguments section.

rcond — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
An estimate of the reciprocal condition number of the matrix *A* after equilibration (if done). The routine sets *rcond* = 0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.

ferr, *berr* — REAL for single precision flavors.
DOUBLE PRECISION for double precision flavors.
Arrays, DIMENSION at least max(1, *nrhs*). Contain the component-wise forward and relative backward errors, respectively, for each solution vector.

ipiv	If *fact* = 'N' or 'E', then *ipiv* is an output argument and on exit contains the pivot indices from the factorization *A* = *P*L*U* of the original matrix *A* (if *fact* = 'N') or of the equilibrated matrix *A* (if *fact* = 'E').
equed	If *fact* ≠ 'F' , then *equed* is an output argument. It specifies the form of equilibration that was done (see the description of *equed* in Input Arguments section).
work, *rwork*	On exit, *work*(1) for real flavors, or *rwork*(1) for complex flavors, contains the reciprocal pivot growth factor norm(*A*)/norm(*U*). The "max absolute element" norm is used. If *work*(1) for real flavors, or *rwork*(1) for complex flavors is much less than 1, then the stability of the *LU* factorization of the (equilibrated) matrix *A* could be poor. This also means that the solution *x*, condition estimator *rcond*, and forward error bound *ferr* could be unreliable. If factorization fails with 0 < *info* ≤ *n*, then *work*(1) for real flavors, or *rwork*(1) for complex flavors contains the reciprocal pivot growth factor for the leading *info* columns of *A*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, and *i* ≤ *n*, then *U*(*i*, *i*) is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned. If *info* = *i*, and *i* = *n*+1, then *U* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gesvx interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *nrhs*).

x	Holds the matrix *X* of size (*n*, *nrhs*).
af	Holds the matrix *AF* of size (*n*, *n*).
ipiv	Holds the vector of length (*n*).
r	Holds the vector of length (*n*). Default value for each element is *r*(*i*) = 1.0_WP.
c	Holds the vector of length (*n*). Default value for each element is *c*(*i*) = 1.0_WP.
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
fact	Must be 'N', 'E', or 'F'. The default value is 'N'. If *fact* = 'F', then both arguments *af* and *ipiv* must be present; otherwise, an error is returned.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
equed	Must be 'N', 'B', 'C', or 'R'. The default value is 'N'.
rpvgrw	Real value that contains the reciprocal pivot growth factor norm(*A*)/norm(*U*).

?gbsv

Computes the solution to the system of linear equations with a band matrix A and multiple right-hand sides.

Syntax

Fortran 77:

```
call sgbsv( n, kl, ku, nrhs, ab, ldab, ipiv, b, ldb, info )
call dgbsv( n, kl, ku, nrhs, ab, ldab, ipiv, b, ldb, info )
call cgbsv( n, kl, ku, nrhs, ab, ldab, ipiv, b, ldb, info )
call zgbsv( n, kl, ku, nrhs, ab, ldab, ipiv, b, ldb, info )
```

Fortran 95:

```
call gbsv( a, b [,kl] [,ipiv] [,info] )
```

Description

This routine solves for *X* the real or complex system of linear equations *A*X = B*, where *A* is an *n*-by-*n* band matrix with *kl* subdiagonals and *ku* superdiagonals, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

The *LU* decomposition with partial pivoting and row interchanges is used to factor *A* as *A = L*U*, where *L* is a product of permutation and unit lower triangular matrices with *kl* subdiagonals, and *U* is upper triangular with *kl*+*ku* superdiagonals. The factored form of *A* is then used to solve the system of equations *A*X = B*.

Input Parameters

n	INTEGER. The order of *A*. The number of rows in *B*; *n* ≥ 0.
kl	INTEGER. The number of subdiagonals within the band of *A*; *kl* ≥ 0.
ku	INTEGER. The number of superdiagonals within the band of *A*; *ku* ≥ 0.
nrhs	INTEGER. The number of right-hand sides. The number of columns in *B*; *nrhs* ≥ 0.
ab, *b*	REAL for sgbsv DOUBLE PRECISION for dgbsv COMPLEX for cgbsv DOUBLE COMPLEX for zgbsv. Arrays: *ab*(*ldab*,*), *b*(*ldb*,*). The array *ab* contains the matrix *A* in band storage (see Matrix Storage Schemes). The second dimension of *ab* must be at least max(1, *n*). The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).
ldab	INTEGER. The first dimension of the array *ab*. (*ldab* ≥ 2*kl* + *ku* +1)
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

Output Parameters

ab	Overwritten by *L* and *U*. The diagonal and *kl* + *ku* superdiagonals of *U* are stored in the first 1 + *kl* + *ku* rows of *ab*. The multipliers used to form *L* are stored in the next *kl* rows.
b	Overwritten by the solution matrix *X*.

ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). The pivot indices: row *i* was interchanged with row *ipiv*(*i*).
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, *U*(*i*, *i*) is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution could not be computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gbsv interface are as follows:

a	Stands for argument *ab* in Fortan 77 interface. Holds the array *A* of size (2**kl*+*ku*+1,*n*).
b	Holds the matrix *B* of size (*n*,*nrhs*).
ipiv	Holds the vector of length (*n*).
kl	If omitted, assumed *kl* = *ku*.
ku	Restored as *ku* = *lda*-2**kl*-1.

?gbsvx

Computes the solution to the real or complex system of linear equations with a band matrix A and multiple right-hand sides, and provides error bounds on the solution.

Syntax

Fortran 77:

```
call sgbsvx( fact, trans, n, kl, ku, nrhs, ab, ldab, afb, ldafb, ipiv, equed,
r, c, b, ldb, x, ldx, rcond, ferr, berr, work, iwork, info )

call dgbsvx( fact, trans, n, kl, ku, nrhs, ab, ldab, afb, ldafb, ipiv, equed,
r, c, b, ldb, x, ldx, rcond, ferr, berr, work, iwork, info )

call cgbsvx( fact, trans, n, kl, ku, nrhs, ab, ldab, afb, ldafb, ipiv, equed,
r, c, b, ldb, x, ldx, rcond, ferr, berr, work, rwork, info )

call zgbsvx( fact, trans, n, kl, ku, nrhs, ab, ldab, afb, ldafb, ipiv, equed,
r, c, b, ldb, x, ldx, rcond, ferr, berr, work, rwork, info )
```

Fortran 95:

```
call gbsvx( a, b, x [,kl] [,af] [,ipiv] [,fact] [,trans] [,equed] [,r] [,c]
[,ferr] [,berr] [,rcond] [,rpvgrw] [,info] )
```

Description

This routine uses the *LU* factorization to compute the solution to a real or complex system of linear equations $A*X = B$, $A^T*X = B$, or $A^H*X = B$, where A is a band matrix of order n with kl subdiagonals and ku superdiagonals, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?gbsvx performs the following steps:

1. If *fact* = 'E', real scaling factors r and c are computed to equilibrate the system:

trans = 'N': *diag*(*r*)**A*diag*(*c*) *inv(*diag*(*c*))**X* = *diag*(*r*)**B*

trans = 'T': $(diag(r)*A*diag(c))^T$ *inv(*diag*(*r*))**X* = *diag*(*c*)**B*

trans = 'C': $(diag(r)*A*diag(c))^H$ *inv(*diag*(*r*))**X* = *diag*(*c*)**B*

Whether or not the system will be equilibrated depends on the scaling of the matrix *A*, but if equilibration is used, *A* is overwritten by *diag(r)*A*diag(c)* and *B* by *diag(r)*B* (if *trans*='N') or *diag(c)*B* (if *trans* = 'T' or 'C').

2. If *fact* = 'N' or 'E', the *LU* decomposition is used to factor the matrix *A* (after equilibration if *fact* = 'E') as *A* = *L*U*, where *L* is a product of permutation and unit lower triangular matrices with *kl* subdiagonals, and *U* is upper triangular with *kl*+*ku* superdiagonals.
3. If some $U_{i,i}$ = 0, so that *U* is exactly singular, then the routine returns with *info* = *i*. Otherwise, the factored form of *A* is used to estimate the condition number of the matrix *A*. If the reciprocal of the condition number is less than machine precision, *info* = *n* + 1 is returned as a warning, but the routine still goes on to solve for *X* and compute error bounds as described below.
4. The system of equations is solved for *X* using the factored form of *A*.
5. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.
6. If equilibration was used, the matrix *X* is premultiplied by *diag(c)* (if *trans* = 'N') or *diag(r)* (if *trans* = 'T' or 'C') so that it solves the original system before equilibration.

Input Parameters

fact

CHARACTER*1. Must be 'F', 'N', or 'E'.
Specifies whether or not the factored form of the matrix *A* is supplied on entry, and if not, whether the matrix *A* should be equilibrated before it is factored.
If *fact* = 'F': on entry, *afb* and *ipiv* contain the factored form of *A*. If *equed* is not 'N', the matrix *A* has been equilibrated with scaling factors given by *r* and *c*.

ab, *afb*, and *ipiv* are not modified.
If *fact* = 'N', the matrix *A* will be copied to *afb* and factored.
If *fact* = 'E', the matrix *A* will be equilibrated if necessary, then copied to *afb* and factored.

trans

CHARACTER*1. Must be 'N', 'T', or 'C'.
Specifies the form of the system of equations:
If *trans* = 'N', the system has the form *A*X* = *B* (No transpose).
If *trans* = 'T', the system has the form $A^T*X = B$ (Transpose).
If *trans* = 'C', the system has the form $A^H*X = B$ (Conjugate transpose).

n	INTEGER. The number of linear equations, the order of the matrix *A*; *n* ≥ 0.
kl	INTEGER. The number of subdiagonals within the band of *A*; *kl* ≥ 0.
ku	INTEGER. The number of superdiagonals within the band of *A*; *ku* ≥ 0.
nrhs	INTEGER. The number of right hand sides, the number of columns of the matrices *B* and *X*; *nrhs* ≥ 0.
ab,*afb*,*b*,*work*	REAL for sgesvx DOUBLE PRECISION for dgesvx COMPLEX for cgesvx DOUBLE COMPLEX for zgesvx. Arrays: *a*(*lda*,*), *af*(*ldaf*,*), *b*(*ldb*,*), *work*(*). The array *ab* contains the matrix *A* in band storage (see Matrix Storage Schemes). The second dimension of *ab* must be at least max(1, *n*). If *fact* = 'F' and *equed* is not 'N', then *A* must have been equilibrated by the scaling factors in *r* and/or *c*. The array *afb* is an input argument if *fact* = 'F'. The second dimension of *afb* must be at least max(1,*n*). It contains the factored form of the matrix *A*, that is, the factors *L* and *U* from the factorization *A* = *L*U* as computed by ?gbtrf. *U* is stored as an upper triangular band matrix with *kl* + *ku* superdiagonals in the first 1 + *kl* + *ku* rows of *afb*. The multipliers used during the factorization are stored in the next *kl* rows. If *equed* is not 'N', then *afb* is the factored form of the equilibrated matrix *A*. The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1, *nrhs*). *work(*)* is a workspace array. The dimension of *work* must be at least max(1,3*n) for real flavors, and at least max(1,2*n) for complex flavors.
ldab	INTEGER. The first dimension of *ab*; *ldab* ≥ *kl*+*ku*+1.
ldafb	INTEGER. The first dimension of *afb*; *ldafb* ≥ 2**kl*+*ku*+1.
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).
ipiv	INTEGER.

Array, DIMENSION at least max(1, *n*). The array *ipiv* is an input argument if *fact* = 'F'. It contains the pivot indices from the factorization *A* = *L***U* as computed by ?gbtrf; row *i* of the matrix was interchanged with row *ipiv*(*i*).

equed

CHARACTER*1. Must be 'N', 'R', 'C', or 'B'.
equed is an input argument if *fact* = 'F'. It specifies the form of equilibration that was done:
If *equed* = 'N', no equilibration was done (always true if *fact* = 'N').
If *equed* = 'R', row equilibration was done and *A* has been premultiplied by *diag*(*r*).
If *equed* = 'C', column equilibration was done and *A* has been postmultiplied by *diag*(*c*).
if *equed* = 'B', both row and column equilibration was done; *A* has been replaced by *diag*(*r*)**A***diag*(*c*).

r, *c*

REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Arrays: *r*(*n*), *c*(*n*).
The array *r* contains the row scale factors for *A*, and the array *c* contains the column scale factors for *A*. These arrays are input arguments if *fact* = 'F' only; otherwise they are output arguments.
If *equed* = 'R' or 'B', *A* is multiplied on the left by *diag*(*r*); if *equed* = 'N' or 'C', *r* is not accessed.
If *fact* = 'F' and *equed* = 'R' or 'B', each element of *r* must be positive.
If *equed* = 'C' or 'B', *A* is multiplied on the right by *diag*(*c*); if *equed* = 'N' or 'R', *c* is not accessed.
If *fact* = 'F' and *equed* = 'C' or 'B', each element of *c* must be positive.

ldx

INTEGER. The first dimension of the output array *x*; *ldx* ≥ max(1, *n*).

iwork

INTEGER. Workspace array, DIMENSION at least max(1, *n*); used in real flavors only.

rwork

REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Workspace array, DIMENSION at least max(1, *n*); used in complex flavors only.

Output Parameters

x	REAL for sgbsvx DOUBLE PRECISION for dgbsvx COMPLEX for cgbsvx DOUBLE COMPLEX for zgbsvx. Array, DIMENSION (*ldx*,*). If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X* to the original system of equations. Note that *A* and *B* are modified on exit if *equed* ≠ 'N', and the solution to the equilibrated system is: inv(*diag*(*c*))***X*, if *trans* = 'N' and *equed* = 'C' or 'B'; inv(*diag*(*r*))***X*, if *trans* = 'T' or 'C' and *equed* = 'R' or 'B'. The second dimension of *x* must be at least max(1,*nrhs*).
ab	Array *ab* is not modified on exit if *fact* = 'F' or 'N', or if *fact* = 'E' and *equed* = 'N'. If *equed* ≠ 'N', *A* is scaled on exit as follows: *equed* = 'R': *A* = *diag*(*r*)***A* *equed* = 'C': *A* = *A***diag*(*c*) *equed* = 'B': *A* = *diag*(*r*)***A***diag*(*c*).
afb	If *fact* = 'N' or 'E', then *afb* is an output argument and on exit returns details of the *LU* factorization of the original matrix *A* (if *fact* = 'N') or of the equilibrated matrix *A* (if *fact* = 'E'). See the description of *ab* for the form of the equilibrated matrix.
b	Overwritten by *diag*(*r*)***b* if *trans* = 'N' and *equed* = 'R' or 'B'; overwritten by *diag*(*c*)***b* if *trans* = 'T' and *equed* = 'C' or 'B'; not changed if *equed* = 'N'.
r, *c*	These arrays are output arguments if *fact* ≠ 'F'. See the description of *r*, *c* in Input Arguments section.
rcond	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. An estimate of the reciprocal condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision (in particular, if *rcond* =0), the matrix is singular to working precision. This condition is indicated by a return code of *info*>0.
ferr, *berr*	REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.
Arrays, DIMENSION at least max(1, *nrhs*). Contain the component-wise forward and relative backward errors, respectively, for each solution vector.

ipiv — If *fact* = 'N' or 'E', then *ipiv* is an output argument and on exit contains the pivot indices from the factorization *A* = *L*U* of the original matrix *A* (if *fact* = 'N') or of the equilibrated matrix *A* (if *fact* = 'E').

equed — If *fact* ≠ 'F', then *equed* is an output argument. It specifies the form of equilibration that was done (see the description of *equed* in Input Arguments section).

work, *rwork* — On exit, *work*(1) for real flavors, or *rwork*(1) for complex flavors, contains the reciprocal pivot growth factor norm(*A*)/norm(*U*). The "max absolute element" norm is used. If *work*(1) for real flavors, or *rwork*(1) for complex flavors is much less than 1, then the stability of the *LU* factorization of the (equilibrated) matrix *A* could be poor. This also means that the solution *x*, condition estimator *rcond*, and forward error bound *ferr* could be unreliable. If factorization fails with 0 < *info* ≤ *n*, then *work*(1) for real flavors, or *rwork*(1) for complex flavors contains the reciprocal pivot growth factor for the leading *info* columns of *A*.

info — INTEGER. If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, and *i* ≤ *n*, then *U*(*i*, *i*) is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned. If *info* = *i*, and *i* = *n*+1, then *U* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gbsvx interface are as follows:

a	Stands for argument *ab* in Fortan 77 interface. Holds the array *A* of size (*kl*+*ku*+1,*n*).
b	Holds the matrix *B* of size (*n*,*nrhs*).
x	Holds the matrix *X* of size (*n*,*nrhs*).
af	Stands for argument *ab* in Fortan 77 interface. Holds the array *AF* of size (2**kl*+*ku*+1,*n*).
ipiv	Holds the vector of length (*n*).
r	Holds the vector of length (*n*). Default value for each element is *r*(*i*) = 1.0_WP.
c	Holds the vector of length (*n*). Default value for each element is *c*(*i*) = 1.0_WP.
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
equed	Must be 'N', 'B', 'C', or 'R'. The default value is 'N'.
fact	Must be 'N', 'E', or 'F'. The default value is 'N'. If *fact* = 'F', then both arguments *af* and *ipiv* must be present; otherwise, an error is returned.
rpvgrw	Real value that contains the reciprocal pivot growth factor norm(*A*)/norm(*U*).
kl	If omitted, assumed *kl* = *ku*.
ku	Restored as *ku* = *lda*-*kl*-1.

?gtsv

Computes the solution to the system of linear equations with a tridiagonal matrix A and multiple right-hand sides.

Syntax

Fortran 77:

```
call sgtsv( n, nrhs, dl, d, du, b, ldb, info )
call dgtsv( n, nrhs, dl, d, du, b, ldb, info )
call cgtsv( n, nrhs, dl, d, du, b, ldb, info )
call zgtsv( n, nrhs, dl, d, du, b, ldb, info )
```

Fortran 95:

```
call gtsv( dl, d, du, b [,info] )
```

Description

This routine solves for X the system of linear equations $A*X = B$, where A is an n-by-n tridiagonal matrix, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions. The routine uses Gaussian elimination with partial pivoting.

Note that the equation $A^T*X = B$ may be solved by interchanging the order of the arguments *du* and *dl*.

Input Parameters

n	INTEGER. The order of *A*, the number of rows in *B*; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides, the number of columns in *B*; $nrhs \geq 0$.
dl, *d*, *du*, *b*	REAL for sgtsv DOUBLE PRECISION for dgtsv COMPLEX for cgtsv DOUBLE COMPLEX for zgtsv. Arrays: *dl*(*n* - 1), *d*(*n*), *du*(*n* - 1), *b*(*ldb*,*). The array *dl* contains the (*n* - 1) subdiagonal elements of *A*. The array *d* contains the diagonal elements of *A*.

	The array *du* contains the (*n* – 1) superdiagonal elements of *A*. The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1, *nrhs*).
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

Output Parameters

dl	Overwritten by the (*n*–2) elements of the second superdiagonal of the upper triangular matrix *U* from the *LU* factorization of A. These elements are stored in *dl*(1), ... , *dl*(*n*–2).
d	Overwritten by the *n* diagonal elements of *U*.
du	Overwritten by the (*n*–1) elements of the first superdiagonal of *U*.
b	Overwritten by the solution matrix *X*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = –*i*, the *i*-th parameter had an illegal value. If *info* = *i*, *U*(*i*, *i*) is exactly zero, and the solution has not been computed. The factorization has not been completed unless *i* = *n*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gtsv interface are as follows:

dl	Holds the vector of length (*n*–1).
d	Holds the vector of length (*n*).
dl	Holds the vector of length (*n*–1).
b	Holds the matrix *B* of size (*n*, *nrhs*).

?gtsvx

Computes the solution to the real or complex system of linear equations with a tridiagonal matrix A and multiple right-hand sides, and provides error bounds on the solution.

Syntax

Fortran 77:

```
call sgtsvx( fact, trans, n, nrhs, dl, d, du, dlf, df, duf, du2, ipiv, b, ldb,
x, ldx, rcond, ferr, berr, work, iwork, info )

call dgtsvx( fact, trans, n, nrhs, dl, d, du, dlf, df, duf, du2, ipiv, b, ldb,
x, ldx, rcond, ferr, berr, work, iwork, info )

call cgtsvx( fact, trans, n, nrhs, dl, d, du, dlf, df, duf, du2, ipiv, b, ldb,
x, ldx, rcond, ferr, berr, work, rwork, info )

call zgtsvx( fact, trans, n, nrhs, dl, d, du, dlf, df, duf, du2, ipiv, b, ldb,
x, ldx, rcond, ferr, berr, work, rwork, info )
```

Fortran 95:

```
call gtsvx( dl, d, du, b, x [,dlf] [,df] [,duf] [,du2] [,ipiv] [,fact] [,trans]
[,ferr] [,berr] [,rcond] [,info] )
```

Description

This routine uses the *LU* factorization to compute the solution to a real or complex system of linear equations *A*X = B*, $A^T*X = B$, or $A^H*X = B$, where *A* is a tridiagonal matrix of order *n*, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?gtsvx performs the following steps:

1. If *fact = 'N'*, the *LU* decomposition is used to factor the matrix *A* as *A = L*U*, where *L* is a product of permutation and unit lower bidiagonal matrices and *U* is an upper triangular matrix with nonzeroes in only the main diagonal and first two superdiagonals.

2. If some $U_{i,i}$ = 0, so that U is exactly singular, then the routine returns with *info* = *i*. Otherwise, the factored form of *A* is used to estimate the condition number of the matrix *A*. If the reciprocal of the condition number is less than machine precision, *info* = *n* + 1 is returned as a warning, but the routine still goes on to solve for *X* and compute error bounds as described below.
3. The system of equations is solved for *X* using the factored form of *A*.
4. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.

Input Parameters

fact	CHARACTER*1. Must be 'F' or 'N'. Specifies whether or not the factored form of the matrix *A* has been supplied on entry. If *fact* = 'F': on entry, *dlf*, *df*, *duf*, *du2*, and *ipiv* contain the factored form of *A*; arrays *dl*, *d*, *du*, *dlf*, *df*, *duf*, *du2*, and *ipiv* will not be modified. If *fact* = 'N', the matrix *A* will be copied to *dlf*, *df*, and *duf* and factored.
trans	CHARACTER*1. Must be 'N', 'T', or 'C'. Specifies the form of the system of equations: If *trans* = 'N', the system has the form *A***X* = *B* (No transpose). If *trans* = 'T', the system has the form A^T**X* = *B* (Transpose). If *trans* = 'C', the system has the form A^H**X* = *B* (Conjugate transpose).
n	INTEGER. The number of linear equations, the order of the matrix *A*; *n* ≥ 0.
nrhs	INTEGER. The number of right hand sides, the number of columns of the matrices *B* and *X*; *nrhs* ≥ 0.
dl,*d*,*du*,*dlf*,*df*, *duf*,*du2*,*b*, *x*,*work*	REAL for sgtsvx DOUBLE PRECISION for dgtsvx COMPLEX for cgtsvx DOUBLE COMPLEX for zgtsvx. Arrays: *dl*, dimension (*n* -1), contains the subdiagonal elements of *A*. *d*, dimension (*n*), contains the diagonal elements of *A*. *du*, dimension (*n* -1), contains the superdiagonal elements of *A*.

dlf, dimension (*n* -1). If *fact* = 'F' , then *dlf* is an input argument and on entry contains the (*n* -1) multipliers that define the matrix *L* from the *LU* factorization of *A* as computed by ?gttrf.
df, dimension (*n*). If *fact* = 'F' , then *df* is an input argument and on entry contains the *n* diagonal elements of the upper triangular matrix *U* from the *LU* factorization of *A*.
duf, dimension (*n* -1). If *fact* = 'F' , then *duf* is an input argument and on entry contains the (*n* -1) elements of the first superdiagonal of *U*.
du2, dimension (*n* -2). If *fact* = 'F' , then *du2* is an input argument and on entry contains the (*n*-2) elements of the second superdiagonal of *U*.
b(*ldb**) contains the right-hand side matrix *B*. The second dimension of *b* must be at least max(1, *nrhs*).
x(*ldx**) contains the solution matrix *X*. The second dimension of *x* must be at least max(1, *nrhs*).
work(*) is a workspace array;
the dimension of *work* must be at least max(1, 3**n*) for real flavors and max(1, 2**n*) for complex flavors.

ldb — INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

ldx — INTEGER. The first dimension of *x*; *ldx* ≥ max(1, *n*).

ipiv — INTEGER.
Array, DIMENSION at least max(1, *n*). If *fact* = 'F' , then *ipiv* is an input argument and on entry contains the pivot indices, as returned by ?gttrf.

iwork — INTEGER. Workspace array, DIMENSION (*n*). Used for real flavors only.

rwork — REAL for cgtsvx
DOUBLE PRECISION for zgtsvx.
Workspace array, DIMENSION (*n*). Used for complex flavors only.

Output Parameters

x — REAL for sgtsvx
DOUBLE PRECISION for dgtsvx
COMPLEX for cgtsvx
DOUBLE COMPLEX for zgtsvx.
Array, DIMENSION (*ldx*,*).

	If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X*. The second dimension of *x* must be at least max(1, *nrhs*).
dlf	If *fact* = 'N', then *dlf* is an output argument and on exit contains the (*n*–1) multipliers that define the matrix *L* from the *LU* factorization of A.
df	If *fact* = 'N', then *df* is an output argument and on exit contains the *n* diagonal elements of the upper triangular matrix *U* from the *LU* factorization of *A*.
duf	If *fact* = 'N', then *duf* is an output argument and on exit contains the (*n*–1) elements of the first superdiagonal of *U*.
du2	If *fact* = 'N', then *du2* is an output argument and on exit contains the (*n*–2) elements of the second superdiagonal of *U*.
ipiv	The array *ipiv* is an output argument if *fact* = 'N' and, on exit, contains the pivot indices from the factorization *A* = *L***U*; row *i* of the matrix was interchanged with row *ipiv*(*i*). The value of *ipiv*(*i*) will always be *i* or *i*+1; *ipiv*(*i*)=*i* indicates a row interchange was not required.
rcond	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. An estimate of the reciprocal condition number of the matrix *A*. If *rcond* is less than the machine precision (in particular, if *rcond* =0), the matrix is singular to working precision. This condition is indicated by a return code of *info*>0.
ferr, *berr*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays, DIMENSION at least max(1, *nrhs*). Contain the component-wise forward and backward errors, respectively, for each solution vector.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = –*i*, the *i*-th parameter had an illegal value. If *info* = *i*, and *i* ≤ *n*, then *U*(*i*, *i*) is exactly zero. The factorization has not been completed unless *i* = *n*, but the factor *U* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned. If *info* = *i*, and *i* = *n* + 1, then *U* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution

and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `gtsvx` interface are as follows:

dl	Holds the vector of length (*n*–1).
d	Holds the vector of length (*n*).
du	Holds the vector of length (*n*–1).
b	Holds the matrix *B* of size (*n*, *nrhs*).
x	Holds the matrix *X* of size (*n*, *nrhs*).
dlf	Holds the vector of length (*n*–1).
df	Holds the vector of length (*n*).
duf	Holds the vector of length (*n*–1).
du2	Holds the vector of length (*n*–2).
ipiv	Holds the vector of length (*n*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
fact	Must be `'N'` or `'F'`. The default value is `'N'`. If *fact* = `'F'`, then the arguments *dlf*, *df*, *duf*, *du2*, and *ipiv* must be present; otherwise, an error is returned.
trans	Must be `'N'`, `'C'`, or `'T'`. The default value is `'N'`.

?posv

Computes the solution to the system of linear equations with a symmetric or Hermitian positive-definite matrix A and multiple right-hand sides.

Syntax

Fortran 77:

```
call sposv( uplo, n, nrhs, a, lda, b, ldb, info )
call dposv( uplo, n, nrhs, a, lda, b, ldb, info )
call cposv( uplo, n, nrhs, a, lda, b, ldb, info )
call zposv( uplo, n, nrhs, a, lda, b, ldb, info )
```

Fortran 95:

```
call posv( a, b [,uplo] [,info] )
```

Description

This routine solves for X the real or complex system of linear equations $A*X = B$, where A is an n-by-n symmetric/Hermitian positive-definite matrix, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

The Cholesky decomposition is used to factor A as

$A = U^T*U$ (real flavors) and $A = U^H*U$ (complex flavors), if $uplo$ = 'U'

or $A = L*L^T$ (real flavors) and $A = L*L^H$ (complex flavors), if $uplo$ = 'L',

where U is an upper triangular matrix and L is a lower triangular matrix. The factored form of A is then used to solve the system of equations $A*X = B$.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of A is stored: If $uplo$ = 'U', the upper triangle of A is stored. If $uplo$ = 'L', the lower triangle of A is stored.
n	INTEGER. The order of matrix A; $n \geq 0$.

nrhs	INTEGER. The number of right-hand sides, the number of columns in *B*; *nrhs* ≥ 0.
a, *b*	REAL for sposv DOUBLE PRECISION for dposv COMPLEX for cposv DOUBLE COMPLEX for zposv. Arrays: *a*(*lda*,*), *b*(*ldb*,*). The array *a* contains the upper or the lower triangular part of the matrix *A* (see *uplo*). The second dimension of *a* must be at least max(1, *n*). The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

Output Parameters

a	If *info* = 0, the upper or lower triangular part of *a* is overwritten by the Cholesky factor *U* or *L*, as specified by *uplo*.
b	Overwritten by the solution matrix *X*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive definite, so the factorization could not be completed, and the solution has not been computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine posv interface are as follows:

a	Holds the matrix *A* of size (*n*,*n*).
b	Holds the matrix *B* of size (*n*,*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

?posvx

Uses the Cholesky factorization to compute the solution to the system of linear equations with a symmetric or Hermitian positive definite matrix A, and provides error bounds on the solution.

Syntax

Fortran 77:

```
call sposvx( fact, uplo, n, nrhs, a, lda, af, ldaf, equed, s, b, ldb, x, ldx,
rcond, ferr, berr, work, iwork, info )

call dposvx( fact, uplo, n, nrhs, a, lda, af, ldaf, equed, s, b, ldb, x, ldx,
rcond, ferr, berr, work, iwork, info )

call cposvx( fact, uplo, n, nrhs, a, lda, af, ldaf, equed, s, b, ldb, x, ldx,
rcond, ferr, berr, work, rwork, info )

call zposvx( fact, uplo, n, nrhs, a, lda, af, ldaf, equed, s, b, ldb, x, ldx,
rcond, ferr, berr, work, rwork, info )
```

Fortran 95:

```
call posvx( a, b, x [,uplo] [,af] [,fact] [,equed] [,s] [,ferr] [,berr] [,rcond]
[,info] )
```

Description

This routine uses the Cholesky factorization $A=U^T*U$ (real flavors) / $A=U^H*U$ (complex flavors) or $A=L*L^T$ (real flavors) / $A=L*L^H$ (complex flavors) to compute the solution to a real or complex system of linear equations $A*X = B$, where A is a n-by-n real symmetric/Hermitian positive definite matrix, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?posvx performs the following steps:

1. If *fact* = 'E', real scaling factors *s* are computed to equilibrate the system:
   *diag(s)*A*diag(s)*inv(diag(s))*X = diag(s)*B*.

   Whether or not the system will be equilibrated depends on the scaling of the matrix *A*, but if equilibration is used, *A* is overwritten by *diag(s)*A*diag(s)* and *B* by *diag(s)*B*.

2. If *fact* = 'N' or 'E', the Cholesky decomposition is used to factor the matrix *A* (after equilibration if *fact* = 'E') as

   A = U^T**U* (real), *A* = U^H**U* (complex), if *uplo* = 'U',

   or *A* = *L**L^T (real), *A* = *L**L^H (complex) , if *uplo* = 'L',

   where *U* is an upper triangular matrix and *L* is a lower triangular matrix.

3. If the leading *i*-by-*i* principal minor is not positive-definite, then the routine returns with *info* = *i*. Otherwise, the factored form of *A* is used to estimate the condition number of the matrix *A*. If the reciprocal of the condition number is less than machine precision, *info* = *n* + 1 is returned as a warning, but the routine still goes on to solve for *X* and compute error bounds as described below.

4. The system of equations is solved for *X* using the factored form of *A*.

5. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.

6. If equilibration was used, the matrix *X* is premultiplied by *diag*(*s*) so that it solves the original system before equilibration.

Input Parameters

fact — CHARACTER*1. Must be 'F', 'N', or 'E'.
Specifies whether or not the factored form of the matrix *A* is supplied on entry, and if not, whether the matrix *A* should be equilibrated before it is factored.
If *fact* = 'F': on entry, *af* contains the factored form of *A*. If *equed* = 'Y', the matrix *A* has been equilibrated with scaling factors given by *s*.

a and *af* will not be modified.
If *fact* = 'N', the matrix *A* will be copied to *af* and factored.
If *fact* = 'E', the matrix *A* will be equilibrated if necessary, then copied to *af* and factored.

uplo — CHARACTER*1. Must be 'U' or 'L'.
Indicates whether the upper or lower triangular part of *A* is stored:
If *uplo* = 'U', the upper triangle of *A* is stored.
If *uplo* = 'L', the lower triangle of *A* is stored.

n — INTEGER. The order of matrix *A*; *n* ≥ 0.

nrhs	INTEGER. The number of right-hand sides, the number of columns in *B*; *nrhs* ≥ 0.
a,*af*,*b*,*work*	REAL for sposvx DOUBLE PRECISION for dposvx COMPLEX for cposvx DOUBLE COMPLEX for zposvx. Arrays: *a*(*lda*,*), *af*(*ldaf*,*), *b*(*ldb*,*), *work*(*). The array *a* contains the matrix *A* as specified by *uplo*. If *fact* = 'F' and *equed* = 'Y', then *A* must have been equilibrated by the scaling factors in *s*, and *a* must contain the equilibrated matrix *diag*(*s*)**A***diag*(*s*). The second dimension of *a* must be at least max(1,*n*). The array *af* is an input argument if *fact* = 'F'. It contains the triangular factor *U* or *L* from the Cholesky factorization of *A* in the same storage format as *A*. If *equed* is not 'N', then *af* is the factored form of the equilibrated matrix *diag*(*s*)**A***diag*(*s*). The second dimension of *af* must be at least max(1,*n*). The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1, *nrhs*). *work(*)* is a workspace array. The dimension of *work* must be at least max(1,3**n*) for real flavors, and at least max(1,2**n*) for complex flavors.
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).
ldaf	INTEGER. The first dimension of *af*; *ldaf* ≥ max(1, *n*).
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).
equed	CHARACTER*1. Must be 'N' or 'Y'. *equed* is an input argument if *fact* = 'F'. It specifies the form of equilibration that was done: if *equed* = 'N', no equilibration was done (always true if *fact* = 'N'); if *equed* = 'Y', equilibration was done and *A* has been replaced by *diag*(*s*)**A***diag*(*s*).
s	REAL for single precision flavors DOUBLE PRECISION for double precision flavors.

Array, DIMENSION (*n*). The array *s* contains the scale factors for *A*. This array is an input argument if *fact* = 'F' only; otherwise it is an output argument.
If *equed* = 'N', *s* is not accessed.
If *fact* = 'F' and *equed* = 'Y', each element of *s* must be positive.

ldx — INTEGER. The first dimension of the output array *x*; *ldx* ≥ max(1, *n*).

iwork — INTEGER. Workspace array, DIMENSION at least max(1, *n*); used in real flavors only.

rwork — REAL for cposvx
DOUBLE PRECISION for zposvx.
Workspace array, DIMENSION at least max(1, *n*); used in complex flavors only.

Output Parameters

x — REAL for sposvx
DOUBLE PRECISION for dposvx
COMPLEX for cposvx
DOUBLE COMPLEX for zposvx.
Array, DIMENSION (*ldx*,*).
If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X* to the original system of equations. Note that if *equed* = 'Y', *A* and *B* are modified on exit, and the solution to the equilibrated system is inv(*diag*(*s*))*X. The second dimension of *x* must be at least max(1,*nrhs*).

a — Array *a* is not modified on exit if *fact* = 'F' or 'N', or if *fact* = 'E' and *equed* = 'N'.
If *fact* = 'E' and *equed* = 'Y', *A* is overwritten by *diag*(*s*)*A*diag*(*s*).

af — If *fact* = 'N' or 'E', then *af* is an output argument and on exit returns the triangular factor *U* or *L* from the Cholesky factorization $A=U^T*U$ or $A=L*L^T$ (real routines), $A=U^H*U$ or $A=L*L^H$ (complex routines) of the original matrix *A* (if *fact* = 'N'), or of the equilibrated matrix *A* (if *fact* = 'E'). See the description of *a* for the form of the equilibrated matrix.

b	Overwritten by *diag(s)*B* , if *equed* = 'Y'; not changed if *equed* = 'N'.
s	This array is an output argument if *fact* ≠ 'F'. See the description of *s* in Input Arguments section.
rcond	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. An estimate of the reciprocal condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision (in particular, if *rcond* =0), the matrix is singular to working precision. This condition is indicated by a return code of *info*>0.
ferr, *berr*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays, DIMENSION at least max(1, *nrhs*). Contain the component-wise forward and relative backward errors, respectively, for each solution vector.
equed	If *fact* ≠ 'F' , then *equed* is an output argument. It specifies the form of equilibration that was done (see the description of *equed* in Input Arguments section).
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, and *i* ≤ *n*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite, so the factorization could not be completed, and the solution and error bounds could not be computed; *rcond* =0 is returned. If *info* = *i*, and *i* = *n* + 1, then *U* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine posvx interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *nrhs*).
x	Holds the matrix *X* of size (*n*, *nrhs*).
af	Holds the matrix *AF* of size (*n*, *n*).
s	Holds the vector of length (*n*). Default value for each element is *s*(*i*) = 1.0_WP.
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
fact	Must be 'N', 'E', or 'F'. The default value is 'N'. If *fact* = 'F', then *af* must be present; otherwise, an error is returned.
equed	Must be 'N' or 'Y'. The default value is 'N'.

?ppsv

Computes the solution to the system of linear equations with a symmetric (Hermitian) positive definite packed matrix A and multiple right-hand sides.

Syntax

Fortran 77:

```
call sppsv( uplo, n, nrhs, ap, b, ldb, info )
call dppsv( uplo, n, nrhs, ap, b, ldb, info )
call cppsv( uplo, n, nrhs, ap, b, ldb, info )
call zppsv( uplo, n, nrhs, ap, b, ldb, info )
```

Fortran 95:

```
call ppsv( a, b [,uplo] [,info] )
```

Description

This routine solves for X the real or complex system of linear equations $A*X = B$, where A is an n-by-n real symmetric/Hermitian positive-definite matrix stored in packed format, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

The Cholesky decomposition is used to factor A as

$A = U^T*U$ (real flavors) and $A = U^H*U$ (complex flavors), if $uplo$ = 'U'

or $A = L*L^T$ (real flavors) and $A = L*L^H$ (complex flavors), if $uplo$ = 'L',

where U is an upper triangular matrix and L is a lower triangular matrix. The factored form of A is then used to solve the system of equations $A*X = B$.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of A is stored: If $uplo$ = 'U', the upper triangle of A is stored. If $uplo$ = 'L', the lower triangle of A is stored.
n	INTEGER. The order of matrix A; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides, the number of columns in B; $nrhs \geq 0$.
ap, *b*	REAL for sppsv DOUBLE PRECISION for dppsv COMPLEX for cppsv DOUBLE COMPLEX for zppsv. Arrays: $ap(*)$, $b(ldb,*)$. The array ap contains the upper or the lower triangular part of the matrix A (as specified by $uplo$) in packed storage (see Matrix Storage Schemes). The dimension of ap must be at least $\max(1, n(n+1)/2)$. The array b contains the matrix B whose columns are the right-hand sides for the systems of equations. The second dimension of b must be at least $\max(1, nrhs)$.
ldb	INTEGER. The first dimension of b; $ldb \geq \max(1, n)$.

Output Parameters

ap	If *info* = 0, the upper or lower triangular part of *A* in packed storage is overwritten by the Cholesky factor *U* or *L*, as specified by *uplo*.
b	Overwritten by the solution matrix *X*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite, so the factorization could not be completed, and the solution has not been computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine ppsv interface are as follows:

a	Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n**(*n*+1)/2).
b	Holds the matrix *B* of size (*n*,*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

?ppsvx

Uses the Cholesky factorization to compute the solution to the system of linear equations with a symmetric (Hermitian) positive definite packed matrix A, and provides error bounds on the solution.

Syntax

Fortran 77:

```
call sppsvx( fact, uplo, n, nrhs, ap, afp, equed, s, b, ldb, x, ldx, rcond,
ferr, berr, work, iwork, info )

call dppsvx( fact, uplo, n, nrhs, ap, afp, equed, s, b, ldb, x, ldx, rcond,
ferr, berr, work, iwork, info )

call cppsvx( fact, uplo, n, nrhs, ap, afp, equed, s, b, ldb, x, ldx, rcond,
ferr, berr, work, rwork, info )

call zppsvx( fact, uplo, n, nrhs, ap, afp, equed, s, b, ldb, x, ldx, rcond,
ferr, berr, work, rwork, info )
```

Fortran 95:

```
call ppsvx( a, b, x [,uplo] [,af] [,fact] [,equed] [,s] [,ferr] [,berr] [,rcond]
[,info] )
```

Description

This routine uses the Cholesky factorization $A=U^T*U$ (real flavors) / $A=U^H*U$ (complex flavors) or $A=L*L^T$ (real flavors) / $A=L*L^H$ (complex flavors) to compute the solution to a real or complex system of linear equations $A*X = B$, where A is a n-by-n symmetric or Hermitian positive-definite matrix stored in packed format, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?ppsvx performs the following steps:

1. If *fact* = 'E', real scaling factors s are computed to equilibrate the system:
   *diag(s)*A*diag(s)*inv(diag(s))*X = diag(s)*B*.

Whether or not the system will be equilibrated depends on the scaling of the matrix *A*, but if equilibration is used, *A* is overwritten by *diag(s)*A*diag(s)* and *B* by *diag(s)*B*.

2. If *fact* = 'N' or 'E', the Cholesky decomposition is used to factor the matrix *A* (after equilibration if *fact* = 'E') as

   $A = U^T*U$ (real), $A = U^H*U$ (complex), if *uplo* = 'U',

   or $A = L*L^T$ (real), $A = L*L^H$ (complex) , if *uplo* = 'L',

   where *U* is an upper triangular matrix and *L* is a lower triangular matrix.

3. If the leading *i*-by-*i* principal minor is not positive-definite, then the routine returns with *info* = *i*. Otherwise, the factored form of *A* is used to estimate the condition number of the matrix *A*. If the reciprocal of the condition number is less than machine precision, *info* = *n*+1 is returned as a warning, but the routine still goes on to solve for *X* and compute error bounds as described below.

4. The system of equations is solved for *X* using the factored form of *A*.

5. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.

6. If equilibration was used, the matrix *X* is premultiplied by *diag(s)* so that it solves the original system before equilibration.

Input Parameters

fact — CHARACTER*1. Must be 'F', 'N', or 'E'.
Specifies whether or not the factored form of the matrix *A* is supplied on entry, and if not, whether the matrix *A* should be equilibrated before it is factored.
If *fact* = 'F': on entry, *afp* contains the factored form of *A*. If *equed* = 'Y', the matrix *A* has been equilibrated with scaling factors given by *s*.

ap and *afp* will not be modified.
If *fact* = 'N', the matrix *A* will be copied to *afp* and factored.
If *fact* = 'E', the matrix *A* will be equilibrated if necessary, then copied to *afp* and factored.

uplo — CHARACTER*1. Must be 'U' or 'L'.
Indicates whether the upper or lower triangular part of *A* is stored:
If *uplo* = 'U', the upper triangle of *A* is stored.

	If *uplo* = 'L', the lower triangle of *A* is stored.
n	INTEGER. The order of matrix *A*; *n* ≥ 0.
nrhs	INTEGER. The number of right-hand sides; the number of columns in *B*; *nrhs* ≥ 0.
ap,*afp*,*b*,*work*	REAL for sppsvx DOUBLE PRECISION for dppsvx COMPLEX for cppsvx DOUBLE COMPLEX for zppsvx. Arrays: *ap*(*), *afp*(*), *b*(*ldb*,*), *work*(*). The array *ap* contains the upper or lower triangle of the original symmetric/Hermitian matrix *A* in packed storage (see Matrix Storage Schemes). In case when *fact* = 'F' and *equed* = 'Y', *ap* must contain the equilibrated matrix *diag*(*s*)*A**diag*(*s*). The array *afp* is an input argument if *fact* = 'F' and contains the triangular factor *U* or *L* from the Cholesky factorization of *A* in the same storage format as *A*. If *equed* is not 'N', then *afp* is the factored form of the equilibrated matrix *A*. The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. *work*(*) is a workspace array. The dimension of arrays *ap* and *afp* must be at least max(1, *n*(*n*+1)/2); the second dimension of *b* must be at least max(1,*nrhs*); the dimension of *work* must be at least max(1, 3**n*) for real flavors and max(1, 2**n*) for complex flavors.
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).
equed	CHARACTER*1. Must be 'N' or 'Y'. *equed* is an input argument if *fact* = 'F'. It specifies the form of equilibration that was done: if *equed* = 'N', no equilibration was done (always true if *fact* = 'N'); if *equed* = 'Y', equilibration was done and *A* has been replaced by *diag*(*s*)*A**diag*(*s*).
s	REAL for single precision flavors DOUBLE PRECISION for double precision flavors.

Array, DIMENSION (*n*). The array *s* contains the scale factors for *A*. This array is an input argument if *fact* = 'F' only; otherwise it is an output argument.
If *equed* = 'N', *s* is not accessed.
If *fact* = 'F' and *equed* = 'Y', each element of *s* must be positive.

ldx — INTEGER. The first dimension of the output array *x*; *ldx* ≥ max(1, *n*).

iwork — INTEGER. Workspace array, DIMENSION at least max(1, *n*); used in real flavors only.

rwork — REAL for cppsvx;
DOUBLE PRECISION for zppsvx.
Workspace array, DIMENSION at least max(1, *n*); used in complex flavors only.

Output Parameters

x — REAL for sppsvx
DOUBLE PRECISION for dppsvx
COMPLEX for cppsvx
DOUBLE COMPLEX for zppsvx.
Array, DIMENSION (*ldx*,*).
If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X* to the original system of equations. Note that if *equed* = 'Y', *A* and *B* are modified on exit, and the solution to the equilibrated system is inv(*diag*(*s*))**X*. The second dimension of *x* must be at least max(1,*nrhs*).

ap — Array *ap* is not modified on exit if *fact* = 'F' or 'N', or if *fact* = 'E' and *equed* = 'N'.
If *fact* = 'E' and *equed* = 'Y', *A* is overwritten by *diag*(*s*)**A***diag*(*s*).

afp — If *fact* = 'N' or 'E', then *afp* is an output argument and on exit returns the triangular factor *U* or *L* from the Cholesky factorization $A=U^T*U$ or $A=L*L^T$ (real routines), $A=U^H*U$ or $A=L*L^H$ (complex routines) of the original matrix *A* (if *fact* = 'N'), or of the equilibrated matrix *A* (if *fact* = 'E'). See the description of *ap* for the form of the equilibrated matrix.

b	Overwritten by *diag(s)*B* , if *equed* = 'Y'; not changed if *equed* = 'N'.
s	This array is an output argument if *fact* ≠ 'F'. See the description of *s* in Input Arguments section.
rcond	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. An estimate of the reciprocal condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision (in particular, if *rcond* = 0), the matrix is singular to working precision. This condition is indicated by a return code of *info* > 0.
ferr, *berr*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays, DIMENSION at least max(1, *nrhs*). Contain the component-wise forward and relative backward errors, respectively, for each solution vector.
equed	If *fact* ≠ 'F' , then *equed* is an output argument. It specifies the form of equilibration that was done (see the description of *equed* in Input Arguments section).
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, and *i* ≤ *n*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite, so the factorization could not be completed, and the solution and error bounds could not be computed; *rcond* = 0 is returned. If *info* = *i*, and *i* = *n* + 1, then *U* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine ppsvx interface are as follows:

a	Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n**(*n*+1)/2).
b	Holds the matrix *B* of size (*n*,*nrhs*).
x	Holds the matrix *X* of size (*n*,*nrhs*).
af	Stands for argument *afp* in Fortan 77 interface. Holds the matrix *AF* of size (*n**(*n*+1)/2).
s	Holds the vector of length (*n*). Default value for each element is *s*(*i*) = 1.0_WP.
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
fact	Must be 'N', 'E', or 'F'. The default value is 'N'. If *fact* = 'F', then *af* must be present; otherwise, an error is returned.
equed	Must be 'N' or 'Y'. The default value is 'N'.

?pbsv

Computes the solution to the system of linear equations with a symmetric or Hermitian positive-definite band matrix A and multiple right-hand sides.

Syntax

Fortran 77:

```
call spbsv( uplo, n, kd, nrhs, ab, ldab, b, ldb, info )
call dpbsv( uplo, n, kd, nrhs, ab, ldab, b, ldb, info )
call cpbsv( uplo, n, kd, nrhs, ab, ldab, b, ldb, info )
call zpbsv( uplo, n, kd, nrhs, ab, ldab, b, ldb, info )
```

Fortran 95:

```
call pbsv( a, b [,uplo] [,info] )
```

Description

This routine solves for X the real or complex system of linear equations $A*X = B$, where A is an n-by-n symmetric/Hermitian positive definite band matrix, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

The Cholesky decomposition is used to factor A as

$A = U^T*U$ (real flavors) and $A = U^H*U$ (complex flavors), if $uplo$ = 'U'

or $A = L*L^T$ (real flavors) and $A = L*L^H$ (complex flavors), if $uplo$ = 'L',

where U is an upper triangular band matrix and L is a lower triangular band matrix, with the same number of superdiagonals or subdiagonals as A. The factored form of A is then used to solve the system of equations $A*X = B$.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of A is stored: If $uplo$ = 'U', the upper triangle of A is stored. If $uplo$ = 'L', the lower triangle of A is stored.
n	INTEGER. The order of matrix A; $n \geq 0$.
kd	INTEGER. The number of superdiagonals of the matrix A if $uplo$ = 'U', or the number of subdiagonals if $uplo$ = 'L'; $kd \geq 0$.
nrhs	INTEGER. The number of right-hand sides, the number of columns in B; $nrhs \geq 0$.
ab, *b*	REAL for spbsv DOUBLE PRECISION for dpbsv COMPLEX for cpbsv DOUBLE COMPLEX for zpbsv. Arrays: $ab(ldab, *)$, $b(ldb,*)$. The array ab contains the upper or the lower triangular part of the matrix A (as specified by $uplo$) in band storage (see Matrix Storage Schemes). The second dimension of ab must be at least max(1, n). The array b contains the matrix B whose columns are the right-hand sides for the systems of equations. The second dimension of b must be at least max(1,$nrhs$).
ldab	INTEGER. The first dimension of the array ab; $ldab \geq kd + 1$.

ldb INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

Output Parameters

ab The upper or lower triangular part of *A* (in band storage) is overwritten by the Cholesky factor *U* or *L*, as specified by *uplo*, in the same storage format as *A*.

b Overwritten by the solution matrix *X*.

info INTEGER. If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite, so the factorization could not be completed, and the solution has not been computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine pbsv interface are as follows:

a Stands for argument *ab* in Fortan 77 interface. Holds the array *A* of size (*kd*+1,*n*).

b Holds the matrix *B* of size (*n*,*nrhs*).

uplo Must be 'U' or 'L'. The default value is 'U'.

?pbsvx

Uses the Cholesky factorization to compute the solution to the system of linear equations with a symmetric (Hermitian) positive-definite band matrix A, and provides error bounds on the solution.

Syntax

Fortran 77:

```
call spbsvx( fact, uplo, n, kd, nrhs, ab, ldab, afb, ldafb, equed, s, b, ldb,
x, ldx, rcond, ferr, berr, work, iwork, info )

```

Fortran 95:

```
call pbsvx( a, b, x [,uplo] [,af] [,fact] [,equed] [,s] [,ferr] [,berr] [,rcond]
[,info] )
```

Description

This routine uses the Cholesky factorization $A=U^T*U$ (real flavors) / $A=U^H*U$ (complex flavors) or $A=L*L^T$ (real flavors) / $A=L*L^H$ (complex flavors) to compute the solution to a real or complex system of linear equations $A*X = B$, where A is a n-by-n symmetric or Hermitian positive definite band matrix, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?pbsvx performs the following steps:

1. If $fact = 'E'$, real scaling factors s are computed to equilibrate the system:
   $diag(s)*A*diag(s)*inv(diag(s))*X = diag(s)*B$.

Whether or not the system will be equilibrated depends on the scaling of the matrix A, but if equilibration is used, A is overwritten by $diag(s)*A*diag(s)$ and B by $diag(s)*B$.

2. If $fact$ = 'N' or 'E', the Cholesky decomposition is used to factor the matrix A (after equilibration if $fact$ = 'E') as

   $A = U^T*U$ (real), $A = U^H*U$ (complex), if $uplo$ = 'U',

   or $A = L*L^T$ (real), $A = L*L^H$ (complex) , if $uplo$ = 'L',

   where U is an upper triangular band matrix and L is a lower triangular band matrix.

3. If the leading i-by-i principal minor is not positive definite, then the routine returns with $info = i$. Otherwise, the factored form of A is used to estimate the condition number of the matrix A. If the reciprocal of the condition number is less than machine precision, $info = n+1$ is returned as a warning, but the routine still goes on to solve for X and compute error bounds as described below.

4. The system of equations is solved for X using the factored form of A.

5. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.

6. If equilibration was used, the matrix X is premultiplied by $diag(s)$ so that it solves the original system before equilibration.

Input Parameters

fact	CHARACTER*1. Must be 'F', 'N', or 'E'. Specifies whether or not the factored form of the matrix A is supplied on entry, and if not, whether the matrix A should be equilibrated before it is factored. If $fact$ = 'F': on entry, afb contains the factored form of A. If $equed$ = 'Y', the matrix A has been equilibrated with scaling factors given by s. ab and afb will not be modified. If $fact$ = 'N', the matrix A will be copied to afb and factored. If $fact$ = 'E', the matrix A will be equilibrated if necessary, then copied to afb and factored.
uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of A is stored: If $uplo$ = 'U', the upper triangle of A is stored.

	If *uplo* = 'L', the lower triangle of *A* is stored.
n	INTEGER. The order of matrix *A*; *n* ≥ 0.
kd	INTEGER. The number of superdiagonals or subdiagonals in the matrix *A*; *kd* ≥ 0.
nrhs	INTEGER. The number of right-hand sides, the number of columns in *B*; *nrhs* ≥ 0.
ab,*afb*,*b*,*work*	REAL for spbsvx DOUBLE PRECISION for dpbsvx COMPLEX for cpbsvx DOUBLE COMPLEX for zpbsvx. Arrays: *ab*(*ldab*,*), *afb*(*ldab*,*), *b*(*ldb*,*), *work*(*). The array *ab* contains the upper or lower triangle of the matrix *A* in band storage (see Matrix Storage Schemes). If *fact* = 'F' and *equed* = 'Y', then *ab* must contain the equilibrated matrix *diag*(*s*)***A***diag*(*s*). The second dimension of *ab* must be at least max(1, *n*). The array *afb* is an input argument if *fact* = 'F'. It contains the triangular factor *U* or *L* from the Cholesky factorization of the band matrix *A* in the same storage format as *A*. If *equed* = 'Y', then *afb* is the factored form of the equilibrated matrix *A*. The second dimension of *afb* must be at least max(1, *n*). The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1, *nrhs*). *work*(*) is a workspace array. The dimension of *work* must be at least max(1,3**n*) for real flavors, and at least max(1,2**n*) for complex flavors.
ldab	INTEGER. The first dimension of *ab*; *ldab* ≥ *kd*+1.
ldafb	INTEGER. The first dimension of *afb*; *ldafb* ≥ *kd*+1.
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).
equed	CHARACTER*1. Must be 'N' or 'Y'. *equed* is an input argument if *fact* = 'F'. It specifies the form of equilibration that was done: if *equed* = 'N', no equilibration was done (always true if *fact* = 'N')

if *equed* = 'Y', equilibration was done and *A* has been replaced by *diag(s)*A*diag(s)*.

s — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION (*n*). The array *s* contains the scale factors for *A*. This array is an input argument if *fact* = 'F' only; otherwise it is an output argument.
If *equed* = 'N', *s* is not accessed.
If *fact* = 'F' and *equed* = 'Y', each element of *s* must be positive.

ldx — INTEGER. The first dimension of the output array *x*; *ldx* ≥ max(1, *n*).

iwork — INTEGER. Workspace array, DIMENSION at least max(1, *n*); used in real flavors only.

rwork — REAL for cpbsvx
DOUBLE PRECISION for zpbsvx.
Workspace array, DIMENSION at least max(1, *n*); used in complex flavors only.

Output Parameters

x — REAL for spbsvx
DOUBLE PRECISION for dpbsvx
COMPLEX for cpbsvx
DOUBLE COMPLEX for zpbsvx.
Array, DIMENSION (*ldx*,*).
If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X* to the original system of equations. Note that if *equed* = 'Y', *A* and *B* are modified on exit, and the solution to the equilibrated system is inv(*diag(s)*)**X*. The second dimension of *x* must be at least max(1,*nrhs*).

ab — On exit, if *fact* = 'E' and *equed* = 'Y', *A* is overwritten by *diag(s)*A*diag(s)*.

afb — If *fact* = 'N' or 'E', then *afb* is an output argument and on exit returns the triangular factor *U* or *L* from the Cholesky factorization $A=U^T*U$ or $A=L*L^T$ (real routines), $A=U^H*U$ or $A=L*L^H$ (complex routines)

	of the original matrix *A* (if *fact* = 'N'), or of the equilibrated matrix *A* (if *fact* = 'E'). See the description of *ab* for the form of the equilibrated matrix.
b	Overwritten by *diag(s)*B* , if *equed* = 'Y'; not changed if *equed* = 'N'.
s	This array is an output argument if *fact* ≠ 'F'. See the description of *s* in Input Arguments section.
rcond	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. An estimate of the reciprocal condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision (in particular, if *rcond* = 0), the matrix is singular to working precision. This condition is indicated by a return code of *info* > 0.
ferr, *berr*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays, DIMENSION at least max(1, *nrhs*). Contain the component-wise forward and relative backward errors, respectively, for each solution vector.
equed	If *fact* ≠ 'F' , then *equed* is an output argument. It specifies the form of equilibration that was done (see the description of *equed* in Input Arguments section).
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, and *i* ≤ *n*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive definite, so the factorization could not be completed, and the solution and error bounds could not be computed; *rcond* =0 is returned. If *info* = *i*, and *i* = *n* + 1, then *U* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `pbsvx` interface are as follows:

a	Stands for argument *ab* in Fortan 77 interface. Holds the array *A* of size (*kd*+1, *n*).
b	Holds the matrix *B* of size (*n*, *nrhs*).
x	Holds the matrix *X* of size (*n*, *nrhs*).
af	Stands for argument *afb* in Fortan 77 interface. Holds the array *AF* of size (*kd*+1, *n*).
s	Holds the vector of length (*n*). Default value for each element is *s*(*i*) = 1.0_WP.
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
fact	Must be 'N', 'E', or 'F'. The default value is 'N'. If *fact* = 'F', then *af* must be present; otherwise, an error is returned.
equed	Must be 'N' or 'Y'. The default value is 'N'.

?ptsv

Computes the solution to the system of linear equations with a symmetric or Hermitian positive definite tridiagonal matrix A and multiple right-hand sides.

Syntax

Fortran 77:

```
call sptsv( n, nrhs, d, e, b, ldb, info )
call dptsv( n, nrhs, d, e, b, ldb, info )
call cptsv( n, nrhs, d, e, b, ldb, info )
call zptsv( n, nrhs, d, e, b, ldb, info )
```

Fortran 95:

```
call ptsv( d, e, b [,info] )
```

Description

This routine solves for X the real or complex system of linear equations $A*X = B$, where A is an n-by-n symmetric/Hermitian positive-definite tridiagonal matrix, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

A is factored as $A = L*D*L^T$ (real flavors) or $A = L*D*L^H$ (complex flavors), and the factored form of A is then used to solve the system of equations $A*X = B$.

Input Parameters

n	INTEGER. The order of matrix A; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides, the number of columns in B; $nrhs \geq 0$.
d	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Array, dimension at least max(1, *n*). Contains the diagonal elements of the tridiagonal matrix A.
e, *b*	REAL for sptsv DOUBLE PRECISION for dptsv COMPLEX for cptsv DOUBLE COMPLEX for zptsv. Arrays: *e*(*n* - 1) , *b*(*ldb*,*). The array *e* contains the (*n* - 1) subdiagonal elements of A. The array *b* contains the matrix B whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

Output Parameters

d	Overwritten by the n diagonal elements of the diagonal matrix D from the $L*D*L^T$ (real)/ $L*D*L^H$ (complex) factorization of A.
e	Overwritten by the (*n* - 1) subdiagonal elements of the unit bidiagonal factor L from the factorization of A.

b	Overwritten by the solution matrix *X*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite, and the solution has not been computed. The factorization has not been completed unless *i* = *n*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine ptsv interface are as follows:

d	Holds the vector of length (*n*).
e	Holds the vector of length (*n*-1).
b	Holds the matrix *B* of size (*n*,*nrhs*).

?ptsvx

Uses factorization to compute the solution to the system of linear equations with a symmetric (Hermitian) positive definite tridiagonal matrix A, and provides error bounds on the solution.

Syntax

Fortran 77:

```
call sptsvx( fact, n, nrhs, d, e, df, ef, b, ldb, x, ldx, rcond, ferr, berr,
work, info )
call dptsvx( fact, n, nrhs, d, e, df, ef, b, ldb, x, ldx, rcond, ferr, berr,
work, info )
call cptsvx( fact, n, nrhs, d, e, df, ef, b, ldb, x, ldx, rcond, ferr, berr,
work, rwork, info )
call zptsvx( fact, n, nrhs, d, e, df, ef, b, ldb, x, ldx, rcond, ferr, berr,
work, rwork, info )
```

Fortran 95:

```
call ptsvx( d, e, b, x [,df] [,ef] [,fact] [,ferr] [,berr] [,rcond] [,info] )
```

Description

This routine uses the Cholesky factorization $A = L*D*L^T$ (real)/$A = L*D*L^H$ (complex) to compute the solution to a real or complex system of linear equations $A*X = B$, where A is a n-by-n symmetric or Hermitian positive definite tridiagonal matrix, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine `?ptsvx` performs the following steps:

1. If $fact = 'N'$, the matrix A is factored as $A = L*D*L^T$ (real flavors)/$A = L*D*L^H$ (complex flavors), where L is a unit lower bidiagonal matrix and D is diagonal. The factorization can also be regarded as having the form $A = U^T*D*U$ (real flavors)/$A = U^H*D*U$ (complex flavors).
2. If the leading i-by-i principal minor is not positive-definite, then the routine returns with $info = i$. Otherwise, the factored form of A is used to estimate the condition number of the matrix A. If the reciprocal of the condition number is less than machine precision, $info = n+1$ is returned as a warning, but the routine still goes on to solve for X and compute error bounds as described below.
3. The system of equations is solved for X using the factored form of A.
4. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.

Input Parameters

fact	`CHARACTER*1`. Must be `'F'` or `'N'`. Specifies whether or not the factored form of the matrix A is supplied on entry. If $fact = 'F'$: on entry, df and ef contain the factored form of A. Arrays d, e, df, and ef will not be modified. If $fact = 'N'$, the matrix A will be copied to df and ef, and factored.
n	`INTEGER`. The order of matrix A; $n \geq 0$.
nrhs	`INTEGER`. The number of right-hand sides, the number of columns in B; $nrhs \geq 0$.

d, *df*, *rwork*
REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Arrays: *d*(*n*), *df*(*n*), *rwork*(*n*).
The array *d* contains the *n* diagonal elements of the tridiagonal matrix *A*.
The array *df* is an input argument if *fact* = 'F' and on entry contains the *n* diagonal elements of the diagonal matrix *D* from the $L*D*L^T$ (real)/ $L*D*L^H$ (complex) factorization of *A*.
The array *rwork* is a workspace array used for complex flavors only.

e,*ef*,*b*,*work*
REAL for sptsvx
DOUBLE PRECISION for dptsvx
COMPLEX for cptsvx
DOUBLE COMPLEX for zptsvx.
Arrays: *e*(*n* -1), *ef*(*n* -1), *b*(*ldb**), *work*(*). The array *e* contains the (*n* - 1) subdiagonal elements of the tridiagonal matrix *A*.
The array *ef* is an input argument if *fact* = 'F' and on entry contains the (*n* - 1) subdiagonal elements of the unit bidiagonal factor *L* from the $L*D*L^T$ (real)/ $L*D*L^H$ (complex) factorization of *A*.
The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations.
The array *work* is a workspace array. The dimension of *work* must be at least 2**n* for real flavors, and at least *n* for complex flavors.

ldb
INTEGER. The leading dimension of *b*; *ldb* ≥ max(1, *n*).

ldx
INTEGER. The leading dimension of *x*; *ldx* ≥ max(1, *n*).

Output Parameters

x
REAL for sptsvx
DOUBLE PRECISION for dptsvx
COMPLEX for cptsvx
DOUBLE COMPLEX for zptsvx.
Array, DIMENSION (*ldx*,*).
If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X* to the system of equations. The second dimension of *x* must be at least max(1,*nrhs*).

df, *ef*
These arrays are output arguments if *fact* = 'N'. See the description of *df*, *ef* in Input Arguments section.

rcond	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. An estimate of the reciprocal condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision (in particular, if *rcond* = 0), the matrix is singular to working precision. This condition is indicated by a return code of *info* > 0.
ferr, *berr*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays, DIMENSION at least max(1, *nrhs*). Contain the component-wise forward and relative backward errors, respectively, for each solution vector.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, and *i* ≤ *n*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite, so the factorization could not be completed, and the solution and error bounds could not be computed; *rcond* =0 is returned. If *info* = *i*, and *i* = *n* + 1, then *U* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine ptsvx interface are as follows:

d	Holds the vector of length (*n*).
e	Holds the vector of length (*n*-1).
b	Holds the matrix *B* of size (*n*, *nrhs*).
x	Holds the matrix *X* of size (*n*, *nrhs*).
df	Holds the vector of length (*n*).
ef	Holds the vector of length (*n*-1).
ferr	Holds the vector of length (*nrhs*).

berr Holds the vector of length (*nrhs*).

fact Must be 'N' or 'F'. The default value is 'N'. If *fact* = 'F', then both arguments *af* and *ipiv* must be present; otherwise, an error is returned.

?sysv

Computes the solution to the system of linear equations with a real or complex symmetric matrix A and multiple right-hand sides.

Syntax

Fortran 77:

```
call ssysv( uplo, n, nrhs, a, lda, ipiv, b, ldb, work, lwork, info )
call dsysv( uplo, n, nrhs, a, lda, ipiv, b, ldb, work, lwork, info )
call csysv( uplo, n, nrhs, a, lda, ipiv, b, ldb, work, lwork, info )
call zsysv( uplo, n, nrhs, a, lda, ipiv, b, ldb, work, lwork, info )
```

Fortran 95:

```
call sysv( a, b [,uplo] [,ipiv] [,info] )
```

Description

This routine solves for *X* the real or complex system of linear equations *A*X = B*, where *A* is an *n*-by-*n* symmetric matrix, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

The diagonal pivoting method is used to factor *A* as $A = U*D*U^T$ or $A = L*D*L^T$, where *U* (or *L*) is a product of permutation and unit upper (lower) triangular matrices, and *D* is symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

The factored form of *A* is then used to solve the system of equations *A*X = B*.

Input Parameters

uplo CHARACTER*1. Must be 'U' or 'L'.
Indicates whether the upper or lower triangular part of *A* is stored:
If *uplo* = 'U', the upper triangle of *A* is stored.

If *uplo* = 'L', the lower triangle of *A* is stored.

n — INTEGER. The order of matrix *A*; *n* ≥ 0.

nrhs — INTEGER. The number of right-hand sides; the number of columns in *B*; *nrhs* ≥ 0.

a, *b*, *work* — REAL for ssysv
DOUBLE PRECISION for dsysv
COMPLEX for csysv
DOUBLE COMPLEX for zsysv.
Arrays: *a*(*lda*,*), *b*(*ldb*,*), *work*(*).
The array *a* contains the upper or the lower triangular part of the symmetric matrix *A* (see *uplo*). The second dimension of *a* must be at least max(1, *n*).
The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).
work is a workspace array, dimension at least max(1,*lwork*).

lda — INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).

ldb — INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

lwork — INTEGER. The size of the *work* array; *lwork* ≥ 1.
If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes below for details and for the suggested value of *lwork*.

Output Parameters

a — If *info* = 0, *a* is overwritten by the block-diagonal matrix *D* and the multipliers used to obtain the factor *U* (or *L*) from the factorization of *A* as computed by ?sytrf.

b — If *info* = 0, *b* is overwritten by the solution matrix *X*.

ipiv — INTEGER.
Array, DIMENSION at least max(1, *n*). Contains details of the interchanges and the block structure of *D*, as determined by ?sytrf.

If *ipiv*(*i*) = *k* >0, then d_{ii} is a 1-by-1 diagonal block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column.
If *uplo* = 'U' and *ipiv*(*i*) = *ipiv*(*i*-1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*–1, and (*i*–1)-th row and column of *A* was interchanged with the *m*–th row and column.
If *uplo* = 'L' and *ipiv*(*i*) = *ipiv*(*i*+1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*+1, and (*i*+1)-th row and column of *A* was interchanged with the *m*-th row and column.

work(1) — If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info — INTEGER. If *info* = 0, the execution is successful.
If *info* = –*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, d_{ii} is 0. The factorization has been completed, but *D* is exactly singular, so the solution could not be computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine sysv interface are as follows:

a — Holds the matrix *A* of size (*n*, *n*).

b — Holds the matrix *B* of size (*n*, *nrhs*).

ipiv — Holds the vector of length (*n*).

uplo — Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For better performance, try using *lwork* = *n*blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = –1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?sysvx

Uses the diagonal pivoting factorization to compute the solution to the system of linear equations with a real or complex symmetric matrix A, and provides error bounds on the solution.

Syntax

Fortran 77:

```
call ssysvx( fact, uplo, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx,
rcond, ferr, berr, work, lwork, iwork, info )

call dsysvx( fact, uplo, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx,
rcond, ferr, berr, work, lwork, iwork, info )

call csysvx( fact, uplo, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx,
rcond, ferr, berr, work, lwork, rwork, info )

call zsysvx( fact, uplo, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx,
rcond, ferr, berr, work, lwork, rwork, info )
```

Fortran 95:

```
call sysvx( a, b, x [,uplo] [,af] [,ipiv] [,fact] [,ferr] [,berr] [,rcond]
[,info] )
```

Description

This routine uses the diagonal pivoting factorization to compute the solution to a real or complex system of linear equations *A*X = B*, where *A* is a *n*-by-*n* symmetric matrix, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?sysvx performs the following steps:

1. If *fact* = 'N', the diagonal pivoting method is used to factor the matrix *A*. The form of the factorization is $A = U*D*U^T$ or $A = L*D*L^T$, where *U* (or *L*) is a product of permutation and unit upper (lower) triangular matrices, and *D* is symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.
2. If some $d_{i,i}$= 0, so that *D* is exactly singular, then the routine returns with *info* = *i*. Otherwise, the factored form of *A* is used to estimate the condition number of the matrix *A*. If the reciprocal of the condition number is less than machine precision, *info* = *n*+1 is returned as a warning, but the routine still goes on to solve for *X* and compute error bounds as described below.
3. The system of equations is solved for *X* using the factored form of *A*.
4. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.

Input Parameters

fact — CHARACTER*1. Must be 'F' or 'N'.
Specifies whether or not the factored form of the matrix *A* has been supplied on entry.
If *fact* = 'F': on entry, *af* and *ipiv* contain the factored form of *A*. Arrays *a*, *af*, and *ipiv* will not be modified.
If *fact* = 'N', the matrix *A* will be copied to *af* and factored.

uplo — CHARACTER*1. Must be 'U' or 'L'.
Indicates whether the upper or lower triangular part of *A* is stored:
If *uplo* = 'U', the upper triangle of *A* is stored.
If *uplo* = 'L', the lower triangle of *A* is stored.

n — INTEGER. The order of matrix *A*; $n \geq 0$.

nrhs — INTEGER. The number of right-hand sides, the number of columns in *B*; $nrhs \geq 0$.

a,*af*,*b*,*work* — REAL for ssysvx
DOUBLE PRECISION for dsysvx
COMPLEX for csysvx
DOUBLE COMPLEX for zsysvx.
Arrays: *a*(*lda*,*), *af*(*ldaf*,*), *b*(*ldb*,*), *work*(*).
The array *a* contains the upper or the lower triangular part of the symmetric matrix *A* (see *uplo*). The second dimension of *a* must be at least max(1,*n*).

The array *af* is an input argument if *fact* = 'F'. It contains he block diagonal matrix *D* and the multipliers used to obtain the factor *U* or *L* from the factorization $A = U*D*U^T$ or $A = L*D*L^T$ as computed by ?sytrf. The second dimension of *af* must be at least max(1,*n*).
The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1, *nrhs*).
work(*) is a workspace array, dimension at least max(1,*lwork*).

lda — INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).

ldaf — INTEGER. The first dimension of *af*; *ldaf* ≥ max(1, *n*).

ldb — INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

ipiv — INTEGER.
Array, DIMENSION at least max(1, *n*). The array *ipiv* is an input argument if *fact* = 'F'. It contains details of the interchanges and the block structure of *D*, as determined by ?sytrf.
If *ipiv*(*i*) = *k* > 0, then d_{ii} is a 1-by-1 diagonal block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column.
If *uplo* = 'U' and *ipiv*(*i*) = *ipiv*(*i*–1) = –*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*–1, and (*i*–1)-th row and column of *A* was interchanged with the *m*-th row and column.
If *uplo* = 'L' and *ipiv*(*i*) = *ipiv*(*i*+1) = –*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*+1, and (*i*+1)-th row and column of *A* was interchanged with the *m*-th row and column.

ldx — INTEGER. The leading dimension of the output array *x*; *ldx* ≥ max(1, *n*).

lwork — INTEGER. The size of the *work* array.
If *lwork* = –1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes below for details and for the suggested value of *lwork*.

iwork — INTEGER. Workspace array, DIMENSION at least max(1, *n*); used in real flavors only.

rwork — REAL for csysvx;
DOUBLE PRECISION for zsysvx.

Workspace array, DIMENSION at least max(1, *n*); used in complex flavors only.

Output Parameters

x
REAL for ssysvx
DOUBLE PRECISION for dsysvx
COMPLEX for csysvx
DOUBLE COMPLEX for zsysvx.
Array, DIMENSION (*ldx*,*).
If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X* to the system of equations. The second dimension of *x* must be at least max(1,*nrhs*).

af, *ipiv*
These arrays are output arguments if *fact* = 'N'.
See the description of *af*, *ipiv* in Input Arguments section.

rcond
REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
An estimate of the reciprocal condition number of the matrix *A*. If *rcond* is less than the machine precision (in particular, if *rcond* = 0), the matrix is singular to working precision. This condition is indicated by a return code of *info* > 0.

ferr, *berr*
REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Arrays, DIMENSION at least max(1, *nrhs*). Contain the component-wise forward and relative backward errors, respectively, for each solution vector.

work(1)
If *info*=0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info
INTEGER. If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, and $i \le n$, then d_{ii} is exactly zero. The factorization has been completed, but the block diagonal matrix *D* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned.

If *info* = *i*, and *i* = *n* + 1, then *D* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `sysvx` interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *nrhs*).
x	Holds the matrix *X* of size (*n*, *nrhs*).
af	Holds the matrix *AF* of size (*n*, *n*).
ipiv	Holds the vector of length (*n*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
fact	Must be `'N'` or `'F'`. The default value is `'N'`. If *fact* = `'F'`, then both arguments *af* and *ipiv* must be present; otherwise, an error is returned.

Application Notes

For real flavors, *lwork* must be at least 3**n*, and for complex flavors at least 2**n*. For better performance, try using *lwork* = *n***blocksize*, where *blocksize* is the optimal block size for `?sytrf`.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = –1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*`(1)`) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?hesv

Computes the solution to the system of linear equations with a Hermitian matrix A and multiple right-hand sides.

Syntax

Fortran 77:

```
call chesv( uplo, n, nrhs, a, lda, ipiv, b, ldb, work, lwork, info )
call zhesv( uplo, n, nrhs, a, lda, ipiv, b, ldb, work, lwork, info )
```

Fortran 95:

```
call hesv( a, b [,uplo] [,ipiv] [,info] )
```

Description

This routine solves for *X* the complex system of linear equations *A*X = B*, where *A* is an *n*-by-*n* symmetric matrix, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

The diagonal pivoting method is used to factor *A* as $A = U*D*U^H$ or $A = L*D*L^H$, where *U* (or *L*) is a product of permutation and unit upper (lower) triangular matrices, and *D* is Hermitian and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

The factored form of *A* is then used to solve the system of equations *A*X = B*.

Input Parameters

uplo — CHARACTER*1. Must be 'U' or 'L'.
Indicates whether the upper or lower triangular part of *A* is stored and how *A* is factored:

If *uplo* = 'U', the array *a* stores the upper triangular part of the matrix *A*, and *A* is factored as $U*D*U^H$.
If *uplo* = 'L', the array *a* stores the lower triangular part of the matrix *A*, and *A* is factored as $L*D*L^H$.

n — INTEGER. The order of matrix *A*; $n \geq 0$.

nrhs — INTEGER. The number of right-hand sides, the number of columns in *B*; $nrhs \geq 0$.

a, *b*, *work* — COMPLEX for chesv
DOUBLE COMPLEX for zhesv.
Arrays: *a*(*lda*,*), *b*(*ldb*,*), *work*(*). The array *a* contains the upper or the lower triangular part of the Hermitian matrix *A* (see *uplo*). The second dimension of *a* must be at least max(1, *n*).
The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).
work is a workspace array, dimension at least max(1,*lwork*).

lda — INTEGER. The first dimension of *a*; $lda \geq \max(1, n)$.

ldb — INTEGER. The first dimension of *b*; $ldb \geq \max(1, n)$.

lwork — INTEGER. The size of the *work* array ($lwork \geq 1$).
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes below for details and for the suggested value of *lwork*.

Output Parameters

a — If *info* = 0, *a* is overwritten by the block-diagonal matrix *D* and the multipliers used to obtain the factor *U* (or *L*) from the factorization of *A* as computed by ?hetrf.

b — If *info* = 0, *b* is overwritten by the solution matrix *X*.

ipiv — INTEGER.
Array, DIMENSION at least max(1, *n*). Contains details of the interchanges and the block structure of *D*, as determined by ?hetrf.

If *ipiv*(*i*) = *k* > 0, then d_{ii} is a 1-by-1 diagonal block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column.
If *uplo* = 'U' and *ipiv*(*i*) = *ipiv*(*i*-1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*–1, and (*i*–1)-th row and column of *A* was interchanged with the *m*-th row and column.
If *uplo* = 'L' and *ipiv*(*i*) = *ipiv*(*i*+1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*+1, and (*i*+1)–th row and column of *A* was interchanged with the *m*-th row and column.

work(1) — If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info — INTEGER. If *info* = 0, the execution is successful.
If *info* = –*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, d_{ii} is 0. The factorization has been completed, but *D* is exactly singular, so the solution could not be computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine hesv interface are as follows:

a — Holds the matrix *A* of size (*n*, *n*).

b — Holds the matrix *B* of size (*n*, *nrhs*).

ipiv — Holds the vector of length (*n*).

uplo — Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For better performance, try using *lwork* = *n***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = –1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?hesvx

Uses the diagonal pivoting factorization to compute the solution to the complex system of linear equations with a Hermitian matrix A, and provides error bounds on the solution.

Syntax

Fortran 77:

```
call chesvx( fact, uplo, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx,
rcond, ferr, berr, work, lwork, rwork, info )
```

```
call zhesvx( fact, uplo, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx,
rcond, ferr, berr, work, lwork, rwork, info )
```

Fortran 95:

```
call hesvx( a, b, x [,uplo] [,af] [,ipiv] [,fact] [,ferr] [,berr] [,rcond]
[,info] )
```

Description

This routine uses the diagonal pivoting factorization to compute the solution to a complex system of linear equations *A*X* = *B*, where *A* is an *n*-by-*n* Hermitian matrix, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?hesvx performs the following steps:

1. If *fact* = 'N', the diagonal pivoting method is used to factor the matrix *A*. The form of the factorization is $A = U*D*U^H$ or $A = L*D*L^H$, where *U* (or *L*) is a product of permutation and unit upper (lower) triangular matrices, and *D* is Hermitian and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

2. If some $d_{i,i} = 0$, so that D is exactly singular, then the routine returns with $info = i$. Otherwise, the factored form of A is used to estimate the condition number of the matrix A. If the reciprocal of the condition number is less than machine precision, $info = n+1$ is returned as a warning, but the routine still goes on to solve for X and compute error bounds as described below.
3. The system of equations is solved for X using the factored form of A.
4. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.

Input Parameters

fact	CHARACTER*1. Must be 'F' or 'N'. Specifies whether or not the factored form of the matrix A has been supplied on entry. If $fact = 'F'$: on entry, af and $ipiv$ contain the factored form of A. Arrays a, af, and $ipiv$ are not modified. If $fact = 'N'$, the matrix A is copied to af and factored.
uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of A is stored and how A is factored: If $uplo = 'U'$, the array a stores the upper triangular part of the Hermitian matrix A, and A is factored as $U*D*U^H$. If $uplo = 'L'$, the array a stores the lower triangular part of the Hermitian matrix A; A is factored as $L*D*L^H$.
n	INTEGER. The order of matrix A; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides, the number of columns in B; $nrhs \geq 0$.
a,*af*,*b*,*work*	COMPLEX for chesvx DOUBLE COMPLEX for zhesvx. Arrays: $a(lda,*)$, $af(ldaf,*)$, $b(ldb,*)$, $work(*)$. The array a contains the upper or the lower triangular part of the Hermitian matrix A (see $uplo$). The second dimension of a must be at least $\max(1,n)$.

The array *af* is an input argument if *fact* = 'F'. It contains he block diagonal matrix *D* and the multipliers used to obtain the factor *U* or *L* from the factorization $A = U*D*U^H$ or $A = L*D*L^H$ as computed by ?hetrf. The second dimension of *af* must be at least max(1,*n*).
The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1, *nrhs*).
work(*) is a workspace array of dimension at least max(1, *lwork*).

lda — INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).

ldaf — INTEGER. The first dimension of *af*; *ldaf* ≥ max(1, *n*).

ldb — INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

ipiv — INTEGER.
Array, DIMENSION at least max(1, *n*). The array *ipiv* is an input argument if *fact* = 'F'. It contains details of the interchanges and the block structure of *D*, as determined by ?hetrf.
If *ipiv*(*i*) = *k* > 0, then d_{ii} is a 1-by-1 diagonal block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column.
If *uplo* = 'U' and *ipiv*(*i*) = *ipiv*(*i*-1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*–1, and (*i*–1)-th row and column of *A* was interchanged with the *m*-th row and column.
If *uplo* = 'L' and *ipiv*(*i*) = *ipiv*(*i*+1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*+1, and (*i*+1)-th row and column of *A* was interchanged with the *m*-th row and column.

ldx — INTEGER. The leading dimension of the output array *x*; *ldx* ≥ max(1, *n*).

lwork — INTEGER. The size of the *work* array.
If *lwork* = –1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes below for details and for the suggested value of *lwork*.

rwork — REAL for chesvx
DOUBLE PRECISION for zhesvx.
Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

x	COMPLEX for chesvx DOUBLE COMPLEX for zhesvx. Array, DIMENSION (*ldx*,*). If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X* to the system of equations. The second dimension of *x* must be at least max(1,*nrhs*).
af, *ipiv*	These arrays are output arguments if *fact* = 'N'. See the description of *af*, *ipiv* in Input Arguments section.
rcond	REAL for chesvx DOUBLE PRECISION for zhesvx. An estimate of the reciprocal condition number of the matrix *A*. If *rcond* is less than the machine precision (in particular, if *rcond* = 0), the matrix is singular to working precision. This condition is indicated by a return code of *info* > 0.
ferr, *berr*	REAL for chesvx DOUBLE PRECISION for zhesvx. Arrays, DIMENSION at least max(1, *nrhs*). Contain the component-wise forward and relative backward errors, respectively, for each solution vector.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, and *i* ≤ *n*, then d_{ii} is exactly zero. The factorization has been completed, but the block diagonal matrix *D* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned. If *info* = *i*, and *i* = *n* + 1, then *D* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `hesvx` interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *nrhs*).
x	Holds the matrix *X* of size (*n*, *nrhs*).
af	Holds the matrix *AF* of size (*n*, *n*).
ipiv	Holds the vector of length (*n*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
fact	Must be `'N'` or `'F'`. The default value is `'N'`. If *fact* = `'F'`, then both arguments *af* and *ipiv* must be present; otherwise, an error is returned.

Application Notes

The value of *lwork* must be at least `2*`*n*. For better performance, try using *lwork* = *n***blocksize*, where *blocksize* is the optimal block size for `?hetrf`.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = –1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*`(1)`) for subsequent runs.

If you set *lwork* = –1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?spsv

Computes the solution to the system of linear equations with a real or complex symmetric matrix A stored in packed format, and multiple right-hand sides.

Syntax

Fortran 77:

```
call sspsv( uplo, n, nrhs, ap, ipiv, b, ldb, info )
call dspsv( uplo, n, nrhs, ap, ipiv, b, ldb, info )
call cspsv( uplo, n, nrhs, ap, ipiv, b, ldb, info )
call zspsv( uplo, n, nrhs, ap, ipiv, b, ldb, info )
```

Fortran 95:

```
call spsv( a, b [,uplo] [,ipiv] [,info] )
```

Description

This routine solves for X the real or complex system of linear equations $A*X = B$, where A is an n-by-n symmetric matrix stored in packed format, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

The diagonal pivoting method is used to factor A as $A = U*D*U^T$ or $A = L*D*L^T$, where U (or L) is a product of permutation and unit upper (lower) triangular matrices, and D is symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

The factored form of A is then used to solve the system of equations $A*X = B$.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of A is stored: If *uplo* = 'U', the upper triangle of A is stored. If *uplo* = 'L', the lower triangle of A is stored.
n	INTEGER. The order of matrix A; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides, the number of columns in B; $nrhs \geq 0$.

ap, *b*	REAL for sspsv DOUBLE PRECISION for dspsv COMPLEX for cspsv DOUBLE COMPLEX for zspsv. Arrays: *ap*(*), *b*(*ldb*,*). The dimension of *ap* must be at least max(1,*n*(*n*+1)/2). The array *ap* contains the factor *U* or *L*, as specified by *uplo*, in packed storage (see Matrix Storage Schemes). The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

Output Parameters

ap	The block-diagonal matrix *D* and the multipliers used to obtain the factor *U* (or *L*) from the factorization of *A* as computed by ?sptrf, stored as a packed triangular matrix in the same storage format as *A*.
b	If *info* = 0, *b* is overwritten by the solution matrix *X*.
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). Contains details of the interchanges and the block structure of *D*, as determined by ?sptrf. If *ipiv*(*i*) = *k* > 0, then d_{ii} is a 1-by-1 block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column. If *uplo* = 'U' and *ipiv*(*i*) = *ipiv*(*i*-1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*–1, and (*i*–1)-th row and column of *A* was interchanged with the *m*-th row and column. If *uplo* = 'L' and *ipiv*(*i*) = *ipiv*(*i*+1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*+1, and (*i*+1)-th row and column of *A* was interchanged with the *m*-th row and column.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = –*i*, the *i*-th parameter had an illegal value. If *info* = *i*, d_{ii} is 0. The factorization has been completed, but *D* is exactly singular, so the solution could not be computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `spsv` interface are as follows:

a	Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n**(*n*+1)/2).
b	Holds the matrix *B* of size (*n*,*nrhs*).
ipiv	Holds the vector of length (*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

?spsvx

Uses the diagonal pivoting factorization to compute the solution to the system of linear equations with a real or complex symmetric matrix A stored in packed format, and provides error bounds on the solution.

Syntax

Fortran 77:

```
call sspsvx( fact, uplo, n, nrhs, ap, afp, ipiv, b, ldb, x, ldx, rcond, ferr,
berr, work, iwork, info )

call dspsvx( fact, uplo, n, nrhs, ap, afp, ipiv, b, ldb, x, ldx, rcond, ferr,
berr, work, iwork, info )

call cspsvx( fact, uplo, n, nrhs, ap, afp, ipiv, b, ldb, x, ldx, rcond, ferr,
berr, work, rwork, info )

call zspsvx( fact, uplo, n, nrhs, ap, afp, ipiv, b, ldb, x, ldx, rcond, ferr,
berr, work, rwork, info )
```

Fortran 95:

```
call spsvx( a, b, x [,uplo] [,af] [,ipiv] [,fact] [,ferr] [,berr] [,rcond]
[,info] )
```

Description

This routine uses the diagonal pivoting factorization to compute the solution to a real or complex system of linear equations *A*X = B*, where *A* is a *n*-by-*n* symmetric matrix stored in packed format, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?spsvx performs the following steps:

1. If *fact = 'N'*, the diagonal pivoting method is used to factor the matrix A. The form of the factorization is $A = U*D*U^T$ or $A = L*D*L^T$, where *U* (or *L*) is a product of permutation and unit upper (lower) triangular matrices, and *D* is symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.
2. If some $d_{i,i} = 0$, so that *D* is exactly singular, then the routine returns with *info = i*. Otherwise, the factored form of *A* is used to estimate the condition number of the matrix *A*. If the reciprocal of the condition number is less than machine precision, *info = n*+1 is returned as a warning, but the routine still goes on to solve for *X* and compute error bounds as described below.
3. The system of equations is solved for *X* using the factored form of *A*.
4. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.

Input Parameters

fact — CHARACTER*1. Must be 'F' or 'N'.
Specifies whether or not the factored form of the matrix *A* has been supplied on entry.
If *fact = 'F'*: on entry, *afp* and *ipiv* contain the factored form of *A*. Arrays *ap*, *afp*, and *ipiv* are not modified.
If *fact = 'N'*, the matrix *A* is copied to *afp* and factored.

uplo — CHARACTER*1. Must be 'U' or 'L'.
Indicates whether the upper or lower triangular part of *A* is stored and how *A* is factored:
If *uplo = 'U'*, the array *ap* stores the upper triangular part of the symmetric matrix *A*, and *A* is factored as $U*D*U^T$.
If *uplo = 'L'*, the array *ap* stores the lower triangular part of the symmetric matrix *A*; *A* is factored as $L*D*L^T$.

n INTEGER. The order of matrix *A*; $n \geq 0$.

nrhs INTEGER. The number of right-hand sides, the number of columns in *B*; $nrhs \geq 0$.

ap,*afp*,*b*,*work* REAL for sspsvx
DOUBLE PRECISION for dspsvx
COMPLEX for cspsvx
DOUBLE COMPLEX for zspsvx.
Arrays: *ap*(*), *afp*(*), *b*(*ldb*,*), *work*(*).
The array *ap* contains the upper or lower triangle of the symmetric matrix *A* in packed storage (see Matrix Storage Schemes).
The array *afp* is an input argument if *fact* = 'F'. It contains the block diagonal matrix *D* and the multipliers used to obtain the factor *U* or *L* from the factorization $A = U*D*U^T$ or $A = L*D*L^T$ as computed by ?sptrf, in the same storage format as *A*.
The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations.
work(*) is a workspace array.
The dimension of arrays *ap* and *afp* must be at least max(1, *n*(*n*+1)/2); the second dimension of *b* must be at least max(1,*nrhs*); the dimension of *work* must be at least max(1,3**n*) for real flavors and max(1,2**n*) for complex flavors.

ldb INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

ipiv INTEGER.
Array, DIMENSION at least max(1, *n*). The array *ipiv* is an input argument if *fact* = 'F'. It contains details of the interchanges and the block structure of *D*, as determined by ?sptrf.
If *ipiv*(*i*) = *k* > 0, then d_{ii} is a 1-by-1 diagonal block, and the *i*-th row and column of *A* was interchanged with the *k*–th row and column.
If *uplo* = 'U' and *ipiv*(*i*) =*ipiv*(*i*-1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*–1, and (*i*–1)-th row and column of *A* was interchanged with the *m*-th row and column.
If *uplo* = 'L' and *ipiv*(*i*) =*ipiv*(*i*+1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*+1, and (*i*+1)-th row and column of *A* was interchanged with the *m*-th row and column.

ldx INTEGER. The leading dimension of the output array *x*; *ldx* ≥ max(1, *n*).

iwork INTEGER. Workspace array, DIMENSION at least max(1, *n*); used in real flavors only.

rwork REAL for cspsvx
DOUBLE PRECISION for zspsvx.
Workspace array, DIMENSION at least max(1, *n*); used in complex flavors only.

Output Parameters

x REAL for sspsvx
DOUBLE PRECISION for dspsvx
COMPLEX for cspsvx
DOUBLE COMPLEX for zspsvx.
Array, DIMENSION (*ldx*,*).
If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X* to the system of equations. The second dimension of *x* must be at least max(1,*nrhs*).

afp, *ipiv* These arrays are output arguments if *fact* = 'N'. See the description of *afp*, *ipiv* in Input Arguments section.

rcond REAL for single precision flavors.
DOUBLE PRECISION for double precision flavors.
An estimate of the reciprocal condition number of the matrix *A*. If *rcond* is less than the machine precision (in particular, if *rcond* = 0), the matrix is singular to working precision. This condition is indicated by a return code of *info* > 0.

ferr, *berr* REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Arrays, DIMENSION at least max(1, *nrhs*). Contain the component-wise forward and relative backward errors, respectively, for each solution vector.

info INTEGER. If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, and $i \le n$, then d_{ii} is exactly zero. The factorization has been completed, but the block diagonal matrix *D* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned.

If *info* = *i*, and *i* = *n* + 1, then *D* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine spsvx interface are as follows:

a	Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n**(*n*+1)/2).
b	Holds the matrix *B* of size (*n*, *nrhs*).
x	Holds the matrix *X* of size (*n*, *nrhs*).
af	Stands for argument *afp* in Fortan 77 interface. Holds the array *AF* of size (*n**(*n*+1)/2).
ipiv	Holds the vector of length (*n*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
fact	Must be 'N' or 'F'. The default value is 'N'. If *fact* = 'F', then both arguments *af* and *ipiv* must be present; otherwise, an error is returned.

?hpsv

Computes the solution to the system of linear equations with a Hermitian matrix A stored in packed format, and multiple right-hand sides.

Syntax

Fortran 77:

```
call chpsv( uplo, n, nrhs, ap, ipiv, b, ldb, info )
call zhpsv( uplo, n, nrhs, ap, ipiv, b, ldb, info )
```

Fortran 95:

```
call hpsv( a, b [,uplo] [,ipiv] [,info] )
```

Description

This routine solves for X the system of linear equations $A*X = B$, where A is an n-by-n Hermitian matrix stored in packed format, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

The diagonal pivoting method is used to factor A as $A = U*D*U^H$ or $A = L*D*L^H$, where U (or L) is a product of permutation and unit upper (lower) triangular matrices, and D is Hermitian and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

The factored form of A is then used to solve the system of equations $A*X = B$.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of A is stored: If *uplo* = 'U', the upper triangle of A is stored. If *uplo* = 'L', the lower triangle of A is stored.
n	INTEGER. The order of matrix A; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides; the number of columns in B; $nrhs \geq 0$.
ap, *b*	COMPLEX for chpsv DOUBLE COMPLEX for zhpsv. Arrays: *ap*(*), *b*(*ldb*,*).

The dimension of *ap* must be at least max(1, *n*(*n*+1)/2). The array *ap* contains the factor *U* or *L*, as specified by *uplo*, in packed storage (see Matrix Storage Schemes).
The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1, *nrhs*).

ldb — INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

Output Parameters

ap — The block-diagonal matrix *D* and the multipliers used to obtain the factor *U* (or *L*) from the factorization of *A* as computed by ?hptrf, stored as a packed triangular matrix in the same storage format as *A*.

b — If *info* = 0, *b* is overwritten by the solution matrix *X*.

ipiv — INTEGER.
Array, DIMENSION at least max(1, *n*). Contains details of the interchanges and the block structure of *D*, as determined by ?hptrf.
If *ipiv*(*i*) = *k* > 0, then d_{ii} is a 1-by-1 block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column.
If *uplo* = 'U' and *ipiv*(*i*) = *ipiv*(*i*-1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*–1, and (*i*–1)-th row and column of *A* was interchanged with the *m*-th row and column.
If *uplo* = 'L' and *ipiv*(*i*) = *ipiv*(*i*+1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*+1, and (*i*+1)-th row and column of *A* was interchanged with the *m*-th row and column.

info — INTEGER. If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, d_{ii} is 0. The factorization has been completed, but *D* is exactly singular, so the solution could not be computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine hpsv interface are as follows:

a	Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n**(*n*+1)/2).
b	Holds the matrix *B* of size (*n*, *nrhs*).
ipiv	Holds the vector of length (*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

?hpsvx

Uses the diagonal pivoting factorization to compute the solution to the system of linear equations with a Hermitian matrix A stored in packed format, and provides error bounds on the solution.

Syntax

Fortran 77:

```
call chpsvx( fact, uplo, n, nrhs, ap, afp, ipiv, b, ldb, x, ldx, rcond, ferr, berr, work, rwork, info )
```

```
call zhpsvx( fact, uplo, n, nrhs, ap, afp, ipiv, b, ldb, x, ldx, rcond, ferr, berr, work, rwork, info )
```

Fortran 95:

```
call hpsvx( a, b, x [,uplo] [,af] [,ipiv] [,fact] [,ferr] [,berr] [,rcond] [,info] )
```

Description

This routine uses the diagonal pivoting factorization to compute the solution to a complex system of linear equations *A*X = B*, where *A* is a *n*-by-*n* Hermitian matrix stored in packed format, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?hpsvx performs the following steps:

1. If *fact* = 'N', the diagonal pivoting method is used to factor the matrix *A*. The form of the factorization is $A = U*D*U^H$ or $A = L*D*L^H$, where *U* (or *L*) is a product of permutation and unit upper (lower) triangular matrices, and *D* is a Hermitian and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

2. If some $d_{i,i} = 0$, so that D is exactly singular, then the routine returns with *info* = *i*. Otherwise, the factored form of A is used to estimate the condition number of the matrix A. If the reciprocal of the condition number is less than machine precision, *info* = *n*+1 is returned as a warning, but the routine still goes on to solve for X and compute error bounds as described below.
3. The system of equations is solved for X using the factored form of A.
4. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.

Input Parameters

fact
CHARACTER*1. Must be 'F' or 'N'.
Specifies whether or not the factored form of the matrix A has been supplied on entry.
If *fact* = 'F': on entry, *afp* and *ipiv* contain the factored form of A. Arrays *ap*, *afp*, and *ipiv* are not modified.
If *fact* = 'N', the matrix A is copied to *afp* and factored.

uplo
CHARACTER*1. Must be 'U' or 'L'.
Indicates whether the upper or lower triangular part of A is stored and how A is factored:
If *uplo* = 'U', the array *ap* stores the upper triangular part of the Hermitian matrix A, and A is factored as $U*D*U^H$.
If *uplo* = 'L', the array *ap* stores the lower triangular part of the Hermitian matrix A, and A is factored as $L*D*L^H$.

n
INTEGER. The order of matrix A; $n \geq 0$.

nrhs
INTEGER. The number of right-hand sides, the number of columns in B; $nrhs \geq 0$.

ap,*afp*,*b*,*work*
COMPLEX for chpsvx
DOUBLE COMPLEX for zhpsvx.
Arrays: *ap*(*), *afp*(*), *b*(*ldb*,*), *work*(*).
The array *ap* contains the upper or lower triangle of the Hermitian matrix A in packed storage (see Matrix Storage Schemes).
The array *afp* is an input argument if *fact* = 'F'. It contains the block diagonal matrix D and the multipliers used to obtain the factor U or L from the factorization $A = U*D*U^H$ or $A = L*D*L^H$ as computed by ?hptrf, in the same storage format as A.

	The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. *work*(*) is a workspace array. The dimension of arrays *ap* and *afp* must be at least max(1,*n*(*n*+1)/2); the second dimension of *b* must be at least max(1,*nrhs*); the dimension of *work* must be at least max(1,2**n*).
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). The array *ipiv* is an input argument if *fact* = 'F'. It contains details of the interchanges and the block structure of *D*, as determined by ?hptrf. If *ipiv*(*i*) = *k* > 0, then d_{ii} is a 1-by-1 diagonal block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column. If *uplo* = 'U' and *ipiv*(*i*) = *ipiv*(*i*-1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*–1, and (*i*–1)-th row and column of *A* was interchanged with the *m*-th row and column. If *uplo* = 'L' and *ipiv*(*i*) = *ipiv*(*i*+1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*+1, and (*i*+1)-th row and column of *A* was interchanged with the *m*–th row and column.
ldx	INTEGER. The leading dimension of the output array *x*; *ldx* ≥ max(1, *n*).
rwork	REAL for chpsvx DOUBLE PRECISION for zhpsvx. Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

x	COMPLEX for chpsvx DOUBLE COMPLEX for zhpsvx. Array, DIMENSION (*ldx*,*). If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X* to the system of equations. The second dimension of *x* must be at least max(1,*nrhs*).
afp, *ipiv*	These arrays are output arguments if *fact* = 'N'. See the description of *afp*, *ipiv* in Input Arguments section.
rcond	REAL for chpsvx

DOUBLE PRECISION for zhpsvx.
An estimate of the reciprocal condition number of the matrix *A*. If *rcond* is less than the machine precision (in particular, if *rcond* = 0), the matrix is singular to working precision. This condition is indicated by a return code of *info* > 0.

ferr, *berr*
REAL for chpsvx
DOUBLE PRECISION for zhpsvx.
Arrays, DIMENSION at least max(1, *nrhs*). Contain the component-wise forward and relative backward errors, respectively, for each solution vector.

info
INTEGER. If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, and $i \leq n$, then d_{ii} is exactly zero. The factorization has been completed, but the block diagonal matrix *D* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned.
If *info* = *i*, and *i* = *n* + 1, then *D* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran-95 Interface Conventions.

Specific details for the routine hpsvx interface are as follows:

a
Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n**(*n*+1)/2).

b
Holds the matrix *B* of size (*n*, *nrhs*).

x
Holds the matrix *X* of size (*n*, *nrhs*).

af
Stands for argument *ap* in Fortan 77 interface. Holds the array *AF* of size (*n**(*n*+1)/2).

ipiv
Holds the vector of length (*n*).

ferr
Holds the vector of length (*nrhs*).

berr	Holds the vector of length (*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
fact	Must be 'N' or 'F'. The default value is 'N'. If *fact* = 'F', then both arguments *af* and *ipiv* must be present; otherwise, an error is returned.

LAPACK Routines: Least Squares and Eigenvalue Problems

4

This chapter describes the Intel® Math Kernel Library implementation of routines from the LAPACK package that are used for solving linear least-squares problems, eigenvalue and singular value problems, as well as performing a number of related computational tasks.

Sections in this chapter include descriptions of LAPACK computational routines and driver routines. For full reference on LAPACK routines and related information see [LUG].

Least-Squares Problems. A typical `least-squares problem` is as follows: given a matrix A and a vector b, find the vector x that minimizes the sum of squares $\sigma_i((Ax)_i - b_i)^2$ or, equivalently, find the vector x that minimizes the 2-norm $||Ax - b||_2$.

In the most usual case, A is an m-by-n matrix with $m < n$ and $\mathrm{rank}(A) = n$. This problem is also referred to as finding the `least-squares solution` to an `overdetermined` system of linear equations (here we have more equations than unknowns). To solve this problem, you can use the QR factorization of the matrix A (see QR Factorization).

If $m < n$ and $\mathrm{rank}(A) = m$, there exist an infinite number of solutions x which exactly satisfy $Ax = b$, and thus minimize the norm $||Ax - b||_2$. In this case it is often useful to find the unique solution that minimizes $||x||_2$. This problem is referred to as finding the `minimum-norm solution` to an `underdetermined` system of linear equations (here we have more unknowns than equations). To solve this problem, you can use the LQ factorization of the matrix A (see LQ Factorization).

In the general case you may have a `rank-deficient least-squares problem`, with $\mathrm{rank}(A) < \min(m, n)$: find the `minimum-norm least-squares solution` that minimizes both $||x||_2$ and $||Ax - b||^2$. In this case (or when the rank of A is in doubt) you can use the QR factorization with pivoting or `singular value decomposition` (see Singular Value Decomposition).

Eigenvalue Problems. The eigenvalue problems (from German *eigen* "own") are stated as follows: given a matrix A, find the `eigenvalues` λ and the corresponding `eigenvectors` z that satisfy the equation

$Az = \lambda z$ (right eigenvectors z)

or the equation

$z^H A = \lambda z^H$ (left eigenvectors z).

If A is a real symmetric or complex Hermitian matrix, the above two equations are equivalent, and the problem is called a `symmetric` eigenvalue problem. Routines for solving this type of problems are described in the section Symmetric Eigenvalue Problems .

Routines for solving eigenvalue problems with nonsymmetric or non-Hermitian matrices are described in the section Nonsymmetric Eigenvalue Problems .

The library also includes routines that handle generalized symmetric-definite eigenvalue problems: find the eigenvalues λ and the corresponding eigenvectors x that satisfy one of the following equations:

$Az = \lambda Bz$, $ABz = \lambda z$, or $BAz = \lambda z$,

where A is symmetric or Hermitian, and B is symmetric positive-definite or Hermitian positive-definite. Routines for reducing these problems to standard symmetric eigenvalue problems are described in the section Generalized Symmetric-Definite Eigenvalue Problems .

To solve a particular problem, you usually call several computational routines. Sometimes you need to combine the routines of this chapter with other LAPACK routines described in Chapter 3 as well as with BLAS routines described in Chapter 2 .

For example, to solve a set of least-squares problems minimizing $||Ax - b||^2$ for all columns b of a given matrix B (where A and B are real matrices), you can call ?geqrf to form the factorization $A = QR$, then call ?ormqr to compute $C = Q^H B$ and finally call the BLAS routine ?trsm to solve for X the system of equations $RX = C$.

Another way is to call an appropriate driver routine that performs several tasks in one call. For example, to solve the least-squares problem the driver routine ?gels can be used.

WARNING. LAPACK routines expect that input matrices do not contain INF or NaN values. When input data is inappropriate for LAPACK, problems may arise, including possible hangs.

Starting from release 8.0, Intel MKL along with Fortran-77 interface to LAPACK computational and driver routines supports also Fortran-95 interface which uses simplified routine calls with shorter argument lists. The calling sequence for Fortran-95 interface is given in the syntax section of the routine description immediately after Fortran-77 calls.

Routine Naming Conventions

For each routine in this chapter, when calling it from the Fortran-77 program you can use the LAPACK name.

LAPACK names have the structure xyyzzz, which is described below.

The initial letter x indicates the data type:

s	real, single precision
c	complex, single precision
d	real, double precision

z	complex, double precision

The second and third letters yy indicate the matrix type and storage scheme:

bd	bidiagonal matrix
ge	general matrix
gb	general band matrix
hs	upper Hessenberg matrix
or	(real) orthogonal matrix
op	(real) orthogonal matrix (packed storage)
un	(complex) unitary matrix
up	(complex) unitary matrix (packed storage)
pt	symmetric or Hermitian positive-definite tridiagonal matrix
sy	symmetric matrix
sp	symmetric matrix (packed storage)
sb	(real) symmetric band matrix
st	(real) symmetric tridiagonal matrix
he	Hermitian matrix
hp	Hermitian matrix (packed storage)
hb	(complex) Hermitian band matrix
tr	triangular or quasi-triangular matrix.

The last three letters zzz indicate the computation performed, for example:

qrf	form the *QR* factorization
lqf	form the *LQ* factorization.

Thus, the routine sgeqrf forms the *QR* factorization of general real matrices in single precision; the corresponding routine for complex matrices is cgeqrf.

Names of the LAPACK computational and driver routines for Fortran-95 interface in Intel MKL are the same as Fortran-77 names but without the first letter that indicates the data type. For example, the name of the routine that forms the *QR* factorization of general real matrices in Fortran-95 interface is geqrf. Handling of different data types is done through defining a specific internal parameter referring to a module block with named constants for single and double precision.

For details on the design of Fortran-95 interface for LAPACK computational and driver routines in Intel MKL and for the general information on how the optional arguments are reconstructed, see Fortran-95 Interface Conventions in chapter 3 .

Matrix Storage Schemes

LAPACK routines use the following matrix storage schemes:

- `Full storage`: a matrix A is stored in a two-dimensional array a, with the matrix element a_{ij} stored in the array element $a(i,j)$.
- `Packed storage` scheme allows you to store symmetric, Hermitian, or triangular matrices more compactly: the upper or lower triangle of the matrix is packed by columns in a one-dimensional array.
- `Band storage`: an m-by-n band matrix with kl sub-diagonals and ku super-diagonals is stored compactly in a two-dimensional array ab with $kl+ku+1$ rows and n columns. Columns of the matrix are stored in the corresponding columns of the array, and `diagonals` of the matrix are stored in rows of the array.

In Chapters 3 and 4 , arrays that hold matrices in packed storage have names ending in p; arrays with matrices in band storage have names ending in b. For more information on matrix storage schemes, see "Matrix Arguments" in Appendix B .

Mathematical Notation

In addition to the mathematical notation used in previous chapters, descriptions of routines in this chapter use the following notation:

λ_i	`Eigenvalues` of the matrix A (for the definition of eigenvalues, see Eigenvalue Problems).
σ_i	`Singular values` of the matrix A. They are equal to square roots of the eigenvalues of $A^H A$. (For more information, see Singular Value Decomposition).
$\|\|x\|\|_2$	The `2-norm` of the vector x: $\|\|x\|\|_2 = (\Sigma_i \|x_i\|^2)^{1/2} = \|\|x\|\|_E$.
$\|\|A\|\|_2$	The `2-norm` (or `spectral norm`) of the matrix A. $\|\|A\|\|_2 = \max_i \sigma_i$, $\|\|A\|\|_2^2 = \max_{\|x\|=1}(Ax \cdot Ax)$.

$\|\|A\|\|_E$	The Euclidean norm of the matrix A: $\|\|A\|\|_E^2 = \Sigma_i\Sigma_j\|a_{ij}\|^2$ (for vectors, the Euclidean norm and the 2-norm are equal: $\|\|x\|\|_E = \|\|x\|\|_2$).
$q(x, y)$	The acute angle between vectors x and y: $\cos q(x, y) = \|x \cdot y\| / (\|\|x\|\|_2 \|\|y\|\|_2)$.

Computational Routines

In the sections that follow, the descriptions of LAPACK computational routines are given. These routines perform distinct computational tasks that can be used for:

Orthogonal Factorizations

Singular Value Decomposition

Symmetric Eigenvalue Problems

Generalized Symmetric-Definite Eigenvalue Problems

Nonsymmetric Eigenvalue Problems

Generalized Nonsymmetric Eigenvalue Problems

Generalized Singular Value Decomposition

See also the respective driver routines.

Orthogonal Factorizations

This section describes the LAPACK routines for the QR (RQ) and LQ (QL) factorization of matrices. Routines for the RZ factorization as well as for generalized QR and RQ factorizations are also included.

QR Factorization. Assume that A is an m-by-n matrix to be factored.

If $m \le n$, the QR factorization is given by

$$A = Q \begin{pmatrix} R \\ 0 \end{pmatrix} = (Q_1, Q_2) \begin{pmatrix} R \\ 0 \end{pmatrix}$$

where R is an n-by-n upper triangular matrix with real diagonal elements, and Q is an m-by-m orthogonal (or unitary) matrix.

You can use the QR factorization for solving the following least-squares problem: minimize $||Ax - b||^2$ where A is a full-rank m-by-n matrix($m < n$). After factoring the matrix, compute the solution x by solving $Rx = (Q_1)^T b$.

If $m < n$, the QR factorization is given by

$A = QR = Q(R_1 R_2)$

where R is trapezoidal, R_1 is upper triangular and R_2 is rectangular.

The LAPACK routines do not form the matrix Q explicitly. Instead, Q is represented as a product of min(m, n) `elementary reflectors`. Routines are provided to work with Q in this representation.

LQ Factorization LQ factorization of an m-by-n matrix A is as follows. If $m \le n$,

$$A = (L, 0)\,Q = (L, 0)\begin{pmatrix} Q_1 \\ Q_2 \end{pmatrix} = (LQ1)$$

where L is an m-by-m lower triangular matrix with real diagonal elements, and Q is an n-by-n orthogonal (or unitary) matrix.

If $m > n$, the LQ factorization is

$$A = \begin{pmatrix} L_1 \\ L_2 \end{pmatrix} Q$$

where L_1 is an n-by-n lower triangular matrix, L_2 is rectangular, and Q is an n-by-n orthogonal (or unitary) matrix.

You can use the LQ factorization to find the minimum-norm solution of an underdetermined system of linear equations $Ax = b$ where A is an m-by-n matrix of rank m $(m < n)$. After factoring the matrix, compute the solution vector x as follows: solve $Ly = b$ for y, and then compute $x = (Q_1)^H y$.

Table 4-1 lists LAPACK routines (Fortran-77 interface) that perform orthogonal factorization of matrices. Respective routine names in Fortran-95 interface are without the first symbol (see Routine Naming Conventions).

Table 4-1 Computational Routines for Orthogonal Factorization

Matrix type, factorization	Factorize without pivoting	Factorize with pivoting	Generate matrix Q	Apply matrix Q

pair of matrices, generalized RQ factorization	?ggrqf			

?geqrf

Computes the QR factorization of a general m-by-n matrix.

Syntax

Fortran 77:

```
call sgeqrf(m, n, a, lda, tau, work, lwork, info)
call dgeqrf(m, n, a, lda, tau, work, lwork, info)
call cgeqrf(m, n, a, lda, tau, work, lwork, info)
call zgeqrf(m, n, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call geqrf(a [, tau] [,info])
```

Description

The routine forms the QR factorization of a general m-by-n matrix A (see Orthogonal Factorizations). No pivoting is performed.

The routine does not form the matrix Q explicitly. Instead, Q is represented as a product of min(m, n) `elementary reflectors`. Routines are provided to work with Q in this representation.

Input Parameters

m	`INTEGER`. The number of rows in the matrix A ($m \geq 0$).
n	`INTEGER`. The number of columns in A ($n \geq 0$).

a, $work$	`REAL` for `sgeqrf`
	`DOUBLE PRECISION` for `dgeqrf`
	`COMPLEX` for `cgeqrf`
	`DOUBLE COMPLEX` for `zgeqrf`.
	Arrays: a(lda,*) contains the matrix A. The second dimension of a must be at least max(1, n).
	$work$ is a workspace array, its dimension `max(1, lwork)`.

lda	`INTEGER`. The first dimension of a; at least max(1, m).
$lwork$	`INTEGER`. The size of the $work$ array ($lwork \geq n$). If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the $work$ array, returns this value as the first entry of the $work$ array, and no error message related to $lwork$ is issued by `xerbla`. See Application Notes for the suggested value of $lwork$.

Output Parameters

a	Overwritten by the factorization data as follows: If $m \geq n$, the elements below the diagonal are overwritten by the details of the unitary matrix Q, and the upper triangle is overwritten by the corresponding elements of the upper triangular matrix R.

	If *m* < *n*, the strictly lower triangular part is overwritten by the details of the unitary matrix *Q*, and the remaining elements are overwritten by the corresponding elements of the *m*-by-*n* upper trapezoidal matrix *R*.
tau	REAL for sgeqrf DOUBLE PRECISION for dgeqrf COMPLEX for cgeqrf DOUBLE COMPLEX for zgeqrf. Array, DIMENSION at least max (1, min(*m*, *n*)). Contains additional information on the matrix *Q*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine *geqrf* interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
tau	Holds the vector of length min(*m*,*n*)

Application Notes

For better performance, try using *lwork* = *n***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed factorization is the exact factorization of a matrix $A + E$, where

$||E||_2 = O(\varepsilon)||A||_2$.

The approximate number of floating-point operations for real flavors is

$(4/3)n^3$	if $m = n$,
$(2/3)n^2(3m-n)$	if $m > n$,
$(2/3)m^2(3n-m)$	if $m < n$.

The number of operations for complex flavors is 4 times greater.

To solve a set of least-squares problems minimizing $||Ax - b||_2$ for all columns b of a given matrix B, you can call the following:

?geqrf (this routine)	to factorize $A = QR$;
?ormqr	to compute $C = Q^T*B$ (for real matrices);
?unmqr	to compute $C = Q^H*B$ (for complex matrices);
?trsm	(a BLAS routine) to solve $R*X = C$.

(The columns of the computed X are the least-squares solution vectors x.)

To compute the elements of Q explicitly, call

?orgqr	(for real matrices)
?ungqr	(for complex matrices).

?geqpf

Computes the QR factorization of a general m-by-n matrix with pivoting.

Syntax

Fortran 77:

```
call sgeqpf(m, n, a, lda, jpvt, tau, work, info)
call dgeqpf(m, n, a, lda, jpvt, tau, work, info)
call cgeqpf(m, n, a, lda, jpvt, tau, work, rwork, info)
call zgeqpf(m, n, a, lda, jpvt, tau, work, rwork, info)
```

Fortran 95:

```
call geqpf(a, jpvt [,tau] [,info])
```

Description

This routine is deprecated and has been replaced by routine ?geqp3.

The routine ?geqpf forms the *QR* factorization of a general *m*-by-*n* matrix *A* with column pivoting: *A*P = Q*R* (see Orthogonal Factorizations). Here *P* denotes an *n*-by-*n* permutation matrix.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of min(*m*, *n*) elementary reflectors. Routines are provided to work with *Q* in this representation.

Input Parameters

m	INTEGER. The number of rows in the matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns in *A* (*n* ≥ 0).
a, *work*	REAL for sgeqpf DOUBLE PRECISION for dgeqpf COMPLEX for cgeqpf DOUBLE COMPLEX for zgeqpf. Arrays: *a* (*lda*,*) contains the matrix *A*. The second dimension of *a* must be at least max(1, *n*).

	work (*lwork*) is a workspace array. The size of the *work* array must be at least max(1, 3**n*) for real flavors and at least max(1, *n*) for complex flavors.
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
jpvt	INTEGER. Array, DIMENSION at least max(1, *n*). On entry, if *jpvt*(*i*) > 0, the *i*-th column of *A* is moved to the beginning of *A*P* before the computation, and fixed in place during the computation. If *jpvt*(*i*) = 0, the *i*th column of *A* is a free column (that is, it may be interchanged during the computation with any other free column).
rwork	REAL for cgeqpf DOUBLE PRECISION for zgeqpf. A workspace array, DIMENSION at least max(1, 2**n*).

Output Parameters

a	Overwritten by the factorization data as follows: If *m* ≥ *n*, the elements below the diagonal are overwritten by the details of the unitary (orthogonal) matrix *Q*, and the upper triangle is overwritten by the corresponding elements of the upper triangular matrix *R*. If *m* < *n*, the strictly lower triangular part is overwritten by the details of the matrix *Q*, and the remaining elements are overwritten by the corresponding elements of the *m*-by-*n* upper trapezoidal matrix *R*.
tau	REAL for sgeqpf DOUBLE PRECISION for dgeqpf COMPLEX for cgeqpf DOUBLE COMPLEX for zgeqpf. Array, DIMENSION at least max (1, min(*m*, *n*)). Contains additional information on the matrix *Q*.
jpvt	Overwritten by details of the permutation matrix *P* in the factorization *A*P = Q*R*. More precisely, the columns of *A*P* are the columns of *A* in the following order: *jpvt*(1), *jpvt*(2), ..., *jpvt*(*n*).
info	INTEGER.

If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine geqpf interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
jpvt	Holds the vector of length (*n*).
tau	Holds the vector of length min(*m*,*n*)

Application Notes

The computed factorization is the exact factorization of a matrix $A + E$, where

$||E||_2 = O(\varepsilon)||A||_2$.

The approximate number of floating-point operations for real flavors is

$(4/3)n^3$	if $m = n$,
$(2/3)n^2(3m-n)$	if $m > n$,
$(2/3)m^2(3n-m)$	if $m < n$.

The number of operations for complex flavors is 4 times greater.

To solve a set of least-squares problems minimizing $||Ax - b||_2$ for all columns b of a given matrix B, you can call the following:

?geqpf (this routine)	to factorize *A*P = Q*R*;
?ormqr	to compute $C = Q^T*B$ (for real matrices);
?unmqr	to compute $C = Q^H*B$ (for complex matrices);
?trsm (a BLAS routine)	to solve *R*X = C*.

(The columns of the computed *X* are the permuted least-squares solution vectors *x*; the output array *jpvt* specifies the permutation order.)

To compute the elements of *Q* explicitly, call

?orgqr	(for real matrices)
?ungqr	(for complex matrices).

?geqp3

Computes the QR factorization of a general m-by-n matrix with column pivoting using Level 3 BLAS.

Syntax

Fortran 77:

```
call sgeqp3(m, n, a, lda, jpvt, tau, work, lwork, info)
call dgeqp3(m, n, a, lda, jpvt, tau, work, lwork, info)
call cgeqp3(m, n, a, lda, jpvt, tau, work, lwork, rwork, info)
call zgeqp3(m, n, a, lda, jpvt, tau, work, lwork, rwork, info)
```

Fortran 95:

```
call geqp3(a, jpvt [,tau] [,info])
```

Description

The routine forms the QR factorization of a general m-by-n matrix A with column pivoting: $AP = Q*R$ (see Orthogonal Factorizations) using Level 3 BLAS. Here P denotes an n-by-n permutation matrix. Use this routine instead of ?geqpf for better performance.

The routine does not form the matrix Q explicitly. Instead, Q is represented as a product of min(m, n) elementary reflectors. Routines are provided to work with Q in this representation.

Input Parameters

m	INTEGER. The number of rows in the matrix A ($m \geq 0$).
n	INTEGER. The number of columns in A ($n \geq 0$).
a, *work*	REAL for sgeqp3 DOUBLE PRECISION for dgeqp3 COMPLEX for cgeqp3 DOUBLE COMPLEX for zgeqp3. Arrays: *a* (*lda*,*) contains the matrix A.

The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).

lda — INTEGER. The first dimension of *a*; at least max(1, *m*).

lwork — INTEGER. The size of the *work* array; must be at least max(1, 3**n*+1) for real flavors, and at least max(1, *n*+1) for complex flavors.
If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes below for details.

jpvt — INTEGER.
Array, DIMENSION at least max(1, *n*).
On entry, if *jpvt*(*i*) ≠ 0, the *i*th column of *A* is moved to the beginning of *AP* before the computation, and fixed in place during the computation.
If *jpvt*(*i*) = 0, the *i*-th column of *A* is a free column (that is, it may be interchanged during the computation with any other free column).

rwork — REAL for cgeqp3
DOUBLE PRECISION for zgeqp3.
A workspace array, DIMENSION at least max(1, 2**n*). Used in complex flavors only.

Output Parameters

a — Overwritten by the factorization data as follows:
If *m* ≥ *n*, the elements below the diagonal are overwritten by the details of the unitary (orthogonal) matrix *Q*, and the upper triangle is overwritten by the corresponding elements of the upper triangular matrix *R*.
If *m* < *n*, the strictly lower triangular part is overwritten by the details of the matrix *Q*, and the remaining elements are overwritten by the corresponding elements of the *m*-by-*n* upper trapezoidal matrix *R*.

tau — REAL for sgeqp3

	DOUBLE PRECISION for dgeqp3 COMPLEX for cgeqp3 DOUBLE COMPLEX for zgeqp3. Array, DIMENSION at least max (1, min(*m*, *n*)). Contains scalar factors of the elementary reflectors for the matrix *Q*.
jpvt	Overwritten by details of the permutation matrix *P* in the factorization *AP = Q*R*. More precisely, the columns of *AP* are the columns of *A* in the following order: *jpvt*(1), *jpvt*(2), ..., *jpvt*(*n*).
info	INTEGER. If *info = 0*, the execution is successful. If *info = -i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine geqp3 interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
jpvt	Holds the vector of length (*n*).
tau	Holds the vector of length min(*m*,*n*)

Application Notes

To solve a set of least-squares problems minimizing $||Ax - b||_2$ for all columns *b* of a given matrix *B*, you can call the following:

?geqp3 (this routine)	to factorize *AP = Q*R*;
?ormqr	to compute $C = Q^T*B$ (for real matrices);
?unmqr	to compute $C = Q^H*B$ (for complex matrices);
?trsm (a BLAS routine)	to solve *R*X = C*.

(The columns of the computed *X* are the permuted least-squares solution vectors *x*; the output array *jpvt* specifies the permutation order.)

To compute the elements of *Q* explicitly, call

?orgqr (for real matrices)

?ungqr (for complex matrices).

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = –1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = –1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?orgqr

Generates the real orthogonal matrix Q of the QR factorization formed by ?geqrf.

Syntax

Fortran 77:

```
call sorgqr(m, n, k, a, lda, tau, work, lwork, info)
call dorgqr(m, n, k, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call orgqr(a, tau [,info])
```

Description

The routine generates the whole or part of *m*-by-*m* orthogonal matrix *Q* of the *QR* factorization formed by the routines sgeqrf/dgeqrf or sgeqpf/dgeqpf. Use this routine after a call to sgeqrf/dgeqrf or sgeqpf/dgeqpf.

Usually Q is determined from the QR factorization of an m by p matrix A with $m \geq p$. To compute the whole matrix Q, use:

```
call ?orgqr(m, m, p, a, lda, tau, work, lwork, info)
```

To compute the leading p columns of Q (which form an orthonormal basis in the space spanned by the columns of A):

```
call ?orgqr(m, p, p, a, lda, tau, work, lwork, info)
```

To compute the matrix Q^k of the QR factorization of A's leading k columns:

```
call ?orgqr(m, m, k, a, lda, tau, work, lwork, info)
```

To compute the leading k columns of Q^k (which form an orthonormal basis in the space spanned by A's leading k columns):

```
call ?orgqr(m, k, k, a, lda, tau, work, lwork, info)
```

Input Parameters

m	INTEGER. The order of the orthogonal matrix Q ($m \geq 0$).
n	INTEGER. The number of columns of Q to be computed ($0 \leq n \leq m$).
k	INTEGER. The number of elementary reflectors whose product defines the matrix Q ($0 \leq k \leq n$).
a, *tau*, *work*	REAL for sorgqr DOUBLE PRECISION for dorgqr Arrays: *a*(*lda*,*) and *tau*(*) are the arrays returned by sgeqrf / dgeqrf or sgeqpf / dgeqpf. The second dimension of *a* must be at least max(1, *n*). The dimension of *tau* must be at least max(1, *k*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
lwork	INTEGER. The size of the *work* array (*lwork* ≥ *n*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

a	Overwritten by *n* leading columns of the *m*-by-*m* orthogonal matrix *Q*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine orgqr interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
tau	Holds the vector of length (*k*)

Application Notes

For better performance, try using *lwork* = *n***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed Q differs from an exactly orthogonal matrix by a matrix E such that

$||E||_2 = O(\varepsilon)||A||_2$ where ε is the machine precision.

The total number of floating-point operations is approximately $4*m*n*k - 2*(m + n)*k^2 + (4/3)*k^3$.

If $n = k$, the number is approximately $(2/3)*n^2*(3m - n)$.

The complex counterpart of this routine is ?ungqr.

?ormqr

Multiplies a real matrix by the orthogonal matrix Q of the QR factorization formed by ?geqrf *or* ?geqpf*.*

Syntax

Fortran 77:

```
call sormqr(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call dormqr(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
```

Fortran 95:

```
call ormqr(a, tau, c [,side] [,trans] [,info])
```

Description

The routine multiplies a real matrix C by Q or Q^T, where Q is the orthogonal matrix Q of the QR factorization formed by the routines sgeqrf/dgeqrf or sgeqpf/dgeqpf.

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products $Q*C$, Q^T*C, $C*Q$, or $C*Q^T$ (overwriting the result on C).

Input Parameters

side	CHARACTER*1. Must be either 'L' or 'R'. If *side* ='L', Q or Q^T is applied to C from the left. If *side* ='R', Q or Q^T is applied to C from the right.
trans	CHARACTER*1. Must be either 'N' or 'T'. If *trans* ='N', the routine multiplies C by Q.

If *trans* ='T', the routine multiplies *C* by Q^T.

m — INTEGER. The number of rows in the matrix *C* (*m* ≥ 0).

n — INTEGER. The number of columns in *C* (*n* ≥ 0).

k — INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. Constraints:

0 ≤ *k* ≤ *m* if *side* ='L';

0 ≤ *k* ≤ *n* if *side* ='R'.

a, *tau*, *c*, *work* — REAL for sgeqrf
DOUBLE PRECISION for dgeqrf.
Arrays:
a(*lda*,*) and *tau*(*) are the arrays returned by sgeqrf / dgeqrf or sgeqpf / dgeqpf. The second dimension of *a* must be at least max(1, *k*). The dimension of *tau* must be at least max(1, *k*).
c(*ldc*,*) contains the matrix *C*.
The second dimension of *c* must be at least max(1, *n*)
work is a workspace array, its dimension max(1, *lwork*).

lda — INTEGER. The first dimension of *a*. Constraints:

lda ≥ max(1, *m*) if *side* = 'L';

lda ≥ max(1, *n*) if *side* = 'R'.

ldc — INTEGER. The first dimension of *c*. Constraint:

ldc ≥ max(1, *m*).

lwork — INTEGER. The size of the *work* array. Constraints:

lwork ≥ max(1, *n*) if *side* = 'L';

lwork ≥ max(1, *m*) if *side* = 'R'.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.
See Application Notes for the suggested value of *lwork*.

Output Parameters

c	Overwritten by the product *Q*C*, Q^T**C*, *C*Q*, or *C**Q^T (as specified by *side* and *trans*).
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = –*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine ormqr interface are the following:

a	Holds the matrix *A* of size (*r*,*k*). *r* = *m* if *side* = 'L'. *r* = *n* if *side* = 'R'.
tau	Holds the vector of length (*k*).
c	Holds the matrix *C* of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
trans	Must be 'N' or 'T'. The default value is 'N'.

Application Notes

For better performance, try using *lwork* = *n*blocksize* (if *side* = 'L') or *lwork* = *m*blocksize* (if *side* = 'R') where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = –1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The complex counterpart of this routine is ?unmqr.

?ungqr

Generates the complex unitary matrix Q of the QR factorization formed by ?geqrf.

Syntax

Fortran 77:

```
call cungqr(m, n, k, a, lda, tau, work, lwork, info)
call zungqr(m, n, k, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call ungqr(a, tau [,info])
```

Description

The routine generates the whole or part of *m*-by-*m* unitary matrix *Q* of the *QR* factorization formed by the routines cgeqrf/zgeqrf or cgeqpf/zgeqpf. Use this routine after a call to cgeqrf/zgeqrf or cgeqpf/zgeqpf.

Usually *Q* is determined from the *QR* factorization of an *m* by *p* matrix *A* with $m \geq p$. To compute the whole matrix *Q*, use:

```
call ?ungqr(m, m, p, a, lda, tau, work, lwork, info)
```

To compute the leading *p* columns of *Q* (which form an orthonormal basis in the space spanned by the columns of *A*):

```
call ?ungqr(m, p, p, a, lda, tau, work, lwork, info)
```

To compute the matrix Q^k of the *QR* factorization of *A*'s leading *k* columns:

```
call ?ungqr(m, m, k, a, lda, tau, work, lwork, info)
```

To compute the leading k columns of Q^k (which form an orthonormal basis in the space spanned by A's leading k columns):

```
call ?ungqr(m, k, k, a, lda, tau, work, lwork, info)
```

Input Parameters

m	INTEGER. The order of the unitary matrix Q ($m \geq 0$).
n	INTEGER. The number of columns of Q to be computed ($0 \leq n \leq m$).
k	INTEGER. The number of elementary reflectors whose product defines the matrix Q ($0 \leq k \leq n$).
a, *tau*, *work*	COMPLEX for cungqr DOUBLE COMPLEX for zungqr Arrays: *a*(*lda*,*) and *tau*(*) are the arrays returned by cgeqrf/zgeqrf or cgeqpf/zgeqpf. The second dimension of *a* must be at least max(1, *n*). The dimension of *tau* must be at least max(1, *k*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
lwork	INTEGER. The size of the *work* array (*lwork* ≥ *n*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

a	Overwritten by *n* leading columns of the *m*-by-*m* unitary matrix Q.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `ungqr` interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
tau	Holds the vector of length (*k*).

Application Notes

For better performance, try using *lwork* =*n***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the `blocked algorithm`.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed *Q* differs from an exactly unitary matrix by a matrix *E* such that $||E||_2 = O(\varepsilon)||A||_2$, where ε is the machine precision.

The total number of floating-point operations is approximately 16**m***n***k* - 8*(*m* + *n*)**k2* + (16/3)**k*^{3}.

If *n* = *k*, the number is approximately (8/3)**n*^{2}*(3*m* - *n*).

The real counterpart of this routine is `?orgqr`.

?unmqr

Multiplies a complex matrix by the unitary matrix Q of the QR factorization formed by ?geqrf.

Syntax

Fortran 77:

```
call cunmqr(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call zunmqr(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
```

Fortran 95:

```
call unmqr(a, tau, c [,side] [,trans] [,info])
```

Description

The routine multiplies a rectangular complex matrix C by Q or Q_H, where Q is the unitary matrix Q of the QR factorization formed by the routines cgeqrf/zgeqrf or cgeqpf/zgeqpf.

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products $Q*C$, Q^H*C, $C*Q$, or $C*Q^H$ (overwriting the result on C).

Input Parameters

side	CHARACTER*1. Must be either 'L' or 'R'. If *side* = 'L', Q or Q_H is applied to C from the left. If *side* = 'R', Q or Q_H is applied to C from the right.
trans	CHARACTER*1. Must be either 'N' or 'C'. If *trans* = 'N', the routine multiplies C by Q. If *trans* = 'C', the routine multiplies C by Q^H.
m	INTEGER. The number of rows in the matrix C ($m \geq 0$).
n	INTEGER. The number of columns in C ($n \geq 0$).
k	INTEGER. The number of elementary reflectors whose product defines the matrix Q. Constraints: $0 \leq k \leq m$ if *side* = 'L'; $0 \leq k \leq n$ if *side* = 'R'.
a, *c*, *tau*, *work*	COMPLEX for cgeqrf

DOUBLE COMPLEX for zgeqrf.
Arrays:
a(*lda*,*) and *tau*(*) are the arrays returned by cgeqrf / zgeqrf or cgeqpf / zgeqpf.
The second dimension of *a* must be at least max(1, *k*).
The dimension of *tau* must be at least max(1, *k*).
c(*ldc*,*) contains the matrix *C*.
The second dimension of *c* must be at least max(1, *n*)
work is a workspace array, its dimension max(1, *lwork*).

lda — INTEGER. The first dimension of *a*. Constraints:

lda ≥ max(1, *m*) if *side* = 'L';

lda ≥ max(1, *n*) if *side* = 'R'.

ldc — INTEGER. The first dimension of *c*. Constraint:

ldc ≥ max(1, *m*).

lwork — INTEGER. The size of the *work* array. Constraints:

lwork ≥ max(1, *n*) if *side* = 'L';

lwork ≥ max(1, *m*) if *side* = 'R'.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.
See Application notes for the suggested value of *lwork*.

Output Parameters

c — Overwritten by the product *Q***C*, Q^H**C*, *C***Q*, or *C**Q^H (as specified by *side* and *trans*).

work(1) — If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `unmqr` interface are the following:

a	Holds the matrix *A* of size (*r*,*k*). *r* = *m* if *side* = 'L'. *r* = *n* if *side* = 'R'.
tau	Holds the vector of length (*k*).
c	Holds the matrix *C* of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
trans	Must be 'N' or 'C'. The default value is 'N'.

Application Notes

For better performance, try using *lwork* = *n***blocksize* (if *side* = 'L') or *lwork* = *m***blocksize* (if *side* = 'R') where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The real counterpart of this routine is ?ormqr.

?gelqf

Computes the LQ factorization of a general m-by-n matrix.

Syntax

Fortran 77:

```
call sgelqf(m, n, a, lda, tau, work, lwork, info)
call dgelqf(m, n, a, lda, tau, work, lwork, info)
call cgelqf(m, n, a, lda, tau, work, lwork, info)
call zgelqf(m, n, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call gelqf(a [, tau] [,info])
```

Description

The routine forms the *LQ* factorization of a general *m*-by-*n* matrix *A* (see Orthogonal Factorizations). No pivoting is performed.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of min(*m*, *n*) elementary reflectors. Routines are provided to work with *Q* in this representation.

Input Parameters

m	INTEGER. The number of rows in the matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns in *A* (*n* ≥ 0).
a, *work*	REAL for sgelqf DOUBLE PRECISION for dgelqf COMPLEX for cgelqf DOUBLE COMPLEX for zgelqf. Arrays: *a*(*lda*,*) contains the matrix *A*. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).

lwork	INTEGER. The size of the *work* array; at least max(1, *m*). If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

a	Overwritten by the factorization data as follows: If $m \le n$, the elements above the diagonal are overwritten by the details of the unitary (orthogonal) matrix Q, and the lower triangle is overwritten by the corresponding elements of the lower triangular matrix L. If $m > n$, the strictly upper triangular part is overwritten by the details of the matrix Q, and the remaining elements are overwritten by the corresponding elements of the m-by-n lower trapezoidal matrix L.
tau	REAL for sgelqf DOUBLE PRECISION for dgelqf COMPLEX for cgelqf DOUBLE COMPLEX for zgelqf. Array, DIMENSION at least max(1, min(*m*, *n*)). Contains additional information on the matrix Q.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = −*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gelqf interface are the following:

a	Holds the matrix A of size (m,n).

tau	Holds the vector of length min(*m*,*n*).

Application Notes

For better performance, try using *lwork* =*m***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed factorization is the exact factorization of a matrix $A + E$, where

$||E||_2 = O(\varepsilon) \ ||A||_2$.

The approximate number of floating-point operations for real flavors is

$(4/3)n^3$	if $m = n$,
$(2/3)n^2(3m-n)$	if $m > n$,
$(2/3)m^2(3n-m)$	if $m < n$.

The number of operations for complex flavors is 4 times greater.

To find the minimum-norm solution of an underdetermined least-squares problem minimizing $||Ax - b||_2$ for all columns b of a given matrix B, you can call the following:

?gelqf (this routine)	to factorize $A = L*Q$;
?trsm (a BLAS routine)	to solve $L*Y = B$ for Y;
?ormlq	to compute $X = (Q_1)^T*Y$ (for real matrices);
?unmlq	to compute $X = (Q_1)^H*Y$ (for complex matrices).

(The columns of the computed X are the minimum-norm solution vectors x. Here A is an m-by-n matrix with $m < n$; Q_1 denotes the first m columns of Q).

To compute the elements of Q explicitly, call

?orglq	(for real matrices)
?unglq	(for complex matrices).

?orglq

Generates the real orthogonal matrix Q of the LQ factorization formed by ?gelqf.

Syntax

Fortran 77:

```
call sorglq(m, n, k, a, lda, tau, work, lwork, info)
call dorglq(m, n, k, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call orglq(a, tau [,info])
```

Description

The routine generates the whole or part of n-by-n orthogonal matrix Q of the LQ factorization formed by the routines sgelqf/gelqf. Use this routine after a call to sgelqf/dgelqf.

Usually Q is determined from the LQ factorization of an p-by-n matrix A with $n \geq p$. To compute the whole matrix Q, use:

```
call ?orglq(n, n, p, a, lda, tau, work, lwork, info)
```

To compute the leading p rows of Q, which form an orthonormal basis in the space spanned by the rows of A, use:

```
call ?orglq(p, n, p, a, lda, tau, work, lwork, info)
```

To compute the matrix Q^k of the LQ factorization of A's leading k rows, use:

```
call ?orglq(n, n, k, a, lda, tau, work, lwork, info)
```

To compute the leading k rows of Q^k, which form an orthonormal basis in the space spanned by A's leading k rows, use:

```
call ?orgqr(k, n, k, a, lda, tau, work, lwork, info)
```

Input Parameters

m	INTEGER. The number of rows of *Q* to be computed ($0 \le m \le n$).
n	INTEGER. The order of the orthogonal matrix *Q* ($n \ge m$).
k	INTEGER. The number of elementary reflectors whose product defines the matrix *Q* ($0 \le k \le m$).
a, *tau*, *work*	REAL for sorglq DOUBLE PRECISION for dorglq Arrays: *a*(*lda*,*) and *tau*(*) are the arrays returned by sgelqf/dgelqf. The second dimension of *a* must be at least max(1, *n*). The dimension of *tau* must be at least max(1, *k*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
lwork	INTEGER. The size of the *work* array; at least max(1, *m*). If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

a	Overwritten by *m* leading rows of the *n*-by-*n* orthogonal matrix *Q*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = −*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `orglq` interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
tau	Holds the vector of length (*k*).

Application Notes

For better performance, try using *lwork* =*m***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the `blocked algorithm`.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = –1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = –1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed *Q* differs from an exactly orthogonal matrix by a matrix *E* such that $||E||_2 = O(\varepsilon)\ ||A||_2$, where *e* is the machine precision.

The total number of floating-point operations is approximately $4*m*n*k - 2*(m + n)*k^2 + (4/3)*k^3$.

If $m = k$, the number is approximately $(2/3)*m^2*(3n - m)$.

The complex counterpart of this routine is `?unglq`.

?ormlq

Multiplies a real matrix by the orthogonal matrix Q of the LQ factorization formed by ?gelqf.

Syntax

Fortran 77:

```
call sormlq(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call dormlq(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
```

Fortran 95:

```
call ormlq(a, tau, c [,side] [,trans] [,info])
```

Description

The routine multiplies a real m-by-n matrix C by Q or Q^T, where Q is the orthogonal matrix Q of the LQ factorization formed by the routine sgelqf/dgelqf.

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products $Q*C$, Q^T*C, $C*Q$, or $C*Q^T$ (overwriting the result on C).

Input Parameters

side	CHARACTER*1. Must be either 'L' or 'R'. If *side* = 'L', Q or Q^T is applied to C from the left. If *side* = 'R', Q or Q^T is applied to C from the right.
trans	CHARACTER*1. Must be either 'N' or 'T'. If *trans* = 'N', the routine multiplies C by Q. If *trans* = 'T', the routine multiplies C by Q^T.
m	INTEGER. The number of rows in the matrix C ($m \geq 0$).
n	INTEGER. The number of columns in C ($n \geq 0$).
k	INTEGER. The number of elementary reflectors whose product defines the matrix Q. Constraints: $0 \leq k \leq m$ if *side* = 'L'; $0 \leq k \leq n$ if *side* = 'R'.
a, *c*, *tau*, *work*	REAL for sormlq

DOUBLE PRECISION for dormlq.
Arrays:
a(*lda*,*) and *tau*(*) are arrays returned by ?gelqf.
The second dimension of *a* must be:
at least max(1, *m*) if *side* = 'L';
at least max(1, *n*) if *side* = 'R'.
The dimension of *tau* must be at least max(1, *k*).
c(*ldc*,*) contains the matrix *C*.
The second dimension of *c* must be at least max(1, *n*)
work is a workspace array, its dimension max(1, *lwork*).

lda — INTEGER. The first dimension of *a*; *lda* ≥ max(1, *k*).

ldc — INTEGER. The first dimension of *c*; *ldc* ≥ max(1, *m*).

lwork — INTEGER. The size of the *work* array. Constraints:

lwork ≥ max(1, *n*) if *side* = 'L';

lwork ≥ max(1, *m*) if *side* = 'R'.

If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.
See Application Notes for the suggested value of *lwork*.

Output Parameters

c — Overwritten by the product *Q***C*, Q^T**C*, *C***Q*, or *C**Q^T (as specified by *side* and *trans*).

work(1) — If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = −*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `ormlq` interface are the following:

a	Holds the matrix *A* of size (*k*,*m*).
tau	Holds the vector of length (*k*).
c	Holds the matrix *C* of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
trans	Must be 'N' or 'T'. The default value is 'N'.

Application Notes

For better performance, try using *lwork* = *n*blocksize* (if *side* = 'L') or *lwork* = *m*blocksize* (if *side* = 'R') where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork*= –1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork*= –1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The complex counterpart of this routine is ?unmlq.

?unglq

Generates the complex unitary matrix Q of the LQ factorization formed by ?gelqf.

Syntax

Fortran 77:

```
call cunglq(m, n, k, a, lda, tau, work, lwork, info)
call zunglq(m, n, k, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call unglq(a, tau [,info])
```

Description

The routine generates the whole or part of n-by-n unitary matrix Q of the LQ factorization formed by the routines cgelqf/zgelqf. Use this routine after a call to cgelqf/zgelqf.

Usually Q is determined from the LQ factorization of an p-by-n matrix A with $n < p$. To compute the whole matrix Q, use:

```
call ?unglq(n, n, p, a, lda, tau, work, lwork, info)
```

To compute the leading p rows of Q, which form an orthonormal basis in the space spanned by the rows of A, use:

```
call ?unglq(p, n, p, a, lda, tau, work, lwork, info)
```

To compute the matrix Q^k of the LQ factorization of A's leading k rows, use:

```
call ?unglq(n, n, k, a, lda, tau, work, lwork, info)
```

To compute the leading k rows of Q^k, which form an orthonormal basis in the space spanned by A's leading k rows, use:

```
call ?ungqr(k, n, k, a, lda, tau, work, lwork, info)
```

Input Parameters

m	INTEGER. The number of rows of Q to be computed ($0 \le m \le n$).
n	INTEGER. The order of the unitary matrix Q ($n \ge m$).

k	INTEGER. The number of elementary reflectors whose product defines the matrix *Q* (0 ≤ *k* ≤ *m*).
a, *tau*, *work*	COMPLEX for cunglq DOUBLE COMPLEX for zunglq Arrays: *a*(*lda*,*) and *tau*(*) are the arrays returned by sgelqf/dgelqf. The second dimension of *a* must be at least max(1, *n*). The dimension of *tau* must be at least max(1, *k*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
lwork	INTEGER. The size of the *work* array; at least max(1, *m*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

a	Overwritten by *m* leading rows of the *n*-by-*n* unitary matrix *Q*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine unglq interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
tau	Holds the vector of length (*k*).

Application Notes

For better performance, try using *lwork* = *m*blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed Q differs from an exactly unitary matrix by a matrix E such that $||E||_2 = O(\varepsilon)||A||_2$, where e is the machine precision.

The total number of floating-point operations is approximately $16*m*n*k - 8*(m + n)*k^2 + (16/3)*k^3$.

If $m = k$, the number is approximately $(8/3)*m^2*(3n - m)$.

The real counterpart of this routine is ?orglq.

?unmlq

Multiplies a complex matrix by the unitary matrix Q of the LQ factorization formed by ?gelqf.

Syntax

Fortran 77:

```
call cunmlq(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call zunmlq(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
```

Fortran 95:

```
call unmlq(a, tau, c [,side] [,trans] [,info])
```

Description

The routine multiplies a real m-by-n matrix C by Q or Q^H, where Q is the unitary matrix Q of the LQ factorization formed by the routine cgelqf/zgelqf.

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products $Q*C$, Q^H*C, $C*Q$, or $C*Q^H$ (overwriting the result on C).

Input Parameters

side	CHARACTER*1. Must be either 'L' or 'R'. If *side* = 'L', Q or Q^H is applied to C from the left. If *side* = 'R', Q or Q^H is applied to C from the right.
trans	CHARACTER*1. Must be either 'N' or 'C'. If *trans* = 'N', the routine multiplies C by Q. If *trans* = 'C', the routine multiplies C by Q_H.
m	INTEGER. The number of rows in the matrix C ($m \geq 0$).
n	INTEGER. The number of columns in C ($n \geq 0$).
k	INTEGER. The number of elementary reflectors whose product defines the matrix Q. Constraints: $0 \leq k \leq m$ if *side* = 'L'; $0 \leq k \leq n$ if *side* = 'R'.
a, *c*, *tau*, *work*	COMPLEX for cunmlq DOUBLE COMPLEX for zunmlq. Arrays: *a*(*lda*,*) and *tau*(*) are arrays returned by ?gelqf. The second dimension of *a* must be: at least max(1, m) if *side* = 'L'; at least max(1, n) if *side* = 'R'. The dimension of *tau* must be at least max(1, k). *c*(*ldc*,*) contains the matrix C. The second dimension of *c* must be at least max(1, n) *work* is a workspace array, its dimension max(1, *lwork*).

lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *k*).
ldc	INTEGER. The first dimension of *c*; *ldc* ≥ max(1, *m*).
lwork	INTEGER. The size of the *work* array. Constraints: *lwork* ≥ max(1, *n*) if *side* = 'L'; *lwork* ≥ max(1, *m*) if *side* = 'R'. If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

c	Overwritten by the product $Q*C$, Q^H*C, $C*Q$, or $C*Q^H$ (as specified by *side* and *trans*).
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = −*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine unmlq interface are the following:

a	Holds the matrix A of size (*k*,*m*).
tau	Holds the vector of length (*k*).
c	Holds the matrix C of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
trans	Must be 'N' or 'C'. The default value is 'N'.

Application Notes

For better performance, try using *lwork* = *n*blocksize* (if *side* = 'L') or *lwork* = *m*blocksize* (if *side* = 'R') where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = –1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = –1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The real counterpart of this routine is ?ormlq.

?geqlf

Computes the QL factorization of a general m-by-n matrix.

Syntax

Fortran 77:

```
call sgeqlf(m, n, a, lda, tau, work, lwork, info)
call dgeqlf(m, n, a, lda, tau, work, lwork, info)
call cgeqlf(m, n, a, lda, tau, work, lwork, info)
call zgeqlf(m, n, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call geqlf(a [, tau] [,info])
```

Description

The routine forms the *QL* factorization of a general *m*-by-*n* matrix *A*. No pivoting is performed.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of min(*m*, *n*) `elementary reflectors`. Routines are provided to work with *Q* in this representation.

Input Parameters

m	`INTEGER`. The number of rows in the matrix *A* (*m* ≥ 0).
n	`INTEGER`. The number of columns in *A* (*n* ≥ 0).

a, *work*	`REAL` for `sgeqlf`
	`DOUBLE PRECISION` for `dgeqlf`
	`COMPLEX` for `cgeqlf`
	`DOUBLE COMPLEX` for `zgeqlf`.
	Arrays: *a*(*lda*,*) contains the matrix *A*.
	The second dimension of *a* must be at least max(1, *n*).
	work is a workspace array, its dimension `max(1, lwork)`.

lda	`INTEGER`. The first dimension of *a*; at least max(1, *m*).
lwork	`INTEGER`. The size of the *work* array; at least max(1, *n*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by `xerbla`. See Application Notes for the suggested value of *lwork*.

Output Parameters

a	Overwritten on exit by the factorization data as follows: if *m* < *n*, the lower triangle of the subarray *a*(*m*-*n*+1:*m*, 1:*n*) contains the *n*-by-*n* lower triangular matrix *L*; if *m* ≤ *n*, the elements on and below the (*n*-*m*)-th superdiagonal contain the *m*-by-*n* lower trapezoidal matrix *L*; in both cases, the remaining elements, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors.
tau	`REAL` for `sgeqlf` `DOUBLE PRECISION` for `dgeqlf`

	COMPLEX for cgeqlf DOUBLE COMPLEX for zgeqlf. Array, DIMENSION at least max(1, min(*m*, *n*)). Contains scalar factors of the elementary reflectors for the matrix *Q*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine geqlf interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
tau	Holds the vector of length min(*m*,*n*).

Application Notes

For better performance, try using *lwork* =*n***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?ungql	to generate matrix Q (for complex matrices);
?ormql	to apply matrix Q (for real matrices);
?unmql	to apply matrix Q (for complex matrices).

?orgql

Generates the real matrix Q of the QL factorization formed by ?geqlf.

Syntax

Fortran 77:

```
call sorgql(m, n, k, a, lda, tau, work, lwork, info)
call dorgql(m, n, k, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call orgql(a, tau [,info])
```

Description

The routine generates an m-by-n real matrix Q with orthonormal columns, which is defined as the last n columns of a product of k elementary reflectors $H(i)$ of order m: $Q = H(k) *...* H(2)*H(1)$ as returned by the routines sgeqlf/dgeqlf. Use this routine after a call to sgeqlf/dgeqlf.

Input Parameters

m	INTEGER. The number of rows of the matrix Q ($m \geq 0$).
n	INTEGER. The number of columns of the matrix Q ($m \geq n \geq 0$).
k	INTEGER. The number of elementary reflectors whose product defines the matrix Q ($n \geq k \geq 0$).
a, *tau*, *work*	REAL for sorgql DOUBLE PRECISION for dorgql

	Arrays: *a*(*lda*,*), *tau*(*). On entry, the (*n* - *k* + *i*)th column of *a* must contain the vector which defines the elementary reflector *H*(*i*), for *i* = 1,2,...,*k*, as returned by sgeqlf/dgeqlf in the last *k* columns of its array argument *a*; *tau*(*i*) must contain the scalar factor of the elementary reflector *H*(*i*), as returned by sgeqlf/dgeqlf; The second dimension of *a* must be at least max(1, *n*). The dimension of *tau* must be at least max(1, *k*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
lwork	INTEGER. The size of the *work* array; at least max(1, *n*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

a	Overwritten by the *m*-by-*n* matrix *Q*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine orgql interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
tau	Holds the vector of length (*k*).

Application Notes

For better performance, try using *lwork* =*n*blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The complex counterpart of this routine is ?ungql.

?ungql

Generates the complex matrix Q of the QL factorization formed by ?geqlf.

Syntax

Fortran 77:

```
call cungql(m, n, k, a, lda, tau, work, lwork, info)
call zungql(m, n, k, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call ungql(a, tau [,info])
```

Description

The routine generates an *m*-by-*n* complex matrix *Q* with orthonormal columns, which is defined as the last *n* columns of a product of *k* elementary reflectors *H*(*i*) of order *m*: *Q* = *H*(*k*) *...* *H*(2)*H*(1) as returned by the routines cgeqlf/zgeqlf . Use this routine after a call to cgeqlf/zgeqlf.

Input Parameters

m	INTEGER. The number of rows of the matrix *Q* (*m*≥ 0).
n	INTEGER. The number of columns of the matrix *Q* (*m*≥*n*≥ 0).
k	INTEGER. The number of elementary reflectors whose product defines the matrix *Q* (*n*≥ *k*≥ 0).
a, *tau*, *work*	COMPLEX for cungql DOUBLE COMPLEX for zungql Arrays: *a*(*lda*,*), *tau*(*), *work*(*lwork*). On entry, the (*n* - *k* + *i*)th column of *a* must contain the vector which defines the elementary reflector *H*(*i*), for i = 1,2,...,*k*, as returned by cgeqlf/zgeqlf in the last *k* columns of its array argument *a*; *tau*(i) must contain the scalar factor of the elementaryreflector *H*(*i*), as returned by cgeqlf/zgeqlf; The second dimension of *a* must be at least max(1, *n*). The dimension of *tau* must be at least max(1, *k*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
lwork	INTEGER. The size of the *work* array; at least max(1, *n*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

a	Overwritten by the *m*-by-*n* matrix *Q*.

work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine ungql interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
tau	Holds the vector of length (*k*).

Application Notes

For better performance, try using *lwork* =*n***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The real counterpart of this routine is ?orgql.

?ormql

Multiplies a real matrix by the orthogonal matrix Q of the QL factorization formed by ?geqlf.

Syntax

Fortran 77:

```
call sormql(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call dormql(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
```

Fortran 95:

```
call ormql(a, tau, c [,side] [,trans] [,info])
```

Description

This routine multiplies a real m-by-n matrix C by Q or Q^T, where Q is the orthogonal matrix Q of the QL factorization formed by the routine sgeqlf/dgeqlf .

Depending on the parameters *side* and *trans*, the routine ?ormql can form one of the matrix products $Q*C$, Q^T*C, $C*Q$, or $C*Q^T$ (overwriting the result over C).

Input Parameters

side	CHARACTER*1. Must be either 'L' or 'R'. If *side* = 'L', Q or Q^T is applied to C from the left. If *side* = 'R', Q or Q^T is applied to C from the right.
trans	CHARACTER*1. Must be either 'N' or 'T'. If *trans* = 'N', the routine multiplies C by Q. If *trans* = 'T', the routine multiplies C by Q^T.
m	INTEGER. The number of rows in the matrix C ($m \geq 0$).
n	INTEGER. The number of columns in C ($n \geq 0$).
k	INTEGER. The number of elementary reflectors whose product defines the matrix Q. Constraints: $0 \leq k \leq m$ if *side* = 'L'; $0 \leq k \leq n$ if *side* = 'R'.
a, *tau*, *c*, *work*	REAL for sormql

DOUBLE PRECISION for dormql.
Arrays: *a*(*lda*,*), *tau*(*), *c*(*ldc*,*).
On entry, the *i*th column of *a* must contain the vector which defines the elementary reflector H_i, for i = 1,2,...,*k*, as returned by sgeqlf/dgeqlf in the last *k* columns of its array argument *a*.
The second dimension of *a* must be at least max(1, *k*).
tau(i) must contain the scalar factor of the elementary reflector H_i, as returned by sgeqlf/dgeqlf.
The dimension of *tau* must be at least max(1, *k*).
c(*ldc*,*) contains the *m*-by-*n* matrix *C*.
The second dimension of *c* must be at least max(1, *n*)
work is a workspace array, its dimension max(1, *lwork*).

lda — INTEGER. The first dimension of *a*;

if *side* = 'L', *lda* ≥ max(1, *m*);

if *side* = 'R', *lda* ≥ max(1, *n*).

ldc — INTEGER. The first dimension of *c*; *ldc* ≥ max(1, *m*).

lwork — INTEGER. The size of the *work* array. Constraints:

lwork ≥ max(1, *n*) if *side* = 'L';

lwork ≥ max(1, *m*) if *side* = 'R'.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.
See Application Notes for the suggested value of *lwork*.

Output Parameters

c — Overwritten by the product $Q*C$, Q^T*C, $C*Q$, or $C*Q^T$ (as specified by *side* and *trans*).

work(1) — If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info — INTEGER.

If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine ormql interface are the following:

a	Holds the matrix *A* of size (*r*,*k*). *r* = *m* if *side* = 'L'. *r* = *n* if *side* = 'R'.
tau	Holds the vector of length (*k*).
c	Holds the matrix *C* of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
trans	Must be 'N' or 'T'. The default value is 'N'.

Application Notes

For better performance, try using *lwork* = *n***blocksize* (if *side* = 'L') or *lwork* = *m***blocksize* (if *side* = 'R') where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The complex counterpart of this routine is ?unmql.

?unmql

Multiplies a complex matrix by the unitary matrix Q of the QL factorization formed by ?geqlf.

Syntax

Fortran 77:

```
call cunmql(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call zunmql(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
```

Fortran 95:

```
call unmql(a, tau, c [,side] [,trans] [,info])
```

Description

The routine multiplies a complex m-by-n matrix C by Q or Q^H, where Q is the unitary matrix Q of the QL factorization formed by the routine cgeqlf/zgeqlf .

Depending on the parameters *side* and *trans*, the routine ?unmql can form one of the matrix products $Q*C$, Q^H*C, $C*Q$, or $C*Q^H$ (overwriting the result over C).

Input Parameters

side	CHARACTER*1. Must be either 'L' or 'R'. If *side* = 'L', Q or Q^H is applied to C from the left. If *side* = 'R', Q or Q^H is applied to C from the right.
trans	CHARACTER*1. Must be either 'N' or 'C'. If *trans* = 'N', the routine multiplies C by Q. If *trans* = 'C', the routine multiplies C by Q^H.
m	INTEGER. The number of rows in the matrix C ($m \geq 0$).
n	INTEGER. The number of columns in C ($n \geq 0$).
k	INTEGER. The number of elementary reflectors whose product defines the matrix Q. Constraints: $0 \leq k \leq m$ if *side* = 'L'; $0 \leq k \leq n$ if *side* = 'R'.
a, *tau*, *c*, *work*	COMPLEX for cunmql

DOUBLE COMPLEX for zunmql.
Arrays: *a*(*lda*,*), *tau*(*), *c*(*ldc*,*), *work*(*lwork*).
On entry, the *i*-th column of *a* must contain the vector which defines the elementary reflector *H*(*i*), for i = 1,2,...,*k*, as returned by cgeqlf/zgeqlf in the last *k* columns of its array argument *a*.
The second dimension of *a* must be at least max(1, *k*).
tau(i) must contain the scalar factor of the elementary reflector*H*(*i*), as returned by cgeqlf/zgeqlf.
The dimension of *tau* must be at least max(1, *k*).
c(*ldc*,*) contains the *m*-by-*n* matrix *C*.
The second dimension of *c* must be at least max(1, *n*)
work is a workspace array, its dimension max(1, *lwork*).

lda — INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).

ldc — INTEGER. The first dimension of *c*; *ldc* ≥ max(1, *m*).

lwork — INTEGER. The size of the *work* array. Constraints:

lwork ≥ max(1, *n*) if *side* = 'L';

lwork ≥ max(1, *m*) if *side* = 'R'.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.
See Application Notes for the suggested value of *lwork*.

Output Parameters

c — Overwritten by the product *Q***C*, Q^H**C*, *C***Q*, or *C**Q^H (as specified by *side* and *trans*).

work(1) — If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `unmql` interface are the following:

a	Holds the matrix *A* of size (*r*,*k*). *r* = *m* if *side* = 'L'. *r* = *n* if *side* = 'R'.
tau	Holds the vector of length (*k*).
c	Holds the matrix *C* of size (*m*,*n*).
side	Must be 'L' or 'L'. The default value is 'L'.
trans	Must be 'N' or 'C'. The default value is 'N'.

Application Notes

For better performance, try using *lwork* = *n***blocksize* (if *side* = 'L') or *lwork* = *m***blocksize* (if *side* = 'R') where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The real counterpart of this routine is ?ormql.

?gerqf

Computes the RQ factorization of a general m-by-n matrix.

Syntax

Fortran 77:

```
call sgerqf(m, n, a, lda, tau, work, lwork, info)
call dgerqf(m, n, a, lda, tau, work, lwork, info)
call cgerqf(m, n, a, lda, tau, work, lwork, info)
call zgerqf(m, n, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call gerqf(a [, tau] [,info])
```

Description

The routine forms the *RQ* factorization of a general *m*-by-*n* matrix *A*. No pivoting is performed.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of min(*m*, *n*) elementary reflectors. Routines are provided to work with *Q* in this representation.

Input Parameters

m	INTEGER. The number of rows in the matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns in *A* (*n* ≥ 0).
a, *work*	REAL for sgerqf DOUBLE PRECISION for dgerqf COMPLEX for cgerqf DOUBLE COMPLEX for zgerqf. Arrays: *a*(*lda*,*) contains the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
lwork	INTEGER. The size of the *work* array;

lwork ≥ max(1, *m*).
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.
See Application Notes for the suggested value of *lwork*.

Output Parameters

a
Overwritten on exit by the factorization data as follows:
if *m* ≤ *n*, the upper triangle of the subarray *a*(1:*m*, *n*-*m*+1:*n*) contains the *m*-by-*m* upper triangular matrix *R*;
if *m* ≥ *n*, the elements on and above the (*m*-*n*)th subdiagonal contain the *m*-by-*n* upper trapezoidal matrix *R*;
in both cases, the remaining elements, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of min(*m*,*n*) elementary reflectors.

tau
REAL for sgerqf
DOUBLE PRECISION for dgerqf
COMPLEX for cgerqf
DOUBLE COMPLEX for zgerqf.
Array, DIMENSION at least max (1, min(*m*, *n*)).
Contains scalar factors of the elementary reflectors for the matrix *Q*.

work(1)
If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance.

info
INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gerqf interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
tau	Holds the vector of length min(*m*,*n*).

Application Notes

For better performance, try using *lwork* =*m***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = –1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = –1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

Related routines include:

?orgrq	to generate matrix Q (for real matrices);
?ungrq	to generate matrix Q (for complex matrices);
?ormrq	to apply matrix Q (for real matrices);
?unmrq	to apply matrix Q (for complex matrices).

?orgrq

Generates the real matrix Q of the RQ factorization formed by ?gerqf.

Syntax

Fortran 77:

```
call sorgrq(m, n, k, a, lda, tau, work, lwork, info)
call dorgrq(m, n, k, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call orgrq(a, tau [,info])
```

Description

The routine generates an *m*-by-*n* real matrix *Q* with orthonormal rows, which is defined as the last *m* rows of a product of *k* elementary reflectors *H*(*i*) of order *n*: *Q* = *H*(1)**H*(2)**...***H*(*k*) as returned by the routines sgerqf/dgerqf. Use this routine after a call to sgerqf/dgerqf.

Input Parameters

m	INTEGER. The number of rows of the matrix *Q* (*m*≥ 0).
n	INTEGER. The number of columns of the matrix *Q* (*n*≥ *m*).
k	INTEGER. The number of elementary reflectors whose product defines the matrix *Q* (*m*≥ *k*≥ 0).
a, *tau*, *work*	REAL for sorgrq DOUBLE PRECISION for dorgrq Arrays: *a*(*lda*,*), *tau*(*). On entry, the (*m* - *k* + *i*)th row of *a* must contain the vector which defines the elementary reflector *H*(*i*), for i = 1,2,...,*k*, as returned by sgerqf/dgerqf in the last *k* rows of its array argument *a*; *tau*(i) must contain the scalar factor of the elementary reflector *H*(*i*), as returned by sgerqf/dgerqf; The second dimension of *a* must be at least max(1, *n*).

	The dimension of *tau* must be at least max(1, *k*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
lwork	INTEGER. The size of the *work* array; at least max(1, *m*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

a	Overwritten by the *m*-by-*n* matrix *Q*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine orgrq interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
tau	Holds the vector of length (*k*).

Application Notes

For better performance, try using *lwork* =*m***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The complex counterpart of this routine is ?ungrq.

?ungrq

Generates the complex matrix Q of the RQ factorization formed by ?gerqf.

Syntax

Fortran 77:

```
call cungrq(m, n, k, a, lda, tau, work, lwork, info)
call zungrq(m, n, k, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call ungrq(a, tau [,info])
```

Description

The routine generates an *m*-by-*n* complex matrix *Q* with orthonormal rows, which is defined as the last *m* rows of a product of *k* elementary reflectors *H*(*i*) of order *n*: *Q* = *H*(1)*H** *H*(2)*H**...**H*(*k*)*H* as returned by the routines sgerqf/dgerqf. Use this routine after a call to sgerqf/dgerqf.

Input Parameters

m — INTEGER. The number of rows of the matrix *Q* (*m* ≥ 0).

n — INTEGER. The number of columns of the matrix *Q* (*n* ≥ *m*).

k	INTEGER. The number of elementary reflectors whose product defines the matrix *Q* (*m*≥ *k*≥ 0).
a, *tau*, *work*	REAL for cungrq DOUBLE PRECISION for zungrq Arrays: *a*(*lda*,*), *tau*(*), *work*(*lwork*). On entry, the (*m* - *k* + *i*)th row of *a* must contain the vector which defines the elementary reflector *H*(*i*), for i = 1,2,...,*k*, as returned by sgerqf/dgerqf in the last *k* rows of its array argument *a*; *tau*(i) must contain the scalar factor of the elementary reflector *H*(*i*), as returned by sgerqf/dgerqf; The second dimension of *a* must be at least max(1, *n*). The dimension of *tau* must be at least max(1, *k*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
lwork	INTEGER. The size of the *work* array; at least max(1, *m*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

a	Overwritten by the *m*-by-*n* matrix *Q*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine ungrq interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
tau	Holds the vector of length (*k*).

Application Notes

For better performance, try using *lwork* =*m***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The real counterpart of this routine is ?orgrq.

?ormrq

Multiplies a real matrix by the orthogonal matrix Q of the RQ factorization formed by ?gerqf.

Syntax

Fortran 77:

```
call sormrq(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call dormrq(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
```

Fortran 95:

```
call ormrq(a, tau, c [,side] [,trans] [,info])
```

Description

The routine multiplies a real m-by-n matrix C by Q or Q^T, where Q is the real orthogonal matrix defined as a product of k elementary reflectors H_i : $Q = H_1 H_2 \ldots H_k$ as returned by the RQ factorization routine sgerqf/dgerqf .

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products QC, Q^TC, CQ, or CQ^T (overwriting the result over C).

Input Parameters

side	CHARACTER*1. Must be either 'L' or 'R'. If *side* = 'L', Q or Q^T is applied to C from the left. If *side* = 'R', Q or Q^T is applied to C from the right.
trans	CHARACTER*1. Must be either 'N' or 'T'. If *trans* = 'N', the routine multiplies C by Q. If *trans* = 'T', the routine multiplies C by Q^T.
m	INTEGER. The number of rows in the matrix C ($m \geq 0$).
n	INTEGER. The number of columns in C ($n \geq 0$).
k	INTEGER. The number of elementary reflectors whose product defines the matrix Q. Constraints: $0 \leq k \leq m$, if *side* = 'L'; $0 \leq k \leq n$, if *side* = 'R'.
a, *tau*, *c*, *work*	REAL for sormrq DOUBLE PRECISION for dormrq. Arrays: *a*(*lda*,*), *tau*(*), *c*(*ldc*,*). On entry, the *i*th row of *a* must contain the vector which defines the elementary reflector H_i, for i = 1,2,...,k, as returned by sgerqf/dgerqf in the last k rows of its array argument *a*. The second dimension of *a* must be at least max(1, m) if *side* = 'L', and at least max(1, n) if *side* = 'R'. *tau*(i) must contain the scalar factor of the elementary reflector H_i, as returned by sgerqf/dgerqf. The dimension of *tau* must be at least max(1, k). *c*(*ldc*,*) contains the m-by-n matrix C. The second dimension of *c* must be at least max(1, n)

	work is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *k*).
ldc	INTEGER. The first dimension of *c*; *ldc* ≥ max(1, *m*).
lwork	INTEGER. The size of the *work* array. Constraints: *lwork* ≥ max(1, *n*) if *side* = 'L'; *lwork* ≥ max(1, *m*) if *side* = 'R'. If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

c	Overwritten by the product QC, Q^TC, CQ, or CQ^T (as specified by *side* and *trans*).
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = −*i*, the *i*th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine ormrq interface are the following:

a	Holds the matrix A of size (*k*,*m*).
tau	Holds the vector of length (*k*).
c	Holds the matrix C of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
trans	Must be 'N' or 'T'. The default value is 'N'.

Application Notes

For better performance, try using *lwork* = *n*blocksize* (if *side* = 'L') or *lwork* = *m*blocksize* (if *side* = 'R') where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = –1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = –1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The complex counterpart of this routine is ?unmrq.

?unmrq

Multiplies a complex matrix by the unitary matrix Q of the RQ factorization formed by ?gerqf.

Syntax

Fortran 77:

```
call cunmrq(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call zunmrq(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
```

Fortran 95:

```
call unmrq(a, tau, c [,side] [,trans] [,info])
```

Description

The routine multiplies a complex *m*-by-*n* matrix *C* by *Q* or Q^H, where *Q* is the complex unitary matrix defined as a product of *k* elementary reflectors *H(i)* of order *n*: *Q = H(1)H* H(2)H*...*H(k)H*as returned by the *RQ* factorization routine cgerqf/zgerqf .

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products *Q*C*, Q^H**C*, *C*Q*, or *C**Q^H (overwriting the result over *C*).

Input Parameters

side	CHARACTER*1. Must be either 'L' or 'R'. If *side* = 'L', *Q* or Q^H is applied to *C* from the left. If *side* = 'R', *Q* or Q^H is applied to *C* from the right.
trans	CHARACTER*1. Must be either 'N' or 'C'. If *trans* = 'N', the routine multiplies *C* by *Q*. If *trans* = 'C', the routine multiplies *C* by Q^H.
m	INTEGER. The number of rows in the matrix *C* (*m* ≥ 0).
n	INTEGER. The number of columns in *C* (*n* ≥ 0).
k	INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. Constraints: 0 ≤ *k* ≤ *m*, if *side* = 'L'; 0 ≤ *k* ≤ *n*, if *side* = 'R'.
a, *tau*, *c*, *work*	COMPLEX for cunmrq DOUBLE COMPLEX for zunmrq. Arrays: *a*(*lda*,*), *tau*(*), *c*(*ldc*,*), *work*(*lwork*). On entry, the *i*th row of *a* must contain the vector which defines the elementary reflector *H*(*i*), for i = 1,2,...,*k*, as returned by cgerqf/zgerqf in the last *k* rows of its array argument *a*. The second dimension of *a* must be at least max(1, *m*) if *side* = 'L', and at least max(1, *n*) if *side* = 'R'. *tau*(i) must contain the scalar factor of the elementary reflector *H*(*i*), as returned by cgerqf/zgerqf. The dimension of *tau* must be at least max(1, *k*). *c*(*ldc*,*) contains the *m*-by-*n* matrix *C*. The second dimension of *c* must be at least max(1, *n*)

	work is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *k*) .
ldc	INTEGER. The first dimension of *c*; *ldc* ≥ max(1, *m*).
lwork	INTEGER. The size of the *work* array. Constraints: *lwork* ≥ max(1, *n*) if *side* = 'L'; *lwork* ≥ max(1, *m*) if *side* = 'R'. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

c	Overwritten by the product *Q*C*, Q^H*C, *C*Q*, or $C*Q^H$ (as specified by *side* and *trans*).
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine unmrq interface are the following:

a	Holds the matrix *A* of size (*k*,*m*).
tau	Holds the vector of length (*k*).
c	Holds the matrix *C* of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
trans	Must be 'N' or 'C'. The default value is 'N'.

Application Notes

For better performance, try using *lwork* = *n*blocksize* (if *side* = 'L') or *lwork* = *m*blocksize* (if *side* = 'R') where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The real counterpart of this routine is ?ormrq.

?tzrzf

Reduces the upper trapezoidal matrix A to upper triangular form.

Syntax

Fortran 77:

```
call stzrzf(m, n, a, lda, tau, work, lwork, info)
call dtzrzf(m, n, a, lda, tau, work, lwork, info)
call ctzrzf(m, n, a, lda, tau, work, lwork, info)
call ztzrzf(m, n, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call tzrzf(a [, tau] [,info])
```

Description

This routine reduces the m-by-n ($m \le n$) real/complex upper trapezoidal matrix A to upper triangular form by means of orthogonal/unitary transformations. The upper trapezoidal matrix A is factored as

$A = (R\ 0) * Z$,

where Z is an n-by-n orthogonal/unitary matrix and R is an m-by-m upper triangular matrix.

See ?larz that applies an elementary reflector returned by ?tzrzf to a general matrix.

Input Parameters

m	INTEGER. The number of rows in the matrix A ($m \ge 0$).
n	INTEGER. The number of columns in A ($n \ge m$).
a, *work*	REAL for stzrzf DOUBLE PRECISION for dtzrzf COMPLEX for ctzrzf DOUBLE COMPLEX for ztzrzf. Arrays: *a*(*lda*,*), *work*(*lwork*) .The leading m-by-n upper trapezoidal part of the array *a* contains the matrix A to be factorized. The second dimension of *a* must be at least max(1, n). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, m).
lwork	INTEGER. The size of the *work* array; *lwork* ≥ max(1, m). If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

a	Overwritten on exit by the factorization data as follows:

	the leading *m*-by-*m* upper triangular part of *a* contains the upper triangular matrix *R*, and elements *m* +1 to *n* of the first *m* rows of *a*, with the array *tau*, represent the orthogonal matrix *Z* as a product of *m* elementary reflectors.
tau	REAL for stzrzf DOUBLE PRECISION for dtzrzf COMPLEX for ctzrzf DOUBLE COMPLEX for ztzrzf. Array, DIMENSION at least max (1, *m*). Contains scalar factors of the elementary reflectors for the matrix *Z*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine tzrzf interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
tau	Holds the vector of length (*m*).

Application Notes

For better performance, try using *lwork* =*m***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

Related routines include:

?ormrz	to apply matrix Q (for real matrices)
?unmrz	to apply matrix Q (for complex matrices).

?ormrz

Multiplies a real matrix by the orthogonal matrix defined from the factorization formed by ?tzrzf.

Syntax

Fortran 77:

```
call sormrz(side, trans, m, n, k, l, a, lda, tau, c, ldc, work, lwork, info)
call dormrz(side, trans, m, n, k, l, a, lda, tau, c, ldc, work, lwork, info)
```

Fortran 95:

```
call ormrz(a, tau, c, l [, side] [,trans] [,info])
```

Description

The routine multiplies a real *m*-by-*n* matrix *C* by *Q* or Q^T, where *Q* is the real orthogonal matrix defined as a product of *k* elementary reflectors *H(i)* of order *n*: *Q = H(1)* H(2)*...*H(k)* as returned by the factorization routine stzrzf/dtzrzf .

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products *Q*C*, Q^T**C*, *C*Q*, or *C**Q^T (overwriting the result over *C*).

The matrix *Q* is of order *m* if *side* = 'L' and of order *n* if *side* = 'R'.

Input Parameters

side	CHARACTER*1. Must be either 'L' or 'R'. If *side* = 'L', *Q* or Q^T is applied to *C* from the left.

	If *side* = 'R', Q or Q^T is applied to C from the right.
trans	CHARACTER*1. Must be either 'N' or 'T'. If *trans* = 'N', the routine multiplies C by Q. If *trans* = 'T', the routine multiplies C by Q^T.
m	INTEGER. The number of rows in the matrix C ($m \geq 0$).
n	INTEGER. The number of columns in C ($n \geq 0$).
k	INTEGER. The number of elementary reflectors whose product defines the matrix Q. Constraints: $0 \leq k \leq m$, if *side* = 'L'; $0 \leq k \leq n$, if *side* = 'R'.
l	INTEGER. The number of columns of the matrix A containing the meaningful part of the Householder reflectors. Constraints: $0 \leq l \leq m$, if *side* = 'L'; $0 \leq l \leq n$, if *side* = 'R'.
a, *tau*, *c*, *work*	REAL for sormrz DOUBLE PRECISION for dormrz. Arrays: *a*(*lda*,*), *tau*(*), *c*(*ldc*,*). On entry, the *i*th row of *a* must contain the vector which defines the elementary reflector *H(i)*, for i = 1,2,...,*k*, as returned by stzrzf/dtzrzf in the last *k* rows of its array argument *a*. The second dimension of *a* must be at least max(1, *m*) if *side* = 'L', and at least max(1, *n*) if *side* = 'R'. *tau*(i) must contain the scalar factor of the elementary reflector *H(i)*, as returned by stzrzf/dtzrzf. The dimension of *tau* must be at least max(1, *k*). *c*(*ldc*,*) contains the *m*-by-*n* matrix C. The second dimension of *c* must be at least max(1, *n*) *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *k*) .
ldc	INTEGER. The first dimension of *c*; *ldc* ≥ max(1, *m*).
lwork	INTEGER. The size of the *work* array. Constraints:

lwork ≥ max(1, *n*) if *side* = 'L';

lwork ≥ max(1, *m*) if *side* = 'R'.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

c	Overwritten by the product $Q*C$, Q^T*C, $C*Q$, or $C*Q^T$ (as specified by *side* and *trans*).
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine ormrz interface are the following:

a	Holds the matrix *A* of size (*k*,*m*).
tau	Holds the vector of length (*k*).
c	Holds the matrix *C* of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
trans	Must be 'N' or 'T'. The default value is 'N'.

Application Notes

For better performance, try using *lwork* = *n***blocksize* (if *side* = 'L') or *lwork* = *m***blocksize* (if *side* = 'R') where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The complex counterpart of this routine is ?unmrz.

?unmrz

Multiplies a complex matrix by the unitary matrix defined from the factorization formed by ?tzrzf.

Syntax

Fortran 77:

```
call cunmrz(side, trans, m, n, k, l, a, lda, tau, c, ldc, work, lwork, info)
call zunmrz(side, trans, m, n, k, l, a, lda, tau, c, ldc, work, lwork, info)
```

Fortran 95:

```
call unmrz(a, tau, c, l [,side] [,trans] [,info])
```

Description

The routine multiplies a complex *m*-by-*n* matrix *C* by *Q* or Q^H, where *Q* is the unitary matrix defined as a product of *k* elementary reflectors *H*(*i*):

Q = *H*(1)*H** *H*(2)*H**...**H*(*k*)*H* as returned by the factorization routine ctzrzf/ztzrzf .

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products *Q***C*, Q^H**C*, *C***Q*, or *C***Q^H** (overwriting the result over *C*).

The matrix *Q* is of order *m* if *side* = 'L' and of order *n* if *side* = 'R'.

Input Parameters

side	CHARACTER*1. Must be either 'L' or 'R'. If *side* = 'L', Q or Q^H is applied to C from the left. If *side* = 'R', Q or Q^H is applied to C from the right.
trans	CHARACTER*1. Must be either 'N' or 'C'. If *trans* = 'N', the routine multiplies C by Q. If *trans* = 'C', the routine multiplies C by Q^H.
m	INTEGER. The number of rows in the matrix C ($m \geq 0$).
n	INTEGER. The number of columns in C ($n \geq 0$).
k	INTEGER. The number of elementary reflectors whose product defines the matrix Q. Constraints: $0 \leq k \leq m$, if *side* = 'L'; $0 \leq k \leq n$, if *side* = 'R'.
l	INTEGER. The number of columns of the matrix A containing the meaningful part of the Householder reflectors. Constraints: $0 \leq l \leq m$, if *side* = 'L'; $0 \leq l \leq n$, if *side* = 'R'.
a, *tau*, *c*, *work*	COMPLEX for cunmrz DOUBLE COMPLEX for zunmrz. Arrays: *a*(*lda*,*), *tau*(*), *c*(*ldc*,*), *work*(*lwork*). On entry, the *i*th row of *a* must contain the vector which defines the elementary reflector *H*(*i*), for i = 1,2,...,*k*, as returned by ctzrzf/ztzrzf in the last *k* rows of its array argument *a*. The second dimension of *a* must be at least max(1, *m*) if *side* = 'L', and at least max(1, *n*) if *side* = 'R'. *tau*(i) must contain the scalar factor of the elementary reflector *H*(*i*), as returned by ctzrzf/ztzrzf. The dimension of *tau* must be at least max(1, *k*). *c*(*ldc*,*) contains the *m*-by-*n* matrix *C*. The second dimension of *c* must be at least max(1, *n*) *work* is a workspace array, its dimension max(1, *lwork*).

lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *k*).
ldc	INTEGER. The first dimension of *c*; *ldc* ≥ max(1, *m*).
lwork	INTEGER. The size of the *work* array. Constraints: *lwork* ≥ max(1, *n*) if *side* = 'L'; *lwork* ≥ max(1, *m*) if *side* = 'R'. If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

c	Overwritten by the product $Q*C$, Q^H*C, $C*Q$, or $C*Q^H$ (as specified by *side* and *trans*).
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = −*i*, the *i*th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine unmrz interface are the following:

a	Holds the matrix *A* of size (*k*,*m*).
tau	Holds the vector of length (*k*).
c	Holds the matrix *C* of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
trans	Must be 'N' or 'C'. The default value is 'N'.

Application Notes

For better performance, try using *lwork* = *n*blocksize* (if *side* = 'L') or *lwork* = *m*blocksize* (if *side* = 'R') where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = –1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = –1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The real counterpart of this routine is ?ormrz.

?ggqrf

Computes the generalized QR factorization of two matrices.

Syntax

Fortran 77:

```
call sggqrf(n, m, p, a, lda, taua, b, ldb, taub, work, lwork, info)
call dggqrf(n, m, p, a, lda, taua, b, ldb, taub, work, lwork, info)
call cggqrf(n, m, p, a, lda, taua, b, ldb, taub, work, lwork, info)
call zggqrf(n, m, p, a, lda, taua, b, ldb, taub, work, lwork, info)
```

Fortran 95:

```
call ggqrf(a, b [,taua] [,taub] [,info])
```

Description

The routine forms the generalized QR factorization of an n-by-m matrix A and an n-by-p matrix B as $A = Q*R$, $B = Q*T*Z$, where Q is an n-by-n orthogonal/unitary matrix, Z is a p-by-p orthogonal/unitary matrix, and R and T assume one of the forms:

$$R = \begin{array}{c} \\ m \\ n-m \end{array} \begin{array}{c} \begin{array}{c} m \end{array} \\ \begin{pmatrix} R_{11} \\ 0 \end{pmatrix} \end{array}, \quad \text{if } n \geq m$$

or

$$R = \begin{array}{c} \\ n \end{array} \begin{array}{c} \begin{array}{cc} n & m-n \end{array} \\ \begin{pmatrix} R_{11} & R_{12} \end{pmatrix} \end{array}, \quad \text{if } n < m$$

where R_{11} is upper triangular, and

$$T = \begin{array}{c} \\ n \end{array} \begin{array}{c} \begin{array}{cc} p-n & n \end{array} \\ \begin{pmatrix} 0 & T_{12} \end{pmatrix} \end{array}, \quad \text{if} \quad n \leq p,$$

$$T = \begin{array}{c} \\ n-p \\ p \end{array} \begin{array}{c} \begin{array}{c} p \end{array} \\ \begin{pmatrix} T_{11} \\ T_{21} \end{pmatrix} \end{array}, \quad \text{if } n > p,$$

where T_{12} or T_{21} is a p-by-p upper triangular matrix.

In particular, if B is square and nonsingular, the GQR factorization of A and B implicitly gives the QR factorization of $B^{-1}A$ as:

$B^{-1}*A = Z^{H}*(T^{-1}*R)$

Input Parameters

n	INTEGER. The number of rows of the matrices *A* and *B* (*n* ≥ 0).
m	INTEGER. The number of columns in *A* (*m* ≥ 0).
p	INTEGER. The number of columns in *B* (*p* ≥ 0).
a, *b*, *work*	REAL for sggqrf DOUBLE PRECISION for dggqrf COMPLEX for cggqrf DOUBLE COMPLEX for zggqrf. Arrays: *a*(*lda*,*) contains the matrix *A*. The second dimension of *a* must be at least max(1, *m*). *b*(*ldb*,*) contains the matrix *B*. The second dimension of *b* must be at least max(1, *p*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
ldb	INTEGER. The first dimension of *b*; at least max(1, *n*).
lwork	INTEGER. The size of the *work* array; must be at least max(1, *n*, *m*, *p*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

a, *b*	Overwritten by the factorization data as follows: on exit, the elements on and above the diagonal of the array *a* contain the min(*n*,*m*)-by-*m* upper trapezoidal matrix *R* (*R* is upper triangular if *n* ≥ *m*);the elements below the diagonal, with the array *taua*, represent the orthogonal/unitary matrix *Q* as a product of min(*n*,*m*) elementary reflectors ; if *n* ≤ *p*, the upper triangle of the subarray *b*(1:*n*, *p*-*n*+1:*p*) contains the *n*-by-*n* upper triangular matrix *T*;

	if $n > p$, the elements on and above the (n-p)th subdiagonal contain the n-by-p upper trapezoidal matrix T; the remaining elements, with the array *taub*, represent the orthogonal/unitary matrix Z as a product of elementary reflectors.

taua, *taub*	`REAL` for `sggqrf`
	`DOUBLE PRECISION` for `dggqrf`
	`COMPLEX` for `cggqrf`
	`DOUBLE COMPLEX` for `zggqrf`.
	Arrays, `DIMENSION` at least max (1, min(n, m)) for *taua* and at least max (1, min(n, p)) for *taub*. The array *taua* contains the scalar factors of the elementary reflectors which represent the orthogonal/unitary matrix Q.
	The array *taub* contains the scalar factors of the elementary reflectors which represent the orthogonal/unitary matrix Z.

work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	`INTEGER`. If *info* = 0, the execution is successful. If *info* = $-i$, the i-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `ggqrf` interface are the following:

a	Holds the matrix A of size (n,m).
b	Holds the matrix B of size (n,p).
taua	Holds the vector of length min(n,m).
taub	Holds the vector of length min(n,p).

Application Notes

For better performance, try using *lwork* ≥ max(*n*,*m*, *p*)*max(*nb1*,*nb2*,*nb3*), where *nb1* is the optimal blocksize for the *QR* factorization of an *n*-by-*m* matrix, *nb2* is the optimal blocksize for the *RQ* factorization of an *n*-by-*p* matrix, and *nb3* is the optimal blocksize for a call of ?ormqr/?unmqr.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?ggrqf

Computes the generalized RQ factorization of two matrices.

Syntax

Fortran 77:

```
call sggrqf (m, p, n, a, lda, taua, b, ldb, taub, work, lwork, info)
call dggrqf (m, p, n, a, lda, taua, b, ldb, taub, work, lwork, info)
call cggrqf (m, p, n, a, lda, taua, b, ldb, taub, work, lwork, info)
call zggrqf (m, p, n, a, lda, taua, b, ldb, taub, work, lwork, info)
```

Fortran 95:

```
call ggrqf(a, b [,taua] [,taub] [,info])
```

Description

The routine forms the generalized *RQ* factorization of an *m*-by-*n* matrix *A* and an *p*-by-*n* matrix *B* as *A = R*Q*, *B = Z*T*Q*, where *Q* is an *n*-by-*n* orthogonal/unitary matrix, *Z* is a *p*-by-*p* orthogonal/unitary matrix, and *R* and *T* assume one of the forms:

$$R = \begin{array}{c} \\ m \end{array} \begin{array}{c} \begin{array}{cc} n-m & m \end{array} \\ \begin{pmatrix} 0 & R_{12} \end{pmatrix} \end{array}, \quad \text{if } m \le n,$$

or

$$R = \begin{array}{c} m-n \\ n \end{array} \begin{array}{c} \begin{array}{c} n \end{array} \\ \begin{pmatrix} R_{11} \\ R_{21} \end{pmatrix} \end{array}, \quad \text{if } m > n,$$

where R_{11} or R_{21} is upper triangular, and

$$T = \begin{array}{c} \\ p-n \end{array} \begin{array}{c} \begin{array}{c} n \end{array} \\ \begin{pmatrix} T_{11} \\ 0 \end{pmatrix} \end{array}, \quad \text{if } p \ge n,$$

or

$$T = \begin{array}{c} p \end{array} \begin{array}{c} \begin{array}{cc} p & n-p \end{array} \\ \begin{pmatrix} T_{11} & T_{12} \end{pmatrix} \end{array}, \quad \text{if } p < n,$$

where T_{11} is upper triangular.

In particular, if B is square and nonsingular, the GRQ factorization of A and B implicitly gives the RQ factorization of $A*B^{-1}$ as:

$A*B^{-1} = (R*T^{-1})*Z^{H}$

Input Parameters

m	INTEGER. The number of rows of the matrix A ($m \geq 0$).
p	INTEGER. The number of rows in B ($p \geq 0$).
n	INTEGER. The number of columns of the matrices A and B ($n \geq 0$).
a, b, $work$	REAL for sggrqf DOUBLE PRECISION for dggrqf COMPLEX for cggrqf DOUBLE COMPLEX for zggrqf. Arrays: a(lda,*) contains the m-by-n matrix A. The second dimension of a must be at least max(1, n). b(ldb,*) contains the p-by-n matrix B. The second dimension of b must be at least max(1, n). $work$ is a workspace array, its dimension max(1, $lwork$).
lda	INTEGER. The first dimension of a; at least max(1, m).
ldb	INTEGER. The first dimension of b; at least max(1, p).
$lwork$	INTEGER. The size of the $work$ array; must be at least max(1, n, m, p). If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the $work$ array, returns this value as the first entry of the $work$ array, and no error message related to $lwork$ is issued by xerbla. See Application Notes for the suggested value of $lwork$.

Output Parameters

a, b	Overwritten by the factorization data as follows: on exit, if $m \leq n$, the upper triangle of the subarray a(1:m, n-m+1:n) contains the m-by-m upper triangular matrix R;

	if $m > n$, the elements on and above the (m-n)th subdiagonal contain the m-by-n upper trapezoidal matrix R; the remaining elements, with the array *taua*, represent the orthogonal/unitary matrix Q as a product of elementary reflectors; the elements on and above the diagonal of the array *b* contain the min(p,n)-by-n upper trapezoidal matrix T (T is upper triangular if $p \geq n$); the elements below the diagonal, with the array *taub*, represent the orthogonal/unitary matrix Z as a product of elementary reflectors.

taua, *taub*	`REAL` for `sggrqf`
	`DOUBLE PRECISION` for `dggrqf`
	`COMPLEX` for `cggrqf`
	`DOUBLE COMPLEX` for `zggrqf`.
	Arrays, `DIMENSION` at least max (1, min(m, n)) for *taua* and at least max (1, min(p, n)) for *taub*.
	The array *taua* contains the scalar factors of the elementary reflectors which represent the orthogonal/unitary matrix Q.
	The array *taub* contains the scalar factors of the elementary reflectors which represent the orthogonal/unitary matrix Z.

work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	`INTEGER`. If *info* = 0, the execution is successful. If *info* = –*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `ggrqf` interface are the following:

a	Holds the matrix A of size (m,n).
b	Holds the matrix A of size (p,n).
taua	Holds the vector of length min(m,n).

taub Holds the vector of length min(*p*,*n*).

Application Notes

For better performance, try using

lwork ≥ max(*n*,*m*, *p*)*max(*nb1*,*nb2*,*nb3*),

where *nb1* is the optimal blocksize for the *RQ* factorization of an *m*-by-*n* matrix, *nb2* is the optimal blocksize for the *QR* factorization of an *p*-by-*n* matrix, and *nb3* is the optimal blocksize for a call of ?ormrq/?unmrq.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork*= -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork*= -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

Singular Value Decomposition

This section describes LAPACK routines for computing the singular value decomposition (SVD) of a general *m*-by-*n* matrix *A*:

$A = U\Sigma V^H$.

In this decomposition, *U* and *V* are unitary (for complex *A*) or orthogonal (for real *A*); Σ is an *m*-by-*n* diagonal matrix with real diagonal elements σ_i:

$\sigma_1 < \sigma_2 < \ldots < \sigma_{\min(m,\ n)} < 0$.

The diagonal elements σ_i are singular values of *A*. The first min(*m*, *n*) columns of the matrices *U* and *V* are, respectively, left and right singular vectors of *A*. The singular values and singular vectors satisfy

$Av_i = \sigma_i u_i$ and $A^H ui = \sigma_i v_i$

where u_i and v_i are the i th columns of U and V, respectively.

To find the SVD of a general matrix A, call the LAPACK routine ?gebrd or ?gbbrd for reducing A to a bidiagonal matrix B by a unitary (orthogonal) transformation: $A = QBP^H$. Then call ?bdsqr, which forms the SVD of a bidiagonal matrix: $B = U_1 \Sigma V_1^H$.

Thus, the sought-for SVD of A is given by $A = U\Sigma V^H = (QU_1)\Sigma(V_1^H P^H)$.

Table 4-2 lists LAPACK routines (Fortran-77 interface) that perform singular value decomposition of matrices. Respective routine names in Fortran-95 interface are without the first symbol (see Routine Naming Conventions).

Table 4-2 Computational Routines for Singular Value Decomposition (SVD)

Operation	Real matrices	Complex matrices
Reduce A to a bidiagonal matrix B: $A = QBP^H$ (full storage)	?gebrd	?gebrd
Reduce A to a bidiagonal matrix B: $A = QBP^H$ (band storage)	?gbbrd	?gbbrd
Generate the orthogonal (unitary) matrix Q or P	?orgbr	?ungbr
Apply the orthogonal (unitary) matrix Q or P	?ormbr	?unmbr
Form singular value decomposition of the bidiagonal matrix B: $B = U\Sigma V^H$	?bdsqr ?bdsdc	?bdsqr

Figure 4-1 Decision Tree: Singular Value Decomposition

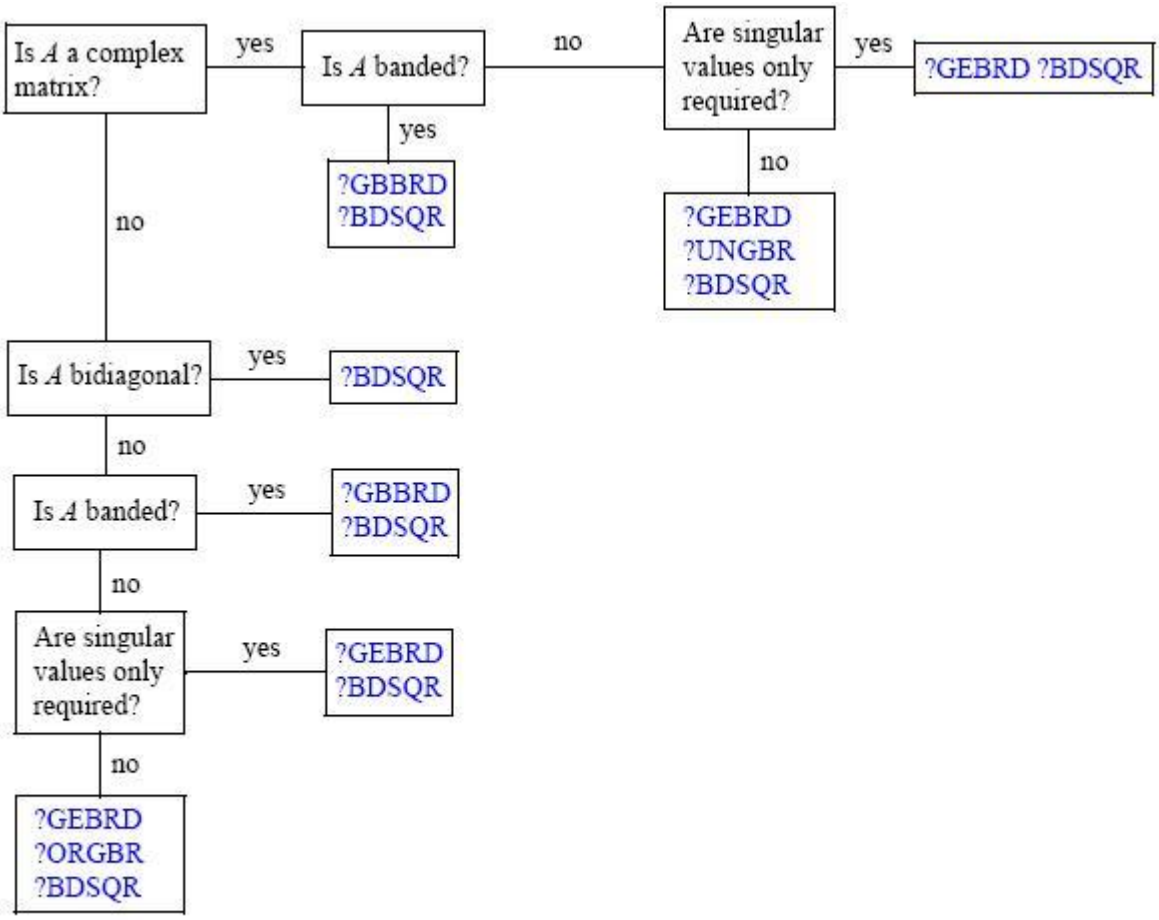

Figure 4-1 "Decision Tree: Singular Value Decomposition" presents a decision tree that helps you choose the right sequence of routines for SVD, depending on whether you need singular values only or singular vectors as well, whether `A` is real or complex, and so on.

You can use the SVD to find a minimum-norm solution to a (possibly) rank-deficient least-squares problem of minimizing $||Ax - b||^2$. The effective rank k of the matrix A can be determined as the number of singular values which exceed a suitable threshold. The minimum-norm solution is

$x = V_k(\Sigma_k)^{-1}c$,

where Σ_k is the leading k -by- k submatrix of Σ, the matrix V_k consists of the first k columns of $V = PV_1$, and the vector c consists of the first k elements of $U^Hb = U_1{}^HQ^Hb$.

?gebrd

Reduces a general matrix to bidiagonal form.

Syntax

Fortran 77:

```
call sgebrd(m, n, a, lda, d, e, tauq, taup, work, lwork, info)
call dgebrd(m, n, a, lda, d, e, tauq, taup, work, lwork, info)
call cgebrd(m, n, a, lda, d, e, tauq, taup, work, lwork, info)
call zgebrd(m, n, a, lda, d, e, tauq, taup, work, lwork, info)
```

Fortran 95:

```
call gebrd(a [, d] [,e] [,tauq] [,taup] [,info])
```

Description

The routine reduces a general m-by-n matrix A to a bidiagonal matrix B by an orthogonal (unitary) transformation.

If $m \geq n$, the reduction is given by

$$A = QBP^H = Q\begin{pmatrix} B_1 \\ 0 \end{pmatrix}P^H = Q_1B_1P^H,$$

where B_1 is an n-by-n upper diagonal matrix, Q and P are orthogonal or, for a complex A, unitary matrices; Q_1 consists of the first n columns of Q.

If $m < n$, the reduction is given by

$A = Q*B*P^H = Q*(B_10)*P^H = Q_1*B_1*P_1{}^H$,

where B_1 is an m-by-m lower diagonal matrix, Q and P are orthogonal or, for a complex A, unitary matrices; P_1 consists of the first m rows of P.

The routine does not form the matrices Q and P explicitly, but represents them as products of elementary reflectors. Routines are provided to work with the matrices Q and P in this representation:

If the matrix A is real,

- to compute Q and P explicitly, call ?orgbr.
- to multiply a general matrix by Q or P, call ?ormbr.

If the matrix A is complex,

- to compute Q and P explicitly, call ?ungbr.
- to multiply a general matrix by Q or P, call ?unmbr.

Input Parameters

m	INTEGER. The number of rows in the matrix A ($m \geq 0$).
n	INTEGER. The number of columns in A ($n \geq 0$).
a, *work*	REAL for sgebrd DOUBLE PRECISION for dgebrd COMPLEX for cgebrd DOUBLE COMPLEX for zgebrd. Arrays: *a*(*lda*,*) contains the matrix A. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
lwork	INTEGER. The dimension of *work*; at least max(1, *m*, *n*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

a	If $m \geq n$, the diagonal and first super-diagonal of *a* are overwritten by the upper bidiagonal matrix *B*. Elements below the diagonal are overwritten by details of *Q*, and the remaining elements are overwritten by details of *P*. If $m < n$, the diagonal and first sub-diagonal of *a* are overwritten by the lower bidiagonal matrix *B*. Elements above the diagonal are overwritten by details of *P*, and the remaining elements are overwritten by details of *Q*.
d	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. Array, DIMENSION at least max(1, min(*m*, *n*)). Contains the diagonal elements of *B*.
e	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. Array, DIMENSION at least max(1, min(*m*, *n*) - 1). Contains the off-diagonal elements of *B*.
tauq, *taup*	REAL for sgebrd DOUBLE PRECISION for dgebrd COMPLEX for cgebrd DOUBLE COMPLEX for zgebrd. Arrays, DIMENSION at least max (1, min(*m*, *n*)). Contain further details of the matrices *Q* and *P*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gebrd interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
d	Holds the vector of length min(*m*,*n*).
e	Holds the vector of length min(*m*,*n*)-1.
tauq	Holds the vector of length min(*m*,*n*).
taup	Holds the vector of length min(*m*,*n*).

Application Notes

For better performance, try using *lwork* = (*m* + *n*)***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrices *Q*, *B*, and *P* satisfy $QBP^H = A + E$, where $||E||_2 = c(n)\varepsilon ||A||_2$, $c(n)$ is a modestly increasing function of *n*, and ε is the machine precision.

The approximate number of floating-point operations for real flavors is

$(4/3)*n^2*(3*m - n)$ for $m \geq n$,

$(4/3)*m^2*(3*n - m)$ for $m < n$.

The number of operations for complex flavors is four times greater.

If *n* is much less than *m*, it can be more efficient to first form the *QR* factorization of *A* by calling ?geqrf and then reduce the factor *R* to bidiagonal form. This requires approximately $2*n^2*(m + n)$ floating-point operations.

If m is much less than n, it can be more efficient to first form the LQ factorization of A by calling ?gelqf and then reduce the factor L to bidiagonal form. This requires approximately $2*m^2*(m + n)$ floating-point operations.

?gbbrd

Reduces a general band matrix to bidiagonal form.

Syntax

Fortran 77:

```
call sgbbrd(vect, m, n, ncc, kl, ku, ab, ldab, d, e, q, ldq, pt, ldpt, c, ldc, work, info)
call dgbbrd(vect, m, n, ncc, kl, ku, ab, ldab, d, e, q, ldq, pt, ldpt, c, ldc, work, info)
call cgbbrd(vect, m, n, ncc, kl, ku, ab, ldab, d, e, q, ldq, pt, ldpt, c, ldc, work, rwork, info)
call zgbbrd(vect, m, n, ncc, kl, ku, ab, ldab, d, e, q, ldq, pt, ldpt, c, ldc, work, rwork, info)
```

Fortran 95:

```
call gbbrd(a [, c] [,d] [,e] [,q] [,pt] [,kl] [,m] [,info])
```

Description

This routine reduces an m-by-n band matrix A to upper bidiagonal matrix B: $A = Q*B*P^H$. Here the matrices Q and P are orthogonal (for real A) or unitary (for complex A). They are determined as products of Givens rotation matrices, and may be formed explicitly by the routine if required. The routine can also update a matrix C as follows: $C = Q^H*C$.

Input Parameters

vect	CHARACTER*1. Must be 'N' or 'Q' or 'P' or 'B'. If *vect* = 'N', neither Q nor P^H is generated. If *vect* = 'Q', the routine generates the matrix Q. If *vect* = 'P', the routine generates the matrix P^H. If *vect* = 'B', the routine generates both Q and P^H.
m	INTEGER. The number of rows in the matrix A ($m \geq 0$).

n	INTEGER. The number of columns in *A* (*n* ≥ 0).
ncc	INTEGER. The number of columns in *C* (*ncc* ≥ 0).
kl	INTEGER. The number of sub-diagonals within the band of *A* (*kl* ≥ 0).
ku	INTEGER. The number of super-diagonals within the band of *A* (*ku* ≥ 0).
ab, *c*, *work*	REAL for sgbbrd DOUBLE PRECISION for dgbbrd COMPLEX for cgbbrd DOUBLE COMPLEX for zgbbrd. Arrays: *ab*(*ldab*,*) contains the matrix *A* in band storage (see Matrix Storage Schemes). The second dimension of *a* must be at least max(1, *n*). *c*(*ldc*,*) contains an *m*-by-*ncc* matrix *C*. If *ncc* = 0, the array *c* is not referenced. The second dimension of *c* must be at least max(1, *ncc*). *work*(*) is a workspace array. The dimension of *work* must be at least 2*max(*m*, *n*) for real flavors, or max(*m*, *n*) for complex flavors.
ldab	INTEGER. The first dimension of the array *ab* (*ldab* ≥ *kl* + *ku* + 1).
ldq	INTEGER. The first dimension of the output array *q*. *ldq* ≥ max(1, *m*) if *vect* = 'Q' or 'B', *ldq* ≥ 1 otherwise.
ldpt	INTEGER. The first dimension of the output array *pt*. *ldpt* ≥ max(1, *n*) if *vect* = 'P' or 'B', *ldpt* ≥ 1 otherwise.
ldc	INTEGER. The first dimension of the array *c*. *ldc* ≥ max(1, *m*) if *ncc* > 0; *ldc* ≥ 1 if *ncc* = 0.
rwork	REAL for cgbbrd DOUBLE PRECISION for zgbbrd. A workspace array, DIMENSION at least max(*m*, *n*).

Output Parameters

ab	Overwritten by values generated during the reduction.
d	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. Array, DIMENSION at least max(1, min(*m*, *n*)). Contains the diagonal elements of the matrix *B*.
e	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. Array, DIMENSION at least max(1, min(*m*, *n*) - 1). Contains the off-diagonal elements of *B*.
q, *pt*	REAL for sgebrd DOUBLE PRECISION for dgebrd COMPLEX for cgebrd DOUBLE COMPLEX for zgebrd. Arrays: *q*(*ldq*,*) contains the output *m*-by-*m* matrix *Q*. The second dimension of *q* must be at least max(1, *m*). *p*(*ldpt*,*) contains the output *n*-by-*n* matrix P^T. The second dimension of *pt* must be at least max(1, *n*).
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gbbrd interface are the following:

a	Stands for argument *ab* in Fortan 77 interface . Holds the array *A* of size (*kl*+*ku*+1,*n*).
c	Holds the matrix *C* of size (*m*,*ncc*).
d	Holds the vector of length min(*m*,*n*).
e	Holds the vector of length min(*m*,*n*)-1.
q	Holds the matrix *Q* of size (*m*,*m*).

pt	Holds the matrix *PT* of size (*n*,*n*).
m	If omitted, assumed *m* = *n*.
kl	If omitted, assumed *kl* = *ku*.
ku	Restored as *ku* = *lda*-*kl*-1.
vect	Restored based on the presence of arguments *q* and pt as follows: *vect* = 'B', if both *q* and *pt* are present, *vect* = 'Q', if *q* is present and *pt* omitted, *vect* = 'P', if *q* is omitted and *pt* present, *vect* = 'N', if both *q* and *pt* are omitted.

Application Notes

The computed matrices *Q*, *B*, and *P* satisfy $Q*B*P^H = A + E$, where $||E||_2 = c(n)\varepsilon ||A||_2$, $c(n)$ is a modestly increasing function of *n*, and ε is the machine precision.

If *m* = *n*, the total number of floating-point operations for real flavors is approximately the sum of:

$6*n^2*(kl + ku)$ if *vect* = 'N' and *ncc* = 0,

$3*n^2*ncc*(kl + ku - 1)/(kl + ku)$ if *C* is updated, and

$3*n^3*(kl + ku - 1)/(kl + ku)$ if either *Q* or P^H is generated (double this if both).

To estimate the number of operations for complex flavors, use the same formulas with the coefficients 20 and 10 (instead of 6 and 3).

?orgbr

Generates the real orthogonal matrix Q or P^T determined by ?gebrd.

Syntax

Fortran 77:

```
call sorgbr(vect, m, n, k, a, lda, tau, work, lwork, info)
call dorgbr(vect, m, n, k, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call orgbr(a, tau [,vect] [,info])
```

Description

The routine generates the whole or part of the orthogonal matrices Q and P_T formed by the routines sgebrd/dgebrd. Use this routine after a call to sgebrd/dgebrd. All valid combinations of arguments are described in Input parameters. In most cases you need the following:

To compute the whole m-by-m matrix Q:

```
call ?orgbr('Q', m, m, n, a ... )
```

(note that the array a must have at least m columns).

To form the n leading columns of Q if $m > n$:

```
call ?orgbr('Q', m, n, n, a ... )
```

To compute the whole n-by-n matrix P^T:

```
call ?orgbr('P', n, n, m, a ... )
```

(note that the array a must have at least n rows).

To form the m leading rows of P_T if $m < n$:

```
call ?orgbr('P', m, n, m, a ... )
```

Input Parameters

vect	CHARACTER*1. Must be 'Q' or 'P'. If *vect* = 'Q', the routine generates the matrix Q. If *vect* = 'P', the routine generates the matrix P^T.
m	INTEGER. The number of required rows of Q or P^T.
n	INTEGER. The number of required columns of Q or P^T.
k	INTEGER. One of the dimensions of A in ?gebrd: If *vect* = 'Q', the number of columns in A; If *vect* = 'P', the number of rows in A. Constraints: $m \geq 0$, $n \geq 0$, $k \geq 0$. For *vect* = 'Q': $k \leq n \leq m$ if $m > k$, or $m = n$ if $m \leq k$. For *vect* = 'P': $k \leq m \leq n$ if $n > k$, or $m = n$ if $n \leq k$.
a, *work*	REAL for sorgbr DOUBLE PRECISION for dorgbr. Arrays: *a*(*lda*,*) is the array a as returned by ?gebrd. The second dimension of a must be at least max(1, n).

	work is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
tau	REAL for sorgbr DOUBLE PRECISION for dorgbr. For *vect* = 'Q', the array *tauq* as returned by ?gebrd. For *vect* = 'P', the array *taup* as returned by ?gebrd. The dimension of *tau* must be at least max(1, min(*m*, *k*)) for *vect* = 'Q', or max(1, min(*m*, *k*)) for *vect* = 'P'.
lwork	INTEGER. The size of the *work* array. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

a	Overwritten by the orthogonal matrix Q or P^T (or the leading rows or columns thereof) as specified by *vect*, *m*, and *n*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine orgbr interface are the following:

a	Holds the matrix A of size (m,n).
tau	Holds the vector of length min(m,k) where $k = m$, if *vect* = 'P', $k = n$, if *vect* = 'Q'.
vect	Must be 'Q' or 'P'. The default value is 'Q'.

Application Notes

For better performance, try using *lwork* = min(*m*,*n*)***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix Q differs from an exactly orthogonal matrix by a matrix E such that $||E||_2 = O(\varepsilon)$.

The approximate numbers of floating-point operations for the cases listed in *Description* are as follows:

To form the whole of Q:

$(4/3)n(3m^2 - 3m*n + n^2)$ if $m > n$;

$(4/3)m^3$ if $m \le n$.

To form the n leading columns of Q when $m > n$:

$(2/3)n^2(3m - n^2)$ if $m > n$.

To form the whole of P_T:

$(4/3)n^3$ if $m \ge n$;

$(4/3)m(3n^2 - 3m*n + m^2)$ if $m < n$.

To form the m leading columns of P_T when $m < n$:

$(2/3)n^2(3m - n^2)$ if $m > n$.

The complex counterpart of this routine is ?ungbr.

?ormbr

Multiplies an arbitrary real matrix by the real orthogonal matrix Q or P_T determined by ?gebrd.

Syntax

Fortran 77:

```
call sormbr(vect, side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call dormbr(vect, side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
```

Fortran 95:

```
call ormbr(a, tau, c [,vect] [,side] [,trans] [,info])
```

Description

Given an arbitrary real matrix C, this routine forms one of the matrix products $Q*C$, Q^T*C, $C*Q$, $C*Q^T$, $P*C$, P^T*C, $C*P$, or $C*P^T$, where Q and P are orthogonal matrices computed by a call to sgebrd/dgebrd. The routine overwrites the product on C.

Input Parameters

In the descriptions below, r denotes the order of Q or P^T:

If *side* = 'L', $r = m$; if *side* = 'R', $r = n$.

vect	CHARACTER*1. Must be 'Q' or 'P'. If *vect* = 'Q', then Q or Q^T is applied to C. If *vect* = 'P', then P or P_T is applied to C.
side	CHARACTER*1. Must be 'L' or 'R'. If *side* = 'L', multipliers are applied to C from the left. If *side* = 'R', they are applied to C from the right.
trans	CHARACTER*1. Must be 'N' or 'T'. If *trans* = 'N', then Q or P is applied to C. If *trans* = 'T', then Q^T or P^T is applied to C.
m	INTEGER. The number of rows in C.

n	INTEGER. The number of columns in *C*.
k	INTEGER. One of the dimensions of *A* in ?gebrd: If *vect* = 'Q', the number of columns in *A*; If *vect* = 'P', the number of rows in *A*. Constraints: $m \geq 0$, $n \geq 0$, $k \geq 0$.
a, *c*, *work*	REAL for sormbr DOUBLE PRECISION for dormbr. Arrays: *a*(*lda*,*) is the array *a* as returned by ?gebrd. Its second dimension must be at least max(1, min(*r*,*k*)) for *vect* = 'Q', or max(1, *r*)) for *vect* = 'P'. *c*(*ldc*,*) holds the matrix *C*. Its second dimension must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*. Constraints: *lda* ≥ max(1, *r*) if *vect* = 'Q'; *lda* ≥ max(1, min(*r*,*k*)) if *vect* = 'P'.
ldc	INTEGER. The first dimension of *c*; *ldc* ≥ max(1, *m*).
tau	REAL for sormbr DOUBLE PRECISION for dormbr. Array, DIMENSION at least max (1, min(*r*, *k*)). For *vect* = 'Q', the array *tauq* as returned by ?gebrd. For *vect* = 'P', the array *taup* as returned by ?gebrd.
lwork	INTEGER. The size of the *work* array. Constraints: *lwork* ≥ max(1, *n*) if *side* = 'L'; *lwork* ≥ max(1, *m*) if *side* = 'R'. If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

c	Overwritten by the product *Q*C*, Q^T**C*, *C*Q*, *C**Q^T, *P*C*, P^T**C*, *C*P*, or *C**P^T, as specified by *vect*, *side*, and *trans*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine ormbr interface are the following:

a	Holds the matrix *A* of size (*r*,min *(nq,k)*) where *r* = *nq*, if *vect* = 'Q', *r* = min(*nq*,*k*), if *vect* = 'P', *nq* = *m*, if *side* = 'L', *nq* = *n*, if *side* = 'R', *k* = *m*, if *vect* = 'P', *k* = *n*, if *vect* = 'Q'.
tau	Holds the vector of length min(*nq*,*k*).
c	Holds the matrix *C* of size (*m*,*n*).
vect	Must be 'Q' or 'P'. The default value is 'Q'.
side	Must be 'L' or 'R'. The default value is 'L'.
trans	Must be 'N' or 'T'. The default value is 'N'.

Application Notes

For better performance, try using

lwork = *n*blocksize* for *side* = 'L', or

lwork = *m*blocksize* for *side* = 'R',

where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed product differs from the exact product by a matrix E such that $||E||_2 = O(\varepsilon)||C||_2$.

The total number of floating-point operations is approximately

$2*n*k(2*m - k)$ if *side* = 'L' and $m \geq k$;

$2*m*k(2*n - k)$ if *side* = 'R' and $n \geq k$;

$2*m^2*n$ if *side* = 'L' and $m < k$;

$2*n^2*m$ if *side* = 'R' and $n < k$.

The complex counterpart of this routine is ?unmbr.

?ungbr

Generates the complex unitary matrix Q or P_H determined by ?gebrd.

Syntax

Fortran 77:

```
call cungbr(vect, m, n, k, a, lda, tau, work, lwork, info)
call zungbr(vect, m, n, k, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call ungbr(a, tau [,vect] [,info])
```

Description

The routine generates the whole or part of the unitary matrices Q and P_H formed by the routines cgebrd/zgebrd. Use this routine after a call to cgebrd/zgebrd. All valid combinations of arguments are described in Input Parameters;in most cases you need the following:

To compute the whole m-by-m matrix Q, use:

```
call ?ungbr('Q', m, m, n, a ... )
```

(note that the array a must have at least m columns).

To form the n leading columns of Q if $m > n$, use:

```
call ?ungbr('Q', m, n, n, a ... )
```

To compute the whole n-by-n matrix P^H, use:

```
call ?ungbr('P', n, n, m, a ... )
```

(note that the array a must have at least n rows).

To form the m leading rows of P_H if $m < n$, use:

```
call ?ungbr('P', m, n, m, a ... )
```

Input Parameters

vect — CHARACTER*1. Must be 'Q' or 'P'.
If *vect* = 'Q', the routine generates the matrix Q.
If *vect* = 'P', the routine generates the matrix P^H.

m	INTEGER. The number of required rows of Q or P^H.
n	INTEGER. The number of required columns of Q or P^H.
k	INTEGER. One of the dimensions of A in ?gebrd: If *vect* = 'Q', the number of columns in A; If *vect* = 'P', the number of rows in A. Constraints: $m \geq 0$, $n \geq 0$, $k \geq 0$. For *vect* = 'Q': $k \leq n \leq m$ if $m > k$, or $m = n$ if $m \leq k$. For *vect* = 'P': $k \leq m \leq n$ if $n > k$, or $m = n$ if $n \leq k$.
a, *work*	COMPLEX for cungbr DOUBLE COMPLEX for zungbr. Arrays: *a*(*lda*,*) is the array *a* as returned by ?gebrd. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
tau	COMPLEX for cungbr DOUBLE COMPLEX for zungbr. For *vect* = 'Q', the array *tauq* as returned by ?gebrd. For *vect* = 'P', the array *taup* as returned by ?gebrd. The dimension of *tau* must be at least max(1, min(*m*, *k*)) for *vect* = 'Q', or max(1, min(*m*, *k*)) for *vect* = 'P'.
lwork	INTEGER. The size of the *work* array. Constraint: *lwork* < max(1, min(*m*, *n*)). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

a	Overwritten by the orthogonal matrix Q or P^T (or the leading rows or columns thereof) as specified by *vect*, *m*, and *n*.

work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine ungbr interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
tau	Holds the vector of length min(*m*,*k*) where *k* = *m*, if *vect* = 'P', *k* = *n*, if *vect* = 'Q'.
vect	Must be 'Q' or 'P'. The default value is 'Q'.

Application Notes

For better performance, try using *lwork* = min(*m*,*n*)**blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix Q differs from an exactly orthogonal matrix by a matrix E such that $||E||_2 = O(\varepsilon)$.

The approximate numbers of floating-point operations for the cases listed in *Description* are as follows:

To form the whole of Q:

$(16/3)n(3m^2 - 3m*n + n^2)$ if $m > n$;

$(16/3)m^3$ if $m \le n$.

To form the n leading columns of Q when $m > n$:

$(8/3)n^2(3m - n^2)$ if $m > n$.

To form the whole of P_T:

$(16/3)n^3$ if $m \ge n$;

$(16/3)m(3n^2 - 3m*n + m^2)$ if $m < n$.

To form the m leading columns of P_T when $m < n$:

$(8/3)n^2(3m - n^2)$ if $m > n$.

The real counterpart of this routine is ?orgbr.

?unmbr

Multiplies an arbitrary complex matrix by the unitary matrix Q or P determined by ?gebrd.

Syntax

Fortran 77:

```
call cunmbr(vect, side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call zunmbr(vect, side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
```

Fortran 95:

```
call unmbr(a, tau, c [,vect] [,side] [,trans] [,info])
```

Description

Given an arbitrary complex matrix C, this routine forms one of the matrix products $Q*C$, Q^H*C, $C*Q$, $C*Q^H$, $P*C$, P^H*C, $C*P$, or $C*P^H$, where Q and P are orthogonal matrices computed by a call to cgebrd/zgebrd. The routine overwrites the product on C.

Input Parameters

In the descriptions below, r denotes the order of Q or P^H:

If $side$ = 'L', r = m; if $side$ = 'R', r = n.

vect	CHARACTER*1. Must be 'Q' or 'P'. If *vect* = 'Q', then Q or Q^H is applied to C. If *vect* = 'P', then P or P^H is applied to C.
side	CHARACTER*1. Must be 'L' or 'R'. If *side* = 'L', multipliers are applied to C from the left. If *side* = 'R', they are applied to C from the right.
trans	CHARACTER*1. Must be 'N' or 'C'. If *trans* = 'N', then Q or P is applied to C. If *trans* = 'C', then Q^H or P^H is applied to C.
m	INTEGER. The number of rows in C.
n	INTEGER. The number of columns in C.
k	INTEGER. One of the dimensions of A in ?gebrd: If *vect* = 'Q', the number of columns in A; If *vect* = 'P', the number of rows in A. Constraints: $m \geq 0$, $n \geq 0$, $k \geq 0$.
a, *c*, *work*	COMPLEX for cunmbr DOUBLE COMPLEX for zunmbr. Arrays: *a*(*lda*,*) is the array *a* as returned by ?gebrd. Its second dimension must be at least max(1, min(*r*,*k*)) for *vect* = 'Q', or max(1, *r*)) for *vect* = 'P'. *c*(*ldc*,*) holds the matrix C. Its second dimension must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*. Constraints:

	lda ≥ max(1, *r*) if *vect* = 'Q'; *lda* ≥ max(1, min(*r*,*k*)) if *vect* = 'P'.
ldc	INTEGER. The first dimension of *c*; *ldc* ≥ max(1, *m*).
tau	COMPLEX for cunmbr DOUBLE COMPLEX for zunmbr. Array, DIMENSION at least max (1, min(*r*, *k*)). For *vect* = 'Q', the array *tauq* as returned by ?gebrd. For *vect* = 'P', the array *taup* as returned by ?gebrd.
lwork	INTEGER. The size of the *work* array. *lwork* ≥ max(1, *n*) if *side* = 'L'; *lwork* ≥ max(1, *m*) if *side* = 'R'. *lwork* ≥ 1 if *n*=0 or *m*=0. For optimum performance *lwork* ≥ max(1,*n***nb*) if *side* = 'L', and *lwork* ≥ max(1,*m***nb*) if *side* = 'R', where *nb* is the optimal blocksize. (*nb* = 0 if *m* = 0 or *n* = 0.) If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

c	Overwritten by the product *Q***C*, Q^H**C*, *C***Q*, *C**Q^H, *P***C*, P^H**C*, *C***P*, or *C**P^H, as specified by *vect*, *side*, and *trans*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `unmbr` interface are the following:

a	Holds the matrix *A* of size (*r*,min *(nq,k)*) where *r* = *nq*, if *vect* = 'Q', *r* = min(*nq*,*k*), if *vect* = 'P', *nq* = *m*, if *side* = 'L', *nq* = *n*, if *side* = 'R', *k* = *m*, if *vect* = 'P', *k* = *n*, if *vect* = 'Q'.
tau	Holds the vector of length min(*nq*,*k*).
c	Holds the matrix *C* of size (*m*,*n*).
vect	Must be 'Q' or 'P'. The default value is 'Q'.
side	Must be 'L' or 'R'. The default value is 'L'.
trans	Must be 'N' or 'C'. The default value is 'N'.

Application Notes

For better performance, try using

lwork = *n***blocksize* for *side* = 'L', or

lwork = *m***blocksize* for *side* = 'R',

where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the `blocked algorithm`.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed product differs from the exact product by a matrix E such that $||E||_2 = O(\varepsilon)||C||_2$.

The total number of floating-point operations is approximately

$8*n*k(2*m - k)$ if *side* = 'L' and $m \geq k$;

$8*m*k(2*n - k)$ if *side* = 'R' and $n \geq k$;

$8*m^2*n$ if *side* = 'L' and $m < k$;

$8*n^2*m$ if *side* = 'R' and $n < k$.

The real counterpart of this routine is ?ormbr.

?bdsqr

Computes the singular value decomposition of a general matrix that has been reduced to bidiagonal form.

Syntax

Fortran 77:

```
call sbdsqr(uplo, n, ncvt, nru, ncc, d, e, vt, ldvt, u, ldu, c, ldc, work, info)
call dbdsqr(uplo, n, ncvt, nru, ncc, d, e, vt, ldvt, u, ldu, c, ldc, work, info)
call cbdsqr(uplo, n, ncvt, nru, ncc, d, e, vt, ldvt, u, ldu, c, ldc, work, info)
call zbdsqr(uplo, n, ncvt, nru, ncc, d, e, vt, ldvt, u, ldu, c, ldc, work, info)
```

Fortran 95:

```
call rbdsqr(d, e [,vt] [,u] [,c] [,uplo] [,info])
call bdsqr(d, e [,vt] [,u] [,c] [,uplo] [,info])
```

Description

This routine computes the singular values and, optionally, the right and/or left singular vectors from the Singular Value Decomposition (SVD) of a real n-by-n (upper or lower) bidiagonal matrix B using the implicit zero-shift QR algorithm. The SVD of B has the form $B = Q*S*P^H$ where S is the diagonal matrix of singular values, Q is an orthogonal matrix of left singular vectors, and P is an orthogonal matrix of right singular vectors. If left singular vectors are requested, this subroutine actually returns $U*Q$ instead of Q, and, if right singular vectors are requested, this subroutine returns P_H*VT instead of P_H, for given real/complex input matrices U and VT. When U and VT are the orthogonal/unitary matrices that reduce a general matrix A to bidiagonal form: $A = U*B*VT$, as computed by ?gebrd, then

$A = (U*Q)*S*(P^H*VT)$

is the SVD of A. Optionally, the subroutine may also compute Q_H*C for a given real/complex input matrix C.

See also ?lasq1, ?lasq2, ?lasq3, ?lasq4, ?lasq5, ?lasq6 used by this routine.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', B is an upper bidiagonal matrix. If *uplo* = 'L', B is a lower bidiagonal matrix.
n	INTEGER. The order of the matrix B ($n \geq 0$).
ncvt	INTEGER. The number of columns of the matrix VT, that is, the number of right singular vectors ($ncvt \geq 0$). Set *ncvt* = 0 if no right singular vectors are required.
nru	INTEGER. The number of rows in U, that is, the number of left singular vectors ($nru \geq 0$). Set *nru* = 0 if no left singular vectors are required.
ncc	INTEGER. The number of columns in the matrix C used for computing the product Q^H*C ($ncc \geq 0$). Set *ncc* = 0 if no matrix C is supplied.
d, *e*, *work*	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. Arrays: *d*(*) contains the diagonal elements of B.

The dimension of *d* must be at least max(1, *n*).
e(*) contains the (*n*-1) off-diagonal elements of *B*.
The dimension of *e* must be at least max(1, *n*). *e*(*n*) is used for workspace.
work(*) is a workspace array.
The dimension of *work* must be at least max(1, 2**n*) if *ncvt* = *nru* = *ncc* = 0;
max(1, 4*(*n*-1)) otherwise.

vt, *u*, *c*
REAL for sbdsqr
DOUBLE PRECISION for dbdsqr
COMPLEX for cbdsqr
DOUBLE COMPLEX for zbdsqr.
Arrays:
vt(*ldvt*,*) contains an *n*-by-*ncvt* matrix *VT*.
The second dimension of *vt* must be at least max(1, *ncvt*).
vt is not referenced if *ncvt* = 0.
u(*ldu*,*) contains an *nru* by *n* unit matrix *U*.
The second dimension of *u* must be at least max(1, *n*).
u is not referenced if *nru* = 0.
c(*ldc*,*) contains the matrix *C* for computing the product $Q^H * C$.
The second dimension of *c* must be at least max(1, *ncc*).
The array is not referenced if *ncc* = 0.

ldvt
INTEGER. The first dimension of *vt*. Constraints:
ldvt ≥ max(1, *n*) if *ncvt* > 0;
ldvt ≥ 1 if *ncvt* = 0.

ldu
INTEGER. The first dimension of *u*. Constraint:
ldu ≥ max(1, *nru*).

ldc
INTEGER. The first dimension of *c*. Constraints:
ldc ≥ max(1, *n*) if *ncc* > 0; *ldc* ≥ 1 otherwise.

Output Parameters

d
On exit, if *info* = 0, overwritten by the singular values in decreasing order (see *info*).

e
On exit, if *info* = 0, *e* is destroyed. See also *info* below.

c	Overwritten by the product Q^H*C.
vt	On exit, this array is overwritten by P^H *VT.
u	On exit, this array is overwritten by *U* *Q .
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the algorithm failed to converge; *i* specifies how many off-diagonals did not converge. In this case, *d* and *e* contain on exit the diagonal and off-diagonal elements, respectively, of a bidiagonal matrix orthogonally equivalent to *B*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine bdsqr interface are the following:

d	Holds the vector of length (*n*).
e	Holds the vector of length (*n*).
vt	Holds the matrix *VT* of size (*n*, *ncvt*).
u	Holds the matrix *U* of size (*nru*,*n*).
c	Holds the matrix *C* of size (*n*,*ncc*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
ncvt	If argument *vt* is present, then *ncvt* is equal to the number of columns in matrix *VT*; otherwise, *ncvt* is set to zero.
nru	If argument *u* is present, then *nru* is equal to the number of rows in matrix *U*; otherwise, *nru* is set to zero.
ncc	If argument *c* is present, then *ncc* is equal to the number of columns in matrix *C*; otherwise, *ncc* is set to zero.

Note that two variants of Fortran 95 interface for bdsqr routine are needed because of an ambiguous choice between real and complex cases appear when *vt*, *u*, and *c* are omitted. Thus, the name rbdsqr is used in real cases (single or double precision), and the name bdsqr is used in complex cases (single or double precision).

Application Notes

Each singular value and singular vector is computed to high relative accuracy. However, the reduction to bidiagonal form (prior to calling the routine) may decrease the relative accuracy in the small singular values of the original matrix if its singular values vary widely in magnitude.

If s_i is an exact singular value of B, and s_i is the corresponding computed value, then

$|s_i - \sigma_i| \leq p(m,n)*\varepsilon*\sigma_i$

where $p(m, n)$ is a modestly increasing function of m and n, and ε is the machine precision.

If only singular values are computed, they are computed more accurately than when some singular vectors are also computed (that is, the function $p(m, n)$ is smaller).

If u_i is the corresponding exact left singular vector of B, and w_i is the corresponding computed left singular vector, then the angle $\theta(u_i, w_i)$ between them is bounded as follows:

$\theta(u_i, w_i) \leq p(m,n)*\varepsilon / \min_{i \neq j}(|\sigma i - \sigma j|/|\sigma_i + \sigma j|).$

Here $\min_{i \neq j}(|\sigma_i - \sigma_j|/|\sigma_i + \sigma_j|)$ is the relative gap between σ_i and the other singular values. A similar error bound holds for the right singular vectors.

The total number of real floating-point operations is roughly proportional to n^2 if only the singular values are computed. About $6n^2*nru$ additional operations ($12n^2*nru$ for complex flavors) are required to compute the left singular vectors and about $6n^2*ncvt$ operations ($12n^2*ncvt$ for complex flavors) to compute the right singular vectors.

?bdsdc

Computes the singular value decomposition of a real bidiagonal matrix using a divide and conquer method.

Syntax

Fortran 77:

```
call sbdsdc(uplo, compq, n, d, e, u, ldu, vt, ldvt, q, iq, work, iwork, info)
call dbdsdc(uplo, compq, n, d, e, u, ldu, vt, ldvt, q, iq, work, iwork, info)
```

Fortran 95:

```
call bdsdc(d, e [,u] [,vt] [,q] [,iq] [,uplo] [,info])
```

Description

This routine computes the Singular Value Decomposition (SVD) of a real n-by-n (upper or lower) bidiagonal matrix B: $B = U*\Sigma*V^T$, using a divide and conquer method, where Σ is a diagonal matrix with non-negative diagonal elements (the singular values of B), and U and V are orthogonal matrices of left and right singular vectors, respectively. ?bdsdc can be used to compute all singular values, and optionally, singular vectors or singular vectors in compact form.

This rotuine uses ?lasd0, ?lasd1, ?lasd2, ?lasd3, ?lasd4, ?lasd5, ?lasd6, ?lasd7, ?lasd8, ?lasd9, ?lasda, ?lasdq, ?lasdt.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', B is an upper bidiagonal matrix. If *uplo* = 'L', B is a lower bidiagonal matrix.
compq	CHARACTER*1. Must be 'N', 'P', or 'I'. If *compq* = 'N', compute singular values only. If *compq* = 'P', compute singular values and compute singular vectors in compact form. If *compq* = 'I', compute singular values and singular vectors.
n	INTEGER. The order of the matrix B ($n \geq 0$).
d, *e*, *work*	REAL for sbdsdc DOUBLE PRECISION for dbdsdc. Arrays: *d(*)* contains the n diagonal elements of the bidiagonal matrix B. The dimension of *d* must be at least max(1, n). *e*(*) contains the off-diagonal elements of the bidiagonal matrix B. The dimension of *e* must be at least max(1, n). *work*(*) is a workspace array. The dimension of *work* must be at least: max(1, 4*n), if *compq* = 'N'; max(1, 6*n), if *compq* = 'P'; max(1, 3*n^2+4*n), if *compq* = 'I'.

ldu	INTEGER. The first dimension of the output array *u*; *ldu* ≥ 1. If singular vectors are desired, then *ldu* ≥ max(1, *n*).
ldvt	INTEGER. The first dimension of the output array *vt*; *ldvt* ≥ 1. If singular vectors are desired, then *ldvt* ≥ max(1, *n*).
iwork	INTEGER. Workspace array, dimension at least max(1, 8**n*).

Output Parameters

d	If *info* = 0, overwritten by the singular values of *B*.
e	On exit, *e* is overwritten.
u, *vt*, *q*	REAL for sbdsdc DOUBLE PRECISION for dbdsdc. Arrays: *u*(*ldu*,*), *vt*(*ldvt*,*), *q*(*). If *compq* = 'I', then on exit *u* contains the left singular vectors of the bidiagonal matrix *B*, unless *info* ≠ 0 (see *info*). For other values of *compq*, *u* is not referenced. The second dimension of *u* must be at least max(1,*n*). if *compq* = 'I', then on exit *vt* contains the right singular vectors of the bidiagonal matrix *B*, unless *info* ≠ 0 (see *info*). For other values of *compq*, *vt* is not referenced. The second dimension of *vt* must be at least max(1,*n*). If *compq* = 'P', then on exit, if *info* = 0, *q* and *iq* contain the left and right singular vectors in a compact form. Specifically, *q* contains all the REAL (for sbdsdc) or DOUBLE PRECISION (for dbdsdc) data for singular vectors. For other values of *compq*, *q* is not referenced. See Application notes for details.
iq	INTEGER. Array: *iq*(*). If *compq* = 'P', then on exit, if *info* = 0, *q* and *iq* contain the left and right singular vectors in a compact form. Specifically, *iq* contains all the INTEGER data for singular vectors. For other values of *compq*, *iq* is not referenced. See Application notes for details.

info INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, the algorithm failed to compute a singular value. The update process of divide and conquer failed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine bdsdc interface are the following:

d Holds the vector of length (*n*).

e Holds the vector of length (*n*).

u Holds the matrix *U* of size (*n*,*n*).

vt Holds the matrix *VT* of size (*n*,*n*).

q Holds the vector of length (*ldq*), where
ldq ≥ *n**(11 + 2**smlsiz* + 8**int*(*log_2*(*n*/(*smlsiz* + 1))))
and *smlsiz* is returned by *ilaenv* and is equal to the maximum size of the subproblems at the bottom of the computation tree (usually about 25).

compq Restored based on the presence of arguments *u*, *vt*, *q*, and *iq* as follows:
compq = 'N', if none of *u*, *vt*, *q*, and *iq* are present,
compq = 'I', if both *u* and *vt* are present. Arguments *u* and *vt* must either be both present or both omitted,
compq = 'P', if both *q* and *iq* are present. Arguments *q* and *iq* must either be both present or both omitted.
Note that there will be an error condition if all of *u*, *vt*, *q*, and *iq* arguments are present simultaneously.

Symmetric Eigenvalue Problems

Symmetric eigenvalue problems are posed as follows: given an *n*-by-*n* real symmetric or complex Hermitian matrix *A*, find the eigenvaluesλ and the corresponding eigenvectors*z* that satisfy the equation

$Az = \lambda z$. (or, equivalently, $z^H A = \lambda z^H$) .

In such eigenvalue problems, all n eigenvalues are real not only for real symmetric but also for complex Hermitian matrices A, and there exists an orthonormal system of n eigenvectors. If A is a symmetric or Hermitian positive-definite matrix, all eigenvalues are positive.

To solve a symmetric eigenvalue problem with LAPACK, you usually need to reduce the matrix to tridiagonal form and then solve the eigenvalue problem with the tridiagonal matrix obtained. LAPACK includes routines for reducing the matrix to a tridiagonal form by an orthogonal (or unitary) similarity transformation $A = QTQ^H$ as well as for solving tridiagonal symmetric eigenvalue problems. These routines (for Fortran-77 interface) are listed in Table 4-3 . Respective routine names in Fortran-95 interface are without the first symbol (see Routine Naming Conventions).

There are different routines for symmetric eigenvalue problems, depending on whether you need all eigenvectors or only some of them or eigenvalues only, whether the matrix A is positive-definite or not, and so on.

These routines are based on three primary algorithms for computing eigenvalues and eigenvectors of symmetric problems: the divide and conquer algorithm, the QR algorithm, and bisection followed by inverse iteration. The divide and conquer algorithm is generally more efficient and is recommended for computing all eigenvalues and eigenvectors. Furthermore, to solve an eigenvalue problem using the divide and conquer algorithm, you need to call only one routine. In general, more than one routine has to be called if the QR algorithm or bisection followed by inverse iteration is used.

Decision tree in Figure 4-2 will help you choose the right routine or sequence of routines for eigenvalue problems with real symmetric matrices. A similar decision tree for complex Hermitian matrices is presented in Figure 4-3 .

?sytrd

Reduces a real symmetric matrix to tridiagonal form.

Syntax

Fortran 77:

```
call ssytrd(uplo, n, a, lda, d, e, tau, work, lwork, info)
call dsytrd(uplo, n, a, lda, d, e, tau, work, lwork, info)
```

Fortran 95:

```
call sytrd(a, tau [,uplo] [,info])
```

Description

This routine reduces a real symmetric matrix A to symmetric tridiagonal form T by an orthogonal similarity transformation: $A = Q*T*Q^T$. The orthogonal matrix Q is not formed explicitly but is represented as a product of n-1 elementary reflectors. Routines are provided for working with Q in this representation. (They are described later in this section .)

This routine calls ?latrd to reduce a real symmetric matrix to tridiagonal form by an orthogonal similarity transformation.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *a* stores the upper triangular part of *A*. If *uplo* = 'L', *a* stores the lower triangular part of *A*.
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
a, *work*	REAL for ssytrd DOUBLE PRECISION for dsytrd. *a*(*lda*,*) is an array containing either upper or lower triangular part of the matrix *A*, as specified by *uplo*. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
lwork	INTEGER. The size of the *work* array (*lwork* ≥ *n*).

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

a — Overwritten by the tridiagonal matrix *T* and details of the orthogonal matrix *Q*, as specified by *uplo*.

d, *e*, *tau* — REAL for ssytrd
DOUBLE PRECISION for dsytrd.
Arrays:
d(*) contains the diagonal elements of the matrix *T*.
The dimension of *d* must be at least max(1, *n*).
e(*) contains the off-diagonal elements of *T*.
The dimension of *e* must be at least max(1, *n*-1).
tau(*) stores further details of the orthogonal matrix *Q*.
The dimension of *tau* must be at least max(1, *n*-1).

work(1) — If *info*=0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine sytrd interface are the following:

a — Holds the matrix *A* of size (*n*,*n*).

tau — Holds the vector of length (*n*-1).

d — Holds the vector of length (*n*).

e — Holds the vector of length (*n*-1).

uplo — Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For better performance, try using *lwork* =*n***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix T is exactly similar to a matrix $A + E$, where $||E||_2 = c(n)\varepsilon ||A||_2$, $c(n)$ is a modestly increasing function of n, and ε is the machine precision.

The approximate number of floating-point operations is $(4/3)n^3$.

After calling this routine, you can call the following:

?orgtr	to form the computed matrix Q explicitly
?ormtr	to multiply a real matrix by Q.

The complex counterpart of this routine is ?hetrd.

?syrdb

Reduces a real symmetric matrix to tridiagonal form with Successive Bandwidth Reduction approach.

Syntax

Fortran 77:

```
call ssyrdb(jobz, uplo, n, kd, a, lda, d, e, tau, z, ldz, work, lwork, info)
call dsyrdb(jobz, uplo, n, kd, a, lda, d, e, tau, z, ldz, work, lwork, info)
```

Description

This routine reduces a real symmetric matrix A to symmetric tridiagonal form T by an orthogonal similarity transformation: $A = Q*T*Q^T$ and optionally multuplies matrix Z by Q, or simply forms Q.

This routine reduces a full symmetric matrix to the banded symmetric form, and then to the tridiagonal symmetric form with a Successive Bandwidth Reduction approach after Prof. C.Bischof's works (see for instance, [Bischof92]). ?syrdb is functionally close to ?sytrd routine but the tridiagonal form may differ from those obtained by ?sytrd. Unlike ?sytrd, the orthogonal matrix Q cannot be restored from the details of matrix A on exit.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then only A is reduced to T. If *jobz* = 'V', then A is reduced to T and Z contains Q on exit. If *jobz* = 'U', then A is reduced to T and Z contains ZQ on exit.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *a* stores the upper triangular part of A. If *uplo* = 'L', *a* stores the lower triangular part of A.
n	INTEGER. The order of the matrix A ($n \geq 0$).
kd	INTEGER. The bandwidth of the banded matrix B ($kd \geq 1$).
a,*z*, *work*	REAL for ssyrdb.

DOUBLE PRECISION for dsyrdb.
a(*lda*,*) is an array containing either upper or lower triangular part of the matrix *A*, as specified by *uplo*.
The second dimension of *a* must be at least max(1, *n*).
z(*ldz*,*), the second dimension of *z* must be at least max(1, *n*).
If *jobz* = 'U', then the matrix *z* is multiplied by *Q*.
If *jobz* = 'V', then *z* content on input is discarded.
If *jobz* = 'N', then *z* is not referenced.
work(*lwork*) is a workspace array.

lda — INTEGER. The first dimension of *a*; at least max(1, *n*).

ldz — INTEGER. The first dimension of *z*; at least max(1, *n*). Not referenced if *jobz* = 'N'

lwork — INTEGER. The size of the *work* array (*lwork* ≥ (2*kd*+1)*n*+*kd*).
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.
See Application Notes for the suggested value of *lwork*.

Output Parameters

a — Overwritten by the banded matrix *B* and details of the orthogonal matrix Q_B to reduce *A* to *B* as specified by *uplo*.

z — On exit,
if *jobz* = 'U', then the matrix *z* is overwritten by *zQ*.
If *jobz* = 'V', then *z* contains *Q*.
If *jobz* = 'N', then *z* is not referenced.

d, *e*, *tau* — DOUBLE PRECISION.
Arrays:
d(*) contains the diagonal elements of the matrix *T*.
The dimension of *d* must be at least max(1, *n*).
e(*) contains the off-diagonal elements of *T*.
The dimension of *e* must be at least max(1, *n*-1).
tau(*) stores further details of the orthogonal matrix *Q*.
The dimension of *tau* must be at least max(1, *n*-*kd*-1).

work(1)	If *info*=0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Application Notes

For better performance, try using *lwork* = *n**(3**kd*+3).

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

For better performance, try using *kd* equal to 40 if n ≤ 2000 and 64 otherwise.

Try using ?syrdb instead of ?sytrd on large matrices obtaining only eigenvalues - when no eigenvectors are needed, especially in multi-threaded environment. ?syrdb becomes faster beginning approximately with n = 1000, and much faster at larger matrices with a better scalability than ?sytrd.

Avoid applying ?syrdb for computing eigenvectors due to the two-step reduction, that is, the number of operations needed to apply orthogonal transformations to *Z* is doubled compared to the traditional one-step reduction. In that case it is better to apply ?sytrd and ?ormtr/?orgtr to obtain tridiagonal form along with the orthogonal transformation matrix *Q*.

?herdb

Reduces a complex Hermitian matrix to tridiagonal form with Successive Bandwidth Reduction approach.

Syntax

Fortran 77:

```
call cherdb(jobz, uplo, n, kd, a, lda, d, e, tau, z, ldz, work, lwork, info)
call zherdb(jobz, uplo, n, kd, a, lda, d, e, tau, z, ldz, work, lwork, info)
```

Description

This routine reduces a complex Hermitian matrix A to symmetric tridiagonal form T by a unitary similarity transformation: $A = Q*T*Q^T$ and optionally multuplies matrix Z by Q, or simply forms Q.

This routine reduces a full Hermitian matrix to the banded Hermitian form, and then to the tridiagonal symmetric form with a Successive Bandwidth Reduction approach after Prof. C.Bischof's works (see for instance, [Bischof92]). ?herdb is functionally close to ?hetrd routine but the tridiagonal form may differ from those obtained by ?hetrd. Unlike ?hetrd, the orthogonal matrix Q cannot be restored from the details of matrix A on exit.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then only A is reduced to T. If *jobz* = 'V', then A is reduced to T and Z contains Q on exit. If *jobz* = 'U', then A is reduced to T and Z contains ZQ on exit.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *a* stores the upper triangular part of A. If *uplo* = 'L', *a* stores the lower triangular part of A.
n	INTEGER. The order of the matrix A ($n \geq 0$).
kd	INTEGER. The bandwidth of the banded matrix B ($kd \geq 1$).
a,*z*, *work*	COMPLEX for cherdb.

DOUBLE COMPLEX for zherdb.
a(*lda*,*) is an array containing either upper or lower triangular part of the matrix *A*, as specified by *uplo*.
The second dimension of *a* must be at least max(1, *n*).
z(*ldz*,*), the second dimension of *z* must be at least max(1, *n*).
If *jobz* = 'U', then the matrix *z* is multiplied by *Q*.
If *jobz* = 'V', then *z* content on input is discarded.
If *jobz* = 'N', then *z* is not referenced.
work(*lwork*) is a workspace array.

lda — INTEGER. The first dimension of *a*; at least max(1, *n*).

ldz — INTEGER. The first dimension of *z*; at least max(1, *n*). Not referenced if *jobz* = 'N'

lwork — INTEGER. The size of the *work* array (*lwork* ≥ (2*kd*+1)*n*+*kd*).
If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.
See Application Notes for the suggested value of *lwork*.

Output Parameters

a — Overwritten by the banded matrix *B* and details of the unitary matrix Q_B to reduce *A* to *B* as specified by *uplo*.

z — On exit,
if *jobz* = 'U', then the matrix *z* is overwritten by *zQ*.
If *jobz* = 'V', then *z* contains *Q*.
If *jobz* = 'N', then *z* is not referenced.

d, *e* — COMPLEX for cherdb.
DOUBLE COMPLEX for zherdb.
Arrays:
d(*) contains the diagonal elements of the matrix *T*.
The dimension of *d* must be at least max(1, *n*).
e(*) contains the off-diagonal elements of *T*.
The dimension of *e* must be at least max(1, *n*-1).
tau(*) stores further details of the orthogonal matrix *Q*.

	The dimension of *tau* must be at least max(1, *n*-*kd*-1).
tau	COMPLEX for cherdb. DOUBLE COMPLEX for zherdb. Array, DIMENSION at least max(1, *n*-1) Stores further details of the unitary matrix Q_B. The dimension of *tau* must be at least max(1, *n*-*kd*-1).
work(1)	If *info*=0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Application Notes

For better performance, try using *lwork* = *n**(3**kd*+3).

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* size, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*) on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

For better performance, try using *kd* equal to 40 if n ≤ 2000 and 64 otherwise.

Try using ?herdb instead of ?hetrd on large matrices obtaining only eigenvalues - when no eigenvectors are needed, especially in multi-threaded environment. ?herdb becomes faster beginning approximately with n = 1000, and much faster at larger matrices with a better scalability than ?hetrd.

Avoid applying ?herdb for computing eigenvectors due to the two-step reduction, that is, the number of operations needed to apply orthogonal transformations to *Z* is doubled compared to the traditional one-step reduction. In that case it is better to apply ?hetrd and ?unmtr/?ungtr to obtain tridiagonal form along with the unitary transformation matrix *Q*.

?orgtr

Generates the real orthogonal matrix Q determined by ?sytrd.

Syntax

Fortran 77:

```
call sorgtr(uplo, n, a, lda, tau, work, lwork, info)
call dorgtr(uplo, n, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call orgtr(a, tau [,uplo] [,info])
```

Description

The routine explicitly generates the *n*-by-*n* orthogonal matrix *Q* formed by ?sytrd when reducing a real symmetric matrix *A* to tridiagonal form: $A = Q*T*Q^T$. Use this routine after a call to ?sytrd.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Use the same *uplo* as supplied to ?sytrd.
n	INTEGER. The order of the matrix *Q* ($n \geq 0$).
a, *tau*, *work*	REAL for sorgtr DOUBLE PRECISION for dorgtr. Arrays: *a*(*lda*,*) is the array *a* as returned by ?sytrd. The second dimension of *a* must be at least max(1, *n*). *tau*(*) is the array *tau* as returned by ?sytrd. The dimension of *tau* must be at least max(1, *n*-1). *work* is a workspace array, its dimension max(1, *lwork*).

lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
lwork	INTEGER. The size of the *work* array (*lwork* ≥ *n*). If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

a	Overwritten by the orthogonal matrix *Q*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = −*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine orgtr interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
tau	Holds the vector of length (*n*−1).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For better performance, try using *lwork* = (*n*−1)**blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = −1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix Q differs from an exactly orthogonal matrix by a matrix E such that $||E||_2 = O(\varepsilon)$, where e is the machine precision.

The approximate number of floating-point operations is $(4/3)n^3$.

The complex counterpart of this routine is ?ungtr.

?ormtr

Multiplies a real matrix by the real orthogonal matrix Q determined by ?sytrd.

Syntax

Fortran 77:

```
call sormtr(side, uplo, trans, m, n, a, lda, tau, c, ldc, work, lwork, info)
call dormtr(side, uplo, trans, m, n, a, lda, tau, c, ldc, work, lwork, info)
```

Fortran 95:

```
call ormtr(a, tau, c [,side] [,uplo] [,trans] [,info])
```

Description

The routine multiplies a real matrix C by Q or Q^T, where Q is the orthogonal matrix Q formed by ?sytrd when reducing a real symmetric matrix A to tridiagonal form: $A = Q*T*Q^T$. Use this routine after a call to ?sytrd.

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products $Q*C$, Q^T*C, $C*Q$, or $C*Q^T$(overwriting the result on C).

Input Parameters

In the descriptions below, *r* denotes the order of *Q*:

If *side* = 'L', *r* = *m*; if *side* = 'R', *r* = *n*.

side	CHARACTER*1. Must be either 'L' or 'R'. If *side* = 'L', *Q* or Q^T is applied to *C* from the left. If *side* = 'R', *Q* or Q^T is applied to *C* from the right.
uplo	CHARACTER*1. Must be 'U' or 'L'. Use the same *uplo* as supplied to ?sytrd.
trans	CHARACTER*1. Must be either 'N' or 'T'. If *trans* = 'N', the routine multiplies *C* by *Q*. If *trans* = 'T', the routine multiplies *C* by Q^T.
m	INTEGER. The number of rows in the matrix *C* (*m* ≥ 0).
n	INTEGER. The number of columns in *C* (*n* ≥ 0).
a, *c*, *tau*, *work*	REAL for sormtr DOUBLE PRECISION for dormtr *a*(*lda*,*) and *tau* are the arrays returned by ?sytrd. The second dimension of *a* must be at least max(1, *r*). The dimension of *tau* must be at least max(1, *r*-1). *c*(*ldc*,*) contains the matrix *C*. The second dimension of *c* must be at least max(1, *n*) *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *r*).
ldc	INTEGER. The first dimension of *c*; *ldc* ≥ max(1, *n*).
lwork	INTEGER. The size of the *work* array. Constraints: *lwork* ≥ max(1, *n*) if *side* = 'L'; *lwork* ≥ max(1, *m*) if *side* = 'R'. If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

c	Overwritten by the product *Q*C*, Q^T**C*, *C*Q*, or *C**Q^T (as specified by *side* and *trans*).
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine ormtr interface are the following:

a	Holds the matrix *A* of size (*r*,*r*). *r* = *m* if *side* = 'L'. *r* = *n* if *side* = 'R'.
tau	Holds the vector of length (*r*-1).
c	Holds the matrix *C* of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N' or 'T'. The default value is 'N'.

Application Notes

For better performance, try using *lwork* = *n*blocksize* for *side* = 'L', or *lwork* = *m*blocksize* for *side* = 'R', where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed product differs from the exact product by a matrix E such that $||E||^2 = O(\varepsilon)||C||^2$.

The total number of floating-point operations is approximately $2*m^2*n$, if *side* = 'L', or $2*n^2*m$, if *side* = 'R'.

The complex counterpart of this routine is ?unmtr.

?hetrd

Reduces a complex Hermitian matrix to tridiagonal form.

Syntax

Fortran 77:

```
call chetrd(uplo, n, a, lda, d, e, tau, work, lwork, info)
call zhetrd(uplo, n, a, lda, d, e, tau, work, lwork, info)
```

Fortran 95:

```
call hetrd(a, tau [,uplo] [,info])
```

Description

This routine reduces a complex Hermitian matrix A to symmetric tridiagonal form T by a unitary similarity transformation: $A = Q*T*Q^H$. The unitary matrix Q is not formed explicitly but is represented as a product of n-1 elementary reflectors. Routines are provided to work with Q in this representation. (They are described later in this section .)

This routine calls ?latrd to reduce a complex Hermitian matrix A to Hermitian tridiagonal form by a unitary similarity transformation.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *a* stores the upper triangular part of *A*. If *uplo* = 'L', *a* stores the lower triangular part of *A*.
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
a, *work*	COMPLEX for chetrd DOUBLE COMPLEX for zhetrd. *a*(*lda*,*) is an array containing either upper or lower triangular part of the matrix *A*, as specified by *uplo*. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
lwork	INTEGER. The size of the *work* array (*lwork* ≥ *n*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

a	Overwritten by the tridiagonal matrix *T* and details of the unitary matrix *Q*, as specified by *uplo*.
d, *e*	REAL for chetrd DOUBLE PRECISION for zhetrd. Arrays: *d*(*) contains the diagonal elements of the matrix *T*. The dimension of *d* must be at least max(1, *n*). *e*(*) contains the off-diagonal elements of *T*. The dimension of *e* must be at least max(1, *n*-1).
tau	COMPLEX for chetrd DOUBLE COMPLEX for zhetrd. Array, DIMENSION at least max(1, *n*-1). Stores further details of the unitary matrix *Q*.

work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = –*i*, the *i*th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine hetrd interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
tau	Holds the vector of length (*n*–1).
d	Holds the vector of length (*n*).
e	Holds the vector of length (*n*–1).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For better performance, try using *lwork* =*n*blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = –1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = –1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix T is exactly similar to a matrix $A + E$, where $||E||_2 = c(n)\varepsilon ||A||_2$, $c(n)$ is a modestly increasing function of n, and ε is the machine precision.

The approximate number of floating-point operations is $(16/3)n^3$.

After calling this routine, you can call the following:

?ungtr	to form the computed matrix Q explicitly
?unmtr	to multiply a complex matrix by Q.

The real counterpart of this routine is ?sytrd.

?ungtr

Generates the complex unitary matrix Q determined by ?hetrd.

Syntax

Fortran 77:

```
call cungtr(uplo, n, a, lda, tau, work, lwork, info)
call zungtr(uplo, n, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call ungtr(a, tau [,uplo] [,info])
```

The routine explicitly generates the n-by-n unitary matrix Q formed by ?hetrd when reducing a complex Hermitian matrix A to tridiagonal form: $A = Q*T*Q^H$. Use this routine after a call to ?hetrd.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Use the same *uplo* as supplied to ?hetrd.
n	INTEGER. The order of the matrix Q ($n \geq 0$).
a, *tau*, *work*	COMPLEX for cungtr DOUBLE COMPLEX for zungtr. Arrays: *a*(*lda*,*) is the array *a* as returned by ?hetrd. The second dimension of *a* must be at least max(1, *n*).

	tau(*) is the array *tau* as returned by ?hetrd. The dimension of *tau* must be at least max(1, *n*-1). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
lwork	INTEGER. The size of the *work* array (*lwork* ≥ *n*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

a	Overwritten by the unitary matrix *Q*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine ungtr interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
tau	Holds the vector of length (*n*-1).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For better performance, try using *lwork* = (*n*-1)**blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix Q differs from an exactly unitary matrix by a matrix E such that $||E||_2 = O(\varepsilon)$, where e is the machine precision.

The approximate number of floating-point operations is $(16/3)n^3$.

The real counterpart of this routine is ?orgtr.

?unmtr

Multiplies a complex matrix by the complex unitary matrix Q determined by ?hetrd.

Syntax

Fortran 77:

```
call cunmtr(side, uplo, trans, m, n, a, lda, tau, c, ldc, work, lwork, info)
call zunmtr(side, uplo, trans, m, n, a, lda, tau, c, ldc, work, lwork, info)
```

Fortran 95:

```
call unmtr(a, tau, c [,side] [,uplo] [,trans] [,info])
```

Description

The routine multiplies a complex matrix C by Q or Q^H, where Q is the unitary matrix Q formed by ?hetrd when reducing a complex Hermitian matrix A to tridiagonal form: $A = Q*T*Q^H$. Use this routine after a call to ?hetrd.

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products $Q*C$, Q^H*C, $C*Q$, or $C*Q^H$ (overwriting the result on C).

Input Parameters

In the descriptions below, r denotes the order of Q:

If *side* = 'L', $r = m$; if *side* = 'R', $r = n$.

side	CHARACTER*1. Must be either 'L' or 'R'. If *side* = 'L', Q or Q^H is applied to C from the left. If *side* = 'R', Q or Q^H is applied to C from the right.
uplo	CHARACTER*1. Must be 'U' or 'L'. Use the same *uplo* as supplied to ?hetrd.
trans	CHARACTER*1. Must be either 'N' or 'T'. If *trans* = 'N', the routine multiplies C by Q. If *trans* = 'T', the routine multiplies C by Q^H.
m	INTEGER. The number of rows in the matrix C ($m \geq 0$).
n	INTEGER. The number of columns in C ($n \geq 0$).
a, *c*, *tau*, *work*	COMPLEX for cunmtr DOUBLE COMPLEX for zunmtr. *a*(*lda*,*) and *tau* are the arrays returned by ?hetrd. The second dimension of *a* must be at least max(1, *r*). The dimension of *tau* must be at least max(1, *r*-1). *c*(*ldc*,*) contains the matrix C. The second dimension of *c* must be at least max(1, *n*) *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *r*).
ldc	INTEGER. The first dimension of *c*; *ldc* ≥ max(1, *n*).
lwork	INTEGER. The size of the *work* array. Constraints: *lwork* ≥ max(1, *n*) if *side* = 'L'; *lwork* ≥ max(1, *m*) if *side* = 'R'.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

c	Overwritten by the product *Q*C*, Q^H**C*, *C*Q*, or *C**Q^H (as specified by *side* and *trans*).
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine unmtr interface are the following:

a	Holds the matrix *A* of size (*r*,*r*). *r* = *m* if *side* = 'L'. *r* = *n* if *side* = 'R'.
tau	Holds the vector of length (*r*-1).
c	Holds the matrix *C* of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N' or 'C'. The default value is 'N'.

Application Notes

For better performance, try using *lwork* = *n*blocksize* (for *side* = 'L') or *lwork* = *m*blocksize* (for *side* = 'R') where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed product differs from the exact product by a matrix E such that $||E||_2 = O(\varepsilon)||C||_2$, where ε is the machine precision.

The total number of floating-point operations is approximately $8*m^2*n$ if *side* = 'L' or $8*n^2*m$ if *side* = 'R'.

The real counterpart of this routine is ?ormtr.

?sptrd

Reduces a real symmetric matrix to tridiagonal form using packed storage.

Syntax

Fortran 77:

```
call ssptrd(uplo, n, ap, d, e, tau, info)
call dsptrd(uplo, n, ap, d, e, tau, info)
```

Fortran 95:

```
call sptrd(a, tau [,uplo] [,info])
```

Description

This routine reduces a packed real symmetric matrix *A* to symmetric tridiagonal form *T* by an orthogonal similarity transformation: $A = Q*T*Q^T$. The orthogonal matrix *Q* is not formed explicitly but is represented as a product of *n*-1 elementary reflectors. Routines are provided for working with *Q* in this representation. (They are described later in this section .)

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *ap* stores the packed upper triangle of *A*. If *uplo* = 'L', *ap* stores the packed lower triangle of *A*.
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
ap	REAL for ssptrd DOUBLE PRECISION for dsptrd. Array, DIMENSION at least max(1, *n*(*n*+1)/2). Contains either upper or lower triangle of *A* (as specified by *uplo*) in packed form.

Output Parameters

ap	Overwritten by the tridiagonal matrix *T* and details of the orthogonal matrix *Q*, as specified by *uplo*.
d, *e*, *tau*	REAL for ssptrd DOUBLE PRECISION for dsptrd. Arrays: *d*(*) contains the diagonal elements of the matrix *T*. The dimension of *d* must be at least max(1, *n*). *e*(*) contains the off-diagonal elements of *T*. The dimension of *e* must be at least max(1, *n*-1). *tau*(*) stores further details of the matrix *Q*. The dimension of *tau* must be at least max(1, *n*-1).
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `sptrd` interface are the following:

a	Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n*(n+1)/2*).
tau	Holds the vector of length (*n*-1).
d	Holds the vector of length (*n*).
e	Holds the vector of length (*n*-1).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

The computed matrix *T* is exactly similar to a matrix $A + E$, where $||E||_2 = c(n)\varepsilon ||A||_2$, $c(n)$ is a modestly increasing function of n, and ε is the machine precision. The approximate number of floating-point operations is $(4/3)n^3$.

After calling this routine, you can call the following:

`?opgtr`	to form the computed matrix *Q* explicitly
`?opmtr`	to multiply a real matrix by *Q*.

The complex counterpart of this routine is `?hptrd`.

?opgtr

Generates the real orthogonal matrix Q determined by `?sptrd`.

Syntax

Fortran 77:

```
call sopgtr(uplo, n, ap, tau, q, ldq, work, info)
call dopgtr(uplo, n, ap, tau, q, ldq, work, info)
```

Fortran 95:

```
call opgtr(a, tau, q [,uplo] [,info])
```

Description

The routine explicitly generates the n-by-n orthogonal matrix Q formed by ?sptrd when reducing a packed real symmetric matrix A to tridiagonal form: $A = Q*T*Q^T$. Use this routine after a call to ?sptrd.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Use the same *uplo* as supplied to ?sptrd.
n	INTEGER. The order of the matrix Q ($n \geq 0$).
ap, *tau*	REAL for sopgtr DOUBLE PRECISION for dopgtr. Arrays *ap* and *tau*, as returned by ?sptrd. The dimension of *ap* must be at least max(1, $n(n+1)/2$). The dimension of *tau* must be at least max(1, $n-1$).
ldq	INTEGER. The first dimension of the output array q; at least max(1, n).
work	REAL for sopgtr DOUBLE PRECISION for dopgtr. Workspace array, DIMENSION at least max(1, $n-1$).

Output Parameters

q	REAL for sopgtr DOUBLE PRECISION for dopgtr. Array, DIMENSION (*ldq*,*). Contains the computed matrix Q. The second dimension of q must be at least max(1, n).
info	INTEGER. If *info* = 0, the execution is successful. If *info* = $-i$, the ith parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `opgtr` interface are the following:

a	Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n*(n+1)/2*).
tau	Holds the vector of length (*n*–1).
q	Holds the matrix *Q* of size (*n*,*n*).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

The computed matrix *Q* differs from an exactly orthogonal matrix by a matrix *E* such that $||E||_2 = O(\varepsilon)$, where ε is the machine precision.

The approximate number of floating-point operations is $(4/3)n^3$.

The complex counterpart of this routine is `?upgtr`.

?opmtr

Multiplies a real matrix by the real orthogonal matrix Q determined by `?sptrd`.

Syntax

Fortran 77:

```
call sopmtr(side, uplo, trans, m, n, ap, tau, c, ldc, work, info)
call dopmtr(side, uplo, trans, m, n, ap, tau, c, ldc, work, info)
```

Fortran 95:

```
call opmtr(a, tau, c [,side] [,uplo] [,trans] [,info])
```

Description

The routine multiplies a real matrix C by Q or Q^T, where Q is the orthogonal matrix Q formed by ?sptrd when reducing a packed real symmetric matrix A to tridiagonal form: $A = QTQ^T$. Use this routine after a call to ?sptrd.

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products Q

$*C$, Q^T*C, $C*Q$, or $C*Q^T$ (overwriting the result on C).

Input Parameters

In the descriptions below, r denotes the order of Q:

If *side* = 'L', $r = m$; if *side* = 'R', $r = n$.

side	CHARACTER*1. Must be either 'L' or 'R'. If *side* = 'L', Q or Q^T is applied to C from the left. If *side* = 'R', Q or Q^T is applied to C from the right.
uplo	CHARACTER*1. Must be 'U' or 'L'. Use the same *uplo* as supplied to ?sptrd.
trans	CHARACTER*1. Must be either 'N' or 'T'. If *trans* = 'N', the routine multiplies C by Q. If *trans* = 'T', the routine multiplies C by Q^T.
m	INTEGER. The number of rows in the matrix C ($m \geq 0$).
n	INTEGER. The number of columns in C ($n \geq 0$).
ap, *tau*, *c*, *work*	REAL for sopmtr DOUBLE PRECISION for dopmtr. *ap* and *tau* are the arrays returned by ?sptrd. The dimension of *ap* must be at least max(1, r(r+1)/2). The dimension of *tau* must be at least max(1, r-1). c(*ldc*,*) contains the matrix C. The second dimension of c must be at least max(1, n) *work*(*) is a workspace array. The dimension of *work* must be at least max(1, n) if *side* = 'L'; max(1, m) if *side* = 'R'.
ldc	INTEGER. The first dimension of c; *ldc* $\geq$ max(1, n).

Output Parameters

c	Overwritten by the product *Q*C*, Q^T**C*, *C*Q*, or *C*Q^T* (as specified by *side* and *trans*).
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine opmtr interface are the following:

a	Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*r*(r+1)/2*), where *r* = *m* if *side* = 'L'. *r* = *n* if *side* = 'R'.
tau	Holds the vector of length (*r*-1).
c	Holds the matrix *C* of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.

Application Notes

The computed product differs from the exact product by a matrix *E* such that $||E||_2 = O(\varepsilon)||C||_2$, where ε is the machine precision.

The total number of floating-point operations is approximately $2*m^2*n$ if *side* = 'L' or $2*n^2*m$ if *side* = 'R'.

The complex counterpart of this routine is ?upmtr.

?hptrd

Reduces a complex Hermitian matrix to tridiagonal form using packed storage.

Syntax

Fortran 77:

```
call chptrd(uplo, n, ap, d, e, tau, info)
call zhptrd(uplo, n, ap, d, e, tau, info)
```

Fortran 95:

```
call hptrd(a, tau [,uplo] [,info])
```

Description

This routine reduces a packed complex Hermitian matrix A to symmetric tridiagonal form T by a unitary similarity transformation: $A = Q*T*Q^H$. The unitary matrix Q is not formed explicitly but is represented as a product of n-1 elementary reflectors. Routines are provided for working with Q in this representation. They are described later in this section .

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *ap* stores the packed upper triangle of *A*. If *uplo* = 'L', *ap* stores the packed lower triangle of *A*.
n	INTEGER. The order of the matrix *A* ($n \geq 0$).
ap	COMPLEX for chptrd DOUBLE COMPLEX for zhptrd. Array, DIMENSION at least max(1, $n(n+1)/2$). Contains either upper or lower triangle of *A* (as specified by *uplo*) in packed form.

Output Parameters

ap	Overwritten by the tridiagonal matrix *T* and details of the orthogonal matrix *Q*, as specified by *uplo*.
d, *e*	REAL for chptrd DOUBLE PRECISION for zhptrd.

	Arrays: *d*(*) contains the diagonal elements of the matrix *T*. The dimension of *d* must be at least max(1, *n*). *e*(*) contains the off-diagonal elements of *T*. The dimension of *e* must be at least max(1, *n*-1).
tau	COMPLEX for chptrd DOUBLE COMPLEX for zhptrd. Arrays, DIMENSION at least max(1, *n*-1). Contains further details of the orthogonal matrix *Q*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine hptrd interface are the following:

a	Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n**(*n*+1)/2).
tau	Holds the vector of length (*n*-1).
d	Holds the vector of length (*n*).
e	Holds the vector of length (*n*-1).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed matrix *T* is exactly similar to a matrix *A* + *E*, where $||E||_2 = c(n)\varepsilon ||A||_2$, $c(n)$ is a modestly increasing function of *n*, and ε is the machine precision.

The approximate number of floating-point operations is $(16/3)n^3$.

After calling this routine, you can call the following:

?upgtr	to form the computed matrix *Q* explicitly
?upmtr	to multiply a complex matrix by *Q*.

The real counterpart of this routine is ?sptrd.

?upgtr

Generates the complex unitary matrix Q determined by ?hptrd.

Syntax

Fortran 77:

```
call cupgtr(uplo, n, ap, tau, q, ldq, work, info)
call zupgtr(uplo, n, ap, tau, q, ldq, work, info)
```

Fortran 95:

```
call upgtr(a, tau, q [,uplo] [,info])
```

Description

The routine explicitly generates the n-by-n unitary matrix Q formed by ?hptrd when reducing a packed complex Hermitian matrix A to tridiagonal form: $A = Q*T*Q^H$. Use this routine after a call to ?hptrd.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Use the same *uplo* as supplied to ?sptrd.
n	INTEGER. The order of the matrix Q ($n \geq 0$).
ap, *tau*	COMPLEX for cupgtr DOUBLE COMPLEX for zupgtr. Arrays *ap* and *tau*, as returned by ?hptrd. The dimension of *ap* must be at least max(1, $n(n+1)/2$). The dimension of *tau* must be at least max(1, $n-1$).
ldq	INTEGER. The first dimension of the output array q; at least max(1, n).
work	COMPLEX for cupgtr DOUBLE COMPLEX for zupgtr. Workspace array, DIMENSION at least max(1, $n-1$).

Output Parameters

q	COMPLEX for cupgtr DOUBLE COMPLEX for zupgtr. Array, DIMENSION (*ldq*,*). Contains the computed matrix *Q*. The second dimension of *q* must be at least max(1, *n*).
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine upgtr interface are the following:

a	Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n**(*n*+1)/2).
tau	Holds the vector of length (*n*-1).
q	Holds the matrix *Q* of size (*n*,*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed matrix *Q* differs from an exactly orthogonal matrix by a matrix *E* such that $||E||_2 = O(\varepsilon)$, where ε is the machine precision.

The approximate number of floating-point operations is (16/3)*n3*.

The real counterpart of this routine is ?opgtr.

?upmtr

Multiplies a complex matrix by the unitary matrix Q determined by ?hptrd.

Syntax

Fortran 77:

```
call cupmtr(side, uplo, trans, m, n, ap, tau, c, ldc, work, info)
call zupmtr(side, uplo, trans, m, n, ap, tau, c, ldc, work, info)
```

Fortran 95:

```
call upmtr(a, tau, c [,side] [,uplo] [,trans] [,info])
```

Description

The routine multiplies a complex matrix C by Q or Q^H, where Q is the unitary matrix Q formed by ?hptrd when reducing a packed complex Hermitian matrix A to tridiagonal form: $A = Q*T*Q^H$. Use this routine after a call to ?hptrd.

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products $Q*C$, Q^H*C, $C*Q$, or $C*Q^H$ (overwriting the result on C).

Input Parameters

In the descriptions below, r denotes the order of Q:

If *side* = 'L', $r = m$; if *side* = 'R', $r = n$.

side	CHARACTER*1. Must be either 'L' or 'R'. If *side* = 'L', Q or Q^H is applied to C from the left. If *side* = 'R', Q or Q^H is applied to C from the right.
uplo	CHARACTER*1. Must be 'U' or 'L'. Use the same *uplo* as supplied to ?hptrd.
trans	CHARACTER*1. Must be either 'N' or 'T'. If *trans* = 'N', the routine multiplies C by Q. If *trans* = 'T', the routine multiplies C by Q^H.
m	INTEGER. The number of rows in the matrix C ($m \geq 0$).
n	INTEGER. The number of columns in C ($n \geq 0$).

ap, *tau*, *c*,	COMPLEX for cupmtr DOUBLE COMPLEX for zupmtr. *ap* and *tau* are the arrays returned by ?hptrd. The dimension of *ap* must be at least max(1, *r*(*r*+1)/2). The dimension of *tau* must be at least max(1, *r*-1). *c*(*ldc*,*) contains the matrix *C*. The second dimension of *c* must be at least max(1, *n*) *work*(*) is a workspace array. The dimension of *work* must be at least max(1, *n*) if *side* = 'L'; max(1, *m*) if *side* = 'R'.
ldc	INTEGER. The first dimension of *c*; *ldc* ≥ max(1, *n*).

Output Parameters

c	Overwritten by the product *Q*C*, Q^H*C, *C*Q*, or $C*Q^H$ (as specified by *side* and *trans*).
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine upmtr interface are the following:

a	Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*r*(r+1)/2*), where *r* = *m* if *side* = 'L'. *r* = *n* if *side* = 'R'.
tau	Holds the vector of length (*r*-1).
c	Holds the matrix *C* of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
uplo	Must be 'U' or 'L'.The default value is 'U'.
trans	Must be 'N' or 'C'. The default value is 'N'.

Application Notes

The computed product differs from the exact product by a matrix E such that $||E||_2 = O\varepsilon||C||_2$, where e is the machine precision.

The total number of floating-point operations is approximately $8*m^2*n$ if *side* = 'L' or $8*n^2*m$ if *side* = 'R'.

The real counterpart of this routine is ?opmtr.

?sbtrd

Reduces a real symmetric band matrix to tridiagonal form.

Syntax

Fortran 77:

```
call ssbtrd(vect, uplo, n, kd, ab, ldab, d, e, q, ldq, work, info)
call dsbtrd(vect, uplo, n, kd, ab, ldab, d, e, q, ldq, work, info)
```

Fortran 95:

```
call sbtrd(a [, q] [,vect] [,uplo] [,info])
```

Description

This routine reduces a real symmetric band matrix A to symmetric tridiagonal form T by an orthogonal similarity transformation: $A = Q*T*Q^T$. The orthogonal matrix Q is determined as a product of Givens rotations.

If required, the routine can also form the matrix Q explicitly.

Input Parameters

vect CHARACTER*1. Must be 'V' or 'N'.
If *vect* = 'V', the routine returns the explicit matrix Q.
If *vect* = 'N', the routine does not return Q.

uplo CHARACTER*1. Must be 'U' or 'L'.
If *uplo* = 'U', *ab* stores the upper triangular part of A.
If *uplo* = 'L', *ab* stores the lower triangular part of A.

n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
kd	INTEGER. The number of super- or sub-diagonals in *A* (*kd* < 0).
ab, *work*	REAL for ssbtrd DOUBLE PRECISION for dsbtrd. *ab* (*ldab*,*) is an array containing either upper or lower triangular part of the matrix *A* (as specified by *uplo*) in band storage format. The second dimension of *ab* must be at least max(1, *n*). *work*(*) is a workspace array. The dimension of *work* must be at least max(1, *n*).
ldab	INTEGER. The first dimension of *ab*; at least *kd*+1.
ldq	INTEGER. The first dimension of *q*. Constraints: *ldq* ≥ max(1, *n*) if *vect* = 'V'; *ldq* ≥ 1 if *vect* = 'N'.

Output Parameters

ab	On exit, the array *ab* is overwritten.
d, *e*, *q*	REAL for ssbtrd DOUBLE PRECISION for dsbtrd. Arrays: *d*(*) contains the diagonal elements of the matrix *T*. The dimension of *d* must be at least max(1, *n*). *e*(*) contains the off-diagonal elements of *T*. The dimension of *e* must be at least max(1, *n*-1). *q*(*ldq*,*) is not referenced if *vect* = 'N'. If *vect* = 'V', *q* contains the *n*-by-*n* matrix *Q*. The second dimension of *q* must be: at least max(1, *n*) if *vect* = 'V'; at least 1 if *vect* = 'N'.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `sbtrd` interface are the following:

a	Stands for argument *ab* in Fortan 77 interface. Holds the array *A* of size (*kd+1*,*n*).
q	Holds the matrix *Q* of size (*n*,*n*).
d	Holds the vector of length (*n*).
e	Holds the vector of length (*n*-1).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
vect	If omitted, this argument is restored based on the presence of argument *q* as follows: *vect* = `'V'`, if *q* is present, *vect* = `'N'`, if *q* is omitted. If present, *vect* must be equal to `'V'` or `'U'` and the argument *q* must also be present. Note that there will be an error condition if *vect* is present and *q* omitted.

Application Notes

The computed matrix *T* is exactly similar to a matrix *A* + *E*, where $||E||_2 = c(n)\varepsilon ||A||_2$, $c(n)$ is a modestly increasing function of *n*, and ε is the machine precision. The computed matrix *Q* differs from an exactly orthogonal matrix by a matrix *E* such that $||E||_2 = O(\varepsilon)$.

The total number of floating-point operations is approximately $6n^2*kd$ if *vect* = `'N'`, with $3n^3*(kd-1)/kd$ additional operations if *vect* = `'V'`.

The complex counterpart of this routine is `?hbtrd`.

?hbtrd

Reduces a complex Hermitian band matrix to tridiagonal form.

Syntax

Fortran 77:

```
call chbtrd(vect, uplo, n, kd, ab, ldab, d, e, q, ldq, work, info)
call zhbtrd(vect, uplo, n, kd, ab, ldab, d, e, q, ldq, work, info)
```

Fortran 95:

```
call hbtrd(a [, q] [,vect] [,uplo] [,info])
```

Description

This routine reduces a complex Hermitian band matrix A to symmetric tridiagonal form T by a unitary similarity transformation: $A = Q*T*Q^H$. The unitary matrix Q is determined as a product of Givens rotations.

If required, the routine can also form the matrix Q explicitly.

Input Parameters

vect	CHARACTER*1. Must be 'V' or 'N'. If *vect* = 'V', the routine returns the explicit matrix Q. If *vect* = 'N', the routine does not return Q.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *ab* stores the upper triangular part of A. If *uplo* = 'L', *ab* stores the lower triangular part of A.
n	INTEGER. The order of the matrix A ($n \geq 0$).
kd	INTEGER. The number of super- or sub-diagonals in A ($kd \geq 0$).
ab, *work*	COMPLEX for chbtrd DOUBLE COMPLEX for zhbtrd. *ab* (*ldab*,*) is an array containing either upper or lower triangular part of the matrix A (as specified by *uplo*) in band storage format.

The second dimension of *ab* must be at least max(1, *n*).
work(*) is a workspace array.
The dimension of *work* must be at least max(1, *n*).

ldab INTEGER. The first dimension of *ab*; at least *kd*+1.

ldq INTEGER. The first dimension of *q*. Constraints:

ldq ≥ max(1, *n*) if *vect* = 'V';

ldq ≥ 1 if *vect* = 'N'.

Output Parameters

ab On exit, the array *ab* is overwritten.

d, *e* REAL for chbtrd
DOUBLE PRECISION for zhbtrd.
Arrays:
d(*) contains the diagonal elements of the matrix *T*.
The dimension of *d* must be at least max(1, *n*).
e(*) contains the off-diagonal elements of *T*.
The dimension of *e* must be at least max(1, *n*-1).

q COMPLEX for chbtrd
DOUBLE COMPLEX for zhbtrd.
Array, DIMENSION (*ldq*,*).
If *vect* = 'N', *q* is not referenced.
If *vect* = 'V', *q* contains the *n*-by-*n* matrix *Q*.
The second dimension of *q* must be:
at least max(1, *n*) if *vect* = 'V';
at least 1 if *vect* = 'N'.

info INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine hbtrd interface are the following:

a	Stands for argument *ab* in Fortan 77 interface. Holds the array *A* of size (*kd+1*,*n*).
q	Holds the matrix *Q* of size (*n*,*n*).
d	Holds the vector of length (*n*).
e	Holds the vector of length (*n*-1).
uplo	Must be 'U' or 'L'. The default value is 'U'.
vect	If omitted, this argument is restored based on the presence of argument *q* as follows: *vect* = 'V', if *q* is present, *vect* = 'N', if *q* is omitted. If present, *vect* must be equal to 'V' or 'U' and the argument *q* must also be present. Note that there will be an error condition if *vect* is present and *q* omitted.

Application Notes

The computed matrix *T* is exactly similar to a matrix *A* + *E*, where $||E||_2 = c(n)\varepsilon ||A||_2$, $c(n)$ is a modestly increasing function of *n*, and ε is the machine precision. The computed matrix *Q* differs from an exactly unitary matrix by a matrix *E* such that $||E||_2 = O(\varepsilon)$.

The total number of floating-point operations is approximately $20n^2*kd$ if *vect* = 'N', with $10n^3*(kd-1)/kd$ additional operations if *vect* = 'V'.

The real counterpart of this routine is ?sbtrd.

?sterf

Computes all eigenvalues of a real symmetric tridiagonal matrix using QR algorithm.

Syntax

Fortran 77:

```
call ssterf(n, d, e, info)
call dsterf(n, d, e, info)
```

Fortran 95:

```
call sterf(d, e [,info])
```

Description

This routine computes all the eigenvalues of a real symmetric tridiagonal matrix *T* (which can be obtained by reducing a symmetric or Hermitian matrix to tridiagonal form). The routine uses a square-root-free variant of the *QR* algorithm.

If you need not only the eigenvalues but also the eigenvectors, call ?steqr.

Input Parameters

n	INTEGER. The order of the matrix *T* (*n* ≥ 0).
d, *e*	REAL for ssterf DOUBLE PRECISION for dsterf. Arrays: *d*(*) contains the diagonal elements of *T*. The dimension of *d* must be at least max(1, *n*). *e*(*) contains the off-diagonal elements of *T*. The dimension of *e* must be at least max(1, *n*-1).

Output Parameters

d	The *n* eigenvalues in ascending order, unless *info* > 0. See also *info*.
e	On exit, the array is overwritten; see *info*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = *i*, the algorithm failed to find all the eigenvalues after 30*n* iterations: *i* off-diagonal elements have not converged to zero. On exit, *d* and *e* contain, respectively, the diagonal and off-diagonal elements of a tridiagonal matrix orthogonally similar to *T*. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine sterf interface are the following:

d	Holds the vector of length (*n*).
e	Holds the vector of length (*n*–1).

Application Notes

The computed eigenvalues and eigenvectors are exact for a matrix $T + E$ such that $||E||_2 = O(\varepsilon)\ ||T||_2$, where ε is the machine precision.

If λ_i is an exact eigenvalue, and m_i is the corresponding computed value, then

$|\mu i - \lambda i| \le c(n)\varepsilon\ ||T||_2$

where $c(n)$ is a modestly increasing function of n.

The total number of floating-point operations depends on how rapidly the algorithm converges. Typically, it is about $14n^2$.

?steqr

Computes all eigenvalues and eigenvectors of a symmetric or Hermitian matrix reduced to tridiagonal form (QR algorithm).

Syntax

Fortran 77:

```
call ssteqr(compz, n, d, e, z, ldz, work, info)
call dsteqr(compz, n, d, e, z, ldz, work, info)
call csteqr(compz, n, d, e, z, ldz, work, info)
call zsteqr(compz, n, d, e, z, ldz, work, info)
```

Fortran 95:

```
call rsteqr(d, e [,z] [,compz] [,info])
call steqr(d, e [,z] [,compz] [,info])
```

Description

This routine computes all the eigenvalues and (optionally) all the eigenvectors of a real symmetric tridiagonal matrix T. In other words, the routine can compute the spectral factorization: $T = Z\Lambda Z^T$. Here Λ is a diagonal matrix whose diagonal elements are the eigenvalues λ_i; Z is an orthogonal matrix whose columns are eigenvectors. Thus,

$Tz_i = \lambda_i z_i$ for $i = 1, 2, \ldots, n$.

The routine normalizes the eigenvectors so that $||z_i||_2 = 1$.

You can also use the routine for computing the eigenvalues and eigenvectors of an arbitrary real symmetric (or complex Hermitian) matrix A reduced to tridiagonal form T: $A = Q*T*Q^H$. In this case, the spectral factorization is as follows: $A = Q*T*Q^H = (Q*Z)\Lambda(Q*Z)^H$. Before calling ?steqr, you must reduce A to tridiagonal form and generate the explicit matrix Q by calling the following routines:

	for real matrices:	for complex matrices:
full storage	?sytrd, ?orgtr	?hetrd, ?ungtr
packed storage	?sptrd, ?opgtr	?hptrd, ?upgtr
band storage	?sbtrd *(vect*='V')	?hbtrd *(vect*='V')

If you need eigenvalues only, it's more efficient to call ?sterf. If T is positive-definite, ?pteqr can compute small eigenvalues more accurately than ?steqr.

To solve the problem by a single call, use one of the divide and conquer routines ?stevd, ?syevd, ?spevd, or ?sbevd for real symmetric matrices or ?heevd, ?hpevd, or ?hbevd for complex Hermitian matrices.

Input Parameters

compz — CHARACTER*1. Must be 'N' or 'I' or 'V'.
If *compz* = 'N', the routine computes eigenvalues only.
If *compz* = 'I', the routine computes the eigenvalues and eigenvectors of the tridiagonal matrix T.
If *compz* = 'V', the routine computes the eigenvalues and eigenvectors of A (and the array z must contain the matrix Q on entry).

n	INTEGER. The order of the matrix T ($n \geq 0$).
d, *e*, *work*	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. Arrays: *d*(*) contains the diagonal elements of T. The dimension of *d* must be at least max(1, *n*). *e*(*) contains the off-diagonal elements of T. The dimension of *e* must be at least max(1, *n*-1). *work*(*) is a workspace array. The dimension of *work* must be: at least 1 if *compz* = 'N'; at least max(1, 2**n*-2) if *compz* = 'V' or 'I'.
z	REAL for ssteqr DOUBLE PRECISION for dsteqr COMPLEX for csteqr DOUBLE COMPLEX for zsteqr. Array, DIMENSION (*ldz*, *) If *compz* = 'N' or 'I', *z* need not be set. If *vect* = 'V', *z* must contain the *n*-by-*n* matrix Q. The second dimension of *z* must be: at least 1 if *compz* = 'N'; at least max(1, *n*) if *compz* = 'V' or 'I'. *work* (*lwork*) is a workspace array.
ldz	INTEGER. The first dimension of *z*. Constraints: *ldz* ≥ 1 if *compz* = 'N'; *ldz* ≥ max(1, *n*) if *compz* = 'V' or 'I'.

Output Parameters

d	The *n* eigenvalues in ascending order, unless *info* > 0. See also *info*.
e	On exit, the array is overwritten; see *info*.
z	If *info* = 0, contains the *n* orthonormal eigenvectors, stored by columns. (The *i*-th column corresponds to the *i*th eigenvalue.)
info	INTEGER.

If *info* = 0, the execution is successful.
If *info* = *i*, the algorithm failed to find all the eigenvalues after 30*n* iterations: *i* off-diagonal elements have not converged to zero. On exit, *d* and *e* contain, respectively, the diagonal and off-diagonal elements of a tridiagonal matrix orthogonally similar to *T*.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine steqr interface are the following:

d — Holds the vector of length (*n*).

e — Holds the vector of length (*n*-1).

z — Holds the matrix *Z* of size (*n*,*n*).

compz — If omitted, this argument is restored based on the presence of argument *z* as follows:
compz = 'I', if *z* is present,
compz = 'N', if *z* is omitted.
If present, *compz* must be equal to 'I' or 'V' and the argument *z* must also be present. Note that there will be an error condition if *compz* is present and *z* omitted.
Note that two variants of Fortran 95 interface for steqr routine are needed because of an ambiguous choice between real and complex cases appear when *z* is omitted. Thus, the name rsteqr is used in real cases (single or double precision), and the name steqr is used in complex cases (single or double precision).

Application Notes

The computed eigenvalues and eigenvectors are exact for a matrix $T + E$ such that $||E||_2 = O(\varepsilon)\ ||T||_2$, where ε is the machine precision.

If λ_i is an exact eigenvalue, and μ_i is the corresponding computed value, then

$|\mu_i - \lambda_i| \leq c(n)\varepsilon\ ||T||_2$

where $c(n)$ is a modestly increasing function of n.

If z_i is the corresponding exact eigenvector, and w_i is the corresponding computed vector, then the angle $\theta(z_i, w_i)$ between them is bounded as follows:

$\theta(z_i, w_i) \leq c(n)\varepsilon \, ||T||_2 / \min_{i \neq j}|\lambda_i - \lambda_j|$.

The total number of floating-point operations depends on how rapidly the algorithm converges. Typically, it is about

$24n^2$ if *compz* = 'N';

$7n^3$ (for complex flavors, $14n^3$) if *compz* = 'V' or 'I'.

?stemr

Computes selected eigenvalues and eigenvectors of a real symmetric tridiagonal matrix.

Syntax

Fortran 77:

```
call sstemr(jobz, range, n, d, e, vl, vu, il, iu, m, w, z, ldz, nzc, isuppz,
tryrac, work, lwork, iwork, liwork, info)
call dstemr(jobz, range, n, d, e, vl, vu, il, iu, m, w, z, ldz, nzc, isuppz,
tryrac, work, lwork, iwork, liwork, info)
call cstemr(jobz, range, n, d, e, vl, vu, il, iu, m, w, z, ldz, nzc, isuppz,
tryrac, work, lwork, iwork, liwork, info)
call zstemr(jobz, range, n, d, e, vl, vu, il, iu, m, w, z, ldz, nzc, isuppz,
tryrac, work, lwork, iwork, liwork, info)
```

Description

This routine computes selected eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix T. Any such unreduced matrix has a well defined set of pairwise different real eigenvalues, the corresponding real eigenvectors are pairwise orthogonal.

The spectrum may be computed either completely or partially by specifying either an interval (vl,vu] or a range of indices il:iu for the desired eigenvalues.

Depending on the number of desired eigenvalues, these are computed either by bisection or the *dqds* algorithm. Numerically orthogonal eigenvectors are computed by the use of various suitable $L*D*L^T$ factorizations near clusters of close eigenvalues (referred to as RRRs, Relatively Robust Representations). An informal sketch of the algorithm follows.

For each unreduced block (submatrix) of T,

a. Compute $T - \sigma I = L*D*L^T$, so that L and D define all the wanted eigenvalues to high relative accuracy. This means that small relative changes in the entries of L and D cause only small relative changes in the eigenvalues and eigenvectors. The standard (unfactored) representation of the tridiagonal matrix T does not have this property in general.

b. Compute the eigenvalues to suitable accuracy. If the eigenvectors are desired, the algorithm attains full accuracy of the computed eigenvalues only right before the corresponding vectors have to be computed, see steps c and d.

c. For each cluster of close eigenvalues, select a new shift close to the cluster, find a new factorization, and refine the shifted eigenvalues to suitable accuracy.

d. For each eigenvalue with a large enough relative separation compute the corresponding eigenvector by forming a rank revealing twisted factorization. Go back to step c for any clusters that remain.

For more details, see: [Dhillon04], [Dhillon04-02], [Dhillon97]

The routine works only on machines which follow IEEE-754 floating-point standard in their handling of infinities and NaNs (NaN stands for "not a number"). This permits the use of efficient inner loops avoiding a check for zero divisors.

LAPACK routines can be used to reduce a complex Hermitean matrix to real symmetric tridiagonal form.

(Any complex Hermitean tridiagonal matrix has real values on its diagonal and potentially complex numbers on its off-diagonals. By applying a similarity transform with an appropriate diagonal matrix $\mathrm{diag}(1, e^{i\phi_1}, \ldots, e^{i\phi_{n-1}})$, the complex Hermitean matrix can be transformed into a real symmetric matrix and complex arithmetic can be entirely avoided.) While the eigenvectors of the real symmetric tridiagonal matrix are real, the eigenvectors of original complex Hermitean matrix have complex entries in general. Since LAPACK drivers overwrite the matrix data with the eigenvectors, `zstemr` accepts complex workspace to facilitate interoperability with `zunmtr` or `zupmtr`.

Input Parameters

jobz — `CHARACTER*1`. Must be `'N'` or `'V'`.
If *jobz* = `'N'`, then only eigenvalues are computed.

If *jobz* = 'V', then eigenvalues and eigenvectors are computed.

range — CHARACTER*1. Must be 'A' or 'V' or 'I'.
If *range* = 'A', the routine computes all eigenvalues.
If *range* = 'V', the routine computes all eigenvalues in the half-open interval: (*vl*, *vu*].
If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.

n — INTEGER. The order of the matrix *T* (*n*≥0).

d — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION (*n*).
Contains *n* diagonal elements of the tridiagonal matrix *T*.

e — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION (*n*–1).
Contains (*n*–1) off-diagonal elements of the tridiagonal matrix *T* in elements 1 to *n*–1 of *e*. *e*(*n*) need not be set on input, but is used internally as workspace.

vl, *vu* — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues. Constraint: *vl*<*vu*.
If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, *iu* — INTEGER.
If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.
Constraint: 1≤*il*≤*iu*≤*n*, if *n*>0.
If *range* = 'A' or 'V', *il* and *iu* are not referenced.

ldz — INTEGER. The leading dimension of the output array *z*.
if *jobz* = 'V', then *ldz* ≥ max(1, *n*);
ldz ≥ 1 otherwise.

nzc — INTEGER. The number of eigenvectors to be held in the array *z*.
If *range* = 'A', then *nzc*≥max(1, *n*);

If *range* = 'V', then *nzc* is greater than or equal to the number of eigenvalues in the half-open interval: (*vl*, *vu*].

If *range* = 'I', then *nzc*≥*il*+*iu*+1.

This value is returned as the first entry of the array *z*, and no error message related to *nzc* is issued by the routine xerbla.

tryrac LOGICAL.

If *tryrac* = .TRUE., it indicates that the code should check whether the tridiagonal matrix defines its eigenvalues to high relative accuracy. If so, the code uses relative-accuracy preserving algorithms that might be (a bit) slower depending on the matrix. If the matrix does not define its eigenvalues to high relative accuracy, the code can uses possibly faster algorithms.

If *tryrac* = .FALSE., the code is not required to guarantee relatively accurate eigenvalues and can use the fastest possible techniques.

work REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Workspace array, DIMENSION (*lwork*).

lwork INTEGER.

The dimension of the array *work*,

lwork≥max(1, 18**n*).

If *lwork*=−1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

iwork INTEGER.

Workspace array, DIMENSION (*liwork*).

liwork INTEGER.

The dimension of the array *iwork*.

lwork≥max(1, 10**n*) if the eigenvectors are desired, and

lwork≥max(1, 8**n*) if only the eigenvalues are to be computed.

If *liwork*=-1, then a workspace query is assumed; the routine only calculates the optimal size of the *iwork* array, returns this value as the first entry of the *iwork* array, and no error message related to *liwork* is issued by xerbla.

Output Parameters

e — On exit, the array *e* is overwritten.

m — INTEGER.
The total number of eigenvalues found, $0 \le m \le n$.
If *range* = 'A', then $m=n$, and if If *range* = 'I', then $m=iu-il+1$.

w — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION (*n*).
The first *m* elements contain the selected eigenvalues in ascending order.

z — REAL for sstemr
DOUBLE PRECISION for dstemr
COMPLEX for cstemr
DOUBLE COMPLEX for zstemr.
Array *z*(*ldz*, *), the second dimension of *z* must be at least max(1, *m*).
If *jobz* = 'V', and *info* = 0, then the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *T* corresponding to the selected eigenvalues, with the i-th column of *z* holding the eigenvector associated with *w*(i).
If *jobz* = 'N', then *z* is not referenced.
Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z* ; if *range* = 'V', the exact value of *m* is not known in advance and an can be computed with a workspace query by setting *nzc*=-1, see description of the parameter *nzc*.

isuppz — INTEGER.
Array, DIMENSION (2*max(1, *m*)).

	The support of the eigenvectors in *z*, that is the indices indicating the nonzero elements in *z*. The i-th computed eigenvector is nonzero only in elements *isuppz*(2*i-1) through *isuppz*(2*i). This is relevant in the case when the matrix is split. *isuppz* is only accessed when *jobz* = 'V' and *n*>0.
tryrac	On exit, TRUE. *tryrac* is set to .FALSE. if the matrix does not define its eigenvalues to high relative accuracy.
work(1)	On exit, if *info* = 0, then *work*(1) returns the optimal (and minimal) size of *lwork*.
iwork(1)	On exit, if *info* = 0, then *iwork*(1) returns the optimal size of *liwork*.
info	INTEGER. If = 0, the execution is successful. If *info* = -i, the i-th parameter had an illegal value. If *info* = 1, internal error in ?larre occurred, if *info* = 2, internal error in ?larrv occurred.

?stedc

Computes all eigenvalues and eigenvectors of a symmetric tridiagonal matrix using the divide and conquer method.

Syntax

Fortran 77:

call sstedc(*compz*, *n*, *d*, *e*, *z*, *ldz*, *work*, *lwork*, *iwork*, *liwork*, *info*)

call dstedc(*compz*, *n*, *d*, *e*, *z*, *ldz*, *work*, *lwork*, *iwork*, *liwork*, *info*)

call cstedc(*compz*, *n*, *d*, *e*, *z*, *ldz*, *work*, *lwork*, *rwork*, *lrwork*, *iwork*, *liwork*, *info*)

call zstedc(*compz*, *n*, *d*, *e*, *z*, *ldz*, *work*, *lwork*, *rwork*, *lrwork*, *iwork*, *liwork*, *info*)

Fortran 95:

```
call rstedc(d, e [,z] [,compz] [,info])
call stedc(d, e [,z] [,compz] [,info])
```

Description

This routine computes all the eigenvalues and (optionally) all the eigenvectors of a symmetric tridiagonal matrix using the divide and conquer method. The eigenvectors of a full or band real symmetric or complex Hermitian matrix can also be found if ?sytrd/?hetrd or ?sptrd/?hptrd or ?sbtrd/?hbtrd has been used to reduce this matrix to tridiagonal form.

See also ?laed0, ?laed1, ?laed2, ?laed3, ?laed4, ?laed5, ?laed6, ?laed7, ?laed8, ?laed9, and ?laeda used by this function.

Input Parameters

compz	CHARACTER*1. Must be 'N' or 'I' or 'V'. If *compz* = 'N', the routine computes eigenvalues only. If *compz* = 'I', the routine computes the eigenvalues and eigenvectors of the tridiagonal matrix. If *compz* = 'V', the routine computes the eigenvalues and eigenvectors of original symmetric/Hermitian matrix. On entry, the array *z* must contain the orthogonal/unitary matrix used to reduce the original matrix to tridiagonal form.
n	INTEGER. The order of the symmetric tridiagonal matrix (*n* ≥ 0).
d, *e*, *rwork*	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. Arrays: *d*(*) contains the diagonal elements of the tridiagonal matrix. The dimension of *d* must be at least max(1, *n*). *e*(*) contains the subdiagonal elements of the tridiagonal matrix. The dimension of *e* must be at least max(1, *n*-1). *rwork* is a workspace array, its dimension max(1, *lrwork*).
z, *work*	REAL for sstedc DOUBLE PRECISION for dstedc

COMPLEX for cstedc
DOUBLE COMPLEX for zstedc.
Arrays: *z*(*ldz*, *), *work*(*).
If *compz* = 'V', then, on entry, *z* must contain the orthogonal/unitary matrix used to reduce the original matrix to tridiagonal form.
The second dimension of *z* must be at least max(1, *n*).
work is a workspace array, its dimension max(1, *lwork*).

ldz — INTEGER. The first dimension of *z*. Constraints:
ldz ≥ 1 if *compz* = 'N';
ldz ≥ max(1, *n*) if *compz* = 'V' or 'I'.

lwork — INTEGER. The dimension of the array *work*.
If *compz* = 'N'or 'I', or *n* ≤ 1, *lwork* must be at least 1.
If *compz* = 'V' and *n* > 1, *lwork* must be at least *n***n*.
Note that for *compz* = 'V', and if *n* is less than or equal to the minimum divide size, usually 25, then *lwork* need only be 1.
If *lwork* = –1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla.
See Application Notes for the required value of *lwork*.

lrwork — INTEGER. The dimension of the array *rwork* (used for complex flavors only).
If *compz* = 'N', or *n* ≤ 1, *lrwork* must be at least 1.
If *compz* = 'V' and *n* > 1, *lrwork* must be at least (1+3**n*+2**n**lg(*n*)+3**n***n*), where lg(*n*) is the smallest integer *k* such that 2***k*≥*n*.
If *compz* = 'I' and *n* > 1, *lrwork* must be at least (1+4**n*+2**n***n*).
Note that for *compz* = 'V'or 'I', and if *n* is less than or equal to the minimum divide size, usually 25, then *lrwork* need only be max(1, 2*(*n*–1)).

If *lrwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See Application Notes for the required value of *lrwork*.

iwork INTEGER. Workspace array, its dimension max(1, *liwork*).

liwork INTEGER. The dimension of the array *iwork*.

If *compz* = 'N', or $n \leq 1$, *liwork* must be at least 1.
If *compz* = 'V' and $n > 1$, *liwork* must be at least (6+6**n*+5**n**lg(*n*), where lg(*n*) is the smallest integer *k* such that 2***k*≥*n*.
If *compz* = 'I' and $n > 1$, *liwork* must be at least (3+5**n*).
Note that for *compz* = 'V'or 'I', and if *n* is less than or equal to the minimum divide size, usually 25, then *liwork* need only be 1.
If *liwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See Application Notes for the required value of *liwork*.

Output Parameters

d The *n* eigenvalues in ascending order, unless *info* ≠ 0. See also *info*.

e On exit, the array is overwritten; see *info*.

z If *info* = 0, then if *compz* = 'V', *z* contains the orthonormal eigenvectors of the original symmetric/Hermitian matrix, and if *compz* = 'I', *z* contains the orthonormal eigenvectors of the symmetric tridiagonal matrix. If *compz* = 'N', *z* is not referenced.

work(1) On exit, if *info* = 0, then *work(1)* returns the optimal *lwork*.

rwork(1)	On exit, if *info* = 0, then *rwork(1)* returns the optimal *lrwork* (for complex flavors only).
iwork(1)	On exit, if *info* = 0, then *iwork(1)* returns the optimal *liwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the algorithm failed to compute an eigenvalue while working on the submatrix lying in rows and columns *i*/(*n*+1) through mod(*i*, *n*+1).

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine stedc interface are the following:

d	Holds the vector of length (*n*).
e	Holds the vector of length (*n*-1).
z	Holds the matrix *Z* of size (*n*,*n*).
compz	If omitted, this argument is restored based on the presence of argument *z* as follows: *compz* = 'I', if *z* is present, *compz* = 'N', if *z* is omitted. If present, *compz* must be equal to 'I' or 'V' and the argument *z* must also be present. Note that there will be an error condition if *compz* is present and *z* omitted.

Note that two variants of Fortran 95 interface for stedc routine are needed because of an ambiguous choice between real and complex cases appear when *z* and *work* are omitted. Thus, the name rstedc is used in real cases (single or double precision), and the name stedc is used in complex cases (single or double precision).

Application Notes

The required size of workspace arrays must be as follows.

For sstedc/dstedc:

If *compz* = 'N' or *n* ≤ 1 then *lwork* must be at least 1.

If *compz* = 'V' and $n > 1$ then *lwork* must be at least $(1 + 3n + 2n \cdot \lg n + 3n^2)$, where lg($n$) = smallest integer k such that $2^k \geq n$.

If *compz* = 'I' and $n > 1$ then *lwork* must be at least $(1 + 4n + n^2)$.

If *compz* = 'N' or $n \leq 1$ then *liwork* must be at least 1.

If *compz* = 'V' and $n > 1$ then *liwork* must be at least $(6 + 6n + 5n \cdot \lg n)$.

If *compz* = 'I' and $n > 1$ then *liwork* must be at least $(3 + 5n)$.

For cstedc/zstedc:

If *compz* = 'N' or'I', or $n \leq 1$, *lwork* must be at least 1.

If *compz* = 'V' and $n > 1$, *lwork* must be at least n^2.

If *compz* = 'N' or $n \leq 1$, *lrwork* must be at least 1.

If *compz* = 'V' and $n > 1$, *lrwork* must be at least $(1 + 3n + 2n \cdot \lg n + 3n^2)$, where lg($n$) = smallest integer k such that $2^k \geq n$.

If *compz* = 'I' and $n > 1$, *lrwork* must be at least$(1 + 4n + 2n^2)$.

The required value of *liwork* for complex flavors is the same as for real flavors.

You may set *lwork* (or *liwork* or *lrwork*, if supplied) to -1. The routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*, *lrwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?stegr

Computes selected eigenvalues and eigenvectors of a real symmetric tridiagonal matrix.

Syntax

Fortran 77:

```
call sstegr(jobz, range, n, d, e, vl, vu, il, iu, abstol, m, w, z, ldz, isuppz, work, lwork, iwork, liwork, info)
call dstegr(jobz, range, n, d, e, vl, vu, il, iu, abstol, m, w, z, ldz, isuppz, work, lwork, iwork, liwork, info)
call cstegr(jobz, range, n, d, e, vl, vu, il, iu, abstol, m, w, z, ldz, isuppz, work, lwork, iwork, liwork, info)
call zstegr(jobz, range, n, d, e, vl, vu, il, iu, abstol, m, w, z, ldz, isuppz, work, lwork, iwork, liwork, info)
```

Fortran 95:

```
call rstegr(d, e, w [,z] [,vl] [,vu] [,il] [,iu] [,m] [,isuppz] [,abstol] [,info])
call stegr(d, e, w [,z] [,vl] [,vu] [,il] [,iu] [,m] [,isuppz] [,abstol] [,info])
```

Description

This routine computes selected eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix T. Any such unreduced matrix has a well defined set of pairwise different real eigenvalues, the corresponding real eigenvectors are pairwise orthogonal.

The spectrum may be computed either completely or partially by specifying either an interval $(vl, vu]$ or a range of indices $il:iu$ for the desired eigenvalues.

?sregr is a compatability wrapper around the improved ?stemr routine. See it descriprion for further details.

Note that the *abstol* parameter no longer provides any benefit and hence is no longer used.

See also auxiliary ?lasq2 ?lasq5, ?lasq6 , used by this routine.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *job* = 'N', then only eigenvalues are computed. If *job* = 'V', then eigenvalues and eigenvectors are computed.
range	CHARACTER*1. Must be 'A' or 'V' or 'I'. If *range* = 'A', the routine computes all eigenvalues. If *range* = 'V', the routine computes eigenvalues *lambda*(*i*) in the half-open interval: *vl*< *lambda*(*i*) ≤ *vu*. If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.
n	INTEGER. The order of the matrix *T* (*n* ≥ 0).
d, *e*, *work*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays: *d*(*) contains the diagonal elements of *T*. The dimension of *d* must be at least max(1, *n*). *e*(*) contains the subdiagonal elements of *T* in elements 1 to *n*-1; *e*(*n*) need not be set on input, but it is used as a workspace. The dimension of *e* must be at least max(1, *n*). *work*(*lwork*) is a workspace array.
vl, *vu*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues. Constraint: *vl*< *vu*. If *range* = 'A' or 'I', *vl* and *vu* are not referenced.
il, *iu*	INTEGER. If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned. Constraint: 1 ≤ *il* ≤ *iu* ≤ *n*, if *n* > 0. If *range* = 'A' or 'V', *il* and *iu* are not referenced.
abstol	REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Unused. Was the absolute error tolerance for the eigenvalues/eigenvectors in previous versions.

ldz — INTEGER. The leading dimension of the output array *z*.
Constraints:
ldz < 1 if *jobz* = 'N';
ldz < max(1, *n*) *jobz* = 'V', an.

lwork — INTEGER.
The dimension of the array *work*,

lwork≥max(1, 18**n*) if *jobz* = 'V', and

lwork≥max(1, 12**n*) if *jobz* = 'N'.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes below for details.

iwork — INTEGER.
Workspace array, DIMENSION (*liwork*).

liwork — INTEGER.

The dimension of the array *iwork*, *lwork* ≥ max(1, 10**n*)

if the eigenvectors are desired, and *lwork* ≥ max(1, 8**n*) if only the eigenvalues are to be computed..
If *liwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *iwork* array, returns this value as the first entry of the *iwork* array, and no error message related to *liwork* is issued by xerbla. See Application Notes below for details.

Output Parameters

d, *e* — On exit, *d* and *e* are overwritten.

m — INTEGER. The total number of eigenvalues found,

0 ≤ *m* ≤ *n*.

If *range* = 'A', *m* = *n*, and if *range* = 'I', *m* = *iu*-*il*+1.

w — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.

	Array, DIMENSION at least max(1, *n*). The selected eigenvalues in ascending order, stored in *w*(1) to *w*(*m*).
z	REAL for sstegr DOUBLE PRECISION for dstegr COMPLEX for cstegr DOUBLE COMPLEX for zstegr. Array *z*(*ldz*, *), the second dimension of *z* must be at least max(1, *m*). If *jobz* = 'V', and if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *T* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). If *jobz* = 'N', then *z* is not referenced. Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z* ; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used. Supplying *n* columns is always safe.
isuppz	INTEGER. Array, DIMENSION at least (2*max(1, *m*)). The support of the eigenvectors in *z*, that is the indices indicating the nonzero elements in *z*. The *i*-th computed eigenvector is nonzero only in elements *isuppz*(2**i*–1) through *isuppz*(2**i*). This is relevant in the case when the matrix is split. *isuppz* is only accessed when *jobz* = 'V', and *n* > 0.
work(1)	On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.
iwork(1)	On exit, if *info* = 0, then *iwork(1)* returns the required minimal size of *liwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = –*i*, the *i*-th parameter had an illegal value. If *info* = 1*x*, internal error in ?larre occurred, If *info* = 2*x*, internal error in ?larrv occurred. Here the digit *x* = abs(*iinfo*) < 10, where *iinfo* is the non-zero error code returned by ?larre or ?larrv, respectively.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `stegr` interface are the following:

d	Holds the vector of length (*n*).
e	Holds the vector of length (*n*).
w	Holds the vector of length (*n*).
z	Holds the matrix *Z* of size (*n*,*m*).
isuppz	Holds the vector of length (*2*m*).
vl	Default value for this argument is *vl* = – HUGE (*vl*) where HUGE(*a*) means the largest machine number of the same precision as argument *a*.
vu	Default value for this argument is *vu* = HUGE (*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this argument is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Note that two variants of Fortran 95 interface for `stegr` routine are needed because of an ambiguous choice between real and complex cases appear when *z* is omitted. Thus, the name `rstegr` is used in real cases (single or double precision), and the name `stegr` is used in complex cases (single or double precision).

Application Notes

Currently ?stegr is only set up to find *all* the *n* eigenvalues and eigenvectors of *T* in O(*n2*) time, that is, only *range* = 'A' is supported.

Currently the routine ?stein is called when an appropriate s_i cannot be chosen in step (c) above. ?stein invokes modified Gram-Schmidt when eigenvalues are close.

?stegr works only on machines which follow IEEE-754 floating-point standard in their handling of infinities and NaNs. Normal execution of ?stegr may create NaNs and infinities and hence may abort due to a floating point exception in environments which do not conform to the IEEE-754 standard.

If you are in doubt how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run or set *lwork* = -1 (*liwork* = -1).

If you choose the first option and set any of admissible *lwork* (or *liwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If you set *lwork* = -1 (*liwork* = -1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?pteqr

Computes all eigenvalues and (optionally) all eigenvectors of a real symmetric positive-definite tridiagonal matrix.

Syntax

Fortran 77:

```
call spteqr(compz, n, d, e, z, ldz, work, info)
call dpteqr(compz, n, d, e, z, ldz, work, info)
call cpteqr(compz, n, d, e, z, ldz, work, info)
call zpteqr(compz, n, d, e, z, ldz, work, info)
```

Fortran 95:

```
call rpteqr(d, e [,z] [,compz] [,info])
call pteqr(d, e [,z] [,compz] [,info])
```

Description

This routine computes all the eigenvalues and (optionally) all the eigenvectors of a real symmetric positive-definite tridiagonal matrix T. In other words, the routine can compute the spectral factorization: $T = Z\Lambda Z^T$.

Here Λ is a diagonal matrix whose diagonal elements are the eigenvalues λ_i; Z is an orthogonal matrix whose columns are eigenvectors. Thus,

$Tz_i = \lambda_i z_i$ for $i = 1, 2, \ldots, n$.

(The routine normalizes the eigenvectors so that $||z_i||_2 = 1$.)

You can also use the routine for computing the eigenvalues and eigenvectors of real symmetric (or complex Hermitian) positive-definite matrices A reduced to tridiagonal form T: $A = Q*T*Q^H$.

In this case, the spectral factorization is as follows: $A = Q*T*Q^H = (QZ)\Lambda(QZ)^H$. Before calling ?pteqr, you must reduce A to tridiagonal form and generate the explicit matrix Q by calling the following routines:

	for real matrices:	for complex matrices:
full storage	?sytrd, ?orgtr	?hetrd, ?ungtr
packed storage	?sptrd, ?opgtr	?hptrd, ?upgtr
band storage	?sbtrd *(vect*='V')	?hbtrd *(vect*='V')

The routine first factorizes T as $L*D*L^H$ where L is a unit lower bidiagonal matrix, and D is a diagonal matrix. Then it forms the bidiagonal matrix $B = L*D^{1/2}$ and calls ?bdsqr to compute the singular values of B, which are the same as the eigenvalues of T.

Input Parameters

compz — CHARACTER*1. Must be 'N' or 'I' or 'V'.
If *compz* = 'N', the routine computes eigenvalues only.
If *compz* = 'I', the routine computes the eigenvalues and eigenvectors of the tridiagonal matrix T.
If *compz* = 'V', the routine computes the eigenvalues and eigenvectors of A (and the array z must contain the matrix Q on entry).

n — INTEGER. The order of the matrix T ($n \geq 0$).

d, *e*, *work* — REAL for single-precision flavors
DOUBLE PRECISION for double-precision flavors.
Arrays:
d(*) contains the diagonal elements of T.
The dimension of d must be at least max(1, n).
e(*) contains the off-diagonal elements of T.
The dimension of e must be at least max(1, n-1).
work(*) is a workspace array.
The dimension of *work* must be:
at least 1 if *compz* = 'N';
at least max(1, 4*n-4) if *compz* = 'V' or 'I'.

z — REAL for spteqr
DOUBLE PRECISION for dpteqr
COMPLEX for cpteqr
DOUBLE COMPLEX for zpteqr.
Array, DIMENSION (*ldz*,*)

If *compz* = 'N' or 'I', *z* need not be set.
If *vect* = 'V', *z* must contains the *n*-by-*n* matrix *Q*.
The second dimension of *z* must be:
at least 1 if *compz* = 'N';
at least max(1, *n*) if *compz* = 'V' or 'I'.

ldz — INTEGER. The first dimension of *z*. Constraints:
ldz ≥ 1 if *compz* = 'N';
ldz ≥ max(1, *n*) if *compz* = 'V' or 'I'.

Output Parameters

d — The *n* eigenvalues in descending order, unless *info* > 0. See also *info*.

e — On exit, the array is overwritten.

z — If *info* = 0, contains the *n* orthonormal eigenvectors, stored by columns. (The *i*th column corresponds to the *i*th eigenvalue.)

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = *i*, the leading minor of order *i* (and hence *T* itself) is not positive-definite.
If *info* = *n* + *i*, the algorithm for computing singular values failed to converge; *i* off-diagonal elements have not converged to zero.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine pteqr interface are the following:

d — Holds the vector of length (*n*).

e — Holds the vector of length (*n*-1).

z — Holds the matrix *Z* of size (*n*,*n*).

compz	If omitted, this argument is restored based on the presence of argument *z* as follows: *compz* = 'I', if *z* is present, *compz* = 'N', if *z* is omitted. If present, *compz* must be equal to 'I' or 'V' and the argument *z* must also be present. Note that there will be an error condition if *compz* is present and *z* omitted.

Note that two variants of Fortran 95 interface for pteqr routine are needed because of an ambiguous choice between real and complex cases appear when *z* is omitted. Thus, the name rpteqr is used in real cases (single or double precision), and the name pteqr is used in complex cases (single or double precision).

Application Notes

If λ_i is an exact eigenvalue, and m_i is the corresponding computed value, then

$|\mu_i - \lambda_i| \le c(n)\varepsilon K\lambda_i$

where $c(n)$ is a modestly increasing function of n, ε is the machine precision, and $K = ||DTD||_2 ||(DTD)^{-1}||_2$, D is diagonal with $d_{ii} = t_{ii}^{-1/2}$.

If z_i is the corresponding exact eigenvector, and w_i is the corresponding computed vector, then the angle $\theta(z_i, w_i)$ between them is bounded as follows: $\theta(u_i, w_i) \le c(n)\varepsilon K / \min_{i \neq j}(|\lambda_i - \lambda_j|/|\lambda_i + \lambda_j|)$.

Here $\min_{i \neq j}(|\lambda_i - \lambda_j|/|\lambda_i + \lambda_j|)$ is the relative gap between λ_i and the other eigenvalues.

The total number of floating-point operations depends on how rapidly the algorithm converges.

Typically, it is about

$30n^2$ if *compz* = 'N';

$6n^3$ (for complex flavors, $12n^3$) if *compz* = 'V' or 'I'.

?stebz

Computes selected eigenvalues of a real symmetric tridiagonal matrix by bisection.

Syntax

Fortran 77:

```
call sstebz (range, order, n, vl, vu, il, iu, abstol, d, e, m, nsplit, w,
iblock, isplit, work, iwork, info)
```

```
call dstebz (range, order, n, vl, vu, il, iu, abstol, d, e, m, nsplit, w,
iblock, isplit, work, iwork, info)
```

Fortran 95:

```
call stebz(d, e, m, nsplit, w, iblock, isplit [, order] [,vl] [,vu] [,il]
[,iu] [,abstol] [,info])
```

Description

This routine computes some (or all) of the eigenvalues of a real symmetric tridiagonal matrix T by bisection. The routine searches for zero or negligible off-diagonal elements to see if T splits into block-diagonal form $T = \mathrm{diag}(T_1, T_2, \ldots)$. Then it performs bisection on each of the blocks T_i and returns the block index of each computed eigenvalue, so that a subsequent call to ?stein can also take advantage of the block structure.

See also ?laebz.

Input Parameters

range — CHARACTER*1. Must be 'A' or 'V' or 'I'.
If *range* = 'A', the routine computes all eigenvalues.
If *range* = 'V', the routine computes eigenvalues *lambda*(*i*) in the half-open interval: $vl < lambda(i) \leq vu$.
If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.

order — CHARACTER*1. Must be 'B' or 'E'.
If *order* = 'B', the eigenvalues are to be ordered from smallest to largest within each split-off block.

	If *order* = 'E', the eigenvalues for the entire matrix are to be ordered from smallest to largest.
n	INTEGER. The order of the matrix *T* (*n* ≥ 0).
vl, *vu*	REAL for sstebz DOUBLE PRECISION for dstebz. If *range* = 'V', the routine computes eigenvalues *lambda*(*i*) in the half-open interval: *vl* < *lambda*(*i*) ≤ *vu*. If *range* = 'A' or 'I', *vl* and *vu* are not referenced.
il, *iu*	INTEGER. Constraint: 1 ≤ *il* ≤ *iu* ≤ *n*. If *range* = 'I', the routine computes eigenvalues *lambda*(*i*) such that *il*≤ *i* ≤ *iu* (assuming that the eigenvalues *lambda*(*i*) are in ascending order). If *range* = 'A' or 'V', *il* and *iu* are not referenced.
abstol	REAL for sstebz DOUBLE PRECISION for dstebz. The absolute tolerance to which each eigenvalue is required. An eigenvalue (or cluster) is considered to have converged if it lies in an interval of width *abstol*. If *abstol* ≤ 0.0, then the tolerance is taken as eps*|*T*|, where eps is the machine precision, and |*T*| is the 1-norm of the matrix *T*.
d, *e*, *work*	REAL for sstebz DOUBLE PRECISION for dstebz. Arrays: *d*(*) contains the diagonal elements of *T*. The dimension of *d* must be at least max(1, *n*). *e*(*) contains the off-diagonal elements of *T*. The dimension of *e* must be at least max(1, *n*-1). *work*(*) is a workspace array. The dimension of *work* must be at least max(1, 4*n*).
iwork	INTEGER. Workspace. Array, DIMENSION at least max(1, 3*n*).

Output Parameters

m	INTEGER. The actual number of eigenvalues found.
nsplit	INTEGER. The number of diagonal blocks detected in *T*.
w	REAL for sstebz DOUBLE PRECISION for dstebz. Array, DIMENSION at least max(1, *n*). The computed eigenvalues, stored in *w*(1) to *w*(*m*).
iblock, *isplit*	INTEGER. Arrays, DIMENSION at least max(1, *n*). A positive value *iblock*(*i*) is the block number of the eigenvalue stored in *w*(*i*) (see also *info*). The leading *nsplit* elements of *isplit* contain points at which *T* splits into blocks T_i as follows: the block T_1 contains rows/columns 1 to *isplit*(1); the block T_2 contains rows/columns *isplit*(1)+1 to *isplit*(2), and so on.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = 1, for *range* = 'A' or 'V', the algorithm failed to compute some of the required eigenvalues to the desired accuracy; *iblock*(*i*)<0 indicates that the eigenvalue stored in *w*(*i*) failed to converge. If *info* = 2, for *range* = 'I', the algorithm failed to compute some of the required eigenvalues. Try calling the routine again with *range* = 'A'. If *info* = 3: for *range* = 'A' or 'V', same as *info* = 1; for *range* = 'I', same as *info* = 2. If *info* = 4, no eigenvalues have been computed. The floating-point arithmetic on the computer is not behaving as expected. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine stebz interface are the following:

d	Holds the vector of length (*n*).
e	Holds the vector of length (*n*–1).
w	Holds the vector of length (*n*).
iblock	Holds the vector of length (*n*).
isplit	Holds the vector of length (*n*).
order	Must be 'B' or 'E'. The default value is 'B'.
vl	Default value for this argument is *vl* = - HUGE (*vl*) where HUGE(*a*) means the largest machine number of the same precision as argument *a*.
vu	Default value for this argument is *vu* = HUGE (*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this argument is *abstol* = 0.0_WP.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

The eigenvalues of *T* are computed to high relative accuracy which means that if they vary widely in magnitude, then any small eigenvalues will be computed more accurately than, for example, with the standard *QR* method. However, the reduction to tridiagonal form (prior to calling the routine) may exclude the possibility of obtaining high relative accuracy in the small eigenvalues of the original matrix if its eigenvalues vary widely in magnitude.

?stein

Computes the eigenvectors corresponding to specified eigenvalues of a real symmetric tridiagonal matrix.

Syntax

Fortran 77:

```
call sstein(n, d, e, m, w, iblock, isplit, z, ldz, work, iwork, ifailv, info)
call dstein(n, d, e, m, w, iblock, isplit, z, ldz, work, iwork, ifailv, info)
call cstein(n, d, e, m, w, iblock, isplit, z, ldz, work, iwork, ifailv, info)
call zstein(n, d, e, m, w, iblock, isplit, z, ldz, work, iwork, ifailv, info)
```

Fortran 95:

```
call stein(d, e, w, iblock, isplit, z [,ifailv] [,info])
```

Description

This routine computes the eigenvectors of a real symmetric tridiagonal matrix T corresponding to specified eigenvalues, by inverse iteration. It is designed to be used in particular after the specified eigenvalues have been computed by ?stebz with *order* = 'B', but may also be used when the eigenvalues have been computed by other routines.

If you use this routine after ?stebz, it can take advantage of the block structure by performing inverse iteration on each block T_i separately, which is more efficient than using the whole matrix T.

If T has been formed by reduction of a full symmetric or Hermitian matrix A to tridiagonal form, you can transform eigenvectors of T to eigenvectors of A by calling ?ormtr or ?opmtr (for real flavors) or by calling ?unmtr or ?upmtr (for complex flavors).

Input Parameters

n	INTEGER. The order of the matrix T ($n \geq 0$).
m	INTEGER. The number of eigenvectors to be returned.
d, *e*, *w*	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. Arrays:

	d(*) contains the diagonal elements of *T*. The dimension of *d* must be at least max(1, *n*). *e*(*) contains the sub-diagonal elements of *T* stored in elements 1 to *n*-1 The dimension of *e* must be at least max(1, *n*-1). *w*(*) contains the eigenvalues of *T*, stored in *w*(1) to *w*(*m*) (as returned by ?stebz). Eigenvalues of T_1 must be supplied first, in non-decreasing order; then those of T_2, again in non-decreasing order, and so on. Constraint: if *iblock*(*i*) = *iblock*(*i*+1), *w*(*i*) ≤ *w*(*i*+1). The dimension of *w* must be at least max(1, *n*).
iblock, *isplit*	INTEGER. Arrays, DIMENSION at least max(1, *n*). The arrays *iblock* and *isplit*, as returned by ?stebz with *order* = 'B'. If you did not call ?stebz with *order* = 'B', set all elements of *iblock* to 1, and *isplit*(1) to *n*.)
ldz	INTEGER. The first dimension of the output array *z*; *ldz* ≥ max(1, *n*).
work	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. Workspace array, DIMENSION at least max(1, 5*n*).
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

z	REAL for sstein DOUBLE PRECISION for dstein COMPLEX for cstein DOUBLE COMPLEX for zstein. Array, DIMENSION (*ldz*, *). If *info* = 0, *z* contains the *m* orthonormal eigenvectors, stored by columns. (The *i*th column corresponds to the *i*-th specified eigenvalue.)
ifailv	INTEGER. Array, DIMENSION at least max(1, *m*).

If *info* = *i* > 0, the first *i* elements of *ifailv* contain the indices of any eigenvectors that failed to converge.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = *i*, then *i* eigenvectors (as indicated by the parameter *ifailv*) each failed to converge in 5 iterations. The current iterates are stored in the corresponding columns of the array *z*.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `stein` interface are the following:

d — Holds the vector of length (*n*).

e — Holds the vector of length (*n*).

w — Holds the vector of length (*n*).

iblock — Holds the vector of length (*n*).

isplit — Holds the vector of length (*n*).

z — Holds the matrix *Z* of size (*n*,*m*).

ifailv — Holds the vector of length (*m*).

Application Notes

Each computed eigenvector z_i is an exact eigenvector of a matrix $T + E_i$, where $||E_i||_2 = O(\varepsilon)\ ||T||_2$. However, a set of eigenvectors computed by this routine may not be orthogonal to so high a degree of accuracy as those computed by `?steqr`.

?disna

Computes the reciprocal condition numbers for the eigenvectors of a symmetric/ Hermitian matrix or for the left or right singular vectors of a general matrix.

Syntax

Fortran 77:

```
call sdisna(job, m, n, d, sep, info)
call ddisna(job, m, n, d, sep, info)
```

Fortran 95:

```
call disna(d, sep [,job] [,minmn] [,info])
```

Description

This routine computes the reciprocal condition numbers for the eigenvectors of a real symmetric or complex Hermitian matrix or for the left or right singular vectors of a general *m*-by-*n* matrix.

The reciprocal condition number is the 'gap' between the corresponding eigenvalue or singular value and the nearest other one.

The bound on the error, measured by angle in radians, in the *i*-th computed vector is given by

```
slamch('E')*(anorm/sep(i))
```

where *anorm* = $||A||_2$ = max(|*d*(j)|). *sep*(*i*) is not allowed to be smaller than `slamch('E')*anorm` in order to limit the size of the error bound.

`?disna` may also be used to compute error bounds for eigenvectors of the generalized symmetric definite eigenproblem.

Input Parameters

job — `CHARACTER*1`. Must be `'E'`,`'L'`, or `'R'`. Specifies for which problem the reciprocal condition numbers should be computed:
job = `'E'`: for the eigenvectors of a symmetric/Hermitian matrix;
job = `'L'`: for the left singular vectors of a general matrix;

	job = 'R': for the right singular vectors of a general matrix.
m	INTEGER. The number of rows of the matrix ($m \geq 0$).
n	INTEGER. If *job* = 'L', or 'R', the number of columns of the matrix ($n \geq 0$). Ignored if *job* = 'E'.
d	REAL for sdisna DOUBLE PRECISION for ddisna. Array, dimension at least max(1,*m*) if *job* = 'E', and at least max(1, min(*m*,*n*)) if *job* = 'L' or 'R'. This array must contain the eigenvalues (if *job* = 'E') or singular values (if *job* = 'L' or 'R') of the matrix, in either increasing or decreasing order. If singular values, they must be non-negative.

Output Parameters

sep	REAL for sdisna DOUBLE PRECISION for ddisna. Array, dimension at least max(1,*m*) if *job* = 'E', and at least max(1, min(*m*,*n*)) if *job* = 'L' or 'R'. The reciprocal condition numbers of the vectors.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine disna interface are the following:

d	Holds the vector of length min(*m*,*n*).
sep	Holds the vector of length min(*m*,*n*).
job	Must be 'E', 'L', or 'R'. The default value is 'E'.
minmn	Indicates which of the values *m* or *n* is smaller. Must be either 'M' or 'N', the default is 'M'.

If *job* = 'E', this argument is superfluous, If *job* = 'L' or 'R', this argument is used by the routine.

Generalized Symmetric-Definite Eigenvalue Problems

Generalized symmetric-definite eigenvalue problems are as follows: find the eigenvalues λ and the corresponding eigenvectors z that satisfy one of these equations:

$Az = \lambda Bz$, $ABz = \lambda z$, or $BAz = \lambda z$,

where A is an n-by-n symmetric or Hermitian matrix, and B is an n-by-n symmetric positive-definite or Hermitian positive-definite matrix.

In these problems, there exist n real eigenvectors corresponding to real eigenvalues (even for complex Hermitian matrices A and B).

Routines described in this section allow you to reduce the above generalized problems to standard symmetric eigenvalue problem $Cy = \lambda y$, which you can solve by calling LAPACK routines described earlier in this chapter (see Symmetric Eigenvalue Problems).

Different routines allow the matrices to be stored either conventionally or in packed storage. Prior to reduction, the positive-definite matrix B must first be factorized using either ?potrf or ?pptrf.

The reduction routine for the banded matrices A and B uses a split Cholesky factorization for which a specific routine ?pbstf is provided. This refinement halves the amount of work required to form matrix C.

Table 4-4 lists LAPACK routines (Fortran-77 interface) that can be used to solve generalized symmetric-definite eigenvalue problems. Respective routine names in Fortran-95 interface are without the first symbol (see Routine Naming Conventions).

Table 4-4 Computational Routines for Reducing Generalized Eigenproblems to Standard Problems

Matrix type	Reduce to standard problems (full storage)	Reduce to standard problems (packed storage)	Reduce to standard problems (band matrices)	Factorize band matrix
real symmetric matrices	?sygst	?spgst	?sbgst	?pbstf

Matrix type	Reduce to standard problems (full storage)	Reduce to standard problems (packed storage)	Reduce to standard problems (band matrices)	Factorize band matrix
complex Hermitian matrices	?hegst	?hpgst	?hbgst	?pbstf

?sygst

Reduces a real symmetric-definite generalized eigenvalue problem to the standard form.

Syntax

Fortran 77:

```
call ssygst(itype, uplo, n, a, lda, b, ldb, info)
call dsygst(itype, uplo, n, a, lda, b, ldb, info)
```

Fortran 95:

```
call sygst(a, b [,itype] [,uplo] [,info])
```

Description

This routine reduces real symmetric-definite generalized eigenproblems

$Az = \lambda Bz$, $ABz = \lambda_z$, or $BAz = \lambda z$

to the standard form $Cy = \lambda_y$. Here A is a real symmetric matrix, and B is a real symmetric positive-definite matrix. Before calling this routine, call ?potrf to compute the Cholesky factorization: $B = U^T U$ or $B = LL^T$.

Input Parameters

itype INTEGER. Must be 1 or 2 or 3.
If *itype* = 1, the generalized eigenproblem is *A*z = lambda*B*z*
for *uplo* = 'U': C = inv(U^T)*A*inv(U), z = inv(U)*y;
for *uplo* = 'L': C = inv(L)*A*inv(L^T), z = inv(L^T)*y.

If *itype* = 2, the generalized eigenproblem is *A*B*z = lambda*z*
for *uplo* = 'U': *C* = *U*A*U*^{T}, *z* = inv(*U*)**y*;
for *uplo* = 'L': *C* = *L*^{T}**A*L*, *z* = inv(*L*^{T})**y*.
If *itype* = 3, the generalized eigenproblem is *B*A*z = lambda*z*
for *uplo* = 'U': *C* = *U*A*U*^{T}, *z* = *U*^{T}**y*;
for *uplo* = 'L': *C* = *L*^{T}**A*L*, *z* = *L*y*.

uplo — CHARACTER*1. Must be 'U' or 'L'.
If *uplo* = 'U', the array *a* stores the upper triangle of *A*; you must supply *B* in the factored form *B* = *U*^{T}**U*.
If *uplo* = 'L', the array *a* stores the lower triangle of *A*; you must supply *B* in the factored form *B* = *L*L*^{T}.

n — INTEGER. The order of the matrices *A* and *B* (*n* ≥ 0).

a, *b* — REAL for ssygst
DOUBLE PRECISION for dsygst.
Arrays:
a(*lda*,*) contains the upper or lower triangle of *A*.
The second dimension of *a* must be at least max(1, *n*).
b(*ldb*,*) contains the Cholesky-factored matrix *B*:
B = *U*^{T}**U* or *B* = *L*L*^{T} (as returned by ?potrf).
The second dimension of *b* must be at least max(1, *n*).

lda — INTEGER. The first dimension of *a*; at least max(1, *n*).

ldb — INTEGER. The first dimension of *b*; at least max(1, *n*).

Output Parameters

a — The upper or lower triangle of *A* is overwritten by the upper or lower triangle of *C*, as specified by the arguments *itype* and *uplo*.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `sygst` interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
b	Holds the matrix *B* of size (*n*,*n*).
itype	Must be 1, 2, or 3. The default value is 1.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

Forming the reduced matrix *C* is a stable procedure. However, it involves implicit multiplication by B^{-1} (if *itype* = 1) or *B* (if *itype* = 2 or 3). When the routine is used as a step in the computation of eigenvalues and eigenvectors of the original problem, there may be a significant loss of accuracy if *B* is ill-conditioned with respect to inversion.

The approximate number of floating-point operations is *n3*.

?hegst

Reduces a complex Hermitian-definite generalized eigenvalue problem to the standard form.

Syntax

Fortran 77:

```
call chegst(itype, uplo, n, a, lda, b, ldb, info)
call zhegst(itype, uplo, n, a, lda, b, ldb, info)
```

Fortran 95:

```
call hegst(a, b [,itype] [,uplo] [,info])
```

Description

This routine reduces complex Hermitian-definite generalized eigenvalue problems

$Az = \lambda Bz$, $ABz = \lambda z$, or $BAz = \lambda z$

to the standard form $Cy = \lambda y$. Here the matrix A is complex Hermitian, and B is complex Hermitian positive-definite. Before calling this routine, you must call ?potrf to compute the Cholesky factorization: $B = U^H*U$ or $B = L*L^H$.

Input Parameters

itype	INTEGER. Must be 1 or 2 or 3. If *itype* = 1, the generalized eigenproblem is *A*z = lambda*B*z* for *uplo* = 'U': $C = \text{inv}(U^H)*A*\text{inv}(U)$, $z = \text{inv}(U)*y$; for *uplo* = 'L': $C = \text{inv}(L)*A*\text{inv}(L^H)$, $z = \text{inv}(L^H)*y$. If *itype* = 2, the generalized eigenproblem is *A*B*z = lambda*z* for *uplo* = 'U': $C = U*A*U^H$, $z = \text{inv}(U)*y$; for *uplo* = 'L': $C = L^H*A*L$, $z = \text{inv}(L^H)*y$. If *itype* = 3, the generalized eigenproblem is *B*A*z = lambda*z* for *uplo* = 'U': $C = U*A*U^H$, $z = U^H*y$; for *uplo* = 'L': $C = L^H*A*L$, $z = L*y$.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', the array *a* stores the upper triangle of *A*; you must supply *B* in the factored form $B = U^H*U$. If *uplo* = 'L', the array *a* stores the lower triangle of *A*; you must supply *B* in the factored form $B = L*L^H$.
n	INTEGER. The order of the matrices *A* and *B* ($n \geq 0$).
a, *b*	COMPLEX for chegstDOUBLE COMPLEX for zhegst. Arrays: *a*(*lda*,*) contains the upper or lower triangle of *A*. The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) contains the Cholesky-factored matrix *B*: $B = U^H*U$ or $B = L*L^H$ (as returned by ?potrf). The second dimension of *b* must be at least max(1, *n*).
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
ldb	INTEGER. The first dimension of *b*; at least max(1, *n*).

Output Parameters

a	The upper or lower triangle of *A* is overwritten by the upper or lower triangle of *C*, as specified by the arguments *itype* and *uplo*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine hegst interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
b	Holds the matrix *B* of size (*n*,*n*).
itype	Must be 1, 2, or 3. The default value is 1.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

Forming the reduced matrix *C* is a stable procedure. However, it involves implicit multiplication by inv(*B*) (if *itype* = 1) or *B* (if *itype* = 2 or 3). When the routine is used as a step in the computation of eigenvalues and eigenvectors of the original problem, there may be a significant loss of accuracy if *B* is ill-conditioned with respect to inversion.

The approximate number of floating-point operations is n^3.

?spgst

Reduces a real symmetric-definite generalized eigenvalue problem to the standard form using packed storage.

Syntax

Fortran 77:

```
call sspgst(itype, uplo, n, ap, bp, info)
call dspgst(itype, uplo, n, ap, bp, info)
```

Fortran 95:

```
call spgst(a, b [,itype] [,uplo] [,info])
```

Description

This routine reduces real symmetric-definite generalized eigenproblems

$Az = \lambda Bz$, $ABz = \lambda z$, or $BAz = \lambda z$

to the standard form $Cy = \lambda y$, using packed matrix storage. Here A is a real symmetric matrix, and B is a real symmetric positive-definite matrix. Before calling this routine, call ?pptrf to compute the Cholesky factorization: $B = U^T*U$ or $B = L*L^T$.

Input Parameters

itype — INTEGER. Must be 1 or 2 or 3.
If *itype* = 1, the generalized eigenproblem is *A*z = lambda*B*z*
for *uplo* = 'U': $C = \text{inv}(U^T)*A*\text{inv}(U)$, $z = \text{inv}(U)*y$;
for *uplo* = 'L': $C = \text{inv}(L)*A*\text{inv}(L^T)$, $z = \text{inv}(L^T)*y$.
If *itype* = 2, the generalized eigenproblem is *A*B*z = lambda*z*
for *uplo* = 'U': $C = U*A*U^T$, $z = \text{inv}(U)*y$;
for *uplo* = 'L': $C = L^T*A*L$, $z = \text{inv}(L^T)*y$.
If *itype* = 3, the generalized eigenproblem is *B*A*z = lambda*z*
for *uplo* = 'U': $C = U*A*U^T$, $z = U^T*y$;
for *uplo* = 'L': $C = L^T*A*L$, $z = L*y$.

uplo — CHARACTER*1. Must be 'U' or 'L'.
If *uplo* = 'U', *ap* stores the packed upper triangle of *A*; you must supply *B* in the factored form $B = U^T*U$.
If *uplo* = 'L', *ap* stores the packed lower triangle of *A*; you must supply *B* in the factored form $B = L*L^T$.

n — INTEGER. The order of the matrices *A* and *B* ($n \geq 0$).

ap, *bp* — REAL for sspgst
DOUBLE PRECISION for dspgst.
Arrays:
ap(*) contains the packed upper or lower triangle of *A*.
The dimension of *ap* must be at least max(1, *n**(*n*+1)/2).

b — p(*) contains the packed Cholesky factor of *B* (as returned by ?pptrf with the same *uplo* value).
The dimension of *bp* must be at least max(1, *n**(*n*+1)/2).

Output Parameters

ap — The upper or lower triangle of *A* is overwritten by the upper or lower triangle of *C*, as specified by the arguments *itype* and *uplo*.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine spgst interface are the following:

a — Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n*(n+1)/2*).

b — Stands for argument *bp* in Fortan 77 interface. Holds the array *B* of size (*n*(n+1)/2*).

itype — Must be 1, 2, or 3. The default value is 1.

uplo — Must be 'U' or 'L'. The default value is 'U'.

Application Notes

Forming the reduced matrix C is a stable procedure. However, it involves implicit multiplication by B^{-1} (if $itype = 1$) or B (if $itype = 2$ or 3). When the routine is used as a step in the computation of eigenvalues and eigenvectors of the original problem, there may be a significant loss of accuracy if B is ill-conditioned with respect to inversion.

The approximate number of floating-point operations is n^3.

?hpgst

Reduces a complex Hermitian-definite generalized eigenvalue problem to the standard form using packed storage.

Syntax

Fortran 77:

```
call chpgst(itype, uplo, n, ap, bp, info)
call zhpgst(itype, uplo, n, ap, bp, info)
```

Fortran 95:

```
call hpgst(a, b [,itype] [,uplo] [,info])
```

Description

This routine reduces real symmetric-definite generalized eigenproblems

$Az = \lambda Bz$, $ABz = \lambda z$, or $BAz = \lambda z$

to the standard form $Cy = \lambda y$, using packed matrix storage. Here A is a real symmetric matrix, and B is a real symmetric positive-definite matrix. Before calling this routine, you must call ?pptrf to compute the Cholesky factorization: $B = U^H*U$ or $B = L*L^H$.

Input Parameters

itype	INTEGER. Must be 1 or 2 or 3. If $itype = 1$, the generalized eigenproblem is $A*z = lambda*B*z$ for $uplo$ = 'U': $C = \text{inv}(U^H)*A*\text{inv}(U)$, $z = \text{inv}(U)*y$; for $uplo$ = 'L': $C = \text{inv}(L)*A*\text{inv}(L^H)$, $z = \text{inv}(L^H)*y$.

If *itype* = 2, the generalized eigenproblem is *A*B*z = lambda*z*
for *uplo* = 'U': *C* = *U*A*U^H^*, *z* = inv(*U*)*y*;
for *uplo* = 'L': *C* = *L^H^*A*L*, *z* = inv(*L^H^*)*y*.
If *itype* = 3, the generalized eigenproblem is *B*A*z = lambda*z*
for *uplo* = 'U': *C* = *U*A*U^H^*, *z* = *U^H^*y*;
for *uplo* = 'L': *C* = *L^H^*A*L*, *z* = *L*y*.

uplo — CHARACTER*1. Must be 'U' or 'L'.
If *uplo* = 'U', *ap* stores the packed upper triangle of *A*; you must supply *B* in the factored form *B* = *U^H^*U*.
If *uplo* = 'L', *ap* stores the packed lower triangle of *A*; you must supply *B* in the factored form B = *L*L^H^*.

n — INTEGER. The order of the matrices *A* and *B* (*n* ≥ 0).

ap, *bp* — COMPLEX for chpgstDOUBLE COMPLEX for zhpgst.
Arrays:
ap(*) contains the packed upper or lower triangle of *A*.
The dimension of *a* must be at least max(1, *n**(*n*+1)/2).
bp(*) contains the packed Cholesky factor of *B* (as returned by ?pptrf with the same *uplo* value).
The dimension of *b* must be at least max(1, *n**(*n*+1)/2).

Output Parameters

ap — The upper or lower triangle of *A* is overwritten by the upper or lower triangle of *C*, as specified by the arguments *itype* and *uplo*.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine hpgst interface are the following:

a	Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n*(n+1)/2*).
b	Stands for argument *bp* in Fortan 77 interface. Holds the array *B* of size (*n*(n+1)/2*).
itype	Must be 1, 2, or 3. The default value is 1.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

Forming the reduced matrix *C* is a stable procedure. However, it involves implicit multiplication by inv(*B*) (if *itype* = 1) or *B* (if *itype* = 2 or 3). When the routine is used as a step in the computation of eigenvalues and eigenvectors of the original problem, there may be a significant loss of accuracy if *B* is ill-conditioned with respect to inversion.

The approximate number of floating-point operations is n^3.

?sbgst

Reduces a real symmetric-definite generalized eigenproblem for banded matrices to the standard form using the factorization performed by ?pbstf*.*

Syntax

Fortran 77:

```
call ssbgst(vect, uplo, n, ka, kb, ab, ldab, bb, ldbb, x, ldx, work, info)
call dsbgst(vect, uplo, n, ka, kb, ab, ldab, bb, ldbb, x, ldx, work, info)
```

Fortran 95:

```
call sbgst(a, b [,x] [,uplo] [,info])
```

Description

To reduce the real symmetric-definite generalized eigenproblem $Az = \lambda Bz$ to the standard form $Cy = \lambda y$, where *A*, *B* and *C* are banded, this routine must be preceded by a call to spbstf/dpbstf, which computes the split Cholesky factorization of the positive-definite matrix *B*: $B = S^T*S$. The split Cholesky factorization, compared with the ordinary Cholesky factorization, allows the work to be approximately halved.

This routine overwrites *A* with $C = X^T*A*X$, where $X = \mathrm{inv}(S)*Q$ and *Q* is an orthogonal matrix chosen (implicitly) to preserve the bandwidth of *A*. The routine also has an option to allow the accumulation of *X*, and then, if *z* is an eigenvector of *C*, *Xz* is an eigenvector of the original system.

Input Parameters

vect	CHARACTER*1. Must be 'N' or 'V'. If *vect* = 'N', then matrix *X* is not returned; If *vect* = 'V', then matrix *X* is returned.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *ab* stores the upper triangular part of *A*. If *uplo* = 'L', *ab* stores the lower triangular part of *A*.
n	INTEGER. The order of the matrices *A* and *B* ($n \geq 0$).
ka	INTEGER. The number of super- or sub-diagonals in *A* ($ka \geq 0$).
kb	INTEGER. The number of super- or sub-diagonals in *B* ($ka \geq kb \geq 0$).
ab, *bb*, *work*	REAL for ssbgst DOUBLE PRECISION for dsbgst *ab* (*ldab*,*) is an array containing either upper or lower triangular part of the symmetric matrix *A* (as specified by *uplo*) in band storage format. The second dimension of the array *ab* must be at least max(1, *n*). *bb* (*ldbb*,*) is an array containing the banded split Cholesky factor of *B* as specified by *uplo*, *n* and *kb* and returned by spbstf/dpbstf. The second dimension of the array *bb* must be at least max(1, *n*). *work(*)* is a workspace array, dimension at least max(1, 2**n*)
ldab	INTEGER. The first dimension of the array *ab*; must be at least *ka*+1.
ldbb	INTEGER. The first dimension of the array *bb*; must be at least *kb*+1.

ldx	The first dimension of the output array x. Constraints: if *vect* = 'N', then *ldx* ≥ 1; if *vect* = 'V', then *ldx* ≥ max(1, *n*).

Output Parameters

ab	On exit, this array is overwritten by the upper or lower triangle of *C* as specified by *uplo*.
x	REAL for ssbgst DOUBLE PRECISION for dsbgst Array. If *vect* = 'V', then *x* (*ldx*,*) contains the *n*-by-*n* matrix *X* = inv(*S*)**Q*. If *vect* = 'N', then *x* is not referenced. The second dimension of x must be: at least max(1, *n*), if *vect* = 'V'; at least 1, if *vect* = 'N'.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine sbgst interface are the following:

a	Stands for argument *ab* in Fortan 77 interface. Holds the array *A* of size (*ka+1*,*n*).
b	Stands for argument *bb* in Fortan 77 interface. Holds the array *B* of size (*kb+1*,*n*).
x	Holds the matrix *X* of size (*n*,*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
vect	Restored based on the presence of the argument *x* as follows: *vect* = 'V', if *x* is present, *vect* = 'N', if *x* is omitted.

Application Notes

Forming the reduced matrix C involves implicit multiplication by B^{-1}. When the routine is used as a step in the computation of eigenvalues and eigenvectors of the original problem, there may be a significant loss of accuracy if B is ill-conditioned with respect to inversion. The total number of floating-point operations is approximately $6n^2*kb$, when `vect = 'N'`. Additional $(3/2)n^3*(kb/ka)$ operations are required when `vect = 'V'`. All these estimates assume that both ka and kb are much less than n.

?hbgst

Reduces a complex Hermitian-definite generalized eigenproblem for banded matrices to the standard form using the factorization performed by `?pbstf`.

Syntax

Fortran 77:

```
call chbgst(vect, uplo, n, ka, kb, ab, ldab, bb, ldbb, x, ldx, work, rwork, info)
```

```
call zhbgst(vect, uplo, n, ka, kb, ab, ldab, bb, ldbb, x, ldx, work, rwork, info)
```

Fortran 95:

```
call hbgst(a, b [,x] [,uplo] [,info])
```

Description

To reduce the complex Hermitian-definite generalized eigenproblem $Az = \lambda Bz$ to the standard form $Cy = \lambda y$, where A, B and C are banded, this routine must be preceded by a call to cpbstf/zpbstf, which computes the split Cholesky factorization of the positive-definite matrix B: $B = S^H*S$. The split Cholesky factorization, compared with the ordinary Cholesky factorization, allows the work to be approximately halved.

This routine overwrites A with $C = X^H*A*X$, where $X = \text{inv}(S)*Q$, and Q is a unitary matrix chosen (implicitly) to preserve the bandwidth of A. The routine also has an option to allow the accumulation of X, and then, if z is an eigenvector of C, Xz is an eigenvector of the original system.

Input Parameters

vect	CHARACTER*1. Must be 'N' or 'V'. If *vect* = 'N', then matrix *X* is not returned; If *vect* = 'V', then matrix *X* is returned.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *ab* stores the upper triangular part of *A*. If *uplo* = 'L', *ab* stores the lower triangular part of *A*.
n	INTEGER. The order of the matrices *A* and *B* (*n* ≥ 0).
ka	INTEGER. The number of super- or sub-diagonals in *A* (*ka* ≥ 0).
kb	INTEGER. The number of super- or sub-diagonals in *B* (*ka* ≥ *kb* ≥ 0).
ab, *bb*, *work*	COMPLEX for chbgstDOUBLE COMPLEX for zhbgst *ab* (*ldab*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *A* (as specified by *uplo*) in band storage format. The second dimension of the array *ab* must be at least max(1, *n*). *bb* (*ldbb*,*) is an array containing the banded split Cholesky factor of *B* as specified by *uplo*, *n* and *kb* and returned by cpbstf/zpbstf. The second dimension of the array *bb* must be at least max(1, *n*). *work(*)* is a workspace array, dimension at least max(1, *n*)
ldab	INTEGER. The first dimension of the array *ab*; must be at least *ka*+1.
ldbb	INTEGER. The first dimension of the array *bb*; must be at least *kb*+1.
ldx	The first dimension of the output array x. Constraints: if *vect* = 'N', then *ldx* ≥ 1; if *vect* = 'V', then *ldx* ≥ max(1, *n*).
rwork	REAL for chbgst DOUBLE PRECISION for zhbgst

Workspace array, `dimension` at least max(1, *n*)

Output Parameters

ab	On exit, this array is overwritten by the upper or lower triangle of *C* as specified by *uplo*.

x	`COMPLEX` for `chbgst`
	`DOUBLE COMPLEX` for `zhbgst`
	Array.
	If *vect* = `'V'`, then *x* (*ldx*,*) contains the *n*-by-*n* matrix *X* = `inv(`*S*`)*`*Q*.
	If *vect* = `'N'`, then *x* is not referenced.
	The second dimension of x must be:
	at least max(1, *n*), if *vect* = `'V'`;
	at least 1, if *vect* = `'N'`.

info	`INTEGER`. If *info* = `0`, the execution is successful. If *info* = `-`*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `hbgst` interface are the following:

a	Stands for argument *ab* in Fortan 77 interface. Holds the array *A* of size (*ka+1*,*n*).
b	Stands for argument *bb* in Fortan 77 interface. Holds the array *B* of size (*kb+1*,*n*).
x	Holds the matrix *X* of size (*n*,*n*).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
vect	Restored based on the presence of the argument *x* as follows: *vect* = `'V'`, if *x* is present, *vect* = `'N'`, if *x* is omitted.

Application Notes

Forming the reduced matrix *C* involves implicit multiplication by inv(*B*). When the routine is used as a step in the computation of eigenvalues and eigenvectors of the original problem, there may be a significant loss of accuracy if *B* is ill-conditioned with respect to inversion. The total number of floating-point operations is approximately $20n^2*kb$, when *vect* = 'N'. Additional $5n^3*(kb/ka)$ operations are required when *vect* = 'V'. All these estimates assume that both *ka* and *kb* are much less than *n*.

?pbstf

Computes a split Cholesky factorization of a real symmetric or complex Hermitian positive-definite banded matrix used in ?sbgst/?hbgst *.*

Syntax

Fortran 77:

```
call spbstf(uplo, n, kb, bb, ldbb, info)
call dpbstf(uplo, n, kb, bb, ldbb, info)
call cpbstf(uplo, n, kb, bb, ldbb, info)
call zpbstf(uplo, n, kb, bb, ldbb, info)
```

Fortran 95:

```
call pbstf(b [, uplo] [,info])
```

Description

This routine computes a split Cholesky factorization of a real symmetric or complex Hermitian positive-definite band matrix *B*. It is to be used in conjunction with ?sbgst/?hbgst.

The factorization has the form $B = S^T*S$ (or $B = S^H*S$ for complex flavors), where *S* is a band matrix of the same bandwidth as *B* and the following structure: S is upper triangular in the first (*n*+*kb*)/2 rows and lower triangular in the remaining rows.

Input Parameters

uplo CHARACTER*1. Must be 'U' or 'L'.
If *uplo* = 'U', *bb* stores the upper triangular part of *B*.
If *uplo* = 'L', *bb* stores the lower triangular part of *B*.

n	INTEGER. The order of the matrix *B* (*n* ≥ 0).
kb	INTEGER. The number of super- or sub-diagonals in *B* (*kb* ≥ 0).
bb	REAL for spbstf DOUBLE PRECISION for dpbstf COMPLEX for cpbstf DOUBLE COMPLEX for zpbstf. *bb* (*ldbb*,*) is an array containing either upper or lower triangular part of the matrix *B* (as specified by *uplo*) in band storage format. The second dimension of the array *bb* must be at least max(1, *n*).
ldbb	INTEGER. The first dimension of *bb*; must be at least *kb*+1.

Output Parameters

bb	On exit, this array is overwritten by the elements of the split Cholesky factor *S*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = *i*, then the factorization could not be completed, because the updated element b_{ii} would be the square root of a negative number; hence the matrix *B* is not positive-definite. If *info* = -*i*, the *i*th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine pbstf interface are the following:

b	Stands for argument *bb* in Fortan 77 interface. Holds the array *B* of size (*kb+1*,*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed factor S is the exact factor of a perturbed matrix $B + E$, where

$$|E| \le c(kb + 1)\varepsilon |S^H||S|, \quad |e_{ij}| \le c(kb + 1)\varepsilon \sqrt{b_{ii} b_{jj}}$$

$c(n)$ is a modest linear function of n, and ε is the machine precision.

The total number of floating-point operations for real flavors is approximately $n(kb+1)^2$. The number of operations for complex flavors is 4 times greater. All these estimates assume that kb is much less than n.

After calling this routine, you can call ?sbgst/?hbgst to solve the generalized eigenproblem $Az = \lambda Bz$, where A and B are banded and B is positive-definite.

Nonsymmetric Eigenvalue Problems

This section describes LAPACK routines for solving nonsymmetric eigenvalue problems, computing the Schur factorization of general matrices, as well as performing a number of related computational tasks.

A nonsymmetric eigenvalue problem is as follows: given a nonsymmetric (or non-Hermitian) matrix A, find the eigenvalues λ and the corresponding eigenvectors z that satisfy the equation

$Az = \lambda z$ (right eigenvectors z)

or the equation

$z^H A = \lambda z^H$ (left eigenvectors z).

Nonsymmetric eigenvalue problems have the following properties:

- The number of eigenvectors may be less than the matrix order (but is not less than the number of distinct eigenvalues of A).
- Eigenvalues may be complex even for a real matrix A.
- If a real nonsymmetric matrix has a complex eigenvalue $a+bi$ corresponding to an eigenvector z, then $a-bi$ is also an eigenvalue. The eigenvalue $a-bi$ corresponds to the eigenvector whose elements are complex conjugate to the elements of z.

To solve a nonsymmetric eigenvalue problem with LAPACK, you usually need to reduce the matrix to the upper Hessenberg form and then solve the eigenvalue problem with the Hessenberg matrix obtained. Table 4-5 lists LAPACK routines (Fortran-77 interface) for reducing the matrix to the upper Hessenberg form by an orthogonal (or unitary) similarity transformation $A = QHQ^H$ as well as routines for solving eigenvalue problems with Hessenberg matrices, forming the Schur factorization of such matrices and computing the corresponding condition numbers. Respective routine names in Fortran-95 interface are without the first symbol (see Routine Naming Conventions).

Decision tree in Figure 4-4 helps you choose the right routine or sequence of routines for an eigenvalue problem with a real nonsymmetric matrix. If you need to solve an eigenvalue problem with a complex non-Hermitian matrix, use the decision tree shown in Figure 4-5 .

Figure 4-4 Decision Tree: Real Nonsymmetric Eigenvalue Problems

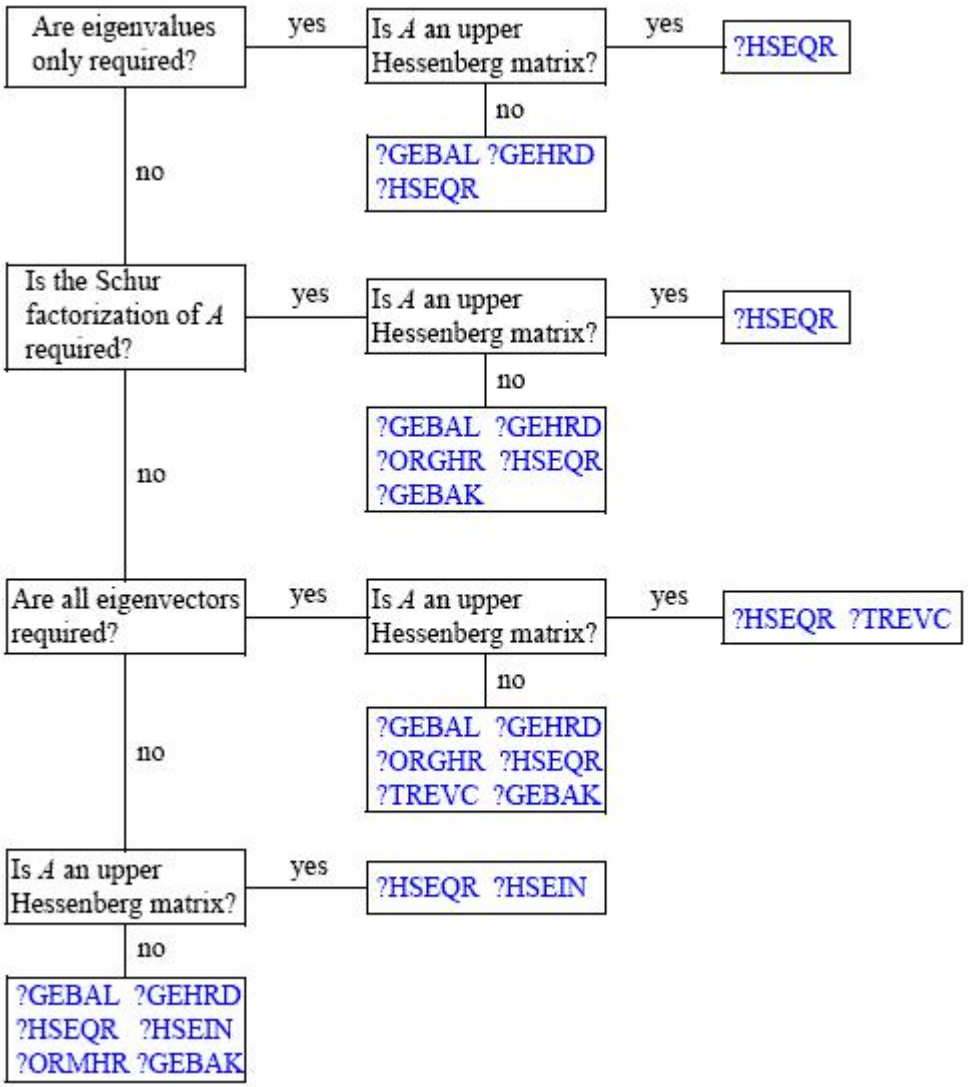

Figure 4-5 Decision Tree: Complex Non-Hermitian Eigenvalue Problems

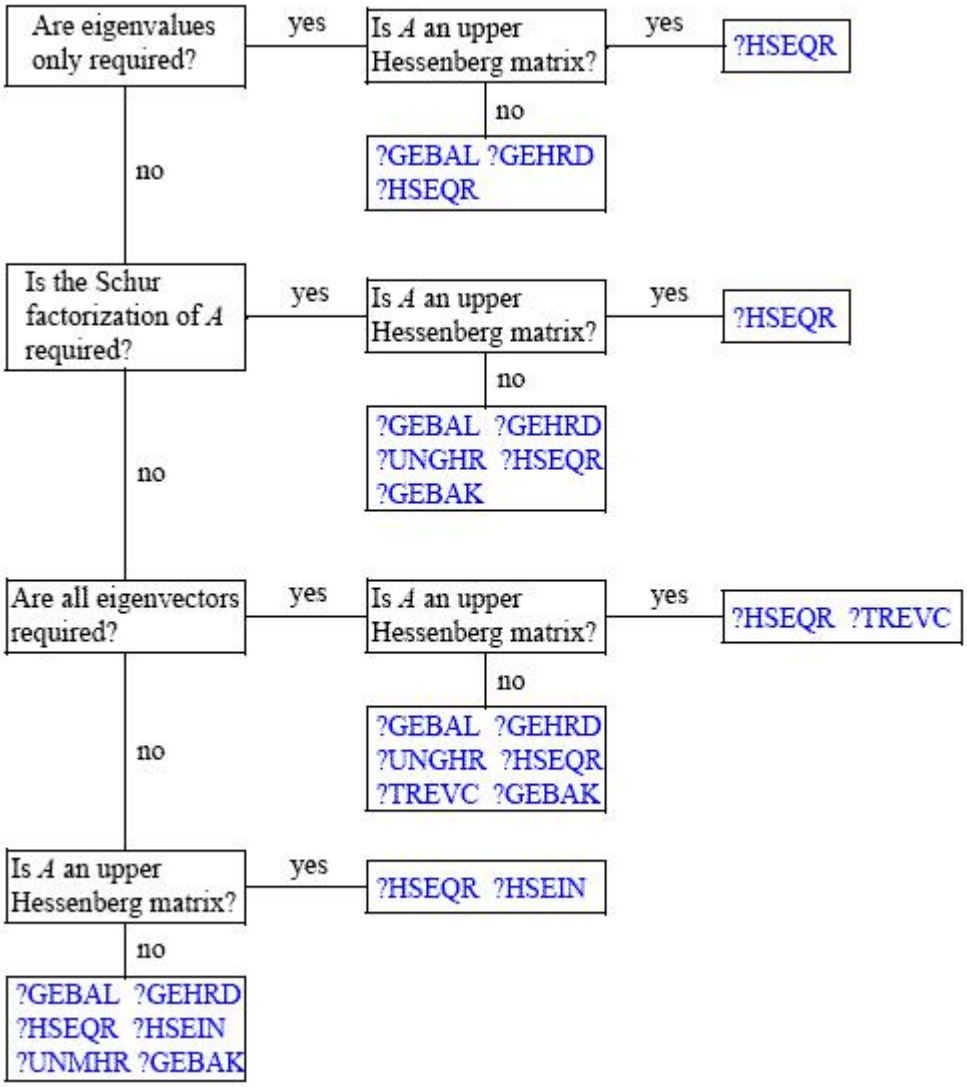

?gehrd

Reduces a general matrix to upper Hessenberg form.

Syntax

Fortran 77:

```
call sgehrd(n, ilo, ihi, a, lda, tau, work, lwork, info)
call dgehrd(n, ilo, ihi, a, lda, tau, work, lwork, info)
call cgehrd(n, ilo, ihi, a, lda, tau, work, lwork, info)
call zgehrd(n, ilo, ihi, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call gehrd(a [, tau] [,ilo] [,ihi] [,info])
```

Description

The routine reduces a general matrix A to upper Hessenberg form H by an orthogonal or unitary similarity transformation $A = Q*H*Q^H$. Here H has real subdiagonal elements.

The routine does not form the matrix Q explicitly. Instead, Q is represented as a product of elementary reflectors. Routines are provided to work with Q in this representation.

Input Parameters

n	INTEGER. The order of the matrix A ($n \geq 0$).
ilo, *ihi*	INTEGER. If A has been output by ?gebal, then *ilo* and *ihi* must contain the values returned by that routine. Otherwise $ilo = 1$ and $ihi = n$. (If $n > 0$, then $1 \leq ilo \leq ihi \leq n$; if $n = 0$, $ilo = 1$ and $ihi = 0$.)
a, *work*	REAL for sgehrd DOUBLE PRECISION for dgehrd COMPLEX for cgehrd DOUBLE COMPLEX for zgehrd. Arrays: *a* (*lda*,*) contains the matrix A. The second dimension of *a* must be at least max(1, *n*).

	work (*lwork*) is a workspace array.
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
lwork	INTEGER. The size of the *work* array; at least max(1, *n*). If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

a	Overwritten by the upper Hessenberg matrix *H* and details of the matrix *Q*. The subdiagonal elements of *H* are real.
tau	REAL for sgehrd DOUBLE PRECISION for dgehrd COMPLEX for cgehrd DOUBLE COMPLEX for zgehrd. Array, DIMENSION at least max (1, *n*-1). Contains additional information on the matrix *Q*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = −*i* , the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gehrd interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
tau	Holds the vector of length (*n*–1).
ilo	Default value for this argument is *ilo* = 1.
ihi	Default value for this argument is *ihi* = *n*.

Application Notes

For better performance, try using *lwork* = *n***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = –1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = –1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed Hessenberg matrix H is exactly similar to a nearby matrix $A + E$, where $||E||_2 < c(n)\varepsilon||A||_2$, $c(n)$ is a modestly increasing function of n, and ε is the machine precision.

The approximate number of floating-point operations for real flavors is $(2/3)(ihi - ilo)^2(2ihi + 2ilo + 3n)$; for complex flavors it is 4 times greater.

?orghr

Generates the real orthogonal matrix Q determined by ?gehrd.

Syntax

Fortran 77:

```
call sorghr(n, ilo, ihi, a, lda, tau, work, lwork, info)
call dorghr(n, ilo, ihi, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call orghr(a, tau [,ilo] [,ihi] [,info])
```

Description

This routine explicitly generates the orthogonal matrix *Q* that has been determined by a preceding call to sgehrd/dgehrd. (The routine ?gehrd reduces a real general matrix *A* to upper Hessenberg form *H* by an orthogonal similarity transformation, $A = Q*H*Q^T$, and represents the matrix *Q* as a product of *ihi-ilo* elementary reflectors. Here *ilo* and *ihi* are values determined by sgebal/dgebal when balancing the matrix;if the matrix has not been balanced, *ilo* = 1 and *ihi* = *n*.)

The matrix *Q* generated by ?orghr has the structure:

$$Q = \begin{bmatrix} I & 0 & 0 \\ 0 & Q_{22} & 0 \\ 0 & 0 & I \end{bmatrix}$$

where Q_{22} occupies rows and columns *ilo* to *ihi*.

Input Parameters

n	INTEGER. The order of the matrix *Q* (*n* ≥ 0).
ilo, *ihi*	INTEGER. These must be the same parameters *ilo* and *ihi*, respectively, as supplied to ?gehrd. (If *n* > 0, then 1 ≤ *ilo* ≤ *ihi* ≤ *n*; if *n* = *0*, *ilo* = 1 and *ihi* = 0.)
a, *tau*, *work*	REAL for sorghr DOUBLE PRECISION for dorghr Arrays: *a*(*lda*,*) contains details of the vectors which define the elementary reflectors, as returned by ?gehrd. The second dimension of *a* must be at least max(1, *n*). *tau*(*) contains further details of the elementary reflectors, as returned by ?gehrd. The dimension of *tau* must be at least max (1, *n*-1). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
lwork	INTEGER. The size of the *work* array;

lwork ≥ max(1, *ihi*-*ilo*).
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.
See Application Notes for the suggested value of *lwork*.

Output Parameters

a	Overwritten by the *n*-by-*n* orthogonal matrix *Q*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine orghr interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
tau	Holds the vector of length (*n*-1).
ilo	Default value for this argument is *ilo* = 1.
ihi	Default value for this argument is *ihi* = *n*.

Application Notes

For better performance, try using *lwork* =(*ihi*-*ilo*)***blocksize* where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix *Q* differs from the exact result by a matrix *E* such that $||E||_2 = O(\varepsilon)$, where ε is the machine precision.

The approximate number of floating-point operations is $(4/3)(ihi-ilo)^3$.

The complex counterpart of this routine is ?unghr.

?ormhr

Multiplies an arbitrary real matrix C by the real orthogonal matrix Q determined by ?gehrd.

Syntax

Fortran 77:

```
call sormhr(side, trans, m, n, ilo, ihi, a, lda, tau, c, ldc, work, lwork, info)
call dormhr(side, trans, m, n, ilo, ihi, a, lda, tau, c, ldc, work, lwork, info)
```

Fortran 95:

```
call ormhr(a, tau, c [,ilo] [,ihi] [,side] [,trans] [,info])
```

Description

This routine multiplies a matrix *C* by the orthogonal matrix *Q* that has been determined by a preceding call to sgehrd/dgehrd. (The routine ?gehrd reduces a real general matrix *A* to upper Hessenberg form *H* by an orthogonal similarity transformation, $A = Q*H*Q^T$, and represents

the matrix *Q* as a product of *ihi*-*ilo* elementary reflectors. Here *ilo* and *ihi* are values determined by sgebal/dgebal when balancing the matrix;if the matrix has not been balanced, *ilo* = 1 and *ihi* = *n*.)

With ?ormhr, you can form one of the matrix products *Q***C*, Q^T**C*, *C***Q*, or *C**Q^T, overwriting the result on *C* (which may be any real rectangular matrix).

A common application of ?ormhr is to transform a matrix *V* of eigenvectors of *H* to the matrix *QV* of eigenvectors of *A*.

Input Parameters

side	CHARACTER*1. Must be 'L' or 'R'. If *side* = 'L', then the routine forms *Q***C* or Q^T**C*. If *side* = 'R', then the routine forms *C***Q* or *C**Q^T.
trans	CHARACTER*1. Must be 'N' or 'T'. If *trans* = 'N' , then *Q* is applied to *C*. If *trans* = 'T', then Q^T is applied to *C*.
m	INTEGER. The number of rows in *C* (*m* ≥ 0).
n	INTEGER. The number of columns in *C* (*n* ≥ 0).
ilo, *ihi*	INTEGER. These must be the same parameters *ilo* and *ihi*, respectively, as supplied to ?gehrd. If *m* > 0 and *side* = 'L', then 1 ≤ *ilo* ≤ *ihi* ≤ *m*. If *m* = 0 and *side* = 'L' , then *ilo* = 1 and *ihi* = 0. If *n* > 0 and *side* = 'R', then 1 ≤ *ilo* ≤ *ihi* ≤ *n*. If *n* = 0 and *side* = 'R' , then *ilo* = 1 and *ihi* = 0.
a, *tau*, *c*, *work*	REAL for sormhr DOUBLE PRECISION for dormhr Arrays: *a*(*lda*,*) contains details of the vectors which define the elementary reflectors, as returned by ?gehrd. The second dimension of *a* must be at least max(1, *m*) if *side* = 'L' and at least max(1, *n*) if *side* = 'R'. *tau*(*) contains further details of the elementary reflectors, as returned by ?gehrd . The dimension of *tau* must be at least max (1, *m*-1) if *side* = 'L' and at least max (1, *n*-1) if *side* = 'R'.

	c(*ldc*,*) contains the *m* by *n* matrix *C*. The second dimension of *c* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*) if *side* = 'L' and at least max (1, *n*) if *side* = 'R'.
ldc	INTEGER. The first dimension of *c*; at least max(1, *m*).
lwork	INTEGER. The size of the *work* array. If *side* = 'L', *lwork* ≥ max(1, *n*). If *side* = 'R', *lwork* ≥ max(1, *m*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

c	*C* is overwritten by $Q*C$ or Q^T*C or $C*Q^T$ or $C*Q$ as specified by *side* and *trans*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine ormhr interface are the following:

a	Holds the matrix *A* of size (*r*,*r*). *r* = *m* if *side* = 'L'. *r* = *n* if *side* = 'R'.
tau	Holds the vector of length (*r*-1).

c	Holds the matrix *C* of size (*m*,*n*).
ilo	Default value for this argument is *ilo* = 1.
ihi	Default value for this argument is *ihi* = *n*.
side	Must be 'L' or 'R'. The default value is 'L'.
trans	Must be 'N' or 'T'. The default value is 'N'.

Application Notes

For better performance, *lwork* should be at least *n***blocksize* if *side* = 'L' and at least *m***blocksize* if *side* = 'R', where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix *Q* differs from the exact result by a matrix *E* such that $||E||_2 = O(\varepsilon)||C||_2$, where ε is the machine precision.

The approximate number of floating-point operations is

$2n(ihi-ilo)^2$ if *side* = 'L';

$2m(ihi-ilo)^2$ if *side* = 'R'.

The complex counterpart of this routine is ?unmhr.

?unghr

Generates the complex unitary matrix Q determined by ?gehrd.

Syntax

Fortran 77:

```
call cunghr(n, ilo, ihi, a, lda, tau, work, lwork, info)
call zunghr(n, ilo, ihi, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call unghr(a, tau [,ilo] [,ihi] [,info])
```

Description

This routine is intended to be used following a call to cgehrd/zgehrd, which reduces a complex matrix A to upper Hessenberg form H by a unitary similarity transformation: $A = Q*H*Q^H$. ?gehrd represents the matrix Q as a product of $ihi-ilo$ elementary reflectors. Here ilo and ihi are values determined by cgebal/zgebal when balancing the matrix; if the matrix has not been balanced, $ilo = 1$ and $ihi = n$.

Use the routine ?unghr to generate Q explicitly as a square matrix. The matrix Q has the structure:

$$Q = \begin{bmatrix} I & 0 & 0 \\ 0 & Q_{22} & 0 \\ 0 & 0 & I \end{bmatrix}$$

where Q_{22} occupies rows and columns ilo to ihi.

Input Parameters

n	INTEGER. The order of the matrix Q ($n \geq 0$).

ilo, *ihi*	INTEGER. These must be the same parameters *ilo* and *ihi*, respectively, as supplied to ?gehrd . (If $n > 0$, then $1 \le ilo \le ihi \le n$. If $n = 0$, then $ilo = 1$ and $ihi = 0$.)
a, *tau*, *work*	COMPLEX for cunghr DOUBLE COMPLEX for zunghr. Arrays: *a*(*lda*,*) contains details of the vectors which define the elementary reflectors, as returned by ?gehrd. The second dimension of *a* must be at least max(1, *n*). *tau*(*) contains further details of the elementary reflectors, as returned by ?gehrd . The dimension of *tau* must be at least max (1, *n*-1). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
lwork	INTEGER. The size of the *work* array; *lwork* ≥ max(1, *ihi*-*ilo*). If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

a	Overwritten by the *n*-by-*n* unitary matrix *Q*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = −*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `unghr` interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
tau	Holds the vector of length (*n*–1).
ilo	Default value for this argument is *ilo* = 1.
ihi	Default value for this argument is *ihi* = *n*.

Application Notes

For better performance, try using *lwork* = (*ihi*-*ilo*)**blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix Q differs from the exact result by a matrix E such that $||E||_2 = O(\varepsilon)$, where ε is the machine precision.

The approximate number of real floating-point operations is $(16/3)(ihi-ilo)^3$.

The real counterpart of this routine is `?orghr`.

?unmhr

Multiplies an arbitrary complex matrix C by the complex unitary matrix Q determined by ?gehrd.

Syntax

Fortran 77:

```
call cunmhr(side, trans, m, n, ilo, ihi, a, lda, tau, c, ldc, work, lwork, info)
call zunmhr(side, trans, m, n, ilo, ihi, a, lda, tau, c, ldc, work, lwork, info)
```

Fortran 95:

```
call unmhr(a, tau, c [,ilo] [,ihi] [,side] [,trans] [,info])
```

Description

This routine multiplies a matrix C by the unitary matrix Q that has been determined by a preceding call to cgehrd/zgehrd. (The routine ?gehrd reduces a real general matrix A to upper Hessenberg form H by an orthogonal similarity transformation, $A = Q*H*Q^H$, and represents the matrix Q as a product of ihi-iloelementary reflectors. Here ilo and ihi are values determined by cgebal/zgebal when balancing the matrix; if the matrix has not been balanced, $ilo = 1$ and $ihi = n$.)

With ?unmhr, you can form one of the matrix products $Q*C$, Q^H*C, $C*Q$, or $C*Q^H$, overwriting the result on C (which may be any complex rectangular matrix). A common application of this routine is to transform a matrix V of eigenvectors of H to the matrix QV of eigenvectors of A.

Input Parameters

side	CHARACTER*1. Must be 'L' or 'R'. If *side* = 'L', then the routine forms $Q*C$ or Q^H*C. If *side* = 'R', then the routine forms $C*Q$ or $C*Q^H$.
trans	CHARACTER*1. Must be 'N' or 'C'. If *trans* = 'N' , then Q is applied to C. If *trans* = 'T', then Q^H is applied to C.
m	INTEGER. The number of rows in C ($m \geq 0$).

n	INTEGER. The number of columns in *C* (*n*≥ 0).
ilo, *ihi*	INTEGER. These must be the same parameters *ilo* and *ihi*, respectively, as supplied to ?gehrd . If *m* > 0 and *side* = 'L', then 1 ≤*ilo*≤*ihi*≤*m*. If *m* = 0 and *side* = 'L' , then *ilo* = 1 and *ihi* = 0. If *n* > 0 and *side* = 'R', then 1 ≤*ilo*≤*ihi*≤*n*. If *n* = 0 and *side* = 'R' , then *ilo* =1 and *ihi* = 0.
a, *tau*, *c*, *work*	COMPLEX for cunmhr DOUBLE COMPLEX for zunmhr. Arrays: *a* (*lda*,*) contains details of the vectors which define the elementary reflectors, as returned by ?gehrd. The second dimension of *a* must be at least max(1, *m*) if *side* = 'L' and at least max(1, *n*) if *side* = 'R'. *tau*(*) contains further details of the elementary reflectors, as returned by ?gehrd. The dimension of *tau* must be at least max (1, *m*-1) if *side* = 'L' and at least max (1, *n*-1) if *side* = 'R'. *c* (*ldc*,*) contains the *m*-by-*n* matrix *C*. The second dimension of *c* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*) if *side* = 'L' and at least max (1, *n*) if *side* = 'R'.
ldc	INTEGER. The first dimension of *c*; at least max(1, *m*).
lwork	INTEGER. The size of the *work* array. If *side* = 'L', *lwork*≥ max(1,*n*). If *side* = 'R', *lwork*≥ max(1,*m*). If *lwork* = –1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

c	*C* is overwritten by *Q*C*, or Q^H**C*, or *C*Q*^{H}, or *C*Q* as specified by *side* and *trans*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine unmhr interface are the following:

a	Holds the matrix *A* of size (*r*,*r*). *r* = *m* if *side* = 'L'. *r* = *n* if *side* = 'R'.
tau	Holds the vector of length (*r*-1).
c	Holds the matrix *C* of size (*m*,*n*).
ilo	Default value for this argument is *ilo* = 1.
ihi	Default value for this argument is *ihi* = *n*.
side	Must be 'L' or 'R'. The default value is 'L'.
trans	Must be 'N' or 'C'. The default value is 'N'.

Application Notes

For better performance, *lwork* should be at least *n***blocksize* if *side* = 'L' and at least *m***blocksize* if *side* = 'R', where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix *Q* differs from the exact result by a matrix *E* such that $||E||_2 = O(\varepsilon)||C||_2$, where ε is the machine precision.

The approximate number of floating-point operations is

$8n(ihi-ilo)^2$ if *side* = 'L';

$8m(ihi-ilo)^2$ if *side* = 'R'.

The real counterpart of this routine is ?ormhr.

?gebal

Balances a general matrix to improve the accuracy of computed eigenvalues and eigenvectors.

Syntax

Fortran 77:

```
call sgebal(job, n, a, lda, ilo, ihi, scale, info)
call dgebal(job, n, a, lda, ilo, ihi, scale, info)
call cgebal(job, n, a, lda, ilo, ihi, scale, info)
call zgebal(job, n, a, lda, ilo, ihi, scale, info)
```

Fortran 95:

```
call gebal(a [, scale] [,ilo] [,ihi] [,job] [,info])
```

Description

This routine *balances* a matrix *A* by performing either or both of the following two similarity transformations:

(1) The routine first attempts to permute *A* to block upper triangular form:

$$PAP^T = A' = \begin{bmatrix} A'_{11} & A'_{12} & A'_{13} \\ 0 & A'_{22} & A'_{23} \\ 0 & 0 & A'_{33} \end{bmatrix}$$

where *P* is a permutation matrix, and A'_{11} and A'_{33} are upper triangular. The diagonal elements of A'_{11} and A'_{33} are eigenvalues of *A*. The rest of the eigenvalues of *A* are the eigenvalues of the central diagonal block A'_{22}, in rows and columns *ilo* to *ihi*. Subsequent operations to compute the eigenvalues of *A* (or its Schur factorization) need only be applied to these rows and columns; this can save a significant amount of work if *ilo* > 1 and *ihi* < *n*.

If no suitable permutation exists (as is often the case), the routine sets *ilo* = 1 and *ihi* = *n*, and A'_{22} is the whole of *A*.

(2) The routine applies a diagonal similarity transformation to *A'*, to make the rows and columns of A'_{22} as close in norm as possible:

$$A'' = DA'D^{-1} = \begin{bmatrix} I & 0 & 0 \\ 0 & D_{22} & 0 \\ 0 & 0 & I \end{bmatrix} \times \begin{bmatrix} A'_{11} & A'_{12} & A'_{13} \\ 0 & A'_{22} & A'_{23} \\ 0 & 0 & A'_{33} \end{bmatrix} \times \begin{bmatrix} I & 0 & 0 \\ 0 & D_{22}^{-1} & 0 \\ 0 & 0 & I \end{bmatrix}$$

This scaling can reduce the norm of the matrix (that is, $||A'_2{}'_2|| < ||A'_{22}||$), and hence reduce the effect of rounding errors on the accuracy of computed eigenvalues and eigenvectors.

Input Parameters

job CHARACTER*1. Must be 'N' or 'P' or 'S' or 'B'.

	If *job* = 'N', then *A* is neither permuted nor scaled (but *ilo*, *ihi*, and *scale* get their values). If *job* = 'P', then *A* is permuted but not scaled. If *job* = 'S', then *A* is scaled but not permuted. If *job* = 'B', then *A* is both scaled and permuted.
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
a	REAL for sgebal DOUBLE PRECISION for dgebal COMPLEX for cgebal DOUBLE COMPLEX for zgebal. Arrays: *a* (*lda*,*) contains the matrix *A*. The second dimension of *a* must be at least max(1, *n*). *a* is not referenced if *job* = 'N'.
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).

Output Parameters

a	Overwritten by the balanced matrix (*a* is not referenced if *job* = 'N').
ilo, *ihi*	INTEGER. The values *ilo* and *ihi* such that on exit *a*(*i*,*j*) is zero if *i* > *j* and 1 ≤ *j* < *ilo* or *ihi* < *i* ≤ *n*. If *job* = 'N' or 'S', then *ilo* = 1 and *ihi* = *n*.
scale	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors Array, DIMENSION at least max(1, *n*). Contains details of the permutations and scaling factors. More precisely, if p_j is the index of the row and column interchanged with row and column *j*, and d_j is the scaling factor used to balance row and column *j*, then *scale*(*j*) = p_j for *j* = 1, 2,..., *ilo*-1, *ihi*+1,..., *n*; *scale*(*j*) = d_j for *j* = *ilo*, *ilo* + 1,..., *ihi*. The order in which the interchanges are made is *n* to *ihi*+1, then 1 to *ilo*-1.
info	INTEGER.

If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gebal interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
scale	Holds the vector of length (*n*).
ilo	Default value for this argument is *ilo* = 1.
ihi	Default value for this argument is *ihi* = *n*.
job	Must be 'B', 'S', 'P', or 'N'. The default value is 'B'.

Application Notes

The errors are negligible, compared with those in subsequent computations.

If the matrix *A* is balanced by this routine, then any eigenvectors computed subsequently are eigenvectors of the matrix *A*'' and hence you must call ?gebak to transform them back to eigenvectors of *A*.

If the Schur vectors of *A* are required, do not call this routine with *job* = 'S' or 'B', because then the balancing transformation is not orthogonal (not unitary for complex flavors).

If you call this routine with *job* = 'P', then any Schur vectors computed subsequently are Schur vectors of the matrix *A*'', and you need to call ?gebak (with *side* = 'R') to transform them back to Schur vectors of *A*.

The total number of floating-point operations is proportional to n^2.

?gebak

Transforms eigenvectors of a balanced matrix to those of the original nonsymmetric matrix.

Syntax

Fortran 77:

```
call sgebak(job, side, n, ilo, ihi, scale, m, v, ldv, info)
call dgebak(job, side, n, ilo, ihi, scale, m, v, ldv, info)
call cgebak(job, side, n, ilo, ihi, scale, m, v, ldv, info)
call zgebak(job, side, n, ilo, ihi, scale, m, v, ldv, info)
```

Fortran 95:

```
call gebak(v, scale [,ilo] [,ihi] [,job] [,side] [,info])
```

Description

This routine is intended to be used after a matrix A has been balanced by a call to ?gebal, and eigenvectors of the balanced matrix A''_{22} have subsequently been computed. For a description of balancing, see ?gebal. The balanced matrix A'' is obtained as $A'' = D*P*A*P^T*\mathrm{inv}(D)$, where P is a permutation matrix and D is a diagonal scaling matrix. This routine transforms the eigenvectors as follows:

if x is a right eigenvector of A'', then $P^T*\mathrm{inv}(D)*x$ is a right eigenvector of A; if x is a left eigenvector of A'', then P^T*D*y is a left eigenvector of A.

Input Parameters

job	CHARACTER*1. Must be 'N' or 'P' or 'S' or 'B'. The same parameter *job* as supplied to ?gebal.
side	CHARACTER*1. Must be 'L' or 'R'. If *side* = 'L' , then left eigenvectors are transformed. If *side* = 'R', then right eigenvectors are transformed.
n	INTEGER. The number of rows of the matrix of eigenvectors ($n \geq 0$).
ilo, *ihi*	INTEGER. The values *ilo* and *ihi*, as returned by ?gebal. (If $n > 0$, then $1 \leq ilo \leq ihi \leq n$;

	if $n = 0$, then $ilo = 1$ and $ihi = 0$.)
scale	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors Array, DIMENSION at least max(1, n). Contains details of the permutations and/or the scaling factors used to balance the original general matrix, as returned by ?gebal.
m	INTEGER. The number of columns of the matrix of eigenvectors ($m \geq 0$).
v	REAL for sgebak DOUBLE PRECISION for dgebak COMPLEX for cgebak DOUBLE COMPLEX for zgebak. Arrays: v (ldv,*) contains the matrix of left or right eigenvectors to be transformed. The second dimension of v must be at least max(1, m).
ldv	INTEGER. The first dimension of v; at least max(1, n).

Output Parameters

v	Overwritten by the transformed eigenvectors.
info	INTEGER. If $info = 0$, the execution is successful. If $info = -i$, the i-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gebak interface are the following:

v	Holds the matrix V of size (n,m).
scale	Holds the vector of length (n).
ilo	Default value for this argument is $ilo = 1$.
ihi	Default value for this argument is $ihi = n$.

job	Must be 'B', 'S', 'P', or 'N'. The default value is 'B'.
side	Must be 'L' or 'R'. The default value is 'L'.

Application Notes

The errors in this routine are negligible.

The approximate number of floating-point operations is approximately proportional to *m*n*.

?hseqr

Computes all eigenvalues and (optionally) the Schur factorization of a matrix reduced to Hessenberg form.

Syntax

Fortran 77:

```
call shseqr(job, compz, n, ilo, ihi, h, ldh, wr, wi, z, ldz, work, lwork, info)
call dhseqr(job, compz, n, ilo, ihi, h, ldh, wr, wi, z, ldz, work, lwork, info)
call chseqr(job, compz, n, ilo, ihi, h, ldh, w, z, ldz, work, lwork, info)
call zhseqr(job, compz, n, ilo, ihi, h, ldh, w, z, ldz, work, lwork, info)
```

Fortran 95:

```
call hseqr(h, wr, wi [,ilo] [,ihi] [,z] [,job] [,compz] [,info])
call hseqr(h, w [,ilo] [,ihi] [,z] [,job] [,compz] [,info])
```

Description

This routine computes all the eigenvalues, and optionally the Schur factorization, of an upper Hessenberg matrix H: $H = ZTZ^H$, where T is an upper triangular (or, for real flavors, quasi-triangular) matrix (the Schur form of H), and Z is the unitary or orthogonal matrix whose columns are the Schur vectors z_i.

You can also use this routine to compute the Schur factorization of a general matrix A which has been reduced to upper Hessenberg form H:

$A = QHQ^H$, where Q is unitary (orthogonal for real flavors);

$A = (QZ)H(QZ)^H$.

In this case, after reducing A to Hessenberg form by ?gehrd, call ?orghr to form Q explicitly and then pass Q to ?hseqr with $compz$ = 'V'.

You can also call ?gebal to balance the original matrix before reducing it to Hessenberg form by ?hseqr, so that the Hessenberg matrix H will have the structure:

$$\begin{bmatrix} H_{11} & H_{12} & H_{13} \\ 0 & H_{22} & H_{23} \\ 0 & 0 & H_{33} \end{bmatrix}$$

where H_{11} and H_{33} are upper triangular.

If so, only the central diagonal block H_{22} (in rows and columns ilo to ihi) needs to be further reduced to Schur form (the blocks H_{12} and H_{23} are also affected). Therefore the values of ilo and ihi can be supplied to ?hseqr directly. Also, after calling this routine you must call ?gebak to permute the Schur vectors of the balanced matrix to those of the original matrix.

If ?gebal has not been called, however, then ilo must be set to 1 and ihi to n. Note that if the Schur factorization of A is required, ?gebal must not be called with job = 'S' or 'B', because the balancing transformation is not unitary (for real flavors, it is not orthogonal).

?hseqr uses a multishift form of the upper Hessenberg QR algorithm. The Schur vectors are normalized so that $||z_i||_2 = 1$, but are determined only to within a complex factor of absolute value 1 (for the real flavors, to within a factor ±1).

Input Parameters

job	CHARACTER*1. Must be 'E' or 'S'. If job = 'E', then eigenvalues only are required. If job = 'S', then the Schur form T is required.
$compz$	CHARACTER*1. Must be 'N' or 'I' or 'V'. If $compz$ = 'N', then no Schur vectors are computed (and the array z is not referenced). If $compz$ = 'I', then the Schur vectors of H are computed (and the array z is initialized by the routine).

	If *compz* = 'V', then the Schur vectors of *A* are computed (and the array *z* must contain the matrix *Q* on entry).
n	INTEGER. The order of the matrix *H* (*n* ≥ 0).
ilo, *ihi*	INTEGER. If *A* has been balanced by ?gebal, then *ilo* and *ihi* must contain the values returned by ?gebal. Otherwise, *ilo* must be set to 1 and *ihi* to *n*.
h, *z*, *work*	REAL for shseqr DOUBLE PRECISION for dhseqr COMPLEX for chseqr DOUBLE COMPLEX for zhseqr. Arrays: *h*(*ldh*,*) The *n*-by-*n* upper Hessenberg matrix *H*. The second dimension of *h* must be at least max(1, *n*). *z*(*ldz*,*) If *compz* = 'V', then *z* must contain the matrix *Q* from the reduction to Hessenberg form. If *compz* = 'I', then *z* need not be set. If *compz* = 'N', then *z* is not referenced. The second dimension of *z* must be at least max(1, *n*) if *compz* = 'V' or 'I'; at least 1 if *compz* = 'N'. *work*(*lwork*) is a workspace array. The dimension of *work* must be at least max (1, *n*).
ldh	INTEGER. The first dimension of *h*; at least max(1, *n*).
ldz	INTEGER. The first dimension of *z*; If *compz* = 'N', then *ldz* ≥ 1. If *compz* = 'V' or 'I', then *ldz* ≥ max(1, *n*).
lwork	INTEGER. The dimension of the array *work*. *lwork* ≥ max(1, *n*) is sufficient, but *lwork* typically as large as 6**n* may be required for optimal performance. A workspace query to determine the optimal workspace size is recommended.

If *lwork* = -1, then a workspace query is assumed; the routine only estimates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for details.

Output Parameters

w
COMPLEX for chseqr
DOUBLE COMPLEX for zhseqr.
Array, DIMENSION at least max (1, *n*). Contains the computed eigenvalues, unless *info*>0. The eigenvalues are stored in the same order as on the diagonal of the Schur form *T* (if computed).

wr, *wi*
REAL for shseqr
DOUBLE PRECISION for dhseqr
Arrays, DIMENSION at least max (1, *n*) each.
Contain the real and imaginary parts, respectively, of the computed eigenvalues, unless *info* > 0. Complex conjugate pairs of eigenvalues appear consecutively with the eigenvalue having positive imaginary part first. The eigenvalues are stored in the same order as on the diagonal of the Schur form *T* (if computed).

h
If *info* = 0 and *job* = 'S', *h* contains the upper triangular matrix *T* from the Schur decomposition (the Schur form).
If *info* = 0 and *job* = 'E', the contents of *h* are unspecified on exit. (The output value of *h* when *info* > 0 is given under the description of *info* below.)

z
If *compz* = 'V' and *info* = 0, then *z* contains *Q***Z*.
If *compz* = 'I' and *info* = 0, then *z* contains the unitary or orthogonal matrix *Z* of the Schur vectors of *H*.
If *compz* = 'N', then *z* is not referenced.

work(1)
On exit, if *info* = 0, then *work(1)* returns the optimal *lwork*.

info
INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, elements 1,2, ..., *ilo*-1 and *i*+1, *i*+2, ..., *n* of *wr* and *wi* contain the real and imaginary parts of those eigenvalues that have been succesively found.
If *info* > 0, and *job* = 'E', then on exit, the remaining unconverged eigenvalues are the eigenvalues of the upper Hessenberg matrix rows and columns *ilo* through *info* of the final output value of *H*.
If *info* > 0, and *job* = 'S', then on exit (initial value of *H*)**U* = *U**(final value of *H*), where *U* is a unitary matrix. The finalvalue of *H* is upper Hessenberg and triangular in rows and columns *info*+1 through *ihi*.
If *info* > 0, and *compz* = 'V', then on exit (final value of *Z*) = (initial value of *Z*)**U*, where *U* is the unitary matrix (regardless of the value of *job*).
If *info* > 0, and *compz* = 'I', then on exit (final value of *Z*) = *U*, where *U* is the unitary matrix (regardless of the value of *job*).
If *info* > 0, and *compz* = 'N', then *Z* is not accessed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine hseqr interface are the following:

h	Holds the matrix *H* of size (*n*,*n*).
wr	Holds the vector of length (*n*). Used in real flavors only.
wi	Holds the vector of length (*n*). Used in real flavors only.
w	Holds the vector of length (*n*). Used in complex flavors only.
z	Holds the matrix *Z* of size (*n*,*n*).
job	Must be 'E' or 'S'. The default value is 'E'.
compz	If omitted, this argument is restored based on the presence of argument *z* as follows: *compz* = 'I', if *z* is present, *compz* = 'N', if *z* is omitted. If present, *compz* must be equal to 'I' or 'V' and the argument *z* must also be present. Note that there will be an error condition if *compz* is present and *z* omitted.

Application Notes

The computed Schur factorization is the exact factorization of a nearby matrix $H + E$, where $||E||_2 < O(\varepsilon) ||H||_2/s_i$, and ε is the machine precision.

If λ_i is an exact eigenvalue, and μ is the corresponding computed value, then $|\lambda_i - \mu_i| \leq c(n)\varepsilon||H||_2/s_i$ where $c(n)$ is a modestly increasing function of n, and s_i is the reciprocal condition number of λ_i. You can compute the condition numbers s_i by calling `?trsna`.

The total number of floating-point operations depends on how rapidly the algorithm converges; typical numbers are as follows.

If only eigenvalues are computed:	$7n^3$ for real flavors $25n^3$ for complex flavors.
If the Schur form is computed:	$10n^3$ for real flavors $35n^3$ for complex flavors.
If the full Schur factorization is computed:	$20n^3$ for real flavors $70n^3$ for complex flavors.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?hsein

Computes selected eigenvectors of an upper Hessenberg matrix that correspond to specified eigenvalues.

Syntax

Fortran 77:

```
call shsein(job, eigsrc, initv, select, n, h, ldh, wr, wi, vl, ldvl, vr, ldvr,
mm, m, work, ifaill, ifailr, info)

call dhsein(job, eigsrc, initv, select, n, h, ldh, wr, wi, vl, ldvl, vr, ldvr,
mm, m, work, ifaill, ifailr, info)

call chsein(job, eigsrc, initv, select, n, h, ldh, w, vl, ldvl, vr, ldvr, mm,
m, work, rwork, ifaill, ifailr, info)

call zhsein(job, eigsrc, initv, select, n, h, ldh, w, vl, ldvl, vr, ldvr, mm,
m, work, rwork, ifaill, ifailr, info)
```

Fortran 95:

```
call hsein(h, wr, wi, select [, vl] [,vr] [,ifaill] [,ifailr] [,initv]
[,eigsrc] [,m] [,info])

call hsein(h, w, select [,vl] [,vr] [,ifaill] [,ifailr] [,initv] [,eigsrc]
[,m] [,info])
```

Description

This routine computes left and/or right eigenvectors of an upper Hessenberg matrix H, corresponding to selected eigenvalues.

The right eigenvector x and the left eigenvector y, corresponding to an eigenvalue λ, are defined by: $Hx = \lambda x$ and $y^H H = \lambda y^H$ (or $H^H y = \lambda^* y$). Here λ^* denotes the conjugate of λ.

The eigenvectors are computed by inverse iteration. They are scaled so that, for a real eigenvector x, $\max|x_i| = 1$, and for a complex eigenvector, $\max(|\mathrm{Re}x_i| + |\mathrm{Im}x_i|) = 1$.

If H has been formed by reduction of a general matrix A to upper Hessenberg form, then eigenvectors of H may be transformed to eigenvectors of A by ?ormhr or ?unmhr.

Input Parameters

job — CHARACTER*1. Must be 'R' or 'L' or 'B'.
If *job* = 'R', then only right eigenvectors are computed.
If *job* = 'L', then only left eigenvectors are computed.
If *job* = 'B', then all eigenvectors are computed.

eigsrc — CHARACTER*1. Must be 'Q' or 'N'.
If *eigsrc* = 'Q', then the eigenvalues of *H* were found using ?hseqr; thus if *H* has any zero sub-diagonal elements (and so is block triangular), then the *j*-th eigenvalue can be assumed to be an eigenvalue of the block containing the *j*-th row/column. This property allows the routine to perform inverse iteration on just one diagonal block. If *eigsrc* = 'N', then no such assumption is made and the routine performs inverse iteration using the whole matrix.

initv — CHARACTER*1. Must be 'N' or 'U'.
If *initv* = 'N', then no initial estimates for the selected eigenvectors are supplied.
If *initv* = 'U', then initial estimates for the selected eigenvectors are supplied in *vl* and/or *vr*.

select — LOGICAL.
Array, DIMENSION at least max (1, *n*). Specifies which eigenvectors are to be computed.
For real flavors:
To obtain the real eigenvector corresponding to the real eigenvalue *wr*(*j*), set *select*(*j*) to .TRUE..
To select the complex eigenvector corresponding to the complex eigenvalue (*wr*(*j*), *wi*(*j*)) with complex conjugate (*wr*(*j*+1), *wi*(*j*+1)), set *select*(*j*) and/or *select*(*j*+1) to .TRUE.; the eigenvector corresponding to the first eigenvalue in the pair is computed.
For complex flavors:
To select the eigenvector corresponding to the eigenvalue *w*(*j*), set *select*(*j*) to .TRUE..

n — INTEGER. The order of the matrix *H* (*n* ≥ 0).

h, *vl*, *vr*, — REAL for shsein
DOUBLE PRECISION for dhsein

	COMPLEX for chsein DOUBLE COMPLEX for zhsein. Arrays: *h*(*ldh*,*) The *n*-by-*n* upper Hessenberg matrix *H*. The second dimension of *h* must be at least max(1, *n*). (*ldvl*,*) If *initv* = 'V' and *job* = 'L' or 'B', then *vl* must contain starting vectors for inverse iteration for the left eigenvectors. Each starting vector must be stored in the same column or columns as will be used to store the corresponding eigenvector. If *initv* = 'N', then *vl* need not be set. The second dimension of *vl* must be at least max(1, *mm*) if *job* = 'L' or 'B' and at least 1 if *job* = 'R'. The array *vl* is not referenced if *job* = 'R'. *vr*(*ldvr*,*) If *initv* = 'V' and *job* = 'R' or 'B', then *vr* must contain starting vectors for inverse iteration for the right eigenvectors. Each starting vector must be stored in the same column or columns as will be used to store the corresponding eigenvector. If *initv* = 'N', then *vr* need not be set. The second dimension of *vr* must be at least max(1, *mm*) if *job* = 'R' or 'B' and at least 1 if *job* = 'L'. The array *vr* is not referenced if *job* = 'L'. *work*(*) is a workspace array. DIMENSION at least max (1, *n**(*n+2*)) for real flavors and at least max (1, *n***n*) for complex flavors.
ldh	INTEGER. The first dimension of *h*; at least max(1, *n*).
w	COMPLEX for chsein DOUBLE COMPLEX for zhsein. Array, DIMENSION at least max (1, *n*). Contains the eigenvalues of the matrix *H*. If *eigsrc* = 'Q', the array must be exactly as returned by ?hseqr.
wr, *wi*	REAL for shsein DOUBLE PRECISION for dhsein Arrays, DIMENSION at least max (1, *n*) each.

Contain the real and imaginary parts, respectively, of the eigenvalues of the matrix *H*. Complex conjugate pairs of values must be stored in consecutive elements of the arrays. If *eigsrc* = 'Q', the arrays must be exactly as returned by ?hseqr.

ldvl — INTEGER. The first dimension of *vl*.

If *job* = 'L' or 'B', *ldvl* ≥ max(1,*n*).

If *job* = 'R', *ldvl* ≥ 1.

ldvr — INTEGER. The first dimension of *vr*.

If *job* = 'R' or 'B', *ldvr* ≥ max(1,*n*).

If *job* = 'L', *ldvr* ≥1.

mm — INTEGER. The number of columns in *vl* and/or *vr*.
Must be at least *m*, the actual number of columns required (see Output Parameters below).
For real flavors, *m* is obtained by counting 1 for each selected real eigenvector and 2 for each selected complex eigenvector (see *select*).
For complex flavors, *m* is the number of selected eigenvectors (see *select*).
Constraint:

0 ≤ *mm* ≤ *n*.

rwork — REAL for chsein
DOUBLE PRECISION for zhsein.
Array, DIMENSION at least max (1, *n*).

Output Parameters

select — Overwritten for real flavors only.
If a complex eigenvector was selected as specified above, then *select*(*j*) is set to .TRUE. and *select*(*j*+1) to .FALSE.

w — The real parts of some elements of *w* may be modified, as close eigenvalues are perturbed slightly in searching for independent eigenvectors.

wr	Some elements of *wr* may be modified, as close eigenvalues are perturbed slightly in searching for independent eigenvectors.
vl, *vr*	If *job* = 'L' or 'B', *vl* contains the computed left eigenvectors (as specified by *select*). If *job* = 'R' or 'B', *vr* contains the computed right eigenvectors (as specified by *select*). The eigenvectors are stored consecutively in the columns of the array, in the same order as their eigenvalues. For real flavors: a real eigenvector corresponding to a selected real eigenvalue occupies one column; a complex eigenvector corresponding to a selected complex eigenvalue occupies two columns: the first column holds the real part and the second column holds the imaginary part.
m	INTEGER. For real flavors: the number of columns of *vl* and/or *vr* required to store the selected eigenvectors. For complex flavors: the number of selected eigenvectors.

ifaill, *ifailr*	INTEGER.
	Arrays, DIMENSION at least max(1, *mm*) each.
	ifaill(*i*) = 0 if the *i*th column of *vl* converged;
	ifaill(*i*) = *j* > 0 if the eigenvector stored in the *i*-th column of *vl* (corresponding to the *j*th eigenvalue) failed to converge.
	ifailr(*i*) = 0 if the *i*th column of *vr* converged;
	ifailr(*i*) = *j* > 0 if the eigenvector stored in the *i*-th column of *vr* (corresponding to the *j*th eigenvalue) failed to converge.
	For real flavors: if the *i*th and (*i*+1)th columns of *vl* contain a selected complex eigenvector, then *ifaill*(*i*) and *ifaill*(*i*+1) are set to the same value. A similar rule holds for *vr* and *ifailr*.
	The array *ifaill* is not referenced if *job* = 'R'. The array *ifailr* is not referenced if *job* = 'L'.

info	INTEGER. If *info* = 0, the execution is successful. If *info* = –*i*, the *i*-th parameter had an illegal value.

If *info* > 0, then *i* eigenvectors (as indicated by the parameters *ifaill* and/or *ifailr* above) failed to converge. The corresponding columns of *vl* and/or *vr* contain no useful information.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine hsein interface are the following:

h	Holds the matrix *H* of size (*n*,*n*).
wr	Holds the vector of length (*n*). Used in real flavors only.
wi	Holds the vector of length (*n*). Used in real flavors only.
w	Holds the vector of length (*n*). Used in complex flavors only.
select	Holds the vector of length (*n*).
vl	Holds the matrix *VL* of size (*n*,*mm*).
vr	Holds the matrix *VR* of size (*n*,*mm*).
ifaill	Holds the vector of length (*mm*). Note that there will be an error condition if *ifaill* is present and *vl* is omitted.
ifailr	Holds the vector of length (*mm*). Note that there will be an error condition if *ifailr* is present and *vr* is omitted.
initv	Must be 'N' or 'U'. The default value is 'N'.
eigsrc	Must be 'N' or 'Q'. The default value is 'N'.
job	Restored based on the presence of arguments *vl* and *vr* as follows: *job* = 'B', if both *vl* and *vr* are present, *job* = 'L', if *vl* is present and *vr* omitted, *job* = 'R', if *vl* is omitted and *vr* present, Note that there will be an error condition if both *vl* and *vr* are omitted.

Application Notes

Each computed right eigenvector *x* i is the exact eigenvector of a nearby matrix $A + E_i$, such that $||E_i|| < O(\varepsilon)||A||$. Hence the residual is small:

$$||Ax_i - \lambda_i x_i|| = O(\varepsilon)||A||.$$

However, eigenvectors corresponding to close or coincident eigenvalues may not accurately span the relevant subspaces.

Similar remarks apply to computed left eigenvectors.

?trevc

Computes selected eigenvectors of an upper (quasi-) triangular matrix computed by ?hseqr.

Syntax

Fortran 77:

call strevc(*side*, *howmny*, *select*, *n*, *t*, *ldt*, *vl*, *ldvl*, *vr*, *ldvr*, *mm*, *m*, *work*, *info*)

call dtrevc(*side*, *howmny*, *select*, *n*, *t*, *ldt*, *vl*, *ldvl*, *vr*, *ldvr*, *mm*, *m*, *work*, *info*)

call ctrevc(*side*, *howmny*, *select*, *n*, *t*, *ldt*, *vl*, *ldvl*, *vr*, *ldvr*, *mm*, *m*, *work*, *rwork*, *info*)

call ztrevc(*side*, *howmny*, *select*, *n*, *t*, *ldt*, *vl*, *ldvl*, *vr*, *ldvr*, *mm*, *m*, *work*, *rwork*, *info*)

Fortran 95:

call trevc(*t* [, *howmny*] [,*select*] [,*vl*] [,*vr*] [,*m*] [,*info*])

Description

This routine computes some or all of the right and/or left eigenvectors of an upper triangular matrix T (or, for real flavors, an upper quasi-triangular matrix T). Matrices of this type are produced by the Schur factorization of a general matrix: $A = Q*T*Q^H$, as computed by ?hseqr.

The right eigenvector x and the left eigenvector y of T corresponding to an eigenvalue w, are defined by:

$T*x = w*x$, $y^H*T = w*y^H$, where y^H denotes the conjugate transpose of y.

The eigenvalues are not input to this routine, but are read directly from the diagonal blocks of T.

This routine returns the matrices X and/or Y of right and left eigenvectors of T, or the products $Q*X$ and/or $Q*Y$, where Q is an input matrix.

If *Q* is the orthogonal/unitary factor that reduces a matrix *A* to Schur form *T*, then *Q***X* and *Q***Y* are the matrices of right and left eigenvectors of *A*.

Input Parameters

side — CHARACTER*1. Must be 'R' or 'L' or 'B'.
If *side* = 'R', then only right eigenvectors are computed.
If *side* = 'L', then only left eigenvectors are computed.
If *side* = 'B', then all eigenvectors are computed.

howmny — CHARACTER*1. Must be 'A' or 'B' or 'S'.
If *howmny* = 'A', then all eigenvectors (as specified by *side*) are computed.
If *howmny* = 'B', then all eigenvectors (as specified by *side*) are computed and backtransformed by the matrices supplied in *vl* and *vr*.
If *howmny* = 'S', then selected eigenvectors (as specified by *side* and *select*) are computed.

select — LOGICAL.
Array, DIMENSION at least max (1, *n*).
If *howmny* = 'S', *select* specifies which eigenvectors are to be computed.
If *howmny* = 'A' or 'B', *select* is not referenced.
For real flavors:
If *omega*(*j*) is a real eigenvalue, the corresponding real eigenvector is computed if *select*(*j*) is .TRUE..
If *omega*(*j*) and *omega*(*j*+1) are the real and imaginary parts of a complex eigenvalue, the corresponding complex eigenvector is computed if either *select*(*j*) or *select*(*j*+1) is .TRUE., and on exit *select*(*j*) is set to .TRUE.and *select*(*j*+1) is set to .FALSE..
For complex flavors:
The eigenvector corresponding to the *j*-th eigenvalue is computed if *select*(*j*) is .TRUE..

n — INTEGER. The order of the matrix *T* (*n* ≥ 0).

t, *vl*, *vr*, — REAL for strevc
DOUBLE PRECISION for dtrevc
COMPLEX for ctrevc
DOUBLE COMPLEX for ztrevc.

	Arrays: *t*(*ldt*,*) contains the *n*-by-*n* matrix *T* in Schur canonical form. The second dimension of *t* must be at least max(1, *n*). *vl*(*ldvl*,*) If *howmny* = 'B' and *side* = 'L' or 'B', then *vl* must contain an *n*-by-*n* matrix *Q* (usually the matrix of Schur vectors returned by ?hseqr). If *howmny* = 'A' or 'S', then *vl* need not be set. The second dimension of *vl* must be at least max(1, *mm*) if *side* = 'L' or 'B' and at least 1 if *side* = 'R'. The array *vl* is not referenced if *side* = 'R'. *vr* (*ldvr*,*) If *howmny* = 'B' and *side* = 'R' or 'B', then *vr* must contain an *n*-by-*n* matrix *Q* (usually the matrix of Schur vectors returned by ?hseqr). . If *howmny* = 'A' or 'S', then *vr* need not be set. The second dimension of *vr* must be at least max(1, *mm*) if *side* = 'R' or 'B' and at least 1 if *side* = 'L'. The array *vr* is not referenced if *side* = 'L'. *work*(*) is a workspace array. DIMENSION at least max (1, 3**n*) for real flavors and at least max (1, 2**n*) for complex flavors.
ldt	INTEGER. The first dimension of *t*; at least max(1, *n*).
ldvl	INTEGER. The first dimension of *vl*. If *side* = 'L' or 'B', *ldvl* ≥ *n*. If *side* = 'R', *ldvl* ≥ 1.
ldvr	INTEGER. The first dimension of *vr*. If *side* = 'R' or 'B', *ldvr* ≥ *n*. If *side* = 'L', *ldvr* ≥ 1.
mm	INTEGER. The number of columns in the arrays *vl* and/or *vr*. Must be at least *m* (the precise number of columns required). If *howmny* = 'A' or 'B', *m* = *n*.

If *howmny* = 'S': for real flavors, *m* is obtained by counting 1 for each selected real eigenvector and 2 for each selected complex eigenvector;
for complex flavors, *m* is the number of selected eigenvectors (see *select*).

Constraint: $0 \le m \le n$.

rwork — REAL for ctrevc
DOUBLE PRECISION for ztrevc.
Workspace array, DIMENSION at least max (1, *n*).

Output Parameters

select — If a complex eigenvector of a real matrix was selected as specified above, then *select*(*j*) is set to .TRUE. and *select*(*j*+1) to .FALSE.

vl, *vr* — If *side* = 'L' or 'B', *vl* contains the computed left eigenvectors (as specified by *howmny* and *select*).
If *side* = 'R' or 'B', *vr* contains the computed right eigenvectors (as specified by *howmny* and *select*).
The eigenvectors are stored consecutively in the columns of the array, in the same order as their eigenvalues.
For real flavors: corresponding to each real eigenvalue is a real eigenvector, occupying one column;corresponding to each complex conjugate pair of eigenvalues is a complex eigenvector, occupying two columns; the first column holds the real part and the second column holds the imaginary part.

m — INTEGER.
For complex flavors: the number of selected eigenvectors.
If *howmny* = 'A' or 'B', *m* is set to *n*.
For real flavors: the number of columns of *vl* and/or *vr* actually used to store the selected eigenvectors.
If *howmny* = 'A' or 'B', *m* is set to *n*.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `trevc` interface are the following:

t	Holds the matrix *T* of size (*n*,*n*).
select	Holds the vector of length (*n*).
vl	Holds the matrix *VL* of size (*n*,*mm*).
vr	Holds the matrix *VR* of size (*n*,*mm*).
side	If omitted, this argument is restored based on the presence of arguments *vl* and *vr* as follows: *side* = 'B', if both *vl* and *vr* are present, *side* = 'L', if *vr* is omitted, *side* = 'R', if *vl* is omitted. Note that there will be an error condition if both *vl* and *vr* are omitted.
howmny	If omitted, this argument is restored based on the presence of argument *select* as follows: *howmny* = 'V', if *q* is present, *howmny* = 'N', if *q* is omitted. If present, *vect* = 'V' or 'U' and the argument *q* must also be present. Note that there will be an error condition if both *select* and *howmny* are present.

Application Notes

If x i is an exact right eigenvector and y_i is the corresponding computed eigenvector, then the angle $\theta(y_i, x_i)$ between them is bounded as follows: $\theta(y_i, x_i) \leq (c(n)\varepsilon||T||_2)/\mathrm{sep}_i$ where sep_i is the reciprocal condition number of x_i. The condition number sep_i may be computed by calling `?trsna`.

?trsna

Estimates condition numbers for specified eigenvalues and right eigenvectors of an upper (quasi-) triangular matrix.

Syntax

Fortran 77:

```
call strsna(job, howmny, select, n, t, ldt, vl, ldvl, vr, ldvr, s, sep, mm, m, work, ldwork, iwork, info)
call dtrsna(job, howmny, select, n, t, ldt, vl, ldvl, vr, ldvr, s, sep, mm, m, work, ldwork, iwork, info)
call ctrsna(job, howmny, select, n, t, ldt, vl, ldvl, vr, ldvr, s, sep, mm, m, work, ldwork, rwork, info)
call ztrsna(job, howmny, select, n, t, ldt, vl, ldvl, vr, ldvr, s, sep, mm, m, work, ldwork, rwork, info)
```

Fortran 95:

```
call trsna(t [, s] [,sep] [,vl] [,vr] [,select] [,m] [,info])
```

Description

This routine estimates condition numbers for specified eigenvalues and/or right eigenvectors of an upper triangular matrix T (or, for real flavors, upper quasi-triangular matrix T in canonical Schur form). These are the same as the condition numbers of the eigenvalues and right eigenvectors of an original matrix $A = Z*T*Z^H$ (with unitary or, for real flavors, orthogonal Z), from which T may have been derived.

The routine computes the reciprocal of the condition number of an eigenvalue $lambda(i)$ as $s_i = |v_H u| / (||u||_E ||v||_E)$, where u and v are the right and left eigenvectors of T, respectively, corresponding to $lambda(i)$. This reciprocal condition number always lies between zero (ill-conditioned) and one (well-conditioned).

An approximate error estimate for a computed eigenvalue $lambda(i)$ is then given by $\varepsilon ||T|| / s_i$, where ε is the machine precision.

To estimate the reciprocal of the condition number of the right eigenvector corresponding to *lambda*(*i*), the routine first calls ?trexc to reorder the eigenvalues so that *lambda*(*j*) is in the leading position:

$$T = Q \begin{bmatrix} \lambda_i & C^H \\ 0 & T_{22} \end{bmatrix} Q^H$$

The reciprocal condition number of the eigenvector is then estimated as sep_i, the smallest singular value of the matrix T_{22} - *lambda*(*i*)*I. This number ranges from zero (ill-conditioned) to very large (well-conditioned).

An approximate error estimate for a computed right eigenvector u corresponding to *lambda*(*i*) is then given by $\varepsilon||T||/sep_i$.

Input Parameters

job	CHARACTER*1. Must be 'E' or 'V' or 'B'. If *job* = 'E', then condition numbers for eigenvalues only are computed. If *job* = 'V', then condition numbers for eigenvectors only are computed. If *job* = 'B', then condition numbers for both eigenvalues and eigenvectors are computed.
howmny	CHARACTER*1. Must be 'A' or 'S'. If *howmny* = 'A' , then the condition numbers for all eigenpairs are computed. If *howmny* = 'S' , then condition numbers for selected eigenpairs (as specified by *select*) are computed.
select	LOGICAL. Array, DIMENSION at least max (1, *n*) if *howmny* = 'S' and at least 1 otherwise. Specifies the eigenpairs for which condition numbers are to be computed if *howmny*= 'S'. For real flavors:

To select condition numbers for the eigenpair corresponding to the real eigenvalue *lambda*(*j*), *select*(*j*) must be set .TRUE.;
to select condition numbers for the eigenpair corresponding to a complex conjugate pair of eigenvalues *lambda*(*j*) and *lambda*(*j*+1), *select*(*j*) and/or *select*(*j*+1) must be set .TRUE.
For complex flavors
To select condition numbers for the eigenpair corresponding to the eigenvalue *lambda*(*j*), *select*(*j*) must be set .TRUE. *select* is not referenced if *howmny* = 'A'.

n — INTEGER. The order of the matrix *T* (*n* ≥ 0).

t, *vl*, *vr*, *work* — REAL for strsna
DOUBLE PRECISION for dtrsna
COMPLEX for ctrsna
DOUBLE COMPLEX for ztrsna.
Arrays:
t(*ldt*,*) contains the *n*-by-*n* matrix *T*.
The second dimension of *t* must be at least max(1, *n*).
vl(*ldvl*,*)
If *job* = 'E' or 'B', then *vl* must contain the left eigenvectors of *T* (or of any matrix $Q*T*Q^H$ with *Q* unitary or orthogonal) corresponding to the eigenpairs specified by *howmny* and *select*. The eigenvectors must be stored in consecutive columns of *vl*, as returned by ?trevc or ?hsein.
The second dimension of *vl* must be at least max(1, *mm*) if *job* = 'E' or 'B' and at least 1 if *job* = 'V'.
The array *vl* is not referenced if *job* = 'V'.
vr(*ldvr*,*)
If *job* = 'E' or 'B', then *vr* must contain the right eigenvectors of *T* (or of any matrix $Q*T*Q^H$ with *Q* unitary or orthogonal) corresponding to the eigenpairs specified by *howmny* and *select*. The eigenvectors must be stored in consecutive columns of *vr*, as returned by ?trevc or ?hsein.

The second dimension of *vr* must be at least max(1, *mm*) if *job* = 'E' or 'B' and at least 1 if *job* = 'V'.
The array *vr* is not referenced if *job* = 'V'.
work is a workspace array, its dimension (*ldwork*,*n*+6).
The array *work* is not referenced if *job* = 'E'.

ldt — INTEGER. The first dimension of *t*; at least max(1, *n*).

ldvl — INTEGER. The first dimension of *vl*.

If *job* = 'E' or 'B', *ldvl* ≥ max(1,*n*).

If *job* = 'V', *ldvl* ≥ 1.

ldvr — INTEGER. The first dimension of *vr*.

If *job* = 'E' or 'B', *ldvr* ≥ max(1,*n*).

If *job* = 'R', *ldvr* ≥ 1.

mm — INTEGER. The number of elements in the arrays *s* and *sep*, and the number of columns in *vl* and *vr* (if used). Must be at least *m* (the precise number required).
If *howmny* = 'A', *m* = *n*;
if *howmny* = 'S', for real flavors *m* is obtained by counting 1 for each selected real eigenvalue and 2 for each selected complex conjugate pair of eigenvalues.
for complex flavors *m* is the number of selected eigenpairs (see *select*). Constraint:

0 ≤ *m* ≤ *n*.

ldwork — INTEGER. The first dimension of *work*.

If *job* = 'V' or 'B', *ldwork* ≥ max(1,*n*).

If *job* = 'E', *ldwork* ≥ 1.

rwork — REAL for ctrsna, ztrsna.
Array, DIMENSION at least max (1, *n*).

iwork — INTEGER for strsna, dtrsna.
Array, DIMENSION at least max (1, *n*).

Output Parameters

s — REAL for single-precision flavors
DOUBLE PRECISION for double-precision flavors.

Array, DIMENSION at least max(1, *mm*) if *job* = 'E' or 'B' and at least 1 if *job* = 'V'.
Contains the reciprocal condition numbers of the selected eigenvalues if *job* = 'E' or 'B', stored in consecutive elements of the array. Thus *s*(*j*), *sep*(*j*) and the *j*-th columns of *vl* and *vr* all correspond to the same eigenpair (but not in general the *j* th eigenpair unless all eigenpairs have been selected).
For real flavors: for a complex conjugate pair of eigenvalues, two consecutive elements of S are set to the same value.
The array *s* is not referenced if *job* = 'V'.

sep

REAL for single-precision flavors
DOUBLE PRECISION for double-precision flavors.
Array, DIMENSION at least max(1, *mm*) if *job* = 'V' or 'B' and at least 1 if *job* = 'E'. Contains the estimated reciprocal condition numbers of the selected right eigenvectors if *job* = 'V' or 'B', stored in consecutive elements of the array.
For real flavors: for a complex eigenvector, two consecutive elements of *sep* are set to the same value; if the eigenvalues cannot be reordered to compute *sep*(*j*), then *sep*(*j*) is set to zero; this can only occur when the true value would be very small anyway. The array *sep* is not referenced if *job* = 'E'.

m

INTEGER.
For complex flavors: the number of selected eigenpairs.
If *howmny* = 'A', *m* is set to *n*.
For real flavors: the number of elements of *s* and/or *sep* actually used to store the estimated condition numbers.
If *howmny* = 'A', *m* is set to *n*.

info

INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `trsna` interface are the following:

t	Holds the matrix *T* of size (*n*,*n*).
s	Holds the vector of length (*mm*).
sep	Holds the vector of length (*mm*).
vl	Holds the matrix *VL* of size (*n*,*mm*).
vr	Holds the matrix *VR* of size (*n*,*mm*).
select	Holds the vector of length (*n*).
job	Restored based on the presence of arguments *s* and sep as follows: *job* = 'B', if both *s* and *sep* are present, *job* = 'E', if *s* is present and *sep* omitted, *job* = 'V', if *s* is omitted and *sep* present. Note an error condition if both *s* and *sep* are omitted.
howmny	Restored based on the presence of the argument *select* as follows: *howmny* = 'S', if *select* is present, *howmny* = 'A', if *select* is omitted.

Note that the arguments *s*, *vl*, and *vr* must either be all present or all omitted.

Otherwise, an error condition is observed.

Application Notes

The computed values sep_i may overestimate the true value, but seldom by a factor of more than 3.

?trexc

Reorders the Schur factorization of a general matrix.

Syntax

Fortran 77:

```
call strexc(compq, n, t, ldt, q, ldq, ifst, ilst, work, info)
call dtrexc(compq, n, t, ldt, q, ldq, ifst, ilst, work, info)
call ctrexc(compq, n, t, ldt, q, ldq, ifst, ilst, info)
call ztrexc(compq, n, t, ldt, q, ldq, ifst, ilst, info)
```

Fortran 95:

```
call trexc(t, ifst, ilst [,q] [,info])
```

Description

This routine reorders the Schur factorization of a general matrix $A = Q*T*Q^H$, so that the diagonal element or block of T with row index $ifst$ is moved to row $ilst$.

The reordered Schur form S is computed by an unitary (or, for real flavors, orthogonal) similarity transformation: $S = Z^H*T*Z$. Optionally the updated matrix P of Schur vectors is computed as $P = Q*Z$, giving $A = P*S*P^H$.

Input Parameters

compq	CHARACTER*1. Must be 'V' or 'N'. If *compq* = 'V', then the Schur vectors (Q) are updated. If *compq* = 'N', then no Schur vectors are updated.
n	INTEGER. The order of the matrix T ($n \geq 0$).
t, *q*	REAL for strexc DOUBLE PRECISION for dtrexc COMPLEX for ctrexc DOUBLE COMPLEX for ztrexc. Arrays: *t*(*ldt*,*) contains the n-by-n matrix T. The second dimension of *t* must be at least max(1, n). *q*(*ldq*,*) If *compq* = 'V', then *q* must contain Q (Schur vectors). If *compq* = 'N', then *q* is not referenced. The second dimension of *q* must be at least max(1, n) if *compq* = 'V' and at least 1 if *compq* = 'N'.
ldt	INTEGER. The first dimension of *t*; at least max(1, n).
ldq	INTEGER. The first dimension of *q*; If *compq* = 'N', then *ldq*≥ 1. If *compq* = 'V', then *ldq*≥ max(1, *n*).
ifst, *ilst*	INTEGER. $1 \leq ifst \leq n$; $1 \leq ilst \leq n$.

	Must specify the reordering of the diagonal elements (or blocks, which is possible for real flavors) of the matrix T. The element (or block) with row index $ifst$ is moved to row $ilst$ by a sequence of exchanges between adjacent elements (or blocks).
work	REAL for strexc DOUBLE PRECISION for dtrexc. Array, DIMENSION at least max (1, n).

Output Parameters

t	Overwritten by the updated matrix S.
q	If $compq$ = 'V', q contains the updated matrix of Schur vectors.
ifst, *ilst*	Overwritten for real flavors only. If $ifst$ pointed to the second row of a 2 by 2 block on entry, it is changed to point to the first row; $ilst$ always points to the first row of the block in its final position (which may differ from its input value by ±1).
info	INTEGER. If $info$ = 0, the execution is successful. If $info$ = $-i$, the i-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine trexc interface are the following:

t	Holds the matrix T of size (n,n).
q	Holds the matrix Q of size (n,n).
compq	Restored based on the presence of the argument q as follows: $compq$ = 'V', if q is present, $compq$ = 'N', if q is omitted.

Application Notes

The computed matrix S is exactly similar to a matrix $T + E$, where $||E||_2 = O(\varepsilon)||T||_2$, and ε is the machine precision.

Note that if a 2 by 2 diagonal block is involved in the re-ordering, its off-diagonal elements are in general changed; the diagonal elements and the eigenvalues of the block are unchanged unless the block is sufficiently ill-conditioned, in which case they may be noticeably altered. It is possible for a 2 by 2 block to break into two 1 by 1 blocks, that is, for a pair of complex eigenvalues to become purely real.

The values of eigenvalues however are never changed by the re-ordering.

The approximate number of floating-point operations is

for real flavors: $6n(ifst-ilst)$ if *compq* = 'N';
$12n(ifst-ilst)$ if *compq* = 'V';

for complex flavors: $20n(ifst-ilst)$ if *compq* = 'N';
$40n(ifst-ilst)$ if *compq* = 'V'.

?trsen

Reorders the Schur factorization of a matrix and (optionally) computes the reciprocal condition numbers and invariant subspace for the selected cluster of eigenvalues.

Syntax

Fortran 77:

```
call strsen(job, compq, select, n, t, ldt, q, ldq, wr, wi, m, s, sep, work, lwork, iwork, liwork, info)
call dtrsen(job, compq, select, n, t, ldt, q, ldq, wr, wi, m, s, sep, work, lwork, iwork, liwork, info)
call ctrsen(job, compq, select, n, t, ldt, q, ldq, w, m, s, sep, work, lwork, info)
call ztrsen(job, compq, select, n, t, ldt, q, ldq, w, m, s, sep, work, lwork, info)
```

Fortran 95:

```
call trsen(t, select [,wr] [,wi] [,m] [,s] [,sep] [,q] [,info])
call trsen(t, select [,w] [,m] [,s] [,sep] [,q] [,info])
```

Description

This routine reorders the Schur factorization of a general matrix $A = Q*T*Q^H$ so that a selected cluster of eigenvalues appears in the leading diagonal elements (or, for real flavors, diagonal blocks) of the Schur form. The reordered Schur form R is computed by an unitary (orthogonal) similarity transformation: $R = Z^H*T*Z$. Optionally the updated matrix P of Schur vectors is computed as $P = Q*Z$, giving $A = P*R*P^H$.

Let

$$R = \begin{bmatrix} T_{11} & T_{12} \\ 0 & T_{13} \end{bmatrix}$$

where the selected eigenvalues are precisely the eigenvalues of the leading m-by-m submatrix T_{11}. Let P be correspondingly partitioned as (Q 1 Q_2) where Q_1 consists of the first m columns of Q. Then $A*Q$ 1 = $Q_1 T_{11}$, and so the m columns of Q_1 form an orthonormal basis for the invariant subspace corresponding to the selected cluster of eigenvalues.

Optionally the routine also computes estimates of the reciprocal condition numbers of the average of the cluster of eigenvalues and of the invariant subspace.

Input Parameters

job	CHARACTER*1. Must be 'N' or 'E' or 'V' or 'B'. If *job* = 'N', then no condition numbers are required. If *job* = 'E', then only the condition number for the cluster of eigenvalues is computed. If *job* = 'V', then only the condition number for the invariant subspace is computed. If *job* = 'B', then condition numbers for both the cluster and the invariant subspace are computed.
compq	CHARACTER*1. Must be 'V' or 'N'. If *compq* = 'V', then Q of the Schur vectors is updated.

If *compq* = 'N', then no Schur vectors are updated.

select — LOGICAL.
Array, DIMENSION at least max (1, *n*).
Specifies the eigenvalues in the selected cluster. To select an eigenvalue *lambda*(*j*), *select*(*j*) must be .TRUE.
For real flavors: to select a complex conjugate pair of eigenvalues *lambda*(*j*) and *lambda*(*j*+1) (corresponding 2 by 2 diagonal block), *select*(*j*) and/or *select*(*j*+1) must be .TRUE.; the complex conjugate *lambda*(*j*)and *lambda*(*j*+1) must be either both included in the cluster or both excluded.

n — INTEGER. The order of the matrix *T* (*n* ≥ 0).

t, *q*, *work* — REAL for strsen
DOUBLE PRECISION for dtrsen
COMPLEX for ctrsen
DOUBLE COMPLEX for ztrsen.
Arrays:
t (*ldt*,*) The *n*-by-*n* *T*.
The second dimension of *t* must be at least max(1, *n*).

q (*ldq*,*)
If *compq* = 'V', then *q* must contain *Q* of Schur vectors.
If *compq* = 'N', then *q* is not referenced.
The second dimension of *q* must be at least max(1, *n*) if *compq* = 'V' and at least 1 if *compq* = 'N'.
work is a workspace array, its dimension max(1, *lwork*).

ldt — INTEGER. The first dimension of *t*; at least max(1, *n*).

ldq — INTEGER. The first dimension of *q*;

If *compq* = 'N', then *ldq* ≥ 1.

If *compq* = 'V', then *ldq* ≥ max(1, *n*).

lwork — INTEGER. The dimension of the array *work*.

If *job* = 'V' or 'B', *lwork* ≥ max(1,2**m**(*n*-*m*)).

If *job* = 'E', then *lwork* ≥ max(1, *m**(*n*-*m*))

If *job* = 'N', then *lwork* ≥ 1 for complex flavors and *lwork* ≥ max(1,*n*) for real flavors.
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for details.

iwork — INTEGER.*iwork*(*liwork*) is a workspace array. The array *iwork* is not referenced if *job* = 'N' or 'E'.
The actual amount of workspace required cannot exceed $n^2/2$ if *job* = 'V' or 'B'.

liwork — INTEGER.
The dimension of the array *iwork*.
If *job* = 'V' or 'B', *liwork* ≥ max(1,2*m*(*n*-*m*)).
If *job* = 'E' or 'E', *liwork* ≥ 1.
If *liwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *iwork* array, returns this value as the first entry of the *iwork* array, and no error message related to *liwork* is issued by xerbla. See Application Notes for details.

Output Parameters

t — Overwritten by the updated matrix *R*.

q — If *compq* = 'V', *q* contains the updated matrix of Schur vectors; the first m columns of the *Q* form an orthogonal basis for the specified invariant subspace.

w — COMPLEX for ctrsen
DOUBLE COMPLEX for ztrsen.
Array, DIMENSION at least max(1, *n*). The recorded eigenvalues of *R*. The eigenvalues are stored in the same order as on the diagonal of *R*.

wr, *wi* — REAL for strsen
DOUBLE PRECISION for dtrsen

Arrays, DIMENSION at least max(1, *n*). Contain the real and imaginary parts, respectively, of the reordered eigenvalues of *R*. The eigenvalues are stored in the same order as on the diagonal of *R*. Note that if a complex eigenvalue is sufficiently ill-conditioned, then its value may differ significantly from its value before reordering.

m

INTEGER.
For complex flavors: the number of the specified invariant subspaces, which is the same as the number of selected eigenvalues (see *select*).
For real flavors: the dimension of the specified invariant subspace. The value of *m* is obtained by counting 1 for each selected real eigenvalue and 2 for each selected complex conjugate pair of eigenvalues (see *select*).

Constraint: $0 \le m \le n$.

s

REAL for single-precision flavors
DOUBLE PRECISION for double-precision flavors.
If *job* = 'E' or 'B', *s* is a lower bound on the reciprocal condition number of the average of the selected cluster of eigenvalues.
If *m* = 0 or *n*, then *s* = 1.
For real flavors: if *info* = 1, then *s* is set to zero.*s* is not referenced if *job* = 'N' or 'V'.

sep

REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors.
If *job* = 'V' or 'B', *sep* is the estimated reciprocal condition number of the specified invariant subspace.
If *m* = 0 or *n*, then *sep* = |*T*|.
For real flavors: if *info* = 1, then *sep* is set to zero.
sep is not referenced if *job* = 'N' or 'E'.

work(1)

On exit, if *info* = 0, then *work*(1) returns the optimal size of *lwork*.

iwork(1)

On exit, if *info* = 0, then *iwork*(1) returns the optimal size of *liwork*.

info

INTEGER.
If *info* = 0, the execution is successful.
If *info* = –*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `trsen` interface are the following:

t	Holds the matrix *T* of size (*n*,*n*).
select	Holds the vector of length (*n*).
wr	Holds the vector of length (*n*). Used in real flavors only.
wi	Holds the vector of length (*n*). Used in real flavors only.
w	Holds the vector of length (*n*). Used in complex flavors only.
q	Holds the matrix *Q* of size (*n*,*n*).
compq	Restored based on the presence of the argument *q* as follows: *compq* = 'V', if *q* is present, *compq* = 'N', if *q* is omitted.
job	Restored based on the presence of arguments *s* and sep as follows: *job* = 'B', if both *s* and *sep* are present, *job* = 'E', if *s* is present and *sep* omitted, *job* = 'V', if *s* is omitted and *sep* present, *job* = 'N', if both *s* and *sep* are omitted.

Application Notes

The computed matrix *R* is exactly similar to a matrix $T + E$, where $||E||_2 = O(\varepsilon)||T||_2$, and ε is the machine precision. The computed *s* cannot underestimate the true reciprocal condition number by more than a factor of $(\min(m, n\text{-}m))_{1/2}$; *sep* may differ from the true value by $(m*n\text{-}m^2)_{1/2}$. The angle between the computed invariant subspace and the true subspace is $O(\varepsilon)||A||_2/sep$. Note that if a 2 by 2 diagonal block is involved in the re-ordering, its off-diagonal elements are in general changed; the diagonal elements and the eigenvalues of the block are unchanged unless the block is sufficiently ill-conditioned, in which case they may be noticeably altered. It is possible for a 2 by 2 block to break into two 1 by 1 blocks, that is, for a pair of complex eigenvalues to become purely real. The values of eigenvalues however are never changed by the re-ordering.

If you are in doubt how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run or set *lwork* = -1 (*liwork* = -1).

If you choose the first option and set any of admissible *lwork* (or *liwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?trsyl

Solves Sylvester equation for real quasi-triangular or complex triangular matrices.

Syntax

Fortran 77:

```
call strsyl(trana, tranb, isgn, m, n, a, lda, b, ldb, c, ldc, scale, info)
call dtrsyl(trana, tranb, isgn, m, n, a, lda, b, ldb, c, ldc, scale, info)
call ctrsyl(trana, tranb, isgn, m, n, a, lda, b, ldb, c, ldc, scale, info)
call ztrsyl(trana, tranb, isgn, m, n, a, lda, b, ldb, c, ldc, scale, info)
```

Fortran 95:

```
call trsyl(a, b, c, scale [, trana] [,tranb] [,isgn] [,info])
```

Description

This routine solves the Sylvester matrix equation op(*A*)*X* ± *X* op(*B*) = α*C*, where op(*A*) = *A* or A^H, and the matrices *A* and *B* are upper triangular (or, for real flavors, upper quasi-triangular in canonical Schur form); α ≤ 1 is a scale factor determined by the routine to avoid overflow in *X*; *A* is *m*-by-*m*, *B* is *n*-by-*n*, and *C* and *X* are both *m*-by-*n*. The matrix *X* is obtained by a straightforward process of back substitution.

The equation has a unique solution if and only if $\alpha_i \pm \beta_i \neq 0$, where $\{\alpha_i\}$ and $\{\beta_i\}$ are the eigenvalues of A and B, respectively, and the sign (+ or -) is the same as that used in the equation to be solved.

Input Parameters

trana	CHARACTER*1. Must be 'N' or 'T' or 'C'. If *trana* = 'N' , then op(*A*) = *A*. If *trana* = 'T', then op(*A*) = A^T (real flavors only). If *trana* = 'C' then op(*A*) = A^H.
tranb	CHARACTER*1. Must be 'N' or 'T' or 'C'. If *tranb* = 'N' , then op(*B*) = *B*. If *tranb* = 'T', then op(*B*) = B^T (real flavors only). If *tranb* = 'C', then op(*B*) = B^H.
isgn	INTEGER. Indicates the form of the Sylvester equation. If *isgn* = +1, op(*A*)**X* + *X**op(*B*) = alpha**C*. If *isgn* = -1, op(*A*)**X* - *X**op(*B*) = alpha**C*.
m	INTEGER. The order of *A*, and the number of rows in *X* and *C* ($m \geq 0$).
n	INTEGER. The order of *B*, and the number of columns in *X* and *C* ($n \geq 0$).
a, *b*, *c*	REAL for strsyl DOUBLE PRECISION for dtrsyl COMPLEX for ctrsyl DOUBLE COMPLEX for ztrsyl. Arrays: *a*(*lda*,*) contains the matrix *A*. The second dimension of *a* must be at least max(1, *m*). *b*(*ldb*,*) contains the matrix *B*. The second dimension of *b* must be at least max(1, *n*). *c*(*ldc*,*) contains the matrix *C*. The second dimension of *c* must be at least max(1, *n*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
ldb	INTEGER. The first dimension of *b*; at least max(1, *n*).
ldc	INTEGER. The first dimension of *c*; at least max(1, *n*).

Output Parameters

c	Overwritten by the solution matrix *X*.
scale	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. The value of the scale factor α.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = 1, *A* and *B* have common or close eigenvalues perturbed values were used to solve the equation.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine trsyl interface are the following:

a	Holds the matrix *A* of size (*m*,*m*).
b	Holds the matrix *B* of size (*n*,*n*).
c	Holds the matrix *C* of size (*m*,*n*).
trana	Must be 'N', 'C', or 'T'. The default value is 'N'.
tranb	Must be 'N', 'C', or 'T'. The default value is 'N'.
isgn	Must be +1 or -1. The default value is +1.

Application Notes

Let *X* be the exact, *Y* the corresponding computed solution, and *R* the residual matrix: *R* = *C* - (*AY* ± *YB*). Then the residual is always small:

$$||R||_F = O(\varepsilon) \quad (||A||_F + ||B||_F) \quad ||Y||_F.$$

However, *Y* is not necessarily the exact solution of a slightly perturbed equation; in other words, the solution is not backwards stable.

For the forward error, the following bound holds:

$$||Y - X||_F \leq ||R||_F / \mathrm{sep}(A, B)$$

but this may be a considerable overestimate. See [Golub96] for a definition of sep(*A*, *B*).

The approximate number of floating-point operations for real flavors is *m***n**(*m* + *n*). For complex flavors it is 4 times greater.

Generalized Nonsymmetric Eigenvalue Problems

This section describes LAPACK routines for solving generalized nonsymmetric eigenvalue problems, reordering the generalized Schur factorization of a pair of matrices, as well as performing a number of related computational tasks.

A `generalized nonsymmetric eigenvalue problem` is as follows: given a pair of nonsymmetric (or non-Hermitian) *n*by-*n* matrices *A* and *B*, find the `generalized eigenvalues` λ and the corresponding `generalized eigenvectors` *x* and *y* that satisfy the equations

$Ax = \lambda Bx$ (right generalized eigenvectors *x*)

and

$y^H A = \lambda_y{}^H B$ (left generalized eigenvectors *y*).

Table 4-6 lists LAPACK routines (Fortran-77 interface) used to solve the generalized nonsymmetric eigenvalue problems and the generalized Sylvester equation. Respective routine names in Fortran-95 interface are without the first symbol (see Routine Naming Conventions).

Table 4-6 Computational Routines for Solving Generalized Nonsymmetric Eigenvalue Problems

Routine name	Operation performed
`?gghrd`	Reduces a pair of matrices to generalized upper Hessenberg form using orthogonal/unitary transformations.
`?ggbal`	Balances a pair of general real or complex matrices.
`?ggbak`	Forms the right or left eigenvectors of a generalized eigenvalue problem.
`?hgeqz`	Implements the QZ method for finding the generalized eigenvalues of the matrix pair (H,T).
`?tgevc`	Computes some or all of the right and/or left generalized eigenvectors of a pair of upper triangular matrices

Routine name	Operation performed
?tgexc	Reorders the generalized Schur decomposition of a pair of matrices (A,B) so that one diagonal block of (A,B) moves to another row index.
?tgsen	Reorders the generalized Schur decomposition of a pair of matrices (A,B) so that a selected cluster of eigenvalues appears in the leading diagonal blocks of (A,B).
?tgsyl	Solves the generalized Sylvester equation.
?tgsna	Estimates reciprocal condition numbers for specified eigenvalues and/or eigenvectors of a pair of matrices in generalized real Schur canonical form.

?gghrd

Reduces a pair of matrices to generalized upper Hessenberg form using orthogonal/unitary transformations.

Syntax

Fortran 77:

```
call sgghrd(compq, compz, n, ilo, ihi, a, lda, b, ldb, q, ldq, z, ldz, info)
call dgghrd(compq, compz, n, ilo, ihi, a, lda, b, ldb, q, ldq, z, ldz, info)
call cgghrd(compq, compz, n, ilo, ihi, a, lda, b, ldb, q, ldq, z, ldz, info)
call zgghrd(compq, compz, n, ilo, ihi, a, lda, b, ldb, q, ldq, z, ldz, info)
```

Fortran 95:

```
call gghrd(a, b [,ilo] [,ihi] [,q] [,z] [,compq] [,compz] [,info])
```

Description

This routine reduces a pair of real/complex matrices (A,B) to generalized upper Hessenberg form using orthogonal/unitary transformations, where A is a general matrix and B is upper triangular. The form of the generalized eigenvalue problem is $A*x = \lambda*B*x$, and B is typically made upper triangular by computing its QR factorization and moving the orthogonal matrix Q to the left side of the equation.

This routine simultaneously reduces A to a Hessenberg matrix H:

$Q^H*A*Z = H$

and transforms B to another upper triangular matrix T:

$Q^H*B*Z = T$

in order to reduce the problem to its standard form $H*y = \lambda*T*y$, where $y = Z^H*x$.

The orthogonal/unitary matrices Q and Z are determined as products of Givens rotations. They may either be formed explicitly, or they may be postmultiplied into input matrices Q_1 and $_1$, so that

$Q_1*A*Z*Z_1^H = (Q_1*Q)*H*(Z_1*Z)^H$

$Q_1*B*Z_1^H = (Q_1*Q)*T*(Z_1*Z)^H$

If Q_1 is the orthogonal/unitary matrix from the QR factorization of B in the original equation $Ax = \lambda Bx$, then the routine `?gghrd` reduces the original problem to generalized Hessenberg form.

Input Parameters

compq	`CHARACTER*1`. Must be `'N'`, `'I'`, or `'V'`. If *compq* = `'N'`, matrix Q is not computed. If *compq* = `'I'`, Q is initialized to the unit matrix, and the orthogonal/unitary matrix Q is returned; If *compq* = `'V'`, Q must contain an orthogonal/unitary matrix Q_1 on entry, and the product Q_1*Q is returned.
compz	`CHARACTER*1`. Must be `'N'`, `'I'`, or `'V'`. If *compz* = `'N'`, matrix Z is not computed. If *compz* = `'I'`, Z is initialized to the unit matrix, and the orthogonal/unitary matrix Z is returned; If *compz* = `'V'`, Z must contain an orthogonal/unitary matrix Z_1 on entry, and the product Z_1*Z is returned.
n	`INTEGER`. The order of the matrices A and B ($n \geq 0$).
ilo, *ihi*	`INTEGER`. *ilo* and *ihi* mark the rows and columns of A which are to be reduced. It is assumed that A is already upper triangular in rows and columns 1:*ilo*-1 and *ihi*+1:*n*. Values of *ilo* and *ihi* are normally set by a previous call to `?ggbal`; otherwise they should be set to 1 and *n* respectively.

Constraint:
If $n > 0$, then $1 \le ilo \le ihi \le n$;
if $n = 0$, then $ilo = 1$ and $ihi = 0$.

a, *b*, *q*, *z*
`REAL` for `sgghrd`
`DOUBLE PRECISION` for `dgghrd`
`COMPLEX` for `cgghrd`
`DOUBLE COMPLEX` for `zgghrd`.
Arrays:
a(*lda*,*) contains the n-by-n general matrix A. The second dimension of *a* must be at least max(1, n).
b(*ldb*,*) contains the n-by-n upper triangular matrix B.
The second dimension of *b* must be at least max(1, n).
q (*ldq*,*)
If *compq* = `'N'`, then *q* is not referenced.
If *compq* = `'V'`, then *q* must contain the orthogonal/unitary matrix Q_1, typically from the QR factorization of B.
The second dimension of *q* must be at least max(1, n).
z (*ldz*,*)
If *compq* = `'N'`, then *z* is not referenced.
If *compq* = `'V'`, then *z* must contain the orthogonal/unitary matrix Z_1.
The second dimension of *z* must be at least max(1, n).

lda
`INTEGER`. The first dimension of *a*; at least max(1, n).

ldb
`INTEGER`. The first dimension of *b*; at least max(1, n).

ldq
`INTEGER`. The first dimension of *q*;
If *compq* = `'N'`, then $ldq \ge 1$.
If *compq* = `'I'`or `'V'`, then $ldq \ge$ max(1, n).

ldz
`INTEGER`. The first dimension of *z*;
If *compq* = `'N'`, then $ldz \ge 1$.
If *compq* = `'I'`or `'V'`, then $ldz \ge$ max(1, n).

Output Parameters

a
On exit, the upper triangle and the first subdiagonal of A are overwritten with the upper Hessenberg matrix H, and the rest is set to zero.

b	On exit, overwritten by the upper triangular matrix $T = Q^H * B * Z$. The elements below the diagonal are set to zero.
q	If *compq* = 'I', then *q* contains the orthogonal/unitary matrix Q, ; If *compq* = 'V', then *q* is overwritten by the product $Q_1 * Q$.
z	If *compq* = 'I', then *z* contains the orthogonal/unitary matrix Z; If *compq* = 'V', then *z* is overwritten by the product $Z_1 * Z$.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gghrd interface are the following:

a	Holds the matrix A of size (n,n).
b	Holds the matrix B of size (n,n).
q	Holds the matrix Q of size (n,n).
z	Holds the matrix Z of size (n,n).
ilo	Default value for this argument is *ilo* = 1.
ihi	Default value for this argument is *ihi* = *n*.
compq	If omitted, this argument is restored based on the presence of argument *q* as follows: *compq* = 'I', if *q* is present, *compq* = 'N', if *q* is omitted. If present, *compq* must be equal to 'I' or 'V' and the argument *q* must also be present. Note that there will be an error condition if *compq* is present and *q* omitted.
compz	If omitted, this argument is restored based on the presence of argument *z* as follows: *compz* = 'I', if *z* is present, *compz* = 'N', if *z* is omitted. If present, *compz* must be equal to 'I' or 'V' and the argument *z* must also be present. Note that there will be an error condition if *compz* is present and *z* omitted.

?ggbal

Balances a pair of general real or complex matrices.

Syntax

Fortran 77:

```
call sggbal(job, n, a, lda, b, ldb, ilo, ihi, lscale, rscale, work, info)
call dggbal(job, n, a, lda, b, ldb, ilo, ihi, lscale, rscale, work, info)
call cggbal(job, n, a, lda, b, ldb, ilo, ihi, lscale, rscale, work, info)
call zggbal(job, n, a, lda, b, ldb, ilo, ihi, lscale, rscale, work, info)
```

Fortran 95:

```
call ggbal(a, b [,ilo] [,ihi] [,lscale] [,rscale] [,job] [,info])
```

Description

This routine balances a pair of general real/complex matrices (*A*,*B*). This involves, first, permuting *A* and *B* by similarity transformations to isolate eigenvalues in the first 1 to *ilo*-1 and last *ihi*+1 to *n* elements on the diagonal;and second, applying a diagonal similarity transformation to rows and columns *ilo* to *ihi* to make the rows and columns as close in norm as possible. Both steps are optional. Balancing may reduce the 1-norm of the matrices, and improve the accuracy of the computed eigenvalues and/or eigenvectors in the generalized eigenvalue problem $Ax = \lambda Bx$.

Input Parameters

job	CHARACTER*1. Specifies the operations to be performed on *A* and *B*. Must be 'N' or 'P' or 'S' or 'B'. If *job* = 'N', then no operations are done; simply set *ilo* =1, *ihi*=*n*, *lscale*(i) =1.0 and *rscale*(i)=1.0 for i = 1,..., *n*. If *job* = 'P', then permute only. If *job* = 'S', then scale only. If *job* = 'B', then both permute and scale.
n	INTEGER. The order of the matrices *A* and *B* ($n \geq 0$).
a, *b*	REAL for sggbal

DOUBLE PRECISION for dggbal
COMPLEX for cggbal
DOUBLE COMPLEX for zggbal.
Arrays:
a(*lda*,*) contains the matrix *A*. The second dimension of *a* must be at least max(1, *n*).
b(*ldb*,*) contains the matrix *B*. The second dimension of *b* must be at least max(1, *n*).

lda — INTEGER. The first dimension of *a*; at least max(1, *n*).

ldb — INTEGER. The first dimension of *b*; at least max(1, *n*).

work — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Workspace array, DIMENSION at least max(1, 6*n*) when *job* = 'S'or 'B', or at least 1 when *job* = 'N'or 'P'.

Output Parameters

a, *b* — Overwritten by the balanced matrices *A* and *B*, respectively. If *job* = 'N', *a* and *b* are not referenced.

ilo, *ihi* — INTEGER. *ilo* and *ihi* are set to integers such that on exit *a*(*i*,*j*)=0 and *b*(*i*,*j*)=0 if *i*>*j* and *j*=1,...,*ilo*-1 or *i*=*ihi*+1,..., *n*.
If *job* = 'N'or 'S', then *ilo* = 1 and *ihi* = *n*.

lscale, *rscale* — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Arrays, DIMENSION at least max(1, *n*).
lscale contains details of the permutations and scaling factors applied to the left side of *A* and *B*.
If P_j is the index of the row interchanged with row *j*, and D_j is the scaling factor applied to row *j*, then
lscale(*J*) = P_j, for *j* = 1,..., *ilo*-1
= D_j, for *j* = *ilo*,...,*ihi*
= P_j, for *j* = *ihi*+1,..., *n*.
rscale contains details of the permutations and scaling factors applied to the right side of *A* and *B*.
If P_j is the index of the column interchanged with column *j*, and D_j is the scaling factor applied to column *j*, then

	rscale(*j*) = P_j, for *j* = 1,..., *ilo*-1 = D_j, for *j* = *ilo*,...,*ihi* = P_j, for *j* = *ihi*+1,..., *n* The order in which the interchanges are made is *n* to *ihi*+1, then 1 to *ilo*-1.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine ggbal interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
b	Holds the matrix *B* of size (*n*,*n*).
lscale	Holds the vector of length (*n*).
rscale	Holds the vector of length (*n*).
ilo	Default value for this argument is *ilo* = 1.
ihi	Default value for this argument is *ihi* = *n*.
job	Must be 'B', 'S', 'P', or 'N'. The default value is 'B'.

?ggbak

Forms the right or left eigenvectors of a generalized eigenvalue problem.

Syntax

Fortran 77:

```
call sggbak(job, side, n, ilo, ihi, lscale, rscale, m, v, ldv, info)
call dggbak(job, side, n, ilo, ihi, lscale, rscale, m, v, ldv, info)
call cggbak(job, side, n, ilo, ihi, lscale, rscale, m, v, ldv, info)
call zggbak(job, side, n, ilo, ihi, lscale, rscale, m, v, ldv, info)
```

Fortran 95:

```
call ggbak(v [, ilo] [,ihi] [,lscale] [,rscale] [,job] [,info])
```

Description

This routine forms the right or left eigenvectors of a real/complex generalized eigenvalue problem

$Ax = \lambda Bx$

by backward transformation on the computed eigenvectors of the balanced pair of matrices output by ?ggbal.

Input Parameters

job	CHARACTER*1. Specifies the type of backward transformation required. Must be 'N', 'P', 'S', or 'B'. If *job* = 'N', then no operations are done; return. If *job* = 'P', then do backward transformation for permutation only. If *job* = 'S', then do backward transformation for scaling only. If *job* = 'B', then do backward transformation for both permutation and scaling. This argument must be the same as the argument *job* supplied to ?ggbal.
side	CHARACTER*1. Must be 'L' or 'R'. If *side* = 'L' , then *v* contains left eigenvectors. If *side* = 'R' , then *v* contains right eigenvectors.
n	INTEGER. The number of rows of the matrix *V* (*n* ≥ 0).
ilo, *ihi*	INTEGER. The integers *ilo* and *ihi* determined by ?gebal. Constraint: If *n* > 0, then 1 ≤ *ilo* ≤ *ihi* ≤ *n*; if *n* = 0, then *ilo* = 1 and *ihi* = 0.
lscale, *rscale*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays, DIMENSION at least max(1, *n*). The array *lscale* contains details of the permutations and/or scaling factors applied to the left side of *A* and *B*, as returned by ?ggbal.

	The array *rscale* contains details of the permutations and/or scaling factors applied to the right side of *A* and *B*, as returned by ?ggbal.
m	INTEGER. The number of columns of the matrix *V* ($m \geq 0$).
v	REAL for sggbak DOUBLE PRECISION for dggbak COMPLEX for cggbak DOUBLE COMPLEX for zggbak. Array *v*(*ldv*,*). Contains the matrix of right or left eigenvectors to be transformed, as returned by ?tgevc. The second dimension of *v* must be at least max(1, *m*).
ldv	INTEGER. The first dimension of *v*; at least max(1, *n*).

Output Parameters

v	Overwritten by the transformed eigenvectors
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine ggbak interface are the following:

v	Holds the matrix *V* of size (*n*,*m*).
lscale	Holds the vector of length (*n*).
rscale	Holds the vector of length (*n*).
ilo	Default value for this argument is *ilo* = 1.
ihi	Default value for this argument is *ihi* = *n*.
job	Must be 'B', 'S', 'P', or 'N'. The default value is 'B'.
side	If omitted, this argument is restored based on the presence of arguments *lscale* and *rscale* as follows: *side* = 'L', if *lscale* is present and *rscale* omitted,

side = 'R', if *lscale* is omitted and *rscale* present.
Note that there will be an error condition if both *lscale* and *rscale* are present or if they both are omitted.

?hgeqz

Implements the QZ method for finding the generalized eigenvalues of the matrix pair (H,T).

Syntax

Fortran 77:

```
call shgeqz(job, compq, compz, n, ilo, ihi, h, ldh, t, ldt, alphar, alphai,
beta, q, ldq, z, ldz, work, lwork, info)
```

```
call dhgeqz(job, compq, compz, n, ilo, ihi, h, ldh, t, ldt, alphar, alphai,
beta, q, ldq, z, ldz, work, lwork, info)
```

```
call chgeqz(job, compq, compz, n, ilo, ihi, h, ldh, t, ldt, alpha, beta, q,
ldq, z, ldz, work, lwork, rwork, info)
```

```
call zhgeqz(job, compq, compz, n, ilo, ihi, h, ldh, t, ldt, alpha, beta, q,
ldq, z, ldz, work, lwork, rwork, info)
```

Fortran 95:

```
call hgeqz(h, t [,ilo] [,ihi] [,alphar] [,alphai] [,beta] [,q] [,z] [,job]
[,compq] [,compz] [,info])
```

```
call hgeqz(h, t [,ilo] [,ihi] [,alpha] [,beta] [,q] [,z] [,job] [,compq] [,
compz] [,info])
```

Description

This routine computes the eigenvalues of a real/complex matrix pair (*H*,*T*), where *H* is an upper Hessenberg matrix and *T* is upper triangular, using the double-shift version (for real flavors) or single-shift version (for complex flavors) of the *QZ* method. Matrix pairs of this type are produced by the reduction to generalized upper Hessenberg form of a real/complex matrix pair (*A*,*B*):

$A = Q_1 * H * Z_1^H, B = Q_1 * T * Z_1^H,$

as computed by ?gghrd.

For real flavors:

If *job* = 'S', then the Hessenberg-triangular pair (*H*,*T*) is also reduced to generalized Schur form,

$H = Q*S*Z^T$, $T = Q*P*Z^T$,

where *Q* and *Z* are orthogonal matrices, *P* is an upper triangular matrix, and *S* is a quasi-triangular matrix with 1-by-1 and 2-by-2 diagonal blocks. The 1-by-1 blocks correspond to real eigenvalues of the matrix pair (*H*,*T*) and the 2-by-2 blocks correspond to complex conjugate pairs of eigenvalues.

Additionally, the 2-by-2 upper triangular diagonal blocks of *P* corresponding to 2-by-2 blocks of *S* are reduced to positive diagonal form, that is, if *S*(j+1,j) is non-zero, then *P*(j+1,j) = *P*(j,j+1) = 0, *P*(j,j) > 0, and *P*(j+1,j+1) > 0.

For complex flavors:

If *job* = 'S', then the Hessenberg-triangular pair (*H*,*T*) is also reduced to generalized Schur form,

$H = Q*\ S*Z^H$, $T = Q*P*Z^H$,

where *Q* and *Z* are unitary matrices, and *S* and *P* are upper triangular.

For all function flavors:

Optionally, the orthogonal/unitary matrix *Q* from the generalized Schur factorization may be postmultiplied into an input matrix Q_1, and the orthogonal/unitary matrix *Z* may be postmultiplied into an input matrix Z_1.

If Q_1 and Z_1 are the orthogonal/unitary matrices from ?gghrd that reduced the matrix pair (*A*,*B*) to generalized upper Hessenberg form, then the output matrices Q_1Q and Z 1Z are the orthogonal/unitary factors from the generalized Schur factorization of (*A*,*B*):

$A = (Q_1Q)*S\ *(Z_1Z)^H$, $B = (Q_1Q)\ *P\ *(Z_1Z)^H$.

To avoid overflow, eigenvalues of the matrix pair (*H*,*T*) (equivalently, of (*A*,*B*)) are computed as a pair of values (*alpha*,*beta*>). For chgeqz/zhgeqz, *alpha* and *beta* are complex, and for shgeqz/dhgeqz, *alpha* is complex and *beta* real. If *beta* is nonzero, λ = *alpha* / *beta* is an eigenvalue of the generalized nonsymmetric eigenvalue problem (GNEP)

$Ax = \lambda Bx$

and if *alpha* is nonzero, μ = *beta* / *alpha* is an eigenvalue of the alternate form of the GNEP

$\mu Ay = By$.

Real eigenvalues (for real flavors) or the values of *alpha* and *beta* for the i-th eigenvalue (for complex flavors) can be read directly from the generalized Schur form:

alpha = *S*(i,i), *beta* = *P*(i,i).

Input Parameters

job	CHARACTER*1. Specifies the operations to be performed. Must be 'E' or 'S'. If *job* = 'E', then compute eigenvalues only; If *job* = 'S', then compute eigenvalues and the Schur form.
compq	CHARACTER*1. Must be 'N', 'I', or 'V'. If *compq* = 'N', left Schur vectors (*q*) are not computed; If *compq* = 'I', *q* is initialized to the unit matrix and the matrix of left Schur vectors of (*H*,*T*) is returned; If *compq* = 'V', *q* must contain an orthogonal/unitary matrix Q_1 on entry and the product Q_1*Q is returned.
compz	CHARACTER*1. Must be 'N', 'I', or 'V'. If *compz* = 'N', right Schur vectors (*z*) are not computed; If *compz* = 'I', *z* is initialized to the unit matrix and the matrix of right Schur vectors of (*H*,*T*) is returned; If *compz* = 'V', *z* must contain an orthogonal/unitary matrix Z_1 on entry and the product Z_1*Z is returned.
n	INTEGER. The order of the matrices *H*, *T*, *Q*, and *Z* ($n \geq 0$).
ilo, *ihi*	INTEGER. *ilo* and *ihi* mark the rows and columns of *H* which are in Hessenberg form. It is assumed that *H* is already upper triangular in rows and columns 1:*ilo*-1 and *ihi*+1:*n*. Constraint: If $n > 0$, then $1 \leq ilo \leq ihi \leq n$; if $n = 0$, then $ilo = 1$ and $ihi = 0$.
h, *t*, *q*, *z*, *work*	REAL for shgeqz DOUBLE PRECISION for dhgeqz COMPLEX for chgeqz

DOUBLE COMPLEX for zhgeqz.
Arrays:
On entry, *h*(*ldh*,*) contains the *n*-by-*n* upper Hessenberg matrix *H*.
The second dimension of *h* must be at least max(1, *n*).
On entry, *t*(*ldt*,*) contains the *n*-by-*n* upper triangular matrix *T*.
The second dimension of *t* must be at least max(1, *n*).
q (*ldq*,*):
On entry, if *compq* = 'V', this array contains the orthogonal/unitary matrix Q_1 used in the reduction of (*A*,*B*) to generalized Hessenberg form.
If *compq* = 'N', then *q* is not referenced.
The second dimension of *q* must be at least max(1, *n*).
z (*ldz*,*):
On entry, if *compz* = 'V', this array contains the orthogonal/unitary matrix Z_1 used in the reduction of (*A*,*B*) to generalized Hessenberg form.
If *compz* = 'N', then *z* is not referenced.
The second dimension of *z* must be at least max(1, *n*).
work is a workspace array, its dimension max(1, *lwork*).

ldh INTEGER. The first dimension of *h*; at least max(1, *n*).

ldt INTEGER. The first dimension of *t*; at least max(1, *n*).

ldq INTEGER. The first dimension of *q*;

If *compq* = 'N', then *ldq* ≥ 1.

If *compq* = 'I'or 'V', then *ldq* ≥ max(1, *n*).

ldz INTEGER. The first dimension of *z*;

If *compq* = 'N', then *ldz* ≥ 1.

If *compq* = 'I'or 'V', then *ldz* ≥ max(1, *n*).

lwork INTEGER. The dimension of the array *work*.

lwork ≥ max(1, *n*).

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for details.

rwork — REAL for chgeqz
DOUBLE PRECISION for zhgeqz.
Workspace array, DIMENSION at least max(1, *n*). Used in complex flavors only.

Output Parameters

h — For real flavors:
If *job* = 'S', then, on exit, *h* contains the upper quasi-triangular matrix *S* from the generalized Schur factorization; 2-by-2 diagonal blocks (corresponding to complex conjugate pairs of eigenvalues) are returned in standard form, with *h*(i,i) = *h*(i+1, i+1) and *h*(i+1, i) * *h*(i, i+1) < 0.
If *job* = 'E', then on exit the diagonal blocks of *h* match those of *S*, but the rest of *h* is unspecified.
For complex flavors:
If *job* = 'S', then, on exit, *h* contains the upper triangular matrix *S* from the generalized Schur factorization.
If *job* = 'E', then on exit the diagonal of *h* matches that of *S*, but the rest of *h* is unspecified.

t — If *job* = 'S', then, on exit, *t* contains the upper triangular matrix *P* from the generalized Schur factorization.
For real flavors:
2-by-2 diagonal blocks of *P* corresponding to 2-by-2 blocks of *S* are reduced to positive diagonal form, that is, if *h*(j+1,j) is non-zero, then *t*(j+1,j)=*t*(j,j+1)=0 and *t*(j,j) and *t*(j+1,j+1) will be positive.
If *job* = 'E', then on exit the diagonal blocks of *t* match those of *P*, but the rest of *t* is unspecified.
For complex flavors:
if *job* = 'E', then on exit the diagonal of *t* matches that of *P*, but the rest of *t* is unspecified.

alphar, *alphai*
REAL for shgeqz;
DOUBLE PRECISION for dhgeqz.
Arrays, DIMENSION at least max(1, *n*). The real and imaginary parts, respectively, of each scalar *alpha* defining an eigenvalue of GNEP.
If *alphai*(j) is zero, then the j-th eigenvalue is real; if positive, then the j-th and (j+1)-th eigenvalues are a complex conjugate pair, with
alphai(j+1) = -*alphai*(j).

alpha
COMPLEX for chgeqz;
DOUBLE COMPLEX for zhgeqz.
Array, DIMENSION at least max(1, *n*).
The complex scalars *alpha* that define the eigenvalues of GNEP. *alphai*(i) = *S*(i,i) in the generalized Schur factorization.

beta
REAL for shgeqz
DOUBLE PRECISION for dhgeqz
COMPLEX for chgeqz
DOUBLE COMPLEX for zhgeqz.
Array, DIMENSION at least max(1, *n*).
For real flavors:
The scalars *beta* that define the eigenvalues of GNEP.
Together, the quantities *alpha* = (*alphar*(j), *alphai*(j)) and *beta* = *beta*(j) represent the j-th eigenvalue of the matrix pair (*A*,*B*), in one of the forms *lambda* = *alpha*/*beta* or *mu* = *beta*/*alpha*. Since either *lambda* or *mu* may overflow, they should not, in general, be computed.
For complex flavors:
The real non-negative scalars *beta* that define the eigenvalues of GNEP.
beta(i) = *P*(i,i) in the generalized Schur factorization.
Together, the quantities *alpha* = *alpha*(j) and *beta* = *beta*(j) represent the j-th eigenvalue of the matrix pair (*A*,*B*), in one of the forms *lambda* = *alpha*/*beta* or *mu* = *beta*/*alpha*. Since either *lambda* or *mu* may overflow, they should not, in general, be computed.

q	On exit, if *compq* = 'I', *q* is overwritten by the orthogonal/unitary matrix of left Schur vectors of the pair (*H*,*T*), and if *compq* = 'V', *q* is overwritten by the orthogonal/unitary matrix of left Schur vectors of (*A*,*B*).
z	On exit, if *compz* = 'I', *z* is overwritten by the orthogonal/unitary matrix of right Schur vectors of the pair (*H*,*T*), and if *compz* = 'V', *z* is overwritten by the orthogonal/unitary matrix of right Schur vectors of (*A*,*B*).
work(1)	If *info* ≥ 0, on exit, *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*th parameter had an illegal value. If *info* = 1,..., *n*, the *QZ* iteration did not converge. (*H*,*T*) is not in Schur form, but *alphar*(i), *alphai*(i) (for real flavors), *alpha*(i) (for complex flavors), and *beta*(i), i=*info*+1,..., *n* should be correct. If *info* = *n*+1,...,2*n*, the shift calculation failed. (*H*,*T*) is not in Schur form, but *alphar*(i), *alphai*(i) (for real flavors), *alpha*(i) (for complex flavors), and *beta*(i), i =*info*-*n*+1,..., *n* should be correct.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine hgeqz interface are the following:

h	Holds the matrix *H* of size (*n*,*n*).
t	Holds the matrix *T* of size (*n*,*n*).
alphar	Holds the vector of length (*n*). Used in real flavors only.
alphai	Holds the vector of length (*n*). Used in real flavors only.
alpha	Holds the vector of length (*n*). Used in complex flavors only.
beta	Holds the vector of length (*n*).

q	Holds the matrix *Q* of size (*n*,*n*).
z	Holds the matrix *Z* of size (*n*,*n*).
ilo	Default value for this argument is *ilo* = 1.
ihi	Default value for this argument is *ihi* = *n*.
job	Must be 'E' or 'S'. The default value is 'E'.
compq	If omitted, this argument is restored based on the presence of argument *q* as follows: *compq* = 'I', if *q* is present, *compq* = 'N', if *q* is omitted. If present, *compq* must be equal to 'I' or 'V' and the argument *q* must also be present. Note that there will be an error condition if *compq* is present and *q* omitted.
compz	If omitted, this argument is restored based on the presence of argument *z* as follows: *compz* = 'I', if *z* is present, *compz* = 'N', if *z* is omitted. If present, *compz* must be equal to 'I' or 'V' and the argument *z* must also be present. Note an error condition if *compz* is present and *z* is omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = –1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = –1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?tgevc

Computes some or all of the right and/or left generalized eigenvectors of a pair of upper triangular matrices.

Syntax

Fortran 77:

```
call stgevc(side, howmny, select, n, s, lds, p, ldp, vl, ldvl, vr, ldvr, mm, m, work, info)
call dtgevc(side, howmny, select, n, s, lds, p, ldp, vl, ldvl, vr, ldvr, mm, m, work, info)
call ctgevc(side, howmny, select, n, s, lds, p, ldp, vl, ldvl, vr, ldvr, mm, m, work, rwork, info)
call ztgevc(side, howmny, select, n, s, lds, p, ldp, vl, ldvl, vr, ldvr, mm, m, work, rwork, info)
```

Fortran 95:

```
call tgevc(s, p [,howmny] [,select] [,vl] [,vr] [,m] [,info])
```

Description

This routine computes some or all of the right and/or left eigenvectors of a pair of real/complex matrices (S,P), where S is quasi-triangular (for real flavors) or upper triangular (for complex flavors) and P is upper triangular.

Matrix pairs of this type are produced by the generalized Schur factorization of a real/complex matrix pair (A,B):

$A = Q*S*Z^H$, $B = Q*P*Z^H$

as computed by ?gghrd plus ?hgeqz.

The right eigenvector x and the left eigenvector y of (S,P) corresponding to an eigenvalue w are defined by:

$S*x = w*P*x$, $y^H*S = w*y^H*P$

The eigenvalues are not input to this routine, but are computed directly from the diagonal blocks or diagonal elements of S and P.

This routine returns the matrices *X* and/or *Y* of right and left eigenvectors of (*S*,*P*), or the products *Z***X* and/or *Q***Y*, where *Z* and *Q* are input matrices.

If *Q* and *Z* are the orthogonal/unitary factors from the generalized Schur factorization of a matrix pair (*A*,*B*), then *Z***X* and *Q***Y* are the matrices of right and left eigenvectors of (*A*,*B*).

Input Parameters

side	CHARACTER*1. Must be 'R', 'L', or 'B'. If *side* = 'R' , compute right eigenvectors only. If *side* = 'L' , compute left eigenvectors only. If *side* = 'B', compute both right and left eigenvectors.
howmny	CHARACTER*1. Must be 'A' , 'B', or 'S'. If *howmny* = 'A' , compute all right and/or left eigenvectors. If *howmny* = 'B' , compute all right and/or left eigenvectors, backtransformed by the matrices in *vr* and/or *vl*. If *howmny* = 'S' , compute selected right and/or left eigenvectors, specified by the logical array *select*.
select	LOGICAL. Array, DIMENSION at least max (1, *n*). If *howmny* = 'S', *select* specifies the eigenvectors to be computed. If *howmny* = 'A'or 'B', *select* is not referenced. For real flavors: If *omega*(*j*) is a real eigenvalue, the corresponding real eigenvector is computed if *select*(*j*) is .TRUE.. If *omega*(*j*) and *omega*(*j*+1) are the real and imaginary parts of a complex eigenvalue, the corresponding complex eigenvector is computed if either *select*(*j*) or *select*(*j*+1) is .TRUE., and on exit *select*(*j*) is set to .TRUE.and *select*(*j*+1) is set to .FALSE.. For complex flavors: The eigenvector corresponding to the *j*-th eigenvalue is computed if *select*(*j*) is .TRUE..
n	INTEGER. The order of the matrices *S* and *P* (*n* ≥ 0).
s, *p*, *vl*, *vr*, *work*	REAL for stgevc

DOUBLE PRECISION for dtgevc
COMPLEX for ctgevc
DOUBLE COMPLEX for ztgevc.
Arrays:
s(*lds*,*) contains the matrix *S* from a generalized Schur factorization as computed by ?hgeqz. This matrix is upper quasi-triangular for real flavors, and upper triangular for complex flavors.
The second dimension of *s* must be at least max(1, *n*).
p(*ldp*,*) contains the upper triangular matrix *P* from a generalized Schur factorization as computed by ?hgeqz. For real flavors, 2-by-2 diagonal blocks of *P* corresponding to 2-by-2 blocks of *S* must be in positive diagonal form. For complex flavors, *P* must have real diagonal elements.
The second dimension of *p* must be at least max(1, *n*).
If *side* = 'L' or 'B' and *howmny* = 'B', *vl*(*ldvl*,*) must contain an *n*-by-*n* matrix *Q* (usually the orthogonal/unitary matrix *Q* of left Schur vectors returned by ?hgeqz). The second dimension of *vl* must be at least max(1, *mm*).
If *side* = 'R' , *vl* is not referenced.
If *side* = 'R' or 'B' and *howmny* = 'B', *vr*(*ldvr*,*) must contain an *n*-by-*n* matrix *Z* (usually the orthogonal/unitary matrix *Z* of right Schur vectors returned by ?hgeqz). The second dimension of *vr* must be at least max(1, *mm*).
If *side* = 'L', *vr* is not referenced.
work(*) is a workspace array.
DIMENSION at least max (1, 6**n*) for real flavors and at least max (1, 2**n*) for complex flavors.

lds — INTEGER. The first dimension of *s*; at least max(1, *n*).

ldp — INTEGER. The first dimension of *p*; at least max(1, *n*).

ldvl — INTEGER. The first dimension of *vl*;
If *side* = 'L' or 'B', then *ldvl* ≥*n*.
If *side* = 'R', then *ldvl* ≥ 1.

ldvr — INTEGER. The first dimension of *vr*;
If *side* = 'R' or 'B', then *ldvr* ≥*n*.
If *side* = 'L', then *ldvr* ≥ 1.

mm INTEGER. The number of columns in the arrays *vl* and/or *vr* (*mm* ≥ *m*).

rwork REAL for ctgevc DOUBLE PRECISION for ztgevc. Workspace array, DIMENSION at least max (1, 2**n*). Used in complex flavors only.

Output Parameters

vl On exit, if *side* = 'L' or 'B', *vl* contains:
if *howmny* = 'A', the matrix *Y* of left eigenvectors of (*S*,*P*);
if *howmny* = 'B', the matrix *Q***Y*;
if *howmny* = 'S', the left eigenvectors of (*S*,*P*) specified by *select*, stored consecutively in the columns of *vl*, in the same order as their eigenvalues.
For real flavors:
A complex eigenvector corresponding to a complex eigenvalue is stored in two consecutive columns, the first holding the real part, and the second the imaginary part.

vr On exit, if *side* = 'R' or 'B', *vr* contains:
if *howmny* = 'A', the matrix *X* of right eigenvectors of (*S*,*P*);
if *howmny* = 'B', the matrix *Z***X*;
if *howmny* = 'S', the right eigenvectors of (*S*,*P*) specified by *select*, stored consecutively in the columns of *vr*, in the same order as their eigenvalues.
For real flavors:
A complex eigenvector corresponding to a complex eigenvalue is stored in two consecutive columns, the first holding the real part, and the second the imaginary part.

m INTEGER. The number of columns in the arrays *vl* and/or *vr* actually used to store the eigenvectors.
If *howmny* = 'A' or 'B', *m* is set to *n*.
For real flavors:
Each selected real eigenvector occupies one column and each selected complex eigenvector occupies two columns.
For complex flavors:
Each selected eigenvector occupies one column.

info INTEGER.
If *info* = 0, the execution is successful.

If *info* = *-i*, the *i*-th parameter had an illegal value.
For real flavors:
if *info* = *i*>0, the 2-by-2 block (*i*:*i*+1) does not have a complex eigenvalue.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `tgevc` interface are the following:

s — Holds the matrix *S* of size (*n*,*n*).

p — Holds the matrix *P* of size (*n*,*n*).

select — Holds the vector of length (*n*).

vl — Holds the matrix *VL* of size (*n*,*mm*).

vr — Holds the matrix *VR* of size (*n*,*mm*).

side — Restored based on the presence of arguments *vl* and *vr* as follows:
side = 'B', if both *vl* and *vr* are present,
side = 'L', if *vl* is present and *vr* omitted,
side = 'R', if *vl* is omitted and *vr* present,
Note that there will be an error condition if both *vl* and *vr* are omitted.

howmny — If omitted, this argument is restored based on the presence of argument *select* as follows:
howmny = 'S', if *select* is present,
howmny = 'A', if *select* is omitted.
If present, *howmny* must be equal to 'A' or 'B' and the argument *select* must be omitted.
Note that there will be an error condition if both *howmny* and *select* are present.

?tgexc

Reorders the generalized Schur decomposition of a pair of matrices (A,B) so that one diagonal block of (A,B) moves to another row index.

Syntax

Fortran 77:

```
call stgexc(wantq, wantz, n, a, lda, b, ldb, q, ldq, z, ldz, ifst, ilst, work, lwork, info)
call dtgexc(wantq, wantz, n, a, lda, b, ldb, q, ldq, z, ldz, ifst, ilst, work, lwork, info)
call ctgexc(wantq, wantz, n, a, lda, b, ldb, q, ldq, z, ldz, ifst, ilst, info)
call ztgexc(wantq, wantz, n, a, lda, b, ldb, q, ldq, z, ldz, ifst, ilst, info)
```

Fortran 95:

```
call tgexc(a, b [,ifst] [,ilst] [,z] [,q] [,info])
```

Description

This routine reorders the generalized real-Schur/Schur decomposition of a real/complex matrix pair (*A*,*B*) using an orthogonal/unitary equivalence transformation

$(A, B) = Q\ (A, B)\ Z^H$,

so that the diagonal block of (*A*, *B*) with row index *ifst* is moved to row *ilst*. Matrix pair (*A*, *B*) must be in a generalized real-Schur/Schur canonical form (as returned by ?gges), that is, *A* is block upper triangular with 1-by-1 and 2-by-2 diagonal blocks and *B* is upper triangular. Optionally, the matrices *Q* and *Z* of generalized Schur vectors are updated.

Q(in) * *A*(in) * *Z*(in)' = *Q*(out) * *A*(out) * *Z*(out)'

Q(in) * *B*(in) * *Z*(in)' = *Q*(out) * *B*(out) * *Z*(out)'.

Input Parameters

wantq, *wantz*	LOGICAL. If *wantq* = .TRUE., update the left transformation matrix *Q*; If *wantq* = .FALSE., do not update *Q*;

	If *wantz* = .TRUE., update the right transformation matrix *Z*; If *wantz* = .FALSE., do not update *Z*.
n	INTEGER. The order of the matrices *A* and *B* (*n* ≥ 0).
a, *b*, *q*,	REAL for stgexc DOUBLE PRECISION for dtgexc COMPLEX for ctgexc DOUBLE COMPLEX for ztgexc. Arrays: *a*(*lda*,*) contains the matrix *A*. The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) contains the matrix *B*. The second dimension of *b* must be at least max(1, *n*). *q* (*ldq*,*) If *wantq* = .FALSE., then *q* is not referenced. If *wantq* = .TRUE., then *q* must contain the orthogonal/unitary matrix *Q*. The second dimension of *q* must be at least max(1, *n*). *z* (*ldz*,*) If *wantz* = .FALSE., then *z* is not referenced. If *wantz* = .TRUE., then *z* must contain the orthogonal/unitary matrix *Z*. The second dimension of *z* must be at least max(1, *n*).
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
ldb	INTEGER. The first dimension of *b*; at least max(1, *n*).
ldq	INTEGER. The first dimension of *q*; If *wantq* = .FALSE., then *ldq* ≥ 1. If *wantq* = .TRUE., then *ldq* ≥ max(1, *n*).
ldz	INTEGER. The first dimension of *z*; If *wantz* = .FALSE., then *ldz* ≥ 1. If *wantz* = .TRUE., then *ldz* ≥ max(1, *n*).
ifst, *ilst*	INTEGER. Specify the reordering of the diagonal blocks of (*A*, *B*). The block with row index *ifst* is moved to row *ilst*, by a sequence of swapping between adjacent blocks. Constraint: 1 ≤ *ifst*, *ilst* ≤ *n*.

work	REAL for stgexc; DOUBLE PRECISION for dtgexc. Workspace array, DIMENSION (*lwork*). Used in real flavors only.
lwork	INTEGER. The dimension of *work*; must be at least $4n + 16$. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for details.

Output Parameters

a, *b*	Overwritten by the updated matrices *A* and *B*.
ifst, *ilst*	Overwritten for real flavors only. If *ifst* pointed to the second row of a 2 by 2 block on entry, it is changed to point to the first row; *ilst* always points to the first row of the block in its final position (which may differ from its input value by ±1).
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = 1, the transformed matrix pair (*A*, *B*) would be too far from generalized Schur form; the problem is ill-conditioned. (*A*, *B*) may have been partially reordered, and *ilst* points to the first row of the current position of the block being moved.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine tgexc interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
b	Holds the matrix *B* of size (*n*,*n*).
z	Holds the matrix *Z* of size (*n*,*n*).

q	Holds the matrix *Q* of size (*n*,*n*).
wantq	Restored based on the presence of the argument *q* as follows: *wantq* = .TRUE., if *q* is present, *wantq* = .FALSE., if *q* is omitted.
wantz	Restored based on the presence of the argument *z* as follows: *wantz* = .TRUE., if *z* is present, *wantz* = .FALSE., if z is omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = –1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = –1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?tgsen

Reorders the generalized Schur decomposition of a pair of matrices (A,B) so that a selected cluster of eigenvalues appears in the leading diagonal blocks of (A,B).

Syntax

Fortran 77:

```
call stgsen(ijob, wantq, wantz, select, n, a, lda, b, ldb, alphar, alphai,
beta, q, ldq, z, ldz, m, pl, pr, dif, work, lwork, iwork, liwork, info)

call dtgsen(ijob, wantq, wantz, select, n, a, lda, b, ldb, alphar, alphai,
beta, q, ldq, z, ldz, m, pl, pr, dif, work, lwork, iwork, liwork, info)

call ctgsen(ijob, wantq, wantz, select, n, a, lda, b, ldb, alpha, beta, q,
ldq, z, ldz, m, pl, pr, dif, work, lwork, iwork, liwork, info)

call ztgsen(ijob, wantq, wantz, select, n, a, lda, b, ldb, alpha, beta, q,
ldq, z, ldz, m, pl, pr, dif, work, lwork, iwork, liwork, info)
```

Fortran 95:

```
call tgsen(a, b, select [,alphar] [,alphai] [,beta] [,ijob] [,q] [,z] [,pl]
[,pr] [,dif] [,m] [,info])

call tgsen(a, b, select [,alpha] [,beta] [,ijob] [,q] [,z] [,pl] [,pr] [, dif]
[,m] [,info])
```

Description

This routine reorders the generalized real-Schur/Schur decomposition of a real/complex matrix pair (*A*, *B*) (in terms of an orthogonal/unitary equivalence transformation *Q* *(*A*, *B*) * *Z*), so that a selected cluster of eigenvalues appears in the leading diagonal blocks of the pair (*A*, *B*). The leading columns of *Q* and *Z* form orthonormal/unitary bases of the corresponding left and right eigenspaces (deflating subspaces).

(*A*, *B*) must be in generalized real-Schur/Schur canonical form (as returned by ?gges), that is, *A* and *B* are both upper triangular.

?tgsen also computes the generalized eigenvalues

ω_j = (*alphar*(j) + *alphai*(j)*i)/*beta*(j) (for real flavors)

ω_j = *alpha*(j)/*beta*(j) (for complex flavors)

of the reordered matrix pair (*A*, *B*).

Optionally, the routine computes the estimates of reciprocal condition numbers for eigenvalues and eigenspaces. These are Difu[(A_{11}, B_{11}), (A_{22}, B_{22})] and Difl[(A_{11}, B_{11}), (A_{22}, B_{22})], that is, the separation(s) between the matrix pairs (A_{11}, B_{11}) and (A_{22}, B_{22}) that correspond to the selected cluster and the eigenvalues outside the cluster, respectively, and norms of "projections" onto left and right eigenspaces with respect to the selected cluster in the (1,1)-block.

Input Parameters

ijob	INTEGER. Specifies whether condition numbers are required for the cluster of eigenvalues (*pl* and *pr*) or the deflating subspaces Difu and Difl. If *ijob* =0, only reorder with respect to *select*; If *ijob* =1, reciprocal of norms of "projections" onto left and right eigenspaces with respect to the selected cluster (*pl* and *pr*); If *ijob* =2, compute upper bounds on Difu and Difl, using F-norm-based estimate (*dif* (1:2)); If *ijob* =3, compute estimate of Difu and Difl, sing 1-norm-based estimate (*dif* (1:2)). This option is about 5 times as expensive as *ijob* =2; If *ijob* =4,>compute *pl*, *pr* and *dif* (i.e., options 0, 1 and 2 above). This is an economic version to get it all; If *ijob* =5, compute *pl*, *pr* and *dif* (i.e., options 0, 1 and 3 above).
wantq, *wantz*	LOGICAL. If *wantq* = .TRUE., update the left transformation matrix *Q*; If *wantq* = .FALSE., do not update *Q*; If *wantz* = .TRUE., update the right transformation matrix *Z*; If *wantz* = .FALSE., do not update *Z*.
select	LOGICAL. Array, DIMENSION at least max (1, *n*). Specifies the eigenvalues in the selected cluster.

	To select an eigenvalue *omega*(*j*), *select*(*j*) must be .TRUE. For real flavors: to select a complex conjugate pair of eigenvalues *omega*(*j*) and *omega*(*j*+1) (corresponding 2 by 2 diagonal block), *select*(*j*) and/or *select*(*j*+1) must be set to .TRUE.; the complex conjugate *omega*(*j*) and *omega*(*j*+1) must be either both included in the cluster or both excluded.
n	INTEGER. The order of the matrices *A* and *B* ($n \geq 0$).
a, *b*, *q*, *z*, *work*	REAL for stgsen DOUBLE PRECISION for dtgsen COMPLEX for ctgsen DOUBLE COMPLEX for ztgsen. Arrays: *a*(*lda*,*) contains the matrix *A*. For real flavors: *A* is upper quasi-triangular, with (*A*, *B*) in generalized real Schur canonical form. For complex flavors: *A* is upper triangular, in generalized Schur canonical form. The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) contains the matrix *B*. For real flavors: *B* is upper triangular, with (*A*, *B*) in generalized real Schur canonical form. For complex flavors: *B* is upper triangular, in generalized Schur canonical form. The second dimension of *b* must be at least max(1, *n*). *q* (*ldq*,*) If *wantq* = .TRUE., then *q* is an *n*-by-*n* matrix; If *wantq* = .FALSE., then *q* is not referenced. The second dimension of *q* must be at least max(1, *n*). *z* (*ldz*,*) If *wantz* = .TRUE., then *z* is an *n*-by-*n* matrix; If *wantz* = .FALSE., then *z* is not referenced. The second dimension of *z* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*). If *ijob*=0, *work* is not referenced.
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).

ldb INTEGER. The first dimension of *b*; at least max(1, *n*).

ldq INTEGER. The first dimension of *q*; *ldq* ≥ 1.
If *wantq* = .TRUE., then *ldq* ≥ max(1, *n*).

ldz INTEGER. The first dimension of *z*; *ldz* ≥ 1.
If *wantz* = .TRUE., then *ldz* ≥ max(1, *n*).

lwork INTEGER. The dimension of the array *work*.
For real flavors:
If *ijob* = 1, 2, or 4, *lwork* ≥ max(4*n*+16, 2*m*(*n*-*m*)).
If *ijob* = 3 or 5, *lwork* ≥ max(4*n*+16, 4*m*(*n*-*m*)).
For complex flavors:
If *ijob* = 1, 2, or 4, *lwork* ≥ max(1, 2*m*(*n*-*m*)).
If *ijob* = 3 or 5, *lwork* ≥ max(1, 4*m*(*n*-*m*)).
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for details.

iwork INTEGER. Workspace array, its dimension max(1, *liwork*).
If *ijob* =0, *iwork* is not referenced.

liwork INTEGER. The dimension of the array *iwork*.
For real flavors:
If *ijob* = 1, 2, or 4, *liwork* ≥ *n*+6.
If *ijob* = 3 or 5, *liwork* ≥ max(*n*+6, 2*m*(*n*-*m*)).
For complex flavors:
If *ijob* = 1, 2, or 4, *liwork* ≥ *n*+2.
If *ijob* = 3 or 5, *liwork* ≥ max(*n*+2, 2*m*(*n*-*m*)).
If *liwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *iwork* array, returns this value as the first entry of the *iwork* array, and no error message related to *liwork* is issued by xerbla. See Application Notes for details.

Output Parameters

a, *b*	Overwritten by the reordered matrices *A* and *B*, respectively.
alphar, *alphai*	REAL for stgsen; DOUBLE PRECISION for dtgsen. Arrays, DIMENSION at least max(1, *n*). Contain values that form generalized eigenvalues in real flavors. See *beta*.
alpha	COMPLEX for ctgsen; DOUBLE COMPLEX for ztgsen. Array, DIMENSION at least max(1, *n*). Contain values that form generalized eigenvalues in complex flavors. See *beta*.
beta	REAL for stgsen DOUBLE PRECISION for dtgsen COMPLEX for ctgsen DOUBLE COMPLEX for ztgsen. Array, DIMENSION at least max(1, *n*). For real flavors: On exit, (*alphar*(j) + *alphai*(j)*i)/*beta*(j), j=1,..., *n*, will be the generalized eigenvalues. *alphar*(j) + *alphai*(j)*i and *beta*(j), j=1,..., *n* are the diagonals of the complex Schur form (*S*,*T*) that would result if the 2-by-2 diagonal blocks of the real generalized Schur form of (*A*,*B*) were further reduced to triangular form using complex unitary transformations. If *alphai*(j) is zero, then the j-th eigenvalue is real; if positive, then the j-th and (j+1)-st eigenvalues are a complex conjugate pair, with *alphai*(j+1) negative. For complex flavors: The diagonal elements of *A* and *B*, respectively, when the pair (*A*,*B*) has been reduced to generalized Schur form. *alpha*(i)/*beta*(i), i=1,..., *n* are the generalized eigenvalues.
q	If *wantq* = .TRUE., then, on exit, *Q* has been postmultiplied by the left orthogonal transformation matrix which reorder (*A*, *B*). The leading *m* columns of *Q* form orthonormal bases for the specified pair of left eigenspaces (deflating subspaces).

z	If *wantz* = .TRUE., then, on exit, *Z* has been postmultiplied by the left orthogonal transformation matrix which reorder (*A*, *B*). The leading *m* columns of *Z* form orthonormal bases for the specified pair of left eigenspaces (deflating subspaces).
m	INTEGER. The dimension of the specified pair of left and right eigen-spaces (deflating subspaces); $0 \le m \le n$.
pl, *pr*	REAL for single precision flavors; DOUBLE PRECISION for double precision flavors. If *ijob* = 1, 4, or 5, *pl* and *pr* are lower bounds on the reciprocal of the norm of "projections" onto left and right eigenspaces with respect to the selected cluster. $0 < pl, pr \le 1$. If $m = 0$ or $m = n$, $pl = pr = 1$. If *ijob* = 0, 2 or 3, *pl* and *pr* are not referenced
dif	REAL for single precision flavors;DOUBLE PRECISION for double precision flavors. Array, DIMENSION (2). If *ijob* ≥ 2, *dif*(1:2) store the estimates ofDifu and Difl. If *ijob* = 2 or 4, *dif*(1:2) are F-norm-based upper bounds on Difu and Difl. If *ijob* = 3 or 5, *dif*(1:2) are 1-norm-based estimates of Difu and Difl. If $m = 0$ or n, *dif*(1:2) = F-norm([*A*, *B*]). If *ijob* = 0 or 1, *dif* is not referenced.
work(1)	If *ijob* is not 0 and *info* = 0, on exit, *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
iwork(1)	If *ijob* is not 0 and *info* = 0, on exit, *iwork*(1) contains the minimum value of *liwork* required for optimum performance. Use this *liwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = 1, Reordering of (*A*, *B*) failed because the transformed matrix pair (*A*, *B*) would be too far from generalized Schur form; the problem is very ill-conditioned. (*A*, *B*) may have been partially reordered.
If requested, 0 is returned in *dif*(*), *pl* and *pr*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `tgsen` interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
b	Holds the matrix *B* of size (*n*,*n*).
select	Holds the vector of length (*n*).
alphar	Holds the vector of length (*n*). Used in real flavors only.
alphai	Holds the vector of length (*n*). Used in real flavors only.
alpha	Holds the vector of length (*n*). Used in complex flavors only.
beta	Holds the vector of length (*n*).
q	Holds the matrix *Q* of size (*n*,*n*).
z	Holds the matrix *Z* of size (*n*,*n*).
dif	Holds the vector of length (2).
ijob	Must be 0, 1, 2, 3, 4, or 5. The default value is 0.
wantq	Restored based on the presence of the argument *q* as follows: *wantq* = .TRUE., if *q* is present, *wantq* = .FALSE., if *q* is omitted.
wantz	Restored based on the presence of the argument *z* as follows: *wantz* = .TRUE., if *z* is present, *wantz* = .FALSE., if z is omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run or set *lwork* = –1 (*liwork* = –1).

If you choose the first option and set any of admissible *lwork* (or *liwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?tgsyl

Solves the generalized Sylvester equation.

Syntax

Fortran 77:

```
call stgsyl(trans, ijob, m, n, a, lda, b, ldb, c, ldc, d, ldd, e, lde, f, ldf,
scale, dif, work, lwork, iwork, info)

call dtgsyl(trans, ijob, m, n, a, lda, b, ldb, c, ldc, d, ldd, e, lde, f, ldf,
scale, dif, work, lwork, iwork, info)

call ctgsyl(trans, ijob, m, n, a, lda, b, ldb, c, ldc, d, ldd, e, lde, f, ldf,
scale, dif, work, lwork, iwork, info)

call ztgsyl(trans, ijob, m, n, a, lda, b, ldb, c, ldc, d, ldd, e, lde, f, ldf,
scale, dif, work, lwork, iwork, info)
```

Fortran 95:

```
call tgsyl(a, b, c, d, e, f [,ijob] [,trans] [,scale] [,dif] [,info])
```

Description

This routine solves the generalized Sylvester equation:

*A R - L B = scale * C*

*D R - L E = scale * F*

where *R* and *L* are unknown *m*-by-*n* matrices, (*A*, *D*), (*B*, *E*) and (*C*, *F*) are given matrix pairs of size *m*-by-*m*, *n*-by-*n* and *m*-by-*n*, respectively, with real/complex entries. (*A*, *D*) and (*B*, *E*) must be in generalized real-Schur/Schur canonical form, that is, *A*, *B* are upper quasi-triangular/triangular and *D*, *E* are upper triangular.

The solution (*R*, *L*) overwrites (*C*, *F*). The factor *scale*, $0 \le scale \le 1$, is an output scaling factor chosen to avoid overflow.

In matrix notation the above equation is equivalent to the following: solve $Zx = scale * b$, where *Z* is defined as

$$Z = \begin{pmatrix} kron(I_n, A) - kron(B', I_m) \\ kron(I_n, D) - kron(E', I_m) \end{pmatrix}$$

Here I_k is the identity matrix of size *k* and *X*' is the transpose/conjugate-transpose of *X*. *kron*(*X*, *Y*) is the Kronecker product between the matrices *X* and *Y*.

If *trans* = 'T' (for real flavors), or *trans* = 'C' (for complex flavors), the routine ?tgsyl solves the transposed/conjugate-transposed system *Z* ' *y* = *scale* * *b*, which is equivalent to solve for *R* and *L* in

A' *R* + *D*' *L* = *scale* * *C*

R B' + *L E*' = *scale* * (-*F*)

This case (*trans* = 'T' for stgsyl/dtgsyl or *trans* = 'C' for ctgsyl/ztgsyl) is used to compute an one-norm-based estimate of Dif[(*A*, *D*), (*B*, *E*)], the separation between the matrix pairs (*A*,*D*) and (*B*,*E*), using slacon/clacon.

If *ijob* < 1, ?tgsyl computes a Frobenius norm-based estimate of Dif[(*A*, *D*), (*B*,*E*)]. That is, the reciprocal of a lower bound on the reciprocal of the smallest singular value of *Z*. This is a level 3 BLAS algorithm.

Input Parameters

trans — CHARACTER*1. Must be 'N', 'T', or 'C'.
If *trans* = 'N', solve the generalized Sylvester equation.
If *trans* = 'T', solve the 'transposed' system (for real flavors only).

	If *trans* = 'C', solve the ' conjugate transposed' system (for complex flavors only).
ijob	INTEGER. Specifies what kind of functionality to be performed: If *ijob* =0 , solve the generalized Sylvester equation only; If *ijob* =1, perform the functionality of *ijob* =0 and *ijob* =3; If *ijob* =2, perform the functionality of *ijob* =0 and *ijob* =4; If *ijob* =3, only an estimate of Dif[(*A*, *D*), (*B*, *E*)] is computed (look ahead strategy is used); If *ijob* =4, only an estimate of Dif[(*A*, *D*), (*B*,*E*)] is computed (?gecon on sub-systems is used). If *trans* = 'T' or 'C', *ijob* is not referenced.
m	INTEGER. The order of the matrices *A* and *D*, and the row dimension of the matrices *C*, *F*, *R* and *L*.
n	INTEGER. The order of the matrices *B* and *E*, and the column dimension of the matrices *C*, *F*, *R* and *L*.
a, *b*, *c*, *d*, *e*, *f*, *work*	REAL for stgsyl DOUBLE PRECISION for dtgsyl COMPLEX for ctgsyl DOUBLE COMPLEX for ztgsyl. Arrays: *a*(*lda*,*) contains the upper quasi-triangular (for real flavors) or upper triangular (for complex flavors) matrix *A*. The second dimension of *a* must be at least max(1, *m*). *b*(*ldb*,*) contains the upper quasi-triangular (for real flavors) or upper triangular (for complex flavors) matrix *B*. The second dimension of *b* must be at least max(1, *n*). *c* (*ldc*,*) contains the right-hand-side of the first matrix equation in the generalized Sylvester equation (as defined by *trans*) The second dimension of *c* must be at least max(1, *n*). *d* (*ldd*,*) contains the upper triangular matrix *D*. The second dimension of *d* must be at least max(1, *m*). *e* (*lde*,*) contains the upper triangular matrix *E*. The second dimension of *e* must be at least max(1, *n*).

	f (*ldf*,*) contains the right-hand-side of the second matrix equation in the generalized Sylvester equation (as defined by *trans*) The second dimension of *f* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
ldb	INTEGER. The first dimension of *b*; at least max(1, *n*).
ldc	INTEGER. The first dimension of *c*; at least max(1, *m*).
ldd	INTEGER. The first dimension of *d*; at least max(1, *m*).
lde	INTEGER. The first dimension of *e*; at least max(1, *n*).
ldf	INTEGER. The first dimension of *f*; at least max(1, *m*).
lwork	INTEGER. The dimension of the array *work*. *lwork* ≥ 1. If *ijob* = 1 or 2 and *trans* = 'N', *lwork* ≥ max(1, 2**m***n*). If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for details.
iwork	INTEGER. Workspace array, DIMENSION at least (*m*+*n*+6) for real flavors, and at least (*m*+*n*+2) for complex flavors. If *ijob*=0, *iwork* is not referenced.

Output Parameters

c	If *ijob*=0, 1, or 2, overwritten by the solution *R*. If *ijob*=3 or 4 and *trans* = 'N', *c* holds *R*, the solution achieved during the computation of the Dif-estimate.
f	If *ijob*=0, 1, or 2, overwritten by the solution *L*. If *ijob*=3 or 4 and *trans* = 'N', *f* holds *L*, the solution achieved during the computation of the Dif-estimate.
dif	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors.

	On exit, *dif* is the reciprocal of a lower bound of the reciprocal of the Dif-function, that is, *dif* is an upper bound of Dif[(*A*, *D*), (*B*, *E*)] = sigma_min(*Z*), where *Z* as in (2). If *ijob* = 0, or *trans* = 'T' (for real flavors), or *trans* = 'C' (for complex flavors), *dif* is not touched.
scale	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. On exit, *scale* is the scaling factor in the generalized Sylvester equation. If 0 < *scale* < 1, *c* and *f* hold the solutions *R* and *L*, respectively, to a slightly perturbed system but the input matrices *A*, *B*, *D* and *E* have not been changed. If *scale* = 0, *c* and *f* hold the solutions *R* and *L*, respectively, to the homogeneous system with *C* = *F* = 0. Normally, *scale* = 1.
work(1)	If *info* = 0, *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* > 0, (*A*, *D*) and (*B*, *E*) have common or close eigenvalues.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine tgsyl interface are the following:

a	Holds the matrix *A* of size (*m*,*m*).
b	Holds the matrix *B* of size (*n*,*n*).
c	Holds the matrix *C* of size (*m*,*n*).
d	Holds the matrix *D* of size (*m*,*m*).
e	Holds the matrix *E* of size (*n*,*n*).
f	Holds the matrix *F* of size (*m*,*n*).

ijob	Must be 0, 1, 2, 3, or 4. The default value is 0.
trans	Must be 'N' or 'T'. The default value is 'N'.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?tgsna

Estimates reciprocal condition numbers for specified eigenvalues and/or eigenvectors of a pair of matrices in generalized real Schur canonical form.

Syntax

Fortran 77:

```
call stgsna(job, howmny, select, n, a, lda, b, ldb, vl, ldvl, vr, ldvr, s,
dif, mm, m, work, lwork, iwork, info)
call dtgsna(job, howmny, select, n, a, lda, b, ldb, vl, ldvl, vr, ldvr, s,
dif, mm, m, work, lwork, iwork, info)
call ctgsna(job, howmny, select, n, a, lda, b, ldb, vl, ldvl, vr, ldvr, s,
dif, mm, m, work, lwork, iwork, info)
call ztgsna(job, howmny, select, n, a, lda, b, ldb, vl, ldvl, vr, ldvr, s,
dif, mm, m, work, lwork, iwork, info)
```

Fortran 95:

```
call tgsna(a, b [,s] [,dif] [,vl] [,vr] [,select] [,m] [,info])
```

Description

The real flavors stgsna/dtgsna of this routine estimate reciprocal condition numbers for specified eigenvalues and/or eigenvectors of a matrix pair (*A*, *B*) in generalized real Schur canonical form (or of any matrix pair ($Q*A*Z^T$, $Q*B*Z^T$) with orthogonal matrices *Q* and *Z*.

(*A*, *B*) must be in generalized real Schur form (as returned by sgges/dgges), that is, *A* is block upper triangular with 1-by-1 and 2-by-2 diagonal blocks. B is upper triangular.

The complex flavors ctgsna/ztgsna estimate reciprocal condition numbers for specified eigenvalues and/or eigenvectors of a matrix pair (*A*, *B*). (*A*, *B*) must be in generalized Schur canonical form , that is, *A* and *B* are both upper triangular.

Input Parameters

job — CHARACTER*1. Specifies whether condition numbers are required for eigenvalues or eigenvectors. Must be 'E' or 'V' or 'B'.
If *job* = 'E', for eigenvalues only (compute *s*).
If *job* = 'V', for eigenvectors only (compute *dif*).
If *job* = 'B', for both eigenvalues and eigenvectors (compute both *s* and *dif*).

howmny — CHARACTER*1. Must be 'A' or 'S'.
If *howmny* = 'A' , compute condition numbers for all eigenpairs.
If *howmny* = 'S' , compute condition numbers for selected eigenpairs specified by the logical array *select*.

select — LOGICAL.
Array, DIMENSION at least max (1, *n*).
If *howmny* = 'S', *select* specifies the eigenpairs for which condition numbers are required.
If *howmny* = 'A', *select* is not referenced.
For real flavors:
To select condition numbers for the eigenpair corresponding to a real eigenvalue omega(*j*), *select*(*j*) must be set to .TRUE.; to select condition numbers corresponding to a

complex conjugate pair of eigenvalues omega(*j*) and omega(*j*+1), either *select*(*j*) or *select*(*j*+1) must be set to .TRUE.
For complex flavors:
To select condition numbers for the corresponding *j*-th eigenvalue and/or eigenvector, *select*(*j*) must be set to .TRUE..

n — INTEGER. The order of the square matrix pair (*A*, *B*) (*n* ≥ 0).

a, *b*, *vl*, *vr*, *work* — REAL for stgsna
DOUBLE PRECISION for dtgsna
COMPLEX for ctgsna
DOUBLE COMPLEX for ztgsna.
Arrays:
a(*lda*,*) contains the upper quasi-triangular (for real flavors) or upper triangular (for complex flavors) matrix *A* in the pair (*A*, *B*).
The second dimension of *a* must be at least max(1, *n*).
b(*ldb*,*) contains the upper triangular matrix *B* in the pair (*A*, *B*). The second dimension of *b* must be at least max(1, *n*).
If *job* = 'E' or 'B', *vl*(*ldvl*,*) must contain left eigenvectors of (*A*, *B*), corresponding to the eigenpairs specified by *howmny* and *select*. The eigenvectors must be stored in consecutive columns of *vl*, as returned by ?tgevc.
If *job* = 'V', *vl* is not referenced. The second dimension of *vl* must be at least max(1, *m*).
If *job* = 'E' or 'B', *vr*(*ldvr*,*) must contain right eigenvectors of (*A*, *B*), corresponding to the eigenpairs specified by *howmny* and *select*. The eigenvectors must be stored in consecutive columns of *vr*, as returned by ?tgevc.
If *job* = 'V', *vr* is not referenced. The second dimension of *vr* must be at least max(1, *m*).
work is a workspace array, its dimension max(1, *lwork*).
If *job* = 'E', *work* is not referenced.

lda — INTEGER. The first dimension of *a*; at least max(1, *n*).

ldb INTEGER. The first dimension of *b*; at least max(1, *n*).

ldvl INTEGER. The first dimension of *vl*; *ldvl* ≥ 1.
If *job* = 'E' or 'B', then *ldvl* ≥ max(1, *n*).

ldvr INTEGER. The first dimension of *vr*; *ldvr* ≥ 1.
If *job* = 'E' or 'B', then *ldvr* ≥ max(1, *n*).

mm INTEGER. The number of elements in the arrays *s* and *dif* (*mm* ≥ *m*).

lwork INTEGER. The dimension of the array *work*.
lwork ≥ max(1, *n*).
If *job* = 'V' or 'B', *lwork* ≥ 2**n**(*n*+2)+16 for real flavors, and *lwork* ≥ max(1, 2**n***n*) for complex flavors.
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for details.

iwork INTEGER. Workspace array, DIMENSION at least (*n*+6) for real flavors, and at least (*n*+2) for complex flavors.
If *ijob* = 'E', *iwork* is not referenced.

Output Parameters

s REAL for single-precision flavors
DOUBLE PRECISION for double-precision flavors.
Array, DIMENSION (*mm*).
If *job* = 'E' or 'B', contains the reciprocal condition numbers of the selected eigenvalues, stored in consecutive elements of the array.
If *job* = 'V', *s* is not referenced.
For real flavors:
For a complex conjugate pair of eigenvalues two consecutive elements of *s* are set to the same value. Thus, *s*(j), *dif*(j), and the j-th columns of *vl* and *vr* all correspond to the same eigenpair (but not in general the j-th eigenpair, unless all eigenpairs are selected).

dif	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. Array, DIMENSION (*mm*). If *job* = 'V' or 'B', contains the estimated reciprocal condition numbers of the selected eigenvectors, stored in consecutive elements of the array. If the eigenvalues cannot be reordered to compute *dif*(j), *dif*(j) is set to 0; this can only occur when the true value would be very small anyway. If *job* = 'E', *dif* is not referenced. For real flavors: For a complex eigenvector, two consecutive elements of *dif* are set to the same value. For complex flavors: For each eigenvalue/vector specified by *select*, *dif* stores a Frobenius norm-based estimate of Difl.
m	INTEGER. The number of elements in the arrays *s* and *dif* used to store the specified condition numbers; for each selected eigenvalue one element is used. If *howmny* = 'A', *m* is set to *n*.
work(1)	*work*(1) If *job* is not 'E' and *info* = 0, on exit, *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine tgsna interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
b	Holds the matrix *B* of size (*n*,*n*).
s	Holds the vector of length (*mm*).

dif	Holds the vector of length (*mm*).
vl	Holds the matrix *VL* of size (*n*,*mm*).
vr	Holds the matrix *VR* of size (*n*,*mm*).
select	Holds the vector of length (*n*).
howmny	Restored based on the presence of the argument *select* as follows: *howmny* = 'S', if *select* is present, *howmny* = 'A', if *select* is omitted.
job	Restored based on the presence of arguments *s* and dif as follows: *job* = 'B', if both *s* and *dif* are present, *job* = 'E', if *s* is present and *dif* omitted, *job* = 'V', if *s* is omitted and *dif* present, Note that there will be an error condition if both *s* and *dif* are omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

Generalized Singular Value Decomposition

This section describes LAPACK computational routines used for finding the generalized singular value decomposition (GSVD) of two matrices *A* and *B* as

$U^H A Q = D_1 * (0\ R)$,

$V^H B Q = D_2 * (0\ R)$,

where *U*, *V*, and *Q* are orthogonal/unitary matrices, *R* is a nonsingular upper triangular matrix, and D_1, D_2 are "diagonal" matrices of the structure detailed in the routines description section.

Table 4-7 lists LAPACK routines (Fortran-77 interface) that perform generalized singular value decomposition of matrices. Respective routine names in Fortran-95 interface are without the first symbol (see Routine Naming Conventions).

Table 4-7 Computational Routines for Generalized Singular Value Decomposition

Routine name	Operation performed
?ggsvp	Computes the preprocessing decomposition for the generalized SVD
?tgsja	Computes the generalized SVD of two upper triangular or trapezoidal matrices

You can use routines listed in the above table as well as the driver routine ?ggsvd to find the GSVD of a pair of general rectangular matrices.

?ggsvp

Computes the preprocessing decomposition for the generalized SVD.

Syntax

Fortran 77:

```
call sggsvp(jobu, jobv, jobq, m, p, n, a, lda, b, ldb, tola, tolb, k, l, u,
ldu, v, ldv, q, ldq, iwork, tau, work, info)
call dggsvp(jobu, jobv, jobq, m, p, n, a, lda, b, ldb, tola, tolb, k, l, u,
ldu, v, ldv, q, ldq, iwork, tau, work, info)
call cggsvp (jobu, jobv, jobq, m, p, n, a, lda, b, ldb, tola, tolb, k, l, u,
ldu, v, ldv, q, ldq, iwork, rwork, tau, work, info)
call zggsvp(jobu, jobv, jobq, m, p, n, a, lda, b, ldb, tola, tolb, k, l, u,
ldu, v, ldv, q, ldq, iwork, rwork, tau, work, info)
```

Fortran 95:

```
call ggsvp(a, b, tola, tolb [, k] [,l] [,u] [,v] [,q] [,info])
```

Description

This routine computes orthogonal matrices U, V and Q such that

$$U^H A Q = \begin{array}{c} \\ k \\ l \\ m-k-l \end{array} \begin{array}{c} \begin{array}{ccc} n-k-l & k & l \end{array} \\ \begin{pmatrix} 0 & A_{12} & A_{13} \\ 0 & 0 & A_{23} \\ 0 & 0 & 0 \end{pmatrix} \end{array}, \quad \text{if } m-k-l \geq 0$$

$$= \begin{array}{c} \\ k \\ m-k \end{array} \begin{array}{c} \begin{array}{ccc} n-k-l & k & l \end{array} \\ \begin{pmatrix} 0 & A_{12} & A_{13} \\ 0 & 0 & A_{23} \end{pmatrix} \end{array}, \quad \text{if } m-k-l < 0$$

$$V^H B Q = \begin{array}{c} \\ l \\ p-l \end{array} \begin{array}{c} \begin{array}{ccc} n-k-l & k & l \end{array} \\ \begin{pmatrix} 0 & 0 & B_{13} \\ 0 & 0 & 0 \end{pmatrix} \end{array}$$

where the k-by-k matrix A_{12} and l-by-l matrix B_{13} are nonsingular upper triangular; A_{23} is l-by-l upper triangular if $m-k-l \geq 0$, otherwise A_{23} is $(m-k)$-by-l upper trapezoidal. The sum $k+l$ is equal to the effective numerical rank of the $(m+p)$-by-n matrix $(A^H, B^H)^H$.

This decomposition is the preprocessing step for computing the Generalized Singular Value Decomposition (GSVD), see subroutine `?ggsvd`.

Input Parameters

jobu	CHARACTER*1. Must be 'U' or 'N'. If *jobu* = 'U', orthogonal/unitary matrix U is computed. If *jobu* = 'N', U is not computed.
jobv	CHARACTER*1. Must be 'V' or 'N'.

	If *jobv* = 'V', orthogonal/unitary matrix *V* is computed. If *jobv* = 'N', *V* is not computed.
jobq	CHARACTER*1. Must be 'Q' or 'N'. If *jobq* = 'Q', orthogonal/unitary matrix *Q* is computed. If *jobq* = 'N', *Q* is not computed.
m	INTEGER. The number of rows of the matrix *A* (*m* ≥ 0).
p	INTEGER. The number of rows of the matrix *B* (*p* ≥ 0).
n	INTEGER. The number of columns of the matrices *A* and *B* (*n* ≥ 0).
a, *b*, *tau*, *work*	REAL for sggsvp DOUBLE PRECISION for dggsvp COMPLEX for cggsvp DOUBLE COMPLEX for zggsvp. Arrays: *a*(*lda*,*) contains the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) contains the *p*-by-*n* matrix *B*. The second dimension of *b* must be at least max(1, *n*). *tau*(*) is a workspace array. The dimension of *tau* must be at least max(1, *n*). *work*(*) is a workspace array. The dimension of *work* must be at least max(1, 3*n*, *m*, *p*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
ldb	INTEGER. The first dimension of *b*; at least max(1, *p*).
tola, *tolb*	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. *tola* and *tolb* are the thresholds to determine the effective numerical rank of matrix *B* and a subblock of *A*. Generally, they are set to *tola* = max(*m*, *n*)*||*A*||*MACHEPS, *tolb* = max(*p*, *n*)*||*B*||*MACHEPS. The size of *tola* and *tolb* may affect the size of backward errors of the decomposition.
ldu	INTEGER. The first dimension of the output array *u* . *ldu* ≥ max(1, *m*) if *jobu* = 'U'; *ldu* ≥ 1 otherwise.

ldv	INTEGER. The first dimension of the output array *v*. *ldv* ≥ max(1, *p*) if *jobv* = 'V'; *ldv* ≥ 1 otherwise.
ldq	INTEGER. The first dimension of the output array *q*. *ldq* ≥ max(1, *n*) if *jobq* = 'Q'; *ldq* ≥ 1 otherwise.
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*).
rwork	REAL for cggsvp DOUBLE PRECISION for zggsvp. Workspace array, DIMENSION at least max(1, 2*n*). Used in complex flavors only.

Output Parameters

a	Overwritten by the triangular (or trapezoidal) matrix described in the Description section.
b	Overwritten by the triangular matrix described in the Description section.
k, *l*	INTEGER. On exit, *k* and *l* specify the dimension of subblocks. The sum *k* + *l* is equal to effective numerical rank of $(A^H, B^H)^H$.
u, *v*, *q*	REAL for sggsvp DOUBLE PRECISION for dggsvp COMPLEX for cggsvp DOUBLE COMPLEX for zggsvp. Arrays: If *jobu* = 'U', *u*(*ldu*,*) contains the orthogonal/unitary matrix *U*. The second dimension of *u* must be at least max(1, *m*). If *jobu* = 'N', *u* is not referenced. If *jobv* = 'V', *v*(*ldv*,*) contains the orthogonal/unitary matrix *V*. The second dimension of *v* must be at least max(1, *m*). If *jobv* = 'N', *v* is not referenced. If *jobq* = 'Q', *q*(*ldq*,*) contains the orthogonal/unitary matrix *Q*. The second dimension of *q* must be at least max(1, *n*). If *jobq* = 'N', *q* is not referenced.

info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine ggsvp interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
b	Holds the matrix *B* of size (*p*,*n*).
u	Holds the matrix *U* of size (*m*,*m*).
v	Holds the matrix *V* of size (*p*,*m*).
q	Holds the matrix *Q* of size (*n*,*n*).
jobu	Restored based on the presence of the argument *u* as follows: *jobu* = 'U', if *u* is present, *jobu* = 'N', if *u* is omitted.
jobv	Restored based on the presence of the argument *v* as follows: *jobz* = 'V', if *v* is present, *jobz* = 'N', if *v* is omitted.
jobq	Restored based on the presence of the argument *q* as follows: *jobz* = 'Q', if *q* is present, *jobz* = 'N', if *q* is omitted.

?tgsja

Computes the generalized SVD of two upper triangular or trapezoidal matrices.

Syntax

Fortran 77:

```
call stgsja(jobu, jobv, jobq, m, p, n, k, l, a, lda, b, ldb, tola, tolb, alpha,
beta, u, ldu, v, ldv, q, ldq, work, ncycle, info)

call dtgsja(jobu, jobv, jobq, m, p, n, k, l, a, lda, b, ldb, tola, tolb, alpha,
beta, u, ldu, v, ldv, q, ldq, work, ncycle, info)

call ctgsja(jobu, jobv, jobq, m, p, n, k, l, a, lda, b, ldb, tola, tolb, alpha,
beta, u, ldu, v, ldv, q, ldq, work, ncycle, info)

call ztgsja(jobu, jobv, jobq, m, p, n, k, l, a, lda, b, ldb, tola, tolb, alpha,
beta, u, ldu, v, ldv, q, ldq, work, ncycle, info)
```

Fortran 95:

```
call tgsja(a, b, tola, tolb, k, l [,u] [,v] [,q] [,jobu] [,jobv] [,jobq]
[,alpha] [,beta] [,ncycle] [,info])
```

Description

This routine computes the generalized singular value decomposition (GSVD) of two real/complex upper triangular (or trapezoidal) matrices A and B. On entry, it is assumed that matrices A and B have the following forms, which may be obtained by the preprocessing subroutine ?ggsvp from a general m-by-n matrix A and p-by-n matrix B:

$$A = \begin{array}{c} \\ k \\ l \\ m-k-l \end{array} \begin{array}{c} \begin{array}{ccc} n-k-l & k & l \end{array} \\ \begin{pmatrix} 0 & A_{12} & A_{13} \\ 0 & 0 & A_{23} \\ 0 & 0 & 0 \end{pmatrix} \end{array}, \quad \text{if } m-k-l \geq 0$$

$$= \begin{array}{c} \\ k \\ m-k \end{array} \begin{array}{c} \begin{array}{ccc} n-k-l & k & l \end{array} \\ \begin{pmatrix} 0 & A_{12} & A_{13} \\ 0 & 0 & A_{23} \end{pmatrix} \end{array}, \quad \text{if } m-k-l < 0$$

$$B = \begin{array}{c} \\ l \\ p-l \end{array} \begin{array}{c} \begin{array}{ccc} n-k-l & k & l \end{array} \\ \begin{pmatrix} 0 & 0 & B_{13} \\ 0 & 0 & 0 \end{pmatrix} \end{array}$$

where the k-by-k matrix A_{12} and l-by-l matrix B_{13} are nonsingular upper triangular; A_{23} is l-by-l upper triangular if $m-k-l \geq 0$, otherwise A_{23} is $(m-k)$-by-l upper trapezoidal.

On exit,

$U^H A Q = D_1 * (0 \ R)$, $V^H B Q = D_2 * (0 \ R)$,

where U, V and Q are orthogonal/unitary matrices, R is a nonsingular upper triangular matrix, and D_1 and D_2 are "diagonal" matrices, which are of the following structures:

If $m-k-l \geq 0$,

$$D_1 = \begin{array}{c} \\ k \\ l \\ m-k-l \end{array} \begin{array}{c} \begin{array}{cc} k & l \end{array} \\ \begin{pmatrix} 0 & 0 \\ 0 & C \\ 0 & 0 \end{pmatrix} \end{array}$$

$$D_1 = \begin{array}{c} \\ l \\ p-l \end{array} \begin{array}{c} \begin{array}{cc} k & l \end{array} \\ \begin{pmatrix} 0 & S \\ 0 & 0 \end{pmatrix} \end{array}$$

$$(0\ R) = \begin{array}{c} \\ k \\ l \end{array} \begin{array}{c} \begin{array}{ccc} n-k-l & k & l \end{array} \\ \begin{pmatrix} 0 & R_{11} & R_{12} \\ 0 & 0 & R_{22} \end{pmatrix} \end{array}$$

where

C = diag ($alpha(k+1),...,alpha(k+l)$)

S = diag ($beta(k+1),...,beta(k+l)$)

$C^2 + S^2 = I$

R is stored in $a(1:k+l, n-k-l+1:n)$ on exit.

If $m-k-l < 0$,

$$D_1 = \begin{array}{c} \\ k \\ m-k \end{array} \begin{array}{c} \begin{array}{ccc} k & m-l & k+l-m \end{array} \\ \begin{pmatrix} I & 0 & 0 \\ 0 & C & 0 \end{pmatrix} \end{array}$$

$$D_2 = \begin{array}{c} \\ m-k \\ k+l-m \\ p-l \end{array} \begin{array}{c} \begin{array}{ccc} k & m-k & k+l-m \end{array} \\ \begin{pmatrix} 0 & S & 0 \\ 0 & 0 & I \\ 0 & 0 & 0 \end{pmatrix} \end{array}$$

$$(0\ R) = \begin{array}{c} \\ k \\ m-k \\ k+l-m \end{array} \begin{array}{c} \begin{array}{cccc} n-k-l & k & m-k & k+l-m \end{array} \\ \begin{pmatrix} 0 & R_{11} & R_{12} & R_{13} \\ 0 & 0 & R_{22} & R_{23} \\ 0 & 0 & 0 & R_{33} \end{pmatrix} \end{array}$$

where

C = diag ($alpha(K+1),...,alpha(m)$),

S = diag ($beta(K+1),...,beta(m)$),

$C^2 + S^2 = I$

On exit, $\begin{pmatrix} R_{11} & R_{12} & R_{13} \\ 0 & R_{22} & R_{23} \end{pmatrix}$ is stored in $a(1{:}m, n-k-l+1{:}n)$ and R_{33} is stored in $b(m-k+1{:}l, n+m-k-l+1{:}n)$.

The computation of the orthogonal/unitary transformation matrices U, V or Q is optional. These matrices may either be formed explicitly, or they *may* be postmultiplied into input matrices U_1, V_1, or Q_1.

Input Parameters

jobu CHARACTER*1. Must be 'U', 'I', or 'N'.

	If *jobu* = 'U', *u* must contain an orthogonal/unitary matrix U_1 on entry. If *jobu* = 'I', *u* is initialized to the unit matrix. If *jobu* = 'N', *u* is not computed.
jobv	CHARACTER*1. Must be 'V', 'I', or 'N'. If *jobv* = 'V', *v* must contain an orthogonal/unitary matrix V_1 on entry. If *jobv* = 'I', *v* is initialized to the unit matrix. If *jobv* = 'N', *v* is not computed.
jobq	CHARACTER*1. Must be 'Q', 'I', or 'N'. If *jobq* = 'Q', *q* must contain an orthogonal/unitary matrix Q_1 on entry. If *jobq* = 'I', *q* is initialized to the unit matrix. If *jobq* = 'N', *q* is not computed.
m	INTEGER. The number of rows of the matrix *A* ($m \geq 0$).
p	INTEGER. The number of rows of the matrix *B* ($p \geq 0$).
n	INTEGER. The number of columns of the matrices *A* and *B* ($n \geq 0$).
k, *l*	INTEGER. Specify the subblocks in the input matrices *A* and *B*, whose GSVD is going to be computed by ?tgsja.
a,*b*,*u*,*v*,*q*,*work*	REAL for stgsja DOUBLE PRECISION for dtgsja COMPLEX for ctgsja DOUBLE COMPLEX for ztgsja. Arrays: *a*(*lda*,*) contains the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) contains the *p*-by-*n* matrix *B*. The second dimension of *b* must be at least max(1, *n*). If *jobu* = 'U', *u*(*ldu*,*) must contain a matrix U_1 (usually the orthogonal/unitary matrix returned by ?ggsvp). The second dimension of *u* must be at least max(1, *m*). If *jobv* = 'V', *v*(*ldv*,*) must contain a matrix V_1 (usually the orthogonal/unitary matrix returned by ?ggsvp). The second dimension of *v* must be at least max(1, *p*).

If *jobq* = 'Q', *q*(*ldq*,*) must contain a matrix Q_1 (usually the orthogonal/unitary matrix returned by ?ggsvp).
The second dimension of *q* must be at least max(1, *n*).
work(*) is a workspace array.
The dimension of *work* must be at least max(1, 2*n*).

lda — INTEGER. The first dimension of *a*; at least max(1, *m*).

ldb — INTEGER. The first dimension of *b*; at least max(1, *p*).

ldu — INTEGER. The first dimension of the array *u* .

ldu ≥ max(1, *m*) if *jobu* = 'U'; *ldu* ≥ 1 otherwise.

ldv — INTEGER. The first dimension of the array *v* .

ldv ≥ max(1, *p*) if *jobv* = 'V'; *ldv* ≥ 1 otherwise.

ldq — INTEGER. The first dimension of the array *q* .

ldq ≥ max(1, *n*) if *jobq* = 'Q'; *ldq* ≥ 1 otherwise.

tola, *tolb* — REAL for single-precision flavors
DOUBLE PRECISION for double-precision flavors.
tola and *tolb* are the convergence criteria for the Jacobi-Kogbetliantz iteration procedure. Generally, they are the same as used in ?ggsvp:
tola = max(*m*, *n*)*|*A*|*MACHEPS,
tolb = max(*p*, *n*)*|*B*|*MACHEPS.

Output Parameters

a — On exit, *a*(*n*-*k*+1:*n*, 1:min(*k*+*l*, *m*)) contains the triangular matrix *R* or part of *R*.

b — On exit, if necessary, *b*(*m*-*k*+1: *l*, *n*+*m*-*k*-*l*+1: *n*)) contains a part of *R*.

alpha, *beta* — REAL for single-precision flavors
DOUBLE PRECISION for double-precision flavors.
Arrays, DIMENSION at least max(1, *n*). Contain the generalized singular value pairs of *A* and *B*:
alpha(1:*k*) = 1,
beta(1:*k*) = 0,
and if *m*-*k*-*l* ≥ 0,
alpha(*k*+1:*k*+*l*) = diag(*C*),

	beta(*k*+1:*k*+*l*) = diag(*S*), or if *m*-*k*-*l* < 0, *alpha*(*k*+1:*m*)= *C*, *alpha*(*m*+1:*k*+*l*)=0 *beta*(*K*+1:*M*) = *S*, *beta*(*m*+1:*k*+*l*) = 1. Furthermore, if *k*+*l* < *n*, *alpha*(*k*+*l*+1:*n*)= 0 and *beta*(*k*+*l*+1:*n*) = 0.
u	If *jobu* = 'I', *u* contains the orthogonal/unitary matrix *U*. If *jobu* = 'U', *u* contains the product U_1**U*. If *jobu* = 'N', *u* is not referenced.
v	If *jobv* = 'I', *v* contains the orthogonal/unitary matrix *U*. If *jobv* = 'V', *v* contains the product V_1**V*. If *jobv* = 'N', *v* is not referenced.
q	If *jobq* = 'I', *q* contains the orthogonal/unitary matrix *U*. If *jobq* = 'Q', *q* contains the product Q_1**Q*. If *jobq* = 'N', *q* is not referenced.
ncycle	INTEGER. The number of cycles required for convergence.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = 1, the procedure does not converge after MAXIT cycles.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine tgsja interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
b	Holds the matrix *B* of size (*p*,*n*).
u	Holds the matrix *U* of size (*m*,*m*).
v	Holds the matrix *V* of size (*p*,*p*).
q	Holds the matrix *Q* of size (*n*,*n*).
alpha	Holds the vector of length (*n*).

beta	Holds the vector of length (*n*).
jobu	If omitted, this argument is restored based on the presence of argument *u* as follows: *jobu* = 'U', if *u* is present, *jobu* = 'N', if *u* is omitted. If present, *jobu* must be equal to 'I' or 'U' and the argument *u* must also be present. Note that there will be an error condition if *jobu* is present and *u* omitted.
jobv	If omitted, this argument is restored based on the presence of argument *v* as follows: *jobv* = 'V', if *v* is present, *jobv* = 'N', if *v* is omitted. If present, *jobv* must be equal to 'I' or 'V' and the argument *v* must also be present. Note that there will be an error condition if *jobv* is present and *v* omitted.
jobq	If omitted, this argument is restored based on the presence of argument *q* as follows: *jobq* = 'Q', if *q* is present, *jobq* = 'N', if *q* is omitted. If present, *jobq* must be equal to 'I' or 'Q' and the argument *q* must also be present. Note that there will be an error condition if *jobq* is present and *q* omitted.

Driver Routines

Each of the LAPACK driver routines solves a complete problem. To arrive at the solution, driver routines typically call a sequence of appropriate computational routines.

Driver routines are described in the following sections :

Linear Least Squares (LLS) Problems

Generalized LLS Problems

Symmetric Eigenproblems

Nonsymmetric Eigenproblems

Linear Least Squares (LLS) Problems

This section describes LAPACK driver routines used for solving linear least-squares problems. Table 4-8 lists all such routines for Fortran-77 interface. Respective routine names in Fortran-95 interface are without the first symbol (see Routine Naming Conventions).

Table 4-8 Driver Routines for Solving LLS Problems

Routine Name	Operation performed
?gels	Uses QR or LQ factorization to solve a overdetermined or underdetermined linear system with full rank matrix.
?gelsy	Computes the minimum-norm solution to a linear least squares problem using a complete orthogonal factorization of A.
?gelss	Computes the minimum-norm solution to a linear least squares problem using the singular value decomposition of A.
?gelsd	Computes the minimum-norm solution to a linear least squares problem using the singular value decomposition of A and a divide and conquer method.

?gels

Uses QR or LQ factorization to solve a overdetermined or underdetermined linear system with full rank matrix.

Syntax

Fortran 77:

```
call sgels(trans, m, n, nrhs, a, lda, b, ldb, work, lwork, info)
call dgels(trans, m, n, nrhs, a, lda, b, ldb, work, lwork, info)
call cgels(trans, m, n, nrhs, a, lda, b, ldb, work, lwork, info)
call zgels(trans, m, n, nrhs, a, lda, b, ldb, work, lwork, info)
```

Fortran 95:

```
call gels(a, b [,trans] [,info])
```

Description

This routine solves overdetermined or underdetermined real/ complex linear systems involving an m-by-n matrix A, or its transpose/ conjugate-transpose, using a QR or LQ factorization of A. It is assumed that A has full rank.

The following options are provided:

1. If $trans$ = 'N' and $m \geq n$: find the least squares solution of an overdetermined system, that is, solve the least squares problem

$$\text{minimize } || b - A x ||_2$$

2. If $trans$ = 'N' and $m < n$: find the minimum norm solution of an underdetermined system $A*X = B$.

3. If $trans$ = 'T' or 'C' and $m \geq n$: find the minimum norm solution of an undetermined system $A_H*X = B$.

4. If $trans$ = 'T' or 'C' and $m < n$: find the least squares solution of an overdetermined system, that is, solve the least squares problem

$$\text{minimize } || b - A^H x ||_2$$

Several right hand side vectors b and solution vectors x can be handled in a single call; they are stored as the columns of the m-by-$nrhs$ right hand side matrix B and the n-by-nrh solution matrix X.

Input Parameters

$trans$	CHARACTER*1. Must be 'N', 'T', or 'C'. If $trans$ = 'N', the linear system involves matrix A; If $trans$ = 'T', the linear system involves the transposed matrix A^T (for real flavors only); If $trans$ = 'C', the linear system involves the conjugate-transposed matrix A^H (for complex flavors only).
m	INTEGER. The number of rows of the matrix A ($m \geq 0$).
n	INTEGER. The number of columns of the matrix A ($n \geq 0$).

nrhs	INTEGER. The number of right-hand sides; the number of columns in *B* (*nrhs* ≥ 0).
a, *b*, *work*	REAL for sgels DOUBLE PRECISION for dgels COMPLEX for cgels DOUBLE COMPLEX for zgels. Arrays: *a*(*lda*,*) contains the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) contains the matrix *B* of right hand side vectors, stored columnwise; *B* is *m*-by-*nrhs* if *trans* = 'N' , or *n*-by-*nrhs* if *trans* = 'T' or 'C'. The second dimension of *b* must be at least max(1, *nrhs*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
ldb	INTEGER. The first dimension of *b*; must be at least max(1, *m*, *n*).
lwork	INTEGER. The size of the *work* array; must be at least min(*m*, *n*)+max(1, *m*, *n*, *nrhs*). If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

a	On exit, overwritten by the factorization data as follows: if *m* ≥ *n*, array *a* contains the details of the *QR* factorization of the matrix *A* as returned by ?geqrf; if *m* ≥ *n*, array *a* contains the details of the *LQ* factorization of the matrix *A* as returned by ?gelqf.
b	If *info* = 0, *b* overwritten by the solution vectors, stored columnwise:

if *trans* = 'N' and $m \geq n$, rows 1 to n of *b* contain the least squares solution vectors; the residual sum of squares for the solution in each column is given by the sum of squares of modulus of elements n+1 to m in that column;

if *trans* = 'N' and $m \geq n$, rows 1 to n of *b* contain the minimum norm solution vectors;
if *trans* = 'T' or 'C' and $m < n$, rows 1 to m of *b* contain the minimum norm solution vectors; if *trans* = 'T' or 'C' and $m < n$, rows 1 to m of *b* contain the least squares solution vectors; the residual sum of squares for the solution in each column is given by the sum of squares of modulus of elements m+1 to n in that column.

work(1) — If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, the *i*-th diagonal element of the triangular factor of *A* is zero, so that *A* does not have full rank; the least squares solution could not be computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gels interface are the following:

a — Holds the matrix *A* of size (*m*,*n*).

b — Holds the matrix of size max(*m*,*n*)-by-*nrhs*.
If *trans* = 'N', then, on entry, the size of *b* is *m*-by-*nrhs*,
If *trans* = 'T', then, on entry, the size of *b* is *n*-by-*nrhs*,

trans — Must be 'N' or 'T'. The default value is 'N'.

Application Notes

For better performance, try using *lwork* = min (*m*, *n*)+max(1, *m*, *n*, *nrhs*)**blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?gelsy

Computes the minimum-norm solution to a linear least squares problem using a complete orthogonal factorization of A.

Syntax

Fortran 77:

call sgelsy(*m*, *n*, *nrhs*, *a*, *lda*, *b*, *ldb*, *jpvt*, *rcond*, *rank*, *work*, *lwork*, *info*)

call dgelsy(*m*, *n*, *nrhs*, *a*, *lda*, *b*, *ldb*, *jpvt*, *rcond*, *rank*, *work*, *lwork*, *info*)

call cgelsy(*m*, *n*, *nrhs*, *a*, *lda*, *b*, *ldb*, *jpvt*, *rcond*, *rank*, *work*, *lwork*, *rwork*, *info*)

call zgelsy(*m*, *n*, *nrhs*, *a*, *lda*, *b*, *ldb*, *jpvt*, *rcond*, *rank*, *work*, *lwork*, *rwork*, *info*)

Fortran 95:

call gelsy(*a*, *b* [,*rank*] [,*jpvt*] [,*rcond*] [,*info*])

Description

This routine computes the minimum-norm solution to a real/complex linear least squares problem:

`minimize || b - A x ||`$_2$

using a complete orthogonal factorization of A. A is an m-by-n matrix which may be rank-deficient. Several right hand side vectors b and solution vectors x can be handled in a single call; they are stored as the columns of the m-by-$nrhs$ right hand side matrix B and the n-by-$nrhs$ solution matrix X.

The routine first computes a QR factorization with column pivoting:

$$AP = Q \begin{pmatrix} R_{11} & R_{12} \\ 0 & R_{22} \end{pmatrix}$$

with R_{11} defined as the largest leading submatrix whose estimated condition number is less than 1/$rcond$. The order of R_{11}, $rank$, is the effective rank of A. Then, R_{22} is considered to be negligible, and R_{12} is annihilated by orthogonal/unitary transformations from the right, arriving at the complete orthogonal factorization:

$$AP = Q \begin{pmatrix} T_{11} & 0 \\ 0 & 0 \end{pmatrix} Z$$

The minimum-norm solution is then

$$X = PZ^H \begin{pmatrix} T_{11}^{-1} & Q_1{}^H b \\ 0 & 0 \end{pmatrix}$$

where Q_1 consists of the first $rank$ columns of Q. This routine is basically identical to the original `?gelsx` except three differences:

- The call to the subroutine ?geqpf has been substituted by the call to the subroutine ?geqp3. This subroutine is a BLAS-3 version of the *QR* factorization with column pivoting.
- Matrix *B* (the right hand side) is updated with BLAS-3.
- The permutation of matrix *B* (the right hand side) is faster and more simple.

Input Parameters

m	INTEGER. The number of rows of the matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns of the matrix *A* (*n* ≥ 0).
nrhs	INTEGER. The number of right-hand sides; the number of columns in *B* (*nrhs* ≥ 0).
a, *b*, *work*	REAL for sgelsy DOUBLE PRECISION for dgelsy COMPLEX for cgelsy DOUBLE COMPLEX for zgelsy. Arrays: *a*(*lda*,*) contains the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) contains the *m*-by-*nrhs* right hand side matrix *B*. The second dimension of *b* must be at least max(1, *nrhs*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
ldb	INTEGER. The first dimension of *b*; must be at least max(1, *m*, *n*).
jpvt	INTEGER. Array, DIMENSION at least max(1, *n*). On entry, if *jpvt*(*i*)≠ 0, the *i*-th column of *A* is permuted to the front of *A***P*, otherwise the *i*-th column of *A* is a free column.
rcond	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors.

rcond is used to determine the effective rank of *A*, which is defined as the order of the largest leading triangular submatrix R_{11} in the *QR* factorization with pivoting of *A*, whose estimated condition number < 1/*rcond*.

lwork — INTEGER. The size of the *work* array.
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

rwork — REAL for cgelsy DOUBLE PRECISION for zgelsy.
Workspace array, DIMENSION at least max(1, 2*n*). Used in complex flavors only.

Output Parameters

a — On exit, overwritten by the details of the complete orthogonal factorization of *A*.

b — Overwritten by the *n*-by-*nrhs* solution matrix *X*.

jpvt — On exit, if *jpvt*(*i*)= *k*, then the *i*th column of *AP* was the *k*-th column of *A*.

rank — INTEGER. The effective rank of *A*, that is, the order of the submatrix R_{11}. This is the same as the order of the submatrix T_{11} in the complete orthogonal factorization of *A*.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gelsy interface are the following:

a — Holds the matrix *A* of size (*m*,*n*).

b	Holds the matrix of size max(*m*,*n*)-by-*nrhs*. On entry, contains the *m*-by-*nrhs* right hand side matrix *B*, On exit, overwritten by the *n*-by-*nrhs* solution matrix *X*.
jpvt	Holds the vector of length (*n*). Default value for this element is *jpvt*(*i*) = 0.
rcond	Default value for this element is *rcond* = 100*EPSILON(1.0_WP).

Application Notes

For real flavors:

The unblocked strategy requires that:

lwork ≥ max(*mn*+3*n*+1, 2**mn* + *nrhs*),

where *mn* = min(*m*, *n*).

The block algorithm requires that:

lwork ≥ max(*mn*+2*n*+*nb**(*n*+1), 2**mn*+*nb***nrhs*),

where *nb* is an upper bound on the blocksize returned by ilaenv for the routines sgeqp3/dgeqp3, stzrzf/dtzrzf, stzrqf/dtzrqf, sormqr/dormqr, and sormrz/dormrz.

For complex flavors:

The unblocked strategy requires that:

lwork ≥ *mn* + max(2**mn*, *n*+1, *mn* + *nrhs*),

where *mn* = min(*m*, *n*).

The block algorithm requires that:

lwork < *mn* + max(2**mn*, *nb**(*n*+1), *mn*+*mn***nb*, *mn*+ *nb***nrhs*),

where *nb* is an upper bound on the blocksize returned by ilaenv for the routines cgeqp3/zgeqp3, ctzrzf/ztzrzf, ctzrqf/ztzrqf, cunmqr/zunmqr, and cunmrz/zunmrz.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = –1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?gelss

Computes the minimum-norm solution to a linear least squares problem using the singular value decomposition of A.

Syntax

Fortran 77:

```
call sgelss(m, n, nrhs, a, lda, b, ldb, s, rcond, rank, work, lwork, info)
call dgelss(m, n, nrhs, a, lda, b, ldb, s, rcond, rank, work, lwork, info)
call cgelss(m, n, nrhs, a, lda, b, ldb, s, rcond, rank, work, lwork, rwork, info)
call zgelss(m, n, nrhs, a, lda, b, ldb, s, rcond, rank, work, lwork, rwork, info)
```

Fortran 95:

```
call gelss(a, b [,rank] [,s] [,rcond] [,info])
```

Description

This routine computes the minimum norm solution to a real linear least squares problem:

$$\text{minimize } || b - Ax ||_2$$

using the singular value decomposition (SVD) of A. A is an m-by-n matrix which may be rank-deficient. Several right hand side vectors b and solution vectors x can be handled in a single call; they are stored as the columns of the m-by-$nrhs$ right hand side matrix B and the n-by-$nrhs$ solution matrix X. The effective rank of A is determined by treating as zero those singular values which are less than $rcond$ times the largest singular value.

Input Parameters

m	INTEGER. The number of rows of the matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns of the matrix *A* (*n* ≥ 0).
nrhs	INTEGER. The number of right-hand sides; the number of columns in *B* (*nrhs* ≥ 0).
a, *b*, *work*	REAL for sgelss DOUBLE PRECISION for dgelss COMPLEX for cgelss DOUBLE COMPLEX for zgelss. Arrays: *a*(*lda*,*) contains the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) contains the *m*-by-*nrhs* right hand side matrix *B*. The second dimension of *b* must be at least max(1, *nrhs*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
ldb	INTEGER. The first dimension of *b*; must be at least max(1, *m*, *n*).
rcond	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. *rcond* is used to determine the effective rank of *A*. Singular values *s*(*i*) ≤ *rcond* **s*(1) are treated as zero. If *rcond* <0, machine precision is used instead.
lwork	INTEGER. The size of the *work* array; *lwork*≥ 1. If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.
rwork	REAL for cgelss DOUBLE PRECISION for zgelss.

Workspace array used in complex flavors only. DIMENSION at least max(1, 5*min(*m*, *n*)).

Output Parameters

a — On exit, the first min(*m*, *n*) rows of *A* are overwritten with its right singular vectors, stored row-wise.

b — Overwritten by the *n*-by-*nrhs* solution matrix *X*.

If *m*≥*n* and *rank* = *n*, the residual sum-of-squares for the solution in the *i*-th column is given by the sum of squares of modulus of elements *n*+1:*m* in that column.

s — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION at least max(1, min(*m*, *n*)). The singular values of *A* in decreasing order. The condition number of *A* in the 2-norm is
k2(*A*) = *s*(1)/ *s*(min(*m*, *n*)) .

rank — INTEGER. The effective rank of *A*, that is, the number of singular values which are greater than *rcond* **s*(1).

work(1) — If *info* = 0, on exit, *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, then the algorithm for computing the SVD failed to converge; *i* indicates the number of off-diagonal elements of an intermediate bidiagonal form which did not converge to zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gelss interface are the following:

a — Holds the matrix *A* of size (*m*,*n*).

b	Holds the matrix of size max(*m*,*n*)-by-*nrhs*. On entry, contains the *m*-by-*nrhs* right hand side matrix *B*, On exit, overwritten by the *n*-by-*nrhs* solution matrix *X*.
s	Holds the vector of length min(*m*,*n*).
rcond	Default value for this element is *rcond* = 100*EPSILON(1.0_WP).

Application Notes

For real flavors:

lwork ≥ 3*min(*m*, *n*)+ max(2*min(*m*, *n*), max(*m*, *n*), *nrhs*)

For complex flavors:

lwork ≥ 2*min(*m*, *n*)+ max(*m*, *n*, *nrhs*)

For good performance, *lwork* should generally be larger.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = –1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = –1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?gelsd

Computes the minimum-norm solution to a linear least squares problem using the singular value decomposition of A and a divide and conquer method.

Syntax

Fortran 77:

```
call sgelsd(m, n, nrhs, a, lda, b, ldb, s, rcond, rank, work, lwork, iwork, info)
call dgelsd(m, n, nrhs, a, lda, b, ldb, s, rcond, rank, work, lwork, iwork, info)
call cgelsd(m, n, nrhs, a, lda, b, ldb, s, rcond, rank, work, lwork, rwork, iwork, info)
call zgelsd(m, n, nrhs, a, lda, b, ldb, s, rcond, rank, work, lwork, rwork, iwork, info)
```

Fortran 95:

```
call gelsd(a, b [,rank] [,s] [,rcond] [,info])
```

Description

This routine computes the minimum-norm solution to a real linear least squares problem:

$$\text{minimize } \| b - Ax \|_2$$

using the singular value decomposition (SVD) of A. A is an m-by-n matrix which may be rank-deficient.

Several right hand side vectors b and solution vectors x can be handled in a single call; they are stored as the columns of the m-by-$nrhs$ right hand side matrix B and the n-by-$nrhs$ solution matrix X.

The problem is solved in three steps:

1. Reduce the coefficient matrix A to bidiagonal form with Householder transformations, reducing the original problem into a "bidiagonal least squares problem" (BLS).
2. Solve the BLS using a divide and conquer approach.
3. Apply back all the Householder transformations to solve the original least squares problem.

The effective rank of *A* is determined by treating as zero those singular values which are less than *rcond* times the largest singular value.

The routine uses auxiliary routines ?lals0 and ?lalsa.

Input Parameters

m	INTEGER. The number of rows of the matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns of the matrix *A* (*n* ≥ 0).
nrhs	INTEGER. The number of right-hand sides; the number of columns in *B* (*nrhs* ≥ 0).
a, *b*, *work*	REAL for sgelsd DOUBLE PRECISION for dgelsd COMPLEX for cgelsd DOUBLE COMPLEX for zgelsd. Arrays: *a*(*lda*,*) contains the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) contains the *m*-by-*nrhs* right hand side matrix *B*. The second dimension of *b* must be at least max(1, *nrhs*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
ldb	INTEGER. The first dimension of *b*; must be at least max(1, *m*, *n*).
rcond	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. *rcond* is used to determine the effective rank of *A*. Singular values *s*(*i*) ≤ *rcond* **s*(1) are treated as zero. If *rcond* ≤ 0, machine precision is used instead.
lwork	INTEGER. The size of the *work* array; *lwork* ≥ 1. If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the array *work* and the minimum sizes of the arrays *rwork* and *iwork*, and

returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* is issued by xerbla.
See Application Notes for the suggested value of *lwork*.

iwork — INTEGER. Workspace array. See Application Notes for the suggested dimension of *iwork*.

rwork — REAL for cgelsd
DOUBLE PRECISION for zgelsd.
Workspace array, used in complex flavors only. See Application Notes for the suggested dimension of *rwork*.

Output Parameters

a — On exit, *A* has been overwritten.

b — Overwritten by the *n*-by-*nrhs* solution matrix *X*.

If $m \geq n$ and $rank = n$, the residual sum-of-squares for the solution in the *i*-th column is given by the sum of squares of modulus of elements *n*+1:*m* in that column.

s — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION at least max(1, min(*m*, *n*)). The singular values of *A* in decreasing order. The condition number of *A* in the 2-norm is
$k^2(A) = s(1) / s(\min(m, n))$.

rank — INTEGER. The effective rank of *A*, that is, the number of singular values which are greater than *rcond* **s*(1).

work(1) — If *info* = 0, on exit, *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

rwork(1) — If *info* = 0, on exit, *rwork*(1) returns the minimum size of the workspace array *iwork* required for optimum performance.

iwork(1) — If *info* = 0, on exit, *iwork*(1) returns the minimum size of the workspace array *iwork* required for optimum performance.

info — INTEGER.

If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, then the algorithm for computing the SVD failed to converge; *i* indicates the number of off-diagonal elements of an intermediate bidiagonal form that did not converge to zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `gelsd` interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
b	Holds the matrix of size max(*m*,*n*)-by-*nrhs*. On entry, contains the *m*-by-*nrhs* right hand side matrix *B*, On exit, overwritten by the *n*-by-*nrhs* solution matrix *X*.
s	Holds the vector of length min(*m*,*n*).
rcond	Default value for this element is *rcond* = 100*EPSILON(1.0_WP).

Application Notes

The divide and conquer algorithm makes very mild assumptions about floating point arithmetic. It will work on machines with a guard digit in add/subtract. It could conceivably fail on hexadecimal or decimal machines without guard digits, but we know of none.

The exact minimum amount of workspace needed depends on *m*, *n* and *nrhs*. The size *lwork* of the workspace array *work* must be as given below.

For real flavors:

If $m \geq n$,

$$lwork \geq 12n + 2n*smlsiz + 8n*nlvl + n*nrhs + (smlsiz+1)^2;$$

If $m < n$,

$$lwork \geq 12m + 2m*smlsiz + 8m*nlvl + m*nrhs + (smlsiz+1)^2;$$

For complex flavors:

If $m \geq n$,

lwork< 2*n* + *n***nrhs*;

If *m* < *n*,

lwork ≥ 2*m* + *m***nrhs*;

where *smlsiz* is returned by ilaenv and is equal to the maximum size of the subproblems at the bottom of the computation tree (usually about 25), and

nlvl = INT($\log_2$(min(*m*, *n*)/(*smlsiz*+1))) + 1.

For good performance, *lwork* should generally be larger.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The dimension of the workspace array *iwork* must be at least

3*min(*m*, *n*)**nlvl* + 11*min(*m*, *n*).

The dimension of the workspace array *iwork* (for complex flavors) must be at least max(1, *lrwork*).

lrwork ≥ 10*n* + 2*n***smlsiz* + 8*n***nlvl* + 3**smlsiz***nrhs* + (*smlsiz*+1)^2 if *m* ≥ *n*, and

lrwork ≥ 10*m* + 2*m***smlsiz* + 8*m***nlvl* + 3**smlsiz***nrhs* + (*smlsiz*+1)^2 if *m* ≥ *n*.

Generalized LLS Problems

This section describes LAPACK driver routines used for solving generalized linear least-squares problems. Table 4-9 lists all such routines for Fortran-77 interface. Respective routine names in Fortran-95 interface are without the first symbol (see Routine Naming Conventions).

Table 4-9 Driver Routines for Solving Generalized LLS Problems

Routine Name	Operation performed
?gglse	Solves the linear equality-constrained least squares problem using a generalized RQ factorization.
?ggglm	Solves a general Gauss-Markov linear model problem using a generalized QR factorization.

?gglse

Solves the linear equality-constrained least squares problem using a generalized RQ factorization.

Syntax

Fortran 77:

```
call sgglse(m, n, p, a, lda, b, ldb, c, d, x, work, lwork, info)
call dgglse(m, n, p, a, lda, b, ldb, c, d, x, work, lwork, info)
call cgglse(m, n, p, a, lda, b, ldb, c, d, x, work, lwork, info)
call zgglse(m, n, p, a, lda, b, ldb, c, d, x, work, lwork, info)
```

Fortran 95:

```
call gglse(a, b, c, d, x [,info])
```

Description

This routine solves the linear equality-constrained least squares (LSE) problem:

`minimize || c - A x ||`^{2} subject to `B x = d`

where `A` is an `m`-by-`n` matrix, `B` is a `p`-by-`n` matrix, `c` is a given `m`-vector, and `d` is a given `p`-vector. It is assumed that $p \le n \le m+p$, and

$$\text{rank}(B) = p \quad \text{and} \quad \text{rank}\begin{pmatrix} A \\ B \end{pmatrix} = n .$$

These conditions ensure that the LSE problem has a unique solution, which is obtained using a generalized *RQ* factorization of the matrices (*B*, *A*) given by

B=(0 *R*)**Q*, *A*=*Z***T***Q*

Input Parameters

m	INTEGER. The number of rows of the matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns of the matrices *A* and *B* (*n* ≥ 0).
p	INTEGER. The number of rows of the matrix *B* (0 ≤ *p* ≤ *n* ≤ *m*+*p*).
a, *b*, *c*, *d*, *work*	REAL for sgglse DOUBLE PRECISION for dgglse COMPLEX for cgglse DOUBLE COMPLEX for zgglse. Arrays: *a*(*lda*,*) contains the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) contains the *p*-by-*n* matrix *B*. The second dimension of *b* must be at least max(1, *n*). *c*(*), dimension at least max(1, *m*), contains the right hand side vector for the least squares part of the LSE problem. *d*(*), dimension at least max(1, *p*), contains the right hand side vector for the constrained equation. *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
ldb	INTEGER. The first dimension of *b*; at least max(1, *p*).
lwork	INTEGER. The size of the *work* array; *lwork* ≥ max(1, *m*+*n*+*p*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

x	REAL for sgglse DOUBLE PRECISION for dgglse COMPLEX for cgglse DOUBLE COMPLEX for zgglse. Array, DIMENSION at least max(1, *n*). On exit, contains the solution of the LSE problem.
a	On exit, the elements on and above the diagonal of the array contain the min(*m*, *n*)-by-*n* upper trapezoidal matrix *T*.
b	On exit, the upper triangle of the subarray *b*(1:*p*, *n*–*p*+1:*n*) contains the *p*-by-*p* upper triangular matrix *R*.
d	On exit, *d* is destroyed.
c	On exit, the residual sum-of-squares for the solution is given by the sum of squares of elements *n*-*p*+1 to *m* of vector *c*.
work(1)	If *info* = 0, on exit, *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = –*i*, the *i*-th parameter had an illegal value. If *info* = 1, the upper triangular factor *R* associated with *B* in the generalized RQ factorization of the pair (*B*, *A*) is singular, so that rank(*B*) < *P*; the least squares solution could not be computed. If *info* = 2, the (*n*–*p*)-by-(*n*–*p*) part of the upper trapezoidal factor *T* associated with *A* in the generalized RQ factorization of the pair (*B*, *A*) is singular, so that $\text{rank}\begin{pmatrix} A \\ B \end{pmatrix} < n$; the least squares solution could not be computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `gglse` interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
b	Holds the matrix *B* of size (*p*,*n*).
c	Holds the vector of length (*m*).
d	Holds the vector of length (*p*).
x	Holds the vector of length (*n*).

Application Notes

For optimum performance, use

lwork ≥ *p* + min(*m*, *n*) + max(*m*, *n*)**nb*,

where *nb* is an upper bound for the optimal blocksizes for `?geqrf`, `?gerqf`, `?ormqr`/`?unmqr` and `?ormrq`/`?unmrq`.

You may set *lwork* to -1. The routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?ggglm

Solves a general Gauss-Markov linear model problem using a generalized QR factorization.

Syntax

Fortran 77:

```
call sggglm(n, m, p, a, lda, b, ldb, d, x, y, work, lwork, info)
call dggglm(n, m, p, a, lda, b, ldb, d, x, y, work, lwork, info)
call cggglm(n, m, p, a, lda, b, ldb, d, x, y, work, lwork, info)
call zggglm(n, m, p, a, lda, b, ldb, d, x, y, work, lwork, info)
```

Fortran 95:

```
call ggglm(a, b, d, x, y [,info])
```

Description

This routine solves a general Gauss-Markov linear model (GLM) problem:

$\text{minimize}_x \; || \; y \; ||_2$ subject to $d = Ax + By$

where A is an n-by-m matrix, B is an n-by-p matrix, and d is a given n-vector. It is assumed that $m \le n \le m+p$, and $\text{rank}(A) = m$ and $\text{rank}(A \; B) = n$.

Under these assumptions, the constrained equation is always consistent, and there is a unique solution x and a minimal 2-norm solution y, which is obtained using a generalized QR factorization of the matrices $(A, \; B)$ given by

$$A = Q \begin{pmatrix} R \\ 0 \end{pmatrix}; \qquad B = Q * T * Z.$$

In particular, if matrix B is square nonsingular, then the problem GLM is equivalent to the following weighted linear least squares problem

$\text{minimize}_x \; || \; B^{-1}(d-Ax) ||_2$.

Input Parameters

n	INTEGER. The number of rows of the matrices *A* and *B* (*n* ≥ 0).
m	INTEGER. The number of columns in *A* (*m* ≥ 0).
p	INTEGER. The number of columns in *B* (*p* ≥ *n* – *m*).
a, *b*, *d*, *work*	REAL for sggglm DOUBLE PRECISION for dggglm COMPLEX for cggglm DOUBLE COMPLEX for zggglm. Arrays: *a*(*lda*,*) contains the *n*-by-*m* matrix *A*. The second dimension of *a* must be at least max(1, *m*). *b*(*ldb*,*) contains the *n*-by-*p* matrix *B*. The second dimension of *b* must be at least max(1, *p*). *d*(*), dimension at least max(1, *n*), contains the left hand side of the GLM equation. *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
ldb	INTEGER. The first dimension of *b*; at least max(1, *n*).
lwork	INTEGER. The size of the *work* array; *lwork* ≥ max(1, *n*+*m*+*p*). If *lwork* = –1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

x, *y*	REAL for sggglm DOUBLE PRECISION for dggglm COMPLEX for cggglm DOUBLE COMPLEX for zggglm. Arrays *x*(*), *y*(*). DIMENSION at least max(1, *m*) for *x* and at least max(1, *p*) for *y*.

	On exit, *x* and *y* are the solutions of the GLM problem.
a	On exit, the upper triangular part of the array *a* contains the *m*-by-*m* upper triangular matrix *R*.
b	On exit, if $n \le p$, the upper triangle of the subarray *b*(1:*n*, *p*−*n*+1:*p*) contains the *n*-by-*n* upper triangular matrix *T*; if $n > p$, the elements on and above the (*n*−*p*)-th subdiagonal contain the *n*-by-*p* upper trapezoidal matrix *T*.
d	On exit, *d* is destroyed
work(1)	If *info* = 0, on exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = −*i*, the *i*-th parameter had an illegal value. If *info* = 1, the upper triangular factor *R* associated with *A* in the generalized QR factorization of the pair (*A*, *B*) is singular, so that rank(*A*) < *m*; the least squares solution could not be computed. If *info* = 2, the bottom (*n*−*m*)-by-(*n*−*m*) part of the upper trapezoidal factor *T* associated with *B* in the generalized QR factorization of the pair (*A*, *B*) is singular, so that rank(*A* *B*) < *n*; the least squares solution could not be computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine ggglm interface are the following:

a	Holds the matrix *A* of size (*n*,*m*).
b	Holds the matrix *B* of size (*n*,*p*).
d	Holds the vector of length (*n*).
x	Holds the vector of length (*m*).
y	Holds the vector of length (*p*).

Application Notes

For optimum performance, use

lwork ≥ *m* + min(*n*, *p*) + max(*n*, *p*)**nb*,

where *nb* is an upper bound for the optimal blocksizes for ?geqrf, ?gerqf, ?ormqr/?unmqr and ?ormrq/?unmrq.

You may set *lwork* to -1. The routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

Symmetric Eigenproblems

This section describes LAPACK driver routines used for solving symmetric eigenvalue problems. See also computational routines computational routines that can be called to solve these problems. Table 4-10 lists all such driver routines for Fortran-77 interface. Respective routine names in Fortran-95 interface are without the first symbol (see Routine Naming Conventions).

Table 4-10 Driver Routines for Solving Symmetric Eigenproblems

Routine Name	Operation performed
?syev/?heev	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric / Hermitian matrix.
?syevd/?heevd	Computes all eigenvalues and (optionally) all eigenvectors of a real symmetric / Hermitian matrix using divide and conquer algorithm.
?syevx/?heevx	Computes selected eigenvalues and, optionally, eigenvectors of a symmetric / Hermitian matrix.
?syevr/?heevr	Computes selected eigenvalues and, optionally, eigenvectors of a real symmetric / Hermitian matrix using the Relatively Robust Representations.
?spev/?hpev	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric / Hermitian matrix in packed storage.

Routine Name	Operation performed
?spevd/?hpevd	Uses divide and conquer algorithm to compute all eigenvalues and (optionally) all eigenvectors of a real symmetric / Hermitian matrix held in packed storage.
?spevx/?hpevx	Computes selected eigenvalues and, optionally, eigenvectors of a real symmetric / Hermitian matrix in packed storage.
?sbev /?hbev	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric / Hermitian band matrix.
?sbevd/?hbevd	Computes all eigenvalues and (optionally) all eigenvectors of a real symmetric / Hermitian band matrix using divide and conquer algorithm.
?sbevx/?hbevx	Computes selected eigenvalues and, optionally, eigenvectors of a real symmetric / Hermitian band matrix.
?stev	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix.
?stevd	Computes all eigenvalues and (optionally) all eigenvectors of a real symmetric tridiagonal matrix using divide and conquer algorithm.
?stevx	Computes selected eigenvalues and eigenvectors of a real symmetric tridiagonal matrix.
?stevr	Computes selected eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix using the Relatively Robust Representations.

?syev

Computes all eigenvalues and, optionally, eigenvectors of a real symmetric matrix.

Syntax

Fortran 77:

```
call ssyev(jobz, uplo, n, a, lda, w, work, lwork, info)
call dsyev(jobz, uplo, n, a, lda, w, work, lwork, info)
```

Fortran 95:

```
call syev(a, w [,jobz] [,uplo] [,info])
```

Description

This routine computes all eigenvalues and, optionally, eigenvectors of a real symmetric matrix *A*.

Note that for most cases of real symmetric eigenvalue problems the default choice should be ?syevr function as its underlying algorithm is faster and uses less workspace.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then only eigenvalues are computed. If *jobz* = 'V', then eigenvalues and eigenvectors are computed.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *a* stores the upper triangular part of *A*. If *uplo* = 'L', *a* stores the lower triangular part of *A*.
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
a, *work*	REAL for ssyev DOUBLE PRECISION for dsyev Arrays: *a*(*lda*,*) is an array containing either upper or lower triangular part of the symmetric matrix *A*, as specified by *uplo*. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of the array *a*. Must be at least max(1, *n*).
lwork	INTEGER. The dimension of the array *work*. Constraint: *lwork* ≥ max(1, 3*n*-1). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See Application Notes for the suggested value of *lwork*.

Output Parameters

a	On exit, if *jobz* = 'V', then if *info* = 0, array *a* contains the orthonormal eigenvectors of the matrix *A*. If *jobz* = 'N', then on exit the lower triangle (if *uplo* = 'L') or the upper triangle (if *uplo* = 'U') of *A*, including the diagonal, is overwritten.
w	REAL for ssyev DOUBLE PRECISION for dsyev Array, DIMENSION at least max(1, *n*). If *info* = 0, contains the eigenvalues of the matrix *A* in ascending order.
work(1)	On exit, if *lwork* > 0, then *work(1)* returns the required minimal size of *lwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, then the algorithm failed to converge; *i* indicates the number of elements of an intermediate tridiagonal form which did not converge to zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine syev interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
w	Holds the vector of length (*n*).
job	Must be 'N' or 'V'. The default value is 'N'.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For optimum performance use

lwork ≥ (*nb*+2)*n,

where *nb* is the blocksize for ?sytrd returned by ilaenv.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = –1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = –1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?heev

Computes all eigenvalues and, optionally, eigenvectors of a Hermitian matrix.

Syntax

Fortran 77:

```
call cheev(jobz, uplo, n, a, lda, w, work, lwork, rwork, info)
call zheev(jobz, uplo, n, a, lda, w, work, lwork, rwork, info)
```

Fortran 95:

```
call heev(a, w [,jobz] [,uplo] [,info])
```

Description

This routine computes all eigenvalues and, optionally, eigenvectors of a complex Hermitian matrix *A*.

Note that for most cases of complex Hermitian eigenvalue problems the default choice should be ?heevr function as its underlying algorithm is faster and uses less workspace.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then only eigenvalues are computed. If *jobz* = 'V', then eigenvalues and eigenvectors are computed.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *a* stores the upper triangular part of *A*. If *uplo* = 'L', *a* stores the lower triangular part of *A*.
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
a, *work*	COMPLEX for cheev DOUBLE COMPLEX for zheev Arrays: *a*(*lda*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *A*, as specified by *uplo*. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of the array *a*. Must be at least max(1, *n*).
lwork	INTEGER. The dimension of the array *work*. C onstraint: *lwork* ≥ max(1, 2*n*-1). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.
rwork	REAL for cheev DOUBLE PRECISION for zheev. Workspace array, DIMENSION at least max(1, 3*n*-2).

Output Parameters

a	On exit, if *jobz* = 'V', then if *info* = 0, array *a* contains the orthonormal eigenvectors of the matrix *A*. If *jobz* = 'N', then on exit the lower triangle

	(if *uplo* = 'L') or the upper triangle (if *uplo* = 'U') of *A*, including the diagonal, is overwritten.
w	REAL for cheev DOUBLE PRECISION for zheev Array, DIMENSION at least max(1, *n*). If *info* = 0, contains the eigenvalues of the matrix *A* in ascending order.
work(1)	On exit, if *lwork* > 0, then *work(1)* returns the required minimal size of *lwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, then the algorithm failed to converge; *i* indicates the number of elements of an intermediate tridiagonal form which did not converge to zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine heev interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
w	Holds the vector of length (*n*).
job	Must be 'N' or 'V'. The default value is 'N'.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For optimum performance use

lwork ≥ (*nb*+1)*n*,

where *nb* is the blocksize for ?hetrd returned by ilaenv.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?syevd

Computes all eigenvalues and (optionally) all eigenvectors of a real symmetric matrix using divide and conquer algorithm.

Syntax

Fortran 77:

```
call ssyevd(jobz, uplo, n, a, lda, w, work, lwork, iwork, liwork, info)
call dsyevd(jobz, uplo, n, a, lda, w, work, lwork, iwork, liwork, info)
```

Fortran 95:

```
call syevd(a, w [,jobz] [,uplo] [,info])
```

Description

This routine computes all the eigenvalues, and optionally all the eigenvectors, of a real symmetric matrix *A*. In other words, it can compute the spectral factorization of *A* as: $A = Z\Lambda Z^T$.

Here Λ is a diagonal matrix whose diagonal elements are the eigenvalues λ_i, and *Z* is the orthogonal matrix whose columns are the eigenvectors z_i. Thus,

$Azi = \lambda_i z_i$ for $i = 1, 2, \ldots, n$.

If the eigenvectors are requested, then this routine uses a divide and conquer algorithm to compute eigenvalues and eigenvectors. However, if only eigenvalues are required, then it uses the Pal-Walker-Kahan variant of the *QL* or *QR* algorithm.

Note that for most cases of real symmetric eigenvalue problems the default choice should be ?syevr function as its underlying algorithm is faster and uses less workspace. ?syevd requires more workspace but is faster in some cases, especially for large matrices.

Input Parameters

jobz — CHARACTER*1. Must be 'N' or 'V'.
If *jobz* = 'N', then only eigenvalues are computed.
If *jobz* = 'V', then eigenvalues and eigenvectors are computed.

uplo — CHARACTER*1. Must be 'U' or 'L'.
If *uplo* = 'U', *a* stores the upper triangular part of *A*.
If *uplo* = 'L', *a* stores the lower triangular part of *A*.

n — INTEGER. The order of the matrix *A* (*n* ≥ 0).

a — REAL for ssyevd
DOUBLE PRECISION for dsyevd
Array, DIMENSION (*lda*, *).
a(*lda*,*) is an array containing either upper or lower triangular part of the symmetric matrix *A*, as specified by *uplo*.
The second dimension of *a* must be at least max(1, *n*).

lda — INTEGER. The first dimension of the array *a*.
Must be at least max(1, *n*).

work — REAL for ssyevd
DOUBLE PRECISION for dsyevd.
Workspace array, DIMENSION at least *lwork*.

lwork — INTEGER.
The dimension of the array *work*.
Constraints:

if *n* ≤ 1, then *lwork* ≥ 1;

if *jobz* = 'N' and *n* > 1, then *lwork* ≥ 2*n + 1;

if *jobz* = 'V' and *n* > 1, then *lwork* ≥ $2*n^2+ 6*n + 1$.
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the required sizes of the *work* and *iwork* arrays, returns these values as the first entries of the

work and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See Application Notes for details.

iwork — INTEGER.
Workspace array, its dimension max(1, *liwork*).

liwork — INTEGER.
The dimension of the array *iwork*.
Constraints:

if $n \le 1$, then *liwork* ≥ 1;

if *jobz* = 'N' and $n > 1$, then *liwork* ≥ 1;

if *jobz* = 'V' and $n > 1$, then *liwork* ≥ 5*n + 3.

If *liwork* = -1, then a workspace query is assumed; the routine only calculates the required sizes of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See Application Notes for details.

Output Parameters

w — REAL for ssyevd
DOUBLE PRECISION for dsyevd
Array, DIMENSION at least max(1, *n*).
If *info* = 0, contains the eigenvalues of the matrix *A* in ascending order. See also *info*.

a — If *jobz* = 'V', then on exit this array is overwritten by the orthogonal matrix *Z* which contains the eigenvectors of *A*.

work(1) — On exit, if *lwork* > 0, then *work(1)* returns the required minimal size of *lwork*.

iwork(1) — On exit, if *liwork* > 0, then *iwork(1)* returns the required minimal size of *liwork*.

info — INTEGER.
If *info* = 0, the execution is successful.

If *info* = *i*, then the algorithm failed to converge; *i* indicates the number of off-diagonal elements of an intermediate tridiagonal form which did not converge to zero.
If *info* = *i*, and *jobz* = 'V', then the algorithm failed to compute an eigenvalue while working on the submatrix lying in rows and columns *info*/(*n*+1) through mod(*info*,*n*+1).
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine syevd interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
w	Holds the vector of length (*n*).
jobz	Must be 'N' or 'V'. The default value is 'N'.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed eigenvalues and eigenvectors are exact for a matrix $T + E$ such that $||E||_2 = O(\varepsilon)\ ||T||_2$, where ε is the machine precision.

If you are in doubt how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run or set *lwork* = -1 (*liwork* = -1).

If you choose the first option and set any of admissible *lwork* (or *liwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The complex analogue of this routine is ?heevd

?heevd

Computes all eigenvalues and (optionally) all eigenvectors of a complex Hermitian matrix using divide and conquer algorithm.

Syntax

Fortran 77:

```
call cheevd(jobz, uplo, n, a, lda, w, work, lwork, rwork, lrwork, iwork, liwork, info)
```

```
call zheevd(jobz, uplo, n, a, lda, w, work, lwork, rwork, lrwork, iwork, liwork, info)
```

Fortran 95:

```
call heevd(a, w [,job] [,uplo] [,info])
```

Description

This routine computes all the eigenvalues, and optionally all the eigenvectors, of a complex Hermitian matrix *A*. In other words, it can compute the spectral factorization of *A* as: $A = Z\Lambda Z^H$.

Here Λ is a real diagonal matrix whose diagonal elements are the eigenvalues λ_i, and *Z* is the (complex) unitary matrix whose columns are the eigenvectors z_i. Thus,

$Azi = \lambda_i zi$ for $i = 1, 2, \ldots, n$.

If the eigenvectors are requested, then this routine uses a divide and conquer algorithm to compute eigenvalues and eigenvectors. However, if only eigenvalues are required, then it uses the Pal-Walker-Kahan variant of the *QL* or *QR* algorithm.

Note that for most cases of complex Hermetian eigenvalue problems the default choice should be ?heevr function as its underlying algorithm is faster and uses less workspace. ?heevd requires more workspace but is faster in some cases, especially for large matrices.

Input Parameters

jobz — CHARACTER*1. Must be 'N' or 'V'.
If *jobz* = 'N', then only eigenvalues are computed.
If *jobz* = 'V', then eigenvalues and eigenvectors are computed.

uplo — CHARACTER*1. Must be 'U' or 'L'.
If *uplo* = 'U', *a* stores the upper triangular part of *A*.
If *uplo* = 'L', *a* stores the lower triangular part of *A*.

n — INTEGER. The order of the matrix *A* (*n* ≥ 0).

a — COMPLEX for cheevd
DOUBLE COMPLEX for zheevd
Array, DIMENSION (*lda*, *).
a(*lda*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *A*, as specified by *uplo*.
The second dimension of *a* must be at least max(1, *n*).

lda — INTEGER. The first dimension of the array *a*. Must be at least max(1, *n*).

work — COMPLEX for cheevd
DOUBLE COMPLEX for zheevd.
Workspace array, DIMENSION max(1, *lwork*).

lwork — INTEGER.
The dimension of the array *work*. Constraints:

if *n* ≤ 1, then *lwork* ≥ 1;

if *jobz* = 'N' and *n* > 1, then *lwork* ≥ *n*+1;

if *jobz* = 'V' and *n* > 1, then *lwork* ≥ n^2+2*n.
If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See Application Notes for details.

rwork — REAL for cheevd
DOUBLE PRECISION for zheevd

Workspace array, DIMENSION at least *lrwork*.

lrwork INTEGER.
The dimension of the array *rwork*. Constraints:

if $n \leq 1$, then *lrwork* ≥ 1;

if *job* = 'N' and $n > 1$, then *lrwork* $\geq n$;

if *job* = 'V' and $n > 1$, then *lrwork* $\geq 2*n^2+ 5*n + 1$.
If *lrwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See Application Notes for details.

iwork INTEGER. Workspace array, its dimension max(1, *liwork*).

liwork INTEGER.
The dimension of the array *iwork*. Constraints: if $n \leq 1$, then

liwork ≥ 1;

if *jobz* = 'N' and $n > 1$, then *liwork* ≥ 1;

if *jobz* = 'V' and $n > 1$, then *liwork* $\geq 5*n+3$.
If *liwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See Application Notes for details.

Output Parameters

w REAL for cheevd
DOUBLE PRECISION for zheevd
Array, DIMENSION at least max(1, *n*).
If *info* = 0, contains the eigenvalues of the matrix *A* in ascending order. See also *info*.

a If *jobz* = 'V', then on exit this array is overwritten by the unitary matrix *Z* which contains the eigenvectors of *A*.

work(1)	On exit, if *lwork* > 0, then the real part of *work*(1) returns the required minimal size of *lwork*.
rwork(1)	On exit, if *lrwork* > 0, then *rwork*(1) returns the required minimal size of *lrwork*.
iwork(1)	On exit, if *liwork* > 0, then *iwork*(1) returns the required minimal size of *liwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = *i*, and *jobz* = 'N', then the algorithm failed to converge; *i* off-diagonal elements of an intermediate tridiagonal form did not converge to zero; if *info* = *i*, and *jobz* = 'V', then the algorithm failed to compute an eigenvalue while working on the submatrix lying in rows and columns *info*/(*n*+1) through mod(*info*, *n*+1). If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine heevd interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
w	Holds the vector of length (*n*).
jobz	Must be 'N' or 'V'. The default value is 'N'.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed eigenvalues and eigenvectors are exact for a matrix $A + E$ such that $||E||_2 = O(\varepsilon)\ ||A||_2$, where ε is the machine precision.

If you are in doubt how much workspace to supply, use a generous value of *lwork* (*liwork* or *lrwork*) for the first run or set *lwork* = -1 (*liwork* = -1, *lrwork* = -1).

If you choose the first option and set any of admissible *lwork* (*liwork* or *lrwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*) on exit. Use this value (*work*(1), *iwork*(1), *rwork*(1)) for subsequent runs.

If you set *lwork* = -1 (*liwork* = -1, *lrwork* = -1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*, *lrwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The real analogue of this routine is ?syevd. See also ?hpevd for matrices held in packed storage, and ?hbevd for banded matrices.

?syevx

Computes selected eigenvalues and, optionally, eigenvectors of a symmetric matrix.

Syntax

Fortran 77:

```
call ssyevx(jobz, range, uplo, n, a, lda, vl, vu, il, iu, abstol, m, w, z,
ldz, work, lwork, iwork, ifail, info)
```

```
call dsyevx(jobz, range, uplo, n, a, lda, vl, vu, il, iu, abstol, m, w, z,
ldz, work, lwork, iwork, ifail, info)
```

Fortran 95:

```
call syevx(a, w [,uplo] [,z] [,vl] [,vu] [,il] [,iu] [,m] [,ifail] [,abstol]
[,info])
```

Description

This routine computes selected eigenvalues and, optionally, eigenvectors of a real symmetric matrix *A*. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Note that for most cases of real symmetric eigenvalue problems the default choice should be ?syevr function as its underlying algorithm is faster and uses less workspace. ?syevx is faster for a few selected eigenvalues.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then only eigenvalues are computed. If *jobz* = 'V', then eigenvalues and eigenvectors are computed.
range	CHARACTER*1. Must be 'A', 'V', or 'I'. If *range* = 'A', all eigenvalues will be found. If *range* = 'V', all eigenvalues in the half-open interval (*vl*, *vu*] will be found. If *range* = 'I', the eigenvalues with indices *il* through *iu* will be found.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *a* stores the upper triangular part of *A*. If *uplo* = 'L', *a* stores the lower triangular part of *A*.
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
a, *work*	REAL for ssyevx DOUBLE PRECISION for dsyevx. Arrays: *a*(*lda*,*) is an array containing either upper or lower triangular part of the symmetric matrix *A*, as specified by *uplo*. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of the array *a*. Must be at least max(1, *n*).
vl, *vu*	REAL for ssyevx DOUBLE PRECISION for dsyevx. If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues; *vl* ≤ *vu*. Not referenced if *range* = 'A'or 'I'.
il, *iu*	INTEGER.

If *range* = 'I', the indices of the smallest and largest eigenvalues to be returned.

Constraints: $1 \le il \le iu \le n$, if $n > 0$; $il = 1$ and $iu = 0$, if $n = 0$.

Not referenced if *range* = 'A' or 'V'.

abstol

REAL for ssyevx

DOUBLE PRECISION for dsyevx.

The absolute error tolerance for the eigenvalues. See Application Notes for more information.

ldz

INTEGER. The first dimension of the output array *z*; $ldz \ge 1$.

If *jobz* = 'V', then $ldz \ge \max(1, n)$.

lwork

INTEGER.

The dimension of the array *work*.

If $n \le 1$ then $lwork \ge 1$, otherwise $lwork = 8*n$.

If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

iwork

INTEGER. Workspace array, DIMENSION at least max(1, $5n$).

Output Parameters

a

On exit, the lower triangle (if *uplo* = 'L') or the upper triangle (if *uplo* = 'U') of *A*, including the diagonal, is overwritten.

m

INTEGER. The total number of eigenvalues found;

$0 \le m \le n$.

If *range* = 'A', $m = n$, and if *range* = 'I', $m = iu-il+1$.

w

REAL for ssyevx

DOUBLE PRECISION for dsyevx

Array, DIMENSION at least max(1, n). The first m elements contain the selected eigenvalues of the matrix *A* in ascending order.

z	REAL for ssyevx DOUBLE PRECISION for dsyevx. Array *z*(*ldz*,*) contains eigenvectors. The second dimension of *z* must be at least max(1, *m*). If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *A* corresponding to the selected eigenvalues, with the i-th column of *z* holding the eigenvector associated with *w*(i). If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*. If *jobz* = 'N', then *z* is not referenced. Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.
work(1)	On exit, if *lwork* > 0, then *work*(1) returns the required minimal size of *lwork*.
ifail	INTEGER. Array, DIMENSION at least max(1, *n*). If *jobz* = 'V', then if *info* = 0, the first *m* elements of *ifail* are zero; if *info* > 0, then *ifail* contains the indices of the eigenvectors that failed to converge. If *jobz* = 'V', then *ifail* is not referenced.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, then *i* eigenvectors failed to converge; their indices are stored in the array *ifail*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine syevx interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).

w	Holds the vector of length (*n*).
a	Holds the matrix *A* of size (*m*, *n*).
ifail	Holds the vector of length (*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
vl	Default value for this element is *vl* = -HUGE(*vl*).
vu	Default value for this element is *vu* = HUGE(*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this element is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted Note that there will be an error condition if *ifail* is present and *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

For optimum performance use *lwork* ≥ (*nb*+3)***n*, where *nb* is the maximum of the blocksize for ?sytrd and ?ormtr returned by ilaenv.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a,b] of width less than or equal to *abstol* + ε * max(|a|,|b|), where ε is the machine precision.

If *abstol* is less than or equal to zero, then ε*|*T*| is used in its place, where|*T*| is the 1-norm of the tridiagonal matrix obtained by reducing *A* to tridiagonal form. Eigenvalues will be computed most accurately when *abstol* is set to twice the underflow threshold 2*slamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, try setting *abstol* to 2*slamch('S').

?heevx

Computes selected eigenvalues and, optionally, eigenvectors of a Hermitian matrix.

Syntax

Fortran 77:

```
call cheevx(jobz, range, uplo, n, a, lda, vl, vu, il, iu, abstol, m, w, z,
ldz, work, lwork, rwork, iwork, ifail, info)
```

```
call zheevx(jobz, range, uplo, n, a, lda, vl, vu, il, iu, abstol, m, w, z,
ldz, work, lwork, rwork, iwork, ifail, info)
```

Fortran 95:

```
call heevx(a, w [,uplo] [,z] [,vl] [,vu] [,il] [,iu] [,m] [,ifail] [,abstol]
[,info])
```

Description

This routine computes selected eigenvalues and, optionally, eigenvectors of a complex Hermitian matrix *A*. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Note that for most cases of complex Hermetian eigenvalue problems the default choice should be ?heevr function as its underlying algorithm is faster and uses less workspace. ?heevx is faster for a few selected eigenvalues.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then only eigenvalues are computed. If *jobz* = 'V', then eigenvalues and eigenvectors are computed.
range	CHARACTER*1. Must be 'A', 'V', or 'I'. If *range* = 'A', all eigenvalues will be found. If *range* = 'V', all eigenvalues in the half-open interval (*vl*, *vu*] will be found. If *range* = 'I', the eigenvalues with indices *il* through *iu* will be found.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *a* stores the upper triangular part of *A*. If *uplo* = 'L', *a* stores the lower triangular part of *A*.
n	INTEGER. The order of the matrix *A* (*n* < 0).
a, *work*	COMPLEX for cheevx DOUBLE COMPLEX for zheevx. Arrays: *a*(*lda*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *A*, as specified by *uplo*. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of the array *a*. Must be at least max(1, *n*).
vl, *vu*	REAL for cheevx DOUBLE PRECISION for zheevx. If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues; *vl* ≤ *vu*. Not referenced if *range* = 'A'or 'I'.
il, *iu*	INTEGER. If *range* = 'I', the indices of the smallest and largest eigenvalues to be returned. Constraints: 1 ≤ *il* ≤ *iu* ≤ *n*, if *n* > 0;*il* = 1 and *iu* = 0, if *n* = 0. Not referenced if *range* = 'A'or 'V'.

abstol REAL for cheevx
DOUBLE PRECISION for zheevx. The absolute error tolerance for the eigenvalues. See Application Notes for more information.

ldz INTEGER. The first dimension of the output array *z*; *ldz* ≥ 1.
If *jobz* = 'V', then *ldz* ≥max(1, *n*).

lwork INTEGER.
The dimension of the array *work*.
lwork ≥ 1 if *n*≤1; otherwise at least 2**n*.
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.
See Application Notes for the suggested value of *lwork*.

rwork REAL for cheevx
DOUBLE PRECISION for zheevx.
Workspace array, DIMENSION at least max(1, 7*n*).

iwork INTEGER. Workspace array, DIMENSION at least max(1, 5*n*).

Output Parameters

a On exit, the lower triangle (if *uplo* = 'L') or the upper triangle (if *uplo* = 'U') of *A*, including the diagonal, is overwritten.

m INTEGER. The total number of eigenvalues found;0 ≤ *m* ≤ *n*.
If *range* = 'A', *m* = *n*, and if *range* = 'I', *m* = *iu*-*il*+1.

w REAL for cheevx
DOUBLE PRECISION for zheevx
Array, DIMENSION at least max(1, *n*). The first *m* elements contain the selected eigenvalues of the matrix *A* in ascending order.

z COMPLEX for cheevx
DOUBLE COMPLEX for zheevx.
Array *z*(*ldz*,*) contains eigenvectors.
The second dimension of *z* must be at least max(1, *m*).

	If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *A* corresponding to the selected eigenvalues, with the i-th column of *z* holding the eigenvector associated with *w*(i). If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*. If *jobz* = 'N', then *z* is not referenced. Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.
work(1)	On exit, if *lwork* > 0, then *work(1)* returns the required minimal size of *lwork*.
ifail	INTEGER. Array, DIMENSION at least max(1, *n*). If *jobz* = 'V', then if *info* = 0, the first *m* elements of *ifail* are zero; if *info* > 0, then *ifail* contains the indices of the eigenvectors that failed to converge. If *jobz* = 'V', then *ifail* is not referenced.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = –*i*, the *i*-th parameter had an illegal value. If *info* = *i*, then *i* eigenvectors failed to converge; their indices are stored in the array *ifail*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine heevx interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
w	Holds the vector of length (*n*).
z	Holds the matrix *Z* of size (*n*, *n*).
ifail	Holds the vector of length (*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

vl	Default value for this element is *vl* = -HUGE(*vl*).
vu	Default value for this element is *vu* = HUGE(*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this element is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted Note that there will be an error condition if *ifail* is present and *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

For optimum performance use *lwork* ≥ (*nb*+1)***n*, where *nb* is the maximum of the blocksize for ?hetrd and ?unmtr returned by ilaenv.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a,b] of width less than or equal to *abstol* + ε * max(|a|,|b|) , where ε is the machine precision.

If *abstol* is less than or equal to zero, then ε*|*T*| will be used in its place, where |*T*| is the 1-norm of the tridiagonal matrix obtained by reducing *A* to tridiagonal form. Eigenvalues will be computed most accurately when *abstol* is set to twice the underflow threshold 2*slamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, try setting *abstol* to 2*slamch('S').

?syevr

Computes selected eigenvalues and, optionally, eigenvectors of a real symmetric matrix using the Relatively Robust Representations.

Syntax

Fortran 77:

```
call ssyevr(jobz, range, uplo, n, a, lda, vl, vu, il, iu, abstol, m, w, z,
ldz, isuppz, work, lwork, iwork, liwork, info)
```

```
call dsyevr(jobz, range, uplo, n, a, lda, vl, vu, il, iu, abstol, m, w, z,
ldz, isuppz, work, lwork, iwork, liwork, info)
```

Fortran 95:

```
call syevr(a, w [,uplo] [,z] [,vl] [,vu] [,il] [,iu] [,m] [,isuppz] [,abstol]
[,info])
```

Description

This routine computes selected eigenvalues and, optionally, eigenvectors of a real symmetric matrix *A*. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

The routine first reduces the matrix *A* to tridiagonal form *T* with a call to ?sytrd. Then, whenever possible, ?syevr calls ?stemr to compute the eigenspectrum using Relatively Robust Representations. ?stemr computes eigenvalues by the *dqds* algorithm, while orthogonal eigenvectors are computed from various "good" $L*D*L^T$ representations (also known as Relatively Robust Representations). Gram-Schmidt orthogonalization is avoided as far as possible. More specifically, the various steps of the algorithm are as follows. For the each unreduced block of *T*,

a. Compute $T - \sigma * I = L * D * L^T$, so that L and D define all the wanted eigenvalues to high relative accuracy. This means that small relative changes in the entries of D and L cause only small relative changes in the eigenvalues and eigenvectors. The standard (unfactored) representation of the tridiagonal matrix T does not have this property in general;

b. Compute the eigenvalues to suitable accuracy. If the eigenvectors are desired, the algorithm attains full accuracy of the computed eigenvalues only right before the corresponding vectors have to be computed, see steps c) and d);

c. For each cluster of close eigenvalues, select a new shift close to the cluster, find a new factorization, and refine the shifted eigenvalues to suitable accuracy;

d. For each eigenvalue with a large enough relative separation compute the corresponding eigenvector by forming a rank revealing twisted factorization. Go back to c) for any clusters that remain.

The desired accuracy of the output can be specified by the input parameter *abstol*.

The routine ?syevr calls ?stemr when the full spectrum is requested on machines that conform to the IEEE-754 floating point standard. ?syevr calls ?stebz and ?stein on non-IEEE machines and when partial spectrum requests are made.

Note that ?syevr is preferable for most cases of real symmetric eigenvalue problems as its underlying algorithm is fast and uses less workspace.

Input Parameters

jobz — CHARACTER*1. Must be 'N' or 'V'.
If *jobz* = 'N', then only eigenvalues are computed.
If *jobz* = 'V', then eigenvalues and eigenvectors are computed.

range — CHARACTER*1. Must be 'A' or 'V' or 'I'.
If *range* = 'A', the routine computes all eigenvalues.
If *range* = 'V', the routine computes eigenvalues *lambda*(*i*) in the half-open interval:
vl < *lambda*(*i*) ≤ *vu*.
If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.
For *range* = 'V' or 'I' and *iu*-*il* < *n*-1, sstebz/dstebz and sstein/dstein are called.

uplo — CHARACTER*1. Must be 'U' or 'L'.

	If *uplo* = 'U', *a* stores the upper triangular part of *A*. If *uplo* = 'L', *a* stores the lower triangular part of *A*.
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
a, *work*	REAL for ssyevr DOUBLE PRECISION for dsyevr. Arrays: *a*(*lda*,*) is an array containing either upper or lower triangular part of the symmetric matrix *A*, as specified by *uplo*. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of the array *a*. Must be at least max(1, *n*).
vl, *vu*	REAL for ssyevr DOUBLE PRECISION for dsyevr. If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues. Constraint: *vl*< *vu*. If *range* = 'A' or 'I', *vl* and *vu* are not referenced.
il, *iu*	INTEGER. If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned. Constraint: 1 ≤ *il* ≤ *iu* ≤ *n*, if *n* > 0; *il*=1 and *iu*=0, if *n* = 0. If *range* = 'A' or 'V', *il* and *iu* are not referenced.
abstol	REAL for ssyevr DOUBLE PRECISION for dsyevr. The absolute error tolerance to which each eigenvalue/eigenvector is required. If *jobz* = 'V', the eigenvalues and eigenvectors output have residual norms bounded by *abstol*, and the dot products between different eigenvectors are bounded by *abstol*.

If *abstol* < *n* *eps*|*T*|, then *n* *eps*|*T*| will be used in its place, where eps is the machine precision, and |*T*| is the 1-norm of the matrix *T*. The eigenvalues are computed to an accuracy of eps*|*T*| irrespective of *abstol*.
If high relative accuracy is important, set *abstol* to ?lamch('S').

ldz — INTEGER. The leading dimension of the output array *z*.
Constraints:

ldz ≥ 1 if *jobz* = 'N';
ldz < max(1, *n*) if *jobz* = 'V'.

lwork — INTEGER.
The dimension of the array *work*.

Constraint: *lwork* ≥ max(1, 26*n*).
If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.
See Application Notes for the suggested value of *lwork*.

iwork — INTEGER. Workspace array, its dimension max(1, *liwork*).

liwork — INTEGER.

The dimension of the array *iwork*, *lwork* ≥ max(1, 10*n*).
If *liwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *iwork* array, returns this value as the first entry of the *iwork* array, and no error message related to *liwork* is issued by xerbla.

Output Parameters

a — On exit, the lower triangle (if *uplo* = 'L') or the upper triangle (if *uplo* = 'U') of *A*, including the diagonal, is overwritten.

m — INTEGER. The total number of eigenvalues found, 0 ≤ *m* ≤ *n*.
If *range* = 'A', *m* = *n*, and if *range* = 'I', *m* = *iu*-*il*+1.

w, *z* — REAL for ssyevr

DOUBLE PRECISION for dsyevr.
Arrays:
w(*), DIMENSION at least max(1, *n*), contains the selected eigenvalues in ascending order, stored in *w*(1) to *w*(*m*);
z(*ldz*, *), the second dimension of *z* must be at least max(1, *m*).
If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *T* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*).
If *jobz* = 'N', then *z* is not referenced. Note that you must ensure that at least max(1, *m*) columns are supplied in the array *z* ; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.

isuppz — INTEGER.
Array, DIMENSION at least 2 *max(1, *m*).
The support of the eigenvectors in *z*, i.e., the indices indicating the nonzero elements in *z*. The *i*-th eigenvector is nonzero only in elements *isuppz*(2*i*-1) through *isuppz*(2*i*). Currently is not implemented, nor referenced.

work(1) — On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.

iwork(1) — On exit, if *info* = 0, then *iwork(1)* returns the required minimal size of *liwork*.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, an internal error has occurred.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine syevr interface are the following:

a — Holds the matrix *A* of size (*n*, *n*).

w — Holds the vector of length (*n*).

z	Holds the matrix *Z* of size (*n*, *n*), where the values *n* and *m* are significant.
isuppz	Holds the vector of length (2**m*), where the values (2**m*) are significant.
uplo	Must be 'U' or 'L'. The default value is 'U'.
vl	Default value for this element is *vl* = -HUGE(*vl*).
vu	Default value for this element is *vu* = HUGE(*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this element is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted Note that there will be an error condition if *isuppz* is present and *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

For optimum performance use *lwork* ≥ (*nb*+6)**n*, where *nb* is the maximum of the blocksize for ?sytrd and ?ormtr returned by ilaenv.

If you are in doubt how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run or set *lwork* = -1 (*liwork* = -1).

If you choose the first option and set any of admissible *lwork* (or *liwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

Normal execution of ?stegr may create NaNs and infinities and hence may abort due to a floating point exception in environments which do not handle NaNs and infinities in the IEEE standard default manner.

?heevr

Computes selected eigenvalues and, optionally, eigenvectors of a Hermitian matrix using the Relatively Robust Representations.

Syntax

Fortran 77:

```
call cheevr(jobz, range, uplo, n, a, lda, vl, vu, il, iu, abstol, m, w, z,
ldz, isuppz, work, lwork, rwork, lrwork, iwork, liwork, info)
```

```
call zheevr(jobz, range, uplo, n, a, lda, vl, vu, il, iu, abstol, m, w, z,
ldz, isuppz, work, lwork, rwork, lrwork, iwork, liwork, info)
```

Fortran 95:

```
call heevr(a, w [,uplo] [,z] [,vl] [,vu] [,il] [,iu] [,m] [,isuppz] [,abstol]
[,info])
```

Description

This routine computes selected eigenvalues and, optionally, eigenvectors of a complex Hermitian matrix *A*. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

THe routine first reduces the matrix *A* to tridiagonal form *T* with a call to ?HETRD. Then, whenever possible, ?heevr calls ?stegr to compute the eigenspectrum using Relatively Robust Representations. ?stegr computes eigenvalues by the *dqds* algorithm, while orthogonal eigenvectors are computed from various "good" $L*D*L^T$ representations (also known as Relatively Robust Representations). Gram-Schmidt orthogonalization is avoided as far as possible. More specifically, the various steps of the algorithm are as follows. For each unreduced block (submatrix) of *T*,

a. Compute $T - \sigma * I = L * D * L^T$, so that L and D define all the wanted eigenvalues to high relative accuracy. This means that small relative changes in the entries of D and L cause only small relative changes in the eigenvalues and eigenvectors. The standard (unfactored) representation of the tridiagonal matrix T does not have this property in general;

b. compute the eigenvalues to suitable accuracy. If the eigenvectors are desired, the algorithm attains full accuracy of the computed eigenvalues only right before the corresponding vectors have to be computed, see steps c) and d);

c. for each cluster of close eigenvalues, select a new shift close to the cluster, find a new factorization, and refine the shifted eigenvalues to suitable accuracy;

d. For each eigenvalue with a large enough relative separation compute the corresponding eigenvector by forming a rank revealing twisted factorization. Go back to the step c) for any clusters that remain.

The desired accuracy of the output can be specified by the input parameter *abstol*.

The routine ?heevr calls ?stemr when the full spectrum is requested on machines which conform to the IEEE-754 floating point standard, or ?stebz and ?stein on non-IEEE machines and when partial spectrum requests are made.

Note that the routine ?heevr is preferable for most cases of complex Hermitian eigenvalue problems as its underlying algorithm is fast and uses less workspace.

Input Parameters

jobz — CHARACTER*1. Must be 'N' or 'V'.
If *job* = 'N', then only eigenvalues are computed.
If *job* = 'V', then eigenvalues and eigenvectors are computed.

range — CHARACTER*1. Must be 'A' or 'V' or 'I'.
If *range* = 'A', the routine computes all eigenvalues.
If *range* = 'V', the routine computes eigenvalues *lambda*(*i*) in the half-open interval: $vl < lambda(i) \leq vu$.
If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.
For *range* = 'V'or 'I', sstebz/dstebz and cstein/zstein are called.

uplo — CHARACTER*1. Must be 'U' or 'L'.
If *uplo* = 'U', *a* stores the upper triangular part of *A*.

If *uplo* = 'L', *a* stores the lower triangular part of *A*.

n
INTEGER. The order of the matrix *A* (*n* ≥ 0).

a, *work*
COMPLEX for cheevr
DOUBLE COMPLEX for zheevr.
Arrays:
a(*lda*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *A*, as specified by *uplo*.
The second dimension of *a* must be at least max(1, *n*).
work is a workspace array, its dimension max(1, *lwork*).

lda
INTEGER. The first dimension of the array *a*.
Must be at least max(1, *n*).

vl, *vu*
REAL for cheevr
DOUBLE PRECISION for zheevr.
If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.
Constraint: *vl*< *vu*.
If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, *iu*
INTEGER.
If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.
Constraint: 1 ≤ *il* ≤ *iu* ≤ *n*, if *n* > 0; *il*=1 and *iu*=0 if *n* = 0.
If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol
REAL for cheevr
DOUBLE PRECISION for zheevr.
The absolute error tolerance to which each eigenvalue/eigenvector is required.
If *jobz* = 'V', the eigenvalues and eigenvectors output have residual norms bounded by *abstol*, and the dot products between different eigenvectors are bounded by *abstol*.
If *abstol* < *n* *eps*|*T*|, then *n* *eps*|*T*| will be used in its place, where eps is the machine precision, and |*T*| is the 1-norm of the matrix *T*. The eigenvalues are computed to an accuracy of eps*|*T*| irrespective of *abstol*.

If high relative accuracy is important, set *abstol* to ?lamch('S').

ldz INTEGER. The leading dimension of the output array *z*.
Constraints:

ldz ≥ 1 if *jobz* = 'N';

ldz ≥ max(1, *n*) if *jobz* = 'V'.

lwork INTEGER.
The dimension of the array *work*.

Constraint: *lwork* ≥ max(1, 2*n*).
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

rwork REAL for cheevr
DOUBLE PRECISION for zheevr.
Workspace array, DIMENSION max(1, *lwork*).

lrwork INTEGER.
The dimension of the array *rwork*;

lwork ≥ max(1, 24*n*).
If *lrwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla.

iwork INTEGER. Workspace array, its dimension max(1, *liwork*).

liwork INTEGER.
The dimension of the array *iwork*,

lwork ≥ max(1, 10*n*).
If *liwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla.

Output Parameters

a	On exit, the lower triangle (if *uplo* = 'L') or the upper triangle (if *uplo* = 'U') of *A*, including the diagonal, is overwritten.
m	INTEGER. The total number of eigenvalues found, $0 \le m \le n$. If *range* = 'A', $m = n$, and if *range* = 'I', $m = iu-il+1$.
w	REAL for cheevr DOUBLE PRECISION for zheevr. Array, DIMENSION at least max(1, *n*), contains the selected eigenvalues in ascending order, stored in *w*(1) to *w*(*m*).
z	COMPLEX for cheevr DOUBLE COMPLEX for zheevr. Array *z*(*ldz*, *); the second dimension of *z* must be at least max(1, *m*). If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *T* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). If *jobz* = 'N', then *z* is not referenced. Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.
isuppz	INTEGER. Array, DIMENSION at least 2 *max(1, *m*). The support of the eigenvectors in *z*, i.e., the indices indicating the nonzero elements in *z*. The *i*-th eigenvector is nonzero only in elements *isuppz*(2*i*-1) through *isuppz*(2*i*).
work(1)	On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.
rwork(1)	On exit, if *info* = 0, then *rwork(1)* returns the required minimal size of *lrwork*.

iwork(1)	On exit, if *info* = 0, then *iwork(1)* returns the required minimal size of *liwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, an internal error has occurred.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine heevr interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
w	Holds the vector of length (*n*).
z	Holds the matrix *Z* of size (*n*, *n*), where the values *n* and *m* are significant.
isuppz	Holds the vector of length (2**n*), where the values (2**m*) are significant.
uplo	Must be 'U' or 'L'. The default value is 'U'.
vl	Default value for this element is *vl* = -HUGE(*vl*).
vu	Default value for this element is *vu* = HUGE(*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this element is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted Note that there will be an error condition if *isuppz* is present and *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

For optimum performance use *lwork* ≥ (*nb*+1)***n*, where *nb* is the maximum of the blocksize for ?hetrd and ?unmtr returned by ilaenv.

If you are in doubt how much workspace to supply, use a generous value of *lwork* (or *lrwork*, or *liwork*) for the first run or set *lwork* = -1 (*lrwork* = -1, *liwork* = -1).

If you choose the first option and set any of admissible *lwork* (or *lrwork*, *liwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *rwork*, *iwork*) on exit. Use this value (*work*(1), *rwork*(1), *iwork*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *rwork*, *iwork*). This operation is called a workspace query.

Note that if you set *lwork* (*lrwork*, *liwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

Normal execution of ?stegr may create NaNs and infinities and hence may abort due to a floating point exception in environments which do not handle NaNs and infinities in the IEEE standard default manner.

?spev

Computes all eigenvalues and, optionally, eigenvectors of a real symmetric matrix in packed storage.

Syntax

Fortran 77:

```
call sspev(jobz, uplo, n, ap, w, z, ldz, work, info)
call dspev(jobz, uplo, n, ap, w, z, ldz, work, info)
```

Fortran 95:

```
call spev(a, w [,uplo] [,z] [,info])
```

Description

This routine computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix *A* in packed storage.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *job* = 'N', then only eigenvalues are computed. If *job* = 'V', then eigenvalues and eigenvectors are computed.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *ap* stores the packed upper triangular part of *A*. If *uplo* = 'L', *ap* stores the packed lower triangular part of *A*.
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
ap, *work*	REAL for sspev DOUBLE PRECISION for dspev Arrays: *ap(*)* contains the packed upper or lower triangle of symmetric matrix *A*, as specified by *uplo*. The dimension of *ap* must be at least max(1, *n**(*n*+1)/2).
work	(*) is a workspace array, DIMENSION at least max(1, 3*n*).
ldz	INTEGER. The leading dimension of the output array *z*. Constraints: if *jobz* = 'N', then *ldz* ≥ 1; if *jobz* = 'V', then *ldz* ≥ max(1, *n*).

Output Parameters

w, *z*	REAL for sspev DOUBLE PRECISION for dspev Arrays: *w*(*), DIMENSION at least max(1, *n*). If *info* = 0, *w* contains the eigenvalues of the matrix *A* in ascending order.

	z(ldz,*). The second dimension of z must be at least max(1, n). If jobz = 'V', then if info = 0, z contains the orthonormal eigenvectors of the matrix A, with the i-th column of z holding the eigenvector associated with w(i). If jobz = 'N', then z is not referenced.
ap	On exit, this array is overwritten by the values generated during the reduction to tridiagonal form. The elements of the diagonal and the off-diagonal of the tridiagonal matrix overwrite the corresponding elements of A.
info	INTEGER. If info = 0, the execution is successful. If info = -i, the i-th parameter had an illegal value. If info = i, then the algorithm failed to converge; i indicates the number of elements of an intermediate tridiagonal form which did not converge to zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine spev interface are the following:

a	Stands for argument ap in Fortan 77 interface. Holds the array A of size (n*(n+1)/2).
w	Holds the vector of length (n).
z	Holds the matrix Z of size (n, n).
uplo	Must be 'U' or 'L'. The default value is 'U'.
jobz	Restored based on the presence of the argument z as follows: jobz = 'V', if z is present, jobz = 'N', if z is omitted.

?hpev

Computes all eigenvalues and, optionally, eigenvectors of a Hermitian matrix in packed storage.

Syntax

Fortran 77:

```
call chpev(jobz, uplo, n, ap, w, z, ldz, work, rwork, info)
call zhpev(jobz, uplo, n, ap, w, z, ldz, work, rwork, info)
```

Fortran 95:

```
call hpev(a, w [,uplo] [,z] [,info])
```

Description

This routine computes all the eigenvalues and, optionally, eigenvectors of a complex Hermitian matrix *A* in packed storage.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *job* = 'N', then only eigenvalues are computed. If *job* = 'V', then eigenvalues and eigenvectors are computed.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *ap* stores the packed upper triangular part of *A*. If *uplo* = 'L', *ap* stores the packed lower triangular part of *A*.
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
ap, *work*	COMPLEX for chpev DOUBLE COMPLEX for zhpev. Arrays: *ap(*)* contains the packed upper or lower triangle of Hermitian matrix A, as specified by *uplo*. The dimension of *ap* must be at least max(1, *n**(*n*+1)/2).

work (*) is a workspace array, DIMENSION at least max(1, 2n-1).

ldz INTEGER. The leading dimension of the output array *z*.
Constraints:
if *jobz* = 'N', then *ldz* ≥ 1;
if *jobz* = 'V', then *ldz* ≥ max(1, *n*) .

rwork REAL for chpev
DOUBLE PRECISION for zhpev.
Workspace array, DIMENSION at least max(1, 3n-2).

Output Parameters

w REAL for chpev
DOUBLE PRECISION for zhpev.
Array, DIMENSION at least max(1, *n*).
If *info* = 0, *w* contains the eigenvalues of the matrix *A* in ascending order.

z COMPLEX for chpev
DOUBLE COMPLEX for zhpev.
Array z(*ldz*,*).
The second dimension of *z* must be at least max(1, *n*).
If *jobz* = 'V', then if *info* = 0, *z* contains the orthonormal eigenvectors of the matrix *A*, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*).
If *jobz* = 'N', then *z* is not referenced.

ap On exit, this array is overwritten by the values generated during the reduction to tridiagonal form. The elements of the diagonal and the off-diagonal of the tridiagonal matrix overwrite the corresponding elements of A.

info INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*th parameter had an illegal value.
If *info* = *i*, then the algorithm failed to converge; *i* indicates the number of elements of an intermediate tridiagonal form which did not converge to zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `hpev` interface are the following:

a	Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n*(n+1)/2*).
w	Holds the vector of length (*n*).
z	Holds the matrix *Z* of size (*n*, *n*).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = `'V'`, if *z* is present, *jobz* = `'N'`, if *z* is omitted.

?spevd

Uses divide and conquer algorithm to compute all eigenvalues and (optionally) all eigenvectors of a real symmetric matrix held in packed storage.

Syntax

Fortran 77:

```
call sspevd(jobz, uplo, n, ap, w, z, ldz, work, lwork, iwork, liwork, info)
call dspevd(jobz, uplo, n, ap, w, z, ldz, work, lwork, iwork, liwork, info)
```

Fortran 95:

```
call spevd(a, w [,uplo] [,z] [,info])
```

Description

This routine computes all the eigenvalues, and optionally all the eigenvectors, of a real symmetric matrix *A* (held in packed storage). In other words, it can compute the spectral factorization of *A* as:

$A = Z\Lambda Z^T$.

Here Λ is a diagonal matrix whose diagonal elements are the eigenvalues λ_i, and Z is the orthogonal matrix whose columns are the eigenvectors z_i. Thus,

$Az_i = \lambda_i z_i$ for $i = 1, 2, \ldots, n$.

If the eigenvectors are requested, then this routine uses a divide and conquer algorithm to compute eigenvalues and eigenvectors. However, if only eigenvalues are required, then it uses the Pal-Walker-Kahan variant of the QL or QR algorithm.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then only eigenvalues are computed. If *jobz* = 'V', then eigenvalues and eigenvectors are computed.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *ap* stores the packed upper triangular part of *A*. If *uplo* = 'L', *ap* stores the packed lower triangular part of *A*.
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
ap, *work*	REAL for sspevd DOUBLE PRECISION for dspevd Arrays: *ap(*)* contains the packed upper or lower triangle of symmetric matrix A, as specified by *uplo*. The dimension of *ap* must be at least max(1, *n**(*n*+1)/2) *work* is a workspace array, its dimension max(1, *lwork*).
ldz	INTEGER. The leading dimension of the output array *z*. Constraints: if *jobz* = 'N', then *ldz* ≥ 1; if *jobz* = 'V', then *ldz* ≥ max(1, *n*).
lwork	INTEGER. The dimension of the array *work*. Constraints: if *n* ≤ 1, then *lwork* ≥ 1; if *jobz* = 'N' and *n* > 1, then *lwork* ≥ 2**n*;

if *jobz* = 'V' and *n* > 1, then

lwork ≥ n^2+ 6**n* + 1.

If *lwork* = −1, then a workspace query is assumed; the routine only calculates the required sizes of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See Application Notes for details.

iwork — INTEGER. Workspace array, its dimension max(1, *liwork*).

liwork — INTEGER.

The dimension of the array *iwork*.

Constraints:

if *n* ≤ 1, then *liwork* ≥ 1;

if *jobz* = 'N' and *n* > 1, then *liwork* ≥ 1;

if *jobz* = 'V' and *n* > 1, then *liwork* ≥ 5**n*+3.

If *liwork* = −1, then a workspace query is assumed; the routine only calculates the required sizes of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See Application Notes for details.

Output Parameters

w, *z*

REAL for sspevd

DOUBLE PRECISION for dspevd

Arrays:

w(*), DIMENSION at least max(1, *n*).

If *info* = 0, contains the eigenvalues of the matrix *A* in ascending order. See also *info*.

z(*ldz*,*).

The second dimension of *z* must be: at least 1 if *jobz* = 'N';at least max(1, *n*) if *jobz* = 'V'.

If *jobz* = 'V', then this array is overwritten by the orthogonal matrix *Z* which contains the eigenvectors of *A*.

If *jobz* = 'N', then *z* is not referenced.

ap	On exit, this array is overwritten by the values generated during the reduction to tridiagonal form. The elements of the diagonal and the off-diagonal of the tridiagonal matrix overwrite the corresponding elements of A.
work(1)	On exit, if *info* = 0, then *work*(1) returns the required *lwork*.
iwork(1)	On exit, if *info* = 0, then *iwork*(1) returns the required *liwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = *i*, then the algorithm failed to converge; *i* indicates the number of elements of an intermediate tridiagonal form which did not converge to zero. If *info* = –*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine spevd interface are the following:

a	Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n*(n+1)/2*).
w	Holds the vector of length (*n*).
z	Holds the matrix *Z* of size (*n*, *n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted.

Application Notes

The computed eigenvalues and eigenvectors are exact for a matrix $T + E$ such that $||E||_2 = O(\varepsilon)||T||_2$, where ε is the machine precision.

If you are in doubt how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run or set *lwork* = –1 (*liwork* = –1).

If you choose the first option and set any of admissible *lwork* (or *liwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If you set *lwork* = -1 (*liwork* = -1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The complex analogue of this routine is ?hpevd.

See also ?syevd for matrices held in full storage, and ?sbevd for banded matrices.

?hpevd

Uses divide and conquer algorithm to compute all eigenvalues and (optionally) all eigenvectors of a complex Hermitian matrix held in packed storage.

Syntax

Fortran 77:

```
call chpevd(jobz, uplo, n, ap, w, z, ldz, work, lwork, rwork, lrwork, iwork, liwork, info)
```

```
call zhpevd(jobz, uplo, n, ap, w, z, ldz, work, lwork, rwork, lrwork, iwork, liwork, info)
```

Fortran 95:

```
call hpevd(a, w [,uplo] [,z] [,info])
```

Description

This routine computes all the eigenvalues, and optionally all the eigenvectors, of a complex Hermitian matrix A (held in packed storage). In other words, it can compute the spectral factorization of A as: $A = Z\Lambda Z^H$.

Here Λ is a real diagonal matrix whose diagonal elements are the eigenvalues λ_i, and Z is the (complex) unitary matrix whose columns are the eigenvectors z_i. Thus,

$Az_i = \lambda_i z_i$ for $i = 1, 2, \ldots, n$.

If the eigenvectors are requested, then this routine uses a divide and conquer algorithm to compute eigenvalues and eigenvectors. However, if only eigenvalues are required, then it uses the Pal-Walker-Kahan variant of the QL or QR algorithm.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then only eigenvalues are computed. If *jobz* = 'V', then eigenvalues and eigenvectors are computed.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *ap* stores the packed upper triangular part of *A*. If *uplo* = 'L', *ap* stores the packed lower triangular part of *A*.
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
ap, *work*	COMPLEX for chpevd DOUBLE COMPLEX for zhpevd Arrays: *ap(*)* contains the packed upper or lower triangle of Hermitian matrix A, as specified by *uplo*. The dimension of *ap* must be at least max(1, *n**(*n*+1)/2). *work* is a workspace array, its dimension max(1, *lwork*).
ldz	INTEGER. The leading dimension of the output array *z*. Constraints: if *jobz* = 'N', then *ldz* ≥ 1; if *jobz* = 'V', then *ldz* ≥ max(1, *n*).
lwork	INTEGER. The dimension of the array *work*. Constraints: if *n* ≤ 1, then *lwork* ≥ 1; if *jobz* = 'N' and *n* > 1, then *lwork* ≥ *n*;

if *jobz* = 'V' and *n* > 1, then *lwork* ≥ 2*n.
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See Application Notes for details.

rwork REAL for chpevd
DOUBLE PRECISION for zhpevd
Workspace array, its dimension max(1, *lrwork*).

lrwork INTEGER.
The dimension of the array *rwork*. Constraints:

if *n* ≤ 1, then *lrwork* ≥ 1;

if *jobz* = 'N' and *n* > 1, then *lrwork* ≥ *n*;

if *jobz* = 'V' and *n* > 1, then *lrwork* ≥ 2*n^2 + 5*n + 1.
If *lrwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See Application Notes for details.

iwork INTEGER. Workspace array, its dimension max(1, *liwork*).

liwork INTEGER.
The dimension of the array *iwork*.
Constraints:

if *n* ≤ 1, then *liwork* ≥ 1;

if *jobz* = 'N' and *n* > 1, then *liwork* ≥ 1;

if *jobz* = 'V' and *n* > 1, then *liwork* ≥ 5*n+3.
If *liwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See Application Notes for details.

Output Parameters

w	REAL for chpevd DOUBLE PRECISION for zhpevd Array, DIMENSION at least max(1, *n*). If *info* = 0, contains the eigenvalues of the matrix *A* in ascending order. See also *info*.
z	COMPLEX for chpevd DOUBLE COMPLEX for zhpevd Array, DIMENSION (*ldz*,*). The second dimension of *z* must be: at least 1 if *jobz* = 'N'; at least max(1, *n*) if *jobz* = 'V'. If *jobz* = 'V', then this array is overwritten by the unitary matrix *Z* which contains the eigenvectors of *A*. If *jobz* = 'N', then *z* is not referenced.
ap	On exit, this array is overwritten by the values generated during the reduction to tridiagonal form. The elements of the diagonal and the off-diagonal of the tridiagonal matrix overwrite the corresponding elements of A.
work(1)	On exit, if *info* = 0, then *work*(1) returns the required minimal size of *lwork*.
rwork(1)	On exit, if *info* = 0, then *rwork*(1) returns the required minimal size of *lrwork*.
iwork(1)	On exit, if *info* = 0, then *iwork(1)* returns the required minimal size of *liwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = *i*, then the algorithm failed to converge; *i* indicates the number of elements of an intermediate tridiagonal form which did not converge to zero. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `hpevd` interface are the following:

a	Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n*(n+1)/2*).
w	Holds the vector of length (*n*).
z	Holds the matrix *Z* of size (*n*, *n*).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = `'V'`, if *z* is present, *jobz* = `'N'`, if *z* is omitted.

Application Notes

The computed eigenvalues and eigenvectors are exact for a matrix $T + E$ such that $||E||_2 = O(\varepsilon)||T||_2$, where ε is the machine precision.

If you are in doubt how much workspace to supply, use a generous value of *lwork* (*liwork* or *lrwork*) for the first run or set *lwork* = −1 (*liwork* = −1, *lrwork* = −1).

If you choose the first option and set any of admissible *lwork* (*liwork* or *lrwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*) on exit. Use this value (*work*(1), *iwork*(1), *rwork*(1)) for subsequent runs.

If you set *lwork* = −1 (*liwork* = −1, *lrwork* = −1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*, *lrwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The real analogue of this routine is `?spevd`.

See also `?heevd` for matrices held in full storage, and `?hbevd` for banded matrices.

?spevx

Computes selected eigenvalues and, optionally, eigenvectors of a real symmetric matrix in packed storage.

Syntax

Fortran 77:

```
call sspevx(jobz, range, uplo, n, ap, vl, vu, il, iu, abstol, m, w, z, ldz, work, iwork, ifail, info)
```

```
call dspevx(jobz, range, uplo, n, ap, vl, vu, il, iu, abstol, m, w, z, ldz, work, iwork, ifail, info)
```

Fortran 95:

```
call spevx(a, w [,uplo] [,z] [,vl] [,vu] [,il] [,iu] [,m] [,ifail] [,abstol] [,info])
```

Description

This routine computes selected eigenvalues and, optionally, eigenvectors of a real symmetric matrix *A* in packed storage. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *job* = 'N', then only eigenvalues are computed. If *job* = 'V', then eigenvalues and eigenvectors are computed.
range	CHARACTER*1. Must be 'A' or 'V' or 'I'. If *range* = 'A', the routine computes all eigenvalues. If *range* = 'V', the routine computes eigenvalues *lambda*(*i*) in the half-open interval: $vl < lambda(i) \le vu$. If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *ap* stores the packed upper triangular part of *A*.

If *uplo* = 'L', *ap* stores the packed lower triangular part of *A*.

n — INTEGER. The order of the matrix *A* (*n* ≥ 0).

ap, *work* — REAL for sspevx
DOUBLE PRECISION for dspevx
Arrays:
ap(*) contains the packed upper or lower triangle of the symmetric matrix *A*, as specified by *uplo*.
The dimension of *ap* must be at least max(1, *n**(*n*+1)/2).
work(*) is a workspace array, DIMENSION at least max(1, 8*n*).

vl, *vu* — REAL for sspevx
DOUBLE PRECISION for dspevx
If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.
Constraint: *vl*< *vu*.
If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, *iu* — INTEGER.
If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.
Constraint: 1 ≤ *il* ≤ *iu* ≤ *n*, if *n* > 0; *il*=1 and *iu*=0 if *n* = 0.
If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol — REAL for sspevx
DOUBLE PRECISION for dspevx
The absolute error tolerance to which each eigenvalue is required. See Application notes for details on error tolerance.

ldz — INTEGER. The leading dimension of the output array *z*.
Constraints:
if *jobz* = 'N', then *ldz* ≥ 1;
if *jobz* = 'V', then *ldz* ≥ max(1, *n*).

iwork — INTEGER. Workspace array, DIMENSION at least max(1, 5*n*).

Output Parameters

ap	On exit, this array is overwritten by the values generated during the reduction to tridiagonal form. The elements of the diagonal and the off-diagonal of the tridiagonal matrix overwrite the corresponding elements of *A*.
m	INTEGER. The total number of eigenvalues found, $0 \le m \le n$. If *range* = 'A', $m = n$, and if *range* = 'I', $m = iu-il+1$.
w, *z*	REAL for sspevx DOUBLE PRECISION for dspevx Arrays: *w(*)*, DIMENSION at least max(1, *n*). If *info* = 0, contains the selected eigenvalues of the matrix *A* in ascending order. z(*ldz*,*). The second dimension of *z* must be at least max(1, *m*). If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *A* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*. If *jobz* = 'N', then *z* is not referenced. Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.
ifail	INTEGER. Array, DIMENSION at least max(1, *n*). If *jobz* = 'V', then if *info* = 0, the first *m* elements of *ifail* are zero; if *info* > 0, the *ifail* contains the indices the eigenvectors that failed to converge. If *jobz* = 'N', then *ifail* is not referenced.
info	INTEGER. If *info* = 0, the execution is successful.

If *info* = *-i*, the *i*-th parameter had an illegal value.
If *info* = *i*, then *i* eigenvectors failed to converge; their indices are stored in the array *ifail*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine spevx interface are the following:

a	Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n*(n+1)/2*).
w	Holds the vector of length (*n*).
z	Holds the matrix *Z* of size (*n*, *n*), where the values *n* and *m* are significant.
ifail	Holds the vector of length (*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
vl	Default value for this element is *vl* = -HUGE(*vl*).
vu	Default value for this element is *vu* = HUGE(*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this element is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted Note that there will be an error condition if *ifail* is present and *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a,b] of width less than or equal to *abstol* + ε * max(|a|,|b|), where ε is the machine precision.

If *abstol* is less than or equal to zero, then ε*||*T*||$_1$ will be used in its place, where *T* is the tridiagonal matrix obtained by reducing *A* to tridiagonal form. Eigenvalues will be computed most accurately when *abstol* is set to twice the underflow threshold 2*?lamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, try setting *abstol* to 2*?lamch('S').

?hpevx

Computes selected eigenvalues and, optionally, eigenvectors of a Hermitian matrix in packed storage.

Syntax

Fortran 77:

```
call chpevx(jobz, range, uplo, n, ap, vl, vu, il, iu, abstol, m, w, z, ldz,
work, rwork, iwork, ifail, info)
```

```
call zhpevx(jobz, range, uplo, n, ap, vl, vu, il, iu, abstol, m, w, z, ldz,
work, rwork, iwork, ifail, info)
```

Fortran 95:

```
call hpevx(a, w [,uplo] [,z] [,vl] [,vu] [,il] [,iu] [,m] [,ifail] [,abstol]
[,info])
```

Description

This routine computes selected eigenvalues and, optionally, eigenvectors of a complex Hermitian matrix *A* in packed storage. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *job* = 'N', then only eigenvalues are computed.

If *job* = 'V', then eigenvalues and eigenvectors are computed.

range — CHARACTER*1. Must be 'A' or 'V' or 'I'.
If *range* = 'A', the routine computes all eigenvalues.
If *range* = 'V', the routine computes eigenvalues *lambda*(*i*) in the half-open interval: *vl*<*lambda*(*i*) ≤ *vu*.
If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.

uplo — CHARACTER*1. Must be 'U' or 'L'.
If *uplo* = 'U', *ap* stores the packed upper triangular part of *A*.
If *uplo* = 'L', *ap* stores the packed lower triangular part of *A*.

n — INTEGER. The order of the matrix *A* (*n* ≥ 0).

ap, *work* — COMPLEX for chpevx
DOUBLE COMPLEX for zhpevx
Arrays:
ap(*) contains the packed upper or lower triangle of the Hermitian matrix *A*, as specified by *uplo*.
The dimension of *ap* must be at least max(1, *n**(*n*+1)/2).
work(*) is a workspace array, DIMENSION at least max(1, 2*n*).

vl, *vu* — REAL for chpevx
DOUBLE PRECISION for zhpevx
If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.
Constraint: *vl*< *vu*.
If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, *iu* — INTEGER.
If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.
Constraint: 1 ≤ *il* ≤ *iu* ≤ *n*, if *n* > 0; *il*=1 and *iu*=0 if *n* = 0.
If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol — REAL for chpevx
DOUBLE PRECISION for zhpevx

The absolute error tolerance to which each eigenvalue is required. See Application notes for details on error tolerance.

ldz — INTEGER. The leading dimension of the output array *z*. Constraints:

if *jobz* = 'N', then *ldz* ≥ 1;

if *jobz* = 'V', then *ldz* ≥ max(1, *n*).

rwork — REAL for chpevx
DOUBLE PRECISION for zhpevx
Workspace array, DIMENSION at least max(1, 7*n*).

iwork — INTEGER. Workspace array, DIMENSION at least max(1, 5*n*).

Output Parameters

ap — On exit, this array is overwritten by the values generated during the reduction to tridiagonal form. The elements of the diagonal and the off-diagonal of the tridiagonal matrix overwrite the corresponding elements of *A*.

m — INTEGER. The total number of eigenvalues found, 0 ≤ *m* ≤ *n*.
If *range* = 'A', *m* = *n*, and if *range* = 'I', *m* = *iu*-*il*+1.

w — REAL for chpevx
DOUBLE PRECISION for zhpevx
Array, DIMENSION at least max(1, *n*).
If *info* = 0, contains the selected eigenvalues of the matrix *A* in ascending order.

z — COMPLEX for chpevx
DOUBLE COMPLEX for zhpevx
Array z(*ldz*,*).
The second dimension of *z* must be at least max(1, *m*).
If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *A* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*).
If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*.

	If *jobz* = 'N', then *z* is not referenced. Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.
ifail	INTEGER. Array, DIMENSION at least max(1, *n*). If *jobz* = 'V', then if *info* = 0, the first *m* elements of *ifail* are zero; if *info* > 0, the *ifail* contains the indices the eigenvectors that failed to converge. If *jobz* = 'N', then *ifail* is not referenced.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*th parameter had an illegal value. If *info* = *i*, then *i* eigenvectors failed to converge; their indices are stored in the array *ifail*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine hpevx interface are the following:

a	Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n*(n+1)/2*).
w	Holds the vector of length (*n*).
z	Holds the matrix *Z* of size (*n*, *n*), where the values *n* and *m* are significant.
ifail	Holds the vector of length (*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
vl	Default value for this element is *vl* = -HUGE(*vl*).
vu	Default value for this element is *vu* = HUGE(*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this element is *abstol* = 0.0_WP.

jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted Note that there will be an error condition if *ifail* is present and *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a,b] of width less than or equal to *abstol* + ε * max(|a|,|b|), where ε is the machine precision.

If *abstol* is less than or equal to zero, then $\varepsilon * ||T||_1$ will be used in its place, where *T* is the tridiagonal matrix obtained by reducing *A* to tridiagonal form. Eigenvalues will be computed most accurately when *abstol* is set to twice the underflow threshold 2*?lamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, try setting *abstol* to 2*?lamch('S').

?sbev

Computes all eigenvalues and, optionally, eigenvectors of a real symmetric band matrix.

Syntax

Fortran 77:

```
call ssbev(jobz, uplo, n, kd, ab, ldab, w, z, ldz, work, info)
call dsbev(jobz, uplo, n, kd, ab, ldab, w, z, ldz, work, info)
```

Fortran 95:

```
call sbev(a, w [,uplo] [,z] [,info])
```

Description

This routine computes all eigenvalues and, optionally, eigenvectors of a real symmetric band matrix *A*.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then only eigenvalues are computed. If *jobz* = 'V', then eigenvalues and eigenvectors are computed.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *ab* stores the upper triangular part of *A*. If *uplo* = 'L', *ab* stores the lower triangular part of *A*.
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
kd	INTEGER. The number of super- or sub-diagonals in *A* (*kd* ≥ 0).
ab, *work*	REAL for ssbev DOUBLE PRECISION for dsbev. Arrays: *ab* (*ldab*,*) is an array containing either upper or lower triangular part of the symmetric matrix *A* (as specified by *uplo*) in band storage format. The second dimension of *ab* must be at least max(1, *n*). *work* (*) is a workspace array. The dimension of *work* must be at least max(1, 3*n*-2).
ldab	INTEGER. The leading dimension of *ab*; must be at least *kd* +1.
ldz	INTEGER. The leading dimension of the output array *z*. Constraints: if *jobz* = 'N', then *ldz* ≥ 1; if *jobz* = 'V', then *ldz* ≥ max(1, *n*) .

Output Parameters

w, *z*	REAL for ssbev DOUBLE PRECISION for dsbev

	Arrays: *w(*)*, DIMENSION at least max(1, *n*). If *info* = 0, contains the eigenvalues of the matrix *A* in ascending order. z(*ldz*,*). The second dimension of *z* must be at least max(1, *n*). If *jobz* = 'V', then if *info* = 0, *z* contains the orthonormal eigenvectors of the matrix *A*, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). If *jobz* = 'N', then *z* is not referenced.
ab	On exit, this array is overwritten by the values generated during the reduction to tridiagonal form. If *uplo* = 'U', the first superdiagonal and the diagonal of the tridiagonal matrix *T* are returned in rows *kd* and *kd*+1 of *ab*, and if *uplo* = 'L', the diagonal and first subdiagonal of *T* are returned in the first two rows of *ab*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, then the algorithm failed to converge; *i* indicates the number of elements of an intermediate tridiagonal form which did not converge to zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine sbev interface are the following:

a	Stands for argument *ab* in Fortan 77 interface. Holds the array *A* of size (*kd+1*,*n*).
w	Holds the vector of length (*n*).
z	Holds the matrix *Z* of size (*n*, *n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted.

?hbev

Computes all eigenvalues and, optionally, eigenvectors of a Hermitian band matrix.

Syntax

Fortran 77:

```
call chbev(jobz, uplo, n, kd, ab, ldab, w, z, ldz, work, rwork, info)
call zhbev(jobz, uplo, n, kd, ab, ldab, w, z, ldz, work, rwork, info)
```

Fortran 95:

```
call hbev(a, w [,uplo] [,z] [,info])
```

Description

This routine computes all eigenvalues and, optionally, eigenvectors of a complex Hermitian band matrix *A*.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then only eigenvalues are computed. If *jobz* = 'V', then eigenvalues and eigenvectors are computed.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *ab* stores the upper triangular part of *A*. If *uplo* = 'L', *ab* stores the lower triangular part of *A*.
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
kd	INTEGER. The number of super- or sub-diagonals in *A* (*kd* ≥ 0).
ab, *work*	COMPLEX for chbev DOUBLE COMPLEX for zhbev. Arrays: *ab* (*ldab*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *A* (as specified by *uplo*) in band storage format. The second dimension of *ab* must be at least max(1, *n*).

	work (*) is a workspace array. The dimension of *work* must be at least max(1, *n*).
ldab	INTEGER. The leading dimension of *ab*; must be at least *kd* +1.
ldz	INTEGER. The leading dimension of the output array *z*. Constraints: if *jobz* = 'N', then *ldz* ≥ 1; if *jobz* = 'V', then *ldz* ≥ max(1, *n*) .
rwork	REAL for chbev DOUBLE PRECISION for zhbev Workspace array, DIMENSION at least max(1, 3*n*-2).

Output Parameters

w	REAL for chbev DOUBLE PRECISION for zhbev Array, DIMENSION at least max(1, *n*). If *info* = 0, contains the eigenvalues in ascending order.
z	COMPLEX for chbev DOUBLE COMPLEX for zhbev. Array z(*ldz*,*). The second dimension of *z* must be at least max(1, *n*). If *jobz* = 'V', then if *info* = 0, *z* contains the orthonormal eigenvectors of the matrix *A*, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). If *jobz* = 'N', then *z* is not referenced.
ab	On exit, this array is overwritten by the values generated during the reduction to tridiagonal form. If *uplo* = 'U', the first superdiagonal and the diagonal of the tridiagonal matrix *T* are returned in rows *kd* and *kd*+1 of *ab*, and if *uplo* = 'L', the diagonal and first subdiagonal of *T* are returned in the first two rows of *ab*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*th parameter had an illegal value. If *info* = *i*, then the algorithm failed to converge;

i indicates the number of elements of an intermediate tridiagonal form which did not converge to zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `hbev` interface are the following:

a	Stands for argument *ab* in Fortan 77 interface. Holds the array *A* of size (*kd+1*,*n*).
w	Holds the vector of length (*n*).
z	Holds the matrix *Z* of size (*n*, *n*).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = `'V'`, if *z* is present, *jobz* = `'N'`, if *z* is omitted.

?sbevd

Computes all eigenvalues and (optionally) all eigenvectors of a real symmetric band matrix using divide and conquer algorithm.

Syntax

Fortran 77:

```
call ssbevd(jobz, uplo, n, kd, ab, ldab, w, z, ldz, work, lwork, iwork, liwork, info)
call dsbevd(jobz, uplo, n, kd, ab, ldab, w, z, ldz, work, lwork, iwork, liwork, info)
```

Fortran 95:

```
call sbevd(a, w [,uplo] [,z] [,info])
```

Description

This routine computes all the eigenvalues, and optionally all the eigenvectors, of a real symmetric band matrix A. In other words, it can compute the spectral factorization of A as:

$A = Z\Lambda Z^T$

Here Λ is a diagonal matrix whose diagonal elements are the eigenvalues λ_i, and Z is the orthogonal matrix whose columns are the eigenvectors z_i. Thus,

$Az_i = \lambda_i z_i$ for $i = 1, 2, \ldots, n$.

If the eigenvectors are requested, then this routine uses a divide and conquer algorithm to compute eigenvalues and eigenvectors. However, if only eigenvalues are required, then it uses the Pal-Walker-Kahan variant of the QL or QR algorithm.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then only eigenvalues are computed. If *jobz* = 'V', then eigenvalues and eigenvectors are computed.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *ab* stores the upper triangular part of A. If *uplo* = 'L', *ab* stores the lower triangular part of A.
n	INTEGER. The order of the matrix A ($n \geq 0$).
kd	INTEGER. The number of super- or sub-diagonals in A ($kd \geq 0$).
ab, *work*	REAL for ssbevd DOUBLE PRECISION for dsbevd. Arrays: *ab* (*ldab*,*) is an array containing either upper or lower triangular part of the symmetric matrix A (as specified by *uplo*) in band storage format. The second dimension of *ab* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
ldab	INTEGER. The leading dimension of *ab*; must be at least *kd*+1.

ldz INTEGER. The leading dimension of the output array *z*.
Constraints:

if *jobz* = 'N', then *ldz* ≥ 1;

if *jobz* = 'V', then *ldz* ≥ max(1, *n*) .

lwork INTEGER.
The dimension of the array *work*.
Constraints:

if *n* ≤ 1, then *lwork* ≥ 1;

if *jobz* = 'N' and *n* > 1, then *lwork* ≥ 2*n*;

if *jobz* = 'V' and *n* > 1, then *lwork* ≥ 2**n*^{2} + 5**n* + 1.
If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See Application Notes for details.

iwork INTEGER. Workspace array, its dimension max(1, *liwork*).

liwork INTEGER.

The dimension of the array *iwork*. Constraints: if *n* ≤ 1, then *liwork* < 1; if *job* = 'N' and *n* > 1, then *liwork* < 1; if *job* = 'V' and *n* > 1, then *liwork* < 5**n*+3.
If *liwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See Application Notes for details.

Output Parameters

w, *z* REAL for ssbevd
DOUBLE PRECISION for dsbevd
Arrays:
w(*), DIMENSION at least max(1, *n*).

	If *info* = 0, contains the eigenvalues of the matrix *A* in ascending order. See also *info*. z(*ldz*,*). The second dimension of *z* must be: at least 1 if *job* = 'N'; at least max(1, *n*) if *job* = 'V'. If *job* = 'V', then this array is overwritten by the orthogonal matrix *Z* which contains the eigenvectors of *A*. The *i*-th column of *Z* contains the eigenvector which corresponds to the eigenvalue *w(i)*. If *job* = 'N', then *z* is not referenced.
ab	On exit, this array is overwritten by the values generated during the reduction to tridiagonal form.
work(1)	On exit, if *lwork* > 0, then *work*(1) returns the required minimal size of *lwork*.
iwork(1)	On exit, if *liwork* > 0, then *iwork*(1) returns the required minimal size of *liwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = *i*, then the algorithm failed to converge; *i* indicates the number of elements of an intermediate tridiagonal form which did not converge to zero. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine sbevd interface are the following:

a	Stands for argument *ab* in Fortan 77 interface. Holds the array *A* of size (*kd+1*,*n*).
w	Holds the vector of length (*n*).
z	Holds the matrix *Z* of size (*n*, *n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
jobz	Restored based on the presence of the argument *z* as follows:

jobz = 'V', if *z* is present,
jobz = 'N', if *z* is omitted.

Application Notes

The computed eigenvalues and eigenvectors are exact for a matrix $T + E$ such that $||E||_2 = O(\varepsilon)||T||_2$, where ε is the machine precision.

If you are in doubt how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run or set *lwork* = –1 (*liwork* = –1).

If you choose the first option and set any of admissible *lwork* (or *liwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If you set *lwork* = –1 (*liwork* = –1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The complex analogue of this routine is ?hbevd.

See also ?syevd for matrices held in full storage, and ?spevd for matrices held in packed storage.

?hbevd

Computes all eigenvalues and (optionally) all eigenvectors of a complex Hermitian band matrix using divide and conquer algorithm.

Syntax

Fortran 77:

```
call chbevd(jobz, uplo, n, kd, ab, ldab, w, z, ldz, work, lwork, rwork, lrwork, iwork, liwork, info)
```

```
call zhbevd(jobz, uplo, n, kd, ab, ldab, w, z, ldz, work, lwork, rwork, lrwork, iwork, liwork, info)
```

Fortran 95:

```
call hbevd(a, w [,uplo] [,z] [,info])
```

Description

This routine computes all the eigenvalues, and optionally all the eigenvectors, of a complex Hermitian band matrix A. In other words, it can compute the spectral factorization of A as: $A = Z\Lambda Z^H$.

Here Λ is a real diagonal matrix whose diagonal elements are the eigenvalues λ_i, and Z is the (complex) unitary matrix whose columns are the eigenvectors z_i. Thus,

$Az_i = \lambda_i z_i$ for $i = 1, 2, \ldots, n$.

If the eigenvectors are requested, then this routine uses a divide and conquer algorithm to compute eigenvalues and eigenvectors. However, if only eigenvalues are required, then it uses the Pal-Walker-Kahan variant of the QL or QR algorithm.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then only eigenvalues are computed. If *jobz* = 'V', then eigenvalues and eigenvectors are computed.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *ab* stores the upper triangular part of A.

If *uplo* = 'L', *ab* stores the lower triangular part of *A*.

n — INTEGER. The order of the matrix *A* (*n* ≥ 0).

kd — INTEGER. The number of super- or sub-diagonals in *A* (*kd* ≥ 0).

ab, *work* — COMPLEX for chbevd
DOUBLE COMPLEX for zhbevd.
Arrays:
ab (*ldab*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *A* (as specified by *uplo*) in band storage format.
The second dimension of *ab* must be at least max(1, *n*).
work (*) is a workspace array , its dimension max(1, *lwork*).

ldab — INTEGER. The leading dimension of *ab*; must be at least *kd*+1.

ldz — INTEGER. The leading dimension of the output array *z*.
Constraints:
if *jobz* = 'N', then *ldz* ≥ 1;
if *jobz* = 'V', then *ldz* ≥ max(1, *n*) .

lwork — INTEGER.
The dimension of the array *work*.
Constraints:
if *n* ≤ 1, then *lwork* ≥ 1;
if *jobz* = 'N' and *n* > 1, then *lwork* ≥ *n*;
if *jobz* = 'V' and *n* > 1, then *lwork* ≥ 2**n*^{2}.
If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla.
See Application Notes for details.

rwork — REAL for chbevd
DOUBLE PRECISION for zhbevd
Workspace array, DIMENSION at least *lrwork*.

lrwork INTEGER.
The dimension of the array *rwork*.
Constraints:
if $n \leq 1$, then *lrwork* ≥ 1;
if *jobz* = 'N' and $n > 1$, then *lrwork* $\geq n$;
if *jobz* = 'V' and $n > 1$, then *lrwork* $\geq 2*n^2 + 5*n + 1$.
If *lrwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See Application Notes for details.

iwork INTEGER. Workspace array, DIMENSION max(1, *liwork*).

liwork INTEGER.
The dimension of the array *iwork*.
Constraints:
if *jobz* = 'N' or $n \leq 1$, then *liwork* ≥ 1;
if *jobz* = 'V' and $n > 1$, then *liwork* $\geq 5*n+3$.
If *liwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See Application Notes for details.

Output Parameters

w REAL for chbevd
DOUBLE PRECISION for zhbevd
Array, DIMENSION at least max(1, *n*).
If *info* = 0, contains the eigenvalues of the matrix *A* in ascending order. See also *info*.

z COMPLEX for chbevd
DOUBLE COMPLEX for zhbevd
Array, DIMENSION (*ldz*,*).

	The second dimension of *z* must be: at least 1 if *jobz* = 'N'; at least max(1, *n*) if *jobz* = 'V'. If *jobz* = 'V', then this array is overwritten by the unitary matrix *Z* which contains the eigenvectors of *A*. The *i*-th column of *Z* contains the eigenvector which corresponds to the eigenvalue *w(i)*. If *jobz* = 'N', then *z* is not referenced.
ab	On exit, this array is overwritten by the values generated during the reduction to tridiagonal form.
work(1)	On exit, if *lwork* > 0, then the real part of *work*(1) returns the required minimal size of *lwork*.
rwork(1)	On exit, if *lrwork* > 0, then *rwork*(1) returns the required minimal size of *lrwork*.
iwork(1)	On exit, if *liwork* > 0, then *iwork*(1) returns the required minimal size of *liwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = *i*, then the algorithm failed to converge; *i* indicates the number of elements of an intermediate tridiagonal form which did not converge to zero. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine hbevd interface are the following:

a	Stands for argument *ab* in Fortan 77 interface. Holds the array *A* of size (*kd+1*,*n*).
w	Holds the vector of length (*n*).
z	Holds the matrix *Z* of size (*n*, *n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present,

jobz = 'N', if *z* is omitted.

Application Notes

The computed eigenvalues and eigenvectors are exact for a matrix $T + E$ such that $||E||_2 = O(\varepsilon)||T||_2$, where ε is the machine precision.

If you are in doubt how much workspace to supply, use a generous value of *lwork* (*liwork* or *lrwork*) for the first run or set *lwork* = -1 (*liwork* = -1, *lrwork* = -1).

If you choose the first option and set any of admissible *lwork* (*liwork* or *lrwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*) on exit. Use this value (*work*(1), *iwork*(1), *rwork*(1)) for subsequent runs.

If you set *lwork* = -1 (*liwork* = -1, *lrwork* = -1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*, *lrwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The real analogue of this routine is ?sbevd.

See also ?heevd for matrices held in full storage, and ?hpevd for matrices held in packed storage.

?sbevx

Computes selected eigenvalues and, optionally, eigenvectors of a real symmetric band matrix.

Syntax

Fortran 77:

call ssbevx(*jobz*, *range*, *uplo*, *n*, *kd*, *ab*, *ldab*, *q*, *ldq*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *w*, *z*, *ldz*, *work*, *iwork*, *ifail*, *info*)

call dsbevx(*jobz*, *range*, *uplo*, *n*, *kd*, *ab*, *ldab*, *q*, *ldq*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *w*, *z*, *ldz*, *work*, *iwork*, *ifail*, *info*)

Fortran 95:

```
call sbevx(a, w [,uplo] [,z] [,vl] [,vu] [,il] [,iu] [,m] [,ifail] [,q]
[,abstol] [,info])
```

Description

This routine computes selected eigenvalues and, optionally, eigenvectors of a real symmetric band matrix *A*. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then only eigenvalues are computed. If *jobz* = 'V', then eigenvalues and eigenvectors are computed.
range	CHARACTER*1. Must be 'A' or 'V' or 'I'. If *range* = 'A', the routine computes all eigenvalues. If *range* = 'V', the routine computes eigenvalues λ_i in the half-open interval: $vl < \lambda_i \leq vu$. If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *ab* stores the upper triangular part of *A*. If *uplo* = 'L', *ab* stores the lower triangular part of *A*.
n	INTEGER. The order of the matrix *A* ($n \geq 0$).
kd	INTEGER. The number of super- or sub-diagonals in *A* ($kd \geq 0$).
ab, *work*	REAL for ssbevx DOUBLE PRECISION for dsbevx. Arrays: *ab* (*ldab*,*) is an array containing either upper or lower triangular part of the symmetric matrix *A* (as specified by *uplo*) in band storage format. The second dimension of *ab* must be at least max(1, *n*). *work* (*) is a workspace array. The dimension of *work* must be at least max(1, 7*n*).

ldab	INTEGER. The leading dimension of *ab*; must be at least *kd* +1.
vl, *vu*	REAL for ssbevx DOUBLE PRECISION for dsbevx. If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues. Constraint: *vl*< *vu*. If *range* = 'A' or 'I', *vl* and *vu* are not referenced.
il, *iu*	INTEGER. If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned. Constraint: 1 ≤ *il* ≤ *iu* ≤ *n*, if *n* > 0; *il*=1 and *iu*=0 if *n* = 0. If *range* = 'A' or 'V', *il* and *iu* are not referenced.
abstol	REAL for chpevx DOUBLE PRECISION for zhpevx The absolute error tolerance to which each eigenvalue is required. See Application notes for details on error tolerance.
ldq, *ldz*	INTEGER. The leading dimensions of the output arrays *q* and *z*, respectively. Constraints: *ldq* ≥ 1, *ldz* ≥ 1; If *jobz* = 'V', then *ldq* ≥ max(1, *n*) and *ldz* ≥ max(1, *n*).
iwork	INTEGER. Workspace array, DIMENSION at least max(1, 5*n*).

Output Parameters

q	REAL for ssbevx DOUBLE PRECISION for dsbevx. Array, DIMENSION (*ldz*,*n*). If *jobz* = 'V', the *n*-by-*n* orthogonal matrix is used in the reduction to tridiagonal form. If *jobz* = 'N', the array *q* is not referenced.
m	INTEGER. The total number of eigenvalues found, 0 ≤ *m* ≤ *n*. If *range* = 'A', *m* = *n*, and if *range* = 'I', *m* = *iu*-*il*+1.

w, *z*
REAL for ssbevx
DOUBLE PRECISION for dsbevx
Arrays:
w(*), DIMENSION at least max(1, *n*). The first *m* elements of *w* contain the selected eigenvalues of the matrix *A* in ascending order.
z(*ldz*,*).
The second dimension of *z* must be at least max(1, *m*).
If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *A* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*).
If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*.
If *jobz* = 'N', then *z* is not referenced.
Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.

ab
On exit, this array is overwritten by the values generated during the reduction to tridiagonal form.
If *uplo* = 'U', the first superdiagonal and the diagonal of the tridiagonal matrix *T* are returned in rows *kd* and *kd*+1 of *ab*, and if *uplo* = 'L', the diagonal and first subdiagonal of *T* are returned in the first two rows of *ab*.

ifail
INTEGER.
Array, DIMENSION at least max(1, *n*).
If *jobz* = 'V', then if *info* = 0, the first *m* elements of *ifail* are zero; if *info* > 0, the *ifail* contains the indices the eigenvectors that failed to converge.
If *jobz* = 'N', then *ifail* is not referenced.

info
INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*th parameter had an illegal value.
If *info* = *i*, then *i* eigenvectors failed to converge; their indices are stored in the array *ifail*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `sbevx` interface are the following:

a	Stands for argument *ab* in Fortan 77 interface. Holds the array *A* of size (*kd+1*,*n*).
w	Holds the vector of length (*n*).
z	Holds the matrix *Z* of size (*n*, *n*), where the values *n* and *m* are significant.
ifail	Holds the vector of length (*n*).
q	Holds the matrix *Q* of size (*n*, *n*).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
vl	Default value for this element is *vl* = -HUGE(*vl*).
vu	Default value for this element is *vu* = HUGE(*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this element is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = `'V'`, if *z* is present, *jobz* = `'N'`, if *z* is omitted Note that there will be an error condition if either *ifail* or *q* is present and *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = `'V'`, if one of or both *vl* and *vu* are present, *range* = `'I'`, if one of or both *il* and *iu* are present, *range* = `'A'`, if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a,b] of width less than or equal to *abstol* + ε * max(|a|,|b|), where ε is the machine precision.

If *abstol* is less than or equal to zero, then ε*||*T*||$_1$ will be used in its place, where *T* is the tridiagonal matrix obtained by reducing *A* to tridiagonal form. Eigenvalues will be computed most accurately when *abstol* is set to twice the underflow threshold 2*?lamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, try setting *abstol* to 2*?lamch('S').

?hbevx

Computes selected eigenvalues and, optionally, eigenvectors of a Hermitian band matrix.

Syntax

Fortran 77:

```
call chbevx(jobz, range, uplo, n, kd, ab, ldab, q, ldq, vl, vu, il, iu, abstol,
m, w, z, ldz, work, rwork, iwork, ifail, info)
```

```
call zhbevx(jobz, range, uplo, n, kd, ab, ldab, q, ldq, vl, vu, il, iu, abstol,
m, w, z, ldz, work, rwork, iwork, ifail, info)
```

Fortran 95:

```
call hbevx(a, w [,uplo] [,z] [,vl] [,vu] [,il] [,iu] [,m] [,ifail] [,q]
[,abstol] [,info])
```

Description

This routine computes selected eigenvalues and, optionally, eigenvectors of a complex Hermitian band matrix *A*. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Input Parameters

jobz CHARACTER*1. Must be 'N' or 'V'.
If *job* = 'N', then only eigenvalues are computed.

	If *job* = 'V', then eigenvalues and eigenvectors are computed.
range	CHARACTER*1. Must be 'A' or 'V' or 'I'. If *range* = 'A', the routine computes all eigenvalues. If *range* = 'V', the routine computes eigenvalues *lambda*(*i*) in the half-open interval: *vl* < *lambda*(*i*) ≤ *vu*. If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *ab* stores the upper triangular part of *A*. If *uplo* = 'L', *ab* stores the lower triangular part of *A*.
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
kd	INTEGER. The number of super- or sub-diagonals in *A* (*kd* ≥ 0).
ab, *work*	COMPLEX for chbevx DOUBLE COMPLEX for zhbevx. Arrays: *ab* (*ldab*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *A* (as specified by *uplo*) in band storage format. The second dimension of *ab* must be at least max(1, *n*). *work* (*) is a workspace array. The dimension of *work* must be at least max(1, *n*).
ldab	INTEGER. The leading dimension of *ab*; must be at least *kd* +1.
vl, *vu*	REAL for chbevx DOUBLE PRECISION for zhbevx. If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues. Constraint: *vl* < *vu*. If *range* = 'A' or 'I', *vl* and *vu* are not referenced.
il, *iu*	INTEGER. If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.

Constraint: $1 \le il \le iu \le n$, if $n > 0$; $il=1$ and $iu=0$ if $n = 0$.
If $range$ = 'A' or 'V', il and iu are not referenced.

abstol — REAL for chbevx
DOUBLE PRECISION for zhbevx.
The absolute error tolerance to which each eigenvalue is required. See Application notes for details on error tolerance.

ldq, *ldz* — INTEGER. The leading dimensions of the output arrays q and z, respectively.
Constraints:

$ldq \ge 1$, $ldz \ge 1$;

If $jobz$ = 'V', then $ldq \ge \max(1, n)$ and $ldz \ge \max(1, n)$.

rwork — REAL for chbevx
DOUBLE PRECISION for zhbevx
Workspace array, DIMENSION at least max(1, $7n$).

iwork — INTEGER. Workspace array, DIMENSION at least max(1, $5n$).

Output Parameters

q — COMPLEX for chbevx DOUBLE COMPLEX for zhbevx.
Array, DIMENSION (ldz,n).
If $jobz$ = 'V', the n-by-n unitary matrix is used in the reduction to tridiagonal form.
If $jobz$ = 'N', the array q is not referenced.

m — INTEGER. The total number of eigenvalues found,

$0 \le m \le n$.
If $range$ = 'A', $m = n$, and if $range$ = 'I', $m = iu-il+1$.

w — REAL for chbevx
DOUBLE PRECISION for zhbevx
Array, DIMENSION at least max(1, n). The first m elements contain the selected eigenvalues of the matrix A in ascending order.

z — COMPLEX for chbevx
DOUBLE COMPLEX for zhbevx.
Array z(ldz,*).

	The second dimension of *z* must be at least max(1, *m*). If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *A* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*. If *jobz* = 'N', then *z* is not referenced. Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.
ab	On exit, this array is overwritten by the values generated during the reduction to tridiagonal form. If *uplo* = 'U', the first superdiagonal and the diagonal of the tridiagonal matrix *T* are returned in rows *kd* and *kd*+1 of *ab*, and if *uplo* = 'L', the diagonal and first subdiagonal of *T* are returned in the first two rows of *ab*.
ifail	INTEGER. Array, DIMENSION at least max(1, *n*). If *jobz* = 'V', then if *info* = 0, the first *m* elements of *ifail* are zero; if *info* > 0, the *ifail* contains the indices of the eigenvectors that failed to converge. If *jobz* = 'N', then *ifail* is not referenced.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = –*i*, the *i*-th parameter had an illegal value. If *info* = *i*, then *i* eigenvectors failed to converge; their indices are stored in the array *ifail*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine hbevx interface are the following:

a	Stands for argument *ab* in Fortan 77 interface. Holds the array *A* of size (*kd+1*,*n*).
w	Holds the vector of length (*n*).
z	Holds the matrix *Z* of size (*n*, *n*), where the values *n* and *m* are significant.
ifail	Holds the vector of length (*n*).
q	Holds the matrix *Q* of size (*n*, *n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
vl	Default value for this element is *vl* = -HUGE(*vl*).
vu	Default value for this element is *vu* = HUGE(*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this element is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted Note that there will be an error condition if either *ifail* or *q* is present and *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a,b] of width less than or equal to *abstol* + ε * max(|a|,|b|), where ε is the machine precision.

If *abstol* is less than or equal to zero, then ε*||*T*||$_1$ will be used in its place, where *T* is the tridiagonal matrix obtained by reducing *A* to tridiagonal form. Eigenvalues will be computed most accurately when *abstol* is set to twice the underflow threshold 2*?lamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, try setting *abstol* to 2*?lamch('S').

?stev

Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix.

Syntax

Fortran 77:

```
call sstev(jobz, n, d, e, z, ldz, work, info)
call dstev(jobz, n, d, e, z, ldz, work, info)
```

Fortran 95:

```
call stev(d, e [,z] [,info])
```

Description

This routine computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix *A*.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then only eigenvalues are computed. If *jobz* = 'V', then eigenvalues and eigenvectors are computed.
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
d, *e*, *work*	REAL for sstev DOUBLE PRECISION for dstev. Arrays: *d*(*) contains the *n* diagonal elements of the tridiagonal matrix *A*. The dimension of *d* must be at least max(1, *n*). *e*(*) contains the *n*-1 subdiagonal elements of the tridiagonal matrix *A*. The dimension of *e* must be at least max(1, *n*-1). The *n*-th element of this array is used as workspace.

	work(*) is a workspace array. The dimension of *work* must be at least max(1, 2*n*-2). If *jobz* = 'N', *work* is not referenced.
ldz	INTEGER. The leading dimension of the output array *z*; *ldz* ≥ 1. If *jobz* = 'V' then *ldz* ≥ max(1, *n*).

Output Parameters

d	On exit, if *info* = 0, contains the eigenvalues of the matrix *A* in ascending order.
z	REAL for sstev DOUBLE PRECISION for dstev Array, DIMENSION (*ldz*, *). The second dimension of *z* must be at least max(1, *n*). If *jobz* = 'V', then if *info* = 0, *z* contains the orthonormal eigenvectors of the matrix *A*, with the *i*-th column of *z* holding the eigenvector associated with the eigenvalue returned in *d*(*i*). If *job* = 'N', then *z* is not referenced.
e	On exit, this array is overwritten with intermediate results.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, then the algorithm failed to converge; *i* elements of *e* did not converge to zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine stev interface are the following:

d	Holds the vector of length (*n*).
e	Holds the vector of length (*n*).
z	Holds the matrix *Z* of size (*n*, *n*).
jobz	Restored based on the presence of the argument *z* as follows:

jobz = 'V', if *z* is present,
jobz = 'N', if *z* is omitted.

?stevd

Computes all eigenvalues and (optionally) all eigenvectors of a real symmetric tridiagonal matrix using divide and conquer algorithm.

Syntax

Fortran 77:

```
call sstevd(jobz, n, d, e, z, ldz, work, lwork, iwork, liwork, info)
call dstevd(jobz, n, d, e, z, ldz, work, lwork, iwork, liwork, info)
```

Fortran 95:

```
call stevd(d, e [,z] [,info])
```

Description

This routine computes all the eigenvalues, and optionally all the eigenvectors, of a real symmetric tridiagonal matrix T. In other words, the routine can compute the spectral factorization of T as: $T = Z\Lambda Z^T$.

Here Λ is a diagonal matrix whose diagonal elements are the eigenvalues λ_i, and Z is the orthogonal matrix whose columns are the eigenvectors z_i. Thus,

$Tz_i = \lambda_i z_i$ for $i = 1, 2, \ldots, n$.

If the eigenvectors are requested, then this routine uses a divide and conquer algorithm to compute eigenvalues and eigenvectors. However, if only eigenvalues are required, then it uses the Pal-Walker-Kahan variant of the QL or QR algorithm.

There is no complex analogue of this routine.

Input Parameters

jobz — CHARACTER*1. Must be 'N' or 'V'.
If *jobz* = 'N', then only eigenvalues are computed.
If *jobz* = 'V', then eigenvalues and eigenvectors are computed.

n — INTEGER. The order of the matrix T ($n \geq 0$).

d, *e*, *work* — REAL for sstevd
DOUBLE PRECISION for dstevd.
Arrays:
d(*) contains the n diagonal elements of the tridiagonal matrix T.
The dimension of *d* must be at least max(1, n).
e(*) contains the n-1 off-diagonal elements of T.
The dimension of *e* must be at least max(1, n-1). The n–th element of this array is used as workspace.
work(*) is a workspace array.
The dimension of *work* must be at least *lwork*.

ldz — INTEGER. The leading dimension of the output array *z*.
Constraints:
ldz ≥ 1 if *job* = 'N';
ldz < max(1, *n*) if *job* = 'V'.

lwork — INTEGER.
The dimension of the array *work*.
Constraints:
if *jobz* = 'N' or $n \leq 1$, then *lwork* ≥ 1;
if *jobz* = 'V' and $n > 1$, then *lwork* ≥ $n^2 + 4*n + 1$.
If *lwork* = −1, then a workspace query is assumed; the routine only calculates the required sizes of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See Application Notes for details.

iwork — INTEGER. Workspace array, its dimension max(1, *liwork*).

liwork — INTEGER.
The dimension of the array *iwork*.
Constraints:
if *jobz* = 'N' or $n \leq 1$, then *liwork* ≥ 1;
if *jobz* = 'V' and $n > 1$, then *liwork* ≥ 5*n+3.

If *liwork* = -1, then a workspace query is assumed; the routine only calculates the required sizes of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See Application Notes for details.

Output Parameters

d
On exit, if *info* = 0, contains the eigenvalues of the matrix *T* in ascending order.
See also *info*.

z
REAL for sstevd
DOUBLE PRECISION for dstevd
Array, DIMENSION (*ldz*, *).
The second dimension of *z* must be:
at least 1 if *jobz* = 'N';
at least max(1, *n*) if *jobz* = 'V'.
If *jobz* = 'V', then this array is overwritten by the orthogonal matrix *Z* which contains the eigenvectors of *T*.
If *jobz* = 'N', then *z* is not referenced.

e
On exit, this array is overwritten with intermediate results.

work(1)
On exit, if *lwork* > 0, then *work*(1) returns the required minimal size of *lwork*.

iwork(1)
On exit, if *liwork* > 0, then *iwork*(1) returns the required minimal size of *liwork*.

info
INTEGER.
If *info* = 0, the execution is successful.
If *info* = *i*, then the algorithm failed to converge; *i* indicates the number of elements of an intermediate tridiagonal form which did not converge to zero.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `stevd` interface are the following:

d	Holds the vector of length (*n*).
e	Holds the vector of length (*n*).
z	Holds the matrix *Z* of size (*n*, *n*).
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted.

Application Notes

The computed eigenvalues and eigenvectors are exact for a matrix $T + E$ such that $||E||_2 = O(\varepsilon)||T||_2$, where ε is the machine precision.

If λ_i is an exact eigenvalue, and m_i is the corresponding computed value, then

$$|\mu_i - \lambda_i| \le c(n)\varepsilon ||T||_2$$

where $c(n)$ is a modestly increasing function of n.

If z_i is the corresponding exact eigenvector, and w_i is the corresponding computed vector, then the angle $\theta(z_i, w_i)$ between them is bounded as follows:

$$\theta(z_i, w_i) \le c(n)\varepsilon ||T||_2 / \min_{i \neq j}|\lambda_i - \lambda_j|.$$

Thus the accuracy of a computed eigenvector depends on the gap between its eigenvalue and all the other eigenvalues.

If you are in doubt how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run or set *lwork* = -1 (*liwork* = -1).

If you choose the first option and set any of admissible *lwork* (or *liwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If you set *lwork* = -1 (*liwork* = -1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?stevx

Computes selected eigenvalues and eigenvectors of a real symmetric tridiagonal matrix.

Syntax

Fortran 77:

```
call sstevx(jobz, range, n, d, e, vl, vu, il, iu, abstol, m, w, z, ldz, work, iwork, ifail, info)
call dstevx(jobz, range, n, d, e, vl, vu, il, iu, abstol, m, w, z, ldz, work, iwork, ifail, info)
```

Fortran 95:

```
call stevx(d, e, w [, z] [,vl] [,vu] [,il] [,iu] [,m] [,ifail] [,abstol] [,info])
```

Description

This routine computes selected eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix *A*. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Input Parameters

jobz — CHARACTER*1. Must be 'N' or 'V'.
If *job* = 'N', then only eigenvalues are computed.
If *job* = 'V', then eigenvalues and eigenvectors are computed.

range — CHARACTER*1. Must be 'A' or 'V' or 'I'.
If *range* = 'A', the routine computes all eigenvalues.
If *range* = 'V', the routine computes eigenvalues *lambda*(*i*) in the half-open interval: $vl < lambda(i) \le vu$.
If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.

n — INTEGER. The order of the matrix *A* (*n* ≥ 0).

d, *e*, *work* — REAL for sstevx
DOUBLE PRECISION for dstevx.
Arrays:
d(*) contains the *n* diagonal elements of the tridiagonal matrix *A*.
The dimension of *d* must be at least max(1, *n*).
e(*) contains the *n*-1 subdiagonal elements of *A*.
The dimension of *e* must be at least max(1, *n*-1). The *n*-th element of this array is used as workspace.
work(*) is a workspace array.
The dimension of *work* must be at least max(1, 5*n*).

vl, *vu* — REAL for sstevx
DOUBLE PRECISION for dstevx.
If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.
Constraint: *vl*< *vu*.
If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, *iu* — INTEGER.
If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.
Constraint: 1 ≤ *il* ≤ *iu* ≤ *n*, if *n* > 0; *il*=1 and *iu*=0 if *n* = 0.
If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol — REAL for sstevx
DOUBLE PRECISION for dstevx. The absolute error tolerance to which each eigenvalue is required. See Application notes for details on error tolerance.

ldz — INTEGER. The leading dimensions of the output array *z*; *ldz* ≥ 1. If *jobz* = 'V', then *ldz* ≥ max(1, *n*).

iwork — INTEGER. Workspace array, DIMENSION at least max(1, 5*n*).

Output Parameters

m — INTEGER. The total number of eigenvalues found, 0 ≤ *m* ≤ *n*.

	If *range* = 'A', *m* = *n*, and if *range* = 'I', *m* = *iu*-*il*+1.
w, *z*	REAL for sstevx DOUBLE PRECISION for dstevx. Arrays: *w(*)*, DIMENSION at least max(1, *n*). The first *m* elements of *w* contain the selected eigenvalues of the matrix *A* in ascending order. z(*ldz*,*). The second dimension of *z* must be at least max(1, *m*). If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *A* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*. If *jobz* = 'N', then *z* is not referenced. Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.
d, *e*	On exit, these arrays may be multiplied by a constant factor chosen to avoid overflow or underflow in computing the eigenvalues.
ifail	INTEGER. Array, DIMENSION at least max(1, *n*). If *jobz* = 'V', then if *info* = 0, the first *m* elements of *ifail* are zero; if *info* > 0, the *ifail* contains the indices of the eigenvectors that failed to converge. If *jobz* = 'N', then *ifail* is not referenced.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, then *i* eigenvectors failed to converge; their indices are stored in the array *ifail*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `stevx` interface are the following:

d	Holds the vector of length (*n*).
e	Holds the vector of length (*n*).
w	Holds the vector of length (*n*).
z	Holds the matrix *Z* of size (*n*, *n*), where the values *n* and *m* are significant.
ifail	Holds the vector of length (*n*).
vl	Default value for this element is *vl* = -HUGE(*vl*).
vu	Default value for this element is *vu* = HUGE(*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this element is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted Note that there will be an error condition if *ifail* is present and *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a,b] of width less than or equal to *abstol* + ε * max(|a|,|b|), where ε is the machine precision.

If *abstol* is less than or equal to zero, then $\varepsilon * ||A||_1$ will be used in its place. Eigenvalues will be computed most accurately when *abstol* is set to twice the underflow threshold 2*?lamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, try setting *abstol* to 2*?lamch('S').

?stevr

Computes selected eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix using the Relatively Robust Representations.

Syntax

Fortran 77:

```
call sstevr(jobz, range, n, d, e, vl, vu, il, iu, abstol, m, w, z, ldz, isuppz, work, lwork, iwork, liwork, info)
```

```
call dstevr(jobz, range, n, d, e, vl, vu, il, iu, abstol, m, w, z, ldz, isuppz, work, lwork, iwork, liwork, info)
```

Fortran 95:

```
call stevr(d, e, w [, z] [,vl] [,vu] [,il] [,iu] [,m] [,isuppz] [,abstol] [,info])
```

Description

This routine computes selected eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix *T*. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Whenever possible, the routine calls ?stemr to compute the eigenspectrum using Relatively Robust Representations. ?stegr computes eigenvalues by the *dqds* algorithm, while orthogonal eigenvectors are computed from various "good" $L*D*L^T$ representations (also known as Relatively Robust Representations). Gram-Schmidt orthogonalization is avoided as far as possible. More specifically, the various steps of the algorithm are as follows. For the i-th unreduced block of *T*,

a. Compute $T - \sigma_i = L_i*D_i*L_i^T$, such that $L_i*D_i*L_i^T$ is a relatively robust representation;

b. Compute the eigenvalues, λ_j, of $L_i*D_i*L_i^T$ to high relative accuracy by the *dqds* algorithm;

c. If there is a cluster of close eigenvalues, "choose" σ_i close to the cluster, and go to step (a);

d. Given the approximate eigenvalue λ_j of $L_i D_i L_i^T$, compute the corresponding eigenvector by forming a rank-revealing twisted factorization.

The desired accuracy of the output can be specified by the input parameter *abstol*.

The routine ?stevr calls ?stemr when the full spectrum is requested on machines which conform to the IEEE-754 floating point standard. ?stevr calls ?stebz and ?stein on non-IEEE machines and when partial spectrum requests are made.

Input Parameters

jobz — CHARACTER*1. Must be 'N' or 'V'.
If *jobz* = 'N', then only eigenvalues are computed.
If *jobz* = 'V', then eigenvalues and eigenvectors are computed.

range — CHARACTER*1. Must be 'A' or 'V' or 'I'.
If *range* = 'A', the routine computes all eigenvalues.
If *range* = 'V', the routine computes eigenvalues *lambda*(*i*) in the half-open interval:
vl<*lambda*(*i*) ≤ *vu*.
If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.
For *range* = 'V'or 'I' and *iu*-*il* < *n*–1, sstebz/dstebz and sstein/dstein are called.

n — INTEGER. The order of the matrix *T* (*n* ≥ 0).

d, *e*, *work* — REAL for sstevr
DOUBLE PRECISION for dstevr.
Arrays:
d(*) contains the *n* diagonal elements of the tridiagonal matrix *T*.
The dimension of *d* must be at least max(1, *n*).
e(*) contains the *n*-1 subdiagonal elements of *A*.
The dimension of *e* must be at least max(1, *n*-1). The *n*-th element of this array is used as workspace.
work is a workspace array, its dimension max(1, *lwork*).

vl, *vu*	REAL for sstevr DOUBLE PRECISION for dstevr. If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues. Constraint: *vl*< *vu*. If *range* = 'A' or 'I', *vl* and *vu* are not referenced.
il, *iu*	INTEGER. If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned. Constraint: 1 ≤ *il* ≤ *iu*≤ *n*, if *n* > 0; *il*=1 and *iu*=0 if *n* = 0. If *range* = 'A' or 'V', *il* and *iu* are not referenced.
abstol	REAL for ssyevr DOUBLE PRECISION for dsyevr. The absolute error tolerance to which each eigenvalue/eigenvector is required. If *jobz* = 'V', the eigenvalues and eigenvectors output have residual norms bounded by *abstol*, and the dot products between different eigenvectors are bounded by *abstol*. If *abstol* < *n* *eps*|*T*|, then *n* *eps*|*T*| will be used in its place, where eps is the machine precision, and |*T*| is the 1-norm of the matrix *T*. The eigenvalues are computed to an accuracy of eps*|*T*| irrespective of *abstol*. If high relative accuracy is important, set *abstol* to ?lamch('S').
ldz	INTEGER. The leading dimension of the output array *z*. Constraints: *ldz* ≥ 1 if *jobz* = 'N'; *ldz* ≥ max(1, *n*) if *jobz* = 'V'.
lwork	INTEGER. The dimension of the array *work*. Constraint: *lwork* ≥ max(1, 20**n*). If *lwork* = −1, then a workspace query is assumed; the routine only calculates the required sizes of the *work* and *iwork* arrays, returns these values as the first entries of the

work and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See Application Notes for details.

iwork INTEGER.
Workspace array, its dimension max(1, *liwork*).

liwork INTEGER.
The dimension of the array *iwork*,
lwork ≥ max(1, 10*n).
If *liwork* = -1, then a workspace query is assumed; the routine only calculates the required sizes of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See Application Notes for details.

Output Parameters

m INTEGER. The total number of eigenvalues found,
0 ≤ *m* ≤ *n*. If *range* = 'A', *m* = *n*, and if *range* = 'I', *m* = *iu*-*il*+1.

w, *z* REAL for sstevr
DOUBLE PRECISION for dstevr.
Arrays:
w(*), DIMENSION at least max(1, *n*).
The first *m* elements of *w* contain the selected eigenvalues of the matrix *T* in ascending order.
z(*ldz*,*).
The second dimension of *z* must be at least max(1, *m*).
If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *T* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*).
If *jobz* = 'N', then *z* is not referenced.
Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.

d, *e*	On exit, these arrays may be multiplied by a constant factor chosen to avoid overflow or underflow in computing the eigenvalues.
isuppz	INTEGER. Array, DIMENSION at least 2 *max(1, *m*). The support of the eigenvectors in *z*, i.e., the indices indicating the nonzero elements in *z*. The *i*-th eigenvector is nonzero only in elements *isuppz*(2*i*-1) through *isuppz*(2*i*). Implemented only for *range* = 'A' or 'I' and *iu*-*il* = *n*-1.
work(1)	On exit, if *info* = 0, then *work*(1) returns the required minimal size of *lwork*.
iwork(1)	On exit, if *info* = 0, then *iwork*(1) returns the required minimal size of *liwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, an internal error has occurred.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine stevr interface are the following:

d	Holds the vector of length (*n*).
e	Holds the vector of length (*n*).
w	Holds the vector of length (*n*).
z	Holds the matrix *Z* of size (*n*, *n*), where the values *n* and *m* are significant.
isuppz	Holds the vector of length (2**n*), where the values (2**m*) are significant.
vl	Default value for this element is *vl* = -HUGE(*vl*).
vu	Default value for this element is *vu* = HUGE(*vl*).
il	Default value for this argument is *il* = 1.

iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this element is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted Note that there will be an error condition if *ifail* is present and *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

Normal execution of the routine ?stegr may create NaNs and infinities and hence may abort due to a floating point exception in environments which do not handle NaNs and infinities in the IEEE standard default manner.

If you are in doubt how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run or set *lwork* = –1 (*liwork* = –1).

If you choose the first option and set any of admissible *lwork* (or *liwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If you set *lwork* = –1 (*liwork* = –1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

Nonsymmetric Eigenproblems

This section describes LAPACK driver routines used for solving nonsymmetric eigenproblems. See also computational routines that can be called to solve these problems.

Table 4-11 lists all such driver routines for Fortran-77 interface. Respective routine names in Fortran-95 interface are without the first symbol (see Routine Naming Conventions).

Table 4-11 Driver Routines for Solving Nonsymmetric Eigenproblems

Routine Name	Operation performed
?gees	Computes the eigenvalues and Schur factorization of a general matrix, and orders the factorization so that selected eigenvalues are at the top left of the Schur form.
?geesx	Computes the eigenvalues and Schur factorization of a general matrix, orders the factorization and computes reciprocal condition numbers.
?geev	Computes the eigenvalues and left and right eigenvectors of a general matrix.
?geevx	Computes the eigenvalues and left and right eigenvectors of a general matrix, with preliminary matrix balancing, and computes reciprocal condition numbers for the eigenvalues and right eigenvectors.

?gees

Computes the eigenvalues and Schur factorization of a general matrix, and orders the factorization so that selected eigenvalues are at the top left of the Schur form.

Syntax

Fortran 77:

```
call sgees(jobvs, sort, select, n, a, lda, sdim, wr, wi, vs, ldvs, work, lwork, bwork, info)
call dgees(jobvs, sort, select, n, a, lda, sdim, wr, wi, vs, ldvs, work, lwork, bwork, info)
call cgees(jobvs, sort, select, n, a, lda, sdim, w, vs, ldvs, work, lwork, rwork, bwork, info)
call zgees(jobvs, sort, select, n, a, lda, sdim, w, vs, ldvs, work, lwork, rwork, bwork, info)
```

Fortran 95:

```
call gees(a, wr, wi [,vs] [,select] [,sdim] [,info])
call gees(a, w [,vs] [,select] [,sdim] [,info])
```

Description

This routine computes for an *n*-by-*n* real/complex nonsymmetric matrix *A*, the eigenvalues, the real Schur form *T*, and, optionally, the matrix of Schur vectors *Z*. This gives the Schur factorization $A = Z*T*Z^H$.

Optionally, it also orders the eigenvalues on the diagonal of the real-Schur/Schur form so that selected eigenvalues are at the top left. The leading columns of *Z* then form an orthonormal basis for the invariant subspace corresponding to the selected eigenvalues.

A real matrix is in real-Schur form if it is upper quasi-triangular with 1-by-1 and 2-by-2 blocks. 2-by-2 blocks will be standardized in the form

$$\begin{pmatrix} a & b \\ c & a \end{pmatrix}$$

where $b*c < 0$. The eigenvalues of such a block are $a \pm \sqrt{bc}$

A complex matrix is in Schur form if it is upper triangular.

Input Parameters

jobvs	CHARACTER*1. Must be 'N' or 'V'. If *jobvs* = 'N', then Schur vectors are not computed. If *jobvs* = 'V', then Schur vectors are computed.
sort	CHARACTER*1. Must be 'N' or 'S'. Specifies whether or not to order the eigenvalues on the diagonal of the Schur form. If *sort* = 'N', then eigenvalues are not ordered. If *sort* = 'S', eigenvalues are ordered (see *select*).
select	LOGICAL FUNCTION of two REAL arguments for real flavors.

	LOGICAL FUNCTION of one COMPLEX argument for complex flavors. *select* must be declared EXTERNAL in the calling subroutine. If *sort* = 'S', *select* is used to select eigenvalues to sort to the top left of the Schur form. If *sort* = 'N', *select* is not referenced. For real flavors: An eigenvalue *wr*(j)+sqrt(-1)**wi*(j) is selected if *select*(*wr*(j), *wi*(j)) is true; that is, if either one of a complex conjugate pair of eigenvalues is selected, then both complex eigenvalues are selected. Note that a selected complex eigenvalue may no longer satisfy *select*(*wr*(j), *wi*(j))= .TRUE. after ordering, since ordering may change the value of complex eigenvalues (especially if the eigenvalue is ill-conditioned); in this case *info* may be set to *n*+2 (see *info* below). For complex flavors: An eigenvalue *w*(j) is selected if *select*(*w*(j)) is true.
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
a, *work*	REAL for sgees DOUBLE PRECISION for dgees COMPLEX for cgees DOUBLE COMPLEX for zgees. Arrays: *a*(*lda*,*) is an array containing the *n*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of the array *a*. Must be at least max(1, *n*).
ldvs	INTEGER. The leading dimension of the output array *vs*. Constraints: *ldvs* ≥ 1; *ldvs* ≥ max(1, *n*) if *jobvs* = 'V'.
lwork	INTEGER. The dimension of the array *work*.

Constraint:

lwork ≥ max(1, 3*n*) for real flavors;

lwork ≥ max(1, 2*n*) for complex flavors.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

rwork — REAL for cgees
DOUBLE PRECISION for zgees
Workspace array, DIMENSION at least max(1, *n*). Used in complex flavors only.

bwork — LOGICAL. Workspace array, DIMENSION at least max(1, *n*). Not referenced if *sort* = 'N'.

Output Parameters

a — On exit, this array is overwritten by the real-Schur/Schur form *T*.

sdim — INTEGER.
If *sort* = 'N', *sdim*= 0.
If *sort* = 'S', *sdim* is equal to the number of eigenvalues (after sorting) for which *select* is true.
Note that for real flavors complex conjugate pairs for which *select* is true for either eigenvalue count as 2.

wr, *wi* — REAL for sgees
DOUBLE PRECISION for dgees
Arrays, DIMENSION at least max (1, *n*) each. Contain the real and imaginary parts, respectively, of the computed eigenvalues, in the same order that they appear on the diagonal of the output real-Schur form *T*. Complex conjugate pairs of eigenvalues appear consecutively with the eigenvalue having positive imaginary part first.

w — COMPLEX for cgees
DOUBLE COMPLEX for zgees.
Array, DIMENSION at least max(1, *n*). Contains the computed eigenvalues. The eigenvalues are stored in the same order as they appear on the diagonal of the output Schur form *T*.

vs	REAL for sgees DOUBLE PRECISION for dgees COMPLEX for cgees DOUBLE COMPLEX for zgees. Array *vs*(*ldvs*,*);the second dimension of *vs* must be at least max(1, *n*). If *jobvs* = 'V', *vs* contains the orthogonal/unitary matrix *Z* of Schur vectors. If *jobvs* = 'N', *vs* is not referenced.
work(1)	On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*th parameter had an illegal value. If *info* = *i*, and *i* ≤ *n*: the *QR* algorithm failed to compute all the eigenvalues; elements 1:*ilo*-1 and *i*+1:*n* of *wr* and *wi* (for real flavors) or *w* (for complex flavors) contain those eigenvalues which have converged; if *jobvs* = 'V', *vs* contains the matrix which reduces *A* to its partially converged Schur form; *i* = *n*+1: the eigenvalues could not be reordered because some eigenvalues were too close to separate (the problem is very ill-conditioned); *i* = *n*+2: after reordering, round-off changed values of some complex eigenvalues so that leading eigenvalues in the Schur form no longer satisfy *select* = .TRUE.. This could also be caused by underflow due to scaling.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gees interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
wr	Holds the vector of length (*n*). Used in real flavors only.
wi	Holds the vector of length (*n*). Used in real flavors only.
w	Holds the vector of length (*n*). Used in complex flavors only.
vs	Holds the matrix *VS* of size (*n*, *n*).
jobvs	Restored based on the presence of the argument *vs* as follows: *jobvs* = 'V', if *vs* is present, *jobvs* = 'N', if *vs* is omitted.
sort	Restored based on the presence of the argument *select* as follows: *sort* = 'S', if *select* is present, *sort* = 'N', if *select* is omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = –1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = –1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?geesx

Computes the eigenvalues and Schur factorization of a general matrix, orders the factorization and computes reciprocal condition numbers.

Syntax

Fortran 77:

```
call sgeesx(jobvs, sort, select, sense, n, a, lda, sdim, wr, wi, vs, ldvs,
rconde, rcondv, work, lwork, iwork, liwork, bwork, info)

call dgeesx(jobvs, sort, select, sense, n, a, lda, sdim, wr, wi, vs, ldvs,
rconde, rcondv, work, lwork, iwork, liwork, bwork, info)

call cgeesx(jobvs, sort, select, sense, n, a, lda, sdim, w, vs, ldvs, rconde,
rcondv, work, lwork, rwork, bwork, info)

call zgeesx(jobvs, sort, select, sense, n, a, lda, sdim, w, vs, ldvs, rconde,
rcondv, work, lwork, rwork, bwork, info)
```

Fortran 95:

```
call geesx(a, wr, wi [,vs] [,select] [,sdim] [,rconde] [,rcondev] [,info])

call geesx(a, w [,vs] [,select] [,sdim] [,rconde] [,rcondev] [,info])
```

Description

This routine computes for an n-by-n real/complex nonsymmetric matrix A, the eigenvalues, the real-Schur/Schur form T, and, optionally, the matrix of Schur vectors Z. This gives the Schur factorization $A = Z*T*Z^H$.

Optionally, it also orders the eigenvalues on the diagonal of the real-Schur/Schur form so that selected eigenvalues are at the top left; computes a reciprocal condition number for the average of the selected eigenvalues (*rconde*); and computes a reciprocal condition number for the right invariant subspace corresponding to the selected eigenvalues (*rcondv*). The leading columns of Z form an orthonormal basis for this invariant subspace.

For further explanation of the reciprocal condition numbers *rconde* and *rcondv*, see [LUG], Section 4.10 (where these quantities are called s and sep respectively).

A real matrix is in real-Schur form if it is upper quasi-triangular with 1-by-1 and 2-by-2 blocks. 2-by-2 blocks will be standardized in the form

$$\begin{pmatrix} a & b \\ c & a \end{pmatrix}$$

where *b*c* < 0. The eigenvalues of such a block are $a \pm \sqrt{bc}$

A complex matrix is in Schur form if it is upper triangular.

Input Parameters

jobvs — CHARACTER*1. Must be 'N' or 'V'.
If *jobvs* = 'N', then Schur vectors are not computed.
If *jobvs* = 'V', then Schur vectors are computed.

sort — CHARACTER*1. Must be 'N' or 'S'. Specifies whether or not to order the eigenvalues on the diagonal of the Schur form.
If *sort* = 'N', then eigenvalues are not ordered.
If *sort* = 'S', eigenvalues are ordered (see *select*).

select — LOGICAL FUNCTION of two REAL arguments for real flavors.
LOGICAL FUNCTION of one COMPLEX argument for complex flavors.
select must be declared EXTERNAL in the calling subroutine.
If *sort* = 'S', *select* is used to select eigenvalues to sort to the top left of the Schur form.
If *sort* = 'N', *select* is not referenced.
For real flavors:
An eigenvalue *wr*(j)+sqrt(-1)**wi*(j) is selected if *select*(*wr*(j), *wi*(j)) is true; that is, if either one of a complex conjugate pair of eigenvalues is selected, then both complex eigenvalues are selected.
Note that a selected complex eigenvalue may no longer satisfy *select*(*wr*(j), *wi*(j)) = .TRUE. after ordering, since ordering may change the value of complex eigenvalues (especially if the eigenvalue is ill-conditioned); in this case *info* may be set to *n*+2 (see *info* below).
For complex flavors:

	An eigenvalue *w*(j) is selected if *select*(*w*(j)) is true.
sense	CHARACTER*1. Must be 'N', 'E', 'V', or 'B'. Determines which reciprocal condition number are computed. If *sense* = 'N', none are computed; If *sense* = 'E', computed for average of selected eigenvalues only; If *sense* = 'V', computed for selected right invariant subspace only; If *sense* = 'B', computed for both. If *sense* is 'E', 'V', or 'B', then *sort* must equal 'S'.
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
a, *work*	REAL for sgeesx DOUBLE PRECISION for dgeesx COMPLEX for cgeesx DOUBLE COMPLEX for zgeesx. Arrays: *a*(*lda*,*) is an array containing the *n*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of the array *a*. Must be at least max(1, *n*).
ldvs	INTEGER. The leading dimension of the output array *vs*. Constraints: *ldvs* ≥ 1; *ldvs* ≥ max(1, *n*) if *jobvs* = 'V'.
lwork	INTEGER. The dimension of the array *work*. Constraint: *lwork* ≥ max(1, 3*n*) for real flavors; *lwork* ≥ max(1, 2*n*) for complex flavors. Also, if *sense* = 'E', 'V', or 'B', then *lwork* ≥ *n*+2**sdim**(*n*−*sdim*) for real flavors; *lwork* ≥ 2**sdim**(*n*−*sdim*) for complex flavors; where *sdim* is the number of selected eigenvalues computed by this routine.

Note that 2*sdim*(n-sdim) ≤ n*n/2. Note also that an error is only returned if lwork<max(1, 2*n), but if sense = 'E', or 'V', or 'B' this may not be large enough.
For good performance, lwork must generally be larger.
If lwork = -1, then a workspace query is assumed; the routine only calculates upper bound on the optimal size of the array work, returns this value as the first entry of the work array, and no error message related to lwork is issued by xerbla.

iwork INTEGER.
Workspace array, DIMENSION (*liwork*). Used in real flavors only. Not referenced if *sense* = 'N' or 'E'.

liwork INTEGER.
The dimension of the array *iwork*. Used in real flavors only.
Constraint:

liwork ≥ 1;

if *sense* = 'V' or 'B', *liwork* ≥ *sdim**(*n*-*sdim*).

rwork REAL for cgeesx
DOUBLE PRECISION for zgeesx
Workspace array, DIMENSION at least max(1, *n*). Used in complex flavors only.

bwork LOGICAL. Workspace array, DIMENSION at least max(1, *n*). Not referenced if *sort* = 'N'.

Output Parameters

a On exit, this array is overwritten by the real-Schur/Schur form *T*.

sdim INTEGER.
If *sort* = 'N', *sdim*= 0.
If *sort* = 'S', *sdim* is equal to the number of eigenvalues (after sorting) for which *select* is true.
Note that for real flavors complex conjugate pairs for which *select* is true for either eigenvalue count as 2.

wr, *wi* REAL for sgeesx
DOUBLE PRECISION for dgeesx

	Arrays, DIMENSION at least max (1, *n*) each. Contain the real and imaginary parts, respectively, of the computed eigenvalues, in the same order that they appear on the diagonal of the output real-Schur form *T*. Complex conjugate pairs of eigenvalues appear consecutively with the eigenvalue having positive imaginary part first.
w	COMPLEX for cgeesx DOUBLE COMPLEX for zgeesx. Array, DIMENSION at least max(1, *n*). Contains the computed eigenvalues. The eigenvalues are stored in the same order as they appear on the diagonal of the output Schur form *T*.
vs	REAL for sgeesx DOUBLE PRECISION for dgeesx COMPLEX for cgeesx DOUBLE COMPLEX for zgeesx. Array *vs*(*ldvs*,*);the second dimension of *vs* must be at least max(1, *n*). If *jobvs* = 'V', *vs* contains the orthogonal/unitary matrix *Z* of Schur vectors. If *jobvs* = 'N', *vs* is not referenced.
rconde, *rcondv*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. If *sense* = 'E' or 'B', *rconde* contains the reciprocal condition number for the average of the selected eigenvalues. If *sense* = 'N' or 'V', *rconde* is not referenced. If *sense* = 'V' or 'B', *rcondv* contains the reciprocal condition number for the selected right invariant subspace. If *sense* = 'N' or 'E', *rcondv* is not referenced.
work(1)	On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = –*i*, the *i*th parameter had an illegal value. If *info* = *i*, and *i* ≤ *n*:

the *QR* algorithm failed to compute all the eigenvalues; elements 1:*ilo*-1 and *i*+1:*n* of *wr* and *wi* (for real flavors) or *w* (for complex flavors) contain those eigenvalues which have converged; if *jobvs* = 'V', *vs* contains the transformation which reduces *A* to its partially converged Schur form;
i = *n*+1:
the eigenvalues could not be reordered because some eigenvalues were too close to separate (the problem is very ill-conditioned);
i = *n*+2:
after reordering, roundoff changed values of some complex eigenvalues so that leading eigenvalues in the Schur form no longer satisfy *select* = .TRUE.. This could also be caused by underflow due to scaling.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine geesx interface are the following:

a Holds the matrix *A* of size (*n*, *n*).

wr Holds the vector of length (*n*). Used in real flavors only.

wi Holds the vector of length (*n*). Used in real flavors only.

w Holds the vector of length (*n*). Used in complex flavors only.

vs Holds the matrix *VS* of size (*n*, *n*).

jobvs Restored based on the presence of the argument *vs* as follows:
jobvs = 'V', if *vs* is present,
jobvs = 'N', if *vs* is omitted.

sort Restored based on the presence of the argument *select* as follows:
sort = 'S', if *select* is present,
sort = 'N', if *select* is omitted.

sense Restored based on the presence of arguments *rconde* and rcondv as follows:
sense = 'B', if both *rconde* and *rcondv* are present,
sense = 'E', if *rconde* is present and *rcondv* omitted,

sense = 'V', if *rconde* is omitted and *rcondv* present,
sense = 'N', if both *rconde* and *rcondv* are omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run or set *lwork* = –1 (*liwork* = –1).

If you choose the first option and set any of admissible *lwork* (or *liwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If you set *lwork* = –1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?geev

Computes the eigenvalues and left and right eigenvectors of a general matrix.

Syntax

Fortran 77:

```
call sgeev(jobvl, jobvr, n, a, lda, wr, wi, vl, ldvl, vr, ldvr, work, lwork, info)
call dgeev(jobvl, jobvr, n, a, lda, wr, wi, vl, ldvl, vr, ldvr, work, lwork, info)
call cgeev(jobvl, jobvr, n, a, lda, w, vl, ldvl, vr, ldvr, work, lwork, rwork, info)
call zgeev(jobvl, jobvr, n, a, lda, w, vl, ldvl, vr, ldvr, work, lwork, rwork, info)
```

Fortran 95:

```
call geev(a, wr, wi [,vl] [,vr] [,info])
call geev(a, w [,vl] [,vr] [,info])
```

Description

This routine computes for an n-by-n real/complex nonsymmetric matrix A, the eigenvalues and, optionally, the left and/or right eigenvectors. The right eigenvector $v(j)$ of A satisfies

$$A*v(j) = \lambda(j)*v(j)$$

where $\lambda(j)$ is its eigenvalue.

The left eigenvector $u(j)$ of A satisfies

$$u(j)^H*A = \lambda(j)*u(j)^H$$

where $u(j)^H$ denotes the conjugate transpose of $u(j)$. The computed eigenvectors are normalized to have Euclidean norm equal to 1 and largest component real.

Input Parameters

jobvl	CHARACTER*1. Must be 'N' or 'V'. If *jobvl* = 'N', then left eigenvectors of *A* are not computed. If *jobvl* = 'V', then left eigenvectors of *A* are computed.
jobvr	CHARACTER*1. Must be 'N' or 'V'. If *jobvr* = 'N', then right eigenvectors of *A* are not computed. If *jobvr* = 'V', then right eigenvectors of *A* are computed.
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
a, *work*	REAL for sgeev DOUBLE PRECISION for dgeev COMPLEX for cgeev DOUBLE COMPLEX for zgeev. Arrays: *a*(*lda*,*) is an array containing the *n*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).

lda	INTEGER. The first dimension of the array *a*. Must be at least max(1, *n*).
ldvl, *ldvr*	INTEGER. The leading dimensions of the output arrays *vl* and *vr*, respectively. Constraints: *ldvl* ≥ 1; *ldvr* ≥ 1. If *jobvl* = 'V', *ldvl* ≥ max(1, *n*); If *jobvr* = 'V', *ldvr* ≥ max(1, *n*).
lwork	INTEGER. The dimension of the array *work*. Constraint: *lwork* ≥ max(1, 3*n*), and if *jobvl* = 'V' or *jobvr* = 'V', *lwork* < max(1, 4*n*) (for real flavors); *lwork* < max(1, 2*n*) (for complex flavors). For good performance, *lwork* must generally be larger. If *lwork* = –1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.
rwork	REAL for cgeev DOUBLE PRECISION for zgeev Workspace array, DIMENSION at least max(1, 2*n*). Used in complex flavors only.

Output Parameters

a	On exit, this array is overwritten by intermediate results.
wr, *wi*	REAL for sgeev DOUBLE PRECISION for dgeev Arrays, DIMENSION at least max (1, *n*) each. Contain the real and imaginary parts, respectively, of the computed eigenvalues. Complex conjugate pairs of eigenvalues appear consecutively with the eigenvalue having positive imaginary part first.
w	COMPLEX for cgeev DOUBLE COMPLEX for zgeev.

Array, DIMENSION at least max(1, *n*).
Contains the computed eigenvalues.

vl, *vr*

REAL for sgeev
DOUBLE PRECISION for dgeev
COMPLEX for cgeev
DOUBLE COMPLEX for zgeev.
Arrays:
vl(*ldvl*,*);the second dimension of *vl* must be at least max(1, *n*).
If *jobvl* = 'V', the left eigenvectors *u*(j) are stored one after another in the columns of *vl*, in the same order as their eigenvalues.
If *jobvl* = 'N', *vl* is not referenced.
For real flavors:
If the j-th eigenvalue is real, then *u*(j) = *vl*(:,j), the j-th column of *vl*.
If the j-th and (j+1)-st eigenvalues form a complex conjugate pair, then *u*(j) = *vl*(:,j) + *i***vl*(:,j+1) and *u*(j+1) = *vl*(:,j)– *i***vl*(:,j+1), where *i* = sqrt(–1).
For complex flavors:
u(j) = *vl*(:,j), the j-th column of *vl*.
vr(*ldvr*,*); the second dimension of *vr* must be at least max(1, *n*).
If *jobvr* = 'V', the right eigenvectors *v*(j) are stored one after another in the columns of *vr*, in the same order as their eigenvalues.
If *jobvr* = 'N', *vr* is not referenced.
For real flavors:
If the j-th eigenvalue is real, then *v*(j) = *vr*(:,j), the j-th column of *vr*.
If the j-th and (j+1)-st eigenvalues form a complex conjugate pair, then *v*(j) = *vr*(:,j) + *i***vr*(:,j+1) and *v*(j+1) = *vr*(:,j) – *i***vr*(:,j+1), where *i* = sqrt(–1).
For complex flavors:
v(j) = *vr*(:,j), the j-th column of *vr*.

work(1)	On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*th parameter had an illegal value. If *info* = *i*, the *QR* algorithm failed to compute all the eigenvalues, and no eigenvectors have been computed; elements *i*+1:*n* of *wr* and *wi* (for real flavors) or *w* (for complex flavors) contain those eigenvalues which have converged.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine geev interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
wr	Holds the vector of length (*n*). Used in real flavors only.
wi	Holds the vector of length (*n*). Used in real flavors only.
w	Holds the vector of length (*n*). Used in complex flavors only.
vl	Holds the matrix *VL* of size (*n*, *n*).
vr	Holds the matrix *VR* of size (*n*, *n*).
jobvl	Restored based on the presence of the argument *vl* as follows: *jobvl* = 'V', if *vl* is present, *jobvl* = 'N', if *vl* is omitted.
jobvr	Restored based on the presence of the argument *vr* as follows: *jobvr* = 'V', if *vr* is present, *jobvr* = 'N', if *vr* is omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?geevx

Computes the eigenvalues and left and right eigenvectors of a general matrix, with preliminary matrix balancing, and computes reciprocal condition numbers for the eigenvalues and right eigenvectors.

Syntax

Fortran 77:

```
call sgeevx(balanc, jobvl, jobvr, sense, n, a, lda, wr, wi, vl, ldvl, vr,
ldvr, ilo, ihi, scale, abnrm, rconde, rcondv, work, lwork, iwork, info)
```

```
call dgeevx(balanc, jobvl, jobvr, sense, n, a, lda, wr, wi, vl, ldvl, vr,
ldvr, ilo, ihi, scale, abnrm, rconde, rcondv, work, lwork, iwork, info)
```

```
call cgeevx(balanc, jobvl, jobvr, sense, n, a, lda, w, vl, ldvl, vr, ldvr,
ilo, ihi, scale, abnrm, rconde, rcondv, work, lwork, rwork, info)
```

```
call zgeevx(balanc, jobvl, jobvr, sense, n, a, lda, w, vl, ldvl, vr, ldvr,
ilo, ihi, scale, abnrm, rconde, rcondv, work, lwork, rwork, info)
```

Fortran 95:

```
call geevx(a, wr, wi [,vl] [,vr] [,balanc] [,ilo] [,ihi] [,scale] [,abnrm] [,
rconde] [,rcondv] [,info])
```

```
call geevx(a, w [,vl] [,vr] [,balanc] [,ilo] [,ihi] [,scale] [,abnrm] [,rconde]
[, rcondv] [,info])
```

Description

This routine computes for an *n*-by-*n* real/complex nonsymmetric matrix *A*, the eigenvalues and, optionally, the left and/or right eigenvectors.

Optionally also, it computes a balancing transformation to improve the conditioning of the eigenvalues and eigenvectors (*ilo*, *ihi*, *scale*, and *abnrm*), reciprocal condition numbers for the eigenvalues (*rconde*), and reciprocal condition numbers for the right eigenvectors (*rcondv*).

The right eigenvector *v*(j) of *A* satisfies

$$A*v(j) = \lambda(j)*v(j)$$

where $\lambda(j)$ is its eigenvalue.

The left eigenvector *u*(j) of *A* satisfies

$$u(j)^H*A = \lambda(j)*u(j)^H$$

where $u(j)^H$ denotes the conjugate transpose of *u*(j). The computed eigenvectors are normalized to have Euclidean norm equal to 1 and largest component real.

Balancing a matrix means permuting the rows and columns to make it more nearly upper triangular, and applying a diagonal similarity transformation *D***A**inv(*D*), where *D* is a diagonal matrix, to make its rows and columns closer in norm and the condition numbers of its eigenvalues and eigenvectors smaller. The computed reciprocal condition numbers correspond to the balanced matrix. Permuting rows and columns will not change the condition numbers in exact arithmetic) but diagonal scaling will. For further explanation of balancing, see [LUG], Section 4.10.

Input Parameters

balanc — CHARACTER*1. Must be 'N', 'P', 'S', or 'B'. Indicates how the input matrix should be diagonally scaled and/or permuted to improve the conditioning of its eigenvalues.
If *balanc* = 'N', do not diagonally scale or permute;
If *balanc* = 'P', perform permutations to make the matrix more nearly upper triangular. Do not diagonally scale;
If *balanc* = 'S', diagonally scale the matrix, i.e. replace *A* by *D***A**inv(*D*), where *D* is a diagonal matrix chosen to make the rows and columns of *A* more equal in norm. Do not permute;
If *balanc* = 'B', both diagonally scale and permute *A*.

Computed reciprocal condition numbers will be for the matrix after balancing and/or permuting. Permuting does not change condition numbers (in exact arithmetic), but balancing does.

jobvl — CHARACTER*1. Must be 'N' or 'V'.
If *jobvl* = 'N', left eigenvectors of *A* are not computed;
If *jobvl* = 'V', left eigenvectors of *A* are computed.
If *sense* = 'E' or 'B', then *jobvl* must be 'V'.

jobvr — CHARACTER*1. Must be 'N' or 'V'.
If *jobvr* = 'N', right eigenvectors of *A* are not computed;
If *jobvr* = 'V', right eigenvectors of *A* are computed.
If *sense* = 'E' or 'B', then *jobvr* must be 'V'.

sense — CHARACTER*1. Must be 'N', 'E', 'V', or 'B'. Determines which reciprocal condition number are computed.
If *sense* = 'N', none are computed;
If *sense* = 'E', computed for eigenvalues only;
If *sense* = 'V', computed for right eigenvectors only;
If *sense* = 'B', computed for eigenvalues and right eigenvectors.
If *sense* is 'E' or 'B', both left and right eigenvectors must also be computed (*jobvl* = 'V' and *jobvr* = 'V').

n — INTEGER. The order of the matrix *A* (*n* ≥ 0).

a, *work* — REAL for sgeevx
DOUBLE PRECISION for dgeevx
COMPLEX for cgeevx
DOUBLE COMPLEX for zgeevx.
Arrays:
a(*lda*,*) is an array containing the *n*-by-*n* matrix *A*.
The second dimension of *a* must be at least max(1, *n*).
work is a workspace array, its dimension max(1, *lwork*).

lda — INTEGER. The first dimension of the array *a*. Must be at least max(1, *n*).

ldvl, *ldvr* — INTEGER. The leading dimensions of the output arrays *vl* and *vr*, respectively.
Constraints:
ldvl ≥ 1; *ldvr* ≥ 1.

If *jobvl* = 'V', *ldvl* ≥ max(1, *n*);

If *jobvr* = 'V', *ldvr* ≥ max(1, *n*).

lwork INTEGER.
The dimension of the array *work*.
For real flavors:

If *sense* = 'N' or 'E', *lwork* ≥ max(1, 2*n*), and if *jobvl* = 'V' or *jobvr* = 'V', *lwork* ≥ 3*n*;

If *sense* = 'V' or 'B', *lwork* ≥ *n**(*n*+6).
For good performance, *lwork* must generally be larger.
For complex flavors:

If *sense* = 'N'or 'E', *lwork* ≥ max(1, 2*n*);

If *sense* = 'V' or 'B', *lwork* ≥ n^2+2*n*. For good performance, *lwork* must generally be larger.
If *lwork* = –1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

rwork REAL for cgeevx
DOUBLE PRECISION for zgeevx
Workspace array, DIMENSION at least max(1, 2*n*). Used in complex flavors only.

iwork INTEGER.
Workspace array, DIMENSION at least max(1, 2*n*-2). Used in real flavors only. Not referenced if *sense* = 'N' or 'E'.

Output Parameters

a On exit, this array is overwritten.
If *jobvl* = 'V' or *jobvr* = 'V', it contains the real-Schur/Schur form of the balanced version of the input matrix *A*.

wr, *wi* REAL for sgeevx
DOUBLE PRECISION for dgeevx

Arrays, DIMENSION at least max (1, *n*) each. Contain the real and imaginary parts, respectively, of the computed eigenvalues. Complex conjugate pairs of eigenvalues appear consecutively with the eigenvalue having positive imaginary part first.

w

COMPLEX for cgeevx
DOUBLE COMPLEX for zgeevx.
Array, DIMENSION at least max(1, *n*). Contains the computed eigenvalues.

vl, *vr*

REAL for sgeevx
DOUBLE PRECISION for dgeevx
COMPLEX for cgeevx
DOUBLE COMPLEX for zgeevx.
Arrays:
vl(*ldvl*,*); the second dimension of *vl* must be at least max(1, *n*).
If *jobvl* = 'V', the left eigenvectors *u*(j) are stored one after another in the columns of *vl*, in the same order as their eigenvalues.
If *jobvl* = 'N', *vl* is not referenced.
For real flavors:
If the j-th eigenvalue is real, then *u*(j) = *vl*(:,j), the j-th column of *vl*.
If the j-th and (j+1)-st eigenvalues form a complex conjugate pair, then *u*(j) = *vl*(:,j) + *i***vl*(:,j+1) and (j+1) = *vl*(:,j) – *i***vl*(:,j+1), where *i* = sqrt(–1).
For complex flavors:
u(j) = *vl*(:,j), the j-th column of *vl*.
vr(*ldvr*,*); the second dimension of *vr* must be at least max(1, *n*).
If *jobvr* = 'V', the right eigenvectors *v*(j) are stored one after another in the columns of *vr*, in the same order as their eigenvalues.
If *jobvr* = 'N', *vr* is not referenced.
For real flavors:
If the j-th eigenvalue is real, then *v*(j) = *vr*(:,j), the j-th column of *vr*.

	If the j-th and (j+1)-st eigenvalues form a complex conjugate pair, then `v(j) = vr(:,j) + i*vr(:,j+1)` and `v(j+1) = vr(:,j) – i*vr(:,j+1)`, where `i = sqrt(-1)` . For complex flavors: `v(j) = vr(:,j)`, the j-th column of *vr*.
ilo, *ihi*	INTEGER. *ilo* and *ihi* are integer values determined when *A* was balanced. The balanced `A(i,j) = 0` if `i > j` and `j = 1,..., ilo-1` or `i = ihi+1,..., n`. If *balanc* = 'N' or 'S', *ilo* = 1 and *ihi* = *n*.
scale	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. Array, DIMENSION at least max(1, *n*). Details of the permutations and scaling factors applied when balancing *A*. If *P*(j) is the index of the row and column interchanged with row and column j, and *D*(j) is the scaling factor applied to row and column j, then *scale*(j) = *P*(j), for `j = 1,...,ilo-1` = *D*(j), for `j = ilo,...,ihi` = *P*(j) for `j = ihi+1,..., n`. The order in which the interchanges are made is *n* to *ihi*+1, then 1 to *ilo*-1.
abnrm	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. The one-norm of the balanced matrix (the maximum of the sum of absolute values of elements of any column).
rconde, *rcondv*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays, DIMENSION at least max(1, *n*) each. *rconde*(j) is the reciprocal condition number of the j-th eigenvalue. *rcondv*(j) is the reciprocal condition number of the j-th right eigenvector.
work(1)	On exit, if `info = 0`, then *work(1)* returns the required minimal size of *lwork*.
info	INTEGER.

If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*th parameter had an illegal value.
If *info* = *i*, the *QR* algorithm failed to compute all the eigenvalues, and no eigenvectors or condition numbers have been computed; elements 1:*ilo*-1 and *i*+1:*n* of *wr* and *wi* (for real flavors) or *w* (for complex flavors) contain eigenvalues which have converged.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine geevx interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
wr	Holds the vector of length (*n*). Used in real flavors only.
wi	Holds the vector of length (*n*). Used in real flavors only.
w	Holds the vector of length (*n*). Used in complex flavors only.
vl	Holds the matrix *VL* of size (*n*, *n*).
vr	Holds the matrix *VR* of size (*n*, *n*).
scale	Holds the vector of length (*n*).
rconde	Holds the vector of length (*n*).
rcondv	Holds the vector of length (*n*).
balanc	Must be 'N', 'B', 'P' or 'S'. The default value is 'N'.
jobvl	Restored based on the presence of the argument *vl* as follows: *jobvl* = 'V', if *vl* is present, *jobvl* = 'N', if *vl* is omitted.
jobvr	Restored based on the presence of the argument *vr* as follows: *jobvr* = 'V', if *vr* is present, *jobvr* = 'N', if *vr* is omitted.
sense	Restored based on the presence of arguments *rconde* and rcondv as follows: *sense* = 'B', if both *rconde* and *rcondv* are present, *sense* = 'E', if *rconde* is present and *rcondv* omitted, *sense* = 'V', if *rconde* is omitted and *rcondv* present,

sense = 'N', if both *rconde* and *rcondv* are omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

Singular Value Decomposition

This section describes LAPACK driver routines used for solving singular value problems. See also computational routines computational routines that can be called to solve these problems. Table 4-12 lists all such driver routines for Fortran-77 interface. Respective routine names in Fortran-95 interface are without the first symbol (see Routine Naming Conventions).

Table 4-12 Driver Routines for Singular Value Decomposition

Routine Name	Operation performed
?gesvd	Computes the singular value decomposition of a general rectangular matrix.
?gesdd	Computes the singular value decomposition of a general rectangular matrix using a divide and conquer method.
?ggsvd	Computes the generalized singular value decomposition of a pair of general rectangular matrices.

?gesvd

Computes the singular value decomposition of a general rectangular matrix.

Syntax

Fortran 77:

```
call sgesvd(jobu, jobvt, m, n, a, lda, s, u, ldu, vt, ldvt, work, lwork, info)
call dgesvd(jobu, jobvt, m, n, a, lda, s, u, ldu, vt, ldvt, work, lwork, info)
call cgesvd(jobu, jobvt, m, n, a, lda, s, u, ldu, vt, ldvt, work, lwork, rwork, info)
call zgesvd(jobu, jobvt, m, n, a, lda, s, u, ldu, vt, ldvt, work, lwork, rwork, info)
```

Fortran 95:

```
call gesvd(a, s [,u] [,vt] [,ww] [,job] [,info])
```

Description

This routine computes the singular value decomposition (SVD) of a real/complex m-by-n matrix A, optionally computing the left and/or right singular vectors. The SVD is written

$A = U*\Sigma V^H$

where Σ is an m-by-n matrix which is zero except for its min(m,n) diagonal elements, U is an m-by-m orthogonal/unitary matrix, and V is an n-by-n orthogonal/unitary matrix. The diagonal elements of Σ are the singular values of A; they are real and non-negative, and are returned in descending order. The first min(m, n) columns of U and V are the left and right singular vectors of A.

Note that the routine returns V^H, not V.

Input Parameters

jobu	CHARACTER*1. Must be 'A', 'S', 'O', or 'N'. Specifies options for computing all or part of the matrix U. If *jobu* = 'A', all m columns of U are returned in the array *u*;

	if *jobu* = 'S', the first min(*m*, *n*) columns of *U* (the left singular vectors) are returned in the array *u*; if *jobu* = 'O', the first min(*m*, *n*) columns of *U* (the left singular vectors) are overwritten on the array *a*; if *jobu* = 'N', no columns of *U* (no left singular vectors) are computed.
jobvt	CHARACTER*1. Must be 'A', 'S', 'O', or 'N'. Specifies options for computing all or part of the matrix V^H. If *jobvt* = 'A', all *n* rows of V^H are returned in the array *vt*; if *jobvt* = 'S', the first min(*m*,*n*) rows of V^H (the right singular vectors) are returned in the array *vt*; if *jobvt* = 'O', the first min(*m*,*n*) rows of V^H (the right singular vectors) are overwritten on the array *a*; if *jobvt* = 'N', no rows of V^H (no right singular vectors) are computed. *jobvt* and *jobu* cannot both be 'O'.
m	INTEGER. The number of rows of the matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns in *A* (*n* ≥ 0).
a, *work*	REAL for sgesvd DOUBLE PRECISION for dgesvd COMPLEX for cgesvd DOUBLE COMPLEX for zgesvd. Arrays: *a*(*lda*,*) is an array containing the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of the array *a*. Must be at least max(1, *m*).
ldu, *ldvt*	INTEGER. The leading dimensions of the output arrays *u* and *vt*, respectively. Constraints: *ldu* ≥ 1; *ldvt* < 1. If *jobu* = 'S' or 'A', *ldu* ≥ *m*; If *jobvt* = 'A', *ldvt*≥ *n*;

If *jobvt* = 'S', *ldvt* ≥ min(*m*, *n*).

lwork INTEGER.

The dimension of the array *work*; *lwork* ≥ 1.
Constraints:

lwork ≥ max(3*min(*m*, *n*)+max(*m*, *n*), 5*min(*m*,*n*)) (for real flavors);

lwork ≥ 2*min(*m*, *n*)+max(*m*, *n*) (for complex flavors).
For good performance, *lwork* must generally be larger.
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for details.

rwork REAL for cgesvd
DOUBLE PRECISION for zgesvd
Workspace array, DIMENSION at least max(1, 5*min(*m*, *n*)).
Used in complex flavors only.

Output Parameters

a On exit,
If *jobu* = 'O', *a* is overwritten with the first min(*m*,*n*) columns of *U* (the left singular vectors, stored columnwise);
If *jobvt* = 'O', *a* is overwritten with the first min(*m*, *n*) rows of V^H (the right singular vectors, stored rowwise);

If *jobu*≠'O' and *jobvt*≠'O', the contents of *a* are destroyed.

s REAL for single precision flavors DOUBLE PRECISION for double precision flavors.
Array, DIMENSION at least max(1, min(*m*,*n*)). Contains the singular values of *A* sorted so that *s*(i) < *s*(i+1).

u, *vt* REAL for sgesvd
DOUBLE PRECISION for dgesvd
COMPLEX for cgesvd
DOUBLE COMPLEX for zgesvd.
Arrays:

	u(*ldu*,*); the second dimension of *u* must be at least max(1, *m*) if *jobu* = 'A', and at least max(1, min(*m*, *n*)) if *jobu* = 'S'. If *jobu* = 'A', *u* contains the *m*-by-*m* orthogonal/unitary matrix *U*. If *jobu* = 'S', *u* contains the first min(*m*, *n*) columns of *U* (the left singular vectors, stored columnwise). If *jobu* = 'N' or 'O', *u* is not referenced. *vt*(*ldvt*,*); the second dimension of *vt* must be at least max(1, *n*). If *jobvt* = 'A', *vt* contains the *n*-by-*n* orthogonal/unitary matrix V_H. If *jobvt* = 'S', *vt* contains the first min(*m*, *n*) rows of V^H (the right singular vectors, stored rowwise). If *jobvt* = 'N'or 'O', *vt* is not referenced.
work	On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*. For real flavors: If *info* > 0, *work*(2:min(*m*,*n*)) contains the unconverged superdiagonal elements of an upper bidiagonal matrix *B* whose diagonal is in *s* (not necessarily sorted). *B* satisfies *A* = *u* * *B* * *vt*, so it has the same singular values as *A*, and singular vectors related by *u* and *vt*.
rwork	On exit (for complex flavors), if *info* > 0, *rwork*(1:min(*m*,*n*)-1) contains the unconverged superdiagonal elements of an upper bidiagonal matrix *B* whose diagonal is in *s* (not necessarily sorted). *B* satisfies *A* = *u* * *B* * *vt*, so it has the same singular values as *A*, and singular vectors related by *u* and *vt*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, then if ?bdsqr did not converge, *i* specifies how many superdiagonals of the intermediate bidiagonal form *B* did not converge to zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `gesvd` interface are the following:

a Holds the matrix *A* of size (*m*, *n*).

s Holds the vector of length min(*m*, *n*).

u Holds the matrix *U* of size (*m*,min(*m*, *n*)).

vt Holds the matrix *VT* of size (min(*m*, *n*),*n*).

ww Holds the vector of length (min(*m*, *n*)-1).

ww Holds the vector of length min(*m*, *n*)-1. *ww* contains the unconverged superdiagonal elements of an upper bidiagonal matrix *B* whose diagonal is in *s* (not necessarily sorted). *B* satisfies *A = U * B * VT*, so it has the same singular values as *A*, and singular vectors related by *U* and *VT*.

job Must be either `'N'`, or `'U'`, or `'V'`. The default value is `'N'`.
If *job* = `'U'`, and *u* is not present, then *u* is returned in the array *a*.
If *job* = `'V'`, and *vt* is not present, then *vt* is returned in the array *a*.

jobu Restored based on the presence of the argument *u*, value of *job* and sizes of arrays *u* and *a* as follows:
jobu = `'A'`, if *u* is present and the number of columns in *u* is equal to the number of rows in *a*,
jobu = `'S'`, if *u* is present and the number of columns in *u* is not equal to the number of rows in *a*,
jobu = `'O'`, if *u* is not present and *job* is equal to `'U'`,
jobu = `'N'`, if *u* is not present and *job* is not equal to `'U'`.

jobvt Restored based on the presence of the argument *vt*, value of *job* and sizes of arrays *vt* and *a* as follows:
jobvt = `'A'`, if *vt* is present and the number of columns in *vt* is equal to the number of rows in *a*,
jobvt = `'S'`, if *vt* is present and the number of columns in *vt* is not equal to the number of rows in *a*,
jobvt = `'O'`, if *vt* is not present and *job* is equal to `'V'`,
jobvt = `'N'`, if *vt* is not present and *job* is not equal to `'V'`,

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?gesdd

Computes the singular value decomposition of a general rectangular matrix using a divide and conquer method.

Syntax

Fortran 77:

```
call sgesdd(jobz, m, n, a, lda, s, u, ldu, vt, ldvt, work, lwork, iwork, info)
call dgesdd(jobz, m, n, a, lda, s, u, ldu, vt, ldvt, work, lwork, iwork, info)
call cgesdd(jobz, m, n, a, lda, s, u, ldu, vt, ldvt, work, lwork, rwork, iwork, info)
call zgesdd(jobz, m, n, a, lda, s, u, ldu, vt, ldvt, work, lwork, rwork, iwork, info)
```

Fortran 95:

```
call gesdd(a, s [,u] [,vt] [,jobz] [,info])
```

Description

This routine computes the singular value decomposition (SVD) of a real/complex *m*-by-*n* matrix *A*, optionally computing the left and/or right singular vectors.

If singular vectors are desired, it uses a divide and conquer algorithm. The SVD is written

$A = U*\Sigma V^H$,

where Σ is an m-by-n matrix which is zero except for its min(m,n) diagonal elements, U is an m-by-m orthogonal/unitary matrix, and V is an n-by-n orthogonal/unitary matrix. The diagonal elements of Σ are the singular values of A; they are real and non-negative, and are returned in descending order. The first min(m, n) columns of U and V are the left and right singular vectors of A.

Note that the routine returns V^H, not V.

Input Parameters

jobz	CHARACTER*1. Must be 'A', 'S', 'O', or 'N'. Specifies options for computing all or part of the matrix U. If *jobz* = 'A', all m columns of U and all n rows of V^T are returned in the arrays *u* and *vt*; if *jobz* = 'S', the first min(m, n) columns of U and the first min(m, n) rows of V^T are returned in the arrays *u* and *vt*; if *jobz* = 'O', then if $m \geq n$, the first n columns of U are overwritten in the array *a* and all rows of V^T are returned in the array *vt*; if $m \geq n$, all columns of U are returned in the array *u* and the first m rows of V^T are overwritten in the array *a*; if *jobz* = 'N', no columns of U or rows of V^T are computed.
m	INTEGER. The number of rows of the matrix A ($m \geq 0$).
n	INTEGER. The number of columns in A ($n \geq 0$).
a, *work*	REAL for sgesdd DOUBLE PRECISION for dgesdd COMPLEX for cgesdd DOUBLE COMPLEX for zgesdd. Arrays: *a*(*lda*,*) is an array containing the m-by-n matrix A. The second dimension of *a* must be at least max(1, n). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of the array *a*. Must be at least max(1, m).

ldu, *ldvt*	INTEGER. The leading dimensions of the output arrays *u* and *vt*, respectively. Constraints: *ldu* ≥ 1; *ldvt* ≥ 1. If *jobz* = 'S' or 'A', or *jobz* = 'O' and *m* < *n*, then *ldu* ≥ *m*; If *jobz* = 'A' or *jobz* = 'O' and *m* < *n*, then *ldvt* ≥ *n*; If *jobz* = 'S', *ldvt* ≥ min(*m*, *n*).
lwork	INTEGER. The dimension of the array *work*; *lwork* ≥ 1. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the *work*(1), and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.
rwork	REAL for cgesdd DOUBLE PRECISION for zgesdd Workspace array, DIMENSION at least max(1, 5*min(*m*,*n*)) if *jobz* = 'N'. Otherwise, the dimension of *rwork* must be at least max(1, 5*(min(*m*,*n*))^2 + 7*min(*m*,*n*)). This array is used in complex flavors only.
iwork	INTEGER. Workspace array, DIMENSION at least max(1, 8 *min(*m*, *n*)).

Output Parameters

a	On exit: If *jobz* = 'O', then if *m*≥ *n*, *a* is overwritten with the first *n* columns of *U* (the left singular vectors, stored columnwise). If *m* < *n*, *a* is overwritten with the first *m* rows of V^T (the right singular vectors, stored rowwise); If *jobz*≠'O', the contents of *a* are destroyed.
s	REAL for single precision flavors DOUBLE PRECISION for double precision flavors.

Array, DIMENSION at least max(1, min(*m*,*n*)). Contains the singular values of *A* sorted so that *s*(i) ≥ *s*(i+1).

u, *vt*

REAL for sgesdd
DOUBLE PRECISION for dgesdd
COMPLEX for cgesdd
DOUBLE COMPLEX for zgesdd.
Arrays:
u(*ldu*,*); the second dimension of *u* must be at least max(1, *m*) if *jobz* = 'A' or *jobz* = 'O' and *m* < *n*.
If *jobz* = 'S', the second dimension of *u* must be at least max(1, min(*m*, *n*)).
If *jobz* = 'A'or *jobz* = 'O' and *m* < *n*, *u* contains the *m*-by-*m* orthogonal/unitary matrix *U*.
If *jobz* = 'S', *u* contains the first min(*m*, *n*) columns of *U* (the left singular vectors, stored columnwise).
If *jobz* = 'O' and *m* < *n*, or *jobz* = 'N', *u* is not referenced.
vt(*ldvt*,*); the second dimension of *vt* must be at least max(1, *n*).
If *jobz* = 'A'or *jobz* = 'O' and *m*≥*n*, *vt* contains the *n*-by-*n* orthogonal/unitary matrix V^T.
If *jobz* = 'S', *vt* contains the first min(*m*, *n*) rows of V^T (the right singular vectors, stored rowwise).
If *jobz* = 'O' and *m* < *n*, or *jobz* = 'N', *vt* is not referenced.

work(1)

On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.

info

INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, then ?bdsdc did not converge, updating process failed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gesdd interface are the following:

a	Holds the matrix *A* of size (*m*, *n*).
s	Holds the vector of length min(*m*, *n*).
u	Holds the matrix *U* of size (*m*,min(*m*, *n*)).
vt	Holds the matrix *VT* of size (min(*m*, *n*),*n*).
job	Must be 'N', 'A', 'S', or 'O'. The default value is 'N'.

Application Notes

For real flavors:

If *jobz* = 'N', *lwork* ≥ 3*min(*m*, *n*) + max (max(*m*,*n*), 6*min(*m*, *n*));

If *jobz* = 'O', *lwork* ≥ 3*(min(*m*, *n*))^2 +

max (max(*m*, *n*), 5*(min(*m*, *n*))^2 + 4*min(*m*, *n*));

If *jobz* = 'S' or 'A', *lwork* < 3*(min(*m*, *n*))^2 +

max (max(*m*, *n*), 4*(min(*m*, *n*))^2 + 4*min(*m*, *n*)).

For complex flavors:

If *jobz* = 'N', *lwork* ≥ 2*min(*m*, *n*) + max(*m*, *n*);

If *jobz* = 'O', *lwork* ≥ 2*(min(*m*, *n*))^2 + max(*m*, *n*) + 2*min(*m*, *n*);

If *jobz* = 'S' or 'A', *lwork* ≥ (min(*m*, *n*))^2 + max(*m*, *n*) + 2*min(*m*, *n*);

For good performance, *lwork* should generally be larger.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?ggsvd

Computes the generalized singular value decomposition of a pair of general rectangular matrices.

Syntax

Fortran 77:

```
call sggsvd(jobu, jobv, jobq, m, n, p, k, l, a, lda, b, ldb, alpha, beta, u,
ldu, v, ldv, q, ldq, work, iwork, info)
```

```
call dggsvd(jobu, jobv, jobq, m, n, p, k, l, a, lda, b, ldb, alpha, beta, u,
ldu, v, ldv, q, ldq, work, iwork, info)
```

```
call cggsvd(jobu, jobv, jobq, m, n, p, k, l, a, lda, b, ldb, alpha, beta, u,
ldu, v, ldv, q, ldq, work, rwork, iwork, info)
```

```
call zggsvd(jobu, jobv, jobq, m, n, p, k, l, a, lda, b, ldb, alpha, beta, u,
ldu, v, ldv, q, ldq, work, rwork, iwork, info)
```

Fortran 95:

```
call ggsvd(a, b, alpha, beta [, k] [,l] [,u] [,v] [,q] [,iwork] [,info])
```

Description

This routine computes the generalized singular value decomposition (GSVD) of an m-by-n real/complex matrix A and p-by-n real/complex matrix B:

$U^H*A*Q = D_1*(0\ R), V^H*B*Q = D_2*(0\ R),$

where U, V and Q are orthogonal/unitary matrices.

Let $k+l$ = the effective numerical rank of the matrix $(A^H, B^H)^H$, then R is a $(k+l)$-by-$(k+l)$ nonsingular upper triangular matrix, D_1 and D_2 are m-by-$(k+l)$ and p-by-$(k+l)$ "diagonal" matrices and of the following structures, respectively:

If $m-k-l \geq 0$,

$$D_1 = \begin{array}{c} \\ k \\ l \\ m-k-l \end{array} \begin{array}{c} \begin{array}{cc} k & l \end{array} \\ \begin{pmatrix} I & 0 \\ 0 & C \\ 0 & 0 \end{pmatrix} \end{array}$$

$$D_2 = \begin{array}{c} \\ l \\ p-l \end{array} \begin{array}{c} \begin{array}{cc} k & l \end{array} \\ \begin{pmatrix} 0 & S \\ 0 & 0 \end{pmatrix} \end{array}$$

$$(0 \quad R) = \begin{array}{c} \\ k \\ l \end{array} \begin{array}{c} \begin{array}{ccc} n-k-l & k & l \end{array} \\ \begin{pmatrix} 0 & R_{11} & R_{12} \\ 0 & 0 & R_{22} \end{pmatrix} \end{array},$$

where

C = diag($alpha(K+1)$,..., $alpha(K+l)$)

S = diag($beta(K+1)$,...,$beta(K+l)$)

$C^2 + S^2 = I$

R is stored in $a(1:k+l, n-k-l+1:n)$ on exit.

If $m-k-l < 0$,

$$D_1 = \begin{array}{c} \\ k \\ m-k \end{array} \begin{array}{c} \begin{array}{ccc} k & m-k & k+l-m \end{array} \\ \begin{pmatrix} I & 0 & 0 \\ 0 & C & 0 \end{pmatrix} \end{array}$$

$$D_2 = \begin{array}{c} \\ m-k \\ k+l-m \\ p-l \end{array} \begin{array}{c} \begin{array}{ccc} k & m-k & k+l-m \end{array} \\ \begin{pmatrix} 0 & S & 0 \\ & 0 & I \\ 0 & 0 & 0 \end{pmatrix} \end{array}$$

$$(0 \quad R) = \begin{array}{c} \\ k \\ m-k \\ k+l-m \end{array} \begin{array}{c} \begin{array}{cccc} n-k-l & k & m-k & k+l-m \end{array} \\ \begin{pmatrix} 0 & R_{11} & R_{12} & R_{13} \\ 0 & 0 & R_{22} & R_{23} \\ 0 & 0 & 0 & R_{33} \end{pmatrix} \end{array}$$

where

C = diag($alpha(K+1)$,..., $alpha(m)$),

S = diag($beta(K+1)$,...,$beta(m)$),

C_2 + S_2 = I

On exit, $\begin{pmatrix} R_{11} & R_{12} & R_{13} \\ 0 & R_{22} & R_{23} \end{pmatrix}$ is stored in $a(1{:}m, n{-}k{-}l{+}1{:}n)$ and R_{33} is stored in $b(m{-}k{+}1{:}l, n{+}m{-}k{-}l{+}1{:}n)$.

The routine computes C, S, R, and optionally the orthogonal/unitary transformation matrices U, V and Q.

In particular, if B is an n-by-n nonsingular matrix, then the GSVD of A and B implicitly gives the SVD of AB^{-1}:

$A*B^{-1} = U(*D_1 \ D_2^{-1})*V^H$.

If $(A^H, B^H)^H$ has orthonormal columns, then the GSVD of A and B is also equal to the CS decomposition of A and B. Furthermore, the GSVD can be used to derive the solution of the eigenvalue problem:

$A^H*A \ \lambda x = \lambda \ B^H*B \ x$.

Input Parameters

jobu	CHARACTER*1. Must be 'U' or 'N'. If *jobu* = 'U', orthogonal/unitary matrix U is computed. If *jobu* = 'N', U is not computed.
jobv	CHARACTER*1. Must be 'V' or 'N'. If *jobv* = 'V', orthogonal/unitary matrix V is computed. If *jobv* = 'N', V is not computed.
jobq	CHARACTER*1. Must be 'Q' or 'N'. If *jobq* = 'Q', orthogonal/unitary matrix Q is computed. If *jobq* = 'N', Q is not computed.
m	INTEGER. The number of rows of the matrix A ($m \geq 0$).
n	INTEGER. The number of columns of the matrices A and B ($n \geq 0$).
p	INTEGER. The number of rows of the matrix B ($p \geq 0$).
a, *b*, *work*	REAL for sggsvd DOUBLE PRECISION for dggsvd COMPLEX for cggsvd DOUBLE COMPLEX for zggsvd. Arrays: *a*(*lda*,*) contains the m-by-n matrix A. The second dimension of *a* must be at least max(1, n). *b*(*ldb*,*) contains the p-by-n matrix B. The second dimension of *b* must be at least max(1, n). *work*(*) is a workspace array. The dimension of *work* must be at least max(3n, m, p)+n.

lda INTEGER. The first dimension of *a*; at least max(1, *m*).

ldb INTEGER. The first dimension of *b*; at least max(1, *p*).

ldu INTEGER. The first dimension of the array *u* .
ldu ≥ max(1, *m*) if *jobu* = 'U'; *ldu* ≥ 1 otherwise.

ldv INTEGER. The first dimension of the array *v* .
ldv ≥ max(1, *p*) if *jobv* = 'V'; *ldv* ≥ 1 otherwise.

ldq INTEGER. The first dimension of the array *q* .
ldq ≥ max(1, *n*) if *jobq* = 'Q'; *ldq* ≥ 1 otherwise.

iwork INTEGER.
Workspace array, DIMENSION at least max(1, *n*).

rwork REAL for cggsvd DOUBLE PRECISION for zggsvd.
Workspace array, DIMENSION at least max(1, 2*n*). Used in complex flavors only.

Output Parameters

k, *l* INTEGER. On exit, *k* and *l* specify the dimension of the subblocks. The sum *k+l* is equal to the effective numerical rank of $(A^H, B^H)^H$.

a On exit, *a* contains the triangular matrix *R* or part of *R*.

b On exit, *b* contains part of the triangular matrix R if *m-k-l* < 0.

alpha, *beta* REAL for single-precision flavors
DOUBLE PRECISION for double-precision flavors.
Arrays, DIMENSION at least max(1, *n*) each.
Contain the generalized singular value pairs of *A* and *B*:
alpha(1:*k*) = 1,
beta(1:*k*) = 0,
and if *m-k-l* ≥ 0,
alpha(*k*+1:*k*+*l*) = *C*,
beta(*k*+1:*k*+*l*) = *S*,
or if *m-k-l* < 0,
alpha(*k*+1:*m*)= *C*, *alpha*(*m*+1:*k*+*l*)=0
beta(*k*+1:*m*) = *S*, *beta*(*m*+1:*k*+*l*) = 1
and

	alpha(*k*+*l*+1:*n*) = 0 *beta*(*k*+*l*+1:*n*) = 0.
u, *v*, *q*	REAL for sggsvd DOUBLE PRECISION for dggsvd COMPLEX for cggsvd DOUBLE COMPLEX for zggsvd. Arrays: *u*(*ldu*,*); the second dimension of *u* must be at least max(1, *m*). If *jobu* = 'U', *u* contains the *m*-by-*m* orthogonal/unitary matrix *U*. If *jobu* = 'N', *u* is not referenced. *v*(*ldv*,*); the second dimension of *v* must be at least max(1, *p*). If *jobv* = 'V', *v* contains the *p*-by-*p* orthogonal/unitary matrix *V*. If *jobv* = 'N', *v* is not referenced. *q*(*ldq*,*); the second dimension of *q* must be at least max(1, *n*). If *jobq* = 'Q', *q* contains the *n*-by-*n* orthogonal/unitary matrix *Q*. If *jobq* = 'N', *q* is not referenced.
iwork	On exit, *iwork* stores the sorting information.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = 1, the Jacobi-type procedure failed to converge. For further details, see subroutine ?tgsja.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine ggsvd interface are the following:

a	Holds the matrix *A* of size (*m*, *n*).
b	Holds the matrix *B* of size (*p*, *n*).

alpha	Holds the vector of length (*n*).
beta	Holds the vector of length (*n*).
u	Holds the matrix *U* of size (*m*, *m*).
v	Holds the matrix *V* of size (*p*, *p*).
q	Holds the matrix *Q* of size (*n*, *n*).
iwork	Holds the vector of length (*n*).
jobu	Restored based on the presence of the argument *u* as follows: *jobu* = 'U', if *u* is present, *jobu* = 'N', if *u* is omitted.
jobv	Restored based on the presence of the argument *v* as follows: *jobz* = 'V', if *v* is present, *jobz* = 'N', if *v* is omitted.
jobq	Restored based on the presence of the argument *q* as follows: *jobz* = 'Q', if *q* is present, *jobz* = 'N', if *q* is omitted.

Generalized Symmetric Definite Eigenproblems

This section describes LAPACK driver routines used for solving generalized symmetric definite eigenproblems. See also computational routines that can be called to solve these problems. Table 4-13 lists all such driver routines for Fortran-77 interface. Respective routine names in Fortran-95 interface are without the first symbol (see Routine Naming Conventions).

Table 4-13 Driver Routines for Solving Generalized Symmetric Definite Eigenproblems

Routine Name	Operation performed
?sygv/?hegv	Computes all eigenvalues and, optionally, eigenvectors of a real / complex generalized symmetric /Hermitian definite eigenproblem.
?sygvd/?hegvd	Computes all eigenvalues and, optionally, eigenvectors of a real / complex generalized symmetric /Hermitian definite eigenproblem. If eigenvectors are desired, it uses a divide and conquer method.
?sygvx/?hegvx	Computes selected eigenvalues and, optionally, eigenvectors of a real / complex generalized symmetric /Hermitian definite eigenproblem.
?spgv/?hpgv	Computes all eigenvalues and, optionally, eigenvectors of a real / complex generalized symmetric /Hermitian definite eigenproblem with matrices in packed storage.

Routine Name	Operation performed
?spgvd/?hpgvd	Computes all eigenvalues and, optionally, eigenvectors of a real / complex generalized symmetric /Hermitian definite eigenproblem with matrices in packed storage. If eigenvectors are desired, it uses a divide and conquer method.
?spgvx/?hpgvx	Computes selected eigenvalues and, optionally, eigenvectors of a real / complex generalized symmetric /Hermitian definite eigenproblem with matrices in packed storage.
?sbgv/?hbgv	Computes all eigenvalues and, optionally, eigenvectors of a real / complex generalized symmetric /Hermitian definite eigenproblem with banded matrices.
?sbgvd/?hbgvd	Computes all eigenvalues and, optionally, eigenvectors of a real / complex generalized symmetric /Hermitian definite eigenproblem with banded matrices. If eigenvectors are desired, it uses a divide and conquer method.
?sbgvx/?hbgvx	Computes selected eigenvalues and, optionally, eigenvectors of a real / complex generalized symmetric /Hermitian definite eigenproblem with banded matrices.

?sygv

Computes all eigenvalues and, optionally, eigenvectors of a real generalized symmetric definite eigenproblem.

Syntax

Fortran 77:

```
call ssygv(itype, jobz, uplo, n, a, lda, b, ldb, w, work, lwork, info)
call dsygv(itype, jobz, uplo, n, a, lda, b, ldb, w, work, lwork, info)
```

Fortran 95:

```
call sygv(a, b, w [,itype] [,jobz] [,uplo] [,info])
```

Description

This routine computes all the eigenvalues, and optionally, the eigenvectors of a real generalized symmetric-definite eigenproblem, of the form

$Ax = \lambda Bx$, $ABx = \lambda x$, or $B\,Ax = \lambda x$.

Here A and B are assumed to be symmetric and B is also positive definite.

Input Parameters

itype	INTEGER. Must be 1 or 2 or 3. Specifies the problem type to be solved: if *itype* = 1, the problem type is *A*x = lambda*B*x*; if *itype* = 2, the problem type is *A*B*x* = *lambda*x*; if *itype* = 3, the problem type is *B*A*x = lambda*x*.
jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then compute eigenvalues only. If *jobz* = 'V', then compute eigenvalues and eigenvectors.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', arrays *a* and *b* store the upper triangles of *A* and *B*; If *uplo* = 'L', arrays *a* and *b* store the lower triangles of *A* and *B*.
n	INTEGER. The order of the matrices *A* and *B* ($n \geq 0$).
a, *b*, *work*	REAL for ssygv DOUBLE PRECISION for dsygv. Arrays: *a*(*lda*,*) contains the upper or lower triangle of the symmetric matrix *A*, as specified by *uplo*. The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) contains the upper or lower triangle of the symmetric positive definite matrix *B*, as specified by *uplo*. The second dimension of *b* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
ldb	INTEGER. The first dimension of *b*; at least max(1, *n*).

lwork INTEGER.
The dimension of the array *work*;
lwork ≥ max(1, 3*n*-1).
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

a On exit, if *jobz* = 'V', then if *info* = 0, *a* contains the matrix *Z* of eigenvectors. The eigenvectors are normalized as follows:
if *itype* = 1 or 2, $Z^T*B*Z = I$;
if *itype* = 3, $Z^T*\mathrm{inv}(B)*Z = I$;
If *jobz* = 'N', then on exit the upper triangle (if *uplo* = 'U') or the lower triangle (if *uplo* = 'L') of *A*, including the diagonal, is destroyed.

b On exit, if *info* ≤ *n*, the part of *b* containing the matrix is overwritten by the triangular factor *U* or *L* from the Cholesky factorization $B = U^T*U$ or $B = L*L^T$.

w REAL for ssygv
DOUBLE PRECISION for dsygv.
Array, DIMENSION at least max(1, *n*).
If *info* = 0, contains the eigenvalues in ascending order.

work(1) On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.

info INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th argument had an illegal value.
If *info* > 0, spotrf/dpotrf and ssyev/dsyev returned an error code:
If *info* = *i* ≤ *n*, ssyev/dsyev failed to converge, and *i* off-diagonal elements of an intermediate tridiagonal did not converge to zero;

If *info* = *n* + *i*, for 1 ≤ *i* ≤ *n*, then the leading minor of order *i* of *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `sygv` interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *n*).
w	Holds the vector of length (*n*).
itype	Must be 1, 2, or 3. The default value is 1.
jobz	Must be `'N'` or `'V'`. The default value is `'N'`.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

For optimum performance use *lwork* ≥ (*nb*+2)**n*, where *nb* is the blocksize for `ssytrd`/`dsytrd` returned by `ilaenv`.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = –1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = –1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?hegv

Computes all eigenvalues and, optionally, eigenvectors of a complex generalized Hermitian definite eigenproblem.

Syntax

Fortran 77:

```
call chegv(itype, jobz, uplo, n, a, lda, b, ldb, w, work, lwork, rwork, info)
call zhegv(itype, jobz, uplo, n, a, lda, b, ldb, w, work, lwork, rwork, info)
```

Fortran 95:

```
call hegv(a, b, w [,itype] [,jobz] [,uplo] [,info])
```

Description

This routine computes all the eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitian-definite eigenproblem, of the form

$Ax = \lambda Bx$, $ABx = \lambda x$, or $BAx = \lambda x$.

Here A and B are assumed to be Hermitian and B is also positive definite.

Input Parameters

itype	INTEGER. Must be 1 or 2 or 3. Specifies the problem type to be solved: if *itype* = 1, the problem type is *A*x = lambda*B*x*; if *itype* = 2, the problem type is *A*B*x = lambda*x*; if *itype* = 3, the problem type is *B*A*x = lambda*x*.
jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then compute eigenvalues only. If *jobz* = 'V', then compute eigenvalues and eigenvectors.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', arrays *a* and *b* store the upper triangles of *A* and *B*; If *uplo* = 'L', arrays *a* and *b* store the lower triangles of *A* and *B*.

n	INTEGER. The order of the matrices *A* and *B* ($n \geq 0$).
a, *b*, *work*	COMPLEX for chegv DOUBLE COMPLEX for zhegv. Arrays: *a*(*lda*,*) contains the upper or lower triangle of the Hermitian matrix *A*, as specified by *uplo*. The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) contains the upper or lower triangle of the Hermitian positive definite matrix *B*, as specified by *uplo*. The second dimension of *b* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
ldb	INTEGER. The first dimension of *b*; at least max(1, *n*).
lwork	INTEGER. The dimension of the array *work*; $lwork \geq \max(1, 2n-1)$. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.
rwork	REAL for chegv DOUBLE PRECISION for zhegv. Workspace array, DIMENSION at least max(1, 3*n*-2).

Output Parameters

a	On exit, if *jobz* = 'V', then if *info* = 0, *a* contains the matrix *Z* of eigenvectors. The eigenvectors are normalized as follows: if *itype* = 1 or 2, $Z^H*B*Z = I$; if *itype* = 3, $Z^H*\text{inv}(B)*Z = I$; If *jobz* = 'N', then on exit the upper triangle (if *uplo* = 'U') or the lower triangle (if *uplo* = 'L') of *A*, including the diagonal, is destroyed.

b	On exit, if *info* ≤ *n*, the part of *b* containing the matrix is overwritten by the triangular factor *U* or *L* from the Cholesky factorization $B = U^H*U$ or $B = L*L^H$.
w	REAL for chegv DOUBLE PRECISION for zhegv. Array, DIMENSION at least max(1, *n*). If *info* = 0, contains the eigenvalues in ascending order.
work(1)	On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th argument had an illegal value. If *info* > 0, cpotrf/zpotrf and cheev/zheev returned an error code: If *info* = *i* ≤ *n*, cheev/zheev failed to converge, and *i* off-diagonal elements of an intermediate tridiagonal did not converge to zero; If *info* = *n* + *i*, for 1 ≤ *i* ≤ *n*, then the leading minor of order *i* of *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine hegv interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *n*).
w	Holds the vector of length (*n*).
itype	Must be 1, 2, or 3. The default value is 1.
jobz	Must be 'N' or 'V'. The default value is 'N'.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For optimum performance use *lwork* ≥ (*nb*+1)**n*, where *nb* is the blocksize for `chetrd`/`zhetrd` returned by `ilaenv`.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?sygvd

Computes all eigenvalues and, optionally, eigenvectors of a real generalized symmetric definite eigenproblem. If eigenvectors are desired, it uses a divide and conquer method.

Syntax

Fortran 77:

```
call ssygvd(itype, jobz, uplo, n, a, lda, b, ldb, w, work, lwork, iwork, liwork, info)
```

```
call dsygvd(itype, jobz, uplo, n, a, lda, b, ldb, w, work, lwork, iwork, liwork, info)
```

Fortran 95:

```
call sygvd(a, b, w [,itype] [,jobz] [,uplo] [,info])
```

Description

This routine computes all the eigenvalues, and optionally, the eigenvectors of a real generalized symmetric-definite eigenproblem, of the form

$Ax = \lambda Bx$, $ABx = \lambda x$, or $BAx = \lambda x$.

Here *A* and *B* are assumed to be symmetric and *B* is also positive definite.

If eigenvectors are desired, it uses a divide and conquer algorithm.

Input Parameters

itype	INTEGER. Must be 1 or 2 or 3. Specifies the problem type to be solved: if *itype* = 1, the problem type is *A*x = lambda*B*x*; if *itype* = 2, the problem type is *A*B*x* = *lambda*x*; if *itype* = 3, the problem type is *B*A*x = lambda*x*.
jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then compute eigenvalues only. If *jobz* = 'V', then compute eigenvalues and eigenvectors.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', arrays *a* and *b* store the upper triangles of *A* and *B*; If *uplo* = 'L', arrays *a* and *b* store the lower triangles of *A* and *B*.
n	INTEGER. The order of the matrices *A* and *B* ($n \geq 0$).
a, *b*, *work*	REAL for ssygvd DOUBLE PRECISION for dsygvd. Arrays: *a*(*lda*,*) contains the upper or lower triangle of the symmetric matrix *A*, as specified by *uplo*. The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) contains the upper or lower triangle of the symmetric positive definite matrix *B*, as specified by *uplo*. The second dimension of *b* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
ldb	INTEGER. The first dimension of *b*; at least max(1, *n*).

lwork INTEGER.
The dimension of the array *work*.
Constraints:
If $n \leq 1$, *lwork* ≥ 1;
If *jobz* = 'N' and $n>1$, *lwork* $< 2n+1$;
If *jobz* = 'V' and $n>1$, *lwork* $< 2n^2+6n+1$.
If *lwork* = −1, then a workspace query is assumed; the routine only calculates the required sizes of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See Application Notes for details.

iwork INTEGER.
Workspace array, its dimension max(1, *lwork*).

liwork INTEGER.
The dimension of the array *iwork*.
Constraints:
If $n \leq 1$, *liwork* ≥ 1;
If *jobz* = 'N' and $n>1$, *liwork* ≥ 1;
If *jobz* = 'V' and $n>1$, *liwork* $\geq 5n+3$.
If *liwork* = −1, then a workspace query is assumed; the routine only calculates the required sizes of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See Application Notes for details.

Output Parameters

a On exit, if *jobz* = 'V', then if *info* = 0, *a* contains the matrix *Z* of eigenvectors. The eigenvectors are normalized as follows:
if *itype* = 1 or 2, $Z^T*B*Z = I$;
if *itype* = 3, $Z^T*\text{inv}(B)*Z = I$;
If *jobz* = 'N', then on exit the upper triangle (if *uplo* = 'U') or the lower triangle (if *uplo* = 'L') of *A*, including the diagonal, is destroyed.

b	On exit, if *info* ≤ *n*, the part of *b* containing the matrix is overwritten by the triangular factor *U* or *L* from the Cholesky factorization $B = U^T*U$ or $B = L*L^T$.
w	REAL for ssygvd DOUBLE PRECISION for dsygvd. Array, DIMENSION at least max(1, *n*). If *info* = 0, contains the eigenvalues in ascending order.
work(1)	On exit, if *info* = 0, then *work*(1) returns the required minimal size of *lwork*.
iwork(1)	On exit, if *info* = 0, then *iwork*(1) returns the required minimal size of *liwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th argument had an illegal value. If *info* > 0= *i* ≤ *n*, and *jobz* = 'N', then the algorithm failed to converge; *i* off-diagonal elements of an intermediate tridiagonal form did not converge to zero; if *jobz* = 'V', then the algorithm failed to compute an eigenvalue while working on the submatrix lying in rows and columns *info*/(*n*+1) through mod(*info*,*n*+1); If *info* > 0= *n* + *i*, for 1 ≤ *i* ≤ *n*, then the leading minor of order *i* of *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine sygvd interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *n*).
w	Holds the vector of length (*n*).
itype	Must be 1, 2, or 3. The default value is 1.

jobz	Must be 'N' or 'V'. The default value is 'N'.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run or set *lwork* = –1 (*liwork* = –1).

If you choose the first option and set any of admissible *lwork* (or *liwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If you set *lwork* = –1 (*liwork* = –1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?hegvd

Computes all eigenvalues and, optionally, eigenvectors of a complex generalized Hermitian definite eigenproblem. If eigenvectors are desired, it uses a divide and conquer method.

Syntax

Fortran 77:

```
call chegvd(itype, jobz, uplo, n, a, lda, b, ldb, w, work, lwork, rwork,
lrwork, iwork, liwork, info)
```

```
call zhegvd(itype, jobz, uplo, n, a, lda, b, ldb, w, work, lwork, rwork,
lrwork, iwork, liwork, info)
```

Fortran 95:

```
call hegvd(a, b, w [,itype] [,jobz] [,uplo] [,info])
```

Description

This routine computes all the eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitian-definite eigenproblem, of the form

$Ax = \lambda Bx$, $ABx = \lambda x$, or $BAx = \lambda x$.

Here A and B are assumed to be Hermitian and B is also positive definite.

If eigenvectors are desired, it uses a divide and conquer algorithm.

Input Parameters

itype	INTEGER. Must be 1 or 2 or 3. Specifies the problem type to be solved: if *itype* = 1, the problem type is *A*x = lambda*B*x*; if *itype* = 2, the problem type is *A*B*x = lambda*x*; if *itype* = 3, the problem type is *B*A*x = lambda*x*.
jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then compute eigenvalues only. If *jobz* = 'V', then compute eigenvalues and eigenvectors.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', arrays *a* and *b* store the upper triangles of *A* and *B*; If *uplo* = 'L', arrays *a* and *b* store the lower triangles of *A* and *B*.
n	INTEGER. The order of the matrices *A* and *B* ($n \geq 0$).
a, *b*, *work*	COMPLEX for chegvd DOUBLE COMPLEX for zhegvd. Arrays: *a*(*lda*,*) contains the upper or lower triangle of the Hermitian matrix *A*, as specified by *uplo*. The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) contains the upper or lower triangle of the Hermitian positive definite matrix *B*, as specified by *uplo*. The second dimension of *b* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
ldb	INTEGER. The first dimension of *b*; at least max(1, *n*).

lwork INTEGER.
The dimension of the array *work*.
Constraints:
If $n \leq 1$, *lwork* ≥ 1;
If *jobz* = 'N' and $n>1$, *lwork* $\geq n+1$;
If *jobz* = 'V' and $n>1$, *lwork* $\geq n^2+2n$.
If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See Application Notes for details.

rwork REAL for chegvd
DOUBLE PRECISION for zhegvd.
Workspace array, DIMENSION max(1, *lrwork*).

lrwork INTEGER.
The dimension of the array *rwork*.
Constraints:
If $n \leq 1$, *lrwork* ≥ 1;
If *jobz* = 'N' and $n>1$, *lrwork* $\geq n$;
If *jobz* = 'V' and $n>1$, *lrwork* $< 2n^2+5n+1$.
If *lrwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See Application Notes for details.

iwork INTEGER.
Workspace array, DIMENSION max(1, *liwork*).

liwork INTEGER.
The dimension of the array *iwork*.
Constraints:
If $n \leq 1$, *liwork* ≥ 1;
If *jobz* = 'N' and $n>1$, *liwork* ≥ 1;
If *jobz* = 'V' and $n>1$, *liwork* $\geq 5n+3$.

If *liwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See Application Notes for details.

Output Parameters

a — On exit, if *jobz* = 'V', then if *info* = 0, *a* contains the matrix *Z* of eigenvectors. The eigenvectors are normalized as follows:
if *itype* = 1 or 2, $Z^H * B * Z = I$;
if *itype* = 3, $Z^H * \mathrm{inv}(B) * Z = I$;
If *jobz* = 'N', then on exit the upper triangle (if *uplo* = 'U') or the lower triangle (if *uplo* = 'L') of *A*, including the diagonal, is destroyed.

b — On exit, if *info* ≤ *n*, the part of *b* containing the matrix is overwritten by the triangular factor *U* or *L* from the Cholesky factorization $B = U^H * U$ or $B = L * L^H$.

w — REAL for chegvd
DOUBLE PRECISION for zhegvd.
Array, DIMENSION at least max(1, *n*).
If *info* = 0, contains the eigenvalues in ascending order.

work(1) — On exit, if *info* = 0, then *work*(1) returns the required minimal size of *lwork*.

rwork(1) — On exit, if *info* = 0, then *rwork*(1) returns the required minimal size of *lrwork*.

iwork(1) — On exit, if *info* = 0, then *iwork*(1) returns the required minimal size of *liwork*.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th argument had an illegal value.
If *info* = *i*, and *jobz* = 'N', then the algorithm failed to converge; *i* off-diagonal elements of an intermediate tridiagonal form did not converge to zero;

if *info* = *i*, and *jobz* = 'V', then the algorithm failed to compute an eigenvalue while working on the submatrix lying in rows and columns *info*/(*n*+1) through mod(*info*, *n*+1).

If *info* = *n* + *i*, for 1 ≤ *i* ≤ *n*, then the leading minor of order *i* of *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine hegvd interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *n*).
w	Holds the vector of length (*n*).
itype	Must be 1, 2, or 3. The default value is 1.
jobz	Must be 'N' or 'V'. The default value is 'N'.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* (*liwork* or *lrwork*) for the first run or set *lwork* = −1 (*liwork* = −1, *lrwork* = −1).

If you choose the first option and set any of admissible *lwork* (*liwork* or *lrwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*) on exit. Use this value (*work*(1), *iwork*(1), *rwork*(1)) for subsequent runs.

If you set *lwork* = −1 (*liwork* = −1, *lrwork* = −1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*, *lrwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?sygvx

Computes selected eigenvalues and, optionally, eigenvectors of a real generalized symmetric definite eigenproblem.

Syntax

Fortran 77:

```
call ssygvx(itype, jobz, range, uplo, n, a, lda, b, ldb, vl, vu, il, iu,
abstol, m, w, z, ldz, work, lwork, iwork, ifail, info)
```

```
call dsygvx(itype, jobz, range, uplo, n, a, lda, b, ldb, vl, vu, il, iu,
abstol, m, w, z, ldz, work, lwork, iwork, ifail, info)
```

Fortran 95:

```
call sygvx(a, b, w [,itype] [,uplo] [,z] [,vl] [,vu] [,il] [,iu] [,m] [,ifail]
[,abstol] [,info])
```

Description

This routine computes selected eigenvalues, and optionally, the eigenvectors of a real generalized symmetric-definite eigenproblem, of the form

$Ax = \lambda Bx$, $ABx = \lambda x$, or $BAx = \lambda x$.

Here A and B are assumed to be symmetric and B is also positive definite. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Input Parameters

itype	INTEGER. Must be 1 or 2 or 3. Specifies the problem type to be solved: if *itype* = 1, the problem type is *A*x = lambda*B*x*; if *itype* = 2, the problem type is *A*B*x* = *lambda*x*; if *itype* = 3, the problem type is *B*A*x = lambda*x*.
jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then compute eigenvalues only. If *jobz* = 'V', then compute eigenvalues and eigenvectors.
range	CHARACTER*1. Must be 'A' or 'V' or 'I'.

	If *range* = 'A', the routine computes all eigenvalues. If *range* = 'V', the routine computes eigenvalues *lambda*(i) in the half-open interval: *vl*<*lambda*(i)≤ *vu*. If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', arrays *a* and *b* store the upper triangles of *A* and *B*; If *uplo* = 'L', arrays *a* and *b* store the lower triangles of *A* and *B*.
n	INTEGER. The order of the matrices *A* and *B* (*n* ≥ 0).
a, *b*, *work*	REAL for ssygvx DOUBLE PRECISION for dsygvx. Arrays: *a*(*lda*,*) contains the upper or lower triangle of the symmetric matrix *A*, as specified by *uplo*. The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) contains the upper or lower triangle of the symmetric positive definite matrix *B*, as specified by *uplo*. The second dimension of *b* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
ldb	INTEGER. The first dimension of *b*; at least max(1, *n*).
vl, *vu*	REAL for ssygvx DOUBLE PRECISION for dsygvx. If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues. Constraint: *vl*< *vu*. If *range* = 'A' or 'I', *vl* and *vu* are not referenced.
il, *iu*	INTEGER. If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned. Constraint: 1 ≤ *il* ≤ *iu* ≤ *n*, if *n* > 0; *il*=1 and *iu*=0 if *n* = 0.

If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol — REAL for ssygvx
DOUBLE PRECISION for dsygvx. The absolute error tolerance for the eigenvalues. See Application Notes for more information.

ldz — INTEGER. The leading dimension of the output array *z*. Constraints:
ldz ≥ 1; if *jobz* = 'V', *ldz* ≥ max(1, *n*).

lwork — INTEGER.
The dimension of the array *work*;
lwork < max(1, 8*n*).
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.
See Application Notes for the suggested value of *lwork*.

iwork — INTEGER.
Workspace array, DIMENSION at least max(1, 5*n*).

Output Parameters

a — On exit, the upper triangle (if *uplo* = 'U') or the lower triangle (if *uplo* = 'L') of *A*, including the diagonal, is overwritten.

b — On exit, if *info* ≤ *n*, the part of *b* containing the matrix is overwritten by the triangular factor *U* or *L* from the Cholesky factorization $B = U^T*U$ or $B = L*L^T$.

m — INTEGER. The total number of eigenvalues found,
0 ≤ *m* ≤ *n*. If *range* = 'A', *m* = *n*, and if *range* = 'I', *m* = *iu*-*il*+1.

w, *z* — REAL for ssygvx
DOUBLE PRECISION for dsygvx.
Arrays:
w(*), DIMENSION at least max(1, *n*).
The first *m* elements of *w* contain the selected eigenvalues in ascending order.

	z(*ldz*,*). The second dimension of *z* must be at least max(1, *m*). If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *A* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). The eigenvectors are normalized as follows: if *itype* = 1 or 2, $Z^T*B*Z = I$; if *itype* = 3, $Z^T*\mathrm{inv}(B)*Z = I$; If *jobz* = 'N', then *z* is not referenced. If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*. Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.
work(1)	On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.
ifail	INTEGER. Array, DIMENSION at least max(1, *n*). If *jobz* = 'V', then if *info* = 0, the first *m* elements of *ifail* are zero; if *info* > 0, the *ifail* contains the indices of the eigenvectors that failed to converge. If *jobz* = 'N', then *ifail* is not referenced.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*th argument had an illegal value. If *info* > 0, spotrf/dpotrf and ssyevx/dsyevx returned an error code: If *info* = *i* ≤ *n*, ssyevx/dsyevx failed to converge, and *i* eigenvectors failed to converge. Their indices are stored in the array *ifail*; If *info* = *n* + *i*, for 1 ≤ *i* ≤ *n*, then the leading minor of order *i* of *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `sygvx` interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *n*).
w	Holds the vector of length (*n*).
z	Holds the matrix *Z* of size (*n*, *n*), where the values *n* and *m* are significant.
ifail	Holds the vector of length (*n*).
itype	Must be 1, 2, or 3. The default value is 1.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
vl	Default value for this element is *vl* = -HUGE(*vl*).
vu	Default value for this element is *vu* = HUGE(*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this element is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted. Note that there will be an error condition if *ifail* is present and *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval `[a,b]` of width less than or equal to *abstol* + ε * max(|a|,|b|), where ε is the machine precision.

If *abstol* is less than or equal to zero, then ε*||*T*||$_1$ is be used in its place, where *T* is the tridiagonal matrix obtained by reducing *A* to tridiagonal form. Eigenvalues will be computed most accurately when *abstol* is set to twice the underflow threshold 2*?lamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, try setting *abstol* to 2*?lamch('S').

For optimum performance use *lwork* ≥ (*nb*+3)**n*, where *nb* is the blocksize for ssytrd/dsytrd returned by ilaenv.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = –1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = –1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?hegvx

Computes selected eigenvalues and, optionally, eigenvectors of a complex generalized Hermitian definite eigenproblem.

Syntax

Fortran 77:

```
call chegvx(itype, jobz, range, uplo, n, a, lda, b, ldb, vl, vu, il, iu,
abstol, m, w, z, ldz, work, lwork, rwork, iwork, ifail, info)
```

```
call zhegvx(itype, jobz, range, uplo, n, a, lda, b, ldb, vl, vu, il, iu,
abstol, m, w, z, ldz, work, lwork, rwork, iwork, ifail, info)
```

Fortran 95:

```
call hegvx(a, b, w [,itype] [,uplo] [,z] [,vl] [,vu] [,il] [,iu] [,m] [,ifail]
[,abstol] [,info])
```

Description

This routine computes selected eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitian-definite eigenproblem, of the form

$Ax = \lambda Bx$, $ABx = \lambda x$, or $BAx = \lambda x$.

Here A and B are assumed to be Hermitian and B is also positive definite. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Input Parameters

itype	INTEGER. Must be 1 or 2 or 3. Specifies the problem type to be solved: if *itype* = 1, the problem type is *A*x = lambda*B*x*; if *itype* = 2, the problem type is *A*B*x = lambda*x*; if *itype* = 3, the problem type is *B*A*x = lambda*x*.
jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then compute eigenvalues only. If *jobz* = 'V', then compute eigenvalues and eigenvectors.
range	CHARACTER*1. Must be 'A' or 'V' or 'I'.

If *range* = 'A', the routine computes all eigenvalues.
If *range* = 'V', the routine computes eigenvalues *lambda*(*i*) in the half-open interval:

vl<*lambda*(*i*)≤ *vu*.

If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.

uplo — CHARACTER*1. Must be 'U' or 'L'.
If *uplo* = 'U', arrays *a* and *b* store the upper triangles of *A* and *B*;
If *uplo* = 'L', arrays *a* and *b* store the lower triangles of *A* and *B*.

n — INTEGER. The order of the matrices *A* and *B* (*n* ≥ 0).

a, *b*, *work* — COMPLEX for chegvx
DOUBLE COMPLEX for zhegvx.
Arrays:
a(*lda*,*) contains the upper or lower triangle of the Hermitian matrix *A*, as specified by *uplo*.
The second dimension of *a* must be at least max(1, *n*).
b(*ldb*,*) contains the upper or lower triangle of the Hermitian positive definite matrix *B*, as specified by *uplo*.
The second dimension of *b* must be at least max(1, *n*).
work is a workspace array, its dimension max(1, *lwork*).

lda — INTEGER. The first dimension of *a*; at least max(1, *n*).

ldb — INTEGER. The first dimension of *b*; at least max(1, *n*).

vl, *vu* — REAL for chegvx
DOUBLE PRECISION for zhegvx.
If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.
Constraint: *vl*< *vu*.
If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, *iu* — INTEGER.
If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.

Constraint: 1 ≤ *il* ≤ *iu* ≤ *n*, if *n* > 0; *il*=1 and *iu*=0 if *n* = 0.

If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol — REAL for chegvx
DOUBLE PRECISION for zhegvx.
The absolute error tolerance for the eigenvalues. See Application Notes for more information.

ldz — INTEGER. The leading dimension of the output array *z*.
Constraints:

ldz ≥ 1; if *jobz* = 'V', *ldz* ≥ max(1, *n*).

lwork — INTEGER.

The dimension of the array *work*; *lwork* ≥ max(1, 2*n*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

rwork — REAL for chegvx
DOUBLE PRECISION for zhegvx.
Workspace array, DIMENSION at least max(1, 7*n*).

iwork — INTEGER.
Workspace array, DIMENSION at least max(1, 5*n*).

Output Parameters

a — On exit, the upper triangle (if *uplo* = 'U') or the lower triangle (if *uplo* = 'L') of *A*, including the diagonal, is overwritten.

b — On exit, if *info* ≤ *n*, the part of *b* containing the matrix is overwritten by the triangular factor *U* or *L* from the Cholesky factorization $B = U^H*U$ or $B = L*L^H$.

m — INTEGER. The total number of eigenvalues found,

$0 \le m \le n$. If *range* = 'A', $m = n$, and if *range* = 'I', $m = iu-il+1$.

w — REAL for chegvx
DOUBLE PRECISION for zhegvx.
Array, DIMENSION at least max(1, *n*).

The first *m* elements of *w* contain the selected eigenvalues in ascending order.

z — COMPLEX for chegvx
DOUBLE COMPLEX for zhegvx.
Array z(*ldz*,*). The second dimension of *z* must be at least max(1, *m*).
If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *A* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*).
The eigenvectors are normalized as follows:
if *itype* = 1 or 2, $Z^H*B*Z = I$;
if *itype* = 3, $Z^H*\mathrm{inv}(B)*Z = I$;
If *jobz* = 'N', then *z* is not referenced.
If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*.
Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.

work(1) — On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.

ifail — INTEGER.
Array, DIMENSION at least max(1, *n*).
If *jobz* = 'V', then if *info* = 0, the first *m* elements of *ifail* are zero; if *info* > 0, the *ifail* contains the indices of the eigenvectors that failed to converge.
If *jobz* = 'N', then *ifail* is not referenced.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = –*i*, the *i*th argument had an illegal value.
If *info* > 0, cpotrf/zpotrf and cheevx/zheevx returned an error code:

If *info* = *i* ≤ *n*, cheevx/zheevx failed to converge, and *i* eigenvectors failed to converge. Their indices are stored in the array *ifail*;

If *info* = *n* + *i*, for 1 ≤ *i* ≤ *n*, then the leading minor of order *i* of *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine hegvx interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *n*).
w	Holds the vector of length (*n*).
z	Holds the matrix *Z* of size (*n*, *n*), where the values *n* and *m* are significant.
ifail	Holds the vector of length (*n*).
itype	Must be 1, 2, or 3. The default value is 1.
uplo	Must be 'U' or 'L'. The default value is 'U'.
vl	Default value for this element is *vl* = -HUGE(*vl*).
vu	Default value for this element is *vu* = HUGE(*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this element is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted. Note that there will be an error condition if *ifail* is present and *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present,

Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a,b] of width less than or equal to *abstol* + ε * max(|a|,|b|), where ε is the machine precision.

If *abstol* is less than or equal to zero, then ε*||*T*||$_1$ will be used in its place, where *T* is the tridiagonal matrix obtained by reducing *A* to tridiagonal form. Eigenvalues will be computed most accurately when *abstol* is set to twice the underflow threshold 2*?lamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, try setting *abstol* to 2*?lamch('S').

For optimum performance use *lwork* ≥ (*nb*+1)**n*, where *nb* is the blocksize for chetrd/zhetrd returned by ilaenv.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = –1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = –1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?spgv

Computes all eigenvalues and, optionally, eigenvectors of a real generalized symmetric definite eigenproblem with matrices in packed storage.

Syntax

Fortran 77:

```
call sspgv(itype, jobz, uplo, n, ap, bp, w, z, ldz, work, info)
call dspgv(itype, jobz, uplo, n, ap, bp, w, z, ldz, work, info)
```

Fortran 95:

```
call spgv(a, b, w [,itype] [,uplo] [,z] [,info])
```

Description

This routine computes all the eigenvalues, and optionally, the eigenvectors of a real generalized symmetric-definite eigenproblem, of the form

$Ax = \lambda Bx$, $ABx = \lambda x$, or $BAx = \lambda x$.

Here A and B are assumed to be symmetric, stored in packed format, and B is also positive definite.

Input Parameters

itype	INTEGER. Must be 1 or 2 or 3. Specifies the problem type to be solved: if *itype* = 1, the problem type is *A*x = lambda*B*x*; if *itype* = 2, the problem type is *A*B*x* = *lambda*x*; if *itype* = 3, the problem type is *B*A*x = lambda*x*.
jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then compute eigenvalues only. If *jobz* = 'V', then compute eigenvalues and eigenvectors.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', arrays *ap* and *bp* store the upper triangles of *A* and *B*;

If *uplo* = 'L', arrays *ap* and *bp* store the lower triangles of *A* and *B*.

n — INTEGER. The order of the matrices *A* and *B* (*n* ≥ 0).

ap, *bp*, *work* — REAL for sspgv
DOUBLE PRECISION for dspgv.
Arrays:
ap(*) contains the packed upper or lower triangle of the symmetric matrix *A*, as specified by *uplo*.
The dimension of *ap* must be at least max(1, *n**(*n*+1)/2).
bp(*) contains the packed upper or lower triangle of the symmetric matrix *B*, as specified by *uplo*.
The dimension of *bp* must be at least max(1, *n**(*n*+1)/2).
work(*) is a workspace array, DIMENSION at least max(1, 3*n*).

ldz — INTEGER. The leading dimension of the output array *z*; *ldz* ≥ 1. If *jobz* = 'V', *ldz* ≥ max(1, *n*).

Output Parameters

ap — On exit, the contents of *ap* are overwritten.

bp — On exit, contains the triangular factor *U* or *L* from the Cholesky factorization $B = U^T*U$ or $B = L*L^T$, in the same storage format as *B*.

w, *z* — REAL for sspgv
DOUBLE PRECISION for dspgv.
Arrays:
w(*), DIMENSION at least max(1, *n*).
If *info* = 0, contains the eigenvalues in ascending order.
z(*ldz*,*).
The second dimension of *z* must be at least max(1, *n*).
If *jobz* = 'V', then if *info* = 0, *z* contains the matrix *Z* of eigenvectors. The eigenvectors are normalized as follows:
if *itype* = 1 or 2, $Z^T*B*Z = I$;
if *itype* = 3, $Z^T*\mathrm{inv}(B)*Z = I$;
If *jobz* = 'N', then *z* is not referenced.

info — INTEGER.

If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th argument had an illegal value.
If *info* > 0, spptrf/dpptrf and sspev/dspev returned an error code:

If *info* = *i* ≤ *n*, sspev/dspev failed to converge, and *i* off-diagonal elements of an intermediate tridiagonal did not converge to zero;

If *info* = *n* + *i*, for 1 ≤ *i* ≤ *n*, then the leading minor of order *i* of *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine spgv interface are the following:

a	Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n*(n+1)/2*).
b	Stands for argument *bp* in Fortan 77 interface. Holds the array *B* of size (*n*(n+1)/2*).
w	Holds the vector of length (*n*).
z	Holds the matrix *Z* of size (*n*, *n*).
itype	Must be 1, 2, or 3. The default value is 1.
uplo	Must be 'U' or 'L'. The default value is 'U'.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted.

?hpgv

Computes all eigenvalues and, optionally, eigenvectors of a complex generalized Hermitian definite eigenproblem with matrices in packed storage.

Syntax

Fortran 77:

```
call chpgv(itype, jobz, uplo, n, ap, bp, w, z, ldz, work, rwork, info)
call zhpgv(itype, jobz, uplo, n, ap, bp, w, z, ldz, work, rwork, info)
```

Fortran 95:

```
call hpgv(a, b, w [,itype] [,uplo] [,z] [,info])
```

Description

This routine computes all the eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitian-definite eigenproblem, of the form

$Ax = \lambda Bx$, $ABx = \lambda x$, or $BAx = \lambda x$.

Here A and B are assumed to be Hermitian, stored in packed format, and B is also positive definite.

Input Parameters

itype — INTEGER. Must be 1 or 2 or 3. Specifies the problem type to be solved:
if *itype* = 1, the problem type is *A*x = lambda*B*x*;
if *itype* = 2, the problem type is *A*B*x = lambda*x*;
if *itype* = 3, the problem type is *B*A*x = lambda*x*.

jobz — CHARACTER*1. Must be 'N' or 'V'.
If *jobz* = 'N', then compute eigenvalues only.
If *jobz* = 'V', then compute eigenvalues and eigenvectors.

uplo — CHARACTER*1. Must be 'U' or 'L'.
If *uplo* = 'U', arrays *ap* and *bp* store the upper triangles of *A* and *B*;

If *uplo* = 'L', arrays *ap* and *bp* store the lower triangles of *A* and *B*.

n — INTEGER. The order of the matrices *A* and *B* (*n* ≥ 0).

ap, *bp*, *work* — COMPLEX for chpgv
DOUBLE COMPLEX for zhpgv.
Arrays:
ap(*) contains the packed upper or lower triangle of the Hermitian matrix *A*, as specified by *uplo*.
The dimension of *ap* must be at least max(1, *n**(*n*+1)/2).
bp(*) contains the packed upper or lower triangle of the Hermitian matrix *B*, as specified by *uplo*.
The dimension of *bp* must be at least max(1, *n**(*n*+1)/2).
work(*) is a workspace array, DIMENSION at least max(1, 2*n*-1).

ldz — INTEGER. The leading dimension of the output array *z*; *ldz* ≥ 1. If *jobz* = 'V', *ldz* ≥ max(1, *n*).

rwork — REAL for chpgv
DOUBLE PRECISION for zhpgv.
Workspace array, DIMENSION at least max(1, 3*n*-2).

Output Parameters

ap — On exit, the contents of *ap* are overwritten.

bp — On exit, contains the triangular factor *U* or *L* from the Cholesky factorization $B = U^H*U$ or $B = L*L^H$, in the same storage format as *B*.

w — REAL for chpgv
DOUBLE PRECISION for zhpgv.
Array, DIMENSION at least max(1, *n*).
If *info* = 0, contains the eigenvalues in ascending order.

z — COMPLEX for chpgv
DOUBLE COMPLEX for zhpgv.
Array z(*ldz*,*).
The second dimension of *z* must be at least max(1, *n*).
If *jobz* = 'V', then if *info* = 0, *z* contains the matrix *Z* of eigenvectors. The eigenvectors are normalized as follows:

if *itype* = 1 or 2, $Z^H*B*Z = I$;
if *itype* = 3, $Z^H*\text{inv}(B)*Z = I$;
If *jobz* = 'N', then *z* is not referenced.

info INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th argument had an illegal value.
If *info* > 0, cpptrf/zpptrf and chpev/zhpev returned an error code:

If *info* = *i* ≤ *n*, chpev/zhpev failed to converge, and *i* off-diagonal elements of an intermediate tridiagonal did not converge to zero;

If *info* = *n* + *i*, for 1 ≤ *i* ≤ *n*, then the leading minor of order *i* of *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine hpgv interface are the following:

a Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n**(*n*+1)/2).

b Stands for argument *bp* in Fortan 77 interface. Holds the array *B* of size (*n**(*n*+1)/2).

w Holds the vector of length (*n*).

z Holds the matrix *Z* of size (*n*, *n*).

itype Must be 1, 2, or 3. The default value is 1.

uplo Must be 'U' or 'L'. The default value is 'U'.

jobz Restored based on the presence of the argument *z* as follows:
jobz = 'V', if *z* is present,
jobz = 'N', if *z* is omitted.

?spgvd

Computes all eigenvalues and, optionally, eigenvectors of a real generalized symmetric definite eigenproblem with matrices in packed storage. If eigenvectors are desired, it uses a divide and conquer method.

Syntax

Fortran 77:

```
call sspgvd(itype, jobz, uplo, n, ap, bp, w, z, ldz, work, lwork, iwork, liwork, info)
call dspgvd(itype, jobz, uplo, n, ap, bp, w, z, ldz, work, lwork, iwork, liwork, info)
```

Fortran 95:

```
call spgvd(a, b, w [,itype] [,uplo] [,z] [,info])
```

Description

This routine computes all the eigenvalues, and optionally, the eigenvectors of a real generalized symmetric-definite eigenproblem, of the form

$Ax = \lambda Bx$, $ABx = \lambda x$, or $BAx = \lambda x$.

Here A and B are assumed to be symmetric, stored in packed format, and B is also positive definite.

If eigenvectors are desired, it uses a divide and conquer algorithm.

Input Parameters

itype	INTEGER. Must be 1 or 2 or 3. Specifies the problem type to be solved: if *itype* = 1, the problem type is *A*x = lambda*B*x*; if *itype* = 2, the problem type is *A*B*x* = *lambda*x*; if *itype* = 3, the problem type is *B*A*x = lambda*x*.
jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then compute eigenvalues only. If *jobz* = 'V', then compute eigenvalues and eigenvectors.

uplo — CHARACTER*1. Must be 'U' or 'L'.
If *uplo* = 'U', arrays *ap* and *bp* store the upper triangles of *A* and *B*;
If *uplo* = 'L', arrays *ap* and *bp* store the lower triangles of *A* and *B*.

n — INTEGER. The order of the matrices *A* and *B* ($n \geq 0$).

ap, *bp*, *work* — REAL for sspgvd
DOUBLE PRECISION for dspgvd.
Arrays:
ap(*) contains the packed upper or lower triangle of the symmetric matrix *A*, as specified by *uplo*.
The dimension of *ap* must be at least max(1, n*(n+1)/2).
bp(*) contains the packed upper or lower triangle of the symmetric matrix *B*, as specified by *uplo*.
The dimension of *bp* must be at least max(1, n*(n+1)/2).
work is a workspace array, its dimension max(1, *lwork*).

ldz — INTEGER. The leading dimension of the output array *z*; *ldz* ≥ 1. If *jobz* = 'V', *ldz* $\geq$ max(1, *n*).

lwork — INTEGER.
The dimension of the array *work*.
Constraints:

If $n \leq 1$, *lwork* ≥ 1;

If *jobz* = 'N' and $n>1$, *lwork* $\geq 2n$;

If *jobz* = 'V' and $n>1$, *lwork* $\geq 2n^2+6n+1$.

If *lwork* = −1, then a workspace query is assumed; the routine only calculates the required sizes of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See Application Notes for details.

iwork — INTEGER.
Workspace array, its dimension max(1, *lwork*).

liwork — INTEGER.
The dimension of the array *iwork*.
Constraints:

If $n \leq 1$, $liwork \geq 1$;

If $jobz$ = 'N' and $n>1$, $liwork \geq 1$;

If $jobz$ = 'V' and $n>1$, $liwork \geq 5n+3$.

If $liwork$ = −1, then a workspace query is assumed; the routine only calculates the required sizes of the $work$ and $iwork$ arrays, returns these values as the first entries of the $work$ and $iwork$ arrays, and no error message related to $lwork$ or $liwork$ is issued by xerbla. See Application Notes for details.

Output Parameters

ap

On exit, the contents of ap are overwritten.

bp

On exit, contains the triangular factor U or L from the Cholesky factorization $B = U^T*U$ or $B = L*L^T$, in the same storage format as B.

w, *z*

REAL for sspgv

DOUBLE PRECISION for dspgv.

Arrays:

w(*), DIMENSION at least max(1, n).

If $info$ = 0, contains the eigenvalues in ascending order.

z(ldz,*).

The second dimension of z must be at least max(1, n).

If $jobz$ = 'V', then if $info$ = 0, z contains the matrix Z of eigenvectors. The eigenvectors are normalized as follows:

if $itype$ = 1 or 2, Z^T*B*Z = I;

if $itype$ = 3, Z^T*inv(B)*Z = I;

If $jobz$ = 'N', then z is not referenced.

work(1)

On exit, if $info$ = 0, then $work$(1) returns the required minimal size of $lwork$.

iwork(1)

On exit, if $info$ = 0, then $iwork$(1) returns the required minimal size of $liwork$.

info

INTEGER.

If $info$ = 0, the execution is successful.

If $info$ = −i, the i-th argument had an illegal value.

If *info* > 0, spptrf/dpptrf and sspevd/dspevd returned an error code:

If *info* = *i* ≤ *n*, sspevd/dspevd failed to converge, and *i* off-diagonal elements of an intermediate tridiagonal did not converge to zero;

If *info* = *n* + *i*, for 1 ≤ *i* ≤ *n*, then the leading minor of order *i* of *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine spgvd interface are the following:

a	Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n*(n+1)/2*).
b	Stands for argument *bp* in Fortan 77 interface. Holds the array *B* of size (*n*(n+1)/2*).
w	Holds the vector of length (*n*).
z	Holds the matrix *Z* of size (*n*, *n*).
itype	Must be 1, 2, or 3. The default value is 1.
uplo	Must be 'U' or 'L'. The default value is 'U'.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run or set *lwork* = –1 (*liwork* = –1).

If you choose the first option and set any of admissible *lwork* (or *liwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If you set *lwork* = -1 (*liwork* = -1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

Application Notes

?hpgvd

Computes all eigenvalues and, optionally, eigenvectors of a complex generalized Hermitian definite eigenproblem with matrices in packed storage. If eigenvectors are desired, it uses a divide and conquer method.

Syntax

Fortran 77:

```
call chpgvd(itype, jobz, uplo, n, ap, bp, w, z, ldz, work, lwork, rwork,
lrwork, iwork, liwork, info)
```

```
call zhpgvd(itype, jobz, uplo, n, ap, bp, w, z, ldz, work, lwork, rwork,
lrwork, iwork, liwork, info)
```

Fortran 95:

```
call hpgvd(a, b, w [,itype] [,uplo] [,z] [,info])
```

Description

This routine computes all the eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitian-definite eigenproblem, of the form

$Ax = \lambda Bx$, $ABx = \lambda x$, or $BAx = \lambda x$.

Here *A* and *B* are assumed to be Hermitian, stored in packed format, and *B* is also positive definite.

If eigenvectors are desired, it uses a divide and conquer algorithm.

Input Parameters

itype	INTEGER. Must be 1 or 2 or 3. Specifies the problem type to be solved: if *itype* = 1, the problem type is *A*x = lambda*B*x*; if *itype* = 2, the problem type is *A*B*x = lambda*x*; if *itype* = 3, the problem type is *B*A*x = lambda*x*.
jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then compute eigenvalues only. If *jobz* = 'V', then compute eigenvalues and eigenvectors.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', arrays *ap* and *bp* store the upper triangles of *A* and *B*; If *uplo* = 'L', arrays *ap* and *bp* store the lower triangles of *A* and *B*.
n	INTEGER. The order of the matrices *A* and *B* (*n* ≥ 0).
ap, *bp*, *work*	COMPLEX for chpgvd DOUBLE COMPLEX for zhpgvd. Arrays: *ap(*)* contains the packed upper or lower triangle of the Hermitian matrix *A*, as specified by *uplo*. The dimension of *ap* must be at least max(1, *n**(*n*+1)/2). *bp(*)* contains the packed upper or lower triangle of the Hermitian matrix *B*, as specified by *uplo*. The dimension of *bp* must be at least max(1, *n**(*n*+1)/2). *work* is a workspace array, its dimension max(1, *lwork*).
ldz	INTEGER. The leading dimension of the output array *z*; *ldz* ≥ 1. If *jobz* = 'V', *ldz* ≥ max(1, *n*).
lwork	INTEGER. The dimension of the array *work*. Constraints: If *n* ≤ 1, *lwork* ≥ 1;

If *jobz* = 'N' and *n*>1, *lwork* ≥ *n*;

If *jobz* = 'V' and *n*>1, *lwork* ≥ 2*n*.

If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See Application Notes for details.

rwork — REAL for chpgvd
DOUBLE PRECISION for zhpgvd.
Workspace array, its dimension max(1, *lrwork*).

lrwork — INTEGER.
The dimension of the array *rwork*.
Constraints:

If *n* ≤ 1, *lrwork* ≥ 1;

If *jobz* = 'N' and *n*>1, *lrwork* ≥ *n*;

If *jobz* = 'V' and *n*>1, *lrwork* ≥ $2n^2+5n+1$.

If *lrwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See Application Notes for details.

iwork — INTEGER.
Workspace array, its dimension max(1, *liwork*).

liwork — INTEGER.
The dimension of the array *iwork*.
Constraints:

If *n* ≤ 1, *liwork* ≥ 1;

If *jobz* = 'N' and *n*>1, *liwork* ≥ 1;

If *jobz* = 'V' and *n*>1, *liwork* ≥ 5*n*+3.

If *liwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries

of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See Application Notes for details.

Output Parameters

ap — On exit, the contents of *ap* are overwritten.

bp — On exit, contains the triangular factor *U* or *L* from the Cholesky factorization $B = U^H*U$ or $B = L*L^H$, in the same storage format as *B*.

w — REAL for chpgvd
DOUBLE PRECISION for zhpgvd.
Array, DIMENSION at least max(1, *n*).
If *info* = 0, contains the eigenvalues in ascending order.

z — COMPLEX for chpgvd
DOUBLE COMPLEX for zhpgvd.
Array z(*ldz*,*).
The second dimension of *z* must be at least max(1, *n*).
If *jobz* = 'V', then if *info* = 0, *z* contains the matrix *Z* of eigenvectors. The eigenvectors are normalized as follows:
if *itype* = 1 or 2, $Z^H*B*Z = I$;
if *itype* = 3, $Z^H*\mathrm{inv}(B)*Z = I$;
If *jobz* = 'N', then *z* is not referenced.

work(1) — On exit, if *info* = 0, then *work*(1) returns the required minimal size of *lwork*.

rwork(1) — On exit, if *info* = 0, then *rwork*(1) returns the required minimal size of *lrwork*.

iwork(1) — On exit, if *info* = 0, then *iwork*(1) returns the required minimal size of *liwork*.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th argument had an illegal value.
If *info* > 0, cpptrf/zpptrf and chpevd/zhpevd returned an error code:

If *info* = *i* ≤ *n*, chpevd/zhpevd failed to converge, and *i* off-diagonal elements of an intermediate tridiagonal did not converge to zero;

If *info* = *n* + *i*, for 1 ≤ *i* ≤ *n*, then the leading minor of order *i* of *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine hpgvd interface are the following:

a	Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n*(n+1)/2*).
b	Stands for argument *bp* in Fortan 77 interface. Holds the array *B* of size (*n*(n+1)/2*).
w	Holds the vector of length (*n*).
z	Holds the matrix *Z* of size (*n*, *n*).
itype	Must be 1, 2, or 3. The default value is 1.
uplo	Must be 'U' or 'L'. The default value is 'U'.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* (*liwork* or *lrwork*) for the first run or set *lwork* = -1 (*liwork* = -1, *lrwork* = -1).

If you choose the first option and set any of admissible *lwork* (*liwork* or *lrwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*) on exit. Use this value (*work*(1), *iwork*(1), *rwork*(1)) for subsequent runs.

If you set *lwork* = -1 (*liwork* = -1, *lrwork* = -1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*, *lrwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?spgvx

Computes selected eigenvalues and, optionally, eigenvectors of a real generalized symmetric definite eigenproblem with matrices in packed storage.

Syntax

Fortran 77:

```
call sspgvx(itype, jobz, range, uplo, n, ap, bp, vl, vu, il, iu, abstol, m,
w, z, ldz, work, iwork, ifail, info)
```

```
call dspgvx(itype, jobz, range, uplo, n, ap, bp, vl, vu, il, iu, abstol, m,
w, z, ldz, work, iwork, ifail, info)
```

Fortran 95:

```
call spgvx(a, b, w [,itype] [,uplo] [,z] [,vl] [,vu] [,il] [,iu] [,m] [,ifail]
[,abstol] [,info])
```

Description

This routine computes selected eigenvalues, and optionally, the eigenvectors of a real generalized symmetric-definite eigenproblem, of the form

$Ax = \lambda Bx$, $ABx = \lambda x$, or $BAx = \lambda x$.

Here *A* and *B* are assumed to be symmetric, stored in packed format, and *B* is also positive definite. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Input Parameters

itype	INTEGER. Must be 1 or 2 or 3. Specifies the problem type to be solved: if *itype* = 1, the problem type is *A*x = lambda*B*x*; if *itype* = 2, the problem type is *A*B*x* = *lambda*x*; if *itype* = 3, the problem type is *B*A*x = lambda*x*.
jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then compute eigenvalues only. If *jobz* = 'V', then compute eigenvalues and eigenvectors.
range	CHARACTER*1. Must be 'A' or 'V' or 'I'. If *range* = 'A', the routine computes all eigenvalues. If *range* = 'V', the routine computes eigenvalues *lambda(i)* in the half-open interval: *vl<lambda(i)≤ vu*. If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', arrays *ap* and *bp* store the upper triangles of *A* and *B*; If *uplo* = 'L', arrays *ap* and *bp* store the lower triangles of *A* and *B*.
n	INTEGER. The order of the matrices *A* and *B* (*n* ≥ 0).
ap, *bp*, *work*	REAL for sspgvx DOUBLE PRECISION for dspgvx. Arrays: *ap(*)* contains the packed upper or lower triangle of the symmetric matrix *A*, as specified by *uplo*. The dimension of *ap* must be at least max(1, *n**(*n*+1)/2). *bp(*)* contains the packed upper or lower triangle of the symmetric matrix *B*, as specified by *uplo*. The dimension of *bp* must be at least max(1, *n**(*n*+1)/2). *work(*)* is a workspace array, DIMENSION at least max(1, 8*n*).
vl, *vu*	REAL for sspgvx DOUBLE PRECISION for dspgvx.

If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.
Constraint: *vl*< *vu*.
If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, *iu*
INTEGER.
If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.
Constraint: 1 ≤ *il* ≤ *iu* ≤ *n*, if *n* > 0; *il*=1 and *iu*=0 if *n* = 0.
If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol
REAL for sspgvx
DOUBLE PRECISION for dspgvx.
The absolute error tolerance for the eigenvalues. See Application Notes for more information.

ldz
INTEGER. The leading dimension of the output array *z*.
Constraints:
ldz ≥ 1; if *jobz* = 'V', *ldz* ≥ max(1, *n*).

iwork
INTEGER.
Workspace array, DIMENSION at least max(1, 5*n*).

Output Parameters

ap
On exit, the contents of *ap* are overwritten.

bp
On exit, contains the triangular factor *U* or *L* from the Cholesky factorization $B = U^T*U$ or $B = L*L^T$, in the same storage format as *B*.

m
INTEGER. The total number of eigenvalues found,
0 ≤ *m* ≤ *n*. If *range* = 'A', *m* = *n*, and if *range* = 'I', *m* = *iu*-*il*+1.

w, *z*
REAL for sspgvx
DOUBLE PRECISION for dspgvx.
Arrays:
w(*), DIMENSION at least max(1, *n*).
If *info* = 0, contains the eigenvalues in ascending order.
z(*ldz*,*).
The second dimension of *z* must be at least max(1, *n*).

If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *A* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). The eigenvectors are normalized as follows:
if *itype* = 1 or 2, $Z^T*B*Z = I$;
if *itype* = 3, $Z^T*\mathrm{inv}(B)*Z = I$;
If *jobz* = 'N', then *z* is not referenced.
If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*.
Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.

ifail — INTEGER.
Array, DIMENSION at least max(1, *n*).
If *jobz* = 'V', then if *info* = 0, the first *m* elements of *ifail* are zero; if *info* > 0, the *ifail* contains the indices of the eigenvectors that failed to converge.
If *jobz* = 'N', then *ifail* is not referenced.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th argument had an illegal value.
If *info* > 0, spptrf/dpptrf and sspevx/dspevx returned an error code:

If *info* = *i* ≤ *n*, sspevx/dspevx failed to converge, and *i* eigenvectors failed to converge. Their indices are stored in the array *ifail*;

If *info* = *n* + *i*, for 1 ≤ *i* ≤ *n*, then the leading minor of order *i* of *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `spgvx` interface are the following:

a	Stands for argument *ap* in Fortan 77 interface. Holds the array *A* of size (*n*(n+1)/2*).
b	Stands for argument *bp* in Fortan 77 interface. Holds the array *B* of size (*n*(n+1)/2*).
w	Holds the vector of length (*n*).
z	Holds the matrix *Z* of size (*n*, *n*), where the values *n* and *m* are significant.
ifail	Holds the vector of length (*n*).
itype	Must be 1, 2, or 3. The default value is 1.
uplo	Must be 'U' or 'L'. The default value is 'U'.
vl	Default value for this element is *vl* = -HUGE(*vl*).
vu	Default value for this element is *vu* = HUGE(*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this element is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted. Note that there will be an error condition if *ifail* is present and *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a,b] of width less than or equal to *abstol* + ε * max(|a|,|b|), where ε is the machine precision.

If *abstol* is less than or equal to zero, then ε*||*T*||$_1$ will be used in its place, where *T* is the tridiagonal matrix obtained by reducing *A* to tridiagonal form. Eigenvalues will be computed most accurately when *abstol* is set to twice the underflow threshold 2*?lamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, try setting *abstol* to 2*?lamch('S').

?hpgvx

Computes selected eigenvalues and, optionally, eigenvectors of a generalized Hermitian definite eigenproblem with matrices in packed storage.

Syntax

Fortran 77:

```
call chpgvx(itype, jobz, range, uplo, n, ap, bp, vl, vu, il, iu, abstol, m,
w, z, ldz, work, rwork, iwork, ifail, info)
```

```
call zhpgvx(itype, jobz, range, uplo, n, ap, bp, vl, vu, il, iu, abstol, m,
w, z, ldz, work, rwork, iwork, ifail, info)
```

Fortran 95:

```
call hpgvx(a, b, w [,itype] [,uplo] [,z] [,vl] [,vu] [,il] [,iu] [,m] [,ifail]
[,abstol] [,info])
```

Description

This routine computes selected eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitian-definite eigenproblem, of the form

$Ax = \lambda Bx$, $ABx = \lambda x$, or $BAx = \lambda x$.

Here *A* and *B* are assumed to be Hermitian, stored in packed format, and *B* is also positive definite. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Input Parameters

itype — INTEGER. Must be 1 or 2 or 3. Specifies the problem type to be solved:
if *itype* = 1, the problem type is *A*x = lambda*B*x*;
if *itype* = 2, the problem type is *A*B*x = lambda*x*;
if *itype* = 3, the problem type is *B*A*x = lambda*x*.

jobz — CHARACTER*1. Must be 'N' or 'V'.
If *jobz* = 'N', then compute eigenvalues only.
If *jobz* = 'V', then compute eigenvalues and eigenvectors.

range — CHARACTER*1. Must be 'A' or 'V' or 'I'.
If *range* = 'A', the routine computes all eigenvalues.
If *range* = 'V', the routine computes eigenvalues *lambda(i)* in the half-open interval:

vl< *lambda(i)* ≤ *vu*.

If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.

uplo — CHARACTER*1. Must be 'U' or 'L'.
If *uplo* = 'U', arrays *ap* and *bp* store the upper triangles of *A* and *B*;
If *uplo* = 'L', arrays *ap* and *bp* store the lower triangles of *A* and *B*.

n — INTEGER. The order of the matrices *A* and *B* (*n* ≥ 0).

ap, *bp*, *work* — COMPLEX for chpgvx
DOUBLE COMPLEX for zhpgvx.
Arrays:
ap(*) contains the packed upper or lower triangle of the Hermitian matrix *A*, as specified by *uplo*.
The dimension of *ap* must be at least max(1, *n**(*n*+1)/2).
bp(*) contains the packed upper or lower triangle of the Hermitian matrix *B*, as specified by *uplo*.
The dimension of *bp* must be at least max(1, *n**(*n*+1)/2).
work(*) is a workspace array, DIMENSION at least max(1, 2*n*).

vl, *vu* — REAL for chpgvx
DOUBLE PRECISION for zhpgvx.

If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.
Constraint: *vl*< *vu*.
If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, *iu*
INTEGER.
If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.
Constraint: 1 ≤ *il* ≤ *iu* ≤ *n*, if *n* > 0; *il*=1 and *iu*=0 if *n* = 0.
If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol
REAL for chpgvx
DOUBLE PRECISION for zhpgvx.
The absolute error tolerance for the eigenvalues.
See Application Notes for more information.

ldz
INTEGER. The leading dimension of the output array *z*; *ldz* ≥ 1. If *jobz* = 'V', *ldz* ≥ max(1, *n*).

rwork
REAL for chpgvx
DOUBLE PRECISION for zhpgvx.
Workspace array, DIMENSION at least max(1, 7*n*).

iwork
INTEGER.
Workspace array, DIMENSION at least max(1, 5*n*).

Output Parameters

ap
On exit, the contents of *ap* are overwritten.

bp
On exit, contains the triangular factor *U* or *L* from the Cholesky factorization $B = U^H*U$ or $B = L*L^H$, in the same storage format as *B*.

m
INTEGER. The total number of eigenvalues found, 0 ≤ *m* ≤ *n*. If *range* = 'A', *m* = *n*, and if *range* = 'I', *m* = *iu*-*il*+1.

w
REAL for chpgvx
DOUBLE PRECISION for zhpgvx.
Array, DIMENSION at least max(1, *n*).
If *info* = 0, contains the eigenvalues in ascending order.

z

COMPLEX for chpgvx
DOUBLE COMPLEX for zhpgvx.
Array z(*ldz*,*).
The second dimension of *z* must be at least max(1, *n*).
If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *A* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*).
The eigenvectors are normalized as follows:
if *itype* = 1 or 2, Z^H**B***Z* = I;
if *itype* = 3, Z^H*inv(*B*)**Z* = I;
If *jobz* = 'N', then *z* is not referenced.
If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*.
Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.

ifail

INTEGER.
Array, DIMENSION at least max(1, *n*).
If *jobz* = 'V', then if *info* = 0, the first *m* elements of *ifail* are zero; if *info* > 0, the *ifail* contains the indices of the eigenvectors that failed to converge.
If *jobz* = 'N', then *ifail* is not referenced.

info

INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th argument had an illegal value.
If *info* > 0, cpptrf/zpptrf and chpevx/zhpevx returned an error code:

If *info* = *i* ≤ *n*, chpevx/zhpevx failed to converge, and *i* eigenvectors failed to converge. Their indices are stored in the array *ifail*;

If *info* = *n* + *i*, for 1 ≤ *i* ≤ *n*, then the leading minor of order *i* of *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

Fortran 95 Interface Notes

Application Notes

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a,b] of width less than or equal to *abstol* + ε * max(|a|,|b|), where ε is the machine precision.

If *abstol* is less than or equal to zero, then ε*||*T*||$_1$ will be used in its place, where *T* is the tridiagonal matrix obtained by reducing *A* to tridiagonal form. Eigenvalues will be computed most accurately when *abstol* is set to twice the underflow threshold 2*?lamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, try setting *abstol* to 2*?lamch('S').

?sbgv

Computes all eigenvalues and, optionally, eigenvectors of a real generalized symmetric definite eigenproblem with banded matrices.

Syntax

Fortran 77:

```
call ssbgv(jobz, uplo, n, ka, kb, ab, ldab, bb, ldbb, w, z, ldz, work, info)
call dsbgv(jobz, uplo, n, ka, kb, ab, ldab, bb, ldbb, w, z, ldz, work, info)
```

Fortran 95:

```
call sbgv(a, b, w [,uplo] [,z] [,info])
```

Description

This routine computes all the eigenvalues, and optionally, the eigenvectors of a real generalized symmetric-definite banded eigenproblem, of the form *Ax* = λ*Bx*. Here *A* and *B* are assumed to be symmetric and banded, and *B* is also positive definite.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then compute eigenvalues only. If *jobz* = 'V', then compute eigenvalues and eigenvectors.
uplo	CHARACTER*1. Must be 'U' or 'L'.

	If *uplo* = 'U', arrays *ab* and *bb* store the upper triangles of *A* and *B*; If *uplo* = 'L', arrays *ab* and *bb* store the lower triangles of *A* and *B*.
n	INTEGER. The order of the matrices *A* and *B* (*n* ≥ 0).
ka	INTEGER. The number of super- or sub-diagonals in *A* (*ka* ≥ 0).
kb	INTEGER. The number of super- or sub-diagonals in *B* (*kb* ≥ 0).
ab, *bb*, *work*	REAL for ssbgv DOUBLE PRECISION for dsbgv Arrays: *ab* (*ldab*,*) is an array containing either upper or lower triangular part of the symmetric matrix *A* (as specified by *uplo*) in band storage format. The second dimension of the array *ab* must be at least max(1, *n*). *bb*(*ldbb*,*) is an array containing either upper or lower triangular part of the symmetric matrix *B* (as specified by *uplo*) in band storage format. The second dimension of the array *bb* must be at least max(1, *n*). *work(*)* is a workspace array, dimension at least max(1, 3*n*)
ldab	INTEGER. The first dimension of the array *ab*; must be at least *ka*+1.
ldbb	INTEGER. The first dimension of the array *bb*; must be at least *kb*+1.
ldz	INTEGER. The leading dimension of the output array *z*; *ldz* ≥ 1. If *jobz* = 'V', *ldz* ≥ max(1, *n*).

Output Parameters

ab	On exit, the contents of *ab* are overwritten.

bb — On exit, contains the factor *S* from the split Cholesky factorization $B = S^T*S$, as returned by spbstf/dpbstf.

w, *z* — REAL for ssbgv
DOUBLE PRECISION for dsbgv
Arrays:
w(*), DIMENSION at least max(1, *n*).
If *info* = 0, contains the eigenvalues in ascending order.
z(*ldz*,*).
The second dimension of *z* must be at least max(1, *n*).
If *jobz* = 'V', then if *info* = 0, *z* contains the matrix *Z* of eigenvectors, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). The eigenvectors are normalized so that $Z^T*B*Z = I$.
If *jobz* = 'N', then *z* is not referenced.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th argument had an illegal value.
If *info* > 0, and

if $i \le n$, the algorithm failed to converge, and *i* off-diagonal elements of an intermediate tridiagonal did not converge to zero;

if *info* = *n* + *i*, for $1 \le i \le n$, then spbstf/dpbstf returned *info* = *i* and *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine sbgv interface are the following:

a — Stands for argument *ab* in Fortan 77 interface. Holds the array *A* of size (*ka+1*,*n*).

b — Stands for argument *bb* in Fortan 77 interface. Holds the array *B* of size (*kb+1*,*n*).

w	Holds the vector of length (*n*).
z	Holds the matrix *Z* of size (*n*, *n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted.

?hbgv

Computes all eigenvalues and, optionally, eigenvectors of a complex generalized Hermitian definite eigenproblem with banded matrices.

Syntax

Fortran 77:

```
call chbgv(jobz, uplo, n, ka, kb, ab, ldab, bb, ldbb, w, z, ldz, work, rwork, info)
call zhbgv(jobz, uplo, n, ka, kb, ab, ldab, bb, ldbb, w, z, ldz, work, rwork, info)
```

Fortran 95:

```
call hbgv(a, b, w [,uplo] [,z] [,info])
```

Description

This routine computes all the eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitian-definite banded eigenproblem, of the form $Ax = \lambda Bx$. Here A and B are assumed to be Hermitian and banded, and B is also positive definite.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then compute eigenvalues only. If *jobz* = 'V', then compute eigenvalues and eigenvectors.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', arrays *ab* and *bb* store the upper triangles of *A* and *B*;

If *uplo* = 'L', arrays *ab* and *bb* store the lower triangles of *A* and *B*.

n — INTEGER. The order of the matrices *A* and *B* (*n* ≥ 0).

ka — INTEGER. The number of super- or sub-diagonals in *A* (*ka* ≥ 0).

kb — INTEGER. The number of super- or sub-diagonals in *B* (*kb* ≥ 0).

ab, *bb*, *work* — COMPLEX for chbgv
DOUBLE COMPLEX for zhbgv
Arrays:
ab (*ldab*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *A* (as specified by *uplo*) in band storage format.
The second dimension of the array *ab* must be at least max(1, *n*).
bb(*ldbb*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *B* (as specified by *uplo*) in band storage format.
The second dimension of the array *bb* must be at least max(1, *n*).
work(*) is a workspace array, dimension at least max(1, *n*).

ldab — INTEGER. The first dimension of the array *ab*; must be at least *ka*+1.

ldbb — INTEGER. The first dimension of the array *bb*; must be at least *kb*+1.

ldz — INTEGER. The leading dimension of the output array *z*; *ldz* ≥ 1. If *jobz* = 'V', *ldz* ≥ max(1, *n*).

rwork — REAL for chbgv
DOUBLE PRECISION for zhbgv.
Workspace array, DIMENSION at least max(1, 3*n*).

Output Parameters

ab — On exit, the contents of *ab* are overwritten.

bb	On exit, contains the factor *S* from the split Cholesky factorization *B* = S^H**S*, as returned by cpbstf/zpbstf.
w	REAL for chbgv DOUBLE PRECISION for zhbgv. Array, DIMENSION at least max(1, *n*). If *info* = 0, contains the eigenvalues in ascending order.
z	COMPLEX for chbgv DOUBLE COMPLEX for zhbgv Array z(*ldz*,*). The second dimension of *z* must be at least max(1, *n*). If *jobz* = 'V', then if *info* = 0, *z* contains the matrix *Z* of eigenvectors, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). The eigenvectors are normalized so that Z^H**B***Z* = I. If *jobz* = 'N', then *z* is not referenced.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th argument had an illegal value. If *info* > 0, and if *i* ≤ *n*, the algorithm failed to converge, and *i* off-diagonal elements of an intermediate tridiagonal did not converge to zero; if *info* = *n* + *i*, for 1 ≤ *i* ≤ *n*, then cpbstf/zpbstf returned *info* = *i* and *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine hbgv interface are the following:

a	Stands for argument *ab* in Fortan 77 interface. Holds the array *A* of size (*ka+1*,*n*).

b	Stands for argument *bb* in Fortan 77 interface. Holds the array *B* of size (*kb+1*,*n*).
w	Holds the vector of length (*n*).
z	Holds the matrix *Z* of size (*n*, *n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted.

?sbgvd

Computes all eigenvalues and, optionally, eigenvectors of a real generalized symmetric definite eigenproblem with banded matrices. If eigenvectors are desired, it uses a divide and conquer method.

Syntax

Fortran 77:

```
call ssbgvd(jobz, uplo, n, ka, kb, ab, ldab, bb, ldbb, w, z, ldz, work, lwork, iwork, liwork, info)
```

```
call dsbgvd(jobz, uplo, n, ka, kb, ab, ldab, bb, ldbb, w, z, ldz, work, lwork, iwork, liwork, info)
```

Fortran 95:

```
call sbgvd(a, b, w [,uplo] [,z] [,info])
```

Description

This routine computes all the eigenvalues, and optionally, the eigenvectors of a real generalized symmetric-definite banded eigenproblem, of the form $Ax = \lambda Bx$. Here A and B are assumed to be symmetric and banded, and B is also positive definite.

If eigenvectors are desired, it uses a divide and conquer algorithm.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'.

	If *jobz* = 'N', then compute eigenvalues only. If *jobz* = 'V', then compute eigenvalues and eigenvectors.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', arrays *ab* and *bb* store the upper triangles of *A* and *B*; If *uplo* = 'L', arrays *ab* and *bb* store the lower triangles of *A* and *B*.
n	INTEGER. The order of the matrices *A* and *B* (*n* ≥ 0).
ka	INTEGER. The number of super- or sub-diagonals in *A* (*ka* ≥ 0).
kb	INTEGER. The number of super- or sub-diagonals in *B* (*kb* ≥ 0).
ab, *bb*, *work*	REAL for ssbgvd DOUBLE PRECISION for dsbgvd Arrays: *ab* (*ldab*,*) is an array containing either upper or lower triangular part of the symmetric matrix *A* (as specified by *uplo*) in band storage format. The second dimension of the array *ab* must be at least max(1, *n*). *bb*(*ldbb*,*) is an array containing either upper or lower triangular part of the symmetric matrix *B* (as specified by *uplo*) in band storage format. The second dimension of the array *bb* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
ldab	INTEGER. The first dimension of the array *ab*; must be at least *ka*+1.
ldbb	INTEGER. The first dimension of the array *bb*; must be at least *kb*+1.
ldz	INTEGER. The leading dimension of the output array *z*; *ldz* ≥ 1. If *jobz* = 'V', *ldz* ≥ max(1, *n*).
lwork	INTEGER. The dimension of the array *work*. Constraints:

If $n \le 1$, $lwork \ge 1$;

If $jobz$ = 'N' and $n>1$, $lwork \ge 3n$;

If $jobz$ = 'V' and $n>1$, $lwork \ge 2n^2+5n+1$.

If $lwork$ = -1, then a workspace query is assumed; the routine only calculates the optimal size of the $work$ and $iwork$ arrays, returns these values as the first entries of the $work$ and $iwork$ arrays, and no error message related to $lwork$ or $liwork$ is issued by xerbla. See Application Notes for details.

iwork INTEGER.
Workspace array, its dimension max(1, $liwork$).

liwork INTEGER.
The dimension of the array $iwork$.
Constraints:

If $n \le 1$, $liwork \ge 1$;

If $jobz$ = 'N' and $n>1$, $liwork \ge 1$;

If $jobz$ = 'V' and $n>1$, $liwork \ge 5n+3$.

If $liwork$ = -1, then a workspace query is assumed; the routine only calculates the optimal size of the $work$ and $iwork$ arrays, returns these values as the first entries of the $work$ and $iwork$ arrays, and no error message related to $lwork$ or $liwork$ is issued by xerbla. See Application Notes for details.

Output Parameters

ab On exit, the contents of ab are overwritten.

bb On exit, contains the factor S from the split Cholesky factorization $B = S^T*S$, as returned by spbstf/dpbstf.

w, *z* REAL for ssbgvd
DOUBLE PRECISION for dsbgvd
Arrays:
w(*), DIMENSION at least max(1, n).
If $info$ = 0, contains the eigenvalues in ascending order.
z(ldz,*).
The second dimension of z must be at least max(1, n).

	If *jobz* = 'V', then if *info* = 0, *z* contains the matrix *Z* of eigenvectors, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). The eigenvectors are normalized so that $Z^T*B*Z = I$. If *jobz* = 'N', then *z* is not referenced.
work(1)	On exit, if *info* = 0, then *work*(1) returns the required minimal size of *lwork*.
iwork(1)	On exit, if *info* = 0, then *iwork*(1) returns the required minimal size of *liwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th argument had an illegal value. If *info* > 0, and if *i* ≤ *n*, the algorithm failed to converge, and *i* off-diagonal elements of an intermediate tridiagonal did not converge to zero; if *info* = *n* + *i*, for 1 ≤ *i* ≤ *n*, then spbstf/dpbstf returned *info* = *i* and *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine sbgvd interface are the following:

a	Stands for argument *ab* in Fortan 77 interface. Holds the array *A* of size (*ka+1*,*n*).
b	Stands for argument *bb* in Fortan 77 interface. Holds the array *B* of size (*kb+1*,*n*).
w	Holds the vector of length (*n*).
z	Holds the matrix *Z* of size (*n*, *n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
jobz	Restored based on the presence of the argument *z* as follows:

jobz = 'V', if *z* is present,
jobz = 'N', if *z* is omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run or set *lwork* = –1 (*liwork* = –1).

If you choose the first option and set any of admissible *lwork* (or *liwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If you set *lwork* = –1 (*liwork* = –1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?hbgvd

Computes all eigenvalues and, optionally, eigenvectors of a complex generalized Hermitian definite eigenproblem with banded matrices. If eigenvectors are desired, it uses a divide and conquer method.

Syntax

Fortran 77:

```
call chbgvd(jobz, uplo, n, ka, kb, ab, ldab, bb, ldbb, w, z, ldz, work, lwork,
rwork, lrwork, iwork, liwork, info)
```

```
call zhbgvd(jobz, uplo, n, ka, kb, ab, ldab, bb, ldbb, w, z, ldz, work, lwork,
rwork, lrwork, iwork, liwork, info)
```

Fortran 95:

```
call hbgvd(a, b, w [,uplo] [,z] [,info])
```

Description

This routine computes all the eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitian-definite banded eigenproblem, of the form $Ax = \lambda Bx$. Here A and B are assumed to be Hermitian and banded, and B is also positive definite.

If eigenvectors are desired, it uses a divide and conquer algorithm.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then compute eigenvalues only. If *jobz* = 'V', then compute eigenvalues and eigenvectors.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', arrays *ab* and *bb* store the upper triangles of *A* and *B*; If *uplo* = 'L', arrays *ab* and *bb* store the lower triangles of *A* and *B*.
n	INTEGER. The order of the matrices *A* and *B* (*n* ≥ 0).
ka	INTEGER. The number of super- or sub-diagonals in *A* (*ka* ≥ 0).
kb	INTEGER. The number of super- or sub-diagonals in *B* (*kb* ≥ 0).
ab, *bb*, *work*	COMPLEX for chbgvd DOUBLE COMPLEX for zhbgvd Arrays: *ab* (*ldab*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *A* (as specified by *uplo*) in band storage format. The second dimension of the array *ab* must be at least max(1, *n*). *bb*(*ldbb*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *B* (as specified by *uplo*) in band storage format. The second dimension of the array *bb* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).

ldab INTEGER. The first dimension of the array *ab*; must be at least *ka*+1.

ldbb INTEGER. The first dimension of the array *bb*; must be at least *kb*+1.

ldz INTEGER. The leading dimension of the output array *z*; *ldz* ≥ 1. If *jobz* = 'V', *ldz* ≥ max(1, *n*).

lwork INTEGER.
The dimension of the array *work*.
Constraints:

If *n* ≤ 1, *lwork* ≥ 1;

If *jobz* = 'N' and *n*>1, *lwork* ≥ *n*;
If *jobz* = 'V' and *n*>1, *lwork* < $2n^2$.
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See Application Notes for details.

rwork REAL for chbgvd
DOUBLE PRECISION for zhbgvd.
Workspace array, DIMENSION max(1, *lrwork*).

lrwork INTEGER.
The dimension of the array *rwork*.
Constraints:

If *n* ≤ 1, *lrwork* ≥ 1;

If *jobz* = 'N' and *n*>1, *lrwork* ≥ *n*;

If *jobz* = 'V' and *n*>1, *lrwork* ≥ $2n^2$+5*n* +1.
If *lrwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See Application Notes for details.

iwork INTEGER.
Workspace array, DIMENSION max(1, *liwork*).

liwork INTEGER.
The dimension of the array *iwork*.
Constraints:
If $n \leq 1$, $liwork < 1$;
If *jobz* = 'N' and $n>1$, $liwork \geq 1$;
If *jobz* = 'V' and $n>1$, $liwork \geq 5n+3$.
If *liwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See Application Notes for details.

Output Parameters

ab On exit, the contents of *ab* are overwritten.

bb On exit, contains the factor *S* from the split Cholesky factorization $B = S^H*S$, as returned by cpbstf/zpbstf.

w REAL for chbgvd
DOUBLE PRECISION for zhbgvd.
Array, DIMENSION at least max(1, *n*) .
If *info* = 0, contains the eigenvalues in ascending order.

z COMPLEX for chbgvd
DOUBLE COMPLEX for zhbgvd
Array z(*ldz*,*) .
The second dimension of *z* must be at least max(1, *n*).
If *jobz* = 'V', then if *info* = 0, *z* contains the matrix *Z* of eigenvectors , with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). The eigenvectors are normalized so that $Z^H*B*Z = I$.
If *jobz* = 'N', then *z* is not referenced.

work(1) On exit, if *info* = 0, then *work*(1) returns the required minimal size of *lwork*.

rwork(1) On exit, if *info* = 0, then *rwork*(1) returns the required minimal size of *lrwork*.

iwork(1)	On exit, if *info* = 0, then *iwork*(1) returns the required minimal size of *liwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*th argument had an illegal value. If *info* > 0, and if *i* ≤ *n*, the algorithm failed to converge, and *i* off-diagonal elements of an intermediate tridiagonal did not converge to zero; if *info* = *n* + *i*, for 1 ≤ *i* ≤ *n*, then cpbstf/zpbstf returned *info* = *i* and *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine hbgvd interface are the following:

a	Stands for argument *ab* in Fortan 77 interface. Holds the array *A* of size (*ka+1*,*n*).
b	Stands for argument *bb* in Fortan 77 interface. Holds the array *B* of size (*kb+1*,*n*).
w	Holds the vector of length (*n*).
z	Holds the matrix *Z* of size (*n*, *n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* (*liwork* or *lrwork*) for the first run or set *lwork* = -1 (*liwork* = -1, *lrwork* = -1).

If you choose the first option and set any of admissible *lwork* (*liwork* or *lrwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*) on exit. Use this value (*work*(1), *iwork*(1), *rwork*(1)) for subsequent runs.

If you set *lwork* = -1 (*liwork* = -1, *lrwork* = -1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*, *lrwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?sbgvx

Computes selected eigenvalues and, optionally, eigenvectors of a real generalized symmetric definite eigenproblem with banded matrices.

Syntax

Fortran 77:

```
call ssbgvx(jobz, range, uplo, n, ka, kb, ab, ldab, bb, ldbb, q, ldq, vl, vu,
il, iu, abstol, m, w, z, ldz, work, iwork, ifail, info)
```

```
call dsbgvx(jobz, range, uplo, n, ka, kb, ab, ldab, bb, ldbb, q, ldq, vl, vu,
il, iu, abstol, m, w, z, ldz, work, iwork, ifail, info)
```

Fortran 95:

```
call sbgvx(a, b, w [,uplo] [,z] [,vl] [,vu] [,il] [,iu] [,m] [,ifail] [,q]
[,abstol] [,info])
```

Description

This routine computes selected eigenvalues, and optionally, the eigenvectors of a real generalized symmetric-definite banded eigenproblem, of the form $Ax = \lambda Bx$. Here A and B are assumed to be symmetric and banded, and B is also positive definite. Eigenvalues and eigenvectors can be selected by specifying either all eigenvalues, a range of values or a range of indices for the desired eigenvalues.

Input Parameters

jobz — CHARACTER*1. Must be 'N' or 'V'.
If *jobz* = 'N', then compute eigenvalues only.
If *jobz* = 'V', then compute eigenvalues and eigenvectors.

range — CHARACTER*1. Must be 'A' or 'V' or 'I'.
If *range* = 'A', the routine computes all eigenvalues.
If *range* = 'V', the routine computes eigenvalues *lambda*(*i*) in the half-open interval:
$vl < lambda(i) \leq vu$.
If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.

uplo — CHARACTER*1. Must be 'U' or 'L'.
If *uplo* = 'U', arrays *ab* and *bb* store the upper triangles of *A* and *B*;
If *uplo* = 'L', arrays *ab* and *bb* store the lower triangles of *A* and *B*.

n — INTEGER. The order of the matrices *A* and *B* ($n \geq 0$).

ka — INTEGER. The number of super- or sub-diagonals in *A* ($ka \geq 0$).

kb — INTEGER. The number of super- or sub-diagonals in *B* ($kb \geq 0$).

ab, *bb*, *work* — REAL for ssbgvx
DOUBLE PRECISION for dsbgvx
Arrays:
ab (*ldab*,*) is an array containing either upper or lower triangular part of the symmetric matrix *A* (as specified by *uplo*) in band storage format.
The second dimension of the array *ab* must be at least max(1, *n*).
bb(*ldbb*,*) is an array containing either upper or lower triangular part of the symmetric matrix *B* (as specified by *uplo*) in band storage format.
The second dimension of the array *bb* must be at least max(1, *n*).
work(*) is a workspace array, DIMENSION (7**n*).

ldab	INTEGER. The first dimension of the array *ab*; must be at least *ka*+1.
ldbb	INTEGER. The first dimension of the array *bb*; must be at least *kb*+1.
vl, *vu*	REAL for ssbgvx DOUBLE PRECISION for dsbgvx. If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues. Constraint: *vl*< *vu*. If *range* = 'A' or 'I', *vl* and *vu* are not referenced.
il, *iu*	INTEGER. If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned. Constraint: 1 ≤ *il* ≤ *iu* ≤ *n*, if *n* > 0; *il*=1 and *iu*=0 if *n* = 0. If *range* = 'A' or 'V', *il* and *iu* are not referenced.
abstol	REAL for ssbgvx DOUBLE PRECISION for dsbgvx. The absolute error tolerance for the eigenvalues. See Application Notes for more information.
ldz	INTEGER. The leading dimension of the output array *z*; *ldz* ≥ 1. If *jobz* = 'V', *ldz* ≥ max(1, *n*).
ldq	INTEGER. The leading dimension of the output array *q*; *ldq* < 1. If *jobz* = 'V', *ldq* < max(1, *n*).
iwork	INTEGER. Workspace array, DIMENSION (5**n*).

Output Parameters

ab	On exit, the contents of *ab* are overwritten.
bb	On exit, contains the factor *S* from the split Cholesky factorization $B = S^T*S$, as returned by spbstf/dpbstf.
m	INTEGER. The total number of eigenvalues found, 0 ≤ *m* ≤ *n*. If *range* = 'A', *m* = *n*, and if *range* = 'I',

	m = *iu*-*il*+1.
w, *z*, *q*	REAL for ssbgvx DOUBLE PRECISION for dsbgvx Arrays: *w*(*), DIMENSION at least max(1, *n*) . If *info* = 0, contains the eigenvalues in ascending order. z(*ldz*,*) . The second dimension of *z* must be at least max(1, *n*). If *jobz* = 'V', then if *info* = 0, *z* contains the matrix *Z* of eigenvectors , with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). The eigenvectors are normalized so that $Z^T*B*Z = I$. If *jobz* = 'N', then *z* is not referenced. q(*ldq*,*) . The second dimension of *q* must be at least max(1, *n*). If *jobz* = 'V', then *q* contains the *n*-by-*n* matrix used in the reduction of *Ax* = *lambda*Bx* to standard form, that is, *Cx* = *lambda*x* and consequently *C* to tridiagonal form. If *jobz* = 'N', then *q* is not referenced.
ifail	INTEGER. Array, DIMENSION (*m*). If *jobz* = 'V', then if *info* = 0, the first *m* elements of *ifail* are zero; if *info* > 0, the *ifail* contains the indices of the eigenvectors that failed to converge. If *jobz* = 'N', then *ifail* is not referenced.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*th argument had an illegal value. If *info* > 0, and if *i* ≤ *n*, the algorithm failed to converge, and *i* off-diagonal elements of an intermediate tridiagonal did not converge to zero; if *info* = *n* + *i*, for 1 ≤ *i* ≤ *n*, then spbstf/dpbstf returned *info* = *i* and *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine sbgvx interface are the following:

a	Stands for argument *ab* in Fortan 77 interface. Holds the array *A* of size (*ka+1*,*n*).
b	Stands for argument *bb* in Fortan 77 interface. Holds the array *B* of size (*kb+1*,*n*).
w	Holds the vector of length (*n*).
z	Holds the matrix *Z* of size (*n*, *n*).
ifail	Holds the vector of length (*n*).
q	Holds the matrix *Q* of size (*n*, *n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
vl	Default value for this element is *vl* = -HUGE(*vl*).
vu	Default value for this element is *vu* = HUGE(*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this element is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted. Note that there will be an error condition if *ifail* or *q* is present and *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a,b] of width less than or equal to *abstol* + ε * max(|a|,|b|), where ε is the machine precision.

If *abstol* is less than or equal to zero, then ε*||*T*||$_1$ will be used in its place, where *T* is the tridiagonal matrix obtained by reducing *A* to tridiagonal form. Eigenvalues will be computed most accurately when *abstol* is set to twice the underflow threshold 2*?lamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, try setting *abstol* to 2*?lamch('S').

?hbgvx

Computes selected eigenvalues and, optionally, eigenvectors of a complex generalized Hermitian definite eigenproblem with banded matrices.

Syntax

Fortran 77:

```
call chbgvx(jobz, range, uplo, n, ka, kb, ab, ldab, bb, ldbb, q, ldq, vl, vu,
il, iu, abstol, m, w, z, ldz, work, rwork, iwork, ifail, info)
```

```
call zhbgvx(jobz, range, uplo, n, ka, kb, ab, ldab, bb, ldbb, q, ldq, vl, vu,
il, iu, abstol, m, w, z, ldz, work, rwork, iwork, ifail, info)
```

Fortran 95:

```
call hbgvx(a, b, w [,uplo] [,z] [,vl] [,vu] [,il] [,iu] [,m] [,ifail] [,q]
[,abstol] [,info])
```

Description

This routine computes selected eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitian-definite banded eigenproblem, of the form $Ax = \lambda Bx$. Here *A* and *B* are assumed to be Hermitian and banded, and *B* is also positive definite. Eigenvalues and eigenvectors can be selected by specifying either all eigenvalues, a range of values or a range of indices for the desired eigenvalues.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then compute eigenvalues only. If *jobz* = 'V', then compute eigenvalues and eigenvectors.
range	CHARACTER*1. Must be 'A' or 'V' or 'I'. If *range* = 'A', the routine computes all eigenvalues. If *range* = 'V', the routine computes eigenvalues *lambda*(*i*) in the half-open interval: *vl*< *lambda*(*i*) ≤ *vu*. If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', arrays *ab* and *bb* store the upper triangles of *A* and *B*; If *uplo* = 'L', arrays *ab* and *bb* store the lower triangles of *A* and *B*.
n	INTEGER. The order of the matrices *A* and *B* (*n* ≥ 0).
ka	INTEGER. The number of super- or sub-diagonals in *A* (*ka* ≥ 0).
kb	INTEGER. The number of super- or sub-diagonals in *B* (*kb* ≥ 0).
ab, *bb*, *work*	COMPLEX for chbgvx DOUBLE COMPLEX for zhbgvx Arrays: *ab* (*ldab*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *A* (as specified by *uplo*) in band storage format. The second dimension of the array *ab* must be at least max(1, *n*). *bb*(*ldbb*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *B* (as specified by *uplo*) in band storage format. The second dimension of the array *bb* must be at least max(1, *n*).

work(*) is a workspace array, DIMENSION at least max(1, *n*).

ldab — INTEGER. The first dimension of the array *ab*; must be at least *ka*+1.

ldbb — INTEGER. The first dimension of the array *bb*; must be at least *kb*+1.

vl, *vu* — REAL for chbgvx
DOUBLE PRECISION for zhbgvx.
If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.
Constraint: *vl*< *vu*.
If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, *iu* — INTEGER.
If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.
Constraint: 1 ≤ *il* ≤ *iu* ≤ *n*, if *n* > 0; *il*=1 and *iu*=0 if *n* = 0.
If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol — REAL for chbgvx
DOUBLE PRECISION for zhbgvx.
The absolute error tolerance for the eigenvalues. See Application Notes for more information.

ldz — INTEGER. The leading dimension of the output array *z*; *ldz* ≥ 1. If *jobz* = 'V', *ldz* ≥ max(1, *n*).

ldq — INTEGER. The leading dimension of the output array *q*; *ldq* ≥ 1. If *jobz* = 'V', *ldq* ≥ max(1, *n*).

rwork — REAL for chbgvx
DOUBLE PRECISION for zhbgvx.
Workspace array, DIMENSION at least max(1, 7*n*).

iwork — INTEGER.
Workspace array, DIMENSION at least max(1, 5*n*).

Output Parameters

ab — On exit, the contents of *ab* are overwritten.

bb — On exit, contains the factor *S* from the split Cholesky factorization $B = S^H * S$, as returned by cpbstf/zpbstf.

m — INTEGER. The total number of eigenvalues found, $0 \le m \le n$. If *range* = 'A', $m = n$, and if *range* = 'I', $m = iu - il + 1$.

w — REAL for chbgvx
DOUBLE PRECISION for zhbgvx.
Array *w*(*), DIMENSION at least max(1, *n*).
If *info* = 0, contains the eigenvalues in ascending order.

z, *q* — COMPLEX for chbgvx
DOUBLE COMPLEX for zhbgvx
Arrays:
z(*ldz*,*).
The second dimension of *z* must be at least max(1, *n*).
If *jobz* = 'V', then if *info* = 0, *z* contains the matrix *Z* of eigenvectors, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). The eigenvectors are normalized so that $Z^H * B * Z = I$.
If *jobz* = 'N', then *z* is not referenced.
q(*ldq*,*).
The second dimension of *q* must be at least max(1, *n*).
If *jobz* = 'V', then *q* contains the *n*-by-*n* matrix used in the reduction of $Ax = \lambda Bx$ to standard form, that is, $Cx = \lambda x$ and consequently *C* to tridiagonal form.
If *jobz* = 'N', then *q* is not referenced.

ifail — INTEGER.
Array, DIMENSION at least max(1, *n*).
If *jobz* = 'V', then if *info* = 0, the first *m* elements of *ifail* are zero; if *info* > 0, the *ifail* contains the indices of the eigenvectors that failed to converge.
If *jobz* = 'N', then *ifail* is not referenced.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th argument had an illegal value.
If *info* > 0, and

if $i \leq n$, the algorithm failed to converge, and i off-diagonal elements of an intermediate tridiagonal did not converge to zero;

if $info = n + i$, for $1 \leq i \leq n$, then cpbstf/zpbstf returned $info = i$ and B is not positive-definite. The factorization of B could not be completed and no eigenvalues or eigenvectors were computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine hbgvx interface are the following:

a	Stands for argument *ab* in Fortan 77 interface. Holds the array A of size (*ka+1*,*n*).
b	Stands for argument *bb* in Fortan 77 interface. Holds the array B of size (*kb+1*,*n*).
w	Holds the vector of length (*n*).
z	Holds the matrix Z of size (*n*, *n*).
ifail	Holds the vector of length (*n*).
q	Holds the matrix Q of size (*n*, *n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
vl	Default value for this element is *vl* = -HUGE(*vl*).
vu	Default value for this element is *vu* = HUGE(*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this element is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted. Note that there will be an error condition if *ifail* or *q* is present and *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows:

range = 'V', if one of or both *vl* and *vu* are present,
range = 'I', if one of or both *il* and *iu* are present,
range = 'A', if none of *vl*, *vu*, *il*, *iu* is present,
Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a,b] of width less than or equal to *abstol* + ε * max(|a|,|b|), where ε is the machine precision.

If *abstol* is less than or equal to zero, then ε*||*T*||$_1$ will be used in its place, where *T* is the tridiagonal matrix obtained by reducing *A* to tridiagonal form. Eigenvalues will be computed most accurately when *abstol* is set to twice the underflow threshold 2*?lamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, try setting *abstol* to 2*?lamch('S').

Generalized Nonsymmetric Eigenproblems

This section describes LAPACK driver routines used for solving generalized nonsymmetric eigenproblems. See also computational routines computational routines that can be called to solve these problems. Table 4-14 lists all such driver routines for Fortran-77 interface. Respective routine names in Fortran-95 interface are without the first symbol (see Routine Naming Conventions).

Table 4-14 Driver Routines for Solving Generalized Nonsymmetric Eigenproblems

Routine Name	Operation performed
?gges	Computes the generalized eigenvalues, Schur form, and the left and/or right Schur vectors for a pair of nonsymmetric matrices.
?ggesx	Computes the generalized eigenvalues, Schur form, and, optionally, the left and/or right matrices of Schur vectors.
?ggev	Computes the generalized eigenvalues, and the left and/or right generalized eigenvectors for a pair of nonsymmetric matrices.
?ggevx	Computes the generalized eigenvalues, and, optionally, the left and/or right generalized eigenvectors.

?gges

Computes the generalized eigenvalues, Schur form, and the left and/or right Schur vectors for a pair of nonsymmetric matrices.

Syntax

Fortran 77:

```
call sgges(jobvsl, jobvsr, sort, selctg, n, a, lda, b, ldb, sdim, alphar,
alphai, beta, vsl, ldvsl, vsr, ldvsr, work, lwork, bwork, info)

call dgges(jobvsl, jobvsr, sort, selctg, n, a, lda, b, ldb, sdim, alphar,
alphai, beta, vsl, ldvsl, vsr, ldvsr, work, lwork, bwork, info)

call cgges(jobvsl, jobvsr, sort, selctg, n, a, lda, b, ldb, sdim, alpha, beta,
vsl, ldvsl, vsr, ldvsr, work, lwork, rwork, bwork, info)

call zgges(jobvsl, jobvsr, sort, selctg, n, a, lda, b, ldb, sdim, alpha, beta,
vsl, ldvsl, vsr, ldvsr, work, lwork, rwork, bwork, info)
```

Fortran 95:

```
call gges(a, b, alphar, alphai, beta [,vsl] [,vsr] [,select] [,sdim] [,info])

call gges(a, b, alpha, beta [, vsl] [,vsr] [,select] [,sdim] [,info])
```

Description

This routine computes for a pair of n-by-n real/complex nonsymmetric matrices (A,B), the generalized eigenvalues, the generalized real/complex Schur form (S,T), optionally, the left and/or right matrices of Schur vectors (vsl and vsr). This gives the generalized Schur factorization

$$(A,B) = (vsl*S*vsr^H, vsl*T*vsr^H)$$

Optionally, it also orders the eigenvalues so that a selected cluster of eigenvalues appears in the leading diagonal blocks of the upper quasi-triangular matrix S and the upper triangular matrix T. The leading columns of vsl and vsr then form an orthonormal/unitary basis for the corresponding left and right eigenspaces (deflating subspaces).

(If only the generalized eigenvalues are needed, use the driver ?ggev instead, which is faster.)

A generalized eigenvalue for a pair of matrices (*A*,*B*) is a scalar *w* or a ratio *alpha* / *beta* = *w*, such that *A* - *w***B* is singular. It is usually represented as the pair (*alpha*, *beta*), as there is a reasonable interpretation for *beta*=0 or for both being zero. A pair of matrices (*S*,*T*) is in generalized real Schur form if *T* is upper triangular with non-negative diagonal and *S* is block upper triangular with 1-by-1 and 2-by-2 blocks. 1-by-1 blocks correspond to real generalized eigenvalues, while 2-by-2 blocks of *S* will be "standardized" by making the corresponding elements of *T* have the form:

$$\begin{pmatrix} a & 0 \\ 0 & b \end{pmatrix}$$

and the pair of corresponding 2-by-2 blocks in *S* and *T* will have a complex conjugate pair of generalized eigenvalues. A pair of matrices (*S*,*T*) is in generalized complex Schur form if *S* and *T* are upper triangular and, in addition, the diagonal of *T* are non-negative real numbers.

Input Parameters

jobvsl	CHARACTER*1. Must be 'N' or 'V'. If *jobvsl* = 'N', then the left Schur vectors are not computed. If *jobvsl* = 'V', then the left Schur vectors are computed.
jobvsr	CHARACTER*1. Must be 'N' or 'V'. If *jobvsr* = 'N', then the right Schur vectors are not computed. If *jobvsr* = 'V', then the right Schur vectors are computed.
sort	CHARACTER*1. Must be 'N' or 'S'. Specifies whether or not to order the eigenvalues on the diagonal of the generalized Schur form. If *sort* = 'N', then eigenvalues are not ordered. If *sort* = 'S', eigenvalues are ordered (see *selctg*).
selctg	LOGICAL FUNCTION of three REAL arguments for real flavors. LOGICAL FUNCTION of two COMPLEX arguments for complex flavors. *selctg* must be declared EXTERNAL in the calling subroutine.

If *sort* = 'S', *selctg* is used to select eigenvalues to sort to the top left of the Schur form.
If *sort* = 'N', *selctg* is not referenced.
For real flavors:
An eigenvalue (*alphar*(j) + *alphai*(j))/*beta*(j) is selected if *selctg*(*alphar*(j), *alphai*(j), *beta*(j)) is true; that is, if either one of a complex conjugate pair of eigenvalues is selected, then both complex eigenvalues are selected.
Note that in the ill-conditioned case, a selected complex eigenvalue may no longer satisfy *selctg*(*alphar*(j), *alphai*(j), *beta*(j)) = .TRUE. after ordering. In this case *info* is set to *n*+2 .
For complex flavors:
An eigenvalue *alpha*(j) / *beta*(j) is selected if *selctg*(*alpha*(j), *beta*(j)) is true.
Note that a selected complex eigenvalue may no longer satisfy *selctg*(*alpha*(j), *beta*(j)) = .TRUE. after ordering, since ordering may change the value of complex eigenvalues (especially if the eigenvalue is ill-conditioned); in this case *info* is set to *n*+2 (see *info* below).

n — INTEGER. The order of the matrices *A*, *B*, *vsl*, and *vsr* (*n* ≥ 0).

a, *b*, *work* — REAL for sgges
DOUBLE PRECISION for dgges
COMPLEX for cgges
DOUBLE COMPLEX for zgges.
Arrays:
a(*lda*,*) is an array containing the *n*-by-*n* matrix *A* (first of the pair of matrices).
The second dimension of *a* must be at least max(1, *n*).
b(*ldb*,*) is an array containing the *n*-by-*n* matrix *B* (second of the pair of matrices).
The second dimension of *b* must be at least max(1, *n*).
work is a workspace array, its dimension max(1, *lwork*).

lda — INTEGER. The first dimension of the array *a*. Must be at least max(1, *n*).

ldb	INTEGER. The first dimension of the array *b*. Must be at least max(1, *n*).
ldvsl, *ldvsr*	INTEGER. The first dimensions of the output matrices *vsl* and *vsr*, respectively. Constraints: *ldvsl* ≥ 1. If *jobvsl* = 'V', *ldvsl* ≥ max(1, *n*). *ldvsr* ≥ 1. If *jobvsr* = 'V', *ldvsr* ≥ max(1, *n*).
lwork	INTEGER. The dimension of the array *work*. *lwork* ≥ max(1, 8*n*+16) for real flavors; *lwork* ≥ max(1, 2*n*) for complex flavors. For good performance, *lwork* must generally be larger. If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.
rwork	REAL for cgges DOUBLE PRECISION for zgges Workspace array, DIMENSION at least max(1, 8*n*). This array is used in complex flavors only.
bwork	LOGICAL. Workspace array, DIMENSION at least max(1, *n*). Not referenced if *sort* = 'N'.

Output Parameters

a	On exit, this array has been overwritten by its generalized Schur form *S*.
b	On exit, this array has been overwritten by its generalized Schur form *T*.
sdim	INTEGER. If *sort* = 'N', *sdim*= 0. If *sort* = 'S', *sdim* is equal to the number of eigenvalues (after sorting) for which *selctg* is true. Note that for real flavors complex conjugate pairs for which *selctg* is true for either eigenvalue count as 2.
alphar, *alphai*	REAL for sgges;

DOUBLE PRECISION for dgges.
Arrays, DIMENSION at least max(1, *n*) each. Contain values that form generalized eigenvalues in real flavors.
See *beta*.

alpha
COMPLEX for cgges;
DOUBLE COMPLEX for zgges.
Array, DIMENSION at least max(1, *n*). Contain values that form generalized eigenvalues in complex flavors. See *beta*.

beta
REAL for sgges
DOUBLE PRECISION for dgges
COMPLEX for cgges
DOUBLE COMPLEX for zgges.
Array, DIMENSION at least max(1, *n*).
For real flavors:
On exit, (*alphar*(j) + *alphai*(j)*i)/*beta*(j), j=1,..., *n*, will be the generalized eigenvalues.
alphar(j) + *alphai*(j)*i and *beta*(j), j=1,..., *n* are the diagonals of the complex Schur form (*S*,*T*) that would result if the 2-by-2 diagonal blocks of the real generalized Schur form of (*A*,*B*) were further reduced to triangular form using complex unitary transformations. If *alphai*(j) is zero, then the j-th eigenvalue is real; if positive, then the j-th and (j+1)-st eigenvalues are a complex conjugate pair, with *alphai*(j+1) negative.
For complex flavors:
On exit, *alpha*(j)/*beta*(j), j=1,..., *n*, will be the generalized eigenvalues. *alpha*(j), j=1,...,*n*, and *beta*(j), j=1,..., *n* are the diagonals of the complex Schur form (*S*,*T*) output by cgges/zgges. The *beta*(j) will be non-negative real.
See also Application Notes below.

vsl, *vsr*
REAL for sgges
DOUBLE PRECISION for dgges
COMPLEX for cgges
DOUBLE COMPLEX for zgges.
Arrays:
vsl(*ldvsl*,*), the second dimension of *vsl* must be at least max(1, *n*).

	If *jobvsl* = 'V', this array will contain the left Schur vectors. If *jobvsl* = 'N', *vsl* is not referenced. *vsr*(*ldvsr*,*), the second dimension of *vsr* must be at least max(1, *n*). If *jobvsr* = 'V', this array will contain the right Schur vectors. If *jobvsr* = 'N', *vsr* is not referenced.
work(1)	On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*th parameter had an illegal value. If *info* = *i*, and *i* ≤ *n*: the *QZ* iteration failed. (*A*, *B*) is not in Schur form, but *alphar*(j), *alphai*(j) (for real flavors), or *alpha*(j) (for complex flavors), and *beta*(j), j=*info*+1, . . . , *n* should be correct. *i* > *n*: errors that usually indicate LAPACK problems: *i* = *n*+1: other than *QZ* iteration failed in ?hgeqz; *i* = *n*+2: after reordering, roundoff changed values of some complex eigenvalues so that leading eigenvalues in the generalized Schur form no longer satisfy *selctg* = .TRUE.. This could also be caused due to scaling; *i* = *n*+3: reordering failed in ?tgsen.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine gges interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *n*).
alphar	Holds the vector of length (*n*). Used in real flavors only.
alphai	Holds the vector of length (*n*). Used in real flavors only.

alpha	Holds the vector of length (*n*). Used in complex flavors only.
beta	Holds the vector of length (*n*).
vsl	Holds the matrix *VSL* of size (*n*, *n*).
vsr	Holds the matrix *VSR* of size (*n*, *n*).
jobvsl	Restored based on the presence of the argument *vsl* as follows: *jobvsl* = 'V', if *vsl* is present, *jobvsl* = 'N', if *vsl* is omitted.
jobvsr	Restored based on the presence of the argument *vsr* as follows: *jobvsr* = 'V', if *vsr* is present, *jobvsr* = 'N', if *vsr* is omitted.
sort	Restored based on the presence of the argument *select* as follows: *sort* = 'S', if *select* is present, *sort* = 'N', if *select* is omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The quotients *alphar*(j)/*beta*(j) and *alphai*(j)/*beta*(j) may easily over- or underflow, and *beta*(j) may even be zero. Thus, you should avoid simply computing the ratio. However, *alphar* and *alphai* will be always less than and usually comparable with norm(*A*) in magnitude, and *beta* always less than and usually comparable with norm(*B*).

?ggesx

Computes the generalized eigenvalues, Schur form, and, optionally, the left and/or right matrices of Schur vectors.

Syntax

Fortran 77:

```
call sggesx (jobvsl, jobvsr, sort, selctg, sense, n, a, lda, b, ldb, sdim,
alphar, alphai, beta, vsl, ldvsl, vsr, ldvsr, rconde, rcondv, work, lwork,
iwork, liwork, bwork, info)

call dggesx (jobvsl, jobvsr, sort, selctg, sense, n, a, lda, b, ldb, sdim,
alphar, alphai, beta, vsl, ldvsl, vsr, ldvsr, rconde, rcondv, work, lwork,
iwork, liwork, bwork, info)

call cggesx (jobvsl, jobvsr, sort, selctg, sense, n, a, lda, b, ldb, sdim,
alpha, beta, vsl, ldvsl, vsr, ldvsr, rconde, rcondv, work, lwork, rwork,
iwork, liwork, bwork, info)

call zggesx (jobvsl, jobvsr, sort, selctg, sense, n, a, lda, b, ldb, sdim,
alpha, beta, vsl, ldvsl, vsr, ldvsr, rconde, rcondv, work, lwork, rwork,
iwork, liwork, bwork, info)
```

Fortran 95:

```
call ggesx(a, b, alphar, alphai, beta [,vsl] [,vsr] [,select] [,sdim] [,rconde]
[, rcondv] [,info])

call ggesx(a, b, alpha, beta [, vsl] [,vsr] [,select] [,sdim] [,rconde]
[,rcondv] [, info])
```

Description

This routine computes for a pair of n-by-n real/complex nonsymmetric matrices (A,B), the generalized eigenvalues, the generalized real/complex Schur form (S,T), optionally, the left and/or right matrices of Schur vectors (vsl and vsr). This gives the generalized Schur factorization

$$(A,B) = (vsl*S*vsr^{H}, vsl*T*vsr^{H})$$

Optionally, it also orders the eigenvalues so that a selected cluster of eigenvalues appears in the leading diagonal blocks of the upper quasi-triangular matrix *S* and the upper triangular matrix *T*; computes a reciprocal condition number for the average of the selected eigenvalues (*rconde*); and computes a reciprocal condition number for the right and left deflating subspaces corresponding to the selected eigenvalues (*rcondv*). The leading columns of *vsl* and *vsr* then form an orthonormal/unitary basis for the corresponding left and right eigenspaces (deflating subspaces).

A generalized eigenvalue for a pair of matrices (*A*,*B*) is a scalar *w* or a ratio *alpha / beta = w*, such that *A - w*B* is singular. It is usually represented as the pair (*alpha*, *beta*), as there is a reasonable interpretation for *beta*=0 or for both being zero. A pair of matrices (*S*,*T*) is in generalized real Schur form if *T* is upper triangular with non-negative diagonal and *S* is block upper triangular with 1-by-1 and 2-by-2 blocks. 1-by-1 blocks correspond to real generalized eigenvalues, while 2-by-2 blocks of *S* will be "standardized" by making the corresponding elements of *T* have the form:

$$\begin{pmatrix} a & 0 \\ 0 & b \end{pmatrix}$$

and the pair of corresponding 2-by-2 blocks in *S* and *T* will have a complex conjugate pair of generalized eigenvalues. A pair of matrices (*S*,*T*) is in generalized complex Schur form if *S* and *T* are upper triangular and, in addition, the diagonal of *T* are non-negative real numbers.

Input Parameters

jobvsl — CHARACTER*1. Must be 'N' or 'V'.
If *jobvsl* = 'N', then the left Schur vectors are not computed.
If *jobvsl* = 'V', then the left Schur vectors are computed.

jobvsr — CHARACTER*1. Must be 'N' or 'V'.
If *jobvsr* = 'N', then the right Schur vectors are not computed.
If *jobvsr* = 'V', then the right Schur vectors are computed.

sort CHARACTER*1. Must be 'N' or 'S'. Specifies whether or not to order the eigenvalues on the diagonal of the generalized Schur form.
If *sort* = 'N', then eigenvalues are not ordered.
If *sort* = 'S', eigenvalues are ordered (see *selctg*).

selctg LOGICAL FUNCTION of three REAL arguments for real flavors.
LOGICAL FUNCTION of two COMPLEX arguments for complex flavors.
selctg must be declared EXTERNAL in the calling subroutine.
If *sort* = 'S', *selctg* is used to select eigenvalues to sort to the top left of the Schur form.
If *sort* = 'N', *selctg* is not referenced.
For real flavors:
An eigenvalue (*alphar*(j) + *alphai*(j))/*beta*(j) is selected if *selctg*(*alphar*(j), *alphai*(j), *beta*(j)) is true; that is, if either one of a complex conjugate pair of eigenvalues is selected, then both complex eigenvalues are selected.
Note that in the ill-conditioned case, a selected complex eigenvalue may no longer satisfy *selctg*(*alphar*(j), *alphai*(j), *beta*(j)) = .TRUE. after ordering. In this case *info* is set to *n*+2.
For complex flavors:
An eigenvalue *alpha*(j) / *beta*(j) is selected if *selctg*(*alpha*(j), *beta*(j)) is true.
Note that a selected complex eigenvalue may no longer satisfy *selctg*(*alpha*(j), *beta*(j)) = .TRUE. after ordering, since ordering may change the value of complex eigenvalues (especially if the eigenvalue is ill-conditioned); in this case *info* is set to *n*+2 (see *info* below).

sense CHARACTER*1. Must be 'N', 'E', 'V', or 'B'. Determines which reciprocal condition number are computed.
If *sense* = 'N', none are computed;
If *sense* = 'E', computed for average of selected eigenvalues only;
If *sense* = 'V', computed for selected deflating subspaces only;
If *sense* = 'B', computed for both.

If *sense* is 'E', 'V', or 'B', then *sort* must equal 'S'.

n INTEGER. The order of the matrices *A*, *B*, *vsl*, and *vsr* (*n* ≥ 0).

a, *b*, *work* REAL for sggesx
DOUBLE PRECISION for dggesx
COMPLEX for cggesx
DOUBLE COMPLEX for zggesx.
Arrays:
a(*lda*,*) is an array containing the *n*-by-*n* matrix *A* (first of the pair of matrices).
The second dimension of *a* must be at least max(1, *n*).
b(*ldb*,*) is an array containing the *n*-by-*n* matrix *B* (second of the pair of matrices).
The second dimension of *b* must be at least max(1, *n*).
work is a workspace array, its dimension max(1, *lwork*).

lda INTEGER. The first dimension of the array *a*.
Must be at least max(1, *n*).

ldb INTEGER. The first dimension of the array *b*.
Must be at least max(1, *n*).

ldvsl, *ldvsr* INTEGER. The first dimensions of the output matrices *vsl* and *vsr*, respectively. Constraints:

ldvsl ≥ 1. If *jobvsl* = 'V', *ldvsl* ≥ max(1, *n*).

ldvsr ≥ 1. If *jobvsr* = 'V', *ldvsr* ≥ max(1, *n*).

lwork INTEGER.
The dimension of the array *work*.
For real flavors:

If *n*=0 then *lwork*≥1.

If *n*>0 and *sense* = 'N', then *lwork* ≥ max(8*n, 6*n+16).

If *n*>0 and *sense* = 'E', 'V', or 'B', then *lwork* ≥ max(8*n, 6*n+16, 2*sdim*(n-sdim));
For complex flavors:

If *n*=0 then *lwork*≥1.

If *n*>0 and *sense* = 'N', then *lwork* ≥ max(1, 2*n);

If $n>0$ and *sense* = 'E', 'V', or 'B', then *lwork* ≥ max(1, 2**n*, 2**sdim**(*n*-*sdim*)).

Note that 2**sdim**(*n*-*sdim*) ≤ *n***n*/2.

An error is only returned if *lwork* < max(8**n*, 6**n*+16) for real flavors, and *lwork* < max(1, 2**n*) for complex flavors, but if *sense* = 'E', 'V', or 'B', this may not be large enough.

If *lwork*=-1, then a workspace query is assumed; the routine only calculates the bound on the optimal size of the *work* array and the minimum size of the *iwork* array, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla.

rwork

REAL for cggesx

DOUBLE PRECISION for zggesx

Workspace array, DIMENSION at least max(1, 8*n*).

This array is used in complex flavors only.

iwork

INTEGER.

Workspace array, DIMENSION max(1, *liwork*).

liwork

INTEGER.

The dimension of the array *iwork*.

If *sense* = 'N', or *n*=0, then *liwork*≥1,

otherwise *liwork* ≥ (*n*+6) for real flavors, and *liwork* ≥ (*n*+2) for complex flavors.

If *liwork*=-1, then a workspace query is assumed; the routine only calculates the bound on the optimal size of the *work* array and the minimum size of the *iwork* array, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla.

bwork

LOGICAL.

Workspace array, DIMENSION at least max(1, *n*).

Not referenced if *sort* = 'N'.

Output Parameters

a — On exit, this array has been overwritten by its generalized Schur form *S*.

b — On exit, this array has been overwritten by its generalized Schur form *T*.

sdim — INTEGER.
If *sort* = 'N', *sdim*= 0.
If *sort* = 'S', *sdim* is equal to the number of eigenvalues (after sorting) for which *selctg* is true.
Note that for real flavors complex conjugate pairs for which *selctg* is true for either eigenvalue count as 2.

alphar, *alphai* — REAL for sggesx;
DOUBLE PRECISION for dggesx.
Arrays, DIMENSION at least max(1, *n*) each. Contain values that form generalized eigenvalues in real flavors.
See *beta*.

alpha — COMPLEX for cggesx;
DOUBLE COMPLEX for zggesx.
Array, DIMENSION at least max(1, *n*). Contain values that form generalized eigenvalues in complex flavors. See *beta*.

beta — REAL for sggesx
DOUBLE PRECISION for dggesx
COMPLEX for cggesx
DOUBLE COMPLEX for zggesx.
Array, DIMENSION at least max(1, *n*).
For real flavors:
On exit, (*alphar*(j) + *alphai*(j)*i)/*beta*(j), j=1,..., *n* will be the generalized eigenvalues.
alphar(j) + *alphai*(j)*i and *beta*(j), j=1,..., *n* are the diagonals of the complex Schur form (*S*,*T*) that would result if the 2-by-2 diagonal blocks of the real generalized Schur form of (*A*,*B*) were further reduced to triangular form using complex unitary transformations. If *alphai*(j) is zero, then the j-th eigenvalue is real; if positive, then the j-th and (j+1)-st eigenvalues are a complex conjugate pair, with *alphai*(j+1) negative.
For complex flavors:

	On exit, *alpha*(j)/*beta*(j), j=1,..., *n* will be the generalized eigenvalues. *alpha*(j), j=1,..., *n*, and *beta*(j), j=1,...,*n* are the diagonals of the complex Schur form (*S*,*T*) output by cggesx/zggesx. The *beta*(j) will be non-negative real. See also Application Notes below.
vsl, *vsr*	REAL for sggesx DOUBLE PRECISION for dggesx COMPLEX for cggesx DOUBLE COMPLEX for zggesx. Arrays: *vsl*(*ldvsl*,*), the second dimension of *vsl* must be at least max(1, *n*). If *jobvsl* = 'V', this array will contain the left Schur vectors. If *jobvsl* = 'N', *vsl* is not referenced. *vsr*(*ldvsr*,*), the second dimension of *vsr* must be at least max(1, *n*). If *jobvsr* = 'V', this array will contain the right Schur vectors. If *jobvsr* = 'N', *vsr* is not referenced.
rconde, *rcondv*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays, DIMENSION (2) each If *sense* = 'E' or 'B', *rconde*(1) and *rconde*(2) contain the reciprocal condition numbers for the average of the selected eigenvalues. Not referenced if *sense* = 'N' or 'V'. If *sense* = 'V' or 'B', *rcondv*(1) and *rcondv*(2) contain the reciprocal condition numbers for the selected deflating subspaces. Not referenced if *sense* = 'N' or 'E'.
work(1)	On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.
iwork(1)	On exit, if *info* = 0, then *iwork(1)* returns the required minimal size of *liwork*.
info	INTEGER. If *info* = 0, the execution is successful.

If *info* = *-i*, the *i*th parameter had an illegal value.
If *info* = *i*, and

i ≤ *n*:
the *QZ* iteration failed. (*A*, *B*) is not in Schur form, but *alphar*(j), *alphai*(j) (for real flavors), or *alpha*(j) (for complex flavors), and *beta*(j), j=*info*+1,..., *n* should be correct.
i > *n*: errors that usually indicate LAPACK problems:
i = *n*+1: other than *QZ* iteration failed in ?hgeqz;
i = *n*+2: after reordering, roundoff changed values of some complex eigenvalues so that leading eigenvalues in the generalized Schur form no longer satisfy *selctg* = .TRUE.. This could also be caused due to scaling;
i = *n*+3: reordering failed in ?tgsen.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine ggesx interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *n*).
alphar	Holds the vector of length (*n*). Used in real flavors only.
alphai	Holds the vector of length (*n*). Used in real flavors only.
alpha	Holds the vector of length (*n*). Used in complex flavors only.
beta	Holds the vector of length (*n*).
vsl	Holds the matrix *VSL* of size (*n*, *n*).
vsr	Holds the matrix *VSR* of size (*n*, *n*).
rconde	Holds the vector of length (2).
rcondv	Holds the vector of length (2).
jobvsl	Restored based on the presence of the argument *vsl* as follows: *jobvsl* = 'V', if *vsl* is present, *jobvsl* = 'N', if *vsl* is omitted.
jobvsr	Restored based on the presence of the argument *vsr* as follows:

	jobvsr = 'V', if *vsr* is present, *jobvsr* = 'N', if *vsr* is omitted.
sort	Restored based on the presence of the argument *select* as follows: *sort* = 'S', if *select* is present, *sort* = 'N', if *select* is omitted.
sense	Restored based on the presence of arguments *rconde* and rcondv as follows: *sense* = 'B', if both *rconde* and *rcondv* are present, *sense* = 'E', if *rconde* is present and *rcondv* omitted, *sense* = 'V', if *rconde* is omitted and *rcondv* present, *sense* = 'N', if both *rconde* and *rcondv* are omitted.

Note that there will be an error condition if *rconde* or *rcondv* are present and *select* is omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run or set *lwork* = –1 (*liwork* = –1).

If you choose the first option and set any of admissible *lwork* (or *liwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If you set *lwork* = –1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The quotients *alphar*(j)/*beta*(j) and *alphai*(j)/*beta*(j) may easily over- or underflow, and *beta*(j) may even be zero. Thus, you should avoid simply computing the ratio. However, *alphar* and *alphai* will be always less than and usually comparable with norm(*A*) in magnitude, and *beta* always less than and usually comparable with norm(*B*).

?ggev

Computes the generalized eigenvalues, and the left and/or right generalized eigenvectors for a pair of nonsymmetric matrices.

Syntax

Fortran 77:

```
call sggev(jobvl, jobvr, n, a, lda, b, ldb, alphar, alphai, beta, vl, ldvl, vr, ldvr, work, lwork, info)
call dggev(jobvl, jobvr, n, a, lda, b, ldb, alphar, alphai, beta, vl, ldvl, vr, ldvr, work, lwork, info)
call cggev(jobvl, jobvr, n, a, lda, b, ldb, alpha, beta, vl, ldvl, vr, ldvr, work, lwork, rwork, info)
call zggev(jobvl, jobvr, n, a, lda, b, ldb, alpha, beta, vl, ldvl, vr, ldvr, work, lwork, rwork, info)
```

Fortran 95:

```
call ggev(a, b, alphar, alphai, beta [,vl] [,vr] [,info])
call ggev(a, b, alpha, beta [, vl] [,vr] [,info])
```

Description

This routine computes for a pair of n-by-n real/complex nonsymmetric matrices (A,B), the generalized eigenvalues, and optionally, the left and/or right generalized eigenvectors.

A generalized eigenvalue for a pair of matrices (A,B) is a scalar λ or a ratio $alpha / beta = \lambda$, such that $A - \lambda * B$ is singular. It is usually represented as the pair $(alpha, beta)$, as there is a reasonable interpretation for $beta = 0$ and even for both being zero. The right generalized eigenvector $v(j)$ corresponding to the generalized eigenvalue $l(j)$ of (A,B) satisfies

$$A*v*(j) = \lambda(j)*B*v*(j).$$

The left generalized eigenvector $u(j)$ corresponding to the generalized eigenvalue $\lambda(j)$ of (A,B) satisfies

$$u(j)^H*A = \lambda(j)*u*(j)^H*B$$

where $u(j)^H$ denotes the conjugate transpose of $u(j)$.

Input Parameters

jobvl	CHARACTER*1. Must be 'N' or 'V'. If *jobvl* = 'N', the left generalized eigenvectors are not computed; If *jobvl* = 'V', the left generalized eigenvectors are computed.
jobvr	CHARACTER*1. Must be 'N' or 'V'. If *jobvr* = 'N', the right generalized eigenvectors are not computed; If *jobvr* = 'V', the right generalized eigenvectors are computed.
n	INTEGER. The order of the matrices *A*, *B*, *vl*, and *vr* (*n* ≥ 0).
a, *b*, *work*	REAL for sggev DOUBLE PRECISION for dggev COMPLEX for cggev DOUBLE COMPLEX for zggev. Arrays: *a*(*lda*,*) is an array containing the *n*-by-*n* matrix *A* (first of the pair of matrices). The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) is an array containing the *n*-by-*n* matrix *B* (second of the pair of matrices). The second dimension of *b* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of the array *a*. Must be at least max(1, *n*).
ldb	INTEGER. The first dimension of the array *b*. Must be at least max(1, *n*).
ldvl, *ldvr*	INTEGER. The first dimensions of the output matrices *vl* and *vr*, respectively. Constraints: *ldvl* ≥ 1. If *jobvl* = 'V', *ldvl* ≥ max(1, *n*). *ldvr* ≥ 1. If *jobvr* = 'V', *ldvr* ≥ max(1, *n*).

lwork INTEGER.
The dimension of the array *work*.
lwork ≥ max(1, 8*n*+16) for real flavors;
lwork ≥ max(1, 2*n*) for complex flavors.
For good performance, *lwork* must generally be larger.
If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

rwork REAL for cggev
DOUBLE PRECISION for zggev
Workspace array, DIMENSION at least max(1, 8*n*).
This array is used in complex flavors only.

Output Parameters

a, *b* On exit, these arrays have been overwritten.

alphar, *alphai* REAL for sggev;
DOUBLE PRECISION for dggev.
Arrays, DIMENSION at least max(1, *n*) each. Contain values that form generalized eigenvalues in real flavors.
See *beta*.

alpha COMPLEX for cggev;
DOUBLE COMPLEX for zggev.
Array, DIMENSION at least max(1, *n*). Contain values that form generalized eigenvalues in complex flavors. See *beta*.

beta REAL for sggev
DOUBLE PRECISION for dggev
COMPLEX for cggev
DOUBLE COMPLEX for zggev.
Array, DIMENSION at least max(1, *n*).
For real flavors:
On exit, (*alphar*(j)+ *alphai*(j)*i)/*beta*(j), j=1,..., *n*, are the generalized eigenvalues.
If *alphai*(j) is zero, then the j-th eigenvalue is real; if positive, then the j-th and (j+1)-st eigenvalues are a complex conjugate pair, with *alphai*(j+1) negative.

For complex flavors:
On exit, *alpha*(j)/*beta*(j), j=1,..., *n*, are the generalized eigenvalues.
See also Application Notes below.

vl, *vr*

REAL for sggev
DOUBLE PRECISION for dggev
COMPLEX for cggev
DOUBLE COMPLEX for zggev.
Arrays:
vl(*ldvl*,*); the second dimension of *vl* must be at least max(1, *n*).
If *jobvl* = 'V', the left generalized eigenvectors *u*(j) are stored one after another in the columns of *vl*, in the same order as their eigenvalues. Each eigenvector is scaled so the largest component has abs(Re) + abs(Im) = 1.
If *jobvl* = 'N', *vl* is not referenced.
For real flavors:
If the j-th eigenvalue is real, then *u*(j) = *vl*(:,j), the j-th column of *vl*.
If the j-th and (j+1)-st eigenvalues form a complex conjugate pair, then *u*(j) = *vl*(:,j) + *i**vl*(:,j+1) and *u*(j+1) = *vl*(:,j) – *i**vl*(:,j+1), where *i* = sqrt(–1).
For complex flavors:
u(j) = *vl*(:,j), the j-th column of *vl*.
vr(*ldvr*,*); the second dimension of *vr* must be at least max(1, *n*).
If *jobvr* = 'V', the right generalized eigenvectors *v*(j) are stored one after another in the columns of *vr*, in the same order as their eigenvalues. Each eigenvector is scaled so the largest component has abs(Re) + abs(Im) = 1.
If *jobvr* = 'N', *vr* is not referenced.
For real flavors:
If the j-th eigenvalue is real, then *v*(j) = *vr*(:,j), the j-th column of *vr*.
If the j-th and (j+1)-st eigenvalues form a complex conjugate pair, then *v*(j) = *vr*(:,j) + *i**vr*(:,j+1) and *v*(j+1) = *vr*(:,j) – *i**vr*(:,j+1).

	For complex flavors: `v(j) = vr(:,j)`, the j-th column of `vr`.
`work(1)`	On exit, if `info = 0`, then `work(1)` returns the required minimal size of `lwork`.
`info`	INTEGER. If `info = 0`, the execution is successful. If `info = -i`, the `i`-th parameter had an illegal value. If `info = i`, and `i ≤ n`: the `QZ` iteration failed. No eigenvectors have been calculated, but `alphar`(j), `alphai`(j) (for real flavors), or `alpha`(j) (for complex flavors), and `beta`(j), `j=info+1,..., n` should be correct. `i > n`: errors that usually indicate LAPACK problems: `i = n+1`: other than `QZ` iteration failed in `?hgeqz`; `i = n+2`: error return from `?tgevc`.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine `ggev` interface are the following:

`a`	Holds the matrix `A` of size (`n`, `n`).
`b`	Holds the matrix `B` of size (`n`, `n`).
`alphar`	Holds the vector of length (`n`). Used in real flavors only.
`alphai`	Holds the vector of length (`n`). Used in real flavors only.
`alpha`	Holds the vector of length (`n`). Used in complex flavors only.
`beta`	Holds the vector of length (`n`).
`vl`	Holds the matrix `VL` of size (`n`, `n`).
`vr`	Holds the matrix `VR` of size (`n`, `n`).
`jobvl`	Restored based on the presence of the argument `vl` as follows: `jobvl = 'V'`, if `vl` is present, `jobvl = 'N'`, if `vl` is omitted.
`jobvr`	Restored based on the presence of the argument `vr` as follows:

jobvr = 'V', if *vr* is present,
jobvr = 'N', if *vr* is omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = –1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = –1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The quotients *alphar*(j)/*beta*(j) and *alphai*(j)/*beta*(j) may easily over- or underflow, and *beta*(j) may even be zero. Thus, you should avoid simply computing the ratio. However, *alphar* and *alphai* (for real flavors) or *alpha* (for complex flavors) will be always less than and usually comparable with norm(*A*) in magnitude, and *beta* always less than and usually comparable with norm(*B*).

?ggevx

Computes the generalized eigenvalues, and, optionally, the left and/or right generalized eigenvectors.

Syntax

Fortran 77:

```
call sggevx(balanc, jobvl, jobvr, sense, n, a, lda, b, ldb, alphar, alphai,
beta, vl, ldvl, vr, ldvr, ilo, ihi, lscale, rscale, abnrm, bbnrm, rconde,
rcondv, work, lwork, iwork, bwork, info)
```

```
call dggevx(balanc, jobvl, jobvr, sense, n, a, lda, b, ldb, alphar, alphai,
beta, vl, ldvl, vr, ldvr, ilo, ihi, lscale, rscale, abnrm, bbnrm, rconde,
rcondv, work, lwork, iwork, bwork, info)
```

```
call cggevx(balanc, jobvl, jobvr, sense, n, a, lda, b, ldb, alpha, beta, vl,

lscale] [,rscale] [,abnrm] [,bbnrm] [,rconde] [,rcondv] [,info])
```

```
call ggevx(a, b, alpha, beta [, vl] [,vr] [,balanc] [,ilo] [,ihi] [,lscale]
[, rscale] [,abnrm] [,bbnrm] [,rconde] [,rcondv] [,info])
```

Description

This routine computes for a pair of n-by-n real/complex nonsymmetric matrices (A,B), the generalized eigenvalues, and optionally, the left and/or right generalized eigenvectors.

Optionally also, it computes a balancing transformation to improve the conditioning of the eigenvalues and eigenvectors (*ilo*, *ihi*, *lscale*, *rscale*, *abnrm*, and *bbnrm*), reciprocal condition numbers for the eigenvalues (*rconde*), and reciprocal condition numbers for the right eigenvectors (*rcondv*).

A generalized eigenvalue for a pair of matrices (*A*,*B*) is a scalar λ or a ratio *alpha* / *beta* = λ, such that *A* – λ**B* is singular. It is usually represented as the pair (*alpha*, *beta*), as there is a reasonable interpretation for *beta*=0 and even for both being zero. The right generalized eigenvector *v*(j) corresponding to the generalized eigenvalue λ(j) of (*A*,*B*) satisfies

*A*v**(j) = λ(j)**B*v**(j).

The left generalized eigenvector *u*(j) corresponding to the generalized eigenvalue λ(j) of (*A*,*B*) satisfies

u(j)^{H}**A* = *l*(j)**u**(j)^{H}**B*

where *u*(j)^{H} denotes the conjugate transpose of *u*(j).

Input Parameters

balanc	CHARACTER*1. Must be 'N', 'P', 'S', or 'B'. Specifies the balance option to be performed. If *balanc* = 'N', do not diagonally scale or permute; If *balanc* = 'P', permute only; If *balanc* = 'S', scale only; If *balanc* = 'B', both permute and scale. Computed reciprocal condition numbers will be for the matrices after balancing and/or permuting. Permuting does not change condition numbers (in exact arithmetic), but balancing does.
jobvl	CHARACTER*1. Must be 'N' or 'V'. If *jobvl* = 'N', the left generalized eigenvectors are not computed; If *jobvl* = 'V', the left generalized eigenvectors are computed.
jobvr	CHARACTER*1. Must be 'N' or 'V'. If *jobvr* = 'N', the right generalized eigenvectors are not computed; If *jobvr* = 'V', the right generalized eigenvectors are computed.
sense	CHARACTER*1. Must be 'N', 'E', 'V', or 'B'. Determines which reciprocal condition number are computed. If *sense* = 'N', none are computed;

If *sense* = 'E', computed for eigenvalues only;
If *sense* = 'V', computed for eigenvectors only;
If *sense* = 'B', computed for eigenvalues and eigenvectors.

n — INTEGER. The order of the matrices *A*, *B*, *vl*, and *vr* ($n \geq 0$).

a, *b*, *work* — REAL for sggevx
DOUBLE PRECISION for dggevx
COMPLEX for cggevx
DOUBLE COMPLEX for zggevx.
Arrays:
a(*lda*,*) is an array containing the *n*-by-*n* matrix *A* (first of the pair of matrices).
The second dimension of *a* must be at least max(1, *n*).
b(*ldb*,*) is an array containing the *n*-by-*n* matrix *B* (second of the pair of matrices).
The second dimension of *b* must be at least max(1, *n*).
work is a workspace array, its dimension max(1, *lwork*).

lda — INTEGER. The first dimension of the array *a*.
Must be at least max(1, *n*).

ldb — INTEGER. The first dimension of the array *b*.
Must be at least max(1, *n*).

ldvl, *ldvr* — INTEGER. The first dimensions of the output matrices *vl* and *vr*, respectively.
Constraints:

ldvl ≥ 1. If *jobvl* = 'V', *ldvl* ≥ max(1, *n*).

ldvr ≥ 1. If *jobvr* = 'V', *ldvr* ≥ max(1, *n*).

lwork — INTEGER.

The dimension of the array *work*. *lwork* ≥ max(1, 2**n*);
For real flavors:
If *balanc* = 'S', or 'B', or *jobvl* = 'V', or *jobvr* = 'V', then *lwork* ≥ max(1, 6**n*);

if *sense* = 'E', or 'B', then *lwork* ≥ max(1, 10**n*);

if *sense* = 'V', or 'B', *lwork* ≥ $(2n^2 + 8*n+16)$.
For complex flavors:

if *sense* = 'E', *lwork* ≥ max(1, 4*n);

if *sense* = 'V', or 'B', *lwork* ≥max(1, $2*n^2+ 2*n$).
If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

rwork — REAL for cggevx
DOUBLE PRECISION for zggevx
Workspace array, DIMENSION at least max(1, 6*n) if *balanc* = 'S', or 'B', and at least max(1, 2*n) otherwise.
This array is used in complex flavors only.

iwork — INTEGER.
Workspace array, DIMENSION at least (*n*+6) for real flavors and at least (*n*+2) for complex flavors.
Not referenced if *sense* = 'E'.

bwork — LOGICAL. Workspace array, DIMENSION at least max(1, *n*).
Not referenced if *sense* = 'N'.

Output Parameters

a, *b* — On exit, these arrays have been overwritten.
If *jobvl* = 'V' or *jobvr* = 'V' or both, then *a* contains the first part of the real Schur form of the "balanced" versions of the input *A* and *B*, and *b* contains its second part.

alphar, *alphai* — REAL for sggevx;
DOUBLE PRECISION for dggevx.
Arrays, DIMENSION at least max(1, *n*) each. Contain values that form generalized eigenvalues in real flavors.
See *beta*.

alpha — COMPLEX for cggevx;
DOUBLE COMPLEX for zggevx.
Array, DIMENSION at least max(1, *n*). Contain values that form generalized eigenvalues in complex flavors. See *beta*.

beta — REAL for sggevx
DOUBLE PRECISION for dggevx
COMPLEX for cggevx

DOUBLE COMPLEX for zggevx.
Array, DIMENSION at least max(1, *n*).
For real flavors:
On exit, (*alphar*(j) + *alphai*(j)*i)/*beta*(j), j=1,..., *n*, will be the generalized eigenvalues.
If *alphai*(j) is zero, then the j-th eigenvalue is real; if positive, then the j-th and (j+1)-st eigenvalues are a complex conjugate pair, with *alphai*(j+1) negative.
For complex flavors:
On exit, *alpha*(j)/*beta*(j), j=1,..., *n*, will be the generalized eigenvalues.
See also Application Notes below.

vl, *vr*

REAL for sggevx
DOUBLE PRECISION for dggevx
COMPLEX for cggevx
DOUBLE COMPLEX for zggevx.
Arrays:
vl(*ldvl*,*); the second dimension of *vl* must be at least max(1, *n*).
If *jobvl* = 'V', the left generalized eigenvectors *u*(j) are stored one after another in the columns of *vl*, in the same order as their eigenvalues. Each eigenvector will be scaled so the largest component have abs(Re) + abs(Im) = 1.
If *jobvl* = 'N', *vl* is not referenced.
For real flavors:
If the j-th eigenvalue is real, then *u*(j) = *vl*(:,j), the j-th column of *vl*.
If the j-th and (j+1)-st eigenvalues form a complex conjugate pair, then *u*(j) = *vl*(:,j) + *i**vl*(:,j+1) and *u*(j+1) = *vl*(:,j) – *i**vl*(:,j+1), where *i* = sqrt(–1).
For complex flavors:
u(j) = *vl*(:,j), the j-th column of *vl*.
vr(*ldvr*,*); the second dimension of *vr* must be at least max(1, *n*).

If *jobvr* = 'V', the right generalized eigenvectors *v*(j) are stored one after another in the columns of *vr*, in the same order as their eigenvalues. Each eigenvector will be scaled so the largest component have abs(Re) + abs(Im) = 1.
If *jobvr* = 'N', *vr* is not referenced.
For real flavors:
If the j-th eigenvalue is real, then *v*(j) = *vr*(:,j), the j-th column of *vr*.
If the j-th and (j+1)-st eigenvalues form a complex conjugate pair, then *v*(j) = *vr*(:,j) + *i***vr*(:,j+1) and *v*(j+1) = *vr*(:,j) – *i***vr*(:,j+1).
For complex flavors:
v(j) = *vr*(:,j), the j-th column of *vr*.

ilo, *ihi*

INTEGER. *ilo* and *ihi* are integer values such that on exit *A*(i,j) = 0 and *B*(i,j) = 0 if i > j and j = 1,..., *ilo*–1 or i = *ihi*+1,..., *n*.
If *balanc* = 'N' or 'S', *ilo* = 1 and *ihi* = *n*.

lscale, *rscale*

REAL for single-precision flavors
DOUBLE PRECISION for double-precision flavors.
Arrays, DIMENSION at least max(1, *n*) each.
lscale contains details of the permutations and scaling factors applied to the left side of *A* and *B*.
If *PL*(j) is the index of the row interchanged with row j, and *DL*(j) is the scaling factor applied to row j, then
lscale(j) = *PL*(j), for j = 1,..., *ilo*–1
= *DL*(j), for j = *ilo*,...,*ihi*
= *PL*(j) for j = *ihi*+1,..., *n*.
The order in which the interchanges are made is *n* to *ihi*+1, then 1 to *ilo*-1.
rscale contains details of the permutations and scaling factors applied to the right side of *A* and *B*.
If *PR*(j) is the index of the column interchanged with column j, and *DR*(j) is the scaling factor applied to column j, then
rscale(j) = *PR*(j), for j = 1,..., *ilo*–1
= *DR*(j), for j = *ilo*,...,*ihi*
= *PR*(j) for j = *ihi*+1,..., *n*.
The order in which the interchanges are made is *n* to *ihi*+1, then 1 to *ilo*-1.

abnrm, *bbnrm*
REAL for single-precision flavors
DOUBLE PRECISION for double-precision flavors.
The one-norms of the balanced matrices *A* and *B*, respectively.

rconde, *rcondv*
REAL for single precision flavors DOUBLE PRECISION for double precision flavors.
Arrays, DIMENSION at least max(1, *n*) each.
If *sense* = 'E', or 'B', *rconde* contains the reciprocal condition numbers of the eigenvalues, stored in consecutive elements of the array. For a complex conjugate pair of eigenvalues two consecutive elements of *rconde* are set to the same value. Thus *rconde*(j), *rcondv*(j), and the j-th columns of *vl* and *vr* all correspond to the same eigenpair (but not in general the j-th eigenpair, unless all eigenpairs are selected).
If *sense* = 'N', or 'V', *rconde* is not referenced.
If *sense* = 'V', or 'B', *rcondv* contains the estimated reciprocal condition numbers of the eigenvectors, stored in consecutive elements of the array. For a complex eigenvector two consecutive elements of *rcondv* are set to the same value.
If the eigenvalues cannot be reordered to compute *rcondv*(j), *rcondv*(j) is set to 0; this can only occur when the true value would be very small anyway.
If *sense* = 'N', or 'E', *rcondv* is not referenced.

work(1)
On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.

info
INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, and

i ≤ *n*:
the *QZ* iteration failed. No eigenvectors have been calculated, but *alphar*(j), *alphai*(j) (for real flavors), or *alpha*(j) (for complex flavors), and *beta*(j), j=*info*+1, ..., *n* should be correct.
i > *n*: errors that usually indicate LAPACK problems:

i = *n*+1: other than *QZ* iteration failed in ?hgeqz;
i = *n*+2: error return from ?tgevc.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their Fortran 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran-95 Interface Conventions.

Specific details for the routine ggevx interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *n*).
alphar	Holds the vector of length (*n*). Used in real flavors only.
alphai	Holds the vector of length (*n*). Used in real flavors only.
alpha	Holds the vector of length (*n*). Used in complex flavors only.
beta	Holds the vector of length (*n*).
vl	Holds the matrix *VL* of size (*n*, *n*).
vr	Holds the matrix *VR* of size (*n*, *n*).
lscale	Holds the vector of length (*n*).
rscale	Holds the vector of length (*n*).
rconde	Holds the vector of length (*n*).
rcondv	Holds the vector of length (*n*).
balanc	Must be 'N', 'B', or 'P'. The default value is 'N'.
jobvl	Restored based on the presence of the argument *vl* as follows: *jobvl* = 'V', if *vl* is present, *jobvl* = 'N', if *vl* is omitted.
jobvr	Restored based on the presence of the argument *vr* as follows: *jobvr* = 'V', if *vr* is present, *jobvr* = 'N', if *vr* is omitted.
sense	Restored based on the presence of arguments *rconde* and rcondv as follows: *sense* = 'B', if both *rconde* and *rcondv* are present, *sense* = 'E', if *rconde* is present and *rcondv* omitted, *sense* = 'V', if *rconde* is omitted and *rcondv* present, *sense* = 'N', if both *rconde* and *rcondv* are omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = –1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = –1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The quotients *alphar*(j)/*beta*(j) and *alphai*(j)/*beta*(j) may easily over- or underflow, and *beta*(j) may even be zero. Thus, you should avoid simply computing the ratio. However, *alphar* and *alphai* (for real flavors) or *alpha* (for complex flavors) will be always less than and usually comparable with norm(*A*) in magnitude, and *beta* always less than and usually comparable with norm(*B*).

LAPACK Auxiliary and Utility Routines

5

This chapter describes the Intel® Math Kernel Library implementation of LAPACK auxiliary and utility routines. The library includes auxiliary routines for both real and complex data.

Auxiliary Routines

Routine naming conventions, mathematical notation, and matrix storage schemes used for LAPACK auxiliary routines are the same as for the driver and computational routines described in previous chapters.

The table below summarizes information about the available LAPACK auxiliary routines.

Table 5-1 LAPACK Auxiliary Routines

Routine Name	Data Types	Description
?lacgv	c, z	Conjugates a complex vector.
?lacrm	c, z	Multiplies a complex matrix by a square real matrix.
?lacrt	c, z	Performs a linear transformation of a pair of complex vectors.
?laesy	c, z	Computes the eigenvalues and eigenvectors of a 2-by-2 complex symmetric matrix.
?rot	c, z	Applies a plane rotation with real cosine and complex sine to a pair of complex vectors.
?spmv	c, z	Computes a matrix-vector product for complex vectors using a complex symmetric packed matrix
?spr	c, z	Performs the symmetrical rank-1 update of a complex symmetric packed matrix.
?symv	c, z	Computes a matrix-vector product for a complex symmetric matrix.
?syr	c, z	Performs the symmetric rank-1 update of a complex symmetric matrix.

Routine Name	Data Types	Description
i?max1	c, z	Finds the index of the vector element whose real part has maximum absolute value.
?sum1	sc, dz	Forms the 1-norm of the complex vector using the true absolute value.
?gbtf2	s, d, c, z	Computes the LU factorization of a general band matrix using the unblocked version of the algorithm.
?gebd2	s, d, c, z	Reduces a general matrix to bidiagonal form using an unblocked algorithm.
?gehd2	s, d, c, z	Reduces a general square matrix to upper Hessenberg form using an unblocked algorithm.
?gelq2	s, d, c, z	Computes the LQ factorization of a general rectangular matrix using an unblocked algorithm.
?geql2	s, d, c, z	Computes the QL factorization of a general rectangular matrix using an unblocked algorithm.
?geqr2	s, d, c, z	Computes the QR factorization of a general rectangular matrix using an unblocked algorithm.
?gerq2	s, d, c, z	Computes the RQ factorization of a general rectangular matrix using an unblocked algorithm.
?gesc2	s, d, c, z	Solves a system of linear equations using the LU factorization with complete pivoting computed by ?getc2.
?getc2	s, d, c, z	Computes the LU factorization with complete pivoting of the general n-by-n matrix.
?getf2	s, d, c, z	Computes the LU factorization of a general *m*-by-*n* matrix using partial pivoting with row interchanges (unblocked algorithm).
?gtts2	s, d, c, z	Solves a system of linear equations with a tridiagonal matrix using the LU factorization computed by ?gttrf.
?isnan	s, d,	Tests input for NaN.

Routine Name	Data Types	Description
?laisnan	s, d,	Tests input for NaN by comparing itwo arguments for inequality.
?labrd	s, d, c, z	Reduces the first *nb* rows and columns of a general matrix to a bidiagonal form.
?lacn2	s, d, c, z	Estimates the 1-norm of a square matrix, using reverse communication for evaluating matrix-vector products.
?lacon	s, d, c, z	Estimates the 1-norm of a square matrix, using reverse communication for evaluating matrix-vector products.
?lacpy	s, d, c, z	Copies all or part of one two-dimensional array to another.
?ladiv	s, d, c, z	Performs complex division in real arithmetic, avoiding unnecessary overflow.
?lae2	s, d	Computes the eigenvalues of a 2-by-2 symmetric matrix.
?laebz	s, d	Computes the number of eigenvalues of a real symmetric tridiagonal matrix which are less than or equal to a given value, and performs other tasks required by the routine ?stebz.
?laed0	s, d, c, z	Used by ?stedc. Computes all eigenvalues and corresponding eigenvectors of an unreduced symmetric tridiagonal matrix using the divide and conquer method.
?laed1	s, d	Used by sstedc/dstedc. Computes the updated eigensystem of a diagonal matrix after modification by a rank-one symmetric matrix. Used when the original matrix is tridiagonal.
?laed2	s, d	Used by sstedc/dstedc. Merges eigenvalues and deflates secular equation. Used when the original matrix is tridiagonal.
?laed3	s, d	Used by sstedc/dstedc. Finds the roots of the secular equation and updates the eigenvectors. Used when the original matrix is tridiagonal.

Routine Name	Data Types	Description
?laed4	s, d	Used by sstedc/dstedc. Finds a single root of the secular equation.
?laed5	s, d	Used by sstedc/dstedc. Solves the 2-by-2 secular equation.
?laed6	s, d	Used by sstedc/dstedc. Computes one Newton step in solution of the secular equation.
?laed7	s, d, c, z	Used by ?stedc. Computes the updated eigensystem of a diagonal matrix after modification by a rank-one symmetric matrix. Used when the original matrix is dense.
?laed8	s, d, c, z	Used by ?stedc. Merges eigenvalues and deflates secular equation. Used when the original matrix is dense.
?laed9	s, d	Used by sstedc/dstedc. Finds the roots of the secular equation and updates the eigenvectors. Used when the original matrix is dense.
?laeda	s, d	Used by ?stedc. Computes the Z vector determining the rank-one modification of the diagonal matrix. Used when the original matrix is dense.
?laein	s, d, c, z	Computes a specified right or left eigenvector of an upper Hessenberg matrix by inverse iteration.
?laev2	s, d, c, z	Computes the eigenvalues and eigenvectors of a 2-by-2 symmetric/Hermitian matrix.
?laexc	s, d	Swaps adjacent diagonal blocks of a real upper quasi-triangular matrix in Schur canonical form, by an orthogonal similarity transformation.
?lag2	s, d	Computes the eigenvalues of a 2-by-2 generalized eigenvalue problem, with scaling as necessary to avoid over-/underflow.
?lags2	s, d	Computes 2-by-2 orthogonal matrices U, V, and Q, and applies them to matrices A and B such that the rows of the transformed A and B are parallel.

Routine Name	Data Types	Description
?lagtf	s, d	Computes an LU factorization of a matrix $T-\lambda I$, where T is a general tridiagonal matrix, and λ a scalar, using partial pivoting with row interchanges.
?lagtm	s, d, c, z	Performs a matrix-matrix product of the form $C = \alpha Ab+\beta C$, where A is a tridiagonal matrix, B and C are rectangular matrices, and α and β are scalars, which may be 0, 1, or -1.
?lagts	s, d	Solves the system of equations $(T-\lambda I)x = y$ or $(T-\lambda I)^T x = y$,where T is a general tridiagonal matrix and λ a scalar, using the LU factorization computed by ?lagtf.
?lagv2	s, d	Computes the Generalized Schur factorization of a real 2-by-2 matrix pencil (A,B) where B is upper triangular.
?lahqr	s, d, c, z	Computes the eigenvalues and Schur factorization of an upper Hessenberg matrix, using the double-shift/single-shift QR algorithm.
?lahrd	s, d, c, z	Reduces the first nb columns of a general rectangular matrix A so that elements below the k-th subdiagonal are zero, and returns auxiliary matrices which are needed to apply the transformation to the unreduced part of A.
?lahr2	s, d, c, z	Reduces the specified number of first columns of a general rectangular matrix A so that elements below thespecified subdiagonal are zero, and returns auxiliary matrices which are needed to apply the transformation to the unreduced part of A.
?laic1	s, d, c, z	Applies one step of incremental condition estimation.
?laln2	s, d	Solves a 1-by-1 or 2-by-2 linear system of equations of the specified form.
?lals0	s, d, c, z	Applies back multiplying factors in solving the least squares problem using divide and conquer SVD approach. Used by ?gelsd.

Routine Name	Data Types	Description
?lalsa	s, d, c, z	Computes the SVD of the coefficient matrix in compact form. Used by ?gelsd.
?lalsd	s, d, c, z	Uses the singular value decomposition of A to solve the least squares problem.
?lamrg	s, d	Creates a permutation list to merge the entries of two independently sorted sets into a single set sorted in ascending order.
?laneg	s, d	Computes the Sturm count.
?langb	s, d, c, z	Returns the value of the 1-norm, Frobenius norm, infinity-norm, or the largest absolute value of any element of general band matrix.
?lange	s, d, c, z	Returns the value of the 1-norm, Frobenius norm, infinity-norm, or the largest absolute value of any element of a general rectangular matrix.
?langt	s, d, c, z	Returns the value of the 1-norm, Frobenius norm, infinity-norm, or the largest absolute value of any element of a general tridiagonal matrix.
?lanhs	s, d, c, z	Returns the value of the 1-norm, Frobenius norm, infinity-norm, or the largest absolute value of any element of an upper Hessenberg matrix.
?lansb	s, d, c, z	Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a symmetric band matrix.
?lanhb	c, z	Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a Hermitian band matrix.
?lansp	s, d, c, z	Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a symmetric matrix supplied in packed form.

Routine Name	Data Types	Description
?lanhp	c, z	Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a complex Hermitian matrix supplied in packed form.
?lanst/?lanht	s, d/c, z	Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a real symmetric or complex Hermitian tridiagonal matrix.
?lansy	s, d, c, z	Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a real/complex symmetric matrix.
?lanhe	c, z	Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a complex Hermitian matrix.
?lantb	s, d, c, z	Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a triangular band matrix.
?lantp	s, d, c, z	Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a triangular matrix supplied in packed form.
?lantr	s, d, c, z	Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a trapezoidal or triangular matrix.
?lanv2	s, d	Computes the Schur factorization of a real 2-by-2 nonsymmetric matrix in standard form.
?lapll	s, d, c, z	Measures the linear dependence of two vectors.
?lapmt	s, d, c, z	Performs a forward or backward permutation of the columns of a matrix.
?lapy2	s, d	Returns sqrt(x^2+y^2).
?lapy3	s, d	Returns sqrt($x^2+y^2+z^2$).

Routine Name	Data Types	Description
?laqgb	s, d, c, z	Scales a general band matrix, using row and column scaling factors computed by ?gbequ.
?laqge	s, d, c, z	Scales a general rectangular matrix, using row and column scaling factors computed by ?geequ.
?laqhb	c, z	Scales a Hermetian band matrix, using scaling factors computed by ?pbequ.
?laqp2	s, d, c, z	Computes a QR factorization with column pivoting of the matrix block.
?laqps	s, d, c, z	Computes a step of QR factorization with column pivoting of a real m-by-n matrix *A* by using BLAS level 3.
?laqr0	s, d, c, z	Computes the eigenvalues of a Hessenberg matrix, and optionally the marixes from the Schur decomposition.
?laqr1	s, d, c, z	Sets a scalar multiple of the first column of the product of 2-by-2 or 3-by-3 matrix *H* and specified shifts.
?laqr2	s, d, c, z	Performs the orthogonal/unitary similarity transformation of a Hessenberg matrix to detect and deflate fully converged eigenvalues from a trailing principal submatrix (aggresive early deflation).
?laqr3	s, d, c, z	Performs the orthogonal/unitary similarity transformation of a Hessenberg matrix to detect and deflate fully converged eigenvalues from a trailing principal submatrix (aggresive early deflation).
?laqr4	s, d, c, z	Computes the eigenvalues of a Hessenberg matrix, and optionally the marices from the Schur decomposition.
?laqr5	s, d, c, z	Performs a single small-bulge multi-shift QR sweep.
?laqsb	s, d, c, z	Scales a symmetric/Hermitian band matrix, using scaling factors computed by ?pbequ.

Routine Name	Data Types	Description
?laqsp	s, d, c, z	Scales a symmetric/Hermitian matrix in packed storage, using scaling factors computed by ?ppequ.
?laqsy	s, d, c, z	Scales a symmetric/Hermitian matrix, using scaling factors computed by ?poequ.
?laqtr	s, d	Solves a real quasi-triangular system of equations, or a complex quasi-triangular system of special form, in real arithmetic.
?lar1v	s, d, c, z	Computes the (scaled) r-th column of the inverse of the submatrix in rows $b1$ through bn of the tridiagonal matrix $ldL^T - \sigma I$.
?lar2v	s, d, c, z	Applies a vector of plane rotations with real cosines and real/complex sines from both sides to a sequence of 2-by-2 symmetric/Hermitian matrices.
?larf	s, d, c, z	Applies an elementary reflector to a general rectangular matrix.
?larfb	s, d, c, z	Applies a block reflector or its transpose/conjugate-transpose to a general rectangular matrix.
?larfg	s, d, c, z	Generates an elementary reflector (Householder matrix).
?larft	s, d, c, z	Forms the triangular factor T of a block reflector $H = I - vtv^H$
?larfx	s, d, c, z	Applies an elementary reflector to a general rectangular matrix, with loop unrolling when the reflector has order ≤ 10.
?largv	s, d, c, z	Generates a vector of plane rotations with real cosines and real/complex sines.
?larnv	s, d, c, z	Returns a vector of random numbers from a uniform or normal distribution.
?larra	s, d	Computes the splitting points with the specified threshold.

Routine Name	Data Types	Description
?larrb	s, d	Provides limited bisection to locate eigenvalues for more accuracy.
?larrc	s, d	Computes the number of eigenvalues of the symmetric tridiagonal matrix.
?larrd	s, d	Computes the eigenvalues of a symmetric tridiagonal matrix to suitable accuracy.
?larre	s, d	Given the tridiagonal matrix T, sets small off-diagonal elements to zero and for each unreduced block T_i, finds base representations and eigenvalues.
?larrf	s, d	Finds a new relatively robust representation such that at least one of the eigenvalues is relatively isolated.
?larrj	s, d	Performs refinement of the initial estimates of the eigenvalues of the matrix T.
?larrk	s, d	Computes one eigenvalue of a symmetric tridiagonal matrix T to suitable accuracy.
?larrr	s, d	Performs tests to decide whether the symmetric tridiagonal matrix T warrants expensive computations which guarantee high relative accuracy in the eigenvalues.
?larrv	s, d, c, z	Computes the eigenvectors of the tridiagonal matrix $T = L\,D\,L^T$ given L, D and the eigenvalues of $L\,D\,L^T$.
?lartg	s, d, c, z	Generates a plane rotation with real cosine and real/complex sine.
?lartv	s, d, c, z	Applies a vector of plane rotations with real cosines and real/complex sines to the elements of a pair of vectors.
?laruv	s, d	Returns a vector of n random real numbers from a uniform distribution.
?larz	s, d, c, z	Applies an elementary reflector (as returned by ?tzrzf) to a general matrix.

Routine Name	Data Types	Description
?larzb	s, d, c, z	Applies a block reflector or its transpose/conjugate-transpose to a general matrix.
?larzt	s, d, c, z	Forms the triangular factor T of a block reflector $H = I - vtv^H$.
?las2	s, d	Computes singular values of a 2-by-2 triangular matrix.
?lascl	s, d, c, z	Multiplies a general rectangular matrix by a real scalar defined as c_{to}/c_{from}.
?lasd0	s, d	Computes the singular values of a real upper bidiagonal n-by-m matrix B with diagonal d and off-diagonal e. Used by ?bdsdc.
?lasd1	s, d	Computes the SVD of an upper bidiagonal matrix B of the specified size. Used by ?bdsdc.
?lasd2	s, d	Merges the two sets of singular values together into a single sorted set. Used by ?bdsdc.
?lasd3	s, d	Finds all square roots of the roots of the secular equation, as defined by the values in D and Z, and then updates the singular vectors by matrix multiplication. Used by ?bdsdc.
?lasd4	s, d	Computes the square root of the i-th updated eigenvalue of a positive symmetric rank-one modification to a positive diagonal matrix. Used by ?bdsdc.
?lasd5	s, d	Computes the square root of the i-th eigenvalue of a positive symmetric rank-one modification of a 2-by-2 diagonal matrix.Used by ?bdsdc.
?lasd6	s, d	Computes the SVD of an updated upper bidiagonal matrix obtained by merging two smaller ones by appending a row. Used by ?bdsdc.
?lasd7	s, d	Merges the two sets of singular values together into a single sorted set. Then it tries to deflate the size of the problem. Used by ?bdsdc.

Routine Name	Data Types	Description
?lasd8	s, d	Finds the square roots of the roots of the secular equation, and stores, for each element in D, the distance to its two nearest poles. Used by ?bdsdc.
?lasd9	s, d	Finds the square roots of the roots of the secular equation, and stores, for each element in D, the distance to its two nearest poles. Used by ?bdsdc.
?lasda	s, d	Computes the singular value decomposition (SVD) of a real upper bidiagonal matrix with diagonal *d* and off-diagonal *e*. Used by ?bdsdc.
?lasdq	s, d	Computes the SVD of a real bidiagonal matrix with diagonal *d* and off-diagonal *e*. Used by ?bdsdc.
?lasdt	s, d	Creates a tree of subproblems for bidiagonal divide and conquer. Used by ?bdsdc.
?laset	s, d, c, z	Initializes the off-diagonal elements and the diagonal elements of a matrix to given values.
?lasq1	s, d	Computes the singular values of a real square bidiagonal matrix. Used by ?bdsqr.
?lasq2	s, d	Computes all the eigenvalues of the symmetric positive definite tridiagonal matrix associated with the *qd* Array *Z* to high relative accuracy. Used by ?bdsqr and ?stegr.
?lasq3	s, d	Checks for deflation, computes a shift and calls *dqds*. Used by ?bdsqr.
?lasq4	s, d	Computes an approximation to the smallest eigenvalue using values of *d* from the previous transform. Used by ?bdsqr.
?lasq5	s, d	Computes one *dqds* transform in ping-pong form. Used by ?bdsqr and ?stegr.
?lasq6	s, d	Computes one *dqd* transform in ping-pong form. Used by ?bdsqr and ?stegr.

Routine Name	Data Types	Description
?lasr	s, d, c, z	Applies a sequence of plane rotations to a general rectangular matrix.
?lasrt	s, d	Sorts numbers in increasing or decreasing order.
?lassq	s, d, c, z	Updates a sum of squares represented in scaled form.
?lasv2	s, d	Computes the singular value decomposition of a 2-by-2 triangular matrix.
?laswp	s, d, c, z	Performs a series of row interchanges on a general rectangular matrix.
?lasy2	s, d	Solves the Sylvester matrix equation where the matrices are of order 1 or 2.
?lasyf	s, d, c, z	Computes a partial factorization of a real/complex symmetric matrix, using the diagonal pivoting method.
?lahef	c, z	Computes a partial factorization of a complex Hermitian indefinite matrix, using the diagonal pivoting method.
?latbs	s, d, c, z	Solves a triangular banded system of equations.
?latdf	s, d, c, z	Uses the LU factorization of the n-by-n matrix computed by ?getc2 and computes a contribution to the reciprocal Dif-estimate.
?latps	s, d, c, z	Solves a triangular system of equations with the matrix held in packed storage.
?latrd	s, d, c, z	Reduces the first *nb* rows and columns of a symmetric/Hermitian matrix *A* to real tridiagonal form by an orthogonal/unitary similarity transformation.
?latrs	s, d, c, z	Solves a triangular system of equations with the scale factor set to prevent overflow.
?latrz	s, d, c, z	Factors an upper trapezoidal matrix by means of orthogonal/unitary transformations.

Routine Name	Data Types	Description
?lauu2	s, d, c, z	Computes the product UU^H or L^HL, where U and L are upper or lower triangular matrices (unblocked algorithm).
?lauum	s, d, c, z	Computes the product UU^H or L^HL, where U and L are upper or lower triangular matrices (blocked algorithm).
?lazq3	s, d,	Checks for deflation, computes a shift and calls *dqds*
?lazq4	s, d,	Computes an approximation to the smallest eigenvalue using values of d from the previous transform.
?org2l/?ung2l	s, d/c, z	Generates all or part of the orthogonal/unitary matrix Q from a QL factorization determined by ?geqlf (unblocked algorithm).
?org2r/?ung2r	s, d/c, z	Generates all or part of the orthogonal/unitary matrix Q from a QR factorization determined by ?geqrf (unblocked algorithm).
?orgl2/?ungl2	s, d/c, z	Generates all or part of the orthogonal/unitary matrix Q from an LQ factorization determined by ?gelqf (unblocked algorithm).
?orgr2/?ungr2	s, d/c, z	Generates all or part of the orthogonal/unitary matrix Q from an RQ factorization determined by ?gerqf (unblocked algorithm).
?orm2l/?unm2l	s, d/c, z	Multiplies a general matrix by the orthogonal/unitary matrix from a QL factorization determined by ?geqlf (unblocked algorithm).
?orm2r/?unm2r	s, d/c, z	Multiplies a general matrix by the orthogonal/unitary matrix from a QR factorization determined by ?geqrf (unblocked algorithm).
?orml2/?unml2	s, d/c, z	Multiplies a general matrix by the orthogonal/unitary matrix from a LQ factorization determined by ?gelqf (unblocked algorithm).

Routine Name	Data Types	Description
?ormr2/?unmr2	s, d/c, z	Multiplies a general matrix by the orthogonal/unitary matrix from a RQ factorization determined by ?gerqf (unblocked algorithm).
?ormr3/?unmr3	s, d/c, z	Multiplies a general matrix by the orthogonal/unitary matrix from a RZ factorization determined by ?tzrzf (unblocked algorithm).
?pbtf2	s, d, c, z	Computes the Cholesky factorization of a symmetric/ Hermitian positive definite band matrix (unblocked algorithm).
?potf2	s, d, c, z	Computes the Cholesky factorization of a symmetric/Hermitian positive definite matrix (unblocked algorithm).
?ptts2	s, d, c, z	Solves a tridiagonal system of the form $AX=B$ using the $L D L^H$ factorization computed by ?pttrf.
?rscl	s, d, cs, zd	Multiplies a vector by the reciprocal of a real scalar.
?sygs2/?hegs2	s, d/c, z	Reduces a symmetric/Hermitian definite generalized eigenproblem to standard form, using the factorization results obtained from ?potrf (unblocked algorithm).
?sytd2/?hetd2	s, d/c, z	Reduces a symmetric/Hermitian matrix to real symmetric tridiagonal form by an orthogonal/unitary similarity transformation (unblocked algorithm).
?sytf2	s, d, c, z	Computes the factorization of a real/complex symmetric indefinite matrix, using the diagonal pivoting method (unblocked algorithm).
?hetf2	c, z	Computes the factorization of a complex Hermitian matrix, using the diagonal pivoting method (unblocked algorithm).
?tgex2	s, d, c, z	Swaps adjacent diagonal blocks in an upper (quasi) triangular matrix pair by an orthogonal/unitary equivalence transformation.

Routine Name	Data Types	Description
?tgsy2	s, d, c, z	Solves the generalized Sylvester equation (unblocked algorithm).
?trti2	s, d, c, z	Computes the inverse of a triangular matrix (unblocked algorithm).
clag2z	c → z	Converts a complex single precision matrix to a complex double precision matrix.
dlag2s	d → s	Converts a double precision matrix to a single precision matrix.
slag2d	s → d	Converts a single precision matrix to a double precision matrix.
zlag2c	z → c	Converts a complex double precision matrix to a complex single precision matrix.

?lacgv

Conjugates a complex vector.

Syntax

```
call clacgv( n, x, incx )
call zlacgv( n, x, incx )
```

Description

This routine conjugates a complex vector *x* of length *n* and increment *incx* (see "Vector Arguments in BLAS" in Appendix B).

Input Parameters

n — INTEGER. The length of the vector *x* (*n* ≥ 0).

x — COMPLEX for clacgv
COMPLEX*16 for zlacgv.
Array, dimension (1+(*n*-1)* |*incx*|).
Contains the vector of length *n* to be conjugated.

incx INTEGER. The spacing between successive elements of *x*.

Output Parameters

x On exit, overwritten with conjg(*x*).

?lacrm

Multiplies a complex matrix by a square real matrix.

Syntax

```
call clacrm( m, n, a, lda, b, ldb, c, ldc, rwork )
call zlacrm( m, n, a, lda, b, ldb, c, ldc, rwork )
```

Description

This routine performs a simple matrix-matrix multiplication of the form

*C = A*B*,

where *A* is *m*-by-*n* and complex, *B* is *n*-by-*n* and real, *C* is *m*-by-*n* and complex.

Input Parameters

m INTEGER. The number of rows of the matrix *A* and of the matrix *C* (*m* ≥ 0).

n INTEGER. The number of columns and rows of the matrix *B* and the number of columns of the matrix *C* (*n* ≥ 0).

a COMPLEX for clacrm
COMPLEX*16 for zlacrm
Array, DIMENSION (*lda*, *n*). Contains the *m*-by-*n* matrix *A*.

lda INTEGER. The leading dimension of the array *a*, *lda* ≥ max(1, *m*).

b REAL for clacrm
DOUBLE PRECISION for zlacrm

	Array, DIMENSION (*ldb*, *n*). Contains the *n*-by-*n* matrix *B*.
ldb	INTEGER. The leading dimension of the array *b*, *ldb* ≥ max(1, *n*).
ldc	INTEGER. The leading dimension of the output array *c*, *ldc* ≥ max(1, *n*).
rwork	REAL for clacrm DOUBLE PRECISION for zlacrm Workspace array, DIMENSION (2**m***n*).

Output Parameters

c	COMPLEX for clacrm COMPLEX*16 for zlacrm Array, DIMENSION (*ldc*, *n*). Contains the *m*-by-*n* matrix *C*.

?lacrt

Performs a linear transformation of a pair of complex vectors.

Syntax

```
call clacrt( n, cx, incx, cy, incy, c, s )
call zlacrt( n, cx, incx, cy, incy, c, s )
```

Description

This routine performs the following transformation

$$\begin{pmatrix} c & s \\ -s & c \end{pmatrix} \begin{pmatrix} x \\ y \end{pmatrix} \Rightarrow \begin{pmatrix} x \\ y \end{pmatrix},$$

where *c*, *s* are complex scalars and *x*, *y* are complex vectors.

Input Parameters

n	INTEGER. The number of elements in the vectors *cx* and *cy* ($n \geq 0$).
cx, *cy*	COMPLEX for clacrt COMPLEX*16 for zlacrt Arrays, dimension (n). Contain input vectors x and y, respectively.
incx	INTEGER. The increment between successive elements of *cx*.
incy	INTEGER. The increment between successive elements of *cy*.
c, *s*	COMPLEX for clacrt COMPLEX*16 for zlacrt Complex scalars that define the transform matrix

$$\begin{bmatrix} c & s \\ -s & c \end{bmatrix}$$

Output Parameters

cx	On exit, overwritten with $c*x + s*y$.
cy	On exit, overwritten with $-s*x + c*y$.

?laesy

Computes the eigenvalues and eigenvectors of a 2-by-2 complex symmetric matrix, and checks that the norm of the matrix of eigenvectors is larger than a threshold value.

Syntax

```
call claesy( a, b, c, rt1, rt2, evscal, cs1, sn1 )
call zlaesy( a, b, c, rt1, rt2, evscal, cs1, sn1 )
```

Description

This routine performs the eigendecomposition of a 2-by-2 symmetric matrix

$$\begin{bmatrix} a & b \\ b & c \end{bmatrix},$$

provided the norm of the matrix of eigenvectors is larger than some threshold value.

rt1 is the eigenvalue of larger absolute value, and *rt2* of smaller absolute value. If the eigenvectors are computed, then on return (*cs1*, *sn1*) is the unit eigenvector for *rt1*, hence

$$\begin{bmatrix} cs1 & sn1 \\ -sn1 & cs1 \end{bmatrix} \cdot \begin{bmatrix} a & b \\ b & c \end{bmatrix} \cdot \begin{bmatrix} cs1 & -sn1 \\ sn1 & cs1 \end{bmatrix} = \begin{bmatrix} rt1 & 0 \\ 0 & rt2 \end{bmatrix}$$

Input Parameters

a, *b*, *c*
: `COMPLEX` for `claesy`
`COMPLEX*16` for `zlaesy`
Elements of the input matrix.

Output Parameters

rt1, *rt2*
: `COMPLEX` for `claesy`
`COMPLEX*16` for `zlaesy`
Eigenvalues of larger and smaller modulus, respectively.

evscal
: `COMPLEX` for `claesy`
`COMPLEX*16` for `zlaesy`
The complex value by which the eigenvector matrix was scaled to make it orthonormal. If *evscal* is zero, the eigenvectors were not computed. This means one of two things: the 2-by-2 matrix could not be diagonalized, or the norm of the matrix of eigenvectors before scaling was larger than the threshold value `thresh` (set to 0.1E0).

cs1, *sn1*	COMPLEX for claesy COMPLEX*16 for zlaesy If *evscal* is not zero, then (*cs1*, *sn1*) is the unit right eigenvector for rt1.

?rot

Applies a plane rotation with real cosine and complex sine to a pair of complex vectors.

Syntax

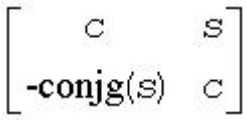
```
call crot( n, cx, incx, cy, incy, c, s )
call zrot( n, cx, incx, cy, incy, c, s )
```

Description

This routine applies a plane rotation, where the cosine (*c*) is real and the sine (*s*) is complex, and the vectors *cx* and *cy* are complex. This routine has its real equivalents in BLAS (see ?rot in Chapter 2).

Input Parameters

n	INTEGER. The number of elements in the vectors *cx* and *cy*.
cx, *cy*	COMPLEX for crot COMPLEX*16 for zrot Arrays of dimension (*n*), contain input vectors *x* and *y*, respectively.
incx	INTEGER. The increment between successive elements of *cx*.
incy	INTEGER. The increment between successive elements of *cy*.
c	REAL for crot DOUBLE PRECISION for zrot
s	COMPLEX for crot COMPLEX*16 for zrot Values that define a rotation



where `c*c + s*conjg(s) = 1.0`.

Output Parameters

cx	On exit, overwritten with `c*x + s*y`.
cy	On exit, overwritten with `-conjg(s)*x + c*y`.

?spmv

Computes a matrix-vector product for complex vectors using a complex symmetric packed matrix.

Syntax

```
call cspmv( uplo, n, alpha, ap, x, incx, beta, y, incy )
call zspmv( uplo, n, alpha, ap, x, incx, beta, y, incy )
```

Description

These routines perform a matrix-vector operation defined as

`y := alpha*a*x + beta*y`,

where:

alpha and *beta* are complex scalars,

x and *y* are *n*-element complex vectors

a is an *n*-by-*n* complex symmetric matrix, supplied in packed form.

These routines have their real equivalents in BLAS (see ?spmv in Chapter 2).

Input Parameters

uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the matrix *a* is supplied in the packed array *ap*, as follows:

If *uplo* = 'U' or 'u', the upper triangular part of the matrix *a* is supplied in the array *ap*.
If *uplo* = 'L' or 'l', the lower triangular part of the matrix *a* is supplied in the array *ap* .

n — INTEGER.
Specifies the order of the matrix *a*.
The value of *n* must be at least zero.

alpha, *beta* — COMPLEX for cspmv
COMPLEX*16 for zspmv
Specify complex scalars *alpha* and *beta*. When *beta* is supplied as zero, then *y* need not be set on input.

ap — COMPLEX for cspmv
COMPLEX*16 for zspmv
Array, DIMENSION at least ((*n**(*n* + 1))/2). Before entry, with *uplo* = 'U' or 'u', the array *ap* must contain the upper triangular part of the symmetric matrix packed sequentially, column-by-column, so that *ap*(1) contains *A*(1, 1), *ap*(2) and *ap*(3) contain *A*(1, 2) and *A*(2, 2) respectively, and so on. Before entry, with *uplo* = 'L' or 'l', the array *ap* must contain the lower triangular part of the symmetric matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1, 1), *ap*(2) and *ap*(3) contain *a*(2, 1) and *a*(3, 1) respectively, and so on.

x — COMPLEX for cspmv
COMPLEX*16 for zspmv
Array, DIMENSION at least (1 + (*n* - 1)*abs(*incx*)). Before entry, the incremented array x must contain the *n*-element vector *x*.

incx — INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.

y — COMPLEX for cspmv
COMPLEX*16 for zspmv
Array, DIMENSION at least (1 + (*n* - 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the *n*-element vector *y*.

incy	INTEGER. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.

Output Parameters

y	Overwritten by the updated vector *y*.

?spr

Performs the symmetrical rank-1 update of a complex symmetric packed matrix.

Syntax

```
call cspr( uplo, n, alpha, x, incx, ap )
call zspr( uplo, n, alpha, x, incx, ap )
```

Description

The ?spr routines perform a matrix-vector operation defined as

a:= *alpha***x**conjg(*x*') + *a*,

where:

alpha is a complex scalar

x is an *n*-element complex vector

a is an *n*-by-*n* complex symmetric matrix, supplied in packed form.

These routines have their real equivalents in BLAS (see ?spr in Chapter 2).

Input Parameters

uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the matrix *a* is supplied in the packed array *ap*, as follows: If *uplo* = 'U' or 'u', the upper triangular part of the matrix *a* is supplied in the array *ap*. If *uplo* = 'L' or 'l', the lower triangular part of the matrix *a* is supplied in the array *ap* .
n	INTEGER.

Specifies the order of the matrix *a*.
The value of *n* must be at least zero.

alpha
COMPLEX for cspr
COMPLEX*16 for zspr
Specifies the scalar *alpha*.

x
COMPLEX for cspr
COMPLEX*16 for zspr
Array, DIMENSION at least (1 + (*n* - 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.

incx
INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.

ap
COMPLEX for cspr
COMPLEX*16 for zspr
Array, DIMENSION at least ((*n**(*n* + 1))/2). Before entry, with *uplo* = 'U' or 'u', the array *ap* must contain the upper triangular part of the symmetric matrix packed sequentially, column-by-column, so that *ap*(1) contains A(1,1), *ap*(2) and *ap*(3) contain A(1, 2) and A(2,2) respectively, and so on.
Before entry, with *uplo* = 'L' or 'l', the array *ap* must contain the lower triangular part of the symmetric matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1,1), *ap*(2) and *ap*(3) contain *a*(2,1) and *a*(3,1) respectively, and so on.
Note that the imaginary parts of the diagonal elements need not be set, they are assumed to be zero, and on exit they are set to zero.

Output Parameters

ap
With *uplo* = 'U' or 'u', overwritten by the upper triangular part of the updated matrix.
With *uplo* = 'L' or 'l', overwritten by the lower triangular part of the updated matrix.

?symv

Computes a matrix-vector product for a complex symmetric matrix.

Syntax

```
call csymv( uplo, n, alpha, a, lda, x, incx, beta, y, incy )
call zsymv( uplo, n, alpha, a, lda, x, incx, beta, y, incy )
```

Description

These routines perform the matrix-vector operation defined as

y := *alpha***a***x* + *beta***y*,

where:

alpha and *beta* are complex scalars

x and *y* are *n*-element complex vectors

a is an *n*-by-*n* symmetric complex matrix.

These routines have their real equivalents in BLAS (see ?symv in Chapter 2).

Input Parameters

uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the array *a* is to be referenced, as follows: If *uplo* = 'U' or 'u', the upper triangular part of the array *a* is to be referenced. If *uplo* = 'L' or 'l', the lower triangular part of the array *a* is to be referenced.
n	INTEGER. Specifies the order of the matrix *a*. The value of *n* must be at least zero.
alpha, *beta*	COMPLEX for csymv COMPLEX*16 for zsymv Specify the scalars *alpha* and *beta*. When *beta* is supplied as zero, then *y* need not be set on input.
a	COMPLEX for csymv COMPLEX*16 for zsymv

Array, DIMENSION (*lda*, *n*). Before entry with *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of *a* is not referenced. Before entry with *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of *a* is not referenced.

lda — INTEGER. Specifies the first dimension of *A* as declared in the calling (sub)program. The value of *lda* must be at least max(1,*n*).

x — COMPLEX for csymv
COMPLEX*16 for zsymv
Array, DIMENSION at least (1 + (*n* – 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.

incx — INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.

y — COMPLEX for csymv
COMPLEX*16 for zsymv
Array, DIMENSION at least (1 + (*n* – 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the *n*-element vector *y*.

incy — INTEGER. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.

Output Parameters

y — Overwritten by the updated vector *y*.

?syr

Performs the symmetric rank-1 update of a complex symmetric matrix.

Syntax

```
call csyr( uplo, n, alpha, x, incx, a, lda )
call zsyr( uplo, n, alpha, x, incx, a, lda )
```

Description

These routines perform the symmetric rank 1 operation defined as

`a := alpha*x*x' + a`,

where:

alpha is a complex scalar

x is an *n*-element complex vector

a is an *n*-by-*n* complex symmetric matrix.

These routines have their real equivalents in BLAS (see ?syr in Chapter 2).

Input Parameters

uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the array *a* is to be referenced, as follows: If *uplo* = 'U' or 'u', the upper triangular part of the array *a* is to be referenced. If *uplo* = 'L' or 'l', the lower triangular part of the array *a* is to be referenced.
n	INTEGER. Specifies the order of the matrix *a*. The value of *n* must be at least zero.
alpha	COMPLEX for csyr COMPLEX*16 for zsyr Specifies the scalar *alpha*.
x	COMPLEX for csyr COMPLEX*16 for zsyr Array, DIMENSION at least (1 + (*n* - 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector x.

incx INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.

a COMPLEX for csyr
COMPLEX*16 for zsyr
Array, DIMENSION (*lda*, *n*). Before entry with *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of *a* is not referenced.
Before entry with *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of *a* is not referenced.

lda INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least max(1,*n*).

Output Parameters

a With *uplo* = 'U' or 'u', the upper triangular part of the array *a* is overwritten by the upper triangular part of the updated matrix.
With *uplo* = 'L' or 'l', the lower triangular part of the array *a* is overwritten by the lower triangular part of the updated matrix.

i?max1

Finds the index of the vector element whose real part has maximum absolute value.

Syntax

```
index = icmax1( n, cx, incx )
index = izmax1( n, cx, incx )
```

Description

Given a complex vector *cx*, the i?max1 functions return the index of the vector element whose real part has maximum absolute value. These functions are based on the BLAS functions icamax/izamax, but using the absolute value of the real part. They are designed for use with clacon/zlacon.

Input Parameters

n	INTEGER. Specifies the number of elements in the vector *cx*.
cx	COMPLEX for icmax1 COMPLEX*16 for izmax1 Array, DIMENSION at least (1+(*n*-1)*abs(*incx*)). Contains the input vector.
incx	INTEGER. Specifies the spacing between successive elements of *cx*.

Output Parameters

index	INTEGER. Contains the index of the vector element whose real part has maximum absolute value.

?sum1

Forms the 1-norm of the complex vector using the true absolute value.

Syntax

```
res = scsum1( n, cx, incx )
res = dzsum1( n, cx, incx )
```

Description

Given a complex vector *cx*, scsum1/dzsum1 functions take the sum of the absolute values of vector elements and return a single/DOUBLE PRECISION result, respectively. These functions are based on scasum/dzasum from Level 1 BLAS, but use the true absolute value and were designed for use with clacon/zlacon.

Input Parameters

n	INTEGER. Specifies the number of elements in the vector *cx*.
cx	COMPLEX for scsum1 COMPLEX*16 for dzsum1 Array, DIMENSION at least (1+(*n*-1)*abs(*incx*)). Contains the input vector whose elements will be summed.
incx	INTEGER. Specifies the spacing between successive elements of *cx* (*incx* > 0).

Output Parameters

res	REAL for scsum1 DOUBLE PRECISION for dzsum1 Contains the sum of absolute values.

?gbtf2

Computes the LU factorization of a general band matrix using the unblocked version of the algorithm.

Syntax

```
call sgbtf2( m, n, kl, ku, ab, ldab, ipiv, info )
call dgbtf2( m, n, kl, ku, ab, ldab, ipiv, info )
call cgbtf2( m, n, kl, ku, ab, ldab, ipiv, info )
call zgbtf2( m, n, kl, ku, ab, ldab, ipiv, info )
```

Description

The routine forms the *LU* factorization of a general real/complex *m*-by-*n* band matrix *A* with *kl* sub-diagonals and *ku* super-diagonals. The routine uses partial pivoting with row interchanges and implements the unblocked version of the algorithm, calling Level 2 BLAS. See also ?gbtrf.

Input Parameters

m	INTEGER. The number of rows of the matrix *A* (*m* ≥ 0).

n	INTEGER. The number of columns in *A* (*n* ≥ 0).
kl	INTEGER. The number of sub-diagonals within the band of *A* (*kl* ≥ 0).
ku	INTEGER. The number of super-diagonals within the band of *A* (*ku* ≥ 0).
ab	REAL for sgbtf2 DOUBLE PRECISION for dgbtf2 COMPLEX for cgbtf2 COMPLEX*16 for zgbtf2. Array, DIMENSION (*ldab*,*). The array *ab* contains the matrix *A* in band storage (see Matrix Arguments). The second dimension of *ab* must be at least max(1, *n*).
ldab	INTEGER. The first dimension of the array *ab*. (*ldab* ≥ 2*kl* + *ku* +1)

Output Parameters

ab	Overwritten by details of the factorization. The diagonal and *kl* + *ku* super-diagonals of *U* are stored in the first 1 + *kl* + *ku* rows of *ab*. The multipliers used during the factorization are stored in the next *kl* rows.
ipiv	INTEGER. Array, DIMENSION at least max(1,min(*m*,*n*)). The pivot indices: row *i* was interchanged with row *ipiv*(*i*).
info	INTEGER. If *info* =0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, u_{ii} is 0. The factorization has been completed, but *U* is exactly singular. Division by 0 will occur if you use the factor *U* for solving a system of linear equations.

?gebd2

Reduces a general matrix to bidiagonal form using an unblocked algorithm.

Syntax

```
call sgebd2( m, n, a, lda, d, e, tauq, taup, work, info )
call dgebd2( m, n, a, lda, d, e, tauq, taup, work, info )
call cgebd2( m, n, a, lda, d, e, tauq, taup, work, info )
call zgebd2( m, n, a, lda, d, e, tauq, taup, work, info )
```

Description

The routine reduces a general m-by-n matrix A to upper or lower bidiagonal form B by an orthogonal (unitary) transformation: $Q'*A*P = B$

If $m \geq n$, B is upper bidiagonal; if $m < n$, B is lower bidiagonal.

The routine does not form the matrices Q and P explicitly, but represents them as products of elementary reflectors. if $m \geq n$,

$Q = H(1)H(2)...H(n)$ and $P = G(1)G(2)...G(n-1)$

if $m < n$,

$Q = H(1)H(2)...H(m-1)$ and $P = G(1)G(2)...G(m)$

Each H(i) and G(i) has the form

$H(i) = I - tauq*v*v'$ and $G(i) = I - taup*u*u'$

where *tauq* and *taup* are scalars (real for sgebd2/dgebd2, complex for cgebd2/zgebd2), and v and u are vectors (real for sgebd2/dgebd2, complex for cgebd2/zgebd2).

Input Parameters

m	INTEGER. The number of rows in the matrix A ($m \geq 0$).
n	INTEGER. The number of columns in A ($n \geq 0$).
a, *work*	REAL for sgebd2 DOUBLE PRECISION for dgebd2 COMPLEX for cgebd2

COMPLEX*16 for zgebd2.
Arrays:
a(*lda*,*) contains the *m*-by-*n* general matrix *A* to be reduced. The second dimension of *a* must be at least max(1, *n*).
work(*) is a workspace array, the dimension of *work* must be at least max(1, *m*, *n*).

lda — INTEGER. The first dimension of *a*; at least max(1, *m*).

Output Parameters

a — if *m* ≥ *n*, the diagonal and first super-diagonal of *a* are overwritten with the upper bidiagonal matrix *B*. Elements below the diagonal, with the array *tauq*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors, and elements above the first superdiagonal, with the array *taup*, represent the orthogonal/unitary matrix *p* as a product of elementary reflectors.
if *m* < *n*, the diagonal and first sub-diagonal of *a* are overwritten by the lower bidiagonal matrix *B*. Elements below the first subdiagonal, with the array *tauq*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors, and elements above the diagonal, with the array *taup*, represent the orthogonal/unitary matrix *p* as a product of elementary reflectors.

d — REAL for single-precision flavors
DOUBLE PRECISION for double-precision flavors.
Array, DIMENSION at least max(1, min(*m*, *n*)).
Contains the diagonal elements of the bidiagonal matrix *B*: *d*(i) = *a*(i, i).

e — REAL for single-precision flavors
DOUBLE PRECISION for double-precision flavors. Array, DIMENSION at least max(1, min(*m*, *n*) - 1).
Contains the off-diagonal elements of the bidiagonal matrix *B*:
if *m* ≥ *n*, *e*(i) = *a*(i, i+1) for i = 1,2,..., *n*-1;
if *m* < *n*, *e*(i) = *a*(i+1, i) for i = 1,2,..., *m*-1.

tauq, *taup*	REAL for sgebd2 DOUBLE PRECISION for dgebd2 COMPLEX for cgebd2 COMPLEX*16 for zgebd2. Arrays, DIMENSION at least max (1, min(*m*, *n*)). Contain scalar factors of the elementary reflectors which represent orthogonal/unitary matrices *Q* and *p*, respectively.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*th parameter had an illegal value.

?gehd2

Reduces a general square matrix to upper Hessenberg form using an unblocked algorithm.

Syntax

```
call sgehd2( n, ilo, ihi, a, lda, tau, work, info )
call dgehd2( n, ilo, ihi, a, lda, tau, work, info )
call cgehd2( n, ilo, ihi, a, lda, tau, work, info )
call zgehd2( n, ilo, ihi, a, lda, tau, work, info )
```

Description

The routine reduces a real/complex general matrix *A* to upper Hessenberg form *H* by an orthogonal or unitary similarity transformation *Q'*A*Q = H*.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of elementary reflectors.

Input Parameters

n	INTEGER The order of the matrix *A* (*n* ≥ 0).
ilo, *ihi*	INTEGER. It is assumed that *A* is already upper triangular in rows and columns 1:*ilo* -1 and *ihi*+1:*n*. If *A* has been output by ?gebal, then

	ilo and *ihi* must contain the values returned by that routine. Otherwise they should be set to *ilo* = 1 and *ihi* = *n*. Constraint: 1 ≤ *ilo* ≤ *ihi* ≤ max(1, *n*).
a, *work*	REAL for sgehd2 DOUBLE PRECISION for dgehd2 COMPLEX for cgehd2 COMPLEX*16 for zgehd2. Arrays: *a* (*lda*,*) contains the *n*-by-*n* matrix *A* to be reduced. The second dimension of *a* must be at least max(1, *n*). *work* (*n*) is a workspace array.
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).

Output Parameters

a	On exit, the upper triangle and the first subdiagonal of *A* are overwritten with the upper Hessenberg matrix *H* and the elements below the first subdiagonal, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors. See Application Notes below.
tau	REAL for sgehd2 DOUBLE PRECISION for dgehd2 COMPLEX for cgehd2 COMPLEX*16 for zgehd2. Array, DIMENSION at least max (1, *n*-1). Contains the scalar factors of elementary reflectors. See Application Notes below.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*th parameter had an illegal value.

Application Notes

The matrix *Q* is represented as a product of (*ihi* - *ilo*) elementary reflectors

Q = *H*(*ilo*) *H*(*ilo* +1) ... *H*(*ihi* -1)

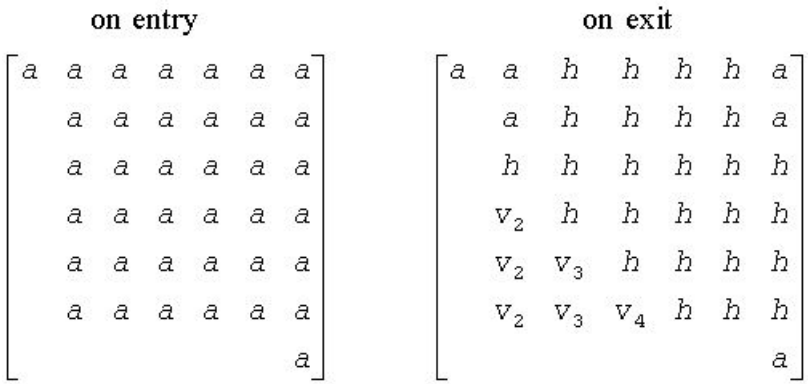
Each *H*(i) has the form

H(i) = *I* - *tau***v***v*'

where *tau* is a real/complex scalar, and *v* is a real/complex vector with *v*(1:i) = 0, *v*(i+1) = 1 and *v*(*ihi*+1:*n*) = 0.

On exit, *v*(i+2:*ihi*) is stored in *a*(i+2:*ihi*, i) and *tau* in *tau*(i).

The contents of *a* are illustrated by the following example, with *n* = 7, *ilo* = 2 and *ihi* = 6:



where *a* denotes an element of the original matrix *A*, *h* denotes a modified element of the upper Hessenberg matrix *H*, and v_i denotes an element of the vector defining *H*(i).

?gelq2

Computes the LQ factorization of a general rectangular matrix using an unblocked algorithm.

Syntax

```
call sgelq2( m, n, a, lda, tau, work, info )
call dgelq2( m, n, a, lda, tau, work, info )
call cgelq2( m, n, a, lda, tau, work, info )
call zgelq2( m, n, a, lda, tau, work, info )
```

Description

The routine computes an *LQ* factorization of a real/complex *m*-by-*n* matrix *A* as *A* = *L***Q*.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of min(*m*, *n*) elementary reflectors :

Q = *H*(k) ... *H*(2) *H*(1) (or *Q* = *H*(k)' ... *H*(2)' *H*(1)' for complex flavors), where *k* = min(*m*, *n*)

Each *H*(i) has the form

H(i) = *I* - *tau***v***v*'

where *tau* is a real/complex scalar stored in *tau*(i), and *v* is a real/complex vector with *v*(1:i-1) = 0 and *v*(i) = 1.

On exit, *v*(i+1:*n*) is stored in *a*(i, i+1:*n*).

Input Parameters

m	INTEGER. The number of rows in the matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns in *A* (*n* ≥ 0).
a, *work*	REAL for sgelq2 DOUBLE PRECISION for dgelq2 COMPLEX for cgelq2 COMPLEX*16 for zgelq2. Arrays: *a*(*lda*,*) contains the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *work*(*m*) is a workspace array.
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).

Output Parameters

a	Overwritten by the factorization data as follows: on exit, the elements on and below the diagonal of the array *a* contain the *m*-by-min(*n*,*m*) lower trapezoidal matrix *L* (*L* is lower triangular if *n* ≥ *m*); the elements above the diagonal, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of min(*n*,*m*) elementary reflectors.
tau	REAL for sgelq2 DOUBLE PRECISION for dgelq2 COMPLEX for cgelq2

COMPLEX*16 for zgelq2.
Array, DIMENSION at least max(1, min(*m*, *n*)).
Contains scalar factors of the elementary reflectors.

info INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*th parameter had an illegal value.

?geql2

Computes the QL factorization of a general rectangular matrix using an unblocked algorithm.

Syntax

```
call sgeql2( m, n, a, lda, tau, work, info )
call dgeql2( m, n, a, lda, tau, work, info )
call cgeql2( m, n, a, lda, tau, work, info )
call zgeql2( m, n, a, lda, tau, work, info )
```

Description

The routine computes a *QL* factorization of a real/complex *m*-by-*n* matrix *A* as *A* = *Q***L*.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of min(*m*, *n*) elementary reflectors :

Q = *H*(k) ... *H*(2) *H*(1), where *k* = min(*m*, *n*)

Each *H*(i) has the form

H(i) = *I* - *tau***v***v*'

where *tau* is a real/complex scalar stored in *tau*(i), and *v* is a real/complex vector with *v*(*m*-k+i+1:*m*) = 0 and *v*(*m*-k+i) = 1.

On exit, *v*(1:*m*-k+i-1) is stored in *a*(1:*m*-k+i-1, *n*-k+i).

Input Parameters

m INTEGER. The number of rows in the matrix *A* (*m* ≥ 0).

n INTEGER. The number of columns in *A* (*n* ≥ 0).

a, *work*	REAL for sgeql2 DOUBLE PRECISION for dgeql2 COMPLEX for cgeql2 COMPLEX*16 for zgeql2. Arrays: *a*(*lda*,*) contains the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *work*(*m*) is a workspace array.
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).

Output Parameters

a	Overwritten by the factorization data as follows: on exit, if $m \geq n$, the lower triangle of the subarray *a*(*m*-*n*+1:*m*, 1:*n*) contains the *n*-by-*n* lower triangular matrix *L*; if $m < n$, the elements on and below the (*n*-*m*)th superdiagonal contain the *m*-by-*n* lower trapezoidal matrix *L*; the remaining elements, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors.
tau	REAL for sgeql2 DOUBLE PRECISION for dgeql2 COMPLEX for cgeql2 COMPLEX*16 for zgeql2. Array, DIMENSION at least max(1, min(*m*, *n*)). Contains scalar factors of the elementary reflectors.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

?geqr2

Computes the QR factorization of a general rectangular matrix using an unblocked algorithm.

Syntax

```
call sgeqr2( m, n, a, lda, tau, work, info )
call dgeqr2( m, n, a, lda, tau, work, info )
call cgeqr2( m, n, a, lda, tau, work, info )
call zgeqr2( m, n, a, lda, tau, work, info )
```

Description

The routine computes a *QR* factorization of a real/complex *m*-by-*n* matrix *A* as *A = Q*R*.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of min(*m*, *n*) elementary reflectors :

Q = H(1)*H*(2) ... *H*(k), where *k = min*(*m*, *n*)

Each *H*(i) has the form

H(i) = *I* - *tau*v*v'*

where *tau* is a real/complex scalar stored in *tau*(i), and *v* is a real/complex vector with *v*(1:i-1) = 0 and *v*(i) = 1.

On exit, *v*(i+1:*m*) is stored in *a*(i+1:*m*, i).

Input Parameters

m	INTEGER. The number of rows in the matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns in *A* (*n* ≥ 0).
a, *work*	REAL for sgeqr2 DOUBLE PRECISION for dgeqr2 COMPLEX for cgeqr2 COMPLEX*16 for zgeqr2. Arrays: *a*(*lda*,*) contains the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*).

	work(*n*) is a workspace array.
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).

Output Parameters

a	Overwritten by the factorization data as follows: on exit, the elements on and above the diagonal of the array *a* contain the min(*n*,*m*)-by-*n* upper trapezoidal matrix *R* (*R* is upper triangular if *m* ≥ *n*); the elements below the diagonal, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors.
tau	REAL for sgeqr2 DOUBLE PRECISION for dgeqr2 COMPLEX for cgeqr2 COMPLEX*16 for zgeqr2. Array, DIMENSION at least max(1, min(*m*, *n*)). Contains scalar factors of the elementary reflectors.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

?gerq2

Computes the RQ factorization of a general rectangular matrix using an unblocked algorithm.

Syntax

```
call sgerq2( m, n, a, lda, tau, work, info )
call dgerq2( m, n, a, lda, tau, work, info )
call cgerq2( m, n, a, lda, tau, work, info )
call zgerq2( m, n, a, lda, tau, work, info )
```

Description

The routine computes a *RQ* factorization of a real/complex *m*-by-*n* matrix *A* as *A* = *R***Q*.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of min(*m*, *n*) elementary reflectors :

Q = *H*(1)*H*(2) ... *H*(k), where *k* = min(*m*, *n*)

Each *H*(i) has the form

H(i) = *I* - *tau***v***v*'

where *tau* is a real/complex scalar stored in *tau*(i), and *v* is a real/complex vector with *v*(*n*-k+i+1:*n*) = 0 and *v*(*n*-k+i) = 1.

On exit, *v*(1:*n*-k+i-1) is stored in *a*(*m*-k+i, 1:*n*-k+i-1).

Input Parameters

m	INTEGER. The number of rows in the matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns in *A* (*n* ≥ 0).
a, *work*	REAL for sgerq2 DOUBLE PRECISION for dgerq2 COMPLEX for cgerq2 COMPLEX*16 for zgerq2. Arrays: *a*(*lda*,*) contains the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *work*(*m*) is a workspace array.
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).

Output Parameters

a	Overwritten by the factorization data as follows: on exit, if *m* ≤ *n*, the upper triangle of the subarray *a*(1:*m*, *n*-*m*+1:*n*) contains the *m*-by-*m* upper triangular matrix *R*; if *m* > *n*, the elements on and above the (*m*-*n*)-th subdiagonal contain the *m*-by-*n* upper trapezoidal matrix *R*; the remaining elements, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors.
tau	REAL for sgerq2 DOUBLE PRECISION for dgerq2

	COMPLEX for cgerq2 COMPLEX*16 for zgerq2. Array, DIMENSION at least max(1, min(*m*, *n*)). Contains scalar factors of the elementary reflectors.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

?gesc2

Solves a system of linear equations using the LU factorization with complete pivoting computed by ?getc2*.*

Syntax

```
call sgesc2( n, a, lda, rhs, ipiv, jpiv, scale )
call dgesc2( n, a, lda, rhs, ipiv, jpiv, scale )
call cgesc2( n, a, lda, rhs, ipiv, jpiv, scale )
call zgesc2( n, a, lda, rhs, ipiv, jpiv, scale )
```

Description

This routine solves a system of linear equations

*A*X = scale*RHS*

with a general *n*-by-*n* matrix *A* using the *LU* factorization with complete pivoting computed by ?getc2.

Input Parameters

n	INTEGER. The order of the matrix *A*.
a, *rhs*	REAL for sgesc2 DOUBLE PRECISION for dgesc2 COMPLEX for cgesc2 COMPLEX*16 for zgesc2. Arrays: *a*(*lda*,*) contains the *LU* part of the factorization of the *n*-by-*n* matrix *A* computed by ?getc2:

	*A = P*L*U*Q*. The second dimension of *a* must be at least max(1, *n*); *rhs*(*n*) contains on entry the right hand side vector for the system of equations.
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
ipiv	INTEGER. Array, DIMENSION at least max(1,*n*). The pivot indices: for 1 ≤ i ≤ *n*, row i of the matrix has been interchanged with row *ipiv*(i).
jpiv	INTEGER. Array, DIMENSION at least max(1,*n*). The pivot indices: for 1 ≤ j ≤ *n*, column j of the matrix has been interchanged with column *jpiv*(j).

Output Parameters

rhs	On exit, overwritten with the solution vector *X*.
scale	REAL for sgesc2/cgesc2 DOUBLE PRECISION for dgesc2/zgesc2 Contains the scale factor. *scale* is chosen in the range 0 ≤ *scale* ≤ 1 to prevent overflow in the solution.

?getc2

Computes the LU factorization with complete pivoting of the general n-by-n matrix.

Syntax

```
call sgetc2( n, a, lda, ipiv, jpiv, info )
call dgetc2( n, a, lda, ipiv, jpiv, info )
call cgetc2( n, a, lda, ipiv, jpiv, info )
call zgetc2( n, a, lda, ipiv, jpiv, info )
```

Description

This routine computes an *LU* factorization with complete pivoting of the *n*-by-*n* matrix *A*. The factorization has the form *A = P*L*U*Q*, where *p* and *Q* are permutation matrices, *L* is lower triangular with unit diagonal elements and *U* is upper triangular.

The LU factorization computed by this routine is used by ?latdf to compute a contribution to the reciprocal Dif-estimate.

Input Parameters

n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
a	REAL for sgetc2 DOUBLE PRECISION for dgetc2 COMPLEX for cgetc2 COMPLEX*16 for zgetc2. Array *a*(*lda*,*) contains the *n*-by-*n* matrix *A* to be factored. The second dimension of *a* must be at least max(1, *n*);
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).

Output Parameters

a	On exit, the factors *L* and *U* from the factorization *A = P*L*U*Q*; the unit diagonal elements of *L* are not stored. If *U*(*k*, *k*) appears to be less than smin, *U*(*k*, *k*) is given the value of smin, i.e., giving a nonsingular perturbed system.
ipiv	INTEGER. Array, DIMENSION at least max(1,*n*). The pivot indices: for 1 ≤ i ≤ *n*, row i of the matrix has been interchanged with row *ipiv*(i).
jpiv	INTEGER. Array, DIMENSION at least max(1,*n*). The pivot indices: for 1 ≤ j ≤ *n*, column j of the matrix has been interchanged with column *jpiv*(j).
info	INTEGER. If *info* = 0, the execution is successful.

If *info* = *k* >0, *U*(*k*, *k*) is likely to produce overflow if we try to solve for *x* in *A***x* = *b*. So *U* is perturbed to avoid the overflow.

?getf2

Computes the LU factorization of a general m-by-n matrix using partial pivoting with row interchanges (unblocked algorithm).

Syntax

```
call sgetf2( m, n, a, lda, ipiv, info )
call dgetf2( m, n, a, lda, ipiv, info )
call cgetf2( m, n, a, lda, ipiv, info )
call zgetf2( m, n, a, lda, ipiv, info )
```

Description

The routine computes the *LU* factorization of a general *m*-by-*n* matrix *A* using partial pivoting with row interchanges. The factorization has the form

A = *P***L***U*

where *p* is a permutation matrix, *L* is lower triangular with unit diagonal elements (lower trapezoidal if *m* > *n*) and *U* is upper triangular (upper trapezoidal if *m* < *n*).

Input Parameters

m	INTEGER. The number of rows in the matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns in *A* (*n* ≥ 0).
a	REAL for sgetf2 DOUBLE PRECISION for dgetf2 COMPLEX for cgetf2 COMPLEX*16 for zgetf2. Array, DIMENSION (*lda*,*). Contains the matrix *A* to be factored. The second dimension of *a* must be at least max(1, *n*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).

Output Parameters

a	Overwritten by *L* and *U*. The unit diagonal elements of *L* are not stored.
ipiv	INTEGER. Array, DIMENSION at least max(1,min(*m*,*n*)). The pivot indices: for $1 \le i \le n$, row *i* was interchanged with row *ipiv*(*i*).
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i* >0, u_{ii} is 0. The factorization has been completed, but *U* is exactly singular. Division by 0 will occur if you use the factor *U* for solving a system of linear equations.

?gtts2

Solves a system of linear equations with a tridiagonal matrix using the LU factorization computed by ?gttrf.

Syntax

```
call sgtts2( itrans, n, nrhs, dl, d, du, du2, ipiv, b, ldb )
call dgtts2( itrans, n, nrhs, dl, d, du, du2, ipiv, b, ldb )
call cgtts2( itrans, n, nrhs, dl, d, du, du2, ipiv, b, ldb )
call zgtts2( itrans, n, nrhs, dl, d, du, du2, ipiv, b, ldb )
```

Description

This routine solves for *X* one of the following systems of linear equations with multiple right hand sides:

*A*X = B*, A^T**X = B*, or A^H**X = B* (for complex matrices only), with a tridiagonal matrix A using the *LU* factorization computed by ?gttrf.

Input Parameters

itrans	INTEGER. Must be 0, 1, or 2.

	Indicates the form of the equations being solved: If *itrans* = 0, then *A*X* = *B* (no transpose). If *itrans* = 1, then $A^T*X = B$ (transpose). If *itrans* = 2, then $A^H*X = B$ (conjugate transpose).
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
nrhs	INTEGER. The number of right-hand sides, i.e., the number of columns in *B* (*nrhs* ≥ 0).
dl,*d*,*du*,*du2*,*b*	REAL for sgtts2 DOUBLE PRECISION for dgtts2 COMPLEX for cgtts2 COMPLEX*16 for zgtts2. Arrays: *dl*(*n* - 1), *d*(*n*), *du*(*n* - 1), *du2*(*n* - 2), *b*(*ldb*,*nrhs*). The array *dl* contains the (*n* - 1) multipliers that define the matrix *L* from the *LU* factorization of *A*. The array *d* contains the *n* diagonal elements of the upper triangular matrix *U* from the *LU* factorization of *A*. The array *du* contains the (*n* - 1) elements of the first super-diagonal of *U*. The array *du2* contains the (*n* - 2) elements of the second super-diagonal of *U*. The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations.
ldb	INTEGER. The leading dimension of *b*; must be *ldb* ≥ max(1, *n*).
ipiv	INTEGER. Array, DIMENSION (*n*). The pivot indices array, as returned by ?gttrf.

Output Parameters

b	Overwritten by the solution matrix *X*.

?isnan

Tests input for NaN.

Syntax

```
val = sisnan( sin )
val = disnan( din )
```

Description

This logical routine returns `.TRUE.` if its argument is `NaN`, and `.FALSE.` otherwise.

Input Parameters

sin	`REAL` for `sisnan` Input to test for `NaN`.
din	`DOUBLE PRECISION` for `disnan` Input to test for `NaN`.

Output Parameters

val	`Logical`. Result of the test.

?laisnan

Tests input for NaN.

Syntax

```
val = slaisnan( sin1, sin2 )
val = dlaisnan( din1, din2 )
```

Description

This logical routine checks for `NaN`s (`NaN` stands for 'Not A Number') by comparing its two arguments for inequality. `NaN` is the only floating-point value where `NaN` ≠ `NaN` returns `.TRUE.` To check for `NaN`s, pass the same variable as both arguments.

This routine is not for general use. It exists solely to avoid over-optimization in `?isnan`.

Input Parameters

sin1, *sin2*	REAL for sisnan Two numbers to compare for inequality.
din2, *din2*	DOUBLE PRECISION for disnan Two numbers to compare for inequality.

Output Parameters

val	Logical. Result of the comparison.

?labrd

Reduces the first nb rows and columns of a general matrix to a bidiagonal form.

Syntax

```
call slabrd( m, n, nb, a, lda, d, e, tauq, taup, x, ldx, y, ldy )
call dlabrd( m, n, nb, a, lda, d, e, tauq, taup, x, ldx, y, ldy )
call clabrd( m, n, nb, a, lda, d, e, tauq, taup, x, ldx, y, ldy )
call zlabrd( m, n, nb, a, lda, d, e, tauq, taup, x, ldx, y, ldy )
```

Description

The routine reduces the first *nb* rows and columns of a general *m*-by-*n* matrix *A* to upper or lower bidiagonal form by an orthogonal/unitary transformation *Q*'**A***P*, and returns the matrices *X* and *Y* which are needed to apply the transformation to the unreduced part of *A*.

if *m* ≥ *n*, *A* is reduced to upper bidiagonal form; if *m* < *n*, to lower bidiagonal form.

The matrices *Q* and *P* are represented as products of elementary reflectors: *Q* = *H*(1) *H*(2) ... *H*(*nb*) and *P* = *G*(1) *G*(2) ... *G*(*nb*)

Each *H*(i) and *G*(i) has the form

H(i) = *I* - *tauq***v***v*' and *G*(i) = *I* - *taup***u***u*'

where *tauq* and *taup* are scalars, and *v* and *u* are vectors.

The elements of the vectors *v* and *u* together form the *m*-by-*nb* matrix *V* and the *nb*-by-*n* matrix *U'* which are needed, with *X* and *Y*, to apply the transformation to the unreduced part of the matrix, using a block update of the form: *A := A - V*Y' - X*U'*.

This is an auxiliary routine called by ?gebrd.

Input Parameters

m	INTEGER. The number of rows in the matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns in *A* (*n* ≥ 0).
nb	INTEGER. The number of leading rows and columns of *A* to be reduced.
a	REAL for slabrd DOUBLE PRECISION for dlabrd COMPLEX for clabrd COMPLEX*16 for zlabrd. Array *a*(*lda*,*) contains the matrix *A* to be reduced. The second dimension of *a* must be at least max(1, *n*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
ldx	INTEGER. The first dimension of the output array *x*; must beat least max(1, *m*).
ldy	INTEGER. The first dimension of the output array *y*; must beat least max(1, *n*).

Output Parameters

a	On exit, the first *nb* rows and columns of the matrix are overwritten; the rest of the array is unchanged. if *m* ≥ *n*, elements on and below the diagonal in the first *nb* columns, with the array *tauq*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors; and elements above the diagonal in the first *nb* rows, with the array *taup*, represent the orthogonal/unitary matrix *p* as a product of elementary reflectors. if *m* < *n*, elements below the diagonal in the first *nb* columns, with the array *tauq*, represent the orthogonal/unitary matrix *Q* as a product of elementary

reflectors, and elements on and above the diagonal in the first *nb* rows, with the array *taup*, represent the orthogonal/unitary matrix *p* as a product of elementary reflectors.

d, *e*
REAL for single-precision flavors
DOUBLE PRECISION for double-precision flavors. Arrays, DIMENSION (*nb*) each. The array *d* contains the diagonal elements of the first *nb* rows and columns of the reduced matrix:
d(i) = *a*(i,i).
The array *e* contains the off-diagonal elements of the first *nb* rows and columns of the reduced matrix.

tauq, *taup*
REAL for slabrd
DOUBLE PRECISION for dlabrd
COMPLEX for clabrd
COMPLEX*16 for zlabrd.
Arrays, DIMENSION (*nb*) each. Contain scalar factors of the elementary reflectors which represent the orthogonal/unitary matrices *Q* and *P*, respectively.

x, *y*
REAL for slabrd
DOUBLE PRECISION for dlabrd
COMPLEX for clabrd
COMPLEX*16 for zlabrd.
Arrays, dimension *x*(*ldx*, *nb*), *y*(*ldy*, *nb*).
The array *x* contains the *m*-by-*nb* matrix *X* required to update the unreduced part of *A*.
The array *y* contains the *n*-by-*nb* matrix *Y* required to update the unreduced part of *A*.

Application Notes

if *m* ≥ *n*, then for the elementary reflectors *H*(i) and *G*(i),

v(1:i-1) = 0, *v*(i) = 1, and *v*(i:*m*) is stored on exit in *a*(i:*m*, i); *u*(1:i) = 0, *u*(i+1) = 1, and *u*(i+1:*n*) is stored on exit in *a*(i, i+1:*n*);

tauq is stored in *tauq*(i) and *taup* in *taup*(i).

if *m* < *n*,

`v(1:i) = 0`, `v(i+1) = 1`, and `v(i+1:m)` is stored on exit in `a(i+2:m, i)`; `u(1:i-1) = 0`, `u(i) = 1`, and `u(i:n)` is stored on exit in `a(i, i+1:n)`; *tauq* is stored in *tauq*(i) and *taup* in *taup*(i).

The contents of *a* on exit are illustrated by the following examples with `nb = 2`:

$m = 6,\ n = 5\ (m > n)$

$$\begin{bmatrix} 1 & 1 & u_1 & u_1 & u_1 \\ v_1 & 1 & 1 & u_2 & u_2 \\ v_1 & v_2 & a & a & a \\ v_1 & v_2 & a & a & a \\ v_1 & v_2 & a & a & a \\ v_1 & v_2 & a & a & a \end{bmatrix}$$

$m = 5,\ n = 6\ (m < n)$

$$\begin{bmatrix} 1 & u_1 & u_1 & u_1 & u_1 & u_1 \\ 1 & 1 & u_2 & u_2 & u_2 & u_2 \\ v_1 & 1 & a & a & a & a \\ v_1 & v_2 & a & a & a & a \\ v_1 & v_2 & a & a & a & a \end{bmatrix}$$

where *a* denotes an element of the original matrix which is unchanged, v_i denotes an element of the vector defining *H*(i), and u_i an element of the vector defining *G*(i).

?lacn2

Estimates the 1-norm of a square matrix, using reverse communication for evaluating matrix-vector products.

Syntax

```
call slacn2( n, v, x, isgn, est, kase, isave )
call dlacn2( n, v, x, isgn, est, kase, isave )
call clacn2( n, v, x, est, kase, isave )
call zlacn2( n, v, x, est, kase, isave )
```

Description

This routine estimates the 1-norm of a square, real or complex matrix *A*. Reverse communication is used for evaluating matrix-vector products.

Input Parameters

n	INTEGER. The order of the matrix *A* ($n \geq 1$).
v, *x*	REAL for slacn2 DOUBLE PRECISION for dlacn2 COMPLEX for clacn2 COMPLEX*16 for zlacn2. Arrays, DIMENSION (*n*) each. *v* is a workspace array. *x* is used as input after an intermediate return.
isgn	INTEGER. Workspace array, DIMENSION (*n*), used with real flavors only.
est	REAL for slacn2/clacn2 DOUBLE PRECISION for dlacn2/zlacn2 On entry with *kase* set to 1 or 2, and *isave*(1) = 1, *est* must be unchanged from the previous call to the routine.
kase	INTEGER. On the initial call to the routine, *kase* must be set to 0.
isave	INTEGER. Array, DIMENSION (3). Contains variables from the previous call to the routine.

Output Parameters

est	An estimate (a lower bound) for norm(*A*).
kase	On an intermediate return, *kase* is set to 1 or 2, indicating whether *x* should be overwritten by *A***x* or *A*'**x*. On the final return, *kase* is set to 0.
v	On the final return, *v* = *A***w*, where *est* = norm(*v*)/norm(*w*) (*w* is not returned).
x	On an intermediate return, *x* should be overwritten by *A***x* , if *kase* = 1,

	*A'*x* , if *kase* = 2, (*A'* is the conjugate transpose of *A*), and the routine must be re-called with all the other parameters unchanged.
isave	This parameter is used to save variables between calls to the routine.

?lacon

Estimates the 1-norm of a square matrix, using reverse communication for evaluating matrix-vector products.

Syntax

```
call slacon( n, v, x, isgn, est, kase )
call dlacon( n, v, x, isgn, est, kase )
call clacon( n, v, x, est, kase )
call zlacon( n, v, x, est, kase )
```

Description

This routine estimates the 1-norm of a square, real/complex matrix *A*. Reverse communication is used for evaluating matrix-vector products.

Input Parameters

n	INTEGER. The order of the matrix *A* (*n* ≥ 1).
v, *x*	REAL for slacon DOUBLE PRECISION for dlacon COMPLEX for clacon COMPLEX*16 for zlacon. Arrays, DIMENSION (*n*) each. *v* is a workspace array. *x* is used as input after an intermediate return.
isgn	INTEGER. Workspace array, DIMENSION (*n*), used with real flavors only.
est	REAL for slacon/clacon

DOUBLE PRECISION for dlacon/zlacon
An estimate that with *kase*=1 or 2 should be unchanged from the previous call to ?lacon.

kase — INTEGER.
On the initial call to ?lacon, *kase* should be 0.

Output Parameters

est — REAL for slacon/clacon
DOUBLE PRECISION for dlacon/zlacon
An estimate (a lower bound) for norm(*A*).

kase — On an intermediate return, *kase* will be 1 or 2, indicating whether *x* should be overwritten by *A***x* or *A*'**x*. On the final return from ?lacon, *kase* will again be 0.

v — On the final return, *v* = *A***w*, where *est* = norm(*v*)/norm(*w*) (*w* is not returned).

x — On an intermediate return, *x* should be overwritten by *A***x* , if *kase* = 1,
A'**x* , if *kase* = 2,
(where for complex flavors *A*' is the conjugate transpose of *A*), and ?lacon must be re-called with all the other parameters unchanged.

?lacpy

Copies all or part of one two-dimensional array to another.

Syntax

```
call slacpy( uplo, m, n, a, lda, b, ldb )
call dlacpy( uplo, m, n, a, lda, b, ldb )
call clacpy( uplo, m, n, a, lda, b, ldb )
call zlacpy( uplo, m, n, a, lda, b, ldb )
```

Description

This routine copies all or part of a two-dimensional matrix *A* to another matrix *B*.

Input Parameters

uplo	CHARACTER*1. Specifies the part of the matrix *A* to be copied to *B*. If *uplo* = 'U', the upper triangular part of *A* is copied. If *uplo* = 'L', the lower triangular part of *A* is copied. Otherwise, all of the matrix *A* is copied.
m	INTEGER. The number of rows in the matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns in *A* (*n* ≥ 0).
a	REAL for slacpy DOUBLE PRECISION for dlacpy COMPLEX for clacpy COMPLEX*16 for zlacpy. Array *a*(*lda*,*), contains the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1,*n*). If *uplo* = 'U', only the upper triangle or trapezoid is accessed; if *uplo* = 'L', only the lower triangle or trapezoid is accessed.
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *m*).
ldb	INTEGER. The first dimension of the output array *b*; *ldb* ≥ max(1, *m*).

Output Parameters

b	REAL for slacpy DOUBLE PRECISION for dlacpy COMPLEX for clacpy COMPLEX*16 for zlacpy. Array *b*(*ldb*,*), contains the *m*-by-*n* matrix *B*. The second dimension of *b* must be at least max(1,*n*). On exit, *B* = *A* in the locations specified by *uplo*.

?ladiv

Performs complex division in real arithmetic, avoiding unnecessary overflow.

Syntax

```
call sladiv( a, b, c, d, p, q )
call dladiv( a, b, c, d, p, q )
res = cladiv( x, y )
res = zladiv( x, y )
```

Description

The routines sladiv/dladiv perform complex division in real arithmetic as

$$p + iq = \frac{a + ib}{c + id}$$

Complex functions cladiv/zladiv compute the result as

res = *x*/*y*,

where *x* and *y* are complex. The computation of *x* / *y* will not overflow on an intermediary step unless the results overflows.

Input Parameters

a, *b*, *c*, *d*	REAL for sladiv DOUBLE PRECISION for dladiv The scalars *a*, *b*, *c*, and *d* in the above expression (for real flavors only).
x, *y*	COMPLEX for cladiv COMPLEX*16 for zladiv The complex scalars *x* and *y* (for complex flavors only).

Output Parameters

p, *q*	REAL for sladiv

	DOUBLE PRECISION for dladiv The scalars *p* and *q* in the above expression (for real flavors only).
res	COMPLEX for cladiv DOUBLE COMPLEX for zladiv Contains the result of division *x* / *y*.

?lae2

Computes the eigenvalues of a 2-by-2 symmetric matrix.

Syntax

```
call slae2( a, b, c, rt1, rt2 )
call dlae2( a, b, c, rt1, rt2 )
```

Description

The routines sla2/dlae2 compute the eigenvalues of a 2-by-2 symmetric matrix

$$\begin{bmatrix} a & b \\ b & c \end{bmatrix}$$

On return, *rt1* is the eigenvalue of larger absolute value, and *rt1* is the eigenvalue of smaller absolute value.

Input Parameters

a, *b*, *c*	REAL for slae2 DOUBLE PRECISION for dlae2 The elements *a*, *b*, and *c* of the 2-by-2 matrix above.

Output Parameters

rt1, *rt2*	REAL for slae2 DOUBLE PRECISION for dlae2

The computed eigenvalues of larger and smaller absolute value, respectively.

Application Notes

rt1 is accurate to a few ulps barring over/underflow. *rt2* may be inaccurate if there is massive cancellation in the determinant *a***c*-*b***b*; higher precision or correctly rounded or correctly truncated arithmetic would be needed to compute *rt2* accurately in all cases.

Overflow is possible only if *rt1* is within a factor of 5 of overflow. Underflow is harmless if the input data is 0 or exceeds

underflow_threshold / macheps.

?laebz

Computes the number of eigenvalues of a real symmetric tridiagonal matrix which are less than or equal to a given value, and performs other tasks required by the routine ?stebz.

Syntax

call slaebz(*ijob*, *nitmax*, *n*, *mmax*, *minp*, *nbmin*, *abstol*, *reltol*, *pivmin*, *d*, *e*, *e2*, *nval*, *ab*, *c*, *mout*, *nab*, *work*, *iwork*, *info*)

call dlaebz(*ijob*, *nitmax*, *n*, *mmax*, *minp*, *nbmin*, *abstol*, *reltol*, *pivmin*, *d*, *e*, *e2*, *nval*, *ab*, *c*, *mout*, *nab*, *work*, *iwork*, *info*)

Description

The routine ?laebz contains the iteration loops which compute and use the function *n*(*w*), which is the count of eigenvalues of a symmetric tridiagonal matrix *T* less than or equal to its argument *w*. It performs a choice of two types of loops:

ijob =1, followed by

ijob =2: It takes as input a list of intervals and returns a list of sufficiently small intervals whose union contains the same eigenvalues as the union of the original intervals. The input intervals are (*ab*(j,1),*ab*(j,2)], j=1,...,*minp*. The output interval (*ab*(j,1),*ab*(j,2)] will contain eigenvalues *nab*(j,1)+1,...,*nab*(j,2), where 1 ≤ j ≤ *mout*.

ijob	=3: It performs a binary search in each input interval *(ab(j,1),ab(j,2)]* for a point *w(j)* such that *n(w(j))=nval(j)*, and uses *c(j)* as the starting point of the search. If such a *w(j)* is found, then on output *ab(j,1)=ab(j,2)=w*. If no such *w(j)* is found, then on output *(ab(j,1),ab(j,2)]* will be a small interval containing the point where *n(w)* jumps through *nval(j)*, unless that point lies outside the initial interval.

Note that the intervals are in all cases half-open intervals, that is, of the form *(a,b]*, which includes *b* but not *a* .

To avoid underflow, the matrix should be scaled so that its largest element is no greater than *overflow***(1/2) * *overflow***(1/4) in absolute value. To assure the most accurate computation of small eigenvalues, the matrix should be scaled to be not much smaller than that, either.

NOTE. In general, the arguments are not checked for unreasonable values.

Input Parameters

ijob	INTEGER. Specifies what is to be done: = 1: Compute *nab* for the initial intervals. = 2: Perform bisection iteration to find eigenvalues of *T*. = 3: Perform bisection iteration to invert *n(w)*, i.e., to find a point which has a specified number of eigenvalues of *T* to its left. Other values will cause *?laebz* to return with *info=-1*.
nitmax	INTEGER. The maximum number of "levels" of bisection to be performed, i.e., an interval of width *W* will not be made smaller than *2**(-nitmax)*W*. If not all intervals have converged after *nitmax* iterations, then *info* is set to the number of non-converged intervals.
n	INTEGER. The dimension *n* of the tridiagonal matrix *T*. It must be at least 1.
mmax	INTEGER. The maximum number of intervals. If more than *mmax* intervals are generated, then *?laebz* will quit with *info=mmax+1*.

minp — INTEGER. The initial number of intervals. It may not be greater than *mmax*.

nbmin — INTEGER. The smallest number of intervals that should be processed using a vector loop. If zero, then only the scalar loop will be used.

abstol — REAL for slaebz
DOUBLE PRECISION for dlaebz.
The minimum (absolute) width of an interval. When an interval is narrower than *abstol*, or than *reltol* times the larger (in magnitude) endpoint, then it is considered to be sufficiently small, i.e., converged. This must be at least zero.

reltol — REAL for slaebz
DOUBLE PRECISION for dlaebz.
The minimum relative width of an interval. When an interval is narrower than *abstol*, or than *reltol* times the larger (in magnitude) endpoint, then it is considered to be sufficiently small, i.e., converged. Note: this should always be at least *radix*machine epsilon*.

pivmin — REAL for slaebz
DOUBLE PRECISION for dlaebz.
The minimum absolute value of a "pivot" in the Sturm sequence loop. This value **must** be at least (max |e(j)**2|**safe_min*) and at least *safe_min*, where *safe_min* is at least the smallest number that can divide one without overflow.

d, *e*, *e2* — REAL for slaebz
DOUBLE PRECISION for dlaebz.
Arrays, dimension (*n*) each. The array *d* contains the diagonal elements of the tridiagonal matrix *T*.
The array *e* contains the off-diagonal elements of the tridiagonal matrix *T* in positions 1 through *n*-1. *e*(*n*)vis arbitrary.
The array *e2* contains the squares of the off-diagonal elements of the tridiagonal matrix *T*. *e2*(*n*) is ignored.

nval — INTEGER.
Array, dimension (*minp*).
If *ijob*=1 or 2, not referenced.

If *ijob*=3, the desired values of *n*(*w*).

ab — REAL for slaebz
DOUBLE PRECISION for dlaebz.
Array, dimension (*mmax*,2) The endpoints of the intervals. *ab*(j,1) is *a*(*j*), the left endpoint of the *j*-th interval, and *ab*(j,2) is *b*(*j*), the right endpoint of the *j*-th interval.

c — REAL for slaebz
DOUBLE PRECISION for dlaebz.
Array, dimension (*mmax*)
If *ijob*=1, ignored.
If *ijob*=2, workspace.
If *ijob*=3, then on input *c*(*j*) should be initialized to the first search point in the binary search.

nab — INTEGER.
Array, dimension (*mmax*,2)
If *ijob*=2, then on input, *nab*(i,j) should be set. It must satisfy the condition:

$n(ab(i,1)) \le nab(i,1) \le nab(i,2) \le n(ab(i,2))$,

which means that in interval i only eigenvalues *nab*(i,1)+1,...,*nab*(i,2) are considered. Usually, *nab*(i,j)=*n*(*ab*(i,j)), from a previous call to ?laebz with *ijob*=1.
If *ijob*=3, normally, *nab* should be set to some distinctive value(s) before ?laebz is called.

work — REAL for slaebz
DOUBLE PRECISION for dlaebz.
Workspace array, dimension (*mmax*).

iwork — INTEGER.
Workspace array, dimension (*mmax*).

Output Parameters

nval — The elements of *nval* will be reordered to correspond with the intervals in *ab*. Thus, *nval*(*j*) on output will not, in general be the same as *nval*(*j*) on input, but it will correspond with the interval (*ab*(j,1),*ab*(j,2)] on output.

ab The input intervals will, in general, be modified, split, and reordered by the calculation.

mout INTEGER.
If *ijob*=1, the number of eigenvalues in the intervals.
If *ijob*=2 or 3, the number of intervals output.
If *ijob*=3, *mout* will equal *minp*.

nab If *ijob*=1, then on output *nab*(i,j) will be set to *N*(*ab*(i,j)).
If *ijob*=2, then on output, *nab*(i,j) will contain max(*na*(*k*, min(*nb*(*k*), *N*(*ab*(i,j)))), where *k* is the index of the input interval that the output interval (*ab*(j,1),*ab*(j,2)] came from, and *na*(*k*) and *nb*(*k*) are the input values of *nab*(*k*,1) and *nab*(*k*,2).
If *ijob*=3, then on output, *nab*(i,j) contains *N*(*ab*(i,j)), unless *N*(*w*) > *nval*(i) for all search points *w*, in which case *nab*(i,1) will not be modified, i.e., the output value will be the same as the input value (modulo reorderings, see *nval* and *ab*), or unless *N*(*w*) < *nval*(i) for all search points *w*, in which case *nab*(i,2) will not be modified.

info INTEGER.

0:	All intervals converged.
1--*mmax*:	The last *info* intervals did not converge.
mmax+1:	More than *mmax* intervals were generated.

Application Notes

This routine is intended to be called only by other LAPACK routines, thus the interface is less user-friendly. It is intended for two purposes:

(a) finding eigenvalues. In this case, ?laebz should have one or more initial intervals set up in *ab*, and ?laebz should be called with *ijob*=1. This sets up *nab*, and also counts the eigenvalues. Intervals with no eigenvalues would usually be thrown out at this point. Also, if not all the eigenvalues in an interval i are desired, *nab*(i,1) can be increased or *nab*(i,2) decreased. For example, set *nab*(i,1)=*nab*(i,2)-1 to get the largest eigenvalue. ?laebz is then called with *ijob*=2 and *mmax* no smaller than the value of *mout* returned by the call with *ijob*=1. After this (*ijob*=2) call, eigenvalues *nab*(i,1)+1 through *nab*(i,2) are approximately *ab*(i,1) (or *ab*(i,2)) to the tolerance specified by *abstol* and *reltol*.

(b) finding an interval (*a*',*b*'] containing eigenvalues *w*(f),...,*w*(l). In this case, start with a Gershgorin interval (*a*,*b*). Set up *ab* to contain 2 search intervals, both initially (*a*,*b*). One *nval* element should contain f-1 and the other should contain l, while *c* should contain *a* and *b*, respectively. *nab*(i,1) should be -1 and *nab*(i,2) should be *n*+1, to flag an error if the desired interval does not lie in (*a*,*b*). ?laebz is then called with *ijob*=3. On exit, if *w*(f-1) < *w*(f), then one of the intervals -- j -- will have *ab*(j,1)=*ab*(j,2) and *nab*(j,1)=*nab*(j,2)=f-1, while if, to the specified tolerance, *w*(f-k)=...=*w*(f+r), k > 0 and r ≥ 0, then the interval will have *n*(*ab*(j,1))=*nab*(j,1)=f-k and *n*(*ab*(j,2))=*nab*(j,2)=f+r. The cases *w*(l) < *w*(l+1) and *w*(l-r)=...=*w*(l+k) are handled similarly.

?laed0

Used by ?stedc. *Computes all eigenvalues and corresponding eigenvectors of an unreduced symmetric tridiagonal matrix using the divide and conquer method.*

Syntax

```
call slaed0( icompq, qsiz, n, d, e, q, ldq, qstore, ldqs, work, iwork, info )
call dlaed0( icompq, qsiz, n, d, e, q, ldq, qstore, ldqs, work, iwork, info )
call claed0( qsiz, n, d, e, q, ldq, qstore, ldqs, rwork, iwork, info )
call zlaed0( qsiz, n, d, e, q, ldq, qstore, ldqs, rwork, iwork, info )
```

Description

Real flavors of this routine compute all eigenvalues and (optionally) corresponding eigenvectors of a symmetric tridiagonal matrix using the divide and conquer method.

Complex flavors claed0/zlaed0 compute all eigenvalues of a symmetric tridiagonal matrix which is one diagonal block of those from reducing a dense or band Hermitian matrix and corresponding eigenvectors of the dense or band matrix.

Input Parameters

icompq	INTEGER. Used with real flavors only. If *icompq* = 0, compute eigenvalues only.

If *icompq* = 1, compute eigenvectors of original dense symmetric matrix also.
On entry, the array *q* must contain the orthogonal matrix used to reduce the original matrix to tridiagonal form.
If *icompq* = 2, compute eigenvalues and eigenvectors of the tridiagonal matrix.

qsiz — INTEGER.
The dimension of the orthogonal/unitary matrix used to reduce the full matrix to tridiagonal form; *qsiz* ≥ *n* (for real flavors, *qsiz* ≥ *n* if *icompq* = 1).

n — INTEGER. The dimension of the symmetric tridiagonal matrix (*n* ≥ 0).

d, *e*, *rwork* — REAL for single-precision flavors
DOUBLE PRECISION for double-precision flavors. Arrays:
d(*) contains the main diagonal of the tridiagonal matrix. The dimension of *d* must be at least max(1, *n*).
e(*) contains the off-diagonal elements of the tridiagonal matrix. The dimension of *e* must be at least max(1, *n*–1).
rwork(*) is a workspace array used in complex flavors only. The dimension of *rwork* must be at least (1 +3*n*+2*n*lg(*n*)+3n^2), where lg(*n*) = smallest integer *k* such that $2^k \geq n$.

q, *qstore* — REAL for slaed0
DOUBLE PRECISION for dlaed0
COMPLEX for claed0
COMPLEX*16 for zlaed0.
Arrays: *q*(*ldq*, *), *qstore*(*ldqs*, *). The second dimension of these arrays must be at least max(1, *n*).
For real flavors:
If *icompq* = 0, array *q* is not referenced.
If *icompq* = 1, on entry, *q* is a subset of the columns of the orthogonal matrix used to reduce the full matrix to tridiagonal form corresponding to the subset of the full matrix which is being decomposed at this time.

If *icompq* = 2, on entry, *q* will be the identity matrix. The array *qstore* is a workspace array referenced only when *icompq* = 1. Used to store parts of the eigenvector matrix when the updating matrix multiplies take place.
For complex flavors:
On entry, *q* must contain an *qsiz*-by-*n* matrix whose columns are unitarily orthonormal. It is a part of the unitary matrix that reduces the full dense Hermitian matrix to a (reducible) symmetric tridiagonal matrix. The array *qstore* is a workspace array used to store parts of the eigenvector matrix when the updating matrix multiplies take place.

ldq — INTEGER. The first dimension of the array *q*; *ldq* ≥ max(1, *n*).

ldqs — INTEGER. The first dimension of the array *qstore*; *ldqs* ≥ max(1, *n*).

work — REAL for slaed0
DOUBLE PRECISION for dlaed0.
Workspace array, used in real flavors only.
If *icompq* = 0 or 1, the dimension of *work* must be at least $(1 + 3n + 2n\lg(n) + 2n^2)$, where lg(*n*) = smallest integer *k* such that $2^k \geq n$.
If *icompq* = 2, the dimension of *work* must be at least $(4n + n^2)$.

iwork — INTEGER.
Workspace array.
For real flavors, if *icompq* = 0 or 1, and for complex flavors, the dimension of *iwork* must be at least $(6 + 6n + 5n\lg(n))$.
For real flavors, if *icompq* = 2, the dimension of *iwork* must be at least $(3 + 5n)$.

Output Parameters

d — On exit, contains eigenvalues in ascending order.

e — On exit, the array has been destroyed.

q — If *icompq* = 2, on exit, *q* contains the eigenvectors of the tridiagonal matrix.

info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i* >0, the algorithm failed to compute an eigenvalue while working on the submatrix lying in rows and columns *i*/(*n*+1) through mod(*i*, *n*+1).

?laed1

Used by sstedc/dstedc*. Computes the updated eigensystem of a diagonal matrix after modification by a rank-one symmetric matrix. Used when the original matrix is tridiagonal.*

Syntax

```
call slaed1( n, d, q, ldq, indxq, rho, cutpnt, work, iwork, info )
call dlaed1( n, d, q, ldq, indxq, rho, cutpnt, work, iwork, info )
```

Description

The routine ?laed1 computes the updated eigensystem of a diagonal matrix after modification by a rank-one symmetric matrix. This routine is used only for the eigenproblem which requires all eigenvalues and eigenvectors of a tridiagonal matrix. ?laed7 handles the case in which eigenvalues only or eigenvalues and eigenvectors of a full symmetric matrix (which was reduced to tridiagonal form) are desired.

T = *Q*(in)(*D*(in)+ *rho***Z***Z*')**Q*'(in) = *Q*(out)**D*(out)**Q*'(out)

where *Z* = *Q*'*u*, *u* is a vector of length *n* with ones in the *cutpnt* and (*cutpnt*+1) -th elements and zeros elsewhere. The eigenvectors of the original matrix are stored in *Q*, and the eigenvalues are in *D*. The algorithm consists of three stages:

The first stage consists of deflating the size of the problem when there are multiple eigenvalues or if there is a zero in the *z* vector. For each such occurrence the dimension of the secular equation problem is reduced by one. This stage is performed by the routine ?laed2.

The second stage consists of calculating the updated eigenvalues. This is done by finding the roots of the secular equation via the routine ?laed4 (as called by ?laed3). This routine also calculates the eigenvectors of the current problem.

The final stage consists of computing the updated eigenvectors directly using the updated eigenvalues. The eigenvectors for the current problem are multiplied with the eigenvectors from the overall problem.

Input Parameters

n	INTEGER. The dimension of the symmetric tridiagonal matrix ($n \geq 0$).
d, *q*, *work*	REAL for slaed1 DOUBLE PRECISION for dlaed1. Arrays: *d*(*) contains the eigenvalues of the rank-1-perturbed matrix. The dimension of *d* must be at least max(1, *n*). *q*(*ldq*, *) contains the eigenvectors of the rank-1-perturbed matrix. The second dimension of *q* must be at least max(1, *n*). *work*(*) is a workspace array, dimension at least ($4n+n^2$).
ldq	INTEGER. The first dimension of the array *q*; *ldq* ≥ max(1, *n*).
indxq	INTEGER. Array, dimension (*n*). On entry, the permutation which separately sorts the two subproblems in *d* into ascending order.
rho	REAL for slaed1 DOUBLE PRECISION for dlaed1. The subdiagonal entry used to create the rank-1 modification.
cutpnt	INTEGER. The location of the last eigenvalue in the leading sub-matrix. min(1,*n*) ≤ *cutpnt* ≤ *n*/2.
iwork	INTEGER. Workspace array, dimension (4*n*).

Output Parameters

d	On exit, contains the eigenvalues of the repaired matrix.
q	On exit, *q* contains the eigenvectors of the repaired tridiagonal matrix.

indxq	On exit, contains the permutation which will reintegrate the subproblems back into sorted order, that is, *d(indxq*(i = 1, *n*)) will be in ascending order.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = 1, an eigenvalue did not converge.

?laed2

Used by sstedc/dstedc*. Merges eigenvalues and deflates secular equation. Used when the original matrix is tridiagonal.*

Syntax

```
call slaed2( k, n, n1, d, q, ldq, indxq, rho, z, dlamda, w, q2, indx, indxc,
indxp, coltyp, info )
```

```
call dlaed2( k, n, n1, d, q, ldq, indxq, rho, z, dlamda, w, q2, indx, indxc,
indxp, coltyp, info )
```

Description

The routine ?laed2 merges the two sets of eigenvalues together into a single sorted set. Then it tries to deflate the size of the problem. There are two ways in which deflation can occur: when two or more eigenvalues are close together or if there is a tiny entry in the *z* vector. For each such occurrence the order of the related secular equation problem is reduced by one.

Input Parameters

k	INTEGER. The number of non-deflated eigenvalues, and the order of the related secular equation ($0 \le k \le n$).
n	INTEGER. The dimension of the symmetric tridiagonal matrix ($n \ge 0$).
n1	INTEGER. The location of the last eigenvalue in the leading sub-matrix; $\min(1,n) \le n1 \le n/2$.
d, *q*, *z*	REAL for slaed2 DOUBLE PRECISION for dlaed2.

Arrays:
d(*) contains the eigenvalues of the two submatrices to be combined. The dimension of *d* must be at least max(1, *n*).
q(*ldq*, *) contains the eigenvectors of the two submatrices in the two square blocks with corners at (1,1), (*n1*,*n1*) and (*n1*+1,*n1*+1), (*n*,*n*). The second dimension of *q* must be at least max(1, *n*).
z(*) contains the updating vector (the last row of the first sub-eigenvector matrix and the first row of the second sub-eigenvector matrix).

ldq — INTEGER. The first dimension of the array *q*; *ldq* ≥ max(1, *n*).

indxq — INTEGER. Array, dimension (*n*).
On entry, the permutation which separately sorts the two subproblems in *d* into ascending order. Note that elements in the second half of this permutation must first have *n1* added to their values.

rho — REAL for slaed2
DOUBLE PRECISION for dlaed2.
On entry, the off-diagonal element associated with the rank-1 cut which originally split the two submatrices which are now being recombined.

indx, *indxp* — INTEGER.
Workspace arrays, dimension (*n*) each. Array *indx* contains the permutation used to sort the contents of *dlamda* into ascending order.
Array *indxp* contains the permutation used to place deflated values of *d* at the end of the array.
indxp(1:*k*) points to the nondeflated *d*-values and *indxp*(*k*+1:*n*) points to the deflated eigenvalues.

coltyp — INTEGER.
Workspace array, dimension (*n*).
During execution, a label which will indicate which of the following types a column in the *q2* matrix is:
1 : non-zero in the upper half only;
2 : dense;
3 : non-zero in the lower half only;

4 : deflated.

Output Parameters

d — On exit, *d* contains the trailing (*n*-*k*) updated eigenvalues (those which were deflated) sorted into increasing order.

q — On exit, *q* contains the trailing (*n*-*k*) updated eigenvectors (those which were deflated) in its last *n*-*k* columns.

indxq — Destroyed on exit.

rho — On exit, *rho* has been modified to the value required by ?laed3.

dlamda, *w*, *q2* — REAL for slaed2
DOUBLE PRECISION for dlaed2.
Arrays: *dlamda*(*n*), *w*(*n*), *q2*($n1^2$+(*n*-*n1*)^2).
The array *dlamda* contains a copy of the first *k* eigenvalues which is used by ?laed3 to form the secular equation.
The array *w* contains the first *k* values of the final deflation-altered *z*-vector which is passed to ?laed3.
The array *q2* contains a copy of the first *k* eigenvectors which is used by ?laed3 in a matrix multiply (sgemm/dgemm) to solve for the new eigenvectors.

indxc — INTEGER. Array, dimension (*n*).
The permutation used to arrange the columns of the deflated *q* matrix into three groups: the first group contains non-zero elements only at and above *n1*, the second contains non-zero elements only below *n1*, and the third is dense.

coltyp — On exit, *coltyp*(i) is the number of columns of type i, for i=1 to 4 only (see the definition of types in the description of *coltyp* in Input Parameters).

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

?laed3

Used by sstedc/dstedc*. Finds the roots of the secular equation and updates the eigenvectors. Used when the original matrix is tridiagonal.*

Syntax

```
call slaed3( k, n, n1, d, q, ldq, rho, dlamda, q2, indx, ctot, w, s, info )
call dlaed3( k, n, n1, d, q, ldq, rho, dlamda, q2, indx, ctot, w, s, info )
```

Description

The routine ?laed3 finds the roots of the secular equation, as defined by the values in *d*, *w*, and *rho*, between 1 and *k*.

It makes the appropriate calls to ?laed4 and then updates the eigenvectors by multiplying the matrix of eigenvectors of the pair of eigensystems being combined by the matrix of eigenvectors of the *k*-by-*k* system which is solved here.

This code makes very mild assumptions about floating point arithmetic. It will work on machines with a guard digit in add/subtract, or on those binary machines without guard digits which subtract like the Cray X-MP, Cray Y-MP, Cray C-90, or Cray-2. It could conceivably fail on hexadecimal or decimal machines without guard digits, but none are known.

Input Parameters

k	INTEGER. The number of terms in the rational function to be solved by ?laed4 ($k \geq 0$).
n	INTEGER. The number of rows and columns in the *q* matrix. $n \geq k$ (deflation may result in $n > k$).
n1	INTEGER. The location of the last eigenvalue in the leading sub-matrix; $\min(1,n) \leq n1 \leq n/2$.
q	REAL for slaed3 DOUBLE PRECISION for dlaed3. Array *q*(*ldq*, *). The second dimension of *q* must be at least max(1, *n*). Initially, the first *k* columns of this array are used as workspace.

ldq — INTEGER. The first dimension of the array *q*; *ldq* ≥ max(1, *n*).

rho — REAL for slaed3
DOUBLE PRECISION for dlaed3.
The value of the parameter in the rank one update equation.
rho ≥ 0 required.

dlamda, *q2*, *w* — REAL for slaed3
DOUBLE PRECISION for dlaed3.
Arrays: *dlamda*(*k*), *q2*(*ldq2*, *), *w*(*k*).
The first *k* elements of the array *dlamda* contain the old roots of the deflated updating problem. These are the poles of the secular equation.
The first *k* columns of the array *q2* contain the non-deflated eigenvectors for the split problem. The second dimension of *q2* must be at least max(1, *n*).
The first *k* elements of the array *w* contain the components of the deflation-adjusted updating vector.

indx — INTEGER. Array, dimension (*n*).
The permutation used to arrange the columns of the deflated *q* matrix into three groups (see ?laed2).
The rows of the eigenvectors found by ?laed4 must be likewise permuted before the matrix multiply can take place.

ctot — INTEGER. Array, dimension (4).
A count of the total number of the various types of columns in *q*, as described in *indx*. The fourth column type is any column which has been deflated.

s — REAL for slaed3
DOUBLE PRECISION for dlaed3.
Workspace array, dimension (*n1*+1)**k* .
Will contain the eigenvectors of the repaired matrix which will be multiplied by the previously accumulated eigenvectors to update the system.

Output Parameters

d — REAL for slaed3
DOUBLE PRECISION for dlaed3.

	Array, dimension at least max(1, *n*). *d*(i) contains the updated eigenvalues for 1 ≤ i ≤ *k*.
q	On exit, the columns 1 to *k* of *q* contain the updated eigenvectors.
dlamda	May be changed on output by having lowest order bit set to zero on Cray X-MP, Cray Y-MP, Cray-2, or Cray C-90, as described above.
w	Destroyed on exit.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = 1, an eigenvalue did not converge.

?laed4

Used by sstedc/dstedc. *Finds a single root of the secular equation.*

Syntax

```
call slaed4( n, i, d, z, delta, rho, dlam, info )
call dlaed4( n, i, d, z, delta, rho, dlam, info )
```

Description

This subroutine computes the *i*-th updated eigenvalue of a symmetric rank-one modification to a diagonal matrix whose elements are given in the array *d*, and that

D(i) < *D*(*j*) for *i* < *j*

and that *rho* > 0. This is arranged by the calling routine, and is no loss in generality. The rank-one modified system is thus

diag(*D*) + *rho***Z* * transpose(*Z*).

where we assume the Euclidean norm of *Z* is 1.

The method consists of approximating the rational functions in the secular equation by simpler interpolating rational functions.

Input Parameters

n	INTEGER. The length of all arrays.
i	INTEGER. The index of the eigenvalue to be computed; 1 ≤ i ≤ *n*.
d, *z*	REAL for slaed4 DOUBLE PRECISION for dlaed4 Arrays, dimension (*n*) each. The array *d* contains the original eigenvalues. It is assumed that they are in order, *d*(i) < *d*(*j*) for *i* < *j*. The array *z* contains the components of the updating vector *Z*.
rho	REAL for slaed4 DOUBLE PRECISION for dlaed4 The scalar in the symmetric updating formula.

Output Parameters

delta	REAL for slaed4 DOUBLE PRECISION for dlaed4 Array, dimension (*n*). If *n* ≠ 1, *delta* contains (*d*(*j*) – *lambda_i*) in its *j*-th component. If *n* = 1, then *delta*(1) = 1. The vector *delta* contains the information necessary to construct the eigenvectors.
dlam	REAL for slaed4 DOUBLE PRECISION for dlaed4 The computed *lambda_i*, the *i*-th updated eigenvalue.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = 1, the updating process failed.

?laed5

Used by sstedc/dstedc. *Solves the 2-by-2 secular equation.*

Syntax

```
call slaed5( i, d, z, delta, rho, dlam )
call dlaed5( i, d, z, delta, rho, dlam )
```

Description

This subroutine computes the *i*-th eigenvalue of a symmetric rank-one modification of a 2-by-2 diagonal matrix

```
diag(D) + rho*Z * transpose(Z).
```

The diagonal elements in the array *D* are assumed to satisfy

```
D(i) < D(j) for i < j .
```

We also assume *rho* > 0 and that the Euclidean norm of the vector *Z* is one.

Input Parameters

i	INTEGER. The index of the eigenvalue to be computed; $1 \le i \le 2$.
d, *z*	REAL for slaed5 DOUBLE PRECISION for dlaed5 Arrays, dimension (2) each. The array *d* contains the original eigenvalues. It is assumed that *d*(1) < *d*(2). The array *z* contains the components of the updating vector.
rho	REAL for slaed5 DOUBLE PRECISION for dlaed5 The scalar in the symmetric updating formula.

Output Parameters

delta	REAL for slaed5 DOUBLE PRECISION for dlaed5 Array, dimension (2).

The vector *delta* contains the information necessary to construct the eigenvectors.

dlam — REAL for slaed5
DOUBLE PRECISION for dlaed5
The computed *lambda_i*, the *i*-th updated eigenvalue.

?laed6

Used by sstedc/dstedc*. Computes one Newton step in solution of the secular equation.*

Syntax

```
call slaed6( kniter, orgati, rho, d, z, finit, tau, info )
call dlaed6( kniter, orgati, rho, d, z, finit, tau, info )
```

Description

This routine computes the positive or negative root (closest to the origin) of

$$f(x) = rho + \frac{z(1)}{d(1) - x} + \frac{z(2)}{d(2) - x} + \frac{z(3)}{d(3) - x}$$

It is assumed that if *orgati* = .TRUE. the root is between *d*(2) and *d*(3);otherwise it is between *d*(1) and *d*(2) This routine is called by ?laed4 when necessary. In most cases, the root sought is the smallest in magnitude, though it might not be in some extremely rare situations.

Input Parameters

kniter — INTEGER.
Refer to ?laed4 for its significance.

orgati — LOGICAL.
If *orgati* = .TRUE., the needed root is between *d*(2) and *d*(3); otherwise it is between *d*(1) and *d*(2). See ?laed4 for further details.

rho — REAL for slaed6
DOUBLE PRECISION for dlaed6

	Refer to the equation for $f(x)$ above.
d, *z*	REAL for slaed6 DOUBLE PRECISION for dlaed6 Arrays, dimension (3) each. The array *d* satisfies *d*(1) < *d*(2) < *d*(3). Each of the elements in the array *z* must be positive.
finit	REAL for slaed6 DOUBLE PRECISION for dlaed6 The value of $f(x)$ at 0. It is more accurate than the one evaluated inside this routine (if someone wants to do so).

Output Parameters

tau	REAL for slaed6 DOUBLE PRECISION for dlaed6 The root of the equation for f(x).
info	INTEGER. If *info* = 0, the execution is successful. If *info* = 1, failure to converge.

?laed7

Used by ?stedc*. Computes the updated eigensystem of a diagonal matrix after modification by a rank-one symmetric matrix. Used when the original matrix is dense.*

Syntax

```
call slaed7( icompq, n, qsiz, tlvls, curlvl, curpbm, d, q, ldq, indxq, rho,
cutpnt, qstore, qptr, prmptr, perm, givptr, givcol, givnum, work, iwork, info
)
```

```
call dlaed7( icompq, n, qsiz, tlvls, curlvl, curpbm, d, q, ldq, indxq, rho,
cutpnt, qstore, qptr, prmptr, perm, givptr, givcol, givnum, work, iwork, info
)
```

```
call claed7( n, cutpnt, qsiz, tlvls, curlvl, curpbm, d, q, ldq, rho, indxq,
qstore, qptr, prmptr, perm, givptr, givcol, givnum, work, rwork, iwork, info
)
```

```
call zlaed7( n, cutpnt, qsiz, tlvls, curlvl, curpbm, d, q, ldq, rho, indxq,
qstore, qptr, prmptr, perm, givptr, givcol, givnum, work, rwork, iwork, info
)
```

Description

The routine ?laed7 computes the updated eigensystem of a diagonal matrix after modification by a rank-one symmetric matrix. This routine is used only for the eigenproblem which requires all eigenvalues and optionally eigenvectors of a dense symmetric/Hermitian matrix that has been reduced to tridiagonal form. For real flavors, slaed1/dlaed1 handles the case in which all eigenvalues and eigenvectors of a symmetric tridiagonal matrix are desired.

T = *Q*(in)*(*D*(in)+*rho***Z***Z*')**Q*'(in) = *Q*(out)**D*(out)**Q*'(out)

where *Z* = *Q*'**u*, *u* is a vector of length *n* with ones in the *cutpnt* and (*cutpnt* + 1) -th elements and zeros elsewhere. The eigenvectors of the original matrix are stored in *Q*, and the eigenvalues are in *D*. The algorithm consists of three stages:

The first stage consists of deflating the size of the problem when there are multiple eigenvalues or if there is a zero in the *z* vector. For each such occurrence the dimension of the secular equation problem is reduced by one. This stage is performed by the routine slaed8/dlaed8 (for real flavors) or by the routine slaed2/dlaed2 (for complex flavors).

The second stage consists of calculating the updated eigenvalues. This is done by finding the roots of the secular equation via the routine ?laed4 (as called by ?laed9 or ?laed3). This routine also calculates the eigenvectors of the current problem.

The final stage consists of computing the updated eigenvectors directly using the updated eigenvalues. The eigenvectors for the current problem are multiplied with the eigenvectors from the overall problem.

Input Parameters

icompq	INTEGER. Used with real flavors only. If *icompq* = 0, compute eigenvalues only. If *icompq* = 1, compute eigenvectors of original dense symmetric matrix also. On entry, the array *q* must contain the orthogonal matrix used to reduce the original matrix to tridiagonal form.
n	INTEGER. The dimension of the symmetric tridiagonal matrix (*n* ≥ 0).
cutpnt	INTEGER. The location of the last eigenvalue in the leading sub-matrix. min(1,*n*) ≤ *cutpnt* ≤ *n* .
qsiz	INTEGER. The dimension of the orthogonal/unitary matrix used to reduce the full matrix to tridiagonal form; *qsiz* ≥ *n* (for real flavors, *qsiz* ≥ *n* if *icompq* = 1).
tlvls	INTEGER. The total number of merging levels in the overall divide and conquer tree.
curlvl	INTEGER. The current level in the overall merge routine, 0 ≤ *curlvl* ≤ *tlvls* .
curpbm	INTEGER. The current problem in the current level in the overall merge routine (counting from upper left to lower right).
d	REAL for slaed7/claed7 DOUBLE PRECISION for dlaed7/zlaed7. Array, dimension at least max(1, *n*). Array *d*(*) contains the eigenvalues of the rank-1-perturbed matrix.

q, *work*	REAL for slaed7 DOUBLE PRECISION for dlaed7 COMPLEX for claed7 COMPLEX*16 for zlaed7. Arrays: *q*(*ldq*, *) contains the the eigenvectors of the rank-1-perturbed matrix. The second dimension of *q* must be at least max(1, *n*). *work*(*) is a workspace array, dimension at least (3*n*+*qsiz***n*) for real flavors and at least (*qsiz***n*) for complex flavors.
ldq	INTEGER. The first dimension of the array *q*; *ldq* ≥ max(1, *n*).
rho	REAL for slaed7 /claed7 DOUBLE PRECISION for dlaed7/zlaed7. The subdiagonal element used to create the rank-1 modification.
qstore	REAL for slaed7/claed7 DOUBLE PRECISION for dlaed7/zlaed7. Array, dimension (n^2+1). Serves also as output parameter. Stores eigenvectors of submatrices encountered during divide and conquer, packed together. *qptr* points to beginning of the submatrices.
qptr	INTEGER. Array, dimension (*n*+2). Serves also as output parameter. List of indices pointing to beginning of submatrices stored in *qstore*. The submatrices are numbered starting at the bottom left of the divide and conquer tree, from left to right and bottom to top.
prmptr, *perm*, *givptr*	INTEGER. Arrays, dimension (*n* lg*n*) each. The array *prmptr*(*) contains a list of pointers which indicate where in *perm* a level's permutation is stored. *prmptr*(i+1) – *prmptr*(i) indicates the size of the permutation and also the size of the full, non-deflated problem. The array *perm*(*) contains the permutations (from deflation and sorting) to be applied to each eigenblock.

	The array *givptr*(*) contains a list of pointers which indicate where in *givcol* a level's Givens rotations are stored. *givptr*(i+1) - *givptr*(i) indicates the number of Givens rotations.
givcol	INTEGER. Array, dimension (2, $n \lg n$). Each pair of numbers indicates a pair of columns to take place in a Givens rotation.
givnum	REAL for slaed7/claed7 DOUBLE PRECISION for dlaed7/zlaed7. Array, dimension (2, $n \lg n$). Each number indicates the S value to be used in the corresponding Givens rotation.
iwork	INTEGER. Workspace array, dimension ($4n$).
rwork	REAL for claed7 DOUBLE PRECISION for zlaed7. Workspace array, dimension ($3n+2qsiz*n$). Used in complex flavors only.

Output Parameters

d	On exit, contains the eigenvalues of the repaired matrix.
q	On exit, *q* contains the eigenvectors of the repaired tridiagonal matrix.
indxq	INTEGER. Array, dimension (n). Contains the permutation which will reintegrate the subproblems back into sorted order, that is, *d*(*indxq*(i = 1, *n*)) will be in ascending order.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = 1, an eigenvalue did not converge.

?laed8

Used by ?stedc*. Merges eigenvalues and deflates secular equation. Used when the original matrix is dense.*

Syntax

call slaed8(*icompq, k, n, qsiz, d, q, ldq, indxq, rho, cutpnt, z, dlamda, q2, ldq2, w, perm, givptr, givcol, givnum, indxp, indx, info*)

call dlaed8(*icompq, k, n, qsiz, d, q, ldq, indxq, rho, cutpnt, z, dlamda, q2, ldq2, w, perm, givptr, givcol, givnum, indxp, indx, info*)

call claed8(*k, n, qsiz, q, ldq, d, rho, cutpnt, z, dlamda, q2, ldq2, w, indxp, indx, indxq, perm, givptr, givcol, givnum, info*)

call zlaed8(*k, n, qsiz, q, ldq, d, rho, cutpnt, z, dlamda, q2, ldq2, w, indxp, indx, indxq, perm, givptr, givcol, givnum, info*)

Description

This routine merges the two sets of eigenvalues together into a single sorted set. Then it tries to deflate the size of the problem. There are two ways in which deflation can occur: when two or more eigenvalues are close together or if there is a tiny element in the *z* vector. For each such occurrence the order of the related secular equation problem is reduced by one.

Input Parameters

icompq — INTEGER. Used with real flavors only.
If *icompq* = 0, compute eigenvalues only.
If *icompq* = 1, compute eigenvectors of original dense symmetric matrix also.
On entry, the array *q* must contain the orthogonal matrix used to reduce the original matrix to tridiagonal form.

n — INTEGER. The dimension of the symmetric tridiagonal matrix ($n \geq 0$).

cutpnt — INTEGER. The location of the last eigenvalue in the leading sub-matrix. $\min(1,n) \leq cutpnt \leq n$.

qsiz — INTEGER.

	The dimension of the orthogonal/unitary matrix used to reduce the full matrix to tridiagonal form; *qsiz* ≥ *n* (for real flavors, *qsiz* ≥ *n* if *icompq* = 1).
d, *z*	REAL for slaed8/claed8 DOUBLE PRECISION for dlaed8/zlaed8. Arrays, dimension at least max(1, *n*) each. The array *d*(*) contains the eigenvalues of the two submatrices to be combined. On entry, *z*(*) contains the updating vector (the last row of the first sub-eigenvector matrix and the first row of the second sub-eigenvector matrix). The contents of *z* are destroyed by the updating process.
q	REAL for slaed8 DOUBLE PRECISION for dlaed8 COMPLEX for claed8 COMPLEX*16 for zlaed8. Array *q*(*ldq*, *). The second dimension of *q* must be at least max(1, *n*). On entry, *q* contains the eigenvectors of the partially solved system which has been previously updated in matrix multiplies with other partially solved eigensystems. For real flavors, If *icompq* = 0, *q* is not referenced.
ldq	INTEGER. The first dimension of the array *q*; *ldq* ≥ max(1, *n*).
ldq2	INTEGER. The first dimension of the output array *q2*; *ldq2* ≥ max(1, *n*).
indxq	INTEGER. Array, dimension (*n*). The permutation which separately sorts the two sub-problems in *d* into ascending order. Note that elements in the second half of this permutation must first have *cutpnt* added to their values in order to be accurate.
rho	REAL for slaed8/claed8 DOUBLE PRECISION for dlaed8/zlaed8. On entry, the off-diagonal element associated with the rank-1 cut which originally split the two submatrices which are now being recombined.

Output Parameters

k	INTEGER. The number of non-deflated eigenvalues, and the order of the related secular equation.
d	On exit, contains the trailing (*n*-*k*) updated eigenvalues (those which were deflated) sorted into increasing order.
q	On exit, *q* contains the trailing (*n*-*k*) updated eigenvectors (those which were deflated) in its last (*n*-*k*) columns.
rho	On exit, *rho* has been modified to the value required by ?laed3.
dlamda, *w*	REAL for slaed8/claed8 DOUBLE PRECISION for dlaed8/zlaed8. Arrays, dimension (*n*) each. The array *dlamda*(*) contains a copy of the first *k* eigenvalues which will be used by ?laed3 to form the secular equation. The array *w*(*) will hold the first *k* values of the final deflation-altered *z*-vector and will be passed to ?laed3.
q2	REAL for slaed8 DOUBLE PRECISION for dlaed8 COMPLEX for claed8 COMPLEX*16 for zlaed8. Array *q2*(*ldq2*, *). The second dimension of *q2* must be at least max(1, *n*). Contains a copy of the first *k* eigenvectors which will be used by slaed7/dlaed7 in a matrix multiply (sgemm/dgemm) to update the new eigenvectors. For real flavors, If *icompq* = 0, *q2* is not referenced.
indxp, *indx*	INTEGER. Workspace arrays, dimension (*n*) each. The array *indxp*(*) will contain the permutation used to place deflated values of *d* at the end of the array. On output, *indxp*(1:*k*) points to the nondeflated *d*-values and *indxp*(*k*+1:*n*) points to the deflated eigenvalues. The array *indx*(*) will contain the permutation used to sort the contents of *d* into ascending order.
perm	INTEGER. Array, dimension (*n*).

	Contains the permutations (from deflation and sorting) to be applied to each eigenblock.
givptr	INTEGER. Contains the number of Givens rotations which took place in this subproblem.
givcol	INTEGER. Array, dimension (2, *n*). Each pair of numbers indicates a pair of columns to take place in a Givens rotation.
givnum	REAL for slaed8/claed8 DOUBLE PRECISION for dlaed8/zlaed8. Array, dimension (2, *n*). Each number indicates the *S* value to be used in the corresponding Givens rotation.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

?laed9

Used by sstedc/dstedc*. Finds the roots of the secular equation and updates the eigenvectors. Used when the original matrix is dense.*

Syntax

```
call slaed9( k, kstart, kstop, n, d, q, ldq, rho, dlamda, w, s, lds, info )
call dlaed9( k, kstart, kstop, n, d, q, ldq, rho, dlamda, w, s, lds, info )
```

Description

This routine finds the roots of the secular equation, as defined by the values in *d*, *z*, and *rho*, between *kstart* and *kstop*. It makes the appropriate calls to slaed4/dlaed4 and then stores the new matrix of eigenvectors for use in calculating the next level of *z* vectors.

Input Parameters

k	INTEGER. The number of terms in the rational function to be solved by slaed4/dlaed4 (*k* ≥ 0).
kstart, *kstop*	INTEGER. The updated eigenvalues *lambda*(i),

kstart ≤ i ≤ *kstop* are to be computed.

1 ≤ *kstart* ≤ *kstop* ≤ *k*.

n INTEGER. The number of rows and columns in the *Q* matrix. *n* ≥ *k* (deflation may result in *n* > *k*).

q REAL for slaed9
DOUBLE PRECISION for dlaed9.
Workspace array, dimension (*ldq*, *).
The second dimension of *q* must be at least max(1, *n*).

ldq INTEGER. The first dimension of the array *q*; *ldq* ≥ max(1, *n*).

rho REAL for slaed9
DOUBLE PRECISION for dlaed9
The value of the parameter in the rank one update equation. *rho* ≥ 0 required.

dlamda, *w* REAL for slaed9
DOUBLE PRECISION for dlaed9
Arrays, dimension (*k*) each. The first *k* elements of the array *dlamda*(*) contain the old roots of the deflated updating problem. These are the poles of the secular equation.
The first *k* elements of the array *w*(*) contain the components of the deflation-adjusted updating vector.

lds INTEGER. The first dimension of the output array *s*; *lds* ≥ max(1, *k*).

Output Parameters

d REAL for slaed9
DOUBLE PRECISION for dlaed9
Array, dimension (*n*). *d*(i) contains the updated eigenvalues for *kstart* ≤ i ≤ *kstop*.

s REAL for slaed9
DOUBLE PRECISION for dlaed9.
Array, dimension (*lds*, *) .

	The second dimension of *s* must be at least max(1, *k*). Will contain the eigenvectors of the repaired matrix which will be stored for subsequent *z* vector calculation and multiplied by the previously accumulated eigenvectors to update the system.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = 1, the eigenvalue did not converge.

?laeda

Used by ?stedc. *Computes the Z vector determining the rank-one modification of the diagonal matrix. Used when the original matrix is dense.*

Syntax

call slaeda(*n*, *tlvls*, *curlvl*, *curpbm*, *prmptr*, *perm*, *givptr*, *givcol*, *givnum*, *q*, *qptr*, *z*, *ztemp*, *info*)

call dlaeda(*n*, *tlvls*, *curlvl*, *curpbm*, *prmptr*, *perm*, *givptr*, *givcol*, *givnum*, *q*, *qptr*, *z*, *ztemp*, *info*)

Description

The routine ?laeda computes the *Z* vector corresponding to the merge step in the *curlvl*-th step of the merge process with *tlvls* steps for the *curpbm*-th problem.

Input Parameters

n	INTEGER. The dimension of the symmetric tridiagonal matrix ($n \geq 0$).
tlvls	INTEGER. The total number of merging levels in the overall divide and conquer tree.
curlvl	INTEGER. The current level in the overall merge routine, $0 \leq curlvl \leq tlvls$.

curpbm — INTEGER. The current problem in the current level in the overall merge routine (counting from upper left to lower right).

prmptr, *perm*, *givptr* — INTEGER. Arrays, dimension ($n \lg n$) each.
The array *prmptr*(*) contains a list of pointers which indicate where in *perm* a level's permutation is stored. *prmptr*(i+1) – *prmptr*(i) indicates the size of the permutation and also the size of the full, non-deflated problem.
The array *perm*(*) contains the permutations (from deflation and sorting) to be applied to each eigenblock.
The array *givptr*(*) contains a list of pointers which indicate where in *givcol* a level's Givens rotations are stored. *givptr*(i+1) – *givptr*(i) indicates the number of Givens rotations.

givcol — INTEGER. Array, dimension (2, $n \lg n$).
Each pair of numbers indicates a pair of columns to take place in a Givens rotation.

givnum — REAL for slaeda
DOUBLE PRECISION for dlaeda.
Array, dimension (2, $n \lg n$).
Each number indicates the s value to be used in the corresponding Givens rotation.

q — REAL for slaeda
DOUBLE PRECISION for dlaeda.
Array, dimension (n^2).
Contains the square eigenblocks from previous levels, the starting positions for blocks are given by *qptr*.

qptr — INTEGER. Array, dimension (n+2). Contains a list of pointers which indicate where in *q* an eigenblock is stored. sqrt(*qptr*(i+1) – *qptr*(i)) indicates the size of the block.

ztemp — REAL for slaeda
DOUBLE PRECISION for dlaeda.
Workspace array, dimension (n).

Output Parameters

z — REAL for slaeda

	DOUBLE PRECISION for dlaeda. Array, dimension (*n*). Contains the updating vector (the last row of the first sub-eigenvector matrix and the first row of the second sub-eigenvector matrix).
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

?laein

Computes a specified right or left eigenvector of an upper Hessenberg matrix by inverse iteration.

Syntax

call slaein(*rightv*, *noinit*, *n*, *h*, *ldh*, *wr*, *wi*, *vr*, *vi*, *b*, *ldb*, *work*, *eps3*, *smlnum*, *bignum*, *info*)

call dlaein(*rightv*, *noinit*, *n*, *h*, *ldh*, *wr*, *wi*, *vr*, *vi*, *b*, *ldb*, *work*, *eps3*, *smlnum*, *bignum*, *info*)

call claein(*rightv*, *noinit*, *n*, *h*, *ldh*, *w*, *v*, *b*, *ldb*, *rwork*, *eps3*, *smlnum*, *info*)

call zlaein(*rightv*, *noinit*, *n*, *h*, *ldh*, *w*, *v*, *b*, *ldb*, *rwork*, *eps3*, *smlnum*, *info*)

Description

The routine ?laein uses inverse iteration to find a right or left eigenvector corresponding to the eigenvalue (*wr*,*wi*) of a real upper Hessenberg matrix *H* (for real flavors slaein/dlaein) or to the eigenvalue *w* of a complex upper Hessenberg matrix *H* (for complex flavors claein/zlaein).

Input Parameters

rightv	LOGICAL. If *rightv* = .TRUE., compute right eigenvector; if *rightv* = .FALSE., compute left eigenvector.
noinit	LOGICAL.

If *noinit* = .TRUE., no initial vector is supplied in (*vr*,*vi*) or in *v* (for complex flavors);
if *noinit* = .FALSE., initial vector is supplied in (*vr*,*vi*) or in *v* (for complex flavors).

n — INTEGER. The order of the matrix *H* (*n* ≥ 0).

h — REAL for slaein
DOUBLE PRECISION for dlaein
COMPLEX for claein
COMPLEX*16 for zlaein.
Array *h*(*ldh*, *).
The second dimension of *h* must be at least max(1, *n*).
Contains the upper Hessenberg matrix *H*.

ldh — INTEGER. The first dimension of the array *h*; *ldh* ≥ max(1, *n*).

wr, *wi* — REAL for slaein
DOUBLE PRECISION for dlaein.
The real and imaginary parts of the eigenvalue of *H* whose corresponding right or left eigenvector is to be computed (for real flavors of the routine).

w — COMPLEX for claein
COMPLEX*16 for zlaein.
The eigenvalue of *H* whose corresponding right or left eigenvector is to be computed (for complex flavors of the routine).

vr, *vi* — REAL for slaein
DOUBLE PRECISION for dlaein.
Arrays, dimension (*n*) each. Used for real flavors only. On entry, if *noinit* = .FALSE. and *wi* = 0.0, *vr* must contain a real starting vector for inverse iteration using the real eigenvalue *wr*;

if *noinit* = .FALSE. and *wi* ≠ 0.0, *vr* and *vi* must contain the real and imaginary parts of a complex starting vector for inverse iteration using the complex eigenvalue (*wr*,*wi*);otherwise *vr* and *vi* need not be set.

v — COMPLEX for claein
COMPLEX*16 for zlaein.

	Array, dimension (*n*). Used for complex flavors only. On entry, if *noinit* = .FALSE., *v* must contain a starting vector for inverse iteration; otherwise *v* need not be set.
b	REAL for slaein DOUBLE PRECISION for dlaein COMPLEX for claein COMPLEX*16 for zlaein. Workspace array *b*(*ldb*, *). The second dimension of *b* must be at least max(1, *n*).
ldb	INTEGER. The first dimension of the array *b*; *ldb* ≥ *n*+1 for real flavors; *ldb* ≥ max(1, *n*) for complex flavors.
work	REAL for slaein DOUBLE PRECISION for dlaein. Workspace array, dimension (*n*). Used for real flavors only.
rwork	REAL for claein DOUBLE PRECISION for zlaein. Workspace array, dimension (*n*). Used for complex flavors only.
eps3, *smlnum*	REAL for slaein/claein DOUBLE PRECISION for dlaein/zlaein. *eps3* is a small machine-dependent value which is used to perturb close eigenvalues, and to replace zero pivots. *smlnum* is a machine-dependent value close to underflow threshold.
bignum	REAL for slaein DOUBLE PRECISION for dlaein. *bignum* is a machine-dependent value close to overflow threshold. Used for real flavors only.

Output Parameters

vr, *vi*	On exit, if *wi* = 0.0 (real eigenvalue), *vr* contains the computed real eigenvector; if *wi* ≠ 0.0 (complex eigenvalue), *vr* and *vi* contain the real and imaginary parts

of the computed complex eigenvector. The eigenvector is normalized so that the component of largest magnitude has magnitude 1; here the magnitude of a complex number (*x*,*y*) is taken to be |*x*| + |*y*|.
vi is not referenced if *wi* = 0.0.

v — On exit, *v* contains the computed eigenvector, normalized so that the component of largest magnitude has magnitude 1; here the magnitude of a complex number (*x*,*y*) is taken to be |*x*| + |*y*|.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = 1, inverse iteration did not converge. For real flavors, *vr* is set to the last iterate, and so is *vi*, if *wi* ≠ 0.0. For complex flavors, *v* is set to the last iterate.

?laev2

Computes the eigenvalues and eigenvectors of a 2-by-2 symmetric/Hermitian matrix.

Syntax

```
call slaev2( a, b, c, rt1, rt2, cs1, sn1 )
call dlaev2( a, b, c, rt1, rt2, cs1, sn1 )
call claev2( a, b, c, rt1, rt2, cs1, sn1 )
call zlaev2( a, b, c, rt1, rt2, cs1, sn1 )
```

Description

This routine performs the eigendecomposition of a 2-by-2 symmetric matrix

$$\begin{bmatrix} a & b \\ b & c \end{bmatrix}$$ (for *slaev2/dlaev2*) or Hermitian matrix $$\begin{bmatrix} a & b \\ \text{conjg}(b) & c \end{bmatrix}$$

(for claev2/zlaev2).

On return, *rt1* is the eigenvalue of larger absolute value, *rt2* of smaller absolute value, and (*cs1*, *sn1*) is the unit right eigenvector for *rt1*, giving the decomposition

$$\begin{bmatrix} cs1 & sn1 \\ -sn1 & cs1 \end{bmatrix} \cdot \begin{bmatrix} a & b \\ b & c \end{bmatrix} \cdot \begin{bmatrix} cs1 & sn1 \\ -sn1 & cs1 \end{bmatrix} = \begin{bmatrix} rt1 & 0 \\ 0 & rt2 \end{bmatrix}$$

(for `slaev2`/`dlaev2`),

or

$$\begin{bmatrix} cs1 & \mathbf{conjg}(sn1) \\ -sn1 & cs1 \end{bmatrix} \cdot \begin{bmatrix} a & b \\ \mathbf{conjg}(b) & c \end{bmatrix} \cdot \begin{bmatrix} cs1 & -\mathbf{conjg}(sn1) \\ sn1 & cs1 \end{bmatrix} = \begin{bmatrix} rt1 & 0 \\ 0 & rt2 \end{bmatrix}$$

(for `claev2`/`zlaev2`).

Input Parameters

a, *b*, *c*	`REAL` for `slaev2`
	`DOUBLE PRECISION` for `dlaev2`
	`COMPLEX` for `claev2`
	`COMPLEX*16` for `zlaev2`.
	Elements of the input matrix.

Output Parameters

rt1, *rt2*	`REAL` for `slaev2`/`claev2` `DOUBLE PRECISION` for `dlaev2`/`zlaev2`. Eigenvalues of larger and smaller absolute value, respectively.
cs1	`REAL` for `slaev2`/`claev2` `DOUBLE PRECISION` for `dlaev2`/`zlaev2`.

sn1	`REAL` for `slaev2`
	`DOUBLE PRECISION` for `dlaev2`
	`COMPLEX` for `claev2`

COMPLEX*16 for zlaev2.
The vector (*cs1*, *sn1*) is the unit right eigenvector for rt1.

Application Notes

rt1 is accurate to a few ulps barring over/underflow. *rt2* may be inaccurate if there is massive cancellation in the determinant *a*c-b*b*; higher precision or correctly rounded or correctly truncated arithmetic would be needed to compute *rt2* accurately in all cases. *cs1* and *sn1* are accurate to a few ulps barring over/underflow. Overflow is possible only if *rt1* is within a factor of 5 of overflow. Underflow is harmless if the input data is 0 or exceeds underflow_threshold / macheps.

?laexc

Swaps adjacent diagonal blocks of a real upper quasi-triangular matrix in Schur canonical form, by an orthogonal similarity transformation.

Syntax

```
call slaexc( wantq, n, t, ldt, q, ldq, j1, n1, n2, work, info )
call dlaexc( wantq, n, t, ldt, q, ldq, j1, n1, n2, work, info )
```

Description

This routine swaps adjacent diagonal blocks T_{11} and T_{22} of order 1 or 2 in an upper quasi-triangular matrix T by an orthogonal similarity transformation.

T must be in Schur canonical form, that is, block upper triangular with 1-by-1 and 2-by-2 diagonal blocks; each 2-by-2 diagonal block has its diagonal elements equal and its off-diagonal elements of opposite sign.

Input Parameters

wantq	LOGICAL. If *wantq* = .TRUE., accumulate the transformation in the matrix Q; If *wantq* = .FALSE., do not accumulate the transformation.
n	INTEGER. The order of the matrix T ($n \geq 0$).
t, *q*	REAL for slaexc

	DOUBLE PRECISION for dlaexc Arrays: *t*(*ldt*,*) contains on entry the upper quasi-triangular matrix *T*, in Schur canonical form. The second dimension of *t* must be at least max(1, *n*). *q*(*ldq*,*) contains on entry, if *wantq* = .TRUE., the orthogonal matrix *Q*. If *wantq* = .FALSE., *q* is not referenced. The second dimension of *q* must be at least max(1, *n*).
ldt	INTEGER. The first dimension of *t*; at least max(1, *n*).
ldq	INTEGER. The first dimension of *q*; If *wantq* = .FALSE., then *ldq* ≥ 1. If *wantq* = .TRUE., then *ldq* ≥ max(1,*n*).
j1	INTEGER. The index of the first row of the first block T_{11}.
n1	INTEGER. The order of the first block T_{11} (*n1* = 0, 1, or 2).
n2	INTEGER. The order of the second block T_{22} (*n2* = 0, 1, or 2).
work	REAL for slaexc; DOUBLE PRECISION for dlaexc. Workspace array, DIMENSION (*n*).

Output Parameters

t	On exit, the updated matrix *T*, again in Schur canonical form.
q	On exit, if *wantq* = .TRUE., the updated matrix *Q*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = 1, the transformed matrix *T* would be too far from Schur form; the blocks are not swapped and *T* and *Q* are unchanged.

?lag2

Computes the eigenvalues of a 2-by-2 generalized eigenvalue problem, with scaling as necessary to avoid over-/underflow.

Syntax

```
call slag2( a, lda, b, ldb, safmin, scale1, scale2, wr1, wr2, wi )
call dlag2( a, lda, b, ldb, safmin, scale1, scale2, wr1, wr2, wi )
```

Description

This routine computes the eigenvalues of a 2 x 2 generalized eigenvalue problem *A* - *w* **B*, with scaling as necessary to avoid over-/underflow. The scaling factor, *s*, results in a modified eigenvalue equation

*s***A* - *w***B* ,

where *s* is a non-negative scaling factor chosen so that *w*, *w***B*, and *s***A* do not overflow and, if possible, do not underflow, either.

Input Parameters

a, *b*	REAL for slag2 DOUBLE PRECISION for dlag2 Arrays: *a*(*lda*,2) contains, on entry, the 2 x 2 matrix *A*. It is assumed that its 1-norm is less than 1/*safmin*. Entries less than sqrt(*safmin*)*norm(*A*) are subject to being treated as zero. *b*(*ldb*,2) contains, on entry, the 2 x 2 upper triangular matrix *B*. It is assumed that the one-norm of *B* is less than 1/*safmin*. The diagonals should be at least sqrt(*safmin*) times the largest element of *B* (in absolute value); if a diagonal is smaller than that, then +/- sqrt(*safmin*) will be used instead of that diagonal.
lda	INTEGER. The first dimension of *a*; *lda* ≥ 2.
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ 2.
safmin	REAL for slag2;

DOUBLE PRECISION for dlag2.
The smallest positive number such that 1/*safmin* does not overflow. (This should always be ?lamch('S') - it is an argument in order to avoid having to call ?lamch frequently.)

Output Parameters

scale1
REAL for slag2;
DOUBLE PRECISION for dlag2.
A scaling factor used to avoid over-/underflow in the eigenvalue equation which defines the first eigenvalue. If the eigenvalues are complex, then the eigenvalues are (*wr1* +/- *wii*)/*scale1* (which may lie outside the exponent range of the machine), *scale1*=*scale2*, and *scale1* will always be positive.
If the eigenvalues are real, then the first (real) eigenvalue is *wr1*/*scale1*, but this may overflow or underflow, and in fact, *scale1* may be zero or less than the underflow threshhold if the exact eigenvalue is sufficiently large.

scale2
REAL for slag2;
DOUBLE PRECISION for dlag2.
A scaling factor used to avoid over-/underflow in the eigenvalue equation which defines the second eigenvalue. If the eigenvalues are complex, then *scale2*=*scale1*. If the eigenvalues are real, then the second (real) eigenvalue is *wr2*/*scale2*, but this may overflow or underflow, and in fact, *scale2* may be zero or less than the underflow threshold if the exact eigenvalue is sufficiently large.

wr1
REAL for slag2;
DOUBLE PRECISION for dlag2.
If the eigenvalue is real, then *wr1* is *scale1* times the eigenvalue closest to the (2,2) element of *A*inv(*B*).
If the eigenvalue is complex, then *wr1*=*wr2* is *scale1* times the real part of the eigenvalues.

wr2
REAL for slag2;
DOUBLE PRECISION for dlag2.

If the eigenvalue is real, then *wr2* is *scale2* times the other eigenvalue. If the eigenvalue is complex, then *wr1*=*wr2* is *scale1* times the real part of the eigenvalues.

wi — REAL for slag2; DOUBLE PRECISION for dlag2.
If the eigenvalue is real, then *wi* is zero. If the eigenvalue is complex, then *wi* is *scale1* times the imaginary part of the eigenvalues. *wi* will always be non-negative.

?lags2

Computes 2-by-2 orthogonal matrices U, V, and Q, and applies them to matrices A and B such that the rows of the transformed A and B are parallel.

Syntax

```
call slags2( upper, a1, a2, a3, b1, b2, b3, csu, snu, csv, snv, csq, snq )
call dlags2( upper, a1, a2, a3, b1, b2, b3, csu, snu, csv, snv, csq, snq )
```

Description

This routine computes 2-by-2 orthogonal matrices *U*, *V* and *Q*, such that if *upper* = .TRUE., then

$$U'*A*Q = U'*\begin{bmatrix} A_1 & A_2 \\ 0 & A_3 \end{bmatrix}*Q = \begin{bmatrix} x & 0 \\ x & x \end{bmatrix}$$

and

$$V'*B*Q = U'*\begin{bmatrix} B_1 & B_2 \\ 0 & B_3 \end{bmatrix}*Q = \begin{bmatrix} x & 0 \\ x & x \end{bmatrix}$$

or if *upper* = .FALSE., then

$$U'*A*Q = U'*\begin{bmatrix} A_1 & 0 \\ A_2 & A_3 \end{bmatrix}*Q = \begin{bmatrix} x & x \\ 0 & x \end{bmatrix}$$

and

$$V'*B*Q = U'*\begin{bmatrix} B_1 & 0 \\ B_2 & B_3 \end{bmatrix}*Q = \begin{bmatrix} x & x \\ 0 & x \end{bmatrix}$$

The rows of the transformed *A* and *B* are parallel, where

$$U=\begin{bmatrix} csu & snu \\ -snu & csu \end{bmatrix}, V = \begin{bmatrix} csv & snv \\ -snv & csv \end{bmatrix}, Q = \begin{bmatrix} csq & snq \\ -snq & csq \end{bmatrix}$$

Here Z' denotes the transpose of Z.

Input Parameters

upper	LOGICAL. If *upper* = .TRUE., the input matrices *A* and *B* are upper triangular; If *upper* = .FALSE., the input matrices *A* and *B* are lower triangular.
a1, *a2*, *a3*	REAL for slags2 DOUBLE PRECISION for dlags2 On entry, *a1*, *a2* and *a3* are elements of the input 2-by-2 upper (lower) triangular matrix *A*.
b1, *b2*, *b3*	REAL for slags2 DOUBLE PRECISION for dlags2 On entry, *b1*, *b2* and *b3* are elements of the input 2-by-2 upper (lower) triangular matrix *B*.

Output Parameters

csu, *snu*	REAL for slags2 DOUBLE PRECISION for dlags2 The desired orthogonal matrix *U*.
csv, *snv*	REAL for slags2 DOUBLE PRECISION for dlags2 The desired orthogonal matrix *V*.
csq, *snq*	REAL for slags2 DOUBLE PRECISION for dlags2 The desired orthogonal matrix *Q*.

?lagtf

Computes an LU factorization of a matrix T-λI, where T is a general tridiagonal matrix, and λ a scalar, using partial pivoting with row interchanges.

Syntax

```
call slagtf( n, a, lambda, b, c, tol, d, in, info )
call dlagtf( n, a, lambda, b, c, tol, d, in, info )
```

Description

This routine factorizes the matrix (*T - lambda*I*), where *T* is an *n*-by-*n* tridiagonal matrix and *lambda* is a scalar, as

*T - lambda*I = P*L*U*,

where *p* is a permutation matrix, *L* is a unit lower tridiagonal matrix with at most one non-zero sub-diagonal elements per column and *U* is an upper triangular matrix with at most two non-zero super-diagonal elements per column. The factorization is obtained by Gaussian elimination with partial pivoting and implicit row scaling. The parameter *lambda* is included in the routine so that ?lagtf may be used, in conjunction with ?lagts, to obtain eigenvectors of *T* by inverse iteration.

Input Parameters

n	INTEGER. The order of the matrix *T* (*n* ≥ 0).

a, *b*, *c*	REAL for slagtf DOUBLE PRECISION for dlagtf Arrays, dimension *a*(*n*), *b*(*n*-1), *c*(*n*-1): On entry, *a*(*) must contain the diagonal elements of the matrix *T*. On entry, *b*(*) must contain the (*n*-1) super-diagonal elements of *T*. On entry, *c*(*) must contain the (*n*-1) sub-diagonal elements of *T*.
tol	REAL for slagtf DOUBLE PRECISION for dlagtf On entry, a relative tolerance used to indicate whether or not the matrix (*T* - *lambda***I*) is nearly singular. *tol* should normally be chose as approximately the largest relative error in the elements of *T*. For example, if the elements of *T* are correct to about 4 significant figures, then *tol* should be set to about $5*10^{-4}$. If *tol* is supplied as less than eps, where eps is the relative machine precision, then the value eps is used in place of *tol*.

Output Parameters

a	On exit, *a* is overwritten by the *n* diagonal elements of the upper triangular matrix *U* of the factorization of *T*.
b	On exit, *b* is overwritten by the *n*-1 super-diagonal elements of the matrix *U* of the factorization of *T*.
c	On exit, *c* is overwritten by the *n*-1 sub-diagonal elements of the matrix *L* of the factorization of *T*.
d	REAL for slagtf DOUBLE PRECISION for dlagtf Array, dimension (*n*-2). On exit, *d* is overwritten by the *n*-2 second super-diagonal elements of the matrix *U* of the factorization of *T*.
in	INTEGER. Array, dimension (*n*).

On exit, *in* contains details of the permutation matrix *p*. If an interchange occurred at the k-th step of the elimination, then *in*(k) = 1, otherwise *in*(k) = 0. The element *in*(*n*) returns the smallest positive integer j such that

abs(*u*(j,j)) ≤ norm((*T* - *lambda***I*)(j))**tol*,

where norm(*A*(j)) denotes the sum of the absolute values of the j-th row of the matrix *A*.
If no such j exists then *in*(*n*) is returned as zero. If *in*(*n*) is returned as positive, then a diagonal element of *U* is small, indicating that (*T* - *lambda***I*) is singular or nearly singular.

info INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*k*, the *k*-th parameter had an illegal value.

?lagtm

*Performs a matrix-matrix product of the form C = alpha*A*B+beta*C, where A is a tridiagonal matrix, B and C are rectangular matrices, and alpha and beta are scalars, which may be 0, 1, or -1.*

Syntax

```
call slagtm( trans, n, nrhs, alpha, dl, d, du, x, ldx, beta, b, ldb )
call dlagtm( trans, n, nrhs, alpha, dl, d, du, x, ldx, beta, b, ldb )
call clagtm( trans, n, nrhs, alpha, dl, d, du, x, ldx, beta, b, ldb )
call zlagtm( trans, n, nrhs, alpha, dl, d, du, x, ldx, beta, b, ldb )
```

Description

This routine performs a matrix-vector product of the form:

*B := alpha*A*X + beta*B*

where *A* is a tridiagonal matrix of order *n*, *B* and *X* are *n*-by-*nrhs* matrices, and *alpha* and *beta* are real scalars, each of which may be 0., 1., or -1.

Input Parameters

trans	CHARACTER*1. Must be 'N' or 'T' or 'C'. Indicates the form of the equations: If *trans* = 'N', then *B* := *alpha***A***X* + *beta***B* (no transpose); If *trans* = 'T', then *B* := *alpha***A*^{T}**X* + *beta***B* (transpose); If *trans* = 'C', then *B* := *alpha***A*^{H}**X* + *beta***B* (conjugate transpose)
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
nrhs	INTEGER. The number of right-hand sides, i.e., the number of columns in *X* and *B* (*nrhs* ≥ 0).
alpha, *beta*	REAL for slagtm/clagtm DOUBLE PRECISION for dlagtm/zlagtm The scalars α and β. *alpha* must be 0., 1., or -1.; otherwise, it is assumed to be 0. *beta* must be 0., 1., or -1.; otherwise, it is assumed to be 1.
dl, *d*, *du*	REAL for slagtm DOUBLE PRECISION for dlagtm COMPLEX for clagtm COMPLEX*16 for zlagtm. Arrays: *dl*(*n* - 1), *d*(*n*), *du*(*n* - 1). The array *dl* contains the (*n* - 1) sub-diagonal elements of *T*. The array *d* contains the *n* diagonal elements of *T*. The array *du* contains the (*n* - 1) super-diagonal elements of *T*.
x, *b*	REAL for slagtm DOUBLE PRECISION for dlagtm COMPLEX for clagtm COMPLEX*16 for zlagtm. Arrays: *x*(*ldx*,*) contains the *n*-by-*nrhs* matrix *X*. The second dimension of *x* must be at least max(1, *nrhs*).

	b(*ldb*,*) contains the *n*-by-*nrhs* matrix *B*. The second dimension of *b* must be at least max(1, *nrhs*).
ldx	INTEGER. The leading dimension of the array *x*; *ldx* ≥ max(1, *n*).
ldb	INTEGER. The leading dimension of the array *b*; *ldb* ≥ max(1, *n*).

Output Parameters

b	Overwritten by the matrix expression *B* := *alpha*A*X* + *beta*B*

?lagts

*Solves the system of equations (T - lambda*I)*x = y or (T - lambda*I)^T*x = y ,where T is a general tridiagonal matrix and lambda is a scalar, using the LU factorization computed by* ?lagtf*.*

Syntax

```
call slagts( job, n, a, b, c, d, in, y, tol, info )
call dlagts( job, n, a, b, c, d, in, y, tol, info )
```

Description

This routine may be used to solve for *x* one of the systems of equations:

(*T* – *lambda*I*)**x* = *y* or (*T* – *lambda*I*)'**x* = *y*,

where *T* is an *n*-by-*n* tridiagonal matrix, following the factorization of (*T* – *lambda*I*) as

T – *lambda*I* = *P*L*U*,

computed by the routine ?lagtf.

The choice of equation to be solved is controlled by the argument *job*, and in each case there is an option to perturb zero or very small diagonal elements of *U*, this option being intended for use in applications such as inverse iteration.

Input Parameters

job	INTEGER. Specifies the job to be performed by ?lagts as follows: = 1: The equations (*T* – *lambda***I*)*x* = *y* are to be solved, but diagonal elements of *U* are not to be perturbed. = -1: The equations (*T* – *lambda***I*)*x* = *y* are to be solved and, if overflow would otherwise occur, the diagonal elements of *U* are to be perturbed. See argument *tol* below. = 2: The equations (*T* – *lambda***I*)'*x* = *y* are to be solved, but diagonal elements of *U* are not to be perturbed. = -2: The equations (*T* – *lambda***I*)'*x* = *y* are to be solved and, if overflow would otherwise occur, the diagonal elements of *U* are to be perturbed. See argument *tol* below.
n	INTEGER. The order of the matrix *T* (*n* ≥ 0).
a, *b*, *c*, *d*	REAL for slagts DOUBLE PRECISION for dlagts Arrays, dimension *a*(*n*), *b*(*n*-1), *c*(*n*-1), *d*(*n*-2): On entry, *a*(*) must contain the diagonal elements of *U* as returned from ?lagtf. On entry, *b*(*) must contain the first super-diagonal elements of *U* as returned from ?lagtf. On entry, *c*(*) must contain the sub-diagonal elements of *L* as returned from ?lagtf. On entry, *d*(*) must contain the second super-diagonal elements of *U* as returned from ?lagtf.
in	INTEGER. Array, dimension (*n*). On entry, *in*(*) must contain details of the matrix *p* as returned from ?lagtf.
y	REAL for slagts DOUBLE PRECISION for dlagts Array, dimension (*n*). On entry, the right hand side vector *y*.
tol	REAL for slagtf DOUBLE PRECISION for dlagtf.

On entry, with *job* < 0, *tol* should be the minimum perturbation to be made to very small diagonal elements of *U*. *tol* should normally be chosen as about *eps**norm(*U*), where *eps* is the relative machine precision, but if *tol* is supplied as non-positive, then it is reset to *eps**max(abs(u(i,j))). If *job* > 0 then *tol* is not referenced.

Output Parameters

y — On exit, *y* is overwritten by the solution vector *x*.

tol — On exit, *tol* is changed as described in Input Parameters section above, only if *tol* is non-positive on entry. Otherwise *tol* is unchanged.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i* >0, overflow would occur when computing the *i*th element of the solution vector *x*. This can only occur when *job* is supplied as positive and either means that a diagonal element of *U* is very small, or that the elements of the right-hand side vector *y* are very large.

?lagv2

Computes the Generalized Schur factorization of a real 2-by-2 matrix pencil (A,B) where B is upper triangular.

Syntax

```
call slagv2( a, lda, b, ldb, alphar, alphai, beta, csl, snl, csr, snr )
call dlagv2( a, lda, b, ldb, alphar, alphai, beta, csl, snl, csr, snr )
```

Description

This routine computes the Generalized Schur factorization of a real 2-by-2 matrix pencil (*A*,*B*) where *B* is upper triangular. The routine computes orthogonal (rotation) matrices given by *csl*, *snl* and *csr*, *snr* such that:

1) if the pencil (*A*,*B*) has two real eigenvalues (include 0/0 or 1/0 types), then

$$\begin{bmatrix} a_{11} & a_{11} \\ 0 & a_{22} \end{bmatrix} = \begin{bmatrix} csl & snl \\ -snl & csl \end{bmatrix} \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix} \begin{bmatrix} csr & -snr \\ snr & csr \end{bmatrix}$$

$$\begin{bmatrix} b_{11} & b_{11} \\ 0 & b_{22} \end{bmatrix} = \begin{bmatrix} csl & snl \\ -snl & csl \end{bmatrix} \begin{bmatrix} b_{11} & b_{12} \\ 0 & b_{22} \end{bmatrix} \begin{bmatrix} csr & -snr \\ snr & csr \end{bmatrix}$$

2) if the pencil (*A*,*B*) has a pair of complex conjugate eigenvalues, then

$$\begin{bmatrix} a_{11} & a_{11} \\ a_{21} & a_{22} \end{bmatrix} = \begin{bmatrix} csl & snl \\ -snl & csl \end{bmatrix} \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix} \begin{bmatrix} csr & -snr \\ snr & csr \end{bmatrix}$$

$$\begin{bmatrix} b_{11} & 0 \\ 0 & b_{22} \end{bmatrix} = \begin{bmatrix} csl & snl \\ -snl & csl \end{bmatrix} \begin{bmatrix} b_{11} & b_{12} \\ 0 & b_{22} \end{bmatrix} \begin{bmatrix} csr & -snr \\ snr & csr \end{bmatrix}$$

where $b_{11} \geq b_{22} > 0$.

Input Parameters

a, *b*	`REAL` for `slagv2`
	`DOUBLE PRECISION` for `dlagv2`
	Arrays:
	a(*lda*,2) contains the 2-by-2 matrix *A*;
	b(*ldb*,2) contains the upper triangular 2-by-2 matrix *B*.

lda	`INTEGER`. The leading dimension of the array *a*; *lda* ≥ 2.

ldb	INTEGER. The leading dimension of the array *b*; *ldb* ≥ 2.

Output Parameters

a	On exit, *a* is overwritten by the "*A*-part" of the generalized Schur form.
b	On exit, *b* is overwritten by the "*B*-part" of the generalized Schur form.
alphar, *alphai*, *beta*	REAL for slagv2 DOUBLE PRECISION for dlagv2. Arrays, dimension (2) each. (*alphar*(k) + *i***alphai*(k))/*beta*(k) are the eigenvalues of the pencil (*A*,*B*), k=1,2 and *i* = sqrt(-1). Note that *beta*(k) may be zero.
csl, *snl*	REAL for slagv2 DOUBLE PRECISION for dlagv2 The cosine and sine of the left rotation matrix, respectively.
csr, *snr*	REAL for slagv2 DOUBLE PRECISION for dlagv2 The cosine and sine of the right rotation matrix, respectively.

?lahqr

Computes the eigenvalues and Schur factorization of an upper Hessenberg matrix, using the double-shift/single-shift QR algorithm.

Syntax

```
call slahqr( wantt, wantz, n, ilo, ihi, h, ldh, wr, wi, iloz, ihiz, z, ldz, info )
call dlahqr( wantt, wantz, n, ilo, ihi, h, ldh, wr, wi, iloz, ihiz, z, ldz, info )
call clahqr( wantt, wantz, n, ilo, ihi, h, ldh, w, iloz, ihiz, z, ldz, info )
call zlahqr( wantt, wantz, n, ilo, ihi, h, ldh, w, iloz, ihiz, z, ldz, info )
```

Description

This routine is an auxiliary routine called by ?hseqr to update the eigenvalues and Schur decomposition already computed by ?hseqr, by dealing with the Hessenberg submatrix in rows and columns *ilo* to *ihi*.

Input Parameters

wantt — LOGICAL.
If *wantt* = .TRUE., the full Schur form *T* is required;
If *wantt* = .FALSE., eigenvalues only are required.

wantz — LOGICAL.
If *wantz* = .TRUE., the matrix of Schur vectors *Z* is required;
If *wantz* = .FALSE., Schur vectors are not required.

n — INTEGER. The order of the matrix *H* (*n* ≥ 0).

ilo, *ihi* — INTEGER.

It is assumed that *h* is already upper quasi-triangular in rows and columns *ihi*+1:*n*, and that *h*(*ilo*,*ilo*-1) = 0 (unless *ilo* = 1). The routine ?lahqr works primarily with the Hessenberg submatrix in rows and columns *ilo* to *ihi*, but applies transformations to all of *h* if *wantt* = .TRUE.. Constraints:

1 ≤ *ilo* ≤ max(1,*ihi*); *ihi* ≤ *n*.

h, *z*

REAL for slahqr
DOUBLE PRECISION for dlahqr
COMPLEX for clahqr
COMPLEX*16 for zlahqr.
Arrays:
h(*ldh*,*) contains the upper Hessenberg matrix *h*.
The second dimension of *h* must be at least max(1, *n*).
z(*ldz*,*)
If *wantz* = .TRUE., then, on entry, *z* must contain the current matrix *z* of transformations accumulated by ?hseqr.
If *wantz* = .FALSE., then *z* is not referenced. The second dimension of *z* must be at least max(1, *n*).

ldh

INTEGER. The first dimension of *h*; at least max(1, *n*).

ldz

INTEGER. The first dimension of *z*; at least max(1, *n*).

iloz, *ihiz*

INTEGER. Specify the rows of *z* to which transformations must be applied if *wantz* = .TRUE..

1 ≤ *iloz* ≤ *ilo*; *ihi* ≤ *ihiz* ≤ *n*.

Output Parameters

h

On exit, if *info*= 0 and *wantt* = .TRUE., then,

- for slahqr/dlahqr, *h* is upper quasi-triangular in rows and columns *ilo*:*ihi* with any 2-by-2 diagonal blocks in standard form.
- for clahqr/zlahqr, *h* is upper triangular in rows and columns *ilo*:*ihi*.

If *info*= 0 and *wantt* = .FALSE., the contents of *h* are unspecified on exit. If *info* is positive, see description of *info* for the output state of *h*.

wr, *wi*

REAL for slahqr
DOUBLE PRECISION for dlahqr
Arrays, DIMENSION at least max(1, *n*) each. Used with real flavors only. The real and imaginary parts, respectively, of the computed eigenvalues *ilo* to *ihi* are stored in the corresponding elements of *wr* and *wi*. If two eigenvalues are computed as a complex conjugate pair, they are stored in consecutive elements of *wr* and *wi*, say the i-th and (i+1)-th, with *wi*(i)> 0 and *wi*(i+1) < 0.
If *wantt* = .TRUE., the eigenvalues are stored in the same order as on the diagonal of the Schur form returned in *h*, with *wr*(i) = *h*(i,i), and, if *h*(i:i+1, i:i+1) is a 2-by-2 diagonal block, *wi*(i) = sqrt(*h*(i+1,i)*h*(i,i+1)) and *wi*(i+1) = -*wi*(i).

w

COMPLEX for clahqr
COMPLEX*16 for zlahqr.
Array, DIMENSION at least max(1, *n*). Used with complex flavors only. The computed eigenvalues *ilo* to *ihi* are stored in the corresponding elements of *w*.
If *wantt* = .TRUE., the eigenvalues are stored in the same order as on the diagonal of the Schur form returned in *h*, with *w*(i) = *h*(i,i).

z

If *wantz* = .TRUE., then, on exit *z* has been updated; transformations are applied only to the submatrix *z*(*iloz*:*ihiz*, *ilo*:*ihi*).

info

INTEGER.
If *info* = 0, the execution is successful.
With *info* > 0,

- if *info* = *i*, ?lahqr failed to compute all the eigenvalues *ilo* to *ihi* in a total of 30 iterations per eigenvalue; elements i+1:*ihi* of *wr* and *wi* (for slahqr/dlahqr) or *w* (for clahqr/zlahqr) contain those eigenvalues which have been successfully computed.

- if *wantt* is .FALSE., then on exit the remaining unconverged eigenvalues are the eigenvalues of the upper Hessenberg matrix rows and columns *ilo* thorugh *info* of the final output value of *h*.
- if *wantt* is .TRUE., then on exit

  (initial value of *h*)*$_{(*)}$ *u* = *u**(final value of *h*),

  where *u* is an orthognal matrix. The final value of *h* is upper Hessenberg and triangular in rows and columns *info*+1 through *ihi*.
- if *wantz* is .TRUE., then on exit

  (final value of *z*) = (initial value of *z*)* *u*,

  where *u* is an orthognal matrix in (*) regardless of the value of *wantt*.

?lahrd

Reduces the first nb columns of a general rectangular matrix A so that elements below the k-th subdiagonal are zero, and returns auxiliary matrices which are needed to apply the transformation to the unreduced part of A.

Syntax

```
call slahrd( n, k, nb, a, lda, tau, t, ldt, y, ldy )
call dlahrd( n, k, nb, a, lda, tau, t, ldt, y, ldy )
call clahrd( n, k, nb, a, lda, tau, t, ldt, y, ldy )
call zlahrd( n, k, nb, a, lda, tau, t, ldt, y, ldy )
```

Description

The routine reduces the first *nb* columns of a real/complex general *n*-by-(*n*-*k*+1) matrix *A* so that elements below the *k*-th subdiagonal are zero. The reduction is performed by an orthogonal/unitary similarity transformation *Q*'**A***Q*. The routine returns the matrices *V* and *T* which determine *Q* as a block reflector *I* - *V***T***V*', and also the matrix *Y* = *A***V***T*.

The matrix *Q* is represented as products of *nb* elementary reflectors:

Q = *H*(1) *H*(2)... *H*(*nb*)

Each *H*(i) has the form

H(i) = *I* - *tau***v***v*'

where *tau* is a real/complex scalar, and *v* is a real/complex vector.

This is an obsolete auxiliary routine. Please use the new routine ?lahr2 instead.

Input Parameters

n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
k	INTEGER. The offset for the reduction. Elements below the *k*-th subdiagonal in the first *nb* columns are reduced to zero.
nb	INTEGER. The number of columns to be reduced.
a	REAL for slahrd DOUBLE PRECISION for dlahrd COMPLEX for clahrd COMPLEX*16 for zlahrd. Array *a*(*lda*, *n*-*k*+1) contains the *n*-by-(*n*-*k*+1) general matrix *A* to be reduced.
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
ldt	INTEGER. The first dimension of the output array *t*; must be at least max(1, *nb*).
ldy	INTEGER. The first dimension of the output array *y*; must be at least max(1, *n*).

Output Parameters

a	On exit, the elements on and above the *k*-th subdiagonal in the first *nb* columns are overwritten with the corresponding elements of the reduced matrix; the elements below the *k*-th subdiagonal, with the array *tau*, represent the matrix *Q* as a product of elementary reflectors. The other columns of *a* are unchanged. See Application Notes below.
tau	REAL for slahrd DOUBLE PRECISION for dlahrd COMPLEX for clahrd COMPLEX*16 for zlahrd. Array, DIMENSION (*nb*). Contains scalar factors of the elementary reflectors.
t, *y*	REAL for slahrd DOUBLE PRECISION for dlahrd COMPLEX for clahrd COMPLEX*16 for zlahrd. Arrays, dimension *t*(*ldt*, *nb*), *y*(*ldy*, *nb*). The array *t* contains upper triangular matrix *T*. The array *y* contains the *n*-by-*nb* matrix *Y* .

Application Notes

For the elementary reflector *H*(i),

v(1:i+*k*–1) = 0, *v*(i+*k*) = 1; *v*(i+*k*+1:*n*) is stored on exit in *a*(i+*k*+1:*n*, i) and *tau* is stored in *tau*(i).

The elements of the vectors *v* together form the (*n*-*k*+1)-by-*nb* matrix *V* which is needed, with *T* and *Y*, to apply the transformation to the unreduced part of the matrix, using an update of the form:

A := (*I* – *V T V'*) * (*A* – *Y V'*).

The contents of *A* on exit are illustrated by the following example with *n* = 7, *k* = 3 and *nb* = 2:

$$\begin{bmatrix} a & h & a & a & a \\ a & h & a & a & a \\ a & h & a & a & a \\ h & h & a & a & a \\ v_1 & h & a & a & a \\ v_1 & v_2 & a & a & a \\ v_1 & v_2 & a & a & a \end{bmatrix}$$

where *a* denotes an element of the original matrix *A*, *h* denotes a modified element of the upper Hessenberg matrix *H*, and v_i denotes an element of the vector defining *H*(i).

?lahr2

Reduces the specified number of first columns of a general rectangular matrix A so that elements below the specified subdiagonal are zero, and returns auxiliary matrices which are needed to apply the transformation to the unreduced part of A.

Syntax

```
call slahr2( n, k, nb, a, lda, tau, t, ldt, y, ldy )
call dlahr2( n, k, nb, a, lda, tau, t, ldt, y, ldy )
call clahr2( n, k, nb, a, lda, tau, t, ldt, y, ldy )
call zlahr2( n, k, nb, a, lda, tau, t, ldt, y, ldy )
```

Description

The routine reduces the first *nb* columns of a real/complex general *n*-by-(*n*-*k*+1) matrix *A* so that elements below the *k*-th subdiagonal are zero. The reduction is performed by an orthogonal/unitary similarity transformation *Q*'**A***Q*. The routine returns the matrices *V* and *T* which determine *Q* as a block reflector *I* - *V***T***V*', and also the matrix *Y* = *A***V***T*.

The matrix *Q* is represented as products of *nb* elementary reflectors:

Q = *H*(1) *H*(2)... *H*(*nb*)

Each *H*(i) has the form

H(i) = *I* - *tau***v***v*'

where *tau* is a real/complex scalar, and *v* is a real/complex vector.

This is an auxiliary routine called by ?gehrd.

Input Parameters

n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
k	INTEGER. The offset for the reduction. Elements below the *k*-th subdiagonal in the first *nb* columns are reduced to zero (*k* < *n*).
nb	INTEGER. The number of columns to be reduced.
a	REAL for slahr2 DOUBLE PRECISION for dlahr2 COMPLEX for clahr2 COMPLEX*16 for zlahr2. Array, DIMENSION (*lda*, *n*-*k*+1) contains the *n*-by-(*n*-*k*+1) general matrix *A* to be reduced.
lda	INTEGER. The first dimension of the array *a*; *lda* ≥ max(1, *n*).
ldt	INTEGER. The first dimension of the output array *t*; *ldt* ≥ *nb*.
ldy	INTEGER. The first dimension of the output array *y*; *ldy* ≥ *n*.

Output Parameters

a	On exit, the elements on and above the *k*-th subdiagonal in the first *nb* columns are overwritten with the corresponding elements of the reduced matrix; the elements below the *k*-th subdiagonal, with the array *tau*, represent the matrix *Q* as a product of elementary reflectors. The other columns of *a* are unchanged. See Application Notes below.

tau	REAL for slahr2 DOUBLE PRECISION for dlahr2 COMPLEX for clahr2 COMPLEX*16 for zlahr2. Array, DIMENSION (*nb*). Contains scalar factors of the elementary reflectors.
t, *y*	REAL for slahr2 DOUBLE PRECISION for dlahr2 COMPLEX for clahr2 COMPLEX*16 for zlahr2. Arrays, dimension *t*(*ldt*, *nb*), *y*(*ldy*, *nb*). The array *t* contains upper triangular matrix *T*. The array *y* contains the *n*-by-*nb* matrix *Y* .

Application Notes

For the elementary reflector *H*(i),

v(1:i+*k*-1) = 0, *v*(i+*k*) = 1; *v*(i+*k*+1:*n*) is stored on exit in *a*(i+*k*+1:*n*, i) and *tau* is stored in *tau*(i).

The elements of the vectors *v* together form the (*n*-*k*+1)-by-*nb* matrix *V* which is needed, with *T* and *Y*, to apply the transformation to the unreduced part of the matrix, using an update of the form:

A := (*I* - *V***T***V*') * (*A* - *Y***V*').

The contents of *A* on exit are illustrated by the following example with *n* = 7, *k* = 3 and *nb* = 2:

$$\begin{bmatrix} a & a & a & a & a \\ a & a & a & a & a \\ a & a & a & a & a \\ h & h & a & a & a \\ v_1 & h & a & a & a \\ v_1 & v_2 & a & a & a \\ v_1 & v_2 & a & a & a \end{bmatrix}$$

where *a* denotes an element of the original matrix *A*, *h* denotes a modified element of the upper Hessenberg matrix *H*, and v_i denotes an element of the vector defining *H*(i).

?laic1

Applies one step of incremental condition estimation.

Syntax

```
call slaic1( job, j, x, sest, w, gamma, sestpr, s, c )
call dlaic1( job, j, x, sest, w, gamma, sestpr, s, c )
call claic1( job, j, x, sest, w, gamma, sestpr, s, c )
call zlaic1( job, j, x, sest, w, gamma, sestpr, s, c )
```

Description

The routine ?laic1 applies one step of incremental condition estimation in its simplest version.

Let *x*, $||x||_2 = 1$ (where $||a||_2$ denotes the 2-norm of *a*), be an approximate singular vector of an *j*-by-*j* lower triangular matrix *L*, such that

$||L*x||_2 = sest$

Then ?laic1 computes *sestpr*, *s*, *c* such that the vector

$$xhat = \begin{bmatrix} s*x \\ c \end{bmatrix}$$

is an approximate singular vector of

$$Lhat = \begin{bmatrix} L & 0 \\ w' & gamma \end{bmatrix}$$

in the sense that

$||Lhat*xhat||_2 = sestpr$.

Depending on *job*, an estimate for the largest or smallest singular value is computed.

Note that `[s c]'` and $sestpr^2$ is an eigenpair of the system (for `slaic1`/`claic`)

$$\mathrm{diag}(sest*sest, 0) + [alpha\ gamma] * \begin{bmatrix} alpha \\ gamma \end{bmatrix}$$

where $alpha = x'*w$;

or of the system (for `claic1`/`zlaic`)

$$\mathrm{diag}(sest*sest, 0) + [alpha\ gamma] * \begin{bmatrix} \mathrm{conjg}(alpha) \\ \mathrm{conjg}(gamma) \end{bmatrix}$$

where $alpha = \mathrm{conjg}(x)'*w$.

Input Parameters

job	`INTEGER`. If *job* =1, an estimate for the largest singular value is computed; If *job* =2, an estimate for the smallest singular value is computed;
j	`INTEGER`. Length of *x* and *w*.

x, *w*	`REAL` for `slaic1`
	`DOUBLE PRECISION` for `dlaic1`
	`COMPLEX` for `claic1`
	`COMPLEX*16` for `zlaic1`.
	Arrays, dimension (*j*) each. Contain vectors *x* and *w*, respectively.

sest	`REAL` for `slaic1`/`claic1`;

DOUBLE PRECISION for dlaic1/zlaic1.
Estimated singular value of *j*-by-*j* matrix *L*.

gamma — REAL for slaic1
DOUBLE PRECISION for dlaic1
COMPLEX for claic1
COMPLEX*16 for zlaic1.
The diagonal element *gamma*.

Output Parameters

sestpr — REAL for slaic1/claic1;
DOUBLE PRECISION for dlaic1/zlaic1.
Estimated singular value of (*j*+1)-by-(*j*+1) matrix *Lhat*.

s, *c* — REAL for slaic1
DOUBLE PRECISION for dlaic1
COMPLEX for claic1
COMPLEX*16 for zlaic1.
Sine and cosine needed in forming *xhat*.

?laln2

Solves a 1-by-1 or 2-by-2 linear system of equations of the specified form.

Syntax

```
call slaln2( ltrans, na, nw, smin, ca, a, lda, d1, d2, b, ldb, wr, wi, x, ldx, scale, xnorm, info )
```

```
call dlaln2( ltrans, na, nw, smin, ca, a, lda, d1, d2, b, ldb, wr, wi, x, ldx, scale, xnorm, info )
```

Description

The routine solves a system of the form

`(ca*A - w*D)*X = s*B`, or `(ca*A' - w*D)*X = s*B`

with possible scaling (*s*) and perturbation of *A* (*A'* means *A*-transpose.)

A is an *na*-by-*na* real matrix, *ca* is a real scalar, *D* is an *na*-by-*na* real diagonal matrix, *w* is a real or complex value, and *X* and *B* are *na*-by-1 matrices: real if *w* is real, complex if *w* is complex. The parameter *na* may be 1 or 2.

If *w* is complex, *X* and *B* are represented as *na*-by-2 matrices, the first column of each being the real part and the second being the imaginary part.

The routine computes the scaling factor *s* (≤ 1) so chosen that *X* can be computed without overflow. *X* is further scaled if necessary to assure that norm(*ca***A* - *w***D*)*norm(*X*) is less than overflow.

If both singular values of (*ca*&**A* - *w***D*) are less than *smin*, *smin***I* (where *I* stands for identity) will be used instead of (*ca***A* - *w***D*). If only one singular value is less than *smin*, one element of (*ca***A* - *w***D*) will be perturbed enough to make the smallest singular value roughly *smin*.

If both singular values are at least *smin*, (*ca***A* - *w***D*) will not be perturbed. In any case, the perturbation will be at most some small multiple of max(*smin*, *ulp**norm(*ca***A* - *w***D*)).

The singular values are computed by infinity-norm approximations, and thus will only be correct to a factor of 2 or so.

NOTE. All input quantities are assumed to be smaller than overflow by a reasonable factor (see *bignum*).

Input Parameters

trans	LOGICAL. If *trans* = .TRUE., *A*- transpose will be used. If *trans* = .FALSE., *A* will be used (not transposed.)
na	INTEGER. The size of the matrix *A*, possible values 1 or 2.
nw	INTEGER. This parameter must be 1 if *w* is real, and 2 if *w* is complex. Possible values 1 or 2.
smin	REAL for slaln2 DOUBLE PRECISION for dlaln2. The desired lower bound on the singular values of *A*.

This should be a safe distance away from underflow or overflow, for example, between (underflow/machine_precision) and (machine_precision * overflow). (See *bignum* and *ulp*).

ca — REAL for slaln2
DOUBLE PRECISION for dlaln2.
The coefficient by which *A* is multiplied.

a — REAL for slaln2
DOUBLE PRECISION for dlaln2.
Array, DIMENSION (*lda*,*na*).
The *na*-by-*na* matrix *A*.

lda — INTEGER. The leading dimension of *a*. Must be at least *na*.

d1, *d2* — REAL for slaln2
DOUBLE PRECISION for dlaln2.
The (1,1) and (2,2) elements in the diagonal matrix *D*, respectively. *d2* is not used if *nw* = 1.

b — REAL for slaln2
DOUBLE PRECISION for dlaln2.
Array, DIMENSION (*ldb*,*nw*). The *na*-by-*nw* matrix *B* (right-hand side). If *nw* =2 (*w* is complex), column 1 contains the real part of *B* and column 2 contains the imaginary part.

ldb — INTEGER. The leading dimension of *b*. Must be at least *na*.

wr, *wi* — REAL for slaln2
DOUBLE PRECISION for dlaln2.
The real and imaginary part of the scalar *w*, respectively. *wi* is not used if *nw* = 1.

ldx — INTEGER. The leading dimension of the output array *x*. Must be at least *na*.

Output Parameters

x — REAL for slaln2
DOUBLE PRECISION for dlaln2.
Array, DIMENSION (*ldx*,*nw*). The *na*-by-*nw* matrix *X* (unknowns), as computed by the routine. If *nw* = 2 (*w* is complex), on exit, column 1 will contain the real part of *X* and column 2 will contain the imaginary part.

scale	REAL for slaln2 DOUBLE PRECISION for dlaln2. The scale factor that *B* must be multiplied by to insure that overflow does not occur when computing *X*. Thus (*ca*A* – *w*D*) *X* will be *scale***B*, not *B* (ignoring perturbations of *A*.) It will be at most 1.
xnorm	REAL for slaln2 DOUBLE PRECISION for dlaln2. The infinity-norm of *X*, when *X* is regarded as an *na*-by-*nw* real matrix.
info	INTEGER. An error flag. It will be zero if no error occurs, a negative number if an argument is in error, or a positive number if (*ca*A* – *w*D*) had to be perturbed. The possible values are: If *info* = 0: no error occurred, and (*ca*A* – *w*D*) did not have to be perturbed. If *info* = 1: (*ca*A* – *w*D*) had to be perturbed to make its smallest (or only) singular value greater than *smin*.

NOTE. For higher speed, this routine does not check the inputs for errors.

?lals0

Applies back multiplying factors in solving the least squares problem using divide and conquer SVD approach. Used by ?gelsd.

Syntax

```
call slals0 ( icompq, nl, nr, sqre, nrhs, b, ldb, bx, ldbx, perm, givptr,
givcol, ldgcol, givnum, ldgnum, poles, difl, difr, z, k, c, s, work, info )

call dlals0 ( icompq, nl, nr, sqre, nrhs, b, ldb, bx, ldbx, perm, givptr,
givcol, ldgcol, givnum, ldgnum, poles, difl, difr, z, k, c, s, work, info )

call clals0( icompq, nl, nr, sqre, nrhs, b, ldb, bx, ldbx, perm, givptr,
givcol, ldgcol, givnum, ldgnum, poles, difl, difr, z, k, c, s, rwork, info )

call zlals0( icompq, nl, nr, sqre, nrhs, b, ldb, bx, ldbx, perm, givptr,
givcol, ldgcol, givnum, ldgnum, poles, difl, difr, z, k, c, s, rwork, info )
```

Description

The routine applies back the multiplying factors of either the left or right singular vector matrix of a diagonal matrix appended by a row to the right hand side matrix *B* in solving the least squares problem using the divide-and-conquer SVD approach.

For the left singular vector matrix, three types of orthogonal matrices are involved:

(1L) Givens rotations: the number of such rotations is *givptr*;the pairs of columns/rows they were applied to are stored in *givcol*;and the *c*- and *s*-values of these rotations are stored in *givnum*.

(2L) Permutation. The (*nl*+1)-st row of *B* is to be moved to the first row, and for j=2:*n*, *perm*(*j*)-th row of *B* is to be moved to the *j*-th row.

(3L) The left singular vector matrix of the remaining matrix.

For the right singular vector matrix, four types of orthogonal matrices are involved:

(1R) The right singular vector matrix of the remaining matrix.

(2R) If *sqre* = 1, one extra Givens rotation to generate the right null space.

(3R) The inverse transformation of (2L).

(4R) The inverse transformation of (1L).

Input Parameters

icompq	INTEGER. Specifies whether singular vectors are to be computed in factored form: If *icompq* = 0: Left singular vector matrix. If *icompq* = 1: Right singular vector matrix.
nl	INTEGER. The row dimension of the upper block. *nl* ≥ 1.
nr	INTEGER. The row dimension of the lower block. *nr* ≥ 1.
sqre	INTEGER. If *sqre* = 0: the lower block is an *nr*-by-*nr* square matrix. If *sqre* = 1: the lower block is an *nr*-by-(*nr*+1) rectangular matrix. The bidiagonal matrix has row dimension *n* = *nl* + *nr* + 1, and column dimension *m* = *n* + *sqre*.
nrhs	INTEGER. The number of columns of *B* and *bx*. Must be at least 1.
b	REAL for slals0 DOUBLE PRECISION for dlals0 COMPLEX for clals0 COMPLEX*16 for zlals0. Array, DIMENSION (*ldb*, *nrhs*). Contains the right hand sides of the least squares problem in rows 1 through *m*.
ldb	INTEGER. The leading dimension of *b*. Must be at least max(1,max(*m*, *n*)).
bx	REAL for slals0 DOUBLE PRECISION for dlals0 COMPLEX for clals0 COMPLEX*16 for zlals0. Workspace array, DIMENSION (*ldbx*, *nrhs*).
ldbx	INTEGER. The leading dimension of *bx*.
perm	INTEGER. Array, DIMENSION (*n*). The permutations (from deflation and sorting) applied to the two blocks.

givptr — INTEGER. The number of Givens rotations which took place in this subproblem.

givcol — INTEGER. Array, DIMENSION (*ldgcol*, 2). Each pair of numbers indicates a pair of rows/columns involved in a Givens rotation.

ldgcol — INTEGER. The leading dimension of *givcol*, must be at least *n*.

givnum — REAL for slals0/clals0
DOUBLE PRECISION for dlals0/zlals0
Array, DIMENSION (*ldgnum*, 2). Each number indicates the *c* or *s* value used in the corresponding Givens rotation.

ldgnum — INTEGER. The leading dimension of arrays *difr*, *poles* and *givnum*, must be at least *k*.

poles — REAL for slals0/clals0
DOUBLE PRECISION for dlals0/zlals0
Array, DIMENSION (*ldgnum*, 2). On entry, *poles*(1:*k*, 1) contains the new singular values obtained from solving the secular equation, and *poles*(1:*k*, 2) is an array containing the poles in the secular equation.

difl — REAL for slals0/clals0
DOUBLE PRECISION for dlals0/zlals0
Array, DIMENSION (*k*). On entry, *difl*(*i*) is the distance between *i*-th updated (undeflated) singular value and the *i*-th (undeflated) old singular value.

difr — REAL for slals0/clals0
DOUBLE PRECISION for dlals0/zlals0
Array, DIMENSION (*ldgnum*, 2). On entry, *difr*(*i*, 1) contains the distances between *i*-th updated (undeflated) singular value and the *i*+*1*-th (undeflated) old singular value. And *difr*(*i*, 2) is the normalizing factor for the *i*-th right singular vector.

z — REAL for slals0/clals0
DOUBLE PRECISION for dlals0/zlals0
Array, DIMENSION (*k*). Contains the components of the deflation-adjusted updating row vector.

K	INTEGER. Contains the dimension of the non-deflated matrix. This is the order of the related secular equation. $1 \leq k \leq n$.
c	REAL for slals0/clals0 DOUBLE PRECISION for dlals0/zlals0 Contains garbage if *sqre* =0 and the *c* value of a Givens rotation related to the right null space if *sqre* = 1.
s	REAL for slals0/clals0 DOUBLE PRECISION for dlals0/zlals0 Contains garbage if *sqre* =0 and the *s* value of a Givens rotation related to the right null space if *sqre* = 1.
work	REAL for slals0 DOUBLE PRECISION for dlals0 Workspace array, DIMENSION (*k*). Used with real flavors only.
rwork	REAL for clals0 DOUBLE PRECISION for zlals0 Workspace array, DIMENSION (*k**(1+*nrhs*) + 2**nrhs*). Used with complex flavors only.

Output Parameters

b	On exit, contains the solution *X* in rows 1 through *n*.
info	INTEGER. If *info* = 0: successful exit. If *info* = -*i* < 0, the *i*-th argument had an illegal value.

?lalsa

Computes the SVD of the coefficient matrix in compact form. Used by ?gelsd.

Syntax

call slalsa(*icompq, smlsiz, n, nrhs, b, ldb, bx, ldbx, u, ldu, vt, k, difl, difr, z, poles, givptr, givcol, ldgcol, perm, givnum, c, s, work, iwork, info*)

call dlalsa(*icompq, smlsiz, n, nrhs, b, ldb, bx, ldbx, u, ldu, vt, k, difl, difr, z, poles, givptr, givcol, ldgcol, perm, givnum, c, s, work, iwork, info*)

call clalsa(*icompq, smlsiz, n, nrhs, b, ldb, bx, ldbx, u, ldu, vt, k, difl, difr, z, poles, givptr, givcol, ldgcol, perm, givnum, c, s, rwork, iwork, info*)

call zlalsa(*icompq, smlsiz, n, nrhs, b, ldb, bx, ldbx, u, ldu, vt, k, difl, difr, z, poles, givptr, givcol, ldgcol, perm, givnum, c, s, rwork, iwork, info*)

Description

The routine is an itermediate step in solving the least squares problem by computing the SVD of the coefficient matrix in compact form. The singular vectors are computed as products of simple orthorgonal matrices.

If *icompq* = 0, ?lalsa applies the inverse of the left singular vector matrix of an upper bidiagonal matrix to the right hand side; and if *icompq* = 1, the routine applies the right singular vector matrix to the right hand side. The singular vector matrices were generated in the compact form by ?lalsa.

Input Parameters

icompq — INTEGER. Specifies whether the left or the right singular vector matrix is involved. If *icompq* = 0: left singular vector matrix is used
If *icompq* = 1: right singular vector matrix is used.

smlsiz — INTEGER. The maximum size of the subproblems at the bottom of the computation tree.

n	INTEGER. The row and column dimensions of the upper bidiagonal matrix.
nrhs	INTEGER. The number of columns of *b* and *bx*. Must be at least 1.
b	REAL for slalsa DOUBLE PRECISION for dlalsa COMPLEX for clalsa COMPLEX*16 for zlalsa Array, DIMENSION (*ldb*, *nrhs*). Contains the right hand sides of the least squares problem in rows 1 through *m*.
ldb	INTEGER. The leading dimension of *b* in the calling subprogram. Must be at least max(1,max(*m*, *n*)).
ldbx	INTEGER. The leading dimension of the output array *bx*.
u	REAL for slalsa/clalsa DOUBLE PRECISION for dlalsa/zlalsa Array, DIMENSION (*ldu*, *smlsiz*). On entry, *u* contains the left singular vector matrices of all subproblems at the bottom level.
ldu	INTEGER, *ldu* ≥ *n*. The leading dimension of arrays *u*, *vt*, *difl*, *difr*, *poles*, *givnum*, and *z*.
vt	REAL for slalsa/clalsa DOUBLE PRECISION for dlalsa/zlalsa Array, DIMENSION (*ldu*, *smlsiz* +1). On entry, contains the right singular vector matrices of all subproblems at the bottom level.
k	INTEGER array, DIMENSION (*n*).
difl	REAL for slalsa/clalsa DOUBLE PRECISION for dlalsa/zlalsa Array, DIMENSION (*ldu*, *nlvl*), where *nlvl* = int($\log_2$(*n* /(*smlsiz*+1))) + 1.
difr	REAL for slalsa/clalsa DOUBLE PRECISION for dlalsa/zlalsa

	Array, DIMENSION (*ldu*, 2**nlvl*). On entry, *difl*(*, *i*) and *difr*(*, 2*i* -1) record distances between singular values on the *i*-th level and singular values on the (*i* -1)-th level, and *difr*(*, 2*i*) record the normalizing factors of the right singular vectors matrices of subproblems on *i*-th level.
z	REAL for slalsa/clalsa DOUBLE PRECISION for dlalsa/zlalsa Array, DIMENSION (*ldu*, *nlvl* . On entry, *z*(1, *i*) contains the components of the deflation- adjusted updating the row vector for subproblems on the *i*-th level.
poles	REAL for slalsa/clalsa DOUBLE PRECISION for dlalsa/zlalsa Array, DIMENSION (*ldu*, 2**nlvl*). On entry, *poles*(*, 2*i*-1: 2*i*) contains the new and old singular values involved in the secular equations on the *i*-th level.
givptr	INTEGER. Array, DIMENSION (*n*). On entry, *givptr*(*i*) records the number of Givens rotations performed on the *i*-th problem on the computation tree.
givcol	INTEGER. Array, DIMENSION (*ldgcol*, 2**nlvl*). On entry, for each *i*, *givcol*(*, 2*i*-1: 2*i*) records the locations of Givens rotations performed on the *i*-th level on the computation tree.
ldgcol	INTEGER, *ldgcol* ≥ *n*. The leading dimension of arrays *givcol* and *perm*.
perm	INTEGER. Array, DIMENSION (*ldgcol*, *nlvl*). On entry, *perm*(*, *i*) records permutations done on the *i*-th level of the computation tree.
givnum	REAL for slalsa/clalsa DOUBLE PRECISION for dlalsa/zlalsa Array, DIMENSION (*ldu*, 2**nlvl*). On entry, *givnum*(*, 2*i*-1 : 2*i*) records the *c* and *s* values of Givens rotations performed on the *i*-th level on the computation tree.
c	REAL for slalsa/clalsa DOUBLE PRECISION for dlalsa/zlalsa

Array, DIMENSION (*n*). On entry, if the *i*-th subproblem is not square, *c*(*i*) contains the *c* value of a Givens rotation related to the right null space of the *i*-th subproblem.

s
REAL for slalsa/clalsa
DOUBLE PRECISION for dlalsa/zlalsa
Array, DIMENSION (*n*). On entry, if the *i*-th subproblem is not square, *s*(*i*) contains the *s*-value of a Givens rotation related to the right null space of the *i*-th subproblem.

work
REAL for slalsa
DOUBLE PRECISION for dlalsa
Workspace array, DIMENSION at least (*n*). Used with real flavors only.

rwork
REAL for clalsa
DOUBLE PRECISION for zlalsa
Workspace array, DIMENSION at least max(*n*, (*smlsz*+1)**nrhs**3). Used with complex flavors only.

iwork
INTEGER.
Workspace array, DIMENSION at least (3*n*).

Output Parameters

b
On exit, contains the solution *X* in rows 1 through *n*.

bx
REAL for slalsa
DOUBLE PRECISION for dlalsa
COMPLEX for clalsa
COMPLEX*16 for zlalsa
Array, DIMENSION (*ldbx*, *nrhs*). On exit, the result of applying the left or right singular vector matrix to *b*.

info
INTEGER. If *info* = 0: successful exit
If *info* = -*i* < 0, the *i*-th argument had an illegal value.

?lalsd

Uses the singular value decomposition of A to solve the least squares problem.

Syntax

```
call slalsd( uplo, smlsiz, n, nrhs, d, e, b, ldb, rcond, rank, work, iwork, info )
call dlalsd( uplo, smlsiz, n, nrhs, d, e, b, ldb, rcond, rank, work, iwork, info )
call clalsd( uplo, smlsiz, n, nrhs, d, e, b, ldb, rcond, rank, work, rwork, iwork, info )
call zlalsd( uplo, smlsiz, n, nrhs, d, e, b, ldb, rcond, rank, work, rwork, iwork, info )
```

Description

The routine uses the singular value decomposition of *A* to solve the least squares problem of finding *X* to minimize the Euclidean norm of each column of *A***X*-*B*, where *A* is *n*-by-*n* upper bidiagonal, and *X* and *B* are *n*-by-*nrhs*. The solution *X* overwrites *B*.

The singular values of *A* smaller than *rcond* times the largest singular value are treated as zero in solving the least squares problem; in this case a minimum norm solution is returned. The actual singular values are returned in *d* in ascending order.

This code makes very mild assumptions about floating point arithmetic. It will work on machines with a guard digit in add/subtract, or on those binary machines without guard digits which subtract like the Cray XMP, Cray YMP, Cray C 90, or Cray 2.

It could conceivably fail on hexadecimal or decimal machines without guard digits, but we know of none.

Input Parameters

uplo	CHARACTER*1. If *uplo* = 'U', *d* and *e* define an upper bidiagonal matrix. If *uplo* = 'L', *d* and *e* define a lower bidiagonal matrix.
smlsiz	INTEGER. The maximum size of the subproblems at the bottom of the computation tree.

n	INTEGER. The dimension of the bidiagonal matrix. $n \geq 0$.
nrhs	INTEGER. The number of columns of *B*. Must be at least 1.
d	REAL for slalsd/clalsd DOUBLE PRECISION for dlalsd/zlalsd Array, DIMENSION (*n*). On entry, *d* contains the main diagonal of the bidiagonal matrix.
e	REAL for slalsd/clalsd DOUBLE PRECISION for dlalsd/zlalsd Array, DIMENSION (*n*-1). Contains the super-diagonal entries of the bidiagonal matrix. On exit, *e* is destroyed.
b	REAL for slalsd DOUBLE PRECISION for dlalsd COMPLEX for clalsd COMPLEX*16 for zlalsd Array, DIMENSION (*ldb*,*nrhs*). On input, *b* contains the right hand sides of the least squares problem. On output, *b* contains the solution X.
ldb	INTEGER. The leading dimension of *b* in the calling subprogram. Must be at least max(1,*n*).
rcond	REAL for slalsd/clalsd DOUBLE PRECISION for dlalsd/zlalsd The singular values of *A* less than or equal to *rcond* times the largest singular value are treated as zero in solving the least squares problem. If *rcond* is negative, machine precision is used instead. For example, for the least squares problem diag(*S*)**X*=*B*, where diag(*S*) is a diagonal matrix of singular values, the solution is *X*(*i*)=*B*(*i*)/*S*(*i*) if *S*(*i*) is greater than *rcond* *max(*S*), and *X*(*i*)=0 if *S*(*i*) is less than or equal to *rcond* *max(*S*).
rank	INTEGER. The number of singular values of *A* greater than *rcond* times the largest singular value.
work	REAL for slalsd DOUBLE PRECISION for dlalsd COMPLEX for clalsd COMPLEX*16 for zlalsd

Workspace array.
DIMENSION for real flavors at least $(9n+2n*smlsiz+8n*nlvl+n*nrhs+(smlsiz+1)^2)$, where $nlvl = \max(0, \text{int}(\log_2(n/(smlsiz+1))) + 1)$.
DIMENSION for complex flavors is $(n*nrhs)$.

rwork — REAL for clalsd
DOUBLE PRECISION for zlalsd
Workspace array, used with complex flavors only.
DIMENSION at least $(9n + 2n*smlsiz + 8n*nlvl + 3*mlsiz*nrhs + (smlsiz+1)^2)$, where $nlvl = \max(0, \text{int}(\log_2(\min(m,n)/(smlsiz+1))) + 1)$.

iwork — INTEGER.
Workspace array of DIMENSION $(3n*nlvl + 11n)$.

Output Parameters

d — On exit, if $info = 0$, d contains singular values of the bidiagonal matrix.

e — On exit, destroyed.

b — On exit, b contains the solution X.

info — INTEGER.
If $info = 0$: successful exit.
If $info = -i < 0$, the i-th argument had an illegal value.
If $info > 0$: The algorithm failed to compute a singular value while working on the submatrix lying in rows and columns $info/(n+1)$ through $\text{mod}(info, n+1)$.

?lamrg

Creates a permutation list to merge the entries of two independently sorted sets into a single set sorted in acsending order.

Syntax

```
call slamrg( n1, n2, a, strd1, strd2, index )
call dlamrg( n1, n2, a, strd1, strd2, index )
```

Description

The routine creates a permutation list which will merge the elements of *a* (which is composed of two independently sorted sets) into a single set which is sorted in ascending order.

Input Parameters

n1, *n2*	INTEGER. These arguments contain the respective lengths of the two sorted lists to be merged.
a	REAL for slamrg DOUBLE PRECISION for dlamrg. Array, DIMENSION (*n1*+*n2*). The first *n1* elements of *a* contain a list of numbers which are sorted in either ascending or descending order. Likewise for the final *n2* elements.
strd1, *strd2*	INTEGER. These are the strides to be taken through the array *a*. Allowable strides are 1 and -1. They indicate whether a subset of *a* is sorted in ascending (*strdx* = 1) or descending (*strdx* = –1) order.

Output Parameters

index	INTEGER. Array, DIMENSION (*n1*+*n2*). On exit, this array will contain a permutation such that if *b*(*i*) = *a*(*index*(*i*)) for *i*=1, *n1*+*n2*, then *b* will be sorted in ascending order.

?laneg

Computes the Sturm count, the number of negative pivots encountered while factoring tridiagonal $T-sigma*I = L*D*L^T$.

Syntax

```
value = slaneg( n, d, lld, sigma, pivmin, r )
value = dlaneg( n, d, lld, sigma, pivmin, r )
```

Description

The routine computes the Sturm count, the number of negative pivots encountered while factoring tridiagonal $T-sigma*I = L*D*L^T$. This implementation works directly on the factors without forming the tridiagonal matrix T. The Sturm count is also the number of eigenvalues of T less than *sigma*. This routine is called from ?larb. The current routine does not use the *pivmin* parameter but rather requires IEEE-754 propagation of infinities and NaNs (NaN stands for 'Not A Number'). This routine also has no input range restrictions but does require default exception handling such that $x/0$ produces Inf when x is non-zero, and Inf/Inf produces NaN. (For more information see [Marques06]).

Input Parameters

n	INTEGER. The order of the matrix.
d	REAL for slaneg DOUBLE PRECISION for dlaneg Array, DIMENSION (*n*). Contains *n* diagonal elements of the matrix *D*.
lld	REAL for slaneg DOUBLE PRECISION for dlaneg Array, DIMENSION (*n*-1). Contains (*n*-1) elements *L*(i)**L*(i)**D*(i).
sigma	REAL for slaneg DOUBLE PRECISION for dlaneg Shift amount in *T*-*sigma***I* = *L***D***L****T*.
pivmin	REAL for slaneg DOUBLE PRECISION for dlaneg

	The minimum pivot in the Sturm sequence. May be used when zero pivots are encountered on non-IEEE-754 architectures.
r	INTEGER. The twist index for the twisted factorization that is used for the negcount.

Output Parameters

value	INTEGER. The number of negative pivots encountered while factoring.

?langb

Returns the value of the 1-norm, Frobenius norm, infinity-norm, or the largest absolute value of any element of general band matrix.

Syntax

val = slangb(*norm*, *n*, *kl*, *ku*, *ab*, *ldab*, *work*)

val = dlangb(*norm*, *n*, *kl*, *ku*, *ab*, *ldab*, *work*)

val = clangb(*norm*, *n*, *kl*, *ku*, *ab*, *ldab*, *work*)

val = zlangb(*norm*, *n*, *kl*, *ku*, *ab*, *ldab*, *work*)

Description

The function returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of an *n*-by-*n* band matrix *A*, with *kl* sub-diagonals and *ku* super-diagonals.

The value *val* returned by the function is:

val = max(abs(A_{ij})), if *norm* = 'M' or 'm'

= norm1(*A*), if *norm* = '1' or 'O' or 'o'

= normI(*A*), if *norm* = 'I' or 'i'

= normF(*A*), if *norm* = 'F', 'f', 'E' or 'e'

where norm1 denotes the 1-norm of a matrix (maximum column sum), normI denotes the infinity norm of a matrix (maximum row sum) and normF denotes the Frobenius norm of a matrix (square root of sum of squares). Note that max(abs(A_{ij})) is not a consistent matrix norm.

Input Parameters

norm — CHARACTER*1. Specifies the vaule to be returned by the routine as described above.

n — INTEGER. The order of the matrix *A*. $n \geq 0$. When $n = 0$, ?langb is set to zero.

kl — INTEGER. The number of sub-diagonals of the matrix *A*. $kl \geq 0$.

ku — INTEGER. The number of super-diagonals of the matrix *A*. $ku \geq 0$.

ab — REAL for slangb
DOUBLE PRECISION for dlangb
COMPLEX for clangb
COMPLEX*16 for zlangb
Array, DIMENSION (*ldab*,*n*).
The band matrix *A*, stored in rows 1 to *kl*+*ku*+1. The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows:
$ab(ku+1+i-j,j) = a(i,j)$
for $\max(1,j-ku) \leq i \leq \min(n,j+kl)$.

ldab — INTEGER. The leading dimension of the array *ab*. $ldab \geq kl+ku+1$.

work — REAL for slangb/clangb
DOUBLE PRECISION for dlangb/zlangb
Workspace array, DIMENSION (max(1,*lwork*)), where $lwork \geq n$ when *norm* = 'I'; otherwise, *work* is not referenced.

Output Parameters

val — REAL for slangb/clangb

DOUBLE PRECISION for dlangb/zlangb
Value returned by the function.

?lange

Returns the value of the 1-norm, Frobenius norm, infinity-norm, or the largest absolute value of any element of a general rectangular matrix.

Syntax

```
val = slange( norm, m, n, a, lda, work )
val = dlange( norm, m, n, a, lda, work )
val = clange( norm, m, n, a, lda, work )
val = zlange( norm, m, n, a, lda, work )
```

Description

The function ?lange returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a real/complex matrix A.

The value *val* returned by the function is:

val = max(abs(A_{ij})), if *norm* = 'M' or 'm'

= norm1(A), if *norm* = '1' or 'O' or 'o'

= normI(A), if *norm* = 'I' or 'i'

= normF(A), if *norm* = 'F', 'f', 'E' or 'e'

where norm1 denotes the 1-norm of a matrix (maximum column sum), normI denotes the infinity norm of a matrix (maximum row sum) and normF denotes the Frobenius norm of a matrix (square root of sum of squares). Note that max(abs(A_{ij})) is not a consistent matrix norm.

Input Parameters

norm — CHARACTER*1. Specifies the vaule to be returned by the routine as described above.

m — INTEGER. The number of rows of the matrix A.

$m \geq 0$. When $m = 0$, ?lange is set to zero.

n	INTEGER. The number of columns of the matrix *A*. *n* ≥ 0. When *n* = 0, ?lange is set to zero.
a	REAL for slange DOUBLE PRECISION for dlange COMPLEX for clange COMPLEX*16 for zlange Array, DIMENSION (*lda*,*n*). The *m*-by-*n* matrix *A*.
lda	INTEGER. The leading dimension of the array *a*. *lda* ≥ max(*m*,1).
work	REAL for slange and clange. DOUBLE PRECISION for dlange and zlange. Workspace array, DIMENSION max(1,*lwork*), where *lwork* ≥ *m* when *norm* = 'I'; otherwise, *work* is not referenced.

Output Parameters

val	REAL for slange/clange DOUBLE PRECISION for dlange/zlange Value returned by the function.

?langt

Returns the value of the 1-norm, Frobenius norm, infinity-norm, or the largest absolute value of any element of a general tridiagonal matrix.

Syntax

```
val = slangt( norm, n, dl, d, du )
val = dlangt( norm, n, dl, d, du )
val = clangt( norm, n, dl, d, du )
val = zlangt( norm, n, dl, d, du )
```

Description

The routine returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a real/complex tridiagonal matrix *A*.

The value *val* returned by the function is:

val = max(abs(A_{ij})), if *norm* = 'M' or 'm'

= norm1(*A*), if *norm* = '1' or 'O'or 'o'

= normI(*A*), if *norm* = 'I' or 'i'

= normF(*A*), if *norm* = 'F', 'f', 'E' or 'e'

where norm1 denotes the 1-norm of a matrix (maximum column sum), normI denotes the infinity norm of a matrix (maximum row sum) and normF denotes the Frobenius norm of a matrix (square root of sum of squares). Note that max(abs(A_{ij})) is not a consistent matrix norm.

Input Parameters

norm	CHARACTER*1. Specifies the vaule to be returned by the routine as described above.
n	INTEGER. The order of the matrix *A*. $n \geq 0$. When $n = 0$, ?langt is set to zero.
dl, *d*, *du*	REAL for slangt DOUBLE PRECISION for dlangt COMPLEX for clangt COMPLEX*16 for zlangt Arrays: *dl* (n-1), *d* (n), *du* (n-1). The array *dl* contains the (n-1) sub-diagonal elements of *A*. The array *d* contains the diagonal elements of *A*. The array *du* contains the (n-1) super-diagonal elements of *A*.

Output Parameters

val	REAL for slangt/clangt DOUBLE PRECISION for dlangt/zlangt Value returned by the function.

?lanhs

Returns the value of the 1-norm, Frobenius norm, infinity-norm, or the largest absolute value of any element of an upper Hessenberg matrix.

Syntax

```
val = slanhs( norm, n, a, lda, work )
val = dlanhs( norm, n, a, lda, work )
val = clanhs( norm, n, a, lda, work )
val = zlanhs( norm, n, a, lda, work )
```

Description

The function ?lanhs returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a Hessenberg matrix *A*.

The value *val* returned by the function is:

val = max(abs(A_{ij})), if *norm* = 'M' or 'm'

= norm1(*A*), if *norm* = '1' or 'O' or 'o'

= normI(*A*), if *norm* = 'I' or 'i'

= normF(*A*), if *norm* = 'F', 'f', 'E' or 'e'

where norm1 denotes the 1-norm of a matrix (maximum column sum), normI denotes the infinity norm of a matrix (maximum row sum) and normF denotes the Frobenius norm of a matrix (square root of sum of squares). Note that max(abs(A_{ij})) is not a consistent matrix norm.

Input Parameters

norm	CHARACTER*1. Specifies the vaule to be returned by the routine as described above.
n	INTEGER. The order of the matrix *A*. $n \geq 0$. When $n = 0$, ?lanhs is set to zero.
a	REAL for slanhs DOUBLE PRECISION for dlanhs COMPLEX for clanhs

	COMPLEX*16 for zlanhs Array, DIMENSION (*lda*,*n*). The *n*-by-*n* upper Hessenberg matrix *A*; the part of *A* below the first sub-diagonal is not referenced.
lda	INTEGER. The leading dimension of the array *a*. *lda* ≥ max(*n*,1).
work	REAL for slanhs and clanhs. DOUBLE PRECISION for dlange and zlange. Workspace array, DIMENSION (max(1,*lwork*)), where *lwork* ≥ *n* when *norm* = 'I'; otherwise, *work* is not referenced.

Output Parameters

val	REAL for slanhs/clanhs DOUBLE PRECISION for dlanhs/zlanhs Value returned by the function.

?lansb

Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a symmetric band matrix.

Syntax

```
val = slansb( norm, uplo, n, k, ab, ldab, work )
val = dlansb( norm, uplo, n, k, ab, ldab, work )
val = clansb( norm, uplo, n, k, ab, ldab, work )
val = zlansb( norm, uplo, n, k, ab, ldab, work )
```

Description

The function ?lansb returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of an *n*-by-*n* real/complex symmetric band matrix *A*, with *k* super-diagonals.

The value *val* returned by the function is:

val = max(abs(A_{ij})), if *norm* = 'M' or 'm'

= norm1(*A*), if *norm* = '1' or 'O' or 'o'

= normI(*A*), if *norm* = 'I' or 'i'

= normF(*A*), if *norm* = 'F', 'f', 'E' or 'e'

where norm1 denotes the 1-norm of a matrix (maximum column sum), normI denotes the infinity norm of a matrix (maximum row sum) and normF denotes the Frobenius norm of a matrix (square root of sum of squares). Note that max(abs(A_{ij})) is not a consistent matrix norm.

Input Parameters

norm — CHARACTER*1. Specifies the vaule to be returned by the routine as described above.

uplo — CHARACTER*1.
Specifies whether the upper or lower triangular part of the band matrix *A* is supplied. If *uplo* = 'U': upper triangular part is supplied; If *uplo* = 'L': lower triangular part is supplied.

n — INTEGER. The order of the matrix *A*. $n \geq 0$.
When *n* = 0, ?lansb is set to zero.

k — INTEGER. The number of super-diagonals or sub-diagonals of the band matrix *A*. $k \geq 0$.

ab — REAL for slansb
DOUBLE PRECISION for dlansb
COMPLEX for clansb
COMPLEX*16 for zlansb
Array, DIMENSION (*ldab*,*n*).
The upper or lower triangle of the symmetric band matrix *A*, stored in the first *k*+1 rows of *ab*. The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows:
if *uplo* = 'U', *ab*(*k*+1+*i*–*j*,*j*) = *a*(*i*,*j*)
for max(1,*j*–*k*) ≤ *i*≤ *j*;
if *uplo* = 'L', *ab*(1+*i*–*j*,*j*) = *a*(*i*,*j*) for
j≤*i*≤min(*n*,*j*+*k*).

ldab — INTEGER. The leading dimension of the array *ab*.

	ldab ≥ *k*+1.
work	REAL for slansb and clansb. DOUBLE PRECISION for dlansb and zlansb. Workspace array, DIMENSION (max(1, *lwork*)), where *lwork* ≥ *n* when *norm* = 'I' or '1' or 'O'; otherwise, *work* is not referenced.

Output Parameters

val	REAL for slansb/clansb DOUBLE PRECISION for dlansb/zlansb Value returned by the function.

?lanhb

Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a Hermitian band matrix.

Syntax

val = clanhb(*norm*, *uplo*, *n*, *k*, *ab*, *ldab*, *work*)

val = zlanhb(*norm*, *uplo*, *n*, *k*, *ab*, *ldab*, *work*)

Description

The routine returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of an *n*-by-*n* Hermitian band matrix *A*, with *k* super-diagonals.

The value *val* returned by the function is:

val = max(abs(A_{ij})), if *norm* = 'M' or 'm'

= norm1(*A*), if *norm* = '1' or 'O' or 'o'

= normI(*A*), if *norm* = 'I' or 'i'

= normF(*A*), if *norm* = 'F', 'f', 'E' or 'e'

where norm1 denotes the 1-norm of a matrix (maximum column sum), normI denotes the infinity norm of a matrix (maximum row sum) and normF denotes the Frobenius norm of a matrix (square root of sum of squares). Note that max(abs(A_{ij})) is not a consistent matrix norm.

Input Parameters

norm — CHARACTER*1. Specifies the vaule to be returned by the routine as described above.

uplo — CHARACTER*1.
Specifies whether the upper or lower triangular part of the band matrix *A* is supplied.
If *uplo* = 'U': upper triangular part is supplied;
If *uplo* = 'L': lower triangular part is supplied.

n — INTEGER. The order of the matrix *A*. *n* ≥ 0. When *n* = 0, ?lanhb is set to zero.

k — INTEGER. The number of super-diagonals or sub-diagonals of the band matrix *A*.

k ≥ 0.

ab — COMPLEX for clanhb.
COMPLEX*16 for zlanhb.
Array, DIMENSION (*ldaB*,*n*). The upper or lower triangle of the Hermitian band matrix *A*, stored in the first *k*+1 rows of *ab*. The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows:
if *uplo* = 'U', *ab*(*k*+1+*i*–*j*,*j*) = *a*(*i*,*j*)

for max(1,*j*–*k*) ≤ *i* ≤ *j*;

if *uplo* = 'L', *ab*(1+*i*–*j*,*j*) = *a*(*i*,*j*) for *j* ≤ *i* ≤ min(*n*,*j*+*k*).
Note that the imaginary parts of the diagonal elements need not be set and are assumed to be zero.

ldab — INTEGER. The leading dimension of the array *ab*. *ldab* ≥ *k*+1.

work — REAL for clanhb.
DOUBLE PRECISION for zlanhb.
Workspace array, DIMENSION max(1, *lwork*), where

lwork ≥ *n* when *norm* = 'I' or '1' or 'O'; otherwise, *work* is not referenced.

Output Parameters

val — REAL for slanhb/clanhb
DOUBLE PRECISION for dlanhb/zlanhb
Value returned by the function.

?lansp

Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a symmetric matrix supplied in packed form.

Syntax

```
val = slansp( norm, uplo, n, ap, work )
val = dlansp( norm, uplo, n, ap, work )
val = clansp( norm, uplo, n, ap, work )
val = zlansp( norm, uplo, n, ap, work )
```

Description

The function ?lansp returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a real/complex symmetric matrix *A*, supplied in packed form.

The value *val* returned by the function is:

val = max(abs(A_{ij})), if *norm* = 'M' or 'm'

= norm1(*A*), if *norm* = '1' or 'O' or 'o'

= normI(*A*), if *norm* = 'I' or 'i'

= normF(*A*), if *norm* = 'F', 'f', 'E' or 'e'

where norm1 denotes the 1-norm of a matrix (maximum column sum), normI denotes the infinity norm of a matrix (maximum row sum) and normF denotes the Frobenius norm of a matrix (square root of sum of squares). Note that max(abs(A_{ij})) is not a consistent matrix norm.

Input Parameters

norm — CHARACTER*1. Specifies the vaule to be returned by the routine as described above.

uplo — CHARACTER*1.
Specifies whether the upper or lower triangular part of the symmetric matrix *A* is supplied.
If *uplo* = 'U': Upper triangular part of *A* is supplied
If *uplo* = 'L': Lower triangular part of *A* is supplied.

n — INTEGER. The order of the matrix *A*. $n \geq 0$. When $n = 0$, ?lansp is set to zero.

ap — REAL for slansp
DOUBLE PRECISION for dlansp
COMPLEX for clansp
COMPLEX*16 for zlansp
Array, DIMENSION ($n(n+1)/2$).
The upper or lower triangle of the symmetric matrix *A*, packed columnwise in a linear array. The j-th column of *A* is stored in the array *ap* as follows:
if *uplo* = 'U', $ap(i + (j-1)j/2) = A(i,j)$ for $1 \leq i \leq j$;
if *uplo* = 'L', $ap(i + (j-1)(2n-j)/2) = A(i,j)$ for $j \leq i \leq n$.

work — REAL for slansp and clansp.
DOUBLE PRECISION for dlansp and zlansp.
Workspace array, DIMENSION (max(1,*lwork*)), where $lwork \geq n$ when *norm* = 'I' or '1' or 'O'; otherwise, *work* is not referenced.

Output Parameters

val — REAL for slansp/clansp

DOUBLE PRECISION for dlansp/zlansp
Value returned by the function.

?lanhp

Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a complex Hermitian matrix supplied in packed form.

Syntax

val = clanhp(*norm*, *uplo*, *n*, *ap*, *work*)

val = zlanhp(*norm*, *uplo*, *n*, *ap*, *work*)

Description

The function ?lanhp returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a complex Hermitian matrix *A*, supplied in packed form.

The value *val* returned by the function is:

val = max(abs(A_{ij})), if *norm* = 'M' or 'm'

= norm1(*A*), if *norm* = '1' or 'O' or 'o'

= normI(*A*), if *norm* = 'I' or 'i'

= normF(*A*), if *norm* = 'F', 'f', 'E' or 'e'

where norm1 denotes the 1-norm of a matrix (maximum column sum), normI denotes the infinity norm of a matrix (maximum row sum) and normF denotes the Frobenius norm of a matrix (square root of sum of squares). Note that max(abs(A_{ij})) is not a consistent matrix norm.

Input Parameters

norm — CHARACTER*1. Specifies the vaule to be returned by the routine as described above.

uplo — CHARACTER*1.
Specifies whether the upper or lower triangular part of the Hermitian matrix *A* is supplied.

If *uplo* = 'U': Upper triangular part of *A* is supplied
If *uplo* = 'L': Lower triangular part of *A* is supplied.

n — INTEGER. The order of the matrix *A*.

$n \geq 0$. When $n = 0$, ?lanhp is set to zero.

ap — COMPLEX for clanhp.
COMPLEX*16 for zlanhp.
Array, DIMENSION ($n(n+1)/2$). The upper or lower triangle of the Hermitian matrix *A*, packed columnwise in a linear array. The j-th column of *A* is stored in the array *ap* as follows:

if *uplo* = 'U', $ap(i + (j-1)j/2) = A(i,j)$ for $1 \leq i \leq j$;
if *uplo* = 'L', $ap(i + (j-1)(2n-j)/2) = A(i,j)$ for $j \leq i \leq n$.

work — REAL for clanhp.
DOUBLE PRECISION for zlanhp.
Workspace array, DIMENSION (max(1,*lwork*)), where *lwork* ≥ *n* when *norm* = 'I' or '1' or 'O'; otherwise, *work* is not referenced.

Output Parameters

val — REAL for clanhp.
DOUBLE PRECISION for zlanhp.
Value returned by the function.

?lanst/?lanht

Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a real symmetric or complex Hermitian tridiagonal matrix.

Syntax

```
val = slanst( norm, n, d, e )
val = dlanst( norm, n, d, e )
val = clanht( norm, n, d, e )
val = zlanht( norm, n, d, e )
```

Description

The functions ?lanst/?lanht return the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a real symmetric or a complex Hermitian tridiagonal matrix A.

The value *val* returned by the function is:

val = max(abs(A_{ij})), if *norm* = 'M' or 'm'

= norm1(A), if *norm* = '1' or 'O' or 'o'

= normI(A), if *norm* = 'I' or 'i'

= normF(A), if *norm* = 'F', 'f', 'E' or 'e'

where norm1 denotes the 1-norm of a matrix (maximum column sum), normI denotes the infinity norm of a matrix (maximum row sum) and normF denotes the Frobenius norm of a matrix (square root of sum of squares). Note that max(abs(A_{ij})) is not a consistent matrix norm.

Input Parameters

norm	CHARACTER*1. Specifies the vaule to be returned by the routine as described above.
n	INTEGER. The order of the matrix A. $n \geq 0$. When $n = 0$, ?lanst/?lanht is set to zero.
d	REAL for slanst/clanht

DOUBLE PRECISION for dlanst/zlanht
Array, DIMENSION (*n*). The diagonal elements of *A*.

e — REAL for slanst
DOUBLE PRECISION for dlanst
COMPLEX for clanht
COMPLEX*16 for zlanht
Array, DIMENSION (*n*-1).
The (*n*-1) sub-diagonal or super-diagonal elements of *A*.

Output Parameters

val — REAL for slanst/clanht
DOUBLE PRECISION for dlanst/zlanht
Value returned by the function.

?lansy

Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a real/complex symmetric matrix.

Syntax

```
val = slansy( norm, uplo, n, a, lda, work )
val = dlansy( norm, uplo, n, a, lda, work )
val = clansy( norm, uplo, n, a, lda, work )
val = zlansy( norm, uplo, n, a, lda, work )
```

Description

The function ?lansy returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a real/complex symmetric matrix *A*.

The value *val* returned by the function is:

val = max(abs(A_{ij})), if *norm* = 'M' or 'm'

= norm1(*A*), if *norm* = '1' or 'O' or 'o'

= normI(*A*), if *norm* = 'I' or 'i'

= normF(*A*), if *norm* = 'F', 'f', 'E' or 'e'

where norm1 denotes the 1-norm of a matrix (maximum column sum), normI denotes the infinity norm of a matrix (maximum row sum) and normF denotes the Frobenius norm of a matrix (square root of sum of squares). Note that max(abs(A_{ij})) is not a consistent matrix norm.

Input Parameters

norm	CHARACTER*1. Specifies the vaule to be returned by the routine as described above.
uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the symmetric matrix *A* is to be referenced. = 'U': Upper triangular part of *A* is referenced. = 'L': Lower triangular part of *A* is referenced
n	INTEGER. The order of the matrix *A*. $n \geq 0$. When $n = 0$, ?lansy is set to zero.
a	REAL for slansy DOUBLE PRECISION for dlansy COMPLEX for clansy COMPLEX*16 for zlansy Array, DIMENSION (*lda*,*n*). The symmetric matrix *A*. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *a* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *a* is not referenced.
lda	INTEGER. The leading dimension of the array *a*. *lda* ≥ max(*n*,1).
work	REAL for slansy and clansy. DOUBLE PRECISION for dlansy and zlansy. Workspace array, DIMENSION (max(1,*lwork*)), where *lwork* ≥ *n* when *norm* = 'I' or '1' or 'O'; otherwise, *work* is not referenced.

Output Parameters

val	REAL for slansy/clansy DOUBLE PRECISION for dlansy/zlansy Value returned by the function.

?lanhe

Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a complex Hermitian matrix.

Syntax

val = clanhe(*norm*, *uplo*, *n*, *a*, *lda*, *work*)

val = zlanhe(*norm*, *uplo*, *n*, *a*, *lda*, *work*)

Description

The function ?lanhe returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a complex Hermitian matrix *A*.

The value *val* returned by the function is:

val = max(abs(A_{ij})), if *norm* = 'M' or 'm'

= norm1(*A*), if *norm* = '1' or 'O'or 'o'

= normI(*A*), if *norm* = 'I' or 'i'

= normF(*A*), if *norm* = 'F', 'f', 'E' or 'e'

where norm1 denotes the 1-norm of a matrix (maximum column sum), normI denotes the infinity norm of a matrix (maximum row sum) and normF denotes the Frobenius norm of a matrix (square root of sum of squares). Note that max(abs(A_{ij})) is not a consistent matrix norm.

Input Parameters

norm	CHARACTER*1. Specifies the vaule to be returned by the routine as described above.
uplo	CHARACTER*1.

	Specifies whether the upper or lower triangular part of the Hermitian matrix *A* is to be referenced. = 'U': Upper triangular part of *A* is referenced. = 'L': Lower triangular part of *A* is referenced
n	INTEGER. The order of the matrix *A*. *n* ≥ 0. When *n* = 0, ?lanhe is set to zero.
a	COMPLEX for clanhe. COMPLEX*16 for zlanhe. Array, DIMENSION (*lda*,*n*). The Hermitian matrix *A*. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *a* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *a* is not referenced.
lda	INTEGER. The leading dimension of the array *a*. *lda* ≥ max(*n*,1).
work	REAL for clanhe. DOUBLE PRECISION for zlanhe. Workspace array, DIMENSION (max(1,*lwork*)) , where *lwork* ≥ *n* when *norm* = 'I' or '1' or 'O'; otherwise, *work* is not referenced.

Output Parameters

val	REAL for clanhe. DOUBLE PRECISION for zlanhe. Value returned by the function.

?lantb

Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a triangular band matrix.

Syntax

```
val = slantb( norm, uplo, diag, n, k, ab, ldab, work )
val = dlantb( norm, uplo, diag, n, k, ab, ldab, work )
val = clantb( norm, uplo, diag, n, k, ab, ldab, work )
val = zlantb( norm, uplo, diag, n, k, ab, ldab, work )
```

Description

The function ?lantb returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of an *n*-by-*n* triangular band matrix *A*, with (*k* + 1) diagonals.

The value *val* returned by the function is:

val = max(abs(A_{ij})), if *norm* = 'M' or 'm'

= norm1(*A*), if *norm* = '1' or 'O' or 'o'

= normI(*A*), if *norm* = 'I' or 'i'

= normF(*A*), if *norm* = 'F', 'f', 'E' or 'e'

where norm1 denotes the 1-norm of a matrix (maximum column sum), normI denotes the infinity norm of a matrix (maximum row sum) and normF denotes the Frobenius norm of a matrix (square root of sum of squares). Note that max(abs(A_{ij})) is not a consistent matrix norm.

Input Parameters

norm	CHARACTER*1. Specifies the vaule to be returned by the routine as described above.
uplo	CHARACTER*1. Specifies whether the matrix *A* is upper or lower triangular. = 'U': Upper triangular = 'L': Lower triangular.

diag — CHARACTER*1.
Specifies whether or not the matrix *A* is unit triangular.
= 'N': Non-unit triangular
= 'U': Unit triangular.

n — INTEGER. The order of the matrix *A*. $n \geq 0$. When $n = 0$, ?lantb is set to zero.

k — INTEGER. The number of super-diagonals of the matrix *A* if *uplo* = 'U', or the number of sub-diagonals of the matrix *A* if *uplo* = 'L'. $k \geq 0$.

ab — REAL for slantb
DOUBLE PRECISION for dlantb
COMPLEX for clantb
COMPLEX*16 for zlantb
Array, DIMENSION (*ldab*,*n*). The upper or lower triangular band matrix *A*, stored in the first *k*+1 rows of *ab*.
The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows:
if *uplo* = 'U', *ab*(*k*+1+*i*–*j*,*j*) = *a*(*i*,*j*) for max(1,*j*–*k*) ≤ i ≤ j;
if *uplo* = 'L', *ab*(1+*i*–*j*,*j*) = *a*(*i*,*j*) for *j*≤ *i*≤ min(*n*,*j*+*k*).
Note that when *diag* = 'U', the elements of the array *ab* corresponding to the diagonal elements of the matrix *A* are not referenced, but are assumed to be one.

ldab — INTEGER. The leading dimension of the array *ab*.
ldab ≥ *k*+1.

work — REAL for slantb and clantb.
DOUBLE PRECISION for dlantb and zlantb.
Workspace array, DIMENSION (max(1,*lwork*)), where *lwork* ≥ *n* when *norm* = 'I' ; otherwise, *work* is not referenced.

Output Parameters

val — REAL for slantb/clantb.
DOUBLE PRECISION for dlantb/zlantb.

Value returned by the function.

?lantp

Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a triangular matrix supplied in packed form.

Syntax

val = slantp(*norm*, *uplo*, *diag*, *n*, *ap*, *work*)

val = dlantp(*norm*, *uplo*, *diag*, *n*, *ap*, *work*)

val = clantp(*norm*, *uplo*, *diag*, *n*, *ap*, *work*)

val = zlantp(*norm*, *uplo*, *diag*, *n*, *ap*, *work*)

Description

The function ?lantp returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a triangular matrix *A*, supplied in packed form.

The value *val* returned by the function is:

val = max(abs(A_{ij})), if *norm* = 'M' or 'm'

= norm1(*A*), if *norm* = '1' or 'O' or 'o'

= normI(*A*), if *norm* = 'I' or 'i'

= normF(*A*), if *norm* = 'F', 'f', 'E' or 'e'

where norm1 denotes the 1-norm of a matrix (maximum column sum), normI denotes the infinity norm of a matrix (maximum row sum) and normF denotes the Frobenius norm of a matrix (square root of sum of squares). Note that max(abs(A_{ij})) is not a consistent matrix norm.

Input Parameters

norm	CHARACTER*1. Specifies the vaule to be returned by the routine as described above.
uplo	CHARACTER*1.

Specifies whether the matrix *A* is upper or lower triangular.
= 'U': Upper triangular
= 'L': Lower triangular.

diag CHARACTER*1.
Specifies whether or not the matrix *A* is unit triangular.
= 'N': Non-unit triangular
= 'U': Unit triangular.

n INTEGER. The order of the matrix *A*.
$n \geq 0$. When $n = 0$, ?lantp is set to zero.

ap REAL for slantp
DOUBLE PRECISION for dlantp
COMPLEX for clantp
COMPLEX*16 for zlantp
Array, DIMENSION ($n(n+1)/2$).
The upper or lower triangular matrix *A*, packed columnwise in a linear array. The *j*-th column of *A* is stored in the array *ap* as follows:
if *uplo* = 'U', $AP(i + (j-1)j/2) = a(i,j)$ for $1 \leq i \leq j$;
if *uplo* = 'L', $ap(i + (j-1)(2n-j)/2) = a(i,j)$ for $j \leq i \leq n$.
Note that when *diag* = 'U', the elements of the array *ap* corresponding to the diagonal elements of the matrix *A* are not referenced, but are assumed to be one.

work REAL for slantp and clantp.
DOUBLE PRECISION for dlantp and zlantp.
Workspace array, DIMENSION (max(1, *lwork*)), where *lwork* ≥ *n* when *norm* = 'I' ; otherwise, *work* is not referenced.

Output Parameters

val REAL for slantp/clantp.
DOUBLE PRECISION for dlantp/zlantp.
Value returned by the function.

?lantr

Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a trapezoidal or triangular matrix.

Syntax

```
val = slantr( norm, uplo, diag, m, n, a, lda, work )
val = dlantr( norm, uplo, diag, m, n, a, lda, work )
val = clantr( norm, uplo, diag, m, n, a, lda, work )
val = zlantr( norm, uplo, diag, m, n, a, lda, work )
```

Description

The function ?lantr returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a trapezoidal or triangular matrix *A*.

The value *val* returned by the function is:

val = max(abs(A_{ij})), if *norm* = 'M' or 'm'

= norm1(*A*), if *norm* = '1' or 'O' or 'o'

= normI(*A*), if *norm* = 'I' or 'i'

= normF(*A*), if *norm* = 'F', 'f', 'E' or 'e'

where norm1 denotes the 1-norm of a matrix (maximum column sum), normI denotes the infinity norm of a matrix (maximum row sum) and normF denotes the Frobenius norm of a matrix (square root of sum of squares). Note that max(abs(A_{ij})) is not a consistent matrix norm.

Input Parameters

norm — CHARACTER*1. Specifies the vaule to be returned by the routine as described above.

uplo — CHARACTER*1.
Specifies whether the matrix *A* is upper or lower trapezoidal.
= 'U': Upper trapezoidal
= 'L': Lower trapezoidal.

Note that *A* is triangular instead of trapezoidal if *m* = *n*.

diag — CHARACTER*1.
Specifies whether or not the matrix *A* has unit diagonal.
= 'N': Non-unit diagonal
= 'U': Unit diagonal.

m — INTEGER. The number of rows of the matrix *A*. *m* ≥ 0, and if *uplo* = 'U', *m* ≤ *n*.
When *m* = 0, ?lantr is set to zero.

n — INTEGER. The number of columns of the matrix *A*. *n* ≥ 0, and if *uplo* = 'L', *n* ≤ *m*.
When *n* = 0, ?lantr is set to zero.

a — REAL for slantr
DOUBLE PRECISION for dlantr
COMPLEX for clantr
COMPLEX*16 for zlantr
Array, DIMENSION (*lda*,*n*).
The trapezoidal matrix *A* (*A* is triangular if *m* = *n*).
If *uplo* = 'U', the leading *m*-by-*n* upper trapezoidal part of the array *a* contains the upper trapezoidal matrix, and the strictly lower triangular part of *A* is not referenced.
If *uplo* = 'L', the leading *m*-by-*n* lower trapezoidal part of the array *a* contains the lower trapezoidal matrix, and the strictly upper triangular part of *A* is not referenced. Note that when *diag* = 'U', the diagonal elements of *A* are not referenced and are assumed to be one.

lda — INTEGER. The leading dimension of the array *a*.
lda ≥ max(*m*,1).

work — REAL for slantr/clantrp.
DOUBLE PRECISION for dlantr/zlantr.
Workspace array, DIMENSION (max(1,*lwork*)), where *lwork* ≥ *m* when *norm* = 'I' ; otherwise, *work* is not referenced.

Output Parameters

val	REAL for slantr/clantrp. DOUBLE PRECISION for dlantr/zlantr. Value returned by the function.

?lanv2

Computes the Schur factorization of a real 2-by-2 nonsymmetric matrix in standard form.

Syntax

```
call slanv2( a, b, c, d, rt1r, rt1i, rt2r, rt2i, cs, sn )
call dlanv2( a, b, c, d, rt1r, rt1i, rt2r, rt2i, cs, sn )
```

Description

The routine computes the Schur factorization of a real 2-by-2 nonsymmetric matrix in standard form:

$$\begin{bmatrix} a & b \\ c & d \end{bmatrix} = \begin{bmatrix} cs & -sn \\ sn & cs \end{bmatrix} \begin{bmatrix} aa & bb \\ cc & dd \end{bmatrix} \begin{bmatrix} cs & sn \\ -sn & cs \end{bmatrix}$$

where either

1. *cc* = 0 so that *aa* and *dd* are real eigenvalues of the matrix, or
2. *aa* = *dd* and *bb***cc* < 0, so that *aa* ± sqrt(*bb***cc*) are complex conjugate eigenvalues.

The routine was adjusted to reduce the risk of cancellation errors, when computing real eigenvalues, and to ensure, if possible, that abs(*rt1r*) ≥ abs(*rt2r*).

Input Parameters

a, *b*, *c*, *d*	REAL for slanv2 DOUBLE PRECISION for dlanv2. On entry, elements of the input matrix.

Output Parameters

a, *b*, *c*, *d*	On exit, overwritten by the elements of the standardized Schur form.
rt1r, *rt1i*, *rt2r*, *rt2i*	REAL for slanv2 DOUBLE PRECISION for dlanv2. The real and imaginary parts of the eigenvalues. If the eigenvalues are a complex conjugate pair, *rt1i* > 0.
cs, *sn*	REAL for slanv2 DOUBLE PRECISION for dlanv2. Parameters of the rotation matrix.

?lapll

Measures the linear dependence of two vectors.

Syntax

```
call slapll( n, x, incx, Y, incy, ssmin )
call dlapll( n, x, incx, Y, incy, ssmin )
call clapll( n, x, incx, Y, incy, ssmin )
call zlapll( n, x, incx, Y, incy, ssmin )
```

Description

Given two column vectors *x* and *y* of length *n*, let

A = (*x y*) be the *n*-by-2 matrix.

The routine ?lapll first computes the *QR* factorization of *A* as *A* = *Q***R* and then computes the SVD of the 2-by-2 upper triangular matrix *R*. The smaller singular value of *R* is returned in *ssmin*, which is used as the measurement of the linear dependency of the vectors *x* and *y*.

Input Parameters

n	INTEGER. The length of the vectors *x* and *y*.
x	REAL for slapll DOUBLE PRECISION for dlapll COMPLEX for clapll

COMPLEX*16 for zlapll
Array, DIMENSION (1+(*n*–1)*incx*).
On entry, *x* contains the *n*-vector x.

y — REAL for slapll
DOUBLE PRECISION for dlapll
COMPLEX for clapll
COMPLEX*16 for zlapll
Array, DIMENSION (1+(*n*-1)*incy*).
On entry, *y* contains the *n*-vector y.

incx — INTEGER. The increment between successive elements of x; *incx* > 0.

incy — INTEGER. The increment between successive elements of y; *incy* > 0.

Output Parameters

x — On exit, *x* is overwritten.

y — On exit, *y* is overwritten.

ssmin — REAL for slapll/clapll
DOUBLE PRECISION for dlapll/zlapll
The smallest singular value of the *n*-by-2 matrix *A* = (*x y*)
.

?lapmt

Performs a forward or backward permutation of the columns of a matrix.

Syntax

```
call slapmt( forwrd, m, n, x, ldx, k )
call dlapmt( forwrd, m, n, x, ldx, k )
call clapmt( forwrd, m, n, x, ldx, k )
call zlapmt( forwrd, m, n, x, ldx, k )
```

Description

The routine ?lapmt rearranges the columns of the *m*-by-*n* matrix *X* as specified by the permutation *k*(1),*k*(2),...,*k*(*n*) of the integers 1,...,*n*.

If *forwrd* = .TRUE., forward permutation:

X(*,*k*(*j*)) is moved to *X*(*,*j*) for *j*=1,2,...,*n*.

If *forwrd* = .FALSE., backward permutation:

X(*,*j*) is moved to *X*(*,*k*(*j*)) for *j* = 1,2,...,*n*.

Input Parameters

forwrd	LOGICAL. If *forwrd* = .TRUE., forward permutation If *forwrd* = .FALSE., backward permutation
m	INTEGER. The number of rows of the matrix *X*. *m* ≥ 0.
n	INTEGER. The number of columns of the matrix *X*. *n* ≥ 0.
x	REAL for slapmt DOUBLE PRECISION for dlapmt COMPLEX for clapmt COMPLEX*16 for zlapmt Array, DIMENSION (*ldx*,*n*). On entry, the *m*-by-*n* matrix *X*.
ldx	INTEGER. The leading dimension of the array *X*, *ldx* ≥ max(1,*m*).
k	INTEGER. Array, DIMENSION (*n*). On entry, *k* contains the permutation vector and is used as internal workspace.

Output Parameters

x	On exit, *x* contains the permuted matrix *X*.
k	On exit, *k* is reset to its original value.

?lapy2

Returns sqrt(x^2+y^2).

Syntax

val = slapy2(*x*, *y*)

val = dlapy2(*x*, *y*)

Description

The function ?lapy2 returns sqrt(x^2+y^2), avoiding unnecessary overflow or harmful underflow.

Input Parameters

x, *y*	REAL for slapy2 DOUBLE PRECISION for dlapy2 Specify the input values *x* and *y*.

Output Parameters

val	REAL for slapy2 DOUBLE PRECISION for dlapy2. Value returned by the function.

?lapy3

Returns sqrt($x^2+y^2+z^2$).

Syntax

val = slapy3(*x*, *y*, *z*)

val = dlapy3(*x*, *y*, *z*)

Description

The function ?lapy3 returns sqrt($x^2+y^2+z^2$), avoiding unnecessary overflow or harmful underflow.

Input Parameters

x, *y*, *z*	REAL for slapy3 DOUBLE PRECISION for dlapy3 Specify the input values *x*, *y* and *z*.

Output Parameters

val	REAL for slapy3 DOUBLE PRECISION for dlapy3. Value returned by the function.

?laqgb

Scales a general band matrix, using row and column scaling factors computed by ?gbequ.

Syntax

```
call slaqgb( m, n, kl, ku, ab, ldab, r, c, rowcnd, colcnd, amax, equed )
call dlaqgb( m, n, kl, ku, ab, ldab, r, c, rowcnd, colcnd, amax, equed )
call claqgb( m, n, kl, ku, ab, ldab, r, c, rowcnd, colcnd, amax, equed )
call zlaqgb( m, n, kl, ku, ab, ldab, r, c, rowcnd, colcnd, amax, equed )
```

Description

The routine equilibrates a general *m*-by-*n* band matrix *A* with *kl* subdiagonals and *ku* superdiagonals using the row and column scaling factors in the vectors *r* and *c*.

Input Parameters

m	INTEGER. The number of rows of the matrix *A*. *m* ≥ 0.
n	INTEGER. The number of columns of the matrix *A*. *n* ≥ 0.
kl	INTEGER. The number of subdiagonals within the band of *A*. *kl* ≥ 0.
ku	INTEGER. The number of superdiagonals within the band of *A*. *ku* ≥ 0.

ab
REAL for slaqgb
DOUBLE PRECISION for dlaqgb
COMPLEX for claqgb
COMPLEX*16 for zlaqgb
Array, DIMENSION (*ldab*,*n*). On entry, the matrix *A* in band storage, in rows 1 to *kl*+*ku*+1. The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows:
ab(*ku*+1+*i*-*j*,*j*) = *A*(*i*,*j*) for max(1,*j*-*ku*) ≤ i ≤ min(*m*,*j*+*kl*).

ldab
INTEGER. The leading dimension of the array *ab*.
lda ≥ *kl*+*ku*+1.

amax
REAL for slaqgb/claqgb
DOUBLE PRECISION for dlaqgb/zlaqgb
Absolute value of largest matrix entry.

r, *c*
REAL for slaqgb/claqgb
DOUBLE PRECISION for dlaqgb/zlaqgb
Arrays *r* (*m*), *c* (*n*). Contain the row and column scale factors for *A*, respectively.

rowcnd
REAL for slaqgb/claqgb
DOUBLE PRECISION for dlaqgb/zlaqgb
Ratio of the smallest *r*(*i*) to the largest *r*(*i*).

colcnd
REAL for slaqgb/claqgb
DOUBLE PRECISION for dlaqgb/zlaqgb
Ratio of the smallest *c*(*i*) to the largest *c*(*i*).

Output Parameters

ab
On exit, the equilibrated matrix, in the same storage format as *A*.
See *equed* for the form of the equilibrated matrix.

equed
CHARACTER*1.
Specifies the form of equilibration that was done.
If *equed* = 'N': No equilibration
If *equed* = 'R': Row equilibration, that is, *A* has been premultiplied by diag(*r*).
If *equed* = 'C': Column equilibration, that is, *A* has been postmultiplied by diag(*c*).

If *equed* = 'B': Both row and column equilibration, that is, *A* has been replaced by diag(*r*)*A*diag(*c*).

Application Notes

The routine uses internal parameters *thresh*, *large*, and *small*, which have the following meaning. *thresh* is a threshold value used to decide if row or column scaling should be done based on the ratio of the row or column scaling factors. If *rowcnd* < *thresh*, row scaling is done, and if *colcnd* < *thresh*, column scaling is done. *large* and *small* are threshold values used to decide if row scaling should be done based on the absolute size of the largest matrix element. If *amax* > *large* or *amax* < *small*, row scaling is done.

?laqge

Scales a general rectangular matrix, using row and column scaling factors computed by ?geequ.

Syntax

```
call slaqge( m, n, a, lda, r, c, rowcnd, colcnd, amax, equed )
call dlaqge( m, n, a, lda, r, c, rowcnd, colcnd, amax, equed )
call claqge( m, n, a, lda, r, c, rowcnd, colcnd, amax, equed )
call zlaqge( m, n, a, lda, r, c, rowcnd, colcnd, amax, equed )
```

Description

The routine equilibrates a general *m*-by-*n* matrix *A* using the row and column scaling factors in the vectors *r* and *c*.

Input Parameters

m	INTEGER. The number of rows of the matrix *A*. *m* ≥ 0.
n	INTEGER. The number of columns of the matrix *A*. *n* ≥ 0.
a	REAL for slaqge DOUBLE PRECISION for dlaqge COMPLEX for claqge

COMPLEX*16 for zlaqge
Array, DIMENSION (*lda*,*n*). On entry, the *m*-by-*n* matrix *A*.

lda INTEGER. The leading dimension of the array *a*.
lda ≥ max(*m*,1).

r REAL for slanqge/claqge
DOUBLE PRECISION for dlaqge/zlaqge
Array, DIMENSION (*m*). The row scale factors for A.

c REAL for slanqge/claqge
DOUBLE PRECISION for dlaqge/zlaqge
Array, DIMENSION (*n*). The column scale factors for A.

rowcnd REAL for slanqge/claqge
DOUBLE PRECISION for dlaqge/zlaqge
Ratio of the smallest *r*(*i*) to the largest *r*(*i*).

colcnd REAL for slanqge/claqge
DOUBLE PRECISION for dlaqge/zlaqge
Ratio of the smallest *c*(*i*) to the largest *c*(*i*).

amax REAL for slanqge/claqge
DOUBLE PRECISION for dlaqge/zlaqge
Absolute value of largest matrix entry.

Output Parameters

a On exit, the equilibrated matrix.
See *equed* for the form of the equilibrated matrix.

equed CHARACTER*1.
Specifies the form of equilibration that was done.
If *equed* = 'N': No equilibration
If *equed* = 'R': Row equilibration, that is, *A* has been premultiplied by diag(*r*).
If *equed* = 'C': Column equilibration, that is, *A* has been postmultiplied by diag(*c*).
If *equed* = 'B': Both row and column equilibration, that is, *A* has been replaced by diag(*r*)*A*diag(*c*).

Application Notes

The routine uses internal parameters *thresh*, *large*, and *small*, which have the following meaning. *thresh* is a threshold value used to decide if row or column scaling should be done based on the ratio of the row or column scaling factors. If *rowcnd* < *thresh*, row scaling is done, and if *colcnd* < *thresh*, column scaling is done. *large* and *small* are threshold values used to decide if row scaling should be done based on the absolute size of the largest matrix element. If *amax* > *large* or *amax* < *small*, row scaling is done.

?laqhb

Scales a Hermetian band matrix, using scaling factors computed by ?pbequ.

Syntax

call claqhb(*uplo*, *n*, *kd*, *ab*, *ldab*, *s*, *scond*, *amax*, *equed*)

call zlaqhb(*uplo*, *n*, *kd*, *ab*, *ldab*, *s*, *scond*, *amax*, *equed*)

Description

The routine equilibrates a Hermetian band matrix *A* using the scaling factors in the vector *s*.

Input Parameters

uplo — CHARACTER*1.
Specifies whether the upper or lower triangular part of the band matrix *A* is stored.
If *uplo* = 'U': upper triangular.
If *uplo* = 'L': lower triangular.

n — INTEGER. The order of the matrix *A*.
n ≥ 0.

kd — INTEGER. The number of super-diagonals of the matrix *A* if *uplo* = 'U', or the number of sub-diagonals if *uplo* = 'L'.
kd ≥ 0.

ab — COMPLEX for claqhb
COMPLEX*16 for zlaqhb

Array, DIMENSION (*ldab*,*n*). On entry, the upper or lower triangle of the band matrix *A*, stored in the first *kd*+1 rows of the array. The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows:
if *uplo* = 'U', *ab*(*kd*+1+*i*-*j*,*j*) = A(*i*,*j*) for max(1,*j*-*kd*) ≤ *i* ≤ *j*;
if *uplo* = 'L', *ab*(1+*i*-*j*,*j*) = A(*i*,*j*) for *j* ≤ *i* ≤ min(*n*,*j*+*kd*).

ldab — INTEGER. The leading dimension of the array *ab*.
ldab ≥ *kd*+1.

scond — REAL for claqsb
DOUBLE PRECISION for zlaqsb
Ratio of the smallest *s*(*i*) to the largest *s*(*i*).

amax — REAL for claqsb
DOUBLE PRECISION for zlaqsb
Absolute value of largest matrix entry.

Output Parameters

ab — On exit, if *info* = 0, the triangular factor *U* or *L* from the Cholesky factorization *A* = *U*'**U* or *A* = *L***L*' of the band matrix *A*, in the same storage format as *A*.

s — REAL for claqsb
DOUBLE PRECISION for zlaqsb
Array, DIMENSION (*n*). The scale factors for A.

equed — CHARACTER*1.
Specifies whether or not equilibration was done.
If *equed* = 'N': No equilibration.
If *equed* = 'Y': Equilibration was done, that is, *A* has been replaced by diag(*s*)**A***diag(*s*).

Application Notes

The routine uses internal parameters *thresh*, *large*, and *small*, which have the following meaning. *thresh* is a threshold value used to decide if scaling should be based on the ratio of the scaling factors. If *scond* < *thresh*, scaling is done.

The values *large* and *small* are threshold values used to decide if scaling should be done based on the absolute size of the largest matrix element. If *amax* > *large* or *amax* < *small*, scaling is done.

?laqp2

Computes a QR factorization with column pivoting of the matrix block.

Syntax

```
call slaqp2( m, n, offset, a, lda, jpvt, tau, vn1, vn2, work )
call dlaqp2( m, n, offset, a, lda, jpvt, tau, vn1, vn2, work )
call claqp2( m, n, offset, a, lda, jpvt, tau, vn1, vn2, work )
call zlaqp2( m, n, offset, a, lda, jpvt, tau, vn1, vn2, work )
```

Description

The routine computes a *QR* factorization with column pivoting of the block A(*offset*+1:*m*,1:*n*). The block A(1:*offset*,1:*n*) is accordingly pivoted, but not factorized.

Input Parameters

m	INTEGER. The number of rows of the matrix *A*. *m* ≥ 0.
n	INTEGER. The number of columns of the matrix *A*. *n* ≥ 0.
offset	INTEGER. The number of rows of the matrix *A* that must be pivoted but no factorized. *offset* ≥ 0.
a	REAL for slaqp2 DOUBLE PRECISION for dlaqp2 COMPLEX for claqp2 COMPLEX*16 for zlaqp2 Array, DIMENSION (*lda*,*n*). On entry, the *m*-by-*n* matrix *A*.
lda	INTEGER. The leading dimension of the array *a*. *lda* ≥ max(1,*m*).
jpvt	INTEGER. Array, DIMENSION (*n*).

On entry, if *jpvt*(*i*) ≠ 0, the *i*-th column of *A* is permuted to the front of *A***P* (a leading column); if *jpvt*(*i*) = 0, the *i*-th column of *A* is a free column.

vn1, *vn2*
REAL for slaqp2/claqp2
DOUBLE PRECISION for dlaqp2/zlaqp2
Arrays, DIMENSION (*n*) each. Contain the vectors with the partial and exact column norms, respectively.

work
REAL for slaqp2
DOUBLE PRECISION for dlaqp2
COMPLEX for claqp2
COMPLEX*16 for zlaqp2 Workspace array, DIMENSION (*n*).

Output Parameters

a
On exit, the upper triangle of block *A*(*offset*+1:*m*,1:*n*) is the triangular factor obtained; the elements in block *A*(*offset*+1:*m*,1:*n*) below the diagonal, together with the array *tau*, represent the orthogonal matrix *Q* as a product of elementary reflectors. Block *A*(1:*offset*,1:*n*) has been accordingly pivoted, but not factorized.

jpvt
On exit, if *jpvt*(*i*) = *k*, then the *i*-th column of *A***P* was the *k*-th column of *A*.

tau
REAL for slaqp2
DOUBLE PRECISION for dlaqp2
COMPLEX for claqp2
COMPLEX*16 for zlaqp2
Array, DIMENSION (min(*m*,*n*)).
The scalar factors of the elementary reflectors.

vn1, *vn2*
Contain the vectors with the partial and exact column norms, respectively.

?laqps

Computes a step of QR factorization with column pivoting of a real m-by-n matrix A by using BLAS level 3.

Syntax

```
call slaqps( m, n, offset, nb, kb, a, lda, jpvt, tau, vn1, vn2, auxv, f, ldf )
call dlaqps( m, n, offset, nb, kb, a, lda, jpvt, tau, vn1, vn2, auxv, f, ldf )
call claqps( m, n, offset, nb, kb, a, lda, jpvt, tau, vn1, vn2, auxv, f, ldf )
call zlaqps( m, n, offset, nb, kb, a, lda, jpvt, tau, vn1, vn2, auxv, f, ldf )
```

Description

This routine computes a step of *QR* factorization with column pivoting of a real *m*-by-*n* matrix *A* by using BLAS level 3. The routine tries to factorize *NB* columns from *A* starting from the row *offset*+1, and updates all of the matrix with BLAS level 3 routine ?gemm.

In some cases, due to catastrophic cancellations, ?laqps cannot factorize *NB* columns. Hence, the actual number of factorized columns is returned in *kb*.

Block *A*(1:*offset*,1:*n*) is accordingly pivoted, but not factorized.

Input Parameters

m	INTEGER. The number of rows of the matrix *A*. *m* ≥ 0.
n	INTEGER. The number of columns of the matrix *A*. *n* ≥ 0.
offset	INTEGER. The number of rows of *A* that have been factorized in previous steps.
nb	INTEGER. The number of columns to factorize.
a	REAL for slaqps DOUBLE PRECISION for dlaqps COMPLEX for claqps COMPLEX*16 for zlaqps

Array, DIMENSION (*lda*,*n*).
On entry, the *m*-by-*n* matrix *A*.

lda INTEGER. The leading dimension of the array *a*.

lda ≥ max(1,*m*).

jpvt INTEGER. Array, DIMENSION (*n*).
If *jpvt*(*I*) = *k* then column *k* of the full matrix *A* has been permuted into position *i* in AP.

vn1, *vn2* REAL for slaqps/claqps
DOUBLE PRECISION for dlaqps/zlaqps
Arrays, DIMENSION (*n*) each. Contain the vectors with the partial and exact column norms, respectively.

auxv REAL for slaqps
DOUBLE PRECISION for dlaqps
COMPLEX for claqps
COMPLEX*16 for zlaqps
Array, DIMENSION (*nb*). Auxiliary vector.

f REAL for slaqps
DOUBLE PRECISION for dlaqps
COMPLEX for claqps
COMPLEX*16 for zlaqps
Array, DIMENSION (*ldf*,*nb*). Matrix *F'* = *L***Y'***A*.

ldf INTEGER. The leading dimension of the array *f*.

ldf ≥ max(1,*n*).

Output Parameters

kb INTEGER. The number of columns actually factorized.

a On exit, block *A*(*offset*+1:*m*,1:*kb*) is the triangular factor obtained and block *A*(1:*offset*,1:*n*) has been accordingly pivoted, but no factorized. The rest of the matrix, block *A*(*offset*+1:*m*,*kb*+1:*n*) has been updated.

jpvt INTEGER array, DIMENSION (*n*). If *jpvt*(*I*) = *k* then column *k* of the full matrix *A* has been permuted into position *i* in AP.

tau REAL for slaqps
DOUBLE PRECISION for dlaqps

	COMPLEX for claqps COMPLEX*16 for zlaqps Array, DIMENSION (*kb*). The scalar factors of the elementary reflectors.
vn1, *vn2*	The vectors with the partial and exact column norms, respectively.
auxv	Auxiliary vector.
f	Matrix *F'* = *L***Y*'**A*.

?laqr0

Computes the eigenvalues of a Hessenberg matrix, and optionally the marixes from the Schur decomposition.

Syntax

```
call slaqr0( wantt, wantz, n, ilo, ihi, h, ldh, wr, wi, iloz, ihiz, z, ldz, work, lwork, info )
call dlaqr0( wantt, wantz, n, ilo, ihi, h, ldh, wr, wi, iloz, ihiz, z, ldz, work, lwork, info )
call claqr0( wantt, wantz, n, ilo, ihi, h, ldh, w, iloz, ihiz, z, ldz, work, lwork, info )
call zlaqr0( wantt, wantz, n, ilo, ihi, h, ldh, w, iloz, ihiz, z, ldz, work, lwork, info )
```

Description

This routine computes the eigenvalues of a Hessenberg matrix *H*, and, optionally, the matrices *T* and *Z* from the Schur decomposition $H=Z*T*Z^H$, where *T* is an upper quasi-triangular/triangular matrix (the Schur form), and *Z* is the orthogonal/unitary matrix of Schur vectors.

Optionally *Z* may be postmultiplied into an input orthogonal/unitary matrix *Q* so that this routine can give the Schur factorization of a matrix *A* which has been reduced to the Hessenberg form *H* by the orthogonal/unitary matrix *Q*: $A = Q*H*Q^H = (QZ)*H*(QZ)^H$.

Input Parameters

wantt	LOGICAL.

If *wantt* = .TRUE., the full Schur form T is required;
If *wantt* = .FALSE., only eigenvalues are required.

wantz — LOGICAL.
If *wantz* = .TRUE., the matrix of Schur vectors *Z* is required;
If *wantz* = .FALSE., Schur vectors are not required.

n — INTEGER. The order of the Hessenberg matrix *H*. (*n* ≥ 0).

ilo, *ihi* — INTEGER.
It is assumed that *H* is already upper triangular in rows and columns 1:*ilo*-1 and *ihi*+1:*n*, and if *ilo* > 1 then *H*(*ilo*, *ilo*-1) = 0.
ilo and *ihi* are normally set by a previous call to cgebal, and then passed to cgehrd when the matrix output by cgebal is reduced to Hessenberg form. Otherwise, *ilo* and *ihi* should be set to 1 and *n*, respectively.
If *n* > 0, then 1 ≤ *ilo* ≤ *ihi* ≤ *n*.
If *n*=0, then *ilo*=1 and *ihi*=0

h — REAL for slaqr0
DOUBLE PRECISION for dlaqr0
COMPLEX for claqr0
COMPLEX*16 for zlaqr0.
Array, DIMENSION (*ldh*, *n*), contains the upper Hessenberg matrix *H*.

ldh — INTEGER. The leading dimension of the array *h*. *ldh* ≥ max(1, *n*).

iloz, *ihiz* — INTEGER. Specify the rows of *Z* to which transformations must be applied if *wantz* is .TRUE., 1 ≤ *iloz* ≤ *ilo*; *ihi* ≤ *ihiz* ≤ *n*.

z — REAL for slaqr0
DOUBLE PRECISION for dlaqr0
COMPLEX for claqr0
COMPLEX*16 for zlaqr0.
Array, DIMENSION (*ldz*, *ihi*), contains the matrix *Z* if *wantz* is .TRUE.. If *wantz* is .FALSE., *z* is not referenced.

ldz	INTEGER. The leading dimension of the array *z*. If *wantz* is .TRUE., then *ldz* ≥ max(1, *ihiz*). Otherwise, *ldz* ≥ 1.
work	REAL for slaqr0 DOUBLE PRECISION for dlaqr0 COMPLEX for claqr0 COMPLEX*16 for zlaqr0. Workspace array with dimension *lwork*.
lwork	INTEGER. The dimension of the array *work*. *lwork* ≥ max(1,*n*) is sufficient, but for the optimal performance a greater workspace may be required, typically as large as 6**n*. It is recommended to use the worlspace query to determine the optimal workspace size. If *lwork*=–1, then the routine performs a workspace query: it estimates the optimal workspace size for the given values of the input parameters *n*, *ilo*, and *ihi*. The estimate is returned in *work*(1). No error messages related to the *lwork* is issued by xerbla. Neither *H* nor *Z* are accessed.

Output Parameters

h	If *info*=0 , and *wantt* is .TRUE., then *h* contains the upper quasi-triangular/triangular matrix *T* from the Schur decomposition (the Schur form). If *info*=0 , and *wantt* is .FALSE., then the contents of *h* are unspecified on exit. (The output values of *h* when *info* > 0 are given under the description of the *info* parameter below.) The routine may explicitly set *h*(i,j) for i>j and j=1,2,...*ilo*–1 or j=*ihi*+1, *ihi*+2,...*n*.
work(1)	On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.
w	COMPLEX for claqr0 COMPLEX*16 for zlaqr0.

Arrays, DIMENSION(*n*). The computed eigenvalues of *h*(*ilo*:*ihi*, *ilo*:*ihi*) are stored in *w*(*ilo*:*ihi*). If *wantt* is .TRUE., then the eigenvalues are stored in the same order as on the diagonal of the Schur form returned in *h*, with *w*(i) = *h*(i,i).

wr, *wi*

REAL for slaqr0
DOUBLE PRECISION for dlaqr0
Arrays, DIMENSION(*ihi*) each. The real and imaginary parts, respectively, of the computed eigenvalues of *h*(*ilo*:*ihi*, *ilo*:*ihi*) are stored in the *wr*(*ilo*:*ihi*) and *wi*(*ilo*:*ihi*). If two eigenvalues are computed as a complex conjugate pair, they are stored in consecutive elements of *wr* and *wi*, say the *i*-th and (*i*+1)-th, with *wi*(*i*)> 0 and *wi*(*i*+1) < 0. If *wantt* is .TRUE. , then the eigenvalues are stored in the same order as on the diagonal of the Schur form returned in *h*, with *wr*(i) = *h*(i,i), and if *h*(i:i+1,i:i+1)is a 2-by-2 diagonal block, then *wi*(i)=sqrt(-*h*(i+1,i)*h(i,i+1)).

z

If *wantz* is .TRUE., then *z(ilo:ihi, iloz:ihiz)* is replaced by *z(ilo:ihi, iloz:ihiz)*U*, where *U* is the orthogonal/unitary Schur factor of *h(ilo:ihi, ilo:ihi)*. If *wantz* is .FALSE., *z* is not referenced.
(The output values of *z* when *info* > 0 are given under the description of the *info* parameter below.)

info

INTEGER.
= 0: the execution is successful.
> 0: if *info* = *i*, then the routine failed to compute all the eigenvalues. Elements 1:*ilo*-1 and i+1:*n* of *wr* and *wi* contain those eigenvalues which have been successfully computed.
> 0: if *wantt* is .FALSE., then the remaining unconverged eigenvalues are the eigenvalues of the upper Hessenberg matrix rows and columns *ilo* through *info* of the final output value of *h*.

> 0: if *wantt* is .TRUE., then (initial value of *h*)*U = U*(final value of *h*, where *U* is an orthogonal/unitary matrix. The final value of *h* is upper Hessenberg and quasi-triangular/triangular in rows and columns *info*+1 through *ihi*.
> 0: if *wantz* is .TRUE., then (final value of *z*(*ilo*:*ihi*, *iloz*:*ihiz*))=(initial value of *z*(*ilo*:*ihi*, *iloz*:*ihiz*)*U, where *U* is the orthogonal/unitary matrix in the previous expression (regardless of the value of *wantt*).
> 0: if *wantz* is .FALSE., then *z* is not accessed.

?laqr1

Sets a scalar multiple of the first column of the product of 2-by-2 or 3-by-3 matrix H and specified shifts.

Syntax

```
call slaqr1( n, h, ldh, sr1, si1, sr2, si2, v )
call dlaqr1( n, h, ldh, sr1, si1, sr2, si2, v )
call claqr1( n, h, ldh, s1, s2, v )
call zlaqr1( n, h, ldh, s1, s2, v )
```

Description

Given a 2-by-2 or 3-by-3 matrix *H*, this routine sets *v* to a scalar multiple of the first column of the product

K = (*H* - *s1*I*)*(*H* - *s2*I*), or *K* = (*H* - (*sr1* + i**si1*)*I*)*(*H* - (*sr2* + i**si2*)*I*)

scaling to avoid overflows and most underflows.

It is assumed that either 1) *sr1* = *sr2* and *si1* = -*si2*, or 2) *si1* = *si2* = 0.

This is useful for starting double implicit shift bulges in the QR algorithm.

Input Parameters

n INTEGER.
The order of the matrix *H*. *n* must be equal to 2 or 3.

sr1, *si2*, *sr2*, *si2*
REAL for slaqr1
DOUBLE PRECISION for dlaqr1
Shift values that define *K* in the formula above.

s1, *s2*
COMPLEX for claqr1
COMPLEX*16 for zlaqr1.
Shift values that define *K* in the formula above.

h
REAL for slaqr1
DOUBLE PRECISION for dlaqr1
COMPLEX for claqr1
COMPLEX*16 for zlaqr1.
Array, DIMENSION (*ldh*, *n*), contains 2-by-2 or 3-by-3 matrix *H* in the formula above.

ldh
INTEGER.
The leading dimension of the array *h* just as declared in the calling routine. *ldh* ≥ *n*.

Output Parameters

v
REAL for slaqr1
DOUBLE PRECISION for dlaqr1
COMPLEX for claqr1
COMPLEX*16 for zlaqr1.
Array with dimension (*n*).
A scalar multiple of the first column of the matrix *K* in the formula above.

?laqr2

Performs the orthogonal/unitary similarity transformation of a Hessenberg matrix to detect and deflate fully converged eigenvalues from a trailing principal submatrix (aggresive early deflation).

Syntax

```

```

Description

This routine accepts as input an upper Hessenberg matrix *H* and performs an orthogonal/unitary similarity transformation designed to detect and deflate fully converged eigenvalues from a trailing principal submatrix. On output *H* has been overwritten by a new Hessenberg matrix that is a perturbation of an orthogonal/unitary similarity transformation of *H*. It is to be hoped that the final version of *H* has many zero subdiagonal entries.

This subroutine is identical to ?laqr3 except that it avoids recursion by calling ?lahqr instead of ?laqr4.

Input Parameters

wantt — LOGICAL.
If *wantt* = .TRUE., then the Hessenberg matrix *H* is fully updated so that the quasi-triangular/triangular Schur factor may be computed (in cooperation with the calling subroutine).
If *wantt* = .FALSE., then only enough of *H* is updated to preserve the eigenvalues.

wantz — LOGICAL.

If *wantz* = .TRUE., then the orthogonal/unitary matrix *Z* is updated so that the orthogonal/unitary Schur factor may be computed (in cooperation with the calling subroutine). If *wantz* = .FALSE., then *Z* is not referenced.

n — INTEGER. The order of the Hessenberg matrix *H* and (if *wantz* = .TRUE.) the order of the orthogonal/unitary matrix *Z*. .

ktop — INTEGER.
It is assumed that either *ktop*=1 or *h*(*ktop*,*ktop-1*)=0. *ktop* and *kbot* together determine an isolated block along the diagonal of the Hessenberg matrix.

kbot — INTEGER.
It is assumed without a check that either *kbot*=*n* or *h*(*kbot*+1,*kbot*)=0. *ktop* and *kbot* together determine an isolated block along the diagonal of the Hessenberg matrix.

nw — INTEGER.
Size of the deflation window. 1 ≤ *nw* ≤ (*kbot*-*ktop*+1).

h — REAL for slaqr2
DOUBLE PRECISION for dlaqr2
COMPLEX for claqr2
COMPLEX*16 for zlaqr2.
Array, DIMENSION (*ldh*, *n*), on input the initial *n*-by-*n* section of *h* stores the Hessenberg matrix *H* undergoing aggressive early deflation.

ldh — INTEGER. The leading dimension of the array *h* just as declared in the calling subroutine. *ldh*≥*n*.

iloz, *ihiz* — INTEGER. Specify the rows of *Z* to which transformations must be applied if *wantz* is .TRUE.. 1 ≤ *iloz* ≤ *ihiz* ≤ *n*.

z — REAL for slaqr2
DOUBLE PRECISION for dlaqr2
COMPLEX for claqr2
COMPLEX*16 for zlaqr2.
Array, DIMENSION (*ldz*, *ihi*), contains the matrix *Z* if *wantz* is .TRUE.. If *wantz* is .FALSE., then *z* is not referenced.

ldz	INTEGER. The leading dimension of the array *z* just as declared in the calling subroutine. *ldz* ≥ 1.
v	REAL for slaqr2 DOUBLE PRECISION for dlaqr2 COMPLEX for claqr2 COMPLEX*16 for zlaqr2. Workspace array with dimension (*ldv*, *nw*). An *nw*-by-*nw* work array.
ldv	INTEGER. The leading dimension of the array *v* just as declared in the calling subroutine. *ldv* ≥ *nw*.
nh	INTEGER. The number of column of *t*. *nh* ≥ *nw*.
t	REAL for slaqr2 DOUBLE PRECISION for dlaqr2 COMPLEX for claqr2 COMPLEX*16 for zlaqr2. Workspace array with dimension (*ldt*, *nw*).
ldt	INTEGER. The leading dimension of the array *t* just as declared in the calling subroutine. *ldt*≥*nw*.
nv	INTEGER. The number of rows of work array *wv* available for workspace. *nv*≥*nw*.
wv	REAL for slaqr2 DOUBLE PRECISION for dlaqr2 COMPLEX for claqr2 COMPLEX*16 for zlaqr2. Workspace array with dimension (*ldwv*, *nw*).
ldwv	INTEGER. The leading dimension of the array *wv* just as declared in the calling subroutine. *ldwv*≥*nw*.
work	REAL for slaqr2 DOUBLE PRECISION for dlaqr2 COMPLEX for claqr2 COMPLEX*16 for zlaqr2. Workspace array with dimension *lwork*.
lwork	INTEGER. The dimension of the array *work*.

lwork=2**nw*) is sufficient, but for the optimal performance a greater workspace may be required.
If *lwork*=-1, then the routine performs a workspace query: it estimates the optimal workspace size for the given values of the input parameters *n*, *nw*, *ktop*, and *kbot*. The estimate is returned in *work*(1). No error messages related to the *lwork* is issued by xerbla. Neither *H* nor *Z* are accessed.

Output Parameters

h
On output *h* has been transformed by an orthogonal/unitary similarity transformation, perturbed, and the returned to Hessenberg form that (it is to be hoped) has some zero subdiagonal entries.

work(1)
On exit *work*(1) is set to an estimate of the optimal value of *lwork* for the given values of the input parameters *n*, *nw*, *ktop*, and *kbot*.

z
If *wantz* is .TRUE., then the orthogonal/unitary similarity transformation is accumulated into *z(iloz:ihiz, ilo:ihi)* from the right.
If *wantz* is .FALSE., then *z* is unreferenced.

nd
INTEGER. The number of converged eigenvalues uncovered by the routine.

ns
INTEGER. The number of unconverged, that is approximate eigenvalues returned in *sr*, *si* or in *sh* that may be used as shifts by the calling subroutine.

sh
COMPLEX for claqr2
COMPLEX*16 for zlaqr2.
Arrays, DIMENSION (*kbot*).
The approximate eigenvalues that may be used for shifts are stored in the *sh*(*kbot*-*nd*-*ns*+1) through the *sh*(*kbot*-*nd*).
The converged eigenvalues are stored in the *sh*(*kbot*-*nd*+1) through the *sh*(*kbot*).

sr, *si*
REAL for slaqr2
DOUBLE PRECISION for dlaqr2
Arrays, DIMENSION (*kbot*) each.

The real and imaginary parts of the approximate eigenvalues that may be used for shifts are stored in the *sr*(*kbot*-*nd*-*ns*+1) through the *sr*(*kbot*-*nd*), and *si*(*kbot*-*nd*-*ns*+1) through the *si*(*kbot*-*nd*), respectively. The real and imaginary parts of converged eigenvalues are stored in the *sr*(*kbot*-*nd*+1) through the *sr*(*kbot*), and *si*(*kbot*-*nd*+1) through the *si*(*kbot*), respectively.

?laqr3

Performs the orthogonal/unitary similarity transformation of a Hessenberg matrix to detect and deflate fully converged eigenvalues from a trailing principal submatrix (aggresive early deflation).

Syntax

```
call slaqr3( wantt, wantz, n, ktop, kbot, nw, h, ldh, iloz, ihiz, z, ldz, ns,
nd, sr, si, v, ldv, nh, t, ldt, nv, wv, ldwv, work, lwork )

call dlaqr3( wantt, wantz, n, ktop, kbot, nw, h, ldh, iloz, ihiz, z, ldz, ns,
nd, sr, si, v, ldv, nh, t, ldt, nv, wv, ldwv, work, lwork )

call claqr3( wantt, wantz, n, ktop, kbot, nw, h, ldh, iloz, ihiz, z, ldz, ns,
nd, sh, v, ldv, nh, t, ldt, nv, wv, ldwv, work, lwork )

call zlaqr3( wantt, wantz, n, ktop, kbot, nw, h, ldh, iloz, ihiz, z, ldz, ns,
nd, sh, v, ldv, nh, t, ldt, nv, wv, ldwv, work, lwork )
```

Description

This routine accepts as input an upper Hessenberg matrix *H* and performs an orthogonal/unitary similarity transformation designed to detect and deflate fully converged eigenvalues from a trailing principal submatrix. On output *H* has been overwritten by a new Hessenberg matrix that is a perturbation of an orthogonal/unitary similarity transformation of *H*. It is to be hoped that the final version of *H* has many zero subdiagonal entries.

Input Parameters

wantt LOGICAL.

If *wantt* = .TRUE., then the Hessenberg matrix *H* is fully updated so that the quasi-triangular/triangular Schur factor may be computed (in cooperation with the calling subroutine).
If *wantt* = .FALSE., then only enough of *H* is updated to preserve the eigenvalues.

wantz — LOGICAL.
If *wantz* = .TRUE., then the orthogonal/unitary matrix *Z* is updated so that the orthogonal/unitary Schur factor may be computed (in cooperation with the calling subroutine).
If *wantz* = .FALSE., then *Z* is not referenced.

n — INTEGER. The order of the Hessenberg matrix *H* and (if *wantz* = .TRUE.) the order of the orthogonal/unitary matrix *Z*.

ktop — INTEGER.
It is assumed that either *ktop*=1 or *h*(*ktop*,*ktop-1*)=0. *ktop* and *kbot* together determine an isolated block along the diagonal of the Hessenberg matrix.

kbot — INTEGER.
It is assumed without a check that either *kbot*=*n* or *h*(*kbot*+1,*kbot*)=0. *ktop* and *kbot* together determine an isolated block along the diagonal of the Hessenberg matrix.

nw — INTEGER.
Size of the deflation window. 1≤*nw*≤(*kbot*-*ktop*+1).

h — REAL for slaqr3
DOUBLE PRECISION for dlaqr3
COMPLEX for claqr3
COMPLEX*16 for zlaqr3.
Array, DIMENSION (*ldh*, *n*), on input the initial *n*-by-*n* section of *h* stores the Hessenberg matrix *H* undergoing aggressive early deflation.

ldh — INTEGER. The leading dimension of the array *h* just as declared in the calling subroutine. *ldh*≥*n*.

iloz, *ihiz* — INTEGER. Specify the rows of *Z* to which transformations must be applied if *wantz* is .TRUE.. 1≤*iloz*≤*ihiz*≤*n*.

z	REAL for slaqr3 DOUBLE PRECISION for dlaqr3 COMPLEX for claqr3 COMPLEX*16 for zlaqr3. Array, DIMENSION (*ldz*, *ihi*), contains the matrix *Z* if *wantz* is .TRUE.. If *wantz* is .FALSE., then *z* is not referenced.
ldz	INTEGER. The leading dimension of the array *z* just as declared in the calling subroutine. *ldz*≥1.
v	REAL for slaqr3 DOUBLE PRECISION for dlaqr3 COMPLEX for claqr3 COMPLEX*16 for zlaqr3. Workspace array with dimension (*ldv*, *nw*). An *nw*-by-*nw* work array.
ldv	INTEGER. The leading dimension of the array *v* just as declared in the calling subroutine. *ldv*≥*nw*.
nh	INTEGER. The number of column of *t*. *nh*≥*nw*.
t	REAL for slaqr3 DOUBLE PRECISION for dlaqr3 COMPLEX for claqr3 COMPLEX*16 for zlaqr3. Workspace array with dimension (*ldt*, *nw*).
ldt	INTEGER. The leading dimension of the array *t* just as declared in the calling subroutine. *ldt*≥*nw*.
nv	INTEGER. The number of rows of work array *wv* available for workspace. *nv*≥*nw*.
wv	REAL for slaqr3 DOUBLE PRECISION for dlaqr3 COMPLEX for claqr3 COMPLEX*16 for zlaqr3. Workspace array with dimension (*ldwv*, *nw*).
ldwv	INTEGER. The leading dimension of the array *wv* just as declared in the calling subroutine. *ldwv*≥*nw*.

work — REAL for slaqr3
DOUBLE PRECISION for dlaqr3
COMPLEX for claqr3
COMPLEX*16 for zlaqr3.
Workspace array with dimension *lwork*.

lwork — INTEGER. The dimension of the array *work*.
lwork=2*nw) is sufficient, but for the optimal performance a greater workspace may be required.
If *lwork*=-1, then the routine performs a workspace query: it estimates the optimal workspace size for the given values of the input parameters *n*, *nw*, *ktop*, and *kbot*. The estimate is returned in *work*(1). No error messages related to the *lwork* is issued by xerbla. Neither *H* nor *Z* are accessed.

Output Parameters

h — On output *h* has been transformed by an orthogonal/unitary similarity transformation, perturbed, and the returned to Hessenberg form that (it is to be hoped) has some zero subdiagonal entries.

work(1) — On exit *work*(1) is set to an estimate of the optimal value of *lwork* for the given values of the input parameters *n*, *nw*, *ktop*, and *kbot*.

z — If *wantz* is .TRUE., then the orthogonal/unitary similarity transformation is accumulated into *z(iloz:ihiz, ilo:ihi)* from the right.
If *wantz* is .FALSE., then *z* is unreferenced.

nd — INTEGER. The number of converged eigenvalues uncovered by the routine.

ns — INTEGER. The number of unconverged, that is approximate eigenvalues returned in *sr*, *si* or in *sh* that may be used as shifts by the calling subroutine.

sh — COMPLEX for claqr3
COMPLEX*16 for zlaqr3.
Arrays, DIMENSION (*kbot*).

	The approximate eigenvalues that may be used for shifts are stored in the *sh*(*kbot*-*nd*-*ns*+1) through the *sh*(*kbot*-*nd*). The converged eigenvalues are stored in the *sh*(*kbot*-*nd*+1) through the *sh*(*kbot*).
sr, *si*	REAL for slaqr3 DOUBLE PRECISION for dlaqr3 Arrays, DIMENSION (*kbot*) each. The real and imaginary parts of the approximate eigenvalues that may be used for shifts are stored in the *sr*(*kbot*-*nd*-*ns*+1) through the *sr*(*kbot*-*nd*), and *si*(*kbot*-*nd*-*ns*+1) through the *si*(*kbot*-*nd*), respectively. The real and imaginary parts of converged eigenvalues are stored in the *sr*(*kbot*-*nd*+1) through the *sr*(*kbot*), and *si*(*kbot*-*nd*+1) through the *si*(*kbot*), respectively.

?laqr4

Computes the eigenvalues of a Hessenberg matrix, and optionally the marices from the Schur decomposition.

Syntax

```
call slaqr4( wantt, wantz, n, ilo, ihi, h, ldh, wr, wi, iloz, ihiz, z, ldz, work, lwork, info )
call dlaqr4( wantt, wantz, n, ilo, ihi, h, ldh, wr, wi, iloz, ihiz, z, ldz, work, lwork, info )
call claqr4( wantt, wantz, n, ilo, ihi, h, ldh, w, iloz, ihiz, z, ldz, work, lwork, info )
call zlaqr4( wantt, wantz, n, ilo, ihi, h, ldh, w, iloz, ihiz, z, ldz, work, lwork, info )
```

Description

This routine computes the eigenvalues of a Hessenberg matrix H, and, optionally, the matrices T and Z from the Schur decomposition $H=Z*T*Z^H$, where T is an upper quasi-triangular/triangular matrix (the Schur form), and Z is the orthogonal/unitary matrix of Schur vectors.

Optionally *Z* may be postmultiplied into an input orthogonal/unitary matrix *Q* so that this routine can give the Schur factorization of a matrix *A* which has been reduced to the Hessenberg form *H* by the orthogonal/unitary matrix *Q*: *A* = *Q***H***Q*^{H} = (*QZ*)**H**(*QZ*)^H.

This routine implements one level of recursion for ?laqr0. It is a complete implementation of the small bulge multi-shift QR algorithm. It may be called by ?laqr0 and, for large enough deflation window size, it may be called by ?laqr3. This routine is identical to ?laqr0 except that it calls ?laqr2 instead of ?laqr3.

Input Parameters

wantt — LOGICAL.
If *wantt* = .TRUE., the full Schur form T is required;
If *wantt* = .FALSE., only eigenvalues are required.

wantz — LOGICAL.
If *wantz* = .TRUE., the matrix of Schur vectors *Z* is required;
If *wantz* = .FALSE., Schur vectors are not required.

n — INTEGER. The order of the Hessenberg matrix *H*. (*n* ≥ 0).

ilo, *ihi* — INTEGER.
It is assumed that *H* is already upper triangular in rows and columns 1:*ilo*-1 and *ihi*+1:*n*, and if *ilo* > 1 then *h*(*ilo*, *ilo*-1) = 0.
ilo and *ihi* are normally set by a previous call to cgebal, and then passed to cgehrd when the matrix output by cgebal is reduced to Hessenberg form. Otherwise, *ilo* and *ihi* should be set to 1 and *n*, respectively.
If *n* > 0, then 1 ≤ *ilo* ≤ *ihi* ≤ *n*.
If *n*=0, then *ilo*=1 and *ihi*=0

h — REAL for slaqr4
DOUBLE PRECISION for dlaqr4
COMPLEX for claqr4
COMPLEX*16 for zlaqr4.
Array, DIMENSION (*ldh*, *n*), contains the upper Hessenberg matrix *H*.

ldh — INTEGER. The leading dimension of the array *h*. *ldh* ≥ max(1, *n*).

iloz, *ihiz*	INTEGER. Specify the rows of *Z* to which transformations must be applied if *wantz* is .TRUE., $1 \le iloz \le ilo$; $ihi \le ihiz \le n$.
z	REAL for slaqr4 DOUBLE PRECISION for dlaqr4 COMPLEX for claqr4 COMPLEX*16 for zlaqr4. Array, DIMENSION (*ldz*, *ihi*), contains the matrix *Z* if *wantz* is .TRUE.. If *wantz* is .FALSE., *z* is not referenced.
ldz	INTEGER. The leading dimension of the array *z*. If *wantz* is .TRUE., then $ldz \ge \max(1, ihiz)$. Otherwise, $ldz \ge 1$.
work	REAL for slaqr4 DOUBLE PRECISION for dlaqr4 COMPLEX for claqr4 COMPLEX*16 for zlaqr4. Workspace array with dimension *lwork*.
lwork	INTEGER. The dimension of the array *work*. $lwork \ge \max(1,n)$ is sufficient, but for the optimal performance a greater workspace may be required, typically as large as $6*n$. It is recommended to use the worlspace query to determine the optimal workspace size. If $lwork=-1$, then the routine performs a workspace query: it estimates the optimal workspace size for the given values of the input parameters *n*, *ilo*, and *ihi*. The estimate is returned in *work*(1). No error messages related to the *lwork* is issued by xerbla. Neither *H* nor *Z* are accessed.

Output Parameters

h	If *info*=0 , and *wantt* is .TRUE., then *h* contains the upper quasi-triangular/triangular matrix *T* from the Schur decomposition (the Schur form). If *info*=0 , and *wantt* is .FALSE., then the contents of *h* are unspecified on exit.

(The output values of *h* when *info* > 0 are given under the description of the *info* parameter below.)
The routines may explicitly set *h*(i,j) for i>j and j=1,2,...*ilo*-1 or j=*ihi*+1, *ihi*+2,...*n*.

work(1) — On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.

w — COMPLEX for claqr4
COMPLEX*16 for zlaqr4.
Arrays, DIMENSION(*n*). The computed eigenvalues of *h*(*ilo*:*ihi*, *ilo*:*ihi*) are stored in *w*(*ilo*:*ihi*). If *wantt* is .TRUE., then the eigenvalues are stored in the same order as on the diagonal of the Schur form returned in *h*, with *w*(i) = *h*(i,i).

wr, *wi* — REAL for slaqr4
DOUBLE PRECISION for dlaqr4
Arrays, DIMENSION(*ihi*) each. The real and imaginary parts, respectively, of the computed eigenvalues of *h*(*ilo*:*ihi*, *ilo*:*ihi*) are stored in the *wr*(*ilo*:*ihi*) and *wi*(*ilo*:*ihi*). If two eigenvalues are computed as a complex conjugate pair, they are stored in consecutive elements of *wr* and *wi*, say the *i*-th and (*i*+1)-th, with *wi*(*i*)> 0 and *wi*(*i*+1) < 0. If *wantt* is .TRUE. , then the eigenvalues are stored in the same order as on the diagonal of the Schur form returned in *h*, with *wr*(i) = *h*(i,i), and if *h*(i:i+1,i:i+1)is a 2-by-2 diagonal block, then *wi*(i)=sqrt(-*h*(i+1,i)*h(i,i+1)).

z — If *wantz* is .TRUE., then *z(ilo:ihi, iloz:ihiz)* is replaced by *z(ilo:ihi, iloz:ihiz)*U*, where *U* is the orthogonal/unitary Schur factor of *h(ilo:ihi, ilo:ihi)*.
If *wantz* is .FALSE., *z* is not referenced.
(The output values of *z* when *info* > 0 are given under the description of the *info* parameter below.)

info — INTEGER.
= 0: the execution is successful.

> 0: if *info* = *i*, then the routine failed to compute all the eigenvalues. Elements 1:*ilo*–1 and i+1:*n* of *wr* and *wi* contain those eigenvalues which have been successfully computed.
> 0: if *wantt* is .FALSE., then the remaining unconverged eigenvalues are the eigenvalues of the upper Hessenberg matrix rows and columns *ilo* through *info* of the final output value of *h*.
> 0: if *wantt* is .TRUE., then (initial value of *h*)***U* = *U**(final value of *h*, where *U* is an orthogonal/unitary matrix. The final value of *h* is upper Hessenberg and quasi-triangular/triangular in rows and columns *info*+1 through *ihi*.
> 0: if *wantz* is .TRUE., then (final value of *z*(*ilo*:*ihi*, *iloz*:*ihiz*))=(initial value of *z*(*ilo*:*ihi*, *iloz*:*ihiz*)***U*, where *U* is the orthogonal/unitary matrix in the previous expression (regardless of the value of *wantt*).
> 0: if *wantz* is .FALSE., then *z* is not accessed.

?laqr5

Performs a single small-bulge multi-shift QR sweep.

Syntax

```
call slaqr5( wantt, wantz, kacc22, n, ktop, kbot, nshfts, sr, si, h, ldh,
iloz, ihiz, z, ldz, v, ldv, u, ldu, nv, wv, ldwv, nh, wh, ldwh )

call dlaqr5( wantt, wantz, kacc22, n, ktop, kbot, nshfts, sr, si, h, ldh,
iloz, ihiz, z, ldz, v, ldv, u, ldu, nv, wv, ldwv, nh, wh, ldwh )

call claqr5( wantt, wantz, kacc22, n, ktop, kbot, nshfts, s, h, ldh, iloz,
ihiz, z, ldz, v, ldv, u, ldu, nv, wv, ldwv, nh, wh, ldwh )

call zlaqr5( wantt, wantz, kacc22, n, ktop, kbot, nshfts, s, h, ldh, iloz,
ihiz, z, ldz, v, ldv, u, ldu, nv, wv, ldwv, nh, wh, ldwh )
```

Description

This auxiliary routine called by ?laqr0 performs a single small-bulge multi-shift QR sweep.

Input Parameters

wantt — LOGICAL.
wantt = .TRUE. if the quasi-triangular/triangular Schur factor is computed.
wantt is set to .FALSE. otherwise.

wantz — LOGICAL.
wantz = .TRUE. if the orthogonal/unitary Schur factor is computed.
wantz is set to .FALSE. otherwise.

kacc22 — INTEGER. Possible values are 0, 1, or 2.
Specifies the computation mode of far-from-diagonal orthogonal updates.
= 0: the routine does not accumulate reflections and does not use matrix-matrix multiply to update far-from-diagonal matrix entries.
= 1: the routine accumulates reflections and uses matrix-matrix multiply to update the far-from-diagonal matrix entries.
= 2: the routine accumulates reflections, uses matrix-matrix multiply to update the far-from-diagonal matrix entries, and takes advantage of 2-by-2 block structure during matrix multiplies.

n — INTEGER. The order of the Hessenberg matrix *H* upon which the routine operates.

ktop, *kbot* — INTEGER.
It is assumed without a check that either *ktop*=1 or *h*(*ktop*,*ktop-1*)=0, and either *kbot*=*n* or *h*(*kbot*+1,*kbot*)=0.

nshfts — INTEGER.
Number of simultaneous shifts, must be positive and even.

sr, *si* — REAL for slaqr5
DOUBLE PRECISION for dlaqr5
Arrays, DIMENSION (*nshfts*) each.
sr contains the real parts and *si* contains the imaginary parts of the *nshfts* shifts of origin that define the multi-shift QR sweep.

s	COMPLEX for claqr5 COMPLEX*16 for zlaqr5. Arrays, DIMENSION (*nshfts*). *s* contains the shifts of origin that define the multi-shift QR sweep.
h	REAL for slaqr5 DOUBLE PRECISION for dlaqr5 COMPLEX for claqr5 COMPLEX*16 for zlaqr5. Array, DIMENSION (*ldh*, *n*), on input contains the Hessenberg matrix.
ldh	INTEGER. The leading dimension of the array *h* just as declared in the calling routine. *ldh* ≥ max(1, *n*).
iloz, *ihiz*	INTEGER. Specify the rows of *Z* to which transformations must be applied if *wantz* is .TRUE.. 1 ≤ *iloz* ≤ *ihiz* ≤ *n*.
z	REAL for slaqr5 DOUBLE PRECISION for dlaqr5 COMPLEX for claqr5 COMPLEX*16 for zlaqr5. Array, DIMENSION (*ldz*, *ihi*), contains the matrix *Z* if *wantz* is .TRUE.. If *wantz* is .FALSE., then *z* is not referenced.
ldz	INTEGER. The leading dimension of the array *z* just as declared in the calling routine. *ldz* ≥ *n*.
v	REAL for slaqr5 DOUBLE PRECISION for dlaqr5 COMPLEX for claqr5 COMPLEX*16 for zlaqr5. Workspace array with dimension (*ldv*, *nshfts*/2).
ldv	INTEGER. The leading dimension of the array *v* just as declared in the calling routine. *ldv* ≥ 3.
u	REAL for slaqr5 DOUBLE PRECISION for dlaqr5 COMPLEX for claqr5

COMPLEX*16 for zlaqr5.
Workspace array with dimension (*ldu*, 3**nshfts*-3).

ldu INTEGER. The leading dimension of the array *u* just as declared in the calling routine. *ldu* ≥ 3**nshfts*-3.

nh INTEGER. The number of column in the array *wh* available for workspace. *nh* ≥ 1.

wh REAL for slaqr5
DOUBLE PRECISION for dlaqr5
COMPLEX for claqr5
COMPLEX*16 for zlaqr5.
Workspace array with dimension (*ldwh*, *nh*)

ldwh INTEGER. The leading dimension of the array *wh* just as declared in the calling routine. *ldwh* ≥ 3**nshfts*-3

nv INTEGER. The number of rows of the array *wv* available for workspace. *nv* ≥ 1.

wv REAL for slaqr5
DOUBLE PRECISION for dlaqr5
COMPLEX for claqr5
COMPLEX*16 for zlaqr5.
Workspace array with dimension (*ldwv*, 3**nshfts*-3).

ldwv INTEGER. The leading dimension of the array *wv* just as declared in the calling routine. *ldwv* ≥ *nv*.

Output Parameters

h On output a multi-shift QR Sweep with shifts *sr*(j)+i**si*(j) or *s*(j) is applied to the isolated diagonal block in rows and columns *ktop* through *kbot* .

z If *wantz* is .TRUE., then the QR Sweep orthogonal/unitary similarity transformation is accumulated into *z(iloz:ihiz, ilo:ihi)* from the right.
If *wantz* is .FALSE., then *z* is unreferenced.

?laqsb

Scales a symmetric band matrix, using scaling factors computed by ?pbequ.

Syntax

```
call slaqsb( uplo, n, kd, ab, ldab, s, scond, amax, equed )
call dlaqsb( uplo, n, kd, ab, ldab, s, scond, amax, equed )
call claqsb( uplo, n, kd, ab, ldab, s, scond, amax, equed )
call zlaqsb( uplo, n, kd, ab, ldab, s, scond, amax, equed )
```

Description

The routine equilibrates a symmetric band matrix *A* using the scaling factors in the vector *s*.

Input Parameters

uplo
CHARACTER*1.
Specifies whether the upper or lower triangular part of the symmetric matrix *A* is stored.
If *uplo* = 'U': upper triangular.
If *uplo* = 'L': lower triangular.

n
INTEGER. The order of the matrix *A*.
n ≥ 0.

kd
INTEGER. The number of super-diagonals of the matrix *A* if *uplo* = 'U', or the number of sub-diagonals if *uplo* = 'L'.
kd ≥ 0.

ab
REAL for slaqsb
DOUBLE PRECISION for dlaqsb
COMPLEX for claqsb
COMPLEX*16 for zlaqsb
Array, DIMENSION (*ldab*,*n*). On entry, the upper or lower triangle of the symmetric band matrix *A*, stored in the first *kd*+1 rows of the array. The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows:

if *uplo* = 'U', *ab*(*kd*+1+*i*-*j*,*j*) = A(*i*,*j*) for max(1,*j*-*kd*) ≤ *i* ≤ *j*;

if *uplo* = 'L', *ab*(1+*i*-*j*,*j*) = A(*i*,*j*) for *j* ≤ *i* ≤ min(*n*,*j*+*kd*).

ldab — INTEGER. The leading dimension of the array *ab*.
ldab ≥ *kd*+1.

s — REAL for slaqsb/claqsb
DOUBLE PRECISION for dlaqsb/zlaqsb
Array, DIMENSION (*n*). The scale factors for A.

scond — REAL for slaqsb/claqsb
DOUBLE PRECISION for dlaqsb/zlaqsb
Ratio of the smallest *s*(*i*) to the largest *s*(*i*).

amax — REAL for slaqsb/claqsb
DOUBLE PRECISION for dlaqsb/zlaqsb
Absolute value of largest matrix entry.

Output Parameters

ab — On exit, if *info* = 0, the triangular factor *U* or *L* from the Cholesky factorization *A* = *U*'**U* or *A* = *L***L*' of the band matrix *A*, in the same storage format as *A*.

equed — CHARACTER*1.
Specifies whether or not equilibration was done.
If *equed* = 'N': No equilibration.
If *equed* = 'Y': Equilibration was done, that is, *A* has been replaced by diag(*s*)**A**diag(*s*).

Application Notes

The routine uses internal parameters *thresh*, *large*, and *small*, which have the following meaning. *thresh* is a threshold value used to decide if scaling should be based on the ratio of the scaling factors. If *scond* < *thresh*, scaling is done. *large* and *small* are threshold values used to decide if scaling should be done based on the absolute size of the largest matrix element. If *amax* > *large* or *amax* < *small*, scaling is done.

?laqsp

Scales a symmetric/Hermitian matrix in packed storage, using scaling factors computed by ?ppequ.

Syntax

```
call slaqsp( uplo, n, ap, s, scond, amax, equed )
call dlaqsp( uplo, n, ap, s, scond, amax, equed )
call claqsp( uplo, n, ap, s, scond, amax, equed )
call zlaqsp( uplo, n, ap, s, scond, amax, equed )
```

Description

The routine ?laqsp equilibrates a symmetric matrix *A* using the scaling factors in the vector *s*.

Input Parameters

uplo — CHARACTER*1.
Specifies whether the upper or lower triangular part of the symmetric matrix *A* is stored.
If *uplo* = 'U': upper triangular.
If *uplo* = 'L': lower triangular.

n — INTEGER. The order of the matrix *A*. $n \geq 0$.

ap — REAL for slaqsp
DOUBLE PRECISION for dlaqsp
COMPLEX for claqsp
COMPLEX*16 for zlaqsp
Array, DIMENSION ($n(n+1)/2$).
On entry, the upper or lower triangle of the symmetric matrix *A*, packed columnwise in a linear array. The j-th column of *A* is stored in the array *ap* as follows:
if *uplo* = 'U', $ap(i + (j-1)j/2) = A(i,j)$ for $1 \leq i \leq j$;
if *uplo* = 'L', $ap(i + (j-1)(2n-j)/2) = A(i,j)$ for $j \leq i \leq n$.

s REAL for slaqsp/claqsp
DOUBLE PRECISION for dlaqsp/zlaqsp
Array, DIMENSION (*n*). The scale factors for A.

scond REAL for slaqsp/claqsp
DOUBLE PRECISION for dlaqsp/zlaqsp
Ratio of the smallest *s*(*i*) to the largest *s*(*i*).

amax REAL for slaqsp/claqsp
DOUBLE PRECISION for dlaqsp/zlaqsp
Absolute value of largest matrix entry.

Output Parameters

ap On exit, the equilibrated matrix: diag(*s*)*A*diag(*s*), in the same storage format as *A*.

equed CHARACTER*1.
Specifies whether or not equilibration was done.
If *equed* = 'N': No equilibration.
If *equed* = 'Y': Equilibration was done, that is, *A* has been replaced by diag(*s*)*A*diag(*s*).

Application Notes

The routine uses internal parameters *thresh*, *large*, and *small*, which have the following meaning. *thresh* is a threshold value used to decide if scaling should be based on the ratio of the scaling factors. If *scond* < *thresh*, scaling is done. *large* and *small* are threshold values used to decide if scaling should be done based on the absolute size of the largest matrix element. If *amax* > *large* or *amax* < *small*, scaling is done.

?laqsy

Scales a symmetric/Hermitian matrix, using scaling factors computed by ?poequ.

Syntax

```
call slaqsy( uplo, n, a, lda, s, scond, amax, equed )
call dlaqsy( uplo, n, a, lda, s, scond, amax, equed )
call claqsy( uplo, n, a, lda, s, scond, amax, equed )
call zlaqsy( uplo, n, a, lda, s, scond, amax, equed )
```

Description

The routine equilibrates a symmetric matrix *A* using the scaling factors in the vector *s*.

Input Parameters

uplo — CHARACTER*1.
Specifies whether the upper or lower triangular part of the symmetric matrix *A* is stored.
If *uplo* = 'U': upper triangular.
If *uplo* = 'L': lower triangular.

n — INTEGER. The order of the matrix *A*.
n ≥ 0.

a — REAL for slaqsy
DOUBLE PRECISION for dlaqsy
COMPLEX for claqsy
COMPLEX*16 for zlaqsy
Array, DIMENSION (*lda*,*n*). On entry, the symmetric matrix *A*.
If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *a* is not referenced.
If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *a* is not referenced.

lda — INTEGER. The leading dimension of the array *a*.

	lda ≥ max(*n*,1).
s	REAL for slaqsy/claqsy DOUBLE PRECISION for dlaqsy/zlaqsy Array, DIMENSION (*n*). The scale factors for A.
scond	REAL for slaqsy/claqsy DOUBLE PRECISION for dlaqsy/zlaqsy Ratio of the smallest *s*(*i*) to the largest *s*(*i*).
amax	REAL for slaqsy/claqsy DOUBLE PRECISION for dlaqsy/zlaqsy Absolute value of largest matrix entry.

Output Parameters

a	On exit, if *equed* = 'Y', the equilibrated matrix: diag(*s*)*A*diag(*s*).
equed	CHARACTER*1. Specifies whether or not equilibration was done. If *equed* = 'N': No equilibration. If *equed* = 'Y': Equilibration was done, i.e., *A* has been replaced by diag(*s*)*A*diag(*s*).

Application Notes

The routine uses internal parameters *thresh*, *large*, and *small*, which have the following meaning. *thresh* is a threshold value used to decide if scaling should be based on the ratio of the scaling factors. If *scond* < *thresh*, scaling is done. *large* and *small* are threshold values used to decide if scaling should be done based on the absolute size of the largest matrix element. If *amax* > *large* or *amax* < *small*, scaling is done.

?laqtr

Solves a real quasi-triangular system of equations, or a complex quasi-triangular system of special form, in real arithmetic.

Syntax

```
call slaqtr( ltran, lreal, n, t, ldt, b, w, scale, x, work, info )
call dlaqtr( ltran, lreal, n, t, ldt, b, w, scale, x, work, info )
```

Description

The routine ?laqtr solves the real quasi-triangular system

op(*T*) * *p* = *scale***c*, if *lreal* = .TRUE.

or the complex quasi-triangular systems

op(*T* + *iB*)*(*p*+*iq*) = *scale**(*c*+*id*), if *lreal* = .FALSE.

in real arithmetic, where *T* is upper quasi-triangular.

If *lreal* = .FALSE., then the first diagonal block of *T* must be 1-by-1, *B* is the specially structured matrix

$$B = \begin{bmatrix} b_1 & b_2 & \dots & \dots & b_n \\ & w & & & \\ & & w & & \\ & & & \dots & \\ & & & & w \end{bmatrix}$$

op*(A)* = *A* or *A*', *A*' denotes the conjugate transpose of matrix *A*.

On input,

$$x = \begin{bmatrix} c \\ d \end{bmatrix}, \text{ on output } x = \begin{bmatrix} p \\ q \end{bmatrix}$$

This routine is designed for the condition number estimation in routine ?trsna.

Input Parameters

ltran — LOGICAL.
On entry, *ltran* specifies the option of conjugate transpose:
= .FALSE., op(*T* + *iB*) = *T* + *iB*,

= .TRUE., op(*T* + *iB*) = (*T* + *iB*)'.

lreal — LOGICAL.
On entry, *lreal* specifies the input matrix structure:
= .FALSE., the input is complex
= .TRUE., the input is real.

n — INTEGER.
On entry, *n* specifies the order of *T* + *iB*. *n* ≥ 0.

t — REAL for slaqtr
DOUBLE PRECISION for dlaqtr
Array, dimension (*ldt*,*n*). On entry, *t* contains a matrix in Schur canonical form. If *lreal* = .FALSE., then the first diagonal block of *t* must be 1-by-1.

ldt — INTEGER. The leading dimension of the matrix *T*.
ldt ≥ max(1,*n*).

b — REAL for slaqtr
DOUBLE PRECISION for dlaqtr
Array, dimension (*n*). On entry, *b* contains the elements to form the matrix *B* as described above. If *lreal* = .TRUE., *b* is not referenced.

w — REAL for slaqtr
DOUBLE PRECISION for dlaqtr
On entry, *w* is the diagonal element of the matrix *B*.
If *lreal* = .TRUE., *w* is not referenced.

x — REAL for slaqtr
DOUBLE PRECISION for dlaqtr
Array, dimension (2*n*). On entry, *x* contains the right hand side of the system.

work — REAL for slaqtr
DOUBLE PRECISION for dlaqtr
Workspace array, dimension (*n*).

Output Parameters

scale — REAL for slaqtr
DOUBLE PRECISION for dlaqtr
On exit, *scale* is the scale factor.

x	On exit, *X* is overwritten by the solution.
info	INTEGER. If *info* = 0: successful exit. If *info* = 1: the some diagonal 1-by-1 block has been perturbed by a small number smin to keep nonsingularity. If *info* = 2: the some diagonal 2-by-2 block has been perturbed by a small number in ?laln2 to keep nonsingularity.

NOTE. For higher speed, this routine does not check the inputs for errors.

?lar1v

Computes the (scaled) r-th column of the inverse of the submatrix in rows b1 through bn of tridiagonal matrix.

Syntax

```
call slar1v( n, b1, bn, lambda, d, l, ld, lld, pivmin, gaptol, z, wantnc,
negcnt, ztz, mingma, r, isuppz, nrminv, resid, rqcorr, work )

call dlar1v( n, b1, bn, lambda, d, l, ld, lld, pivmin, gaptol, z, wantnc,
negcnt, ztz, mingma, r, isuppz, nrminv, resid, rqcorr, work )

call clar1v( n, b1, bn, lambda, d, l, ld, lld, pivmin, gaptol, z, wantnc,
negcnt, ztz, mingma, r, isuppz, nrminv, resid, rqcorr, work )

call zlar1v( n, b1, bn, lambda, d, l, ld, lld, pivmin, gaptol, z, wantnc,
negcnt, ztz, mingma, r, isuppz, nrminv, resid, rqcorr, work )
```

Description

The routine ?lar1v computes the (scaled) *r*-th column of the inverse of the submatrix in rows *b1* through *bn* of the tridiagonal matrix $L*D*L^T - \lambda*I$. When λ is close to an eigenvalue, the computed vector is an accurate eigenvector. Usually, *r* corresponds to the index where the eigenvector is largest in magnitude.

The following steps accomplish this computation :

- Stationary *qd* transform, $L*D*L^T - \lambda*I = L(+)*D(+)*L(+)^T$
- Progressive *qd* transform, $L*D*L^T - \lambda*I = U(-)*D(-)*U(-)^T$,
- Computation of the diagonal elements of the inverse of $L*D*L^T - \lambda*I$ by combining the above transforms, and choosing r as the index where the diagonal of the inverse is (one of the) largest in magnitude.
- Computation of the (scaled) r-th column of the inverse using the twisted factorization obtained by combining the top part of the stationary and the bottom part of the progressive transform.

Input Parameters

n	INTEGER. The order of the matrix $L*D*L^T$.
b1	INTEGER. First index of the submatrix of $L*D*L^T$.
bn	INTEGER. Last index of the submatrix of $L*D*L^T$.
lambda	REAL for slar1v/clar1v DOUBLE PRECISION for dlar1v/zlar1v The shift. To compute an accurate eigenvector, *lambda* should be a good approximation to an eigenvalue of $L*D*L^T$.
l	REAL for slar1v/clar1v DOUBLE PRECISION for dlar1v/zlar1v Array, DIMENSION (n-1). The (n-1) subdiagonal elements of the unit bidiagonal matrix L, in elements 1 to n-1.
d	REAL for slar1v/clar1v DOUBLE PRECISION for dlar1v/zlar1v Array, DIMENSION (n). The n diagonal elements of the diagonal matrix D.
ld	REAL for slar1v/clar1v DOUBLE PRECISION for dlar1v/zlar1v Array, DIMENSION (n-1). The n-1 elements L_i*D_i.
lld	REAL for slar1v/clar1v DOUBLE PRECISION for dlar1v/zlar1v Array, DIMENSION (n-1). The n-1 elements $L_i*L_i*D_i$.

pivmin
REAL for slar1v/clar1v
DOUBLE PRECISION for dlar1v/zlar1v
The minimum pivot in the Sturm sequence.

gaptol
REAL for slar1v/clar1v
DOUBLE PRECISION for dlar1v/zlar1v
Tolerance that indicates when eigenvector entries are negligible with respect to their contribution to the residual.

z
REAL for slar1v
DOUBLE PRECISION for dlar1v
COMPLEX for clar1v
COMPLEX*16 for zlar1v
Array, DIMENSION (*n*). All entries of *z* must be set to 0.

wantnc
LOGICAL.
Specifies whether *negcnt* has to be computed.

r
INTEGER.
The twist index for the twisted factorization used to compute *z*. On input, $0 \le r \le n$. If *r* is input as 0, *r* is set to the index where $(L*D*L^T - lambda*I)^{-1}$ is largest in magnitude. If $1 \le r \le n$, *r* is unchanged.

work
REAL for slar1v/clar1v
DOUBLE PRECISION for dlar1v/zlar1v
Workspace array, DIMENSION (4**n*).

Output Parameters

z
REAL for slar1v
DOUBLE PRECISION for dlar1v
COMPLEX for clar1v
COMPLEX*16 for zlar1v
Array, DIMENSION (*n*). The (scaled) *r*-th column of the inverse. *z*(*r*) is returned to be 1.

negcnt
INTEGER. If *wantnc* is .TRUE. then *negcnt* = the number of pivots < *pivmin* in the matrix factorization $L*D*L^T$, and *negcnt* = -1 otherwise.

ztz
REAL for slar1v/clar1v
DOUBLE PRECISION for dlar1v/zlar1v
The square of the 2-norm of *z*.

mingma — REAL for slar1v/clar1v
DOUBLE PRECISION for dlar1v/zlar1v
The reciprocal of the largest (in magnitude) diagonal element of the inverse of $L*D*L^T$ – *lambda*I*.

r — On output, *r* is the twist index used to compute *z*. Ideally, *r* designates the position of the maximum entry in the eigenvector.

isuppz — INTEGER. Array, DIMENSION (2). The support of the vector in *Z*, that is, the vector *z* is nonzero only in elements *isuppz*(1) through *isuppz*(2).

nrminv — REAL for slar1v/clar1v
DOUBLE PRECISION for dlar1v/zlar1v
Equals 1/sqrt(*ztz*).

resid — REAL for slar1v/clar1v
DOUBLE PRECISION for dlar1v/zlar1v
The residual of the FP vector.
resid = ABS(*mingma*)/sqrt(*ztz*).

rqcorr — REAL for slar1v/clar1v
DOUBLE PRECISION for dlar1v/zlar1v
The Rayleigh Quotient correction to *lambda*.
rqcorr = *mingma*/*ztz*.

?lar2v

Applies a vector of plane rotations with real cosines and real/complex sines from both sides to a sequence of 2-by-2 symmetric/Hermitian matrices.

Syntax

```
call slar2v( n, x, y, z, incx, c, s, incc )
call dlar2v( n, x, y, z, incx, c, s, incc )
call clar2v( n, x, y, z, incx, c, s, incc )
call zlar2v( n, x, y, z, incx, c, s, incc )
```

Description

The routine ?lar2v applies a vector of real/complex plane rotations with real cosines from both sides to a sequence of 2-by-2 real symmetric or complex Hermitian matrices, defined by the elements of the vectors x, y and z. For i = 1,2,...,*n*

$$\begin{bmatrix} x_i & z_i \\ \text{conjg}(z_i) & y_i \end{bmatrix} := \begin{bmatrix} c(i) & \text{conjg}(s(i)) \\ -s(i) & c(i) \end{bmatrix} \begin{bmatrix} x_i & z_i \\ \text{conjg}(z_i) & y_i \end{bmatrix} \begin{bmatrix} c(i) & -\text{conjg}(s(i)) \\ s(i) & c(i) \end{bmatrix}$$

Input Parameters

n	INTEGER. The number of plane rotations to be applied.
x, *y*, *z*	REAL for slar2v DOUBLE PRECISION for dlar2v COMPLEX for clar2v COMPLEX*16 for zlar2v Arrays, DIMENSION (1+(*n*-1)**incx*) each. Contain the vectors x, y and z, respectively. For all flavors of ?lar2v, elements of *x* and *y* are assumed to be real.
incx	INTEGER. The increment between elements of *x*, *y*, and *z*. *incx* > 0.
c	REAL for slar2v/clar2v DOUBLE PRECISION for dlar2v/zlar2v Array, DIMENSION (1+(*n*-1)**incc*). The cosines of the plane rotations.
s	REAL for slar2v DOUBLE PRECISION for dlar2v COMPLEX for clar2v COMPLEX*16 for zlar2v Array, DIMENSION (1+(*n*-1)**incc*). The sines of the plane rotations.
incc	INTEGER. The increment between elements of *c* and *s*. *incc* > 0.

Output Parameters

x, *y*, *z*	Vectors *x*, *y* and *z*, containing the results of transform.

?larf

Applies an elementary reflector to a general rectangular matrix.

Syntax

```
call slarf( side, m, n, v, incv, tau, c, ldc, work )
call dlarf( side, m, n, v, incv, tau, c, ldc, work )
call clarf( side, m, n, v, incv, tau, c, ldc, work )
call zlarf( side, m, n, v, incv, tau, c, ldc, work )
```

Description

The routine applies a real/complex elementary reflector *H* to a real/complex *m*-by-*n* matrix *C*, from either the left or the right. *H* is represented in the form

```
H = I - tau*v*v',
```

where *tau* is a real/complex scalar and v is a real/complex vector.

If *tau* = 0, then *H* is taken to be the unit matrix. For clarf/zlarf, to apply *H'* (the conjugate transpose of *H*), supply conjg(*tau*) instead of *tau*.

Input Parameters

side	CHARACTER*1. If *side* = 'L': form *H***C* If *side* = 'R': form *C***H*.
m	INTEGER. The number of rows of the matrix *C*.
n	INTEGER. The number of columns of the matrix *C*.
v	REAL for slarf DOUBLE PRECISION for dlarf COMPLEX for clarf COMPLEX*16 for zlarf Array, DIMENSION

(1 + (*m*-1)*abs(*incv*)) if *side* = 'L' or
(1 + (*n*-1)*abs(*incv*)) if *side* = 'R'. The vector *v* in the representation of *H*. *v* is not used if *tau* = 0.

incv — INTEGER. The increment between elements of *v*.

incv ≠ 0.

tau — REAL for slarf
DOUBLE PRECISION for dlarf
COMPLEX for clarf
COMPLEX*16 for zlarf
The value *tau* in the representation of *H*.

c — REAL for slarf
DOUBLE PRECISION for dlarf
COMPLEX for clarf
COMPLEX*16 for zlarf
Array, DIMENSION (*ldc*,*n*).
On entry, the *m*-by-*n* matrix *C*.

ldc — INTEGER. The leading dimension of the array *c*.

ldc ≥ max(1,*m*).

work — REAL for slarf
DOUBLE PRECISION for dlarf
COMPLEX for clarf
COMPLEX*16 for zlarf
Workspace array, DIMENSION
(*n*) if *side* = 'L' or
(*m*) if *side* = 'R'.

Output Parameters

c — On exit, *C* is overwritten by the matrix *H***C* if *side* = 'L', or *C***H* if *side* = 'R'.

?larfb

Applies a block reflector or its transpose/conjugate-transpose to a general rectangular matrix.

Syntax

```
call slarfb( side, trans, direct, storev, m, n, k, v, ldv, t, ldt, c, ldc,
work, ldwork )
call dlarfb( side, trans, direct, storev, m, n, k, v, ldv, t, ldt, c, ldc,
work, ldwork )
call clarfb( side, trans, direct, storev, m, n, k, v, ldv, t, ldt, c, ldc,
work, ldwork )
call zlarfb( side, trans, direct, storev, m, n, k, v, ldv, t, ldt, c, ldc,
work, ldwork )
```

Description

The routine ?larfb applies a complex block reflector *H* or its transpose *H'* to a complex *m*-by-*n* matrix *C* from either left or right.

Input Parameters

side — CHARACTER*1.
If *side* = 'L': apply *H* or *H'* from the left
If *side* = 'R': apply *H* or *H'* from the right

trans — CHARACTER*1.
If *trans* = 'N': apply *H* (No transpose)
If *trans* = 'C': apply *H'* (Conjugate transpose)

direct — CHARACTER*1.
Indicates how *H* is formed from a product of elementary reflectors
If *direct* = 'F': *H* = *H*(1) *H*(2) . . . *H*(*k*) (forward)
If *direct* = 'B': *H* = *H*(*k*) . . . *H*(2) *H*(1) (backward)

storev — CHARACTER*1.
Indicates how the vectors which define the elementary reflectors are stored:
If *storev* = 'C': Column-wise

	If *storev* = 'R': Row-wise
m	INTEGER. The number of rows of the matrix *C*.
n	INTEGER. The number of columns of the matrix *C*.
k	INTEGER. The order of the matrix *T* (equal to the number of elementary reflectors whose product defines the block reflector).
v	REAL for slarfb DOUBLE PRECISION for dlarfb COMPLEX for clarfb COMPLEX*16 for zlarfb Array, DIMENSION (*ldv*, *k*) if *storev* = 'C' (*ldv*, *m*) if *storev* = 'R' and *side* = 'L' (*ldv*, *n*) if *storev* = 'R' and *side* = 'R' The matrix *v*.
ldv	INTEGER. The leading dimension of the array v. If *storev* = 'C' and *side* = 'L', *ldv* ≥ max(1,*m*); if *storev* = 'C' and *side* = 'R', *ldv* ≥ max(1,*n*); if *storev* = 'R', *ldv* ≥ *k*.
t	REAL for slarfb DOUBLE PRECISION for dlarfb COMPLEX for clarfb COMPLEX*16 for zlarfb Array, DIMENSION (*ldt*,*k*). Contains the triangular *k*-by-*k* matrix *T* in the representation of the block reflector.
LDT	INTEGER. The leading dimension of the array *t*. *ldt* ≥ *k*.
c	REAL for slarfb DOUBLE PRECISION for dlarfb COMPLEX for clarfb COMPLEX*16 for zlarfb Array, DIMENSION (*ldc*,*n*). On entry, the *m*-by-*n* matrix *C*.
ldc	INTEGER. The leading dimension of the array *c*.

	ldc ≥ max(1,*m*).
work	REAL for slarfb DOUBLE PRECISION for dlarfb COMPLEX for clarfb COMPLEX*16 for zlarfb Workspace array, DIMENSION (*ldwork*, *k*).
ldwork	INTEGER. The leading dimension of the array *work*. If *side* = 'L', *ldwork* ≥ max(1, *n*); if *side* = 'R', *ldwork* ≥ max(1, *m*).

Output Parameters

c	On exit, *c* is overwritten by *H***C*, or *H*'**C*, or *C***H*, or *C***H*'.

?larfg

Generates an elementary reflector (Householder matrix).

Syntax

```
call slarfg( n, alpha, x, incx, tau )
call dlarfg( n, alpha, x, incx, tau )
call clarfg( n, alpha, x, incx, tau )
call zlarfg( n, alpha, x, incx, tau )
```

Description

The routine ?larfg generates a real/complex elementary reflector *H* of order *n*, such that

$$H^{*}\begin{bmatrix} alpha \\ x \end{bmatrix}\begin{bmatrix} beta \\ 0 \end{bmatrix}, H^{*}H = I,$$

where *alpha* and *beta* are scalars (with *beta* real for all flavors), and *x* is an (*n*-1)-element real/complex vector. *H* is represented in the form

$$H = I - tau * \begin{bmatrix} 1 \\ v \end{bmatrix} * \begin{bmatrix} 1 & v' \end{bmatrix}$$

where *tau* is a real/complex scalar and v is a real/complex (*n*-1)-element vector. Note that for clarfg/zlarfg, *H* is not Hermitian.

If the elements of *x* are all zero (and, for complex flavors, *alpha* is real), then *tau* = 0 and *H* is taken to be the unit matrix.

Otherwise, 1 ≤ *tau* ≤ 2 (for real flavors), or

1 ≤ Re(*tau*) ≤ 2 and abs(*tau*-1) ≤ 1 (for complex flavors).

Input Parameters

n	INTEGER. The order of the elementary reflector.
alpha	REAL for slarfg DOUBLE PRECISION for dlarfg COMPLEX for clarfg COMPLEX*16 for zlarfg On entry, the value alpha.
x	REAL for slarfg DOUBLE PRECISION for dlarfg COMPLEX for clarfg COMPLEX*16 for zlarfg Array, DIMENSION (1+(*n*-2)*abs(*incx*)). On entry, the vector *x*.
incx	INTEGER. The increment between elements of *x*. *incx* > 0.

Output Parameters

alpha	On exit, it is overwritten with the value *beta*.
x	On exit, it is overwritten with the vector *v*.
tau	REAL for slarfg DOUBLE PRECISION for dlarfg COMPLEX for clarfg

COMPLEX*16 for zlarfg The value *tau*.

?larft

*Forms the triangular factor T of a block reflector H = I - V*T*V^H.*

Syntax

```
call slarft( direct, storev, n, k, v, ldv, tau, t, ldt )
call dlarft( direct, storev, n, k, v, ldv, tau, t, ldt )
call clarft( direct, storev, n, k, v, ldv, tau, t, ldt )
call zlarft( direct, storev, n, k, v, ldv, tau, t, ldt )
```

Description

The routine ?larft forms the triangular factor *T* of a real/complex block reflector *H* of order *n*, which is defined as a product of *k* elementary reflectors.

If *direct* = 'F', *H* = *H*(1) *H*(2) . . . *H*(*k*) and *T* is upper triangular;

If *direct* = 'B', *H* = *H*(*k*) . . . *H*(2) *H*(1) and *T* is lower triangular.

If *storev* = 'C', the vector which defines the elementary reflector H(*i*) is stored in the *i*-th column of the array *v*, and *H* = *I* - *V***T***V*' .

If *storev* = 'R', the vector which defines the elementary reflector H(*i*) is stored in the *i*-th row of the array *v*, and *H* = *I* - *V*'**T***V*.

Input Parameters

direct — CHARACTER*1.
Specifies the order in which the elementary reflectors are multiplied to form the block reflector:
= 'F': *H* = *H*(1) *H*(2) . . . *H*(*k*) (forward)
= 'B': *H* = *H*(*k*) . . . *H*(2) *H*(1) (backward)

storev — CHARACTER*1.
Specifies how the vectors which define the elementary reflectors are stored (see also Application Notes below):
= 'C': column-wise
= 'R': row-wise.

n	INTEGER. The order of the block reflector *H*. *n* ≥ 0.
k	INTEGER. The order of the triangular factor *T* (equal to the number of elementary reflectors). *k* ≥ 1.
v	REAL for slarft DOUBLE PRECISION for dlarft COMPLEX for clarft COMPLEX*16 for zlarft Array, DIMENSION (*ldv*, *k*) if *storev* = 'C' or (*ldv*, *n*) if *storev* = 'R'. The matrix *V*.
ldv	INTEGER. The leading dimension of the array *v*. If *storev* = 'C', *ldv* ≥ max(1,*n*); if *storev* = 'R', *ldv* ≥ *k*.
tau	REAL for slarft DOUBLE PRECISION for dlarft COMPLEX for clarft COMPLEX*16 for zlarft Array, DIMENSION (*k*). *tau*(*i*) must contain the scalar factor of the elementary reflector *H*(*i*).
ldt	INTEGER. The leading dimension of the output array *t*. *ldt* ≥ *k*.

Output Parameters

t	REAL for slarft DOUBLE PRECISION for dlarft COMPLEX for clarft COMPLEX*16 for zlarft Array, DIMENSION (*ldt*,*k*). The *k*-by-*k* triangular factor *T* of the block reflector. If *direct* = 'F', *T* is upper triangular; if *direct* = 'B', *T* is lower triangular. The rest of the array is not used.
v	The matrix *V*.

Application Notes

The shape of the matrix V and the storage of the vectors which define the $H(i)$ is best illustrated by the following example with $n = 5$ and $k = 3$. The elements equal to 1 are not stored; the corresponding array elements are modified but restored on exit. The rest of the array is not used.

$direct = \text{'F'}$ and $storev = \text{'C'}$:

$$\begin{bmatrix} 1 & & \\ v_1 & 1 & \\ v_1 & v_2 & 1 \\ v_1 & v_2 & v_3 \\ v_1 & v_2 & v_3 \end{bmatrix}$$

$direct = \text{'F'}$ and $storev = \text{'R'}$:

$$\begin{bmatrix} 1 & v_1 & v_1 & v_1 & v_1 \\ & 1 & v_2 & v_2 & v_2 \\ & & 1 & v_3 & v_3 \end{bmatrix}$$

$direct = \text{'B'}$ and $storev = \text{'C'}$:

$$\begin{bmatrix} v_1 & v_2 & v_3 \\ v_1 & v_2 & v_3 \\ 1 & v_2 & v_3 \\ & 1 & v_3 \\ & & 1 \end{bmatrix}$$

$direct = \text{'B'}$ and $storev = \text{'R'}$:

$$\begin{bmatrix} v_1 & v_1 & 1 & & \\ v_2 & v_2 & v_2 & 1 & \\ v_3 & v_3 & v_3 & v_3 & 1 \end{bmatrix}$$

?larfx

Applies an elementary reflector to a general rectangular matrix, with loop unrolling when the reflector has order ≥ 10.

Syntax

```
call slarfx( side, m, n, v, tau, c, ldc, work )
call dlarfx( side, m, n, v, tau, c, ldc, work )
call clarfx( side, m, n, v, tau, c, ldc, work )
call zlarfx( side, m, n, v, tau, c, ldc, work )
```

Description

The routine ?larfx applies a real/complex elementary reflector *H* to a real/complex *m*-by-*n* matrix *C*, from either the left or the right.

H is represented in the form

*H = I - tau*v*v'*, where *tau* is a real/complex scalar and v is a real/complex vector.

If *tau = 0*, then *H* is taken to be the unit matrix

Input Parameters

side	CHARACTER*1. If *side = 'L'*: form *H*C* If *side = 'R'*: form *C*H*.
m	INTEGER. The number of rows of the matrix *C*.
n	INTEGER. The number of columns of the matrix *C*.
v	REAL for slarfx DOUBLE PRECISION for dlarfx COMPLEX for clarfx COMPLEX*16 for zlarfx Array, DIMENSION (*m*) if *side = 'L'* or (*n*) if *side = 'R'*. The vector *v* in the representation of *H*.
tau	REAL for slarfx

DOUBLE PRECISION for dlarfx
COMPLEX for clarfx
COMPLEX*16 for zlarfx
The value *tau* in the representation of *H*.

c — REAL for slarfx
DOUBLE PRECISION for dlarfx
COMPLEX for clarfx
COMPLEX*16 for zlarfx
Array, DIMENSION (*ldc*,*n*). On entry, the *m*-by-*n* matrix C.

ldc — INTEGER. The leading dimension of the array *c*. *lda* ≥ (1,*m*).

work — REAL for slarfx
DOUBLE PRECISION for dlarfx
COMPLEX for clarfx
COMPLEX*16 for zlarfx
Workspace array, DIMENSION
(*n*) if *side* = 'L' or
(*m*) if *side* = 'R'.
work is not referenced if *H* has order < 11.

Output Parameters

c — On exit, C is overwritten by the matrix *H***C* if *side* = 'L', or *C***H* if *side* = 'R'.

?largv

Generates a vector of plane rotations with real cosines and real/complex sines.

Syntax

```
call slargv( n, x, incx, y, incy, c, incc )
call dlargv( n, x, incx, y, incy, c, incc )
call clargv( n, x, incx, y, incy, c, incc )
call zlargv( n, x, incx, y, incy, c, incc )
```

Description

The routine generates a vector of real/complex plane rotations with real cosines, determined by elements of the real/complex vectors *x* and *y*.

For slargv/dlargv:

$$\begin{bmatrix} c(i) & s(i) \\ -s(i) & c(i) \end{bmatrix} \begin{bmatrix} x_i \\ y_i \end{bmatrix} = \begin{bmatrix} a_i \\ 0 \end{bmatrix}, \text{for } i = 1,2,\ldots,n$$

For clargv/zlargv:

$$\begin{bmatrix} c(i) & s(i) \\ -\text{conjg}(s(i)) & c(i) \end{bmatrix} \begin{bmatrix} x_i \\ y_i \end{bmatrix} = \begin{bmatrix} r_i \\ 0 \end{bmatrix}, \text{for } i = 1,2,\ldots,n$$

where $c(i)^2 + abs(s(i))^2 = 1$ and the following conventions are used (these are the same as in clartg/zlartg but differ from the BLAS Level 1 routine crotg/zrotg):

If $y_i = 0$, then $c(i) = 1$ and $s(i) = 0$;

If $x_i = 0$, then $c(i) = 0$ and $s(i)$ is chosen so that r_i is real.

Input Parameters

n	INTEGER. The number of plane rotations to be generated.
x, *y*	REAL for slargv DOUBLE PRECISION for dlargv COMPLEX for clargv COMPLEX*16 for zlargv Arrays, DIMENSION (1+(*n*-1)**incx*) and (1+(*n*-1)**incy*), respectively. On entry, the vectors *x* and *y*.
incx	INTEGER. The increment between elements of *x*. *incx* > 0.
incy	INTEGER. The increment between elements of *y*. *incy* > 0.

incc INTEGER. The increment between elements of the output array *c*. *incc* > 0.

Output Parameters

x On exit, *x*(*i*) is overwritten by a_i (for real flavors), or by r_i (for complex flavors), for *i* = 1,...,*n*.

y On exit, the sines *s*(*i*) of the plane rotations.

c REAL for slargv/clargv
DOUBLE PRECISION for dlargv/zlargv
Array, DIMENSION (1+(*n*-1)**incc*). The cosines of the plane rotations.

?larnv

Returns a vector of random numbers from a uniform or normal distribution.

Syntax

```
call slarnv( idist, iseed, n, x )
call dlarnv( idist, iseed, n, x )
call clarnv( idist, iseed, n, x )
call zlarnv( idist, iseed, n, x )
```

Description

The routine ?larnv returns a vector of *n* random real/complex numbers from a uniform or normal distribution.

This routine calls the auxiliary routine ?laruv to generate random real numbers from a uniform (0,1) distribution, in batches of up to 128 using vectorisable code. The Box-Muller method is used to transform numbers from a uniform to a normal distribution.

Input Parameters

idist INTEGER. Specifies the distribution of the random numbers:
for slarnv and dlanrv:
= 1: uniform (0,1)
= 2: uniform (-1,1)

= 3: normal (0,1).
for `clarnv` and `zlanrv`:
= 1: real and imaginary parts each uniform (0,1)
= 2: real and imaginary parts each uniform (-1,1)
= 3: real and imaginary parts each normal (0,1)
= 4: uniformly distributed on the disc abs(z) < 1
= 5: uniformly distributed on the circle abs(z) = 1

iseed — `INTEGER`. Array, `DIMENSION` (4).
On entry, the seed of the random number generator; the array elements must be between 0 and 4095, and *iseed*(4) must be odd.

n — `INTEGER`. The number of random numbers to be generated.

Output Parameters

x — `REAL` for `slarnv`
`DOUBLE PRECISION` for `dlarnv`
`COMPLEX` for `clarnv`
`COMPLEX*16` for `zlarnv`
Array, `DIMENSION` (*n*). The generated random numbers.

iseed — On exit, the seed is updated.

?larra

Computes the splitting points with the specified threshold.

Syntax

```
call slarra( n, d, e, e2, spltol, tnrm, nsplit, isplit, info )
call dlarra( n, d, e, e2, spltol, tnrm, nsplit, isplit, info )
```

Description

This routine computes the splitting points with the specified threshold and sets any "small" off-diagonal elements to zero.

Input Parameters

n — `INTEGER`. The order of the matrix (*n* > 1).

d
REAL for slarra
DOUBLE PRECISION for dlarra
Array, DIMENSION (*n*).
Contains *n* diagonal elements of the tridiagonal matrix *T*.

e
REAL for slarra
DOUBLE PRECISION for dlarra
Array, DIMENSION (*n*).
First (*n*–1) entries contain the subdiagonal elements of the tridiagonal matrix *T*; *e*(*n*) need not be set.

e2
REAL for slarra
DOUBLE PRECISION for dlarra
Array, DIMENSION (*n*).
First (*n*–1) entries contain the squares of the subdiagonal elements of the tridiagonal matrix *T*; *e2*(*n*) need not be set.

spltol
REAL for slarra
DOUBLE PRECISION for dlarra
The threshold for splitting. Two criteria can be used:
spltol<0 : criterion based on absolute off-diagonal value;
spltol>0 : criterion that preserves relative accuracy.

tnrm
REAL for slarra
DOUBLE PRECISION for dlarra
The norm of the matrix.

Output Parameters

e
On exit, the entries *e*(*isplit*(i)), 1 ≤ i ≤ *nsplit*, are set to zero, the other entries of *e* are untouched.

e2
On exit, the entries *e2*(*isplit*(i)), 1 ≤ i ≤ *nsplit*, are set to zero.

nsplit
INTEGER.
The number of blocks the matrix *T* splits into. 1 ≤ *nsplit* ≤ *n*

isplit
INTEGER.
Array, DIMENSION (*n*).

	The splitting points, at which *T* breaks up into blocks. The first block consists of rows/columns 1 to *isplit*(1), the second of rows/columns *isplit*(1)+1 through *isplit*(2), and so on, and the *nsplit*-th consists of rows/columns *isplit*(*nsplit*-1)+1 through *isplit*(*nsplit*)=*n*.
info	INTEGER. = 0: successful exit.

?larrb

Provides limited bisection to locate eigenvalues for more accuracy.

Syntax

call slarrb(*n*, *d*, *lld*, *ifirst*, *ilast*, *rtol1*, *rtol2*, *offset*, *w*, *wgap*, *werr*, *work*, *iwork*, *pivmin*, *spdiam*, *twist*, *info*)

call dlarrb(*n*, *d*, *lld*, *ifirst*, *ilast*, *rtol1*, *rtol2*, *offset*, *w*, *wgap*, *werr*, *work*, *iwork*, *pivmin*, *spdiam*, *twist*, *info*)

Description

Given the relatively robust representation (RRR) $L*D*L^T$, the routine does "limited" bisection to refine the eigenvalues of $L*D*L^T$, *w*(*ifirst*-*offset*) through *w*(*ilast*-*offset*), to more accuracy. Initial guesses for these eigenvalues are input in *w*. The corresponding estimate of the error in these guesses and their gaps are input in *werr* and *wgap*, respectively. During bisection, intervals [*left*, *right*] are maintained by storing their mid-points and semi-widths in the arrays *w* and *werr* respectively.

Input Parameters

n	INTEGER. The order of the matrix.
d	REAL for slarrb DOUBLE PRECISION for dlarrb Array, DIMENSION (*n*). The *n* diagonal elements of the diagonal matrix *D*.
lld	REAL for slarrb DOUBLE PRECISION for dlarrb Array, DIMENSION (*n*-1).

	The n-1 elements $L_i*L_i*D_i$.
ifirst	INTEGER. The index of the first eigenvalue to be computed.
ilast	INTEGER. The index of the last eigenvalue to be computed.
rtol1, *rtol2*	REAL for slarrb DOUBLE PRECISION for dlarrb Tolerance for the convergence of the bisection intervals. An interval [*left*, *right*] has converged if RIGHT-LEFT.LT.MAX(*rtol1**gap, *rtol2**max(|left|,|right|)), where gap is the (estimated) distance to the nearest eigenvalue.
offset	INTEGER. Offset for the arrays *w*, *wgap* and *werr*, that is, the *ifirst*-*offset* through *ilast*-*offset* elements of these arrays are to be used.
w	REAL for slarrb DOUBLE PRECISION for dlarrb Array, DIMENSION (n). On input, *w*(*ifirst*-*offset*) through *w*(*ilast*-*offset*) are estimates of the eigenvalues of $L*D*L^T$ indexed *ifirst* through *ilast*.
wgap	REAL for slarrb DOUBLE PRECISION for dlarrb Array, DIMENSION (n-1). The estimated gaps between consecutive eigenvalues of $L*D*L^T$, that is, *wgap*(*i*-*offset*) is the gap between eigenvalues i and i+1. Note that if IFIRST.EQ.ILAST then *wgap*(*ifirst*-*offset*) must be set to 0.
werr	REAL for slarrb DOUBLE PRECISION for dlarrb Array, DIMENSION (n). On input, *werr*(*ifirst*-*offset*) through *werr*(*ilast*-*offset*) are the errors in the estimates of the corresponding elements in *w*.
work	REAL for slarrb DOUBLE PRECISION for dlarrb Workspace array, DIMENSION (2*n).
pivmin	REAL for slarrb DOUBLE PRECISION for dlarrb The minimum pivot in the Sturm sequence.

spdiam	REAL for slarrb DOUBLE PRECISION for dlarrb The spectral diameter of the matrix.
twist	INTEGER. The twist index for the twisted factorization that is used for the negcount. *twist* = *n*: Compute negcount from $L*D*L^T - lambda*i = L+ * D+ * L+^T$ *twist* = *n*: Compute negcount from $L*D*L^T - lambda*i = U- * D- * U-^T$ *twist* = *n*: Compute negcount from $L*D*L^T - lambda*i = N_r*D_r*N_r$
iwork	INTEGER. Workspace array, DIMENSION (2**n*).

Output Parameters

w	On output, the estimates of the eigenvalues are"refined".
wgap	On output, the gaps are refined.
werr	On output, "refined" errors in the estimates of *w*.
info	INTEGER. Error flag.

?larrc

Computes the number of eigenvalues of the symmetric tridiagonal matrix.

Syntax

```
call slarrc( jobt, n, vl, vu, d, e, pivmin, eigcnt, lcnt, rcnt, info )
call dlarrc( jobt, n, vl, vu, d, e, pivmin, eigcnt, lcnt, rcnt, info )
```

Description

This routine finds the number of eigenvalues of the symmetric tridiagonal matrix *T* or of its factorization *L*D*L**T* in the specified interval.

Input Parameters

jobt — CHARACTER*1.
= 'T': computes Sturm count for matrix *T*.
= 'L': computes Sturm count for matrix *L*D*L**T*.

n — INTEGER.
The order of the matrix. (*n* > 1).

vl,*vu* — REAL for slarrc
DOUBLE PRECISION for dlarrc
The lower and upper bounds for the eigenvalues.

d — REAL for slarrc
DOUBLE PRECISION for dlarrc
Array, DIMENSION (*n*).
If *jobt*= 'T': contains the *n* diagonal elements of the tridiagonal matrix *T*.
If *jobt*= 'L': contains the *n* diagonal elements of the diagonal matrix *D*.

e — REAL for slarrc
DOUBLE PRECISION for dlarrc
Array, DIMENSION (*n*).
If *jobt*= 'T': contains the (*n*-1) offdiagonal elements of the matrix *T*.
If *jobt*= 'L': contains the (*n*-1) offdiagonal elements of the matrix *L*.

pivmin — REAL for slarrc
DOUBLE PRECISION for dlarrc
The minimum pivot in the Sturm sequence for the matrix *T*.

Output Parameters

eigcnt — INTEGER.
The number of eigenvalues of the symmetric tridiagonal matrix *T* that are in the half-open interval (*vl*,*vu*].

lcnt,*rcnt* — INTEGER.
The left and right negcounts of the interval.

info — INTEGER.

Now it is not used and always is set to 0.

?larrd

Computes the eigenvalues of a symmetric tridiagonal matrix to suitable accuracy.

Syntax

```
call slarrd( range, order, n, vl, vu, il, iu, gers, reltol, d, e, e2, pivmin,
nsplit, isplit, m, w, werr, wl, wu, iblock, indexw, work, iwork, info )
```

```
call dlarrd( range, order, n, vl, vu, il, iu, gers, reltol, d, e, e2, pivmin,
nsplit, isplit, m, w, werr, wl, wu, iblock, indexw, work, iwork, info )
```

Description

The routine computes the eigenvalues of a symmetric tridiagonal matrix T to suitable accuracy. This is an auxiliary code to be called from ?stemr. The user may ask for all eigenvalues, all eigenvalues in the half-open interval $(vl, vu]$, or the il-th through iu-th eigenvalues.

To avoid overflow, the matrix must be scaled so that its largest element is no greater than $(overflow^{1/2}*underflow^{1/4})$ in absolute value, and for greatest accuracy, it should not be much smaller than that. (For more details see [Kahan66].

Input Parameters

range — CHARACTER.
= 'A': ("All") all eigenvalues will be found.
= 'V': ("Value") all eigenvalues in the half-open interval $(vl, vu]$ will be found.
= 'I': ("Index") the il-th through iu-th eigenvalues will be found.

order — CHARACTER.
= 'B': ("By block") the eigenvalues will be grouped by split-off block (see *iblock*, *isplit* below) and ordered from smallest to largest within the block.
= 'E': ("Entire matrix") the eigenvalues for the entire matrix will be ordered from smallest to largest.

n — INTEGER. The order of the tridiagonal matrix T ($n \geq 1$).

vl,*vu*
REAL for slarrd
DOUBLE PRECISION for dlarrd
If *range* = 'V': the lower and upper bounds of the interval to be searched for eigenvalues. Eigenvalues less than or equal to *vl*, or greater than *vu*, will not be returned. *vl* < *vu*.
If *range* = 'A' or 'I': not referenced.

il,*iu*
INTEGER.
If *range* = 'I': the indices (in ascending order) of the smallest and largest eigenvalues to be returned. 1 ≤ *il* ≤ *iu* ≤ *n*, if *n* > 0; *il*=1 and *iu*=0 if *n*=0.
If *range* = 'A' or 'V': not referenced.

gers
REAL for slarrd
DOUBLE PRECISION for dlarrd
Array, DIMENSION (2*n).
The *n* Gerschgorin intervals (the i-th Gerschgorin interval is (*gers*(2*i-1), *gers*(2*i)).

reltol
REAL for slarrd
DOUBLE PRECISION for dlarrd
The minimum relative width of an interval. When an interval is narrower than *reltol* times the larger (in magnitude) endpoint, then it is considered to be sufficiently small, that is converged. Note: this should always be at least *radix*machine epsilon*.

d
REAL for slarrd
DOUBLE PRECISION for dlarrd
Array, DIMENSION (*n*).
Contains *n* diagonal elements of the tridiagonal matrix *T*.

e
REAL for slarrd
DOUBLE PRECISION for dlarrd
Array, DIMENSION (*n*-1).
Contains (*n*-1) off-diagonal elements of the tridiagonal matrix *T*.

e2
REAL for slarrd
DOUBLE PRECISION for dlarrd
Array, DIMENSION (*n*-1).

Contains (*n*-1) squared off-diagonal elements of the tridiagonal matrix *T*.

pivmin — REAL for slarrd
DOUBLE PRECISION for dlarrd
The minimum pivot in the Sturm sequence for the matrix *T*.

nsplit — INTEGER.
The number of diagonal blocks the matrix *T*. 1 ≤ *nsplit* ≤ *n*

isplit — INTEGER.
Arrays, DIMENSION (*n*).
The splitting points, at which *T* breaks up into submatrices. The first submatrix consists of rows/columns 1 to *isplit*(1), the second of rows/columns *isplit*(1)+1 through *isplit*(2), and so on, and the *nsplit*-th consists of rows/columns *isplit*(*nsplit*-1)+1 through *isplit*(*nsplit*)=*n*.
(Only the first *nsplit* elements actually is used, but since the user cannot know a priori value of *nsplit*, *n* words must be reserved for *isplit*.)

work — REAL for slarrd
DOUBLE PRECISION for dlarrd
Workspace array, DIMENSION (4**n*).

iwork — INTEGER.
Workspace array, DIMENSION (4**n*).

Output Parameters

m — INTEGER.
The actual number of eigenvalues found. 0 ≤ *m* ≤ *n*. (See also the description of *info*=2, 3.)

w — REAL for slarrd
DOUBLE PRECISION for dlarrd
Array, DIMENSION (*n*).

The first *m* elements of *w* contain the eigenvalue approximations. ?laprd computes an interval $I_j = (a_j, b_j]$ that includes eigenvalue j. The eigenvalue approximation is given as the interval midpoint *w*(j)= $(a_j+b_j)/2$. The corresponding error is bounded by *werr*(j) = abs$(a_j-b_j)/2$.

werr

REAL for slarrd
DOUBLE PRECISION for dlarrd
Array, DIMENSION (*n*).
The error bound on the corresponding eigenvalue approximation in *w*.

wl, *wu*

REAL for slarrd
DOUBLE PRECISION for dlarrd
The interval (*wl*, *wu*] contains all the wanted eigenvalues.
If *range* = 'V': then *wl*=*vl* and *wu*=*vu*.
If *range* = 'A': then *wl* and *wu* are the global Gerschgorin bounds on the spectrum.
If *range* = 'I': then *wl* and *wu* are computed by ?laebz from the index range specified.

iblock

INTEGER.
Array, DIMENSION (*n*).
At each row/column j where *e*(j) is zero or small, the matrix *T* is considered to split into a block diagonal matrix. If *info* = 0, then *iblock*(i) specifies to which block (from 1 to the number of blocks) the eigenvalue *w*(i) belongs. (The routine may use the remaining *n*–*m* elements as workspace.)

indexw

INTEGER.
Array, DIMENSION (*n*).
The indices of the eigenvalues within each block (submatrix); for example, *indexw*(i)= j and *iblock*(i)=k imply that the i-th eigenvalue *w*(i) is the j-th eigenvalue in block k.

info

INTEGER.
= 0: successful exit.
< 0: if *info* = -i, the i-th argument has an illegal value
> 0: some or all of the eigenvalues fail to converge or are not computed:

=1 or 3: bisection fail to converge for some eigenvalues; these eigenvalues are flagged by a negative block number. The effect is that the eigenvalues may not be as accurate as the absolute and relative tolerances.
=2 or 3: *range*='I' only: not all of the eigenvalues *il*:*iu* are found.
=4: *range*='I', and the Gershgorin interval initially used is too small. No eigenvalues are computed.

?larre

Given the tridiagonal matrix T, sets small off-diagonal elements to zero and for each unreduced block T_i, finds base representations and eigenvalues.

Syntax

```
call slarre( range, n, vl, vu, il, iu, d, e, e2, rtol1, rtol2, spltol, nsplit,
isplit, m, w, werr, wgap, iblock, indexw, gers, pivmin, work, iwork, info )
```

```
call dlarre( range, n, vl, vu, il, iu, d, e, e2, rtol1, rtol2, spltol, nsplit,
isplit, m, w, werr, wgap, iblock, indexw, gers, pivmin, work, iwork, info )
```

Description

To find the desired eigenvalues of a given real symmetric tridiagonal matrix T, the routine sets any "small" off-diagonal elements to zero, and for each unreduced block T_i, it finds

- a suitable shift at one end of the block spectrum
- the base representation, $T_i - \sigma_i * I = L_i * D_i * L_i^T$, and
- eigenvalues of each $L_i * D_i * L_i^T$.

The representations and eigenvalues found are then used by ?stemr to compute the eigenvectors of a symmetric tridiagonal matrix. The accuracy varies depending on whether bisection is used to find a few eigenvalues or the dqds algorithm (subroutine ?lasq2) to compute all and discard any unwanted one. As an added benefit, ?larre also outputs the n Gerschgorin intervals for the matrices $L_i * D_i * L_i^T$.

Input Parameters

range — CHARACTER.
= 'A': ("All") all eigenvalues will be found.
= 'V': ("Value") all eigenvalues in the half-open interval (*vl*, *vu*] will be found.
= 'I': ("Index") the *il*-th through *iu*-th eigenvalues of the entire matrix will be found.

n — INTEGER. The order of the matrix. $n > 0$.

vl, *vu* — REAL for slarre
DOUBLE PRECISION for dlarre
If *range*='V', the lower and upper bounds for the eigenvalues. Eigenvalues less than or equal to *vl*, or greater than *vu*, are not returned. $vl < vu$.

il, *iu* — INTEGER.
If *range*='I', the indices (in ascending order) of the smallest and largest eigenvalues to be returned. $1 \le il \le iu \le n$.

d — REAL for slarre
DOUBLE PRECISION for dlarre
Array, DIMENSION (*n*).
The *n* diagonal elements of the diagonal matrices *T*.

e — REAL for slarre
DOUBLE PRECISION for dlarre
Array, DIMENSION (*n*). The first (*n*-1) entries contain the subdiagonal elements of the tridiagonal matrix *T*; *e*(*n*) need not be set.

e2 — REAL for slarre
DOUBLE PRECISION for dlarre
Array, DIMENSION (*n*). The first (*n*-1) entries contain the squares of the subdiagonal elements of the tridiagonal matrix *T*; *e2*(*n*) need not be set.

rtol1, *rtol2* — REAL for slarre
DOUBLE PRECISION for dlarre

	Parameters for bisection. An interval `[LEFT,RIGHT]` has converged if `RIGHT-LEFT.LT.MAX( rtol1*gap, rtol2*max(|LEFT|,|RIGHT|) )`.

spltol	`REAL` for `slarre`
	`DOUBLE PRECISION` for `dlarre`
	The threshold for splitting.

work	`REAL` for `slarre`
	`DOUBLE PRECISION` for `dlarre`
	Workspace array, `DIMENSION` (6*n).

iwork	`INTEGER`. Workspace array, `DIMENSION` (5*n).

Output Parameters

vl, *vu*	On exit, if *range*='I' or ='A', contain the bounds on the desired part of the spectrum.
d	On exit, the n diagonal elements of the diagonal matrices D_i.
e	On exit, the subdiagonal elements of the unit bidiagonal matrices L_i. The entries *e*(*isplit*(i)), $1 \le i \le nsplit$, contain the base points $sigma_i$ on output.
e2	On exit, the entries *e2*(*isplit*(i)), $1 \le i \le nsplit$, have been set to zero.
nsplit	`INTEGER`. The number of blocks T splits into. $1 \le nsplit \le n$.
isplit	`INTEGER`. Array, `DIMENSION` (n). The splitting points, at which T breaks up into blocks. The first block consists of rows/columns 1 to *isplit*(1), the second of rows/columns *isplit*(1)+1 through *isplit*(2), etc., and the *nsplit*-th consists of rows/columns *isplit*(*nsplit*-1)+1 through *isplit*(*nsplit*)=*n*.
m	`INTEGER`. The total number of eigenvalues (of all the $L_i*D_i*L_i^T$) found.
w	`REAL` for `slarre` `DOUBLE PRECISION` for `dlarre`

Array, DIMENSION (n). The first m elements contain the eigenvalues. The eigenvalues of each of the blocks, $L_i*D_i*L_i^T$, are sorted in ascending order. The routine may use the remaining n-m elements as workspace.

werr
REAL for slarre
DOUBLE PRECISION for dlarre
Array, DIMENSION (n). The error bound on the corresponding eigenvalue in w.

wgap
REAL for slarre
DOUBLE PRECISION for dlarre
Array, DIMENSION (n). The separation from the right neighbor eigenvalue in w. The gap is only with respect to the eigenvalues of the same block as each block has its own representation tree. Exception: at the right end of a block the left gap is stored.

iblock
INTEGER. Array, DIMENSION (n).
The indices of the blocks (submatrices) associated with the corresponding eigenvalues in w; *iblock*(*i*)=1 if eigenvalue $w(i)$ belongs to the first block from the top, =2 if $w(i)$ belongs to the second block, etc.

indexw
INTEGER. Array, DIMENSION (n).
The indices of the eigenvalues within each block (submatrix); for example, *indexw*(*i*)= 10 and *iblock*(*i*)=2 imply that the i-th eigenvalue $w(i)$ is the 10-th eigenvalue in the second block.

gers
REAL for slarre
DOUBLE PRECISION for dlarre
Array, DIMENSION (2*n). The n Gerschgorin intervals (the i-th Gerschgorin interval is (*gers*(2*i-1), *gers*(2*i)).

pivmin
REAL for slarre
DOUBLE PRECISION for dlarre
The minimum pivot in the Sturm sequence for T.

info
INTEGER.
If *info* = 0: successful exit
If *info* > 0: A problem occured in ?larre. If *info* = 5, the Rayleigh Quotient Iteration failed to converge to full accuracy.

If *info* < 0: One of the called subroutines signaled an internal problem. Inspection of the corresponding parameter *info* for further information is required.

- If *info* = -1, there is a problem in ?larrd
- If *info* = -2, no base representation could be found in maxtry iterations. Increasing maxtry and recompilation might be a remedy.
- If *info* = -3, there is a problem in ?larrb when computing the refined root representation for ?lasq2.
- If *info* = -4, there is a problem in ?larrb when preforming bisection on the desired part of the spectrum.
- If *info* = -5, there is a problem in ?lasq2.
- If *info* = -6, there is a problem in ?lasq2.

?larrf

Finds a new relatively robust representation such that at least one of the eigenvalues is relatively isolated.

Syntax

call slarrf(*n*, *d*, *l*, *ld*, *clstrt*, *clend*, *w*, *wgap*, *werr*, *spdiam*, *clgapl*, *clgapr*, *pivmin*, *sigma*, *dplus*, *lplus*, *work*, *info*)

call dlarrf(*n*, *d*, *l*, *ld*, *clstrt*, *clend*, *w*, *wgap*, *werr*, *spdiam*, *clgapl*, *clgapr*, *pivmin*, *sigma*, *dplus*, *lplus*, *work*, *info*)

Description

Given the initial representation $L*D*L^T$ and its cluster of close eigenvalues (in a relative measure), $w(clstrt)$, $w(clstrt+1)$, ... $w(clend)$, the routine ?larrf finds a new relatively robust representation

$$L*D*L^T - \sigma_i*I = L(+)*D(+)*L(+)^T$$

such that at least one of the eigenvalues of $L(+)*D*(+)*L(+)^T$ is relatively isolated.

Input Parameters

n	INTEGER. The order of the matrix (subblock, if the matrix is splitted).
d	REAL for slarrf DOUBLE PRECISION for dlarrf Array, DIMENSION (n). The n diagonal elements of the diagonal matrix D.
l	REAL for slarrf DOUBLE PRECISION for dlarrf Array, DIMENSION (n-1). The (n-1) subdiagonal elements of the unit bidiagonal matrix L.
ld	REAL for slarrf DOUBLE PRECISION for dlarrf Array, DIMENSION (n-1). The n-1 elements L_i*D_i.
clstrt	INTEGER. The index of the first eigenvalue in the cluster.
clend	INTEGER. The index of the last eigenvalue in the cluster.
w	REAL for slarrf DOUBLE PRECISION for dlarrf Array, DIMENSION ≥ (*clend* -*clstrt*+1). The eigenvalue approximations of $L*D*L^T$ in ascending order. w(*clstrt*) through w(*clend*) form the cluster of relatively close eigenvalues.
wgap	REAL for slarrf DOUBLE PRECISION for dlarrf Array, DIMENSION ≥ (*clend* -*clstrt*+1). The separation from the right neighbor eigenvalue in w.
werr	REAL for slarrf DOUBLE PRECISION for dlarrf Array, DIMENSION ≥ (*clend* -*clstrt*+1). On input, *werr* contains the semiwidth of the uncertainty interval of the corresponding eigenvalue approximation in w.
spdiam	REAL for slarrf DOUBLE PRECISION for dlarrf

Estimate of the spectral diameter obtained from the Gerschgorin intervals.

clgapl, *clgapr*
REAL for slarrf
DOUBLE PRECISION for dlarrf
Absolute gap on each end of the cluster. Set by the calling routine to protect against shifts too close to eigenvalues outside the cluster.

pivmin
REAL for slarrf
DOUBLE PRECISION for dlarrf
The minimum pivot allowed in the Sturm sequence.

work
REAL for slarrf
DOUBLE PRECISION for dlarrf
Workspace array, DIMENSION (2*n).

Output Parameters

wgap
On output, the gaps are refined.

sigma
REAL for slarrf
DOUBLE PRECISION for dlarrf
The shift used to form $L(+)*D*(+)*L(+)^T$.

dplus
REAL for slarrf
DOUBLE PRECISION for dlarrf
Array, DIMENSION (n). The n diagonal elements of the diagonal matrix $D(+)$.

lplus
REAL for slarrf
DOUBLE PRECISION for dlarrf
Array, DIMENSION (n). The first (n-1) elements of *lplus* contain the subdiagonal elements of the unit bidiagonal matrix $L(+)$.

?larrj

Performs refinement of the initial estimates of the eigenvalues of the matrix T.

Syntax

```
call slarrj( n, d, e2, ifirst, ilast, rtol, offset, w, werr, work, iwork,
pivmin, spdiam, info )
```

```
call dlarrj( n, d, e2, ifirst, ilast, rtol, offset, w, werr, work, iwork,
pivmin, spdiam, info )
```

Description

Given the initial eigenvalue approximations of *T*, this routine does bisection to refine the eigenvalues of *T*, *w*(*ifirst-offset*) through *w*(*ilast-offset*) , to more accuracy. Initial guesses for these eigenvalues are input in *w*, the corresponding estimate of the error in these guesses in *werr*. During bisection, intervals [a,b] are maintained by storing their mid-points and semi-widths in the arrays *w* and *werr* respectively.

Input Parameters

n — INTEGER. The order of the matrix *T*.

d — REAL for slarrj
DOUBLE PRECISION for dlarrj
Array, DIMENSION (*n*).
Contains *n* diagonal elements of the matrix *T*.

e2 — REAL for slarrj
DOUBLE PRECISION for dlarrj
Array, DIMENSION (*n*–1).
Contains (*n*–1) squared sub-diagonal elements of the *T*.

ifirst — INTEGER.
The index of the first eigenvalue to be computed.

ilast — INTEGER.
The index of the last eigenvalue to be computed.

rtol — REAL for slarrj
DOUBLE PRECISION for dlarrj

	Tolerance for the convergence of the bisection intervals. An interval `[a,b]` is considered to be converged if `(b-a) ≤ rtol*max(|a|,|b|)`.
offset	`INTEGER`. Offset for the arrays *w* and *werr*, that is the *ifirst-offset* through *ilast-offset* elements of these arrays are to be used.

w	`REAL` for `slarrj`
	`DOUBLE PRECISION` for `dlarrj`
	Array, `DIMENSION` (*n*).
	On input, *w*(*ifirst-offset*) through *w*(*ilast-offset*) are estimates of the eigenvalues of *L*D*L**T* indexed *ifirst* through *ilast*.

werr	`REAL` for `slarrj`
	`DOUBLE PRECISION` for `dlarrj`
	Array, `DIMENSION` (*n*).
	On input, *werr*(*ifirst-offset*) through *werr*(*ilast-offset*) are the errors in the estimates of the corresponding elements in *w*.

work	`REAL` for `slarrj`
	`DOUBLE PRECISION` for `dlarrj`
	Workspace array, `DIMENSION` (2**n*).

iwork	`INTEGER`. Workspace array, `DIMENSION` (2**n*).

pivmin	`REAL` for `slarrj`
	`DOUBLE PRECISION` for `dlarrj`
	The minimum pivot in the Sturm sequence for the matrix *T*.

spdiam	`REAL` for `slarrj`
	`DOUBLE PRECISION` for `dlarrj`
	The spectral diameter of the matrix *T*.

Output Parameters

w	On exit, contains the refined estimates of the eigenvalues.

werr	On exit, contains the refined errors in the estimates of the corresponding elements in *w*.
info	INTEGER. Now it is not used and always is set to 0.

?larrk

Computes one eigenvalue of a symmetric tridiagonal matrix T to suitable accuracy.

Syntax

```
call slarrk( n, iw, gl, gu, d, e2, pivmin, reltol, w, werr, info )
call dlarrk( n, iw, gl, gu, d, e2, pivmin, reltol, w, werr, info )
```

Description

The routine computes one eigenvalue of a symmetric tridiagonal matrix *T* to suitable accuracy. This is an auxiliary code to be called from ?stemr.

To avoid overflow, the matrix must be scaled so that its largest element is no greater than $(overflow^{1/2}*underflow^{1/4})$ in absolute value, and for greatest accuracy, it should not be much smaller than that. (For more details see [[Kahan66]].

Input Parameters

n	INTEGER. The order of the matrix *T*. ($n \geq 1$).
iw	INTEGER. The index of the eigenvalue to be returned.
gl, *gu*	REAL for slarrk DOUBLE PRECISION for dlarrk An upper and a lower bound on the eigenvalue.
d	REAL for slarrk DOUBLE PRECISION for dlarrk Array, DIMENSION (n). Contains n diagonal elements of the matrix *T*.
e2	REAL for slarrk DOUBLE PRECISION for dlarrk Array, DIMENSION ($n-1$).

Contains (*n*-1) squared off-diagonal elements of the *T*.

pivmin — REAL for slarrk
DOUBLE PRECISION for dlarrk
The minimum pivot in the Sturm sequence for the matrix *T*.

reltol — REAL for slarrk
DOUBLE PRECISION for dlarrk
The minimum relative width of an interval. When an interval is narrower than *reltol* times the larger (in magnitude) endpoint, then it is considered to be sufficiently small, that is converged. Note: this should always be at least *radix*machine epsilon*.

Output Parameters

w — REAL for slarrk
DOUBLE PRECISION for dlarrk
Contains the eigenvalue approximation.

werr — REAL for slarrk
DOUBLE PRECISION for dlarrk
Contains the error bound on the corresponding eigenvalue approximation in *w*.

info — INTEGER.
= 0: Eigenvalue converges
= -1: Eigenvalue does not converge

?larrr

Performs tests to decide whether the symmetric tridiagonal matrix T warrants expensive computations which guarantee high relative accuracy in the eigenvalues.

Syntax

```
call slarrr( n, d, e, info )
call dlarrr( n, d, e, info )
```

Description

The routine performs tests to decide whether the symmetric tridiagonal matrix T warrants expensive computations which guarantee high relative accuracy in the eigenvalues.

Input Parameters

n	INTEGER. The order of the matrix T. ($n > 0$).
d	REAL for slarrr DOUBLE PRECISION for dlarrr Array, DIMENSION (n). Contains n diagonal elements of the matrix T.
e	REAL for slarrr DOUBLE PRECISION for dlarrr Array, DIMENSION (n). The first $(n-1)$ entries contain sub-diagonal elements of the tridiagonal matrix T; $e(n)$ is set to 0.

Output Parameters

info	INTEGER. = 0: the matrix warrants computations preserving relative accuracy (default value). = -1: the matrix warrants computations guaranteeing only absolute accuracy.

?larrv

Computes the eigenvectors of the tridiagonal matrix $T = L*D*L^T$ given L, D and the eigenvalues of $L*D*L^T$.

Syntax

```
call slarrv( n, vl, vu, d, l, pivmin, isplit, m, dol, dou, minrgp, rtol1,
rtol2, w, werr, wgap, iblock, indexw, gers, z, ldz, isuppz, work, iwork, info
)
```

```
call dlarrv( n, vl, vu, d, l, pivmin, isplit, m, dol, dou, minrgp, rtol1,
rtol2, w, werr, wgap, iblock, indexw, gers, z, ldz, isuppz, work, iwork, info
)
```

```
call clarrv( n, vl, vu, d, l, pivmin, isplit, m, dol, dou, minrgp, rtol1,
rtol2, w, werr, wgap, iblock, indexw, gers, z, ldz, isuppz, work, iwork, info
)
```

```
call zlarrv( n, vl, vu, d, l, pivmin, isplit, m, dol, dou, minrgp, rtol1,
rtol2, w, werr, wgap, iblock, indexw, gers, z, ldz, isuppz, work, iwork, info
)
```

Description

The routine ?larrv computes the eigenvectors of the tridiagonal matrix $T = L*D*L^T$ given L, D and approximations to the eigenvalues of $L*D*L^T$.

The input eigenvalues should have been computed by slarre for real flavors (slarrv/clarrv) and by dlarre for double precision flavors (dlarre/zlarre).

Input Parameters

n	INTEGER. The order of the matrix. $n \geq 0$.
vl, *vu*	REAL for slarrv/clarrv DOUBLE PRECISION for dlarrv/zlarrv Lower and upper bounds respectively of the interval that contains the desired eigenvalues. $vl < vu$. Needed to compute gaps on the left or right end of the extremal eigenvalues in the desired range.
d	REAL for slarrv/clarrv

DOUBLE PRECISION for dlarrv/zlarrv
Array, DIMENSION (*n*). On entry, the *n* diagonal elements of the diagonal matrix *D*.

l — REAL for slarrv/clarrv
DOUBLE PRECISION for dlarrv/zlarrv
Array, DIMENSION (*n*).
On entry, the (*n*-1) subdiagonal elements of the unit bidiagonal matrix *L* are contained in elements 1 to *n*-1 of *L* if the matrix is not splitted. At the end of each block the corresponding shift is stored as given by slarre for real flavors and by dlarre for double precision flavors.

pivmin — REAL for slarrv/clarrv
DOUBLE PRECISION for dlarrv/zlarrv
The minimum pivot allowed in the Sturm sequence.

isplit — INTEGER. Array, DIMENSION (*n*).
The splitting points, at which *T* breaks up into blocks. The first block consists of rows/columns 1 to *isplit*(1), the second of rows/columns *isplit*(1)+1 through *isplit*(2), etc.

m — INTEGER. The total number of eigenvalues found.
$0 \le m \le n$. If *range* = 'A', $m = n$, and if *range* = 'I', $m = iu - il + 1$.

dol, *dou* — INTEGER.
If you want to compute only selected eigenvectors from all the eigenvalues supplied, specify an index range *dol*:*dou*. Or else apply the setting *dol*=1, *dou*=*m*. Note that *dol* and *dou* refer to the order in which the eigenvalues are stored in *w*.
If you want to compute only selected eigenpairs, then the columns *dol*-1 to *dou*+1 of the eigenvector space *Z* contain the computed eigenvectors. All other columns of *Z* are set to zero.

minrgp, *rtol1*, *rtol2* — REAL for slarrv/clarrv
DOUBLE PRECISION for dlarrv/zlarrv
Parameters for bisection. An interval [LEFT,RIGHT] has converged if RIGHT-LEFT.LT.MAX(*rtol1**gap, *rtol2**max(|LEFT|,|RIGHT|)).

w
REAL for slarrv/clarrv
DOUBLE PRECISION for dlarrv/zlarrv
Array, DIMENSION (*n*). The first *m* elements of *w* contain the approximate eigenvalues for which eigenvectors are to be computed. The eigenvalues should be grouped by split-off block and ordered from smallest to largest within the block (the output array *w* from ?larre is expected here). These eigenvalues are set with respect to the shift of the corresponding root representation for their block.

werr
REAL for slarrv/clarrv
DOUBLE PRECISION for dlarrv/zlarrv
Array, DIMENSION (*n*). The first *m* elements contain the semiwidth of the uncertainty interval of the corresponding eigenvalue in *w*.

wgap
REAL for slarrv/clarrv
DOUBLE PRECISION for dlarrv/zlarrv
Array, DIMENSION (*n*). The separation from the right neighbor eigenvalue in *w*.

iblock
INTEGER. Array, DIMENSION (*n*).
The indices of the blocks (submatrices) associated with the corresponding eigenvalues in *w*; *iblock*(*i*)=1 if eigenvalue *w*(*i*) belongs to the first block from the top, =2 if *w*(*i*) belongs to the second block, etc.

indexw
INTEGER. Array, DIMENSION (*n*).
The indices of the eigenvalues within each block (submatrix); for example, *indexw*(*i*)= 10 and *iblock*(*i*)=2 imply that the *i*-th eigenvalue *w*(*i*) is the 10-th eigenvalue in the second block.

gers
REAL for slarrv/clarrv
DOUBLE PRECISION for dlarrv/zlarrv
Array, DIMENSION (2**n*). The *n* Gerschgorin intervals (the *i*-th Gerschgorin interval is (*gers*(2**i*-1), *gers*(2**i*)). The Gerschgorin intervals should be computed from the original unshifted matrix.

ldz
INTEGER. The leading dimension of the output array *Z*. *ldz* ≥ 1, and if *jobz* = 'V', *ldz* ≥ max(1,*n*).

work REAL for slarrv/clarrv
DOUBLE PRECISION for dlarrv/zlarrv
Workspace array, DIMENSION (12*n).

iwork INTEGER.
Workspace array, DIMENSION (7*n).

Output Parameters

d On exit, d may be overwritten.

l On exit, l is overwritten.

w On exit, w holds the eigenvalues of the unshifted matrix.

werr On exit, *werr* contains refined values of its input approximations.

wgap On exit, *wgap* contains refined values of its input approximations. Very small gaps are changed.

z REAL for slarrv
DOUBLE PRECISION for dlarrv
COMPLEX for clarrv
COMPLEX*16 for zlarrv
Array, DIMENSION (ldz, max(1,m)).
If *info* = 0, the first m columns of z contain the orthonormal eigenvectors of the matrix T corresponding to the input eigenvalues, with the i-th column of z holding the eigenvector associated with $w(i)$.

NOTE. The user must ensure that at least max(1,m) columns are supplied in the array z.

isuppz INTEGER .
