Interface Description

(1) RJ45 Signal input and output interfaces

(2) Signal light

(3) Euro terminal blocks

(4) Address setting interface

(5) Power input interface

(reverse connection of input will damage the driver, make sure the wiring is correct before power on.)

(6) Output interface

Remark:

Connect the anode and RGBW wire of common anode RGBW module to the output interface of decoder directly; Connect the anode wire of single-color module to V+ on decoder, and connect the cathode wire to one of RGBW pin according to the LED's color; Connect several colors single-color module to one decoder, please connect their anode wires to V+ pin on decoder.

DIP Switch Setting

	DIP1	DIP2	DIP3	DIP4	DIP5	DIP6	DIP7	DIP8	DIP9	DIP10
OFF	0	0	0	0	0	0	0	0	0	NA
ON	1	2	4	8	16	32	64	128	256	FUN

DIP1~9: Setting the first DMX address of device, the sum of number showed in the table above is the first DMX address of device.

In DMX mode, the effective address is 1-511, and 511 is for fixed mode (511 means output RGBW gradient).

When the address is 0, the default is RDM mode.

DIP10: FUN is 120 ohm terminal resistance.

- 1) Use the CAT-5 cable or three-core shielded cable as DMX512/RDM signal cable, and DMX512/RDM signal has the positive and negative signal. While welding the DMX512/RDM signal cable plug, there must pay much attention to distinguish between positive (+) and negative(-), and then connect the DMX512/RDM signal cable with the corresponding input interface of PX0406 correctly.
- 2) Refer to "DMX Series of address dial code table" to set DMX address by dip-switch.
- 3) Connect a signal terminal at the end of the whole connection.

当地址设置为0时，默认为RDM模式。

DIP10: FUN代表是120欧姆的终结电阻。

接线图

- 1) DMX512/RDM接线为直连式，DMX512/RDM信号有正信号和负信号。接线时，要注意极性。将正信号，负信号和接地信号连接到设备相对应的接口。
- 2) 参阅“DMX系列地址拨码表”，通过拨码开关来设置DMX地址。
- 3) 整个接线的尾部最后需接信号终结器。
