Glossary

ADC	Analog to Digital Converter	USB	Universal Serial Bus
CPU	Central Processing Unit	DAC	Digital to Analog Converter
DMA	Direct Memory Access	E10A	“E10A for Starter Kit” debugger
FDT	Flash Development Tool	RSK	Renesas Starter Kit
LED	Light Emitting Diode	LCD	Liquid Crystal Display

Chapter 2.Purpose

This RSK is an evaluation tool for Renesas microcontrollers.

Features include:

- Renesas Microcontroller Programming.
- User Code Debugging.
- User Circuitry such as switches, LEDs and potentiometer(s).
- Sample Application.
- Sample peripheral device initialisation code.

The CPU board contains all the circuitry required for microcontroller operation.

This manual describes the technical details of the RSK hardware. The Quick Start Guide and Tutorial Manual provide details of the software installation and debugging environment.

Chapter 3.Power Supply

3.1.Requirements

This CPU board operates from a 5V power supply and are supplied with a suitable PSU.

A diode provides reverse polarity protection only if a current limiting power supply is used.

All CPU boards are supplied with an E10A debugger.

When the CPU board is connected to another system that system should supply power to the CPU board.

All CPU boards have an centre positive supply connector using a 2.0mm barrel power jack.

Warning

The CPU board is neither under not over voltage protected. Use a centre positive supply for this board.

3.2.Power – Up Behaviour

When the RSK is purchased the CPU board has the 'Release' or stand alone code from the example tutorial code pre-programmed into the Renesas microcontroller. On powering up the board the user LEDs will start to flash. Switch 2 will cause the LEDs to flash at a rate controlled by the potentiometer.

Chapter 4.Board Layout

4.1.Component Layout

The following diagram shows top layer component layout of the board.

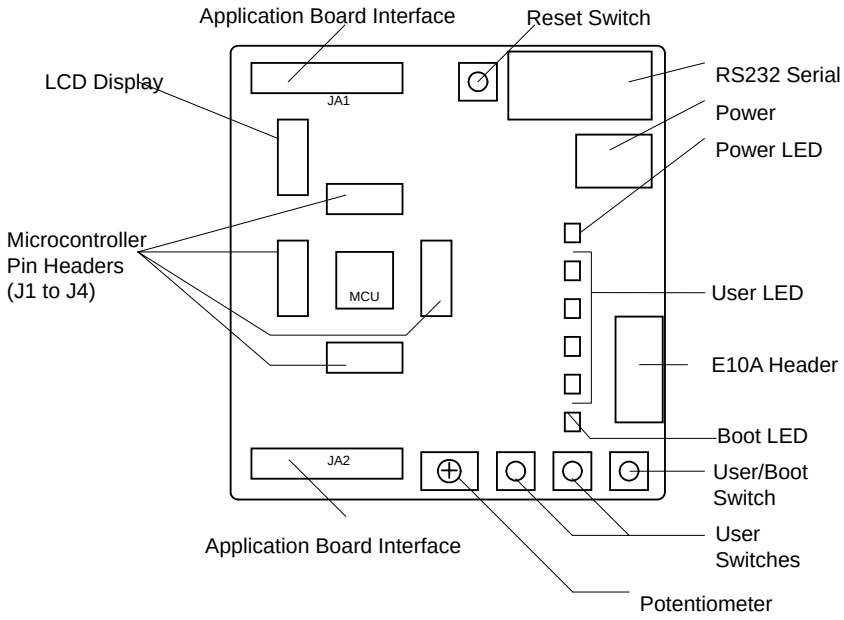

Figure 4-1: Board Layout

4.2.Board Dimensions

The following diagram gives the board dimensions and connector positions. All through hole connectors are on a common 0.1” grid for easy interfacing.

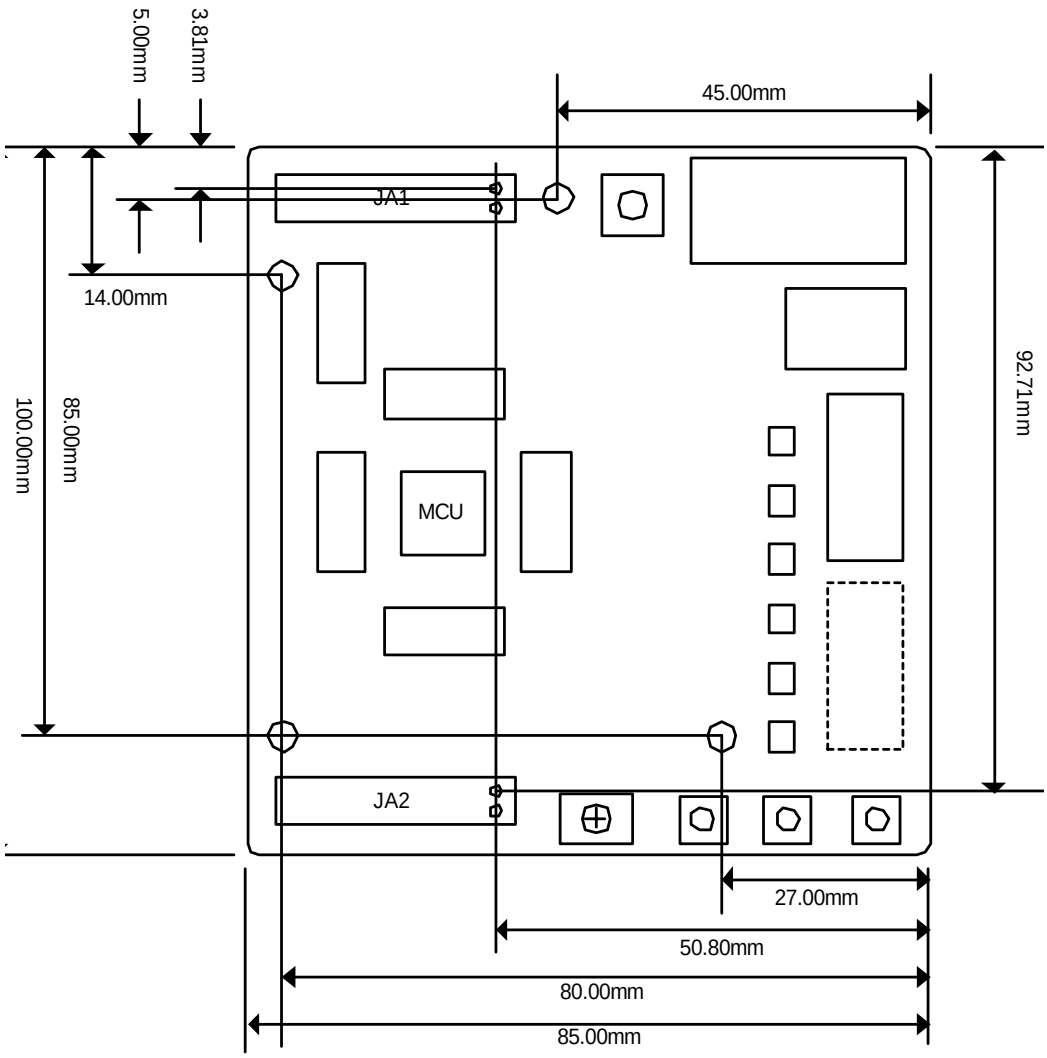

Figure 4-2 : Board Dimensions

Chapter 5.Block Diagram

Figure 5-1 shows the CPU board components and their connectivity.

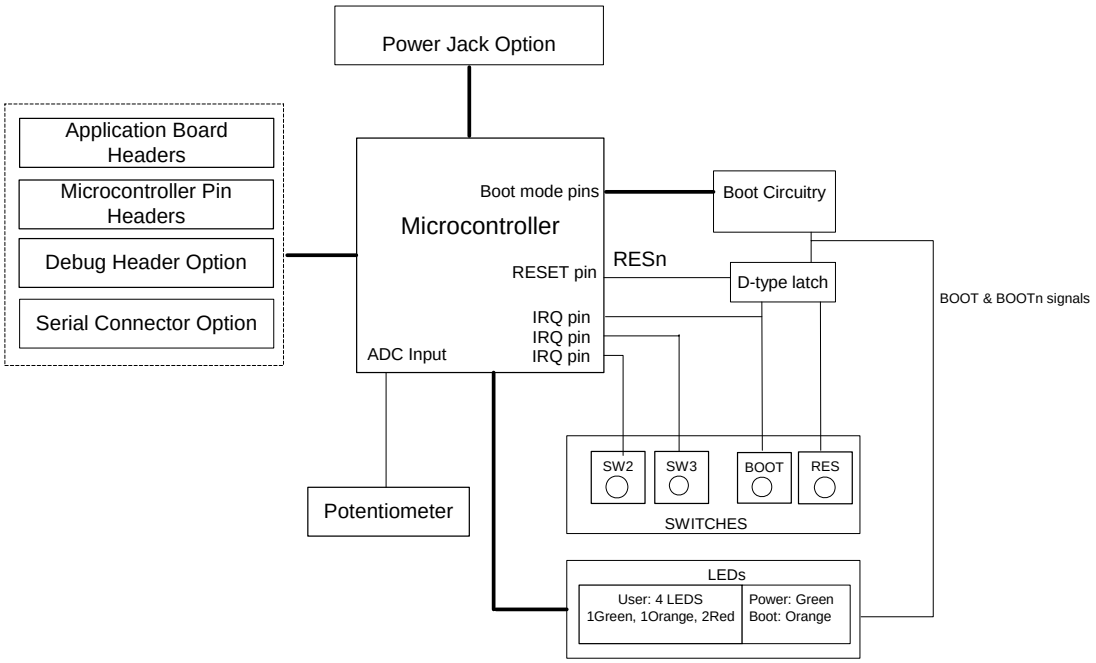

Figure 5-1: Block Diagram

Figure 5-2 shows the connections to the RSK.

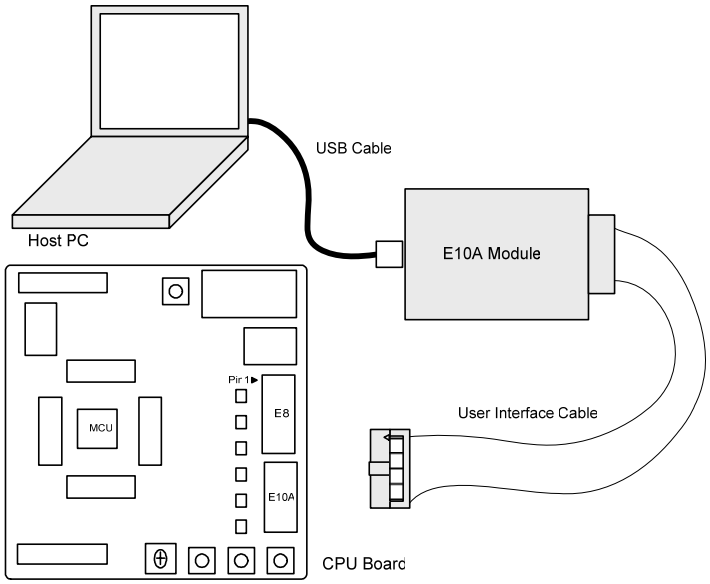

Figure 5-2 : RSK Connctions

Chapter 6.User Circuitry

6.1.Switches

There are four switches located on the CPU board. The function of each switch and its connection are shown in Table 6-1.

Switch	Function	Microcontroller
RES	When pressed; the CPU board microcontroller is reset.	RESn
SW1/BOOT*	Connects to an IRQ input for user controls.	IRQ1, Pin 37 (Port B, pin 3)
SW2*	Connects to an IRQ line for user controls.	IRQ3 , Pin 36 (Port B, pin 5)
SW3*	Connects to the ADC analogue input.	AN3, Pin 44 (Port F, pin 3)

Table 6-1: Switch Functions

*Refer to schematic for detailed connectivity information.

6.2.LEDs

There are six LEDs on the CPU board. The green 'POWER' LED lights when the board is powered. The orange BOOT LED indicates the device is in BOOT mode when lit. The four user LEDs are connected to an IO port and will light when their corresponding port pin is set low.

Table 6-2, below, shows the LED pin references and their corresponding microcontroller port pin connections.

LED Reference (As shown on silkscreen)	Microcontroller Port Pin function	Microcontroller Pin Number	Polarity
LED0	Port E12	5	Active Low
LED1	Port E13	3	Active Low
LED2	Port E14	2	Active Low
LED3	Port E15	1	Active Low

Table 6-2:LED Port

6.3.Potentiometer

A single turn potentiometer is connected to AN2 of the microcontroller. This may be used to vary the input analog voltage value to this pin between AVCC and Ground.

6.4.Serial port

The microcontroller programming serial port (SCI) is connected to the ‘E8’ connector. This serial port can optionally be connected to the RS232 transceiver by fitting option resistors and the D connector in position J7. The connections to be fitted are listed in the following table.

Description	Function	Fit for RS232
TxD1	Programming Serial Port	R48
RxD1	Programming Serial Port	R49

Table 6-3:Serial Options Links

N.B. Do not connect an E8a debugger module (not supplied) if the RS232 port is used.

The board is designed to accept a straight through RS232 cable.

6.5.LCD Module

A LCD module can be connected to the connector J8. Any module that conforms to the pin connections and has a KS0066u compatible controller can be used with the tutorial code. The LCD module uses a 4bit interface to reduce the pin allocation. No contrast control is provided; this must be set on the display module.

Table 6-4 shows the pin allocation and signal names used on this connector.

The module supplied with the CPU board only supports 5V operation.

J13					
Pin	Circuit Net Name	Device Pin	Pin	Circuit Net Name	Device Pin
1	Ground	-	2	5V Only	-
3	No Connection	-	4	LCD_RS	26
5	R/W (Wired to Write only)	-	6	LCD_E	24
7	No Connection	-	8	No connection	-
9	No Connection	-	10		-
11	LCD_D4	11	12	LCD_D5	9
13	LCD_D6	10	14	LCD_D7	7

Table 6-4 LCD Module Connections

6.6.Option Links

Table 6-5 below describes the function of the option links contained on this CPU board. The default configuration is indicated by **BOLD** text.

Option Link Settings				
Reference	Function	Fitted	Alternative (Removed)	Related To
R1	Oscillator	Feedback Resistor across X1	**No feedback**	
R2	Oscillator	**Connects X1 to Microcontroller**	Disconnects X1 from Microcontroller	R3, 4, 5
R3	Oscillator	**Connects X1 to Microcontroller**	Disconnects X1 from Microcontroller	R2, 4, 5
R4	Oscillator	Connects external clock to Microcontroller	**Disconnects external clock from Microcontroller**	R2, 3, 5
R5	Oscillator	Connects external clock to Microcontroller	**Disconnects external clock from Microcontroller**	R2, 3, 4
R10	Power	**Connect J5 to CON_5V**	Disconnect J5	
R11	Power	**UC_VCC Connected**	Disconnect to enable Microcontroller supply current to be measured.	
R12	Power	**Connect Board_VCC to CON_5V**	Disconnect Board_VCC from CON_5V	
R13	Power	**Connect AVCC to CON_5V**	Disconnect AVCC from CON_5V	
R14	Power	**Connect AVSS to GND**	Disconnect AVSS from GND	
R15	Power	**Connect AVSS to GND**	Disconnect AVSS from GND	
R47	RS232 Serial	Shutdown RS232 Transceiver	**Do not shutdown RS232 Transceiver**	
R48	RS232 Serial	Connect TTX to RS232 Serial port	**Only E8 connected**	R49

Option Link Settings				
Reference	Function	Fitted	Alternative (Removed)	Related To
R49	RS232 Serial	Connect TRX to RS232 Serial port	Only E8a connected	R48
R50	E8a (not supplied)	E8a enabled	E8a disabled	
R51	E8a	E8a connected to FWE	E8a not connected to FWE	
R54	Application Board Interface	Connect SCIaTX of application board interface to PA_9	Disconnect SCIaTX of application board interface	R55
R55	Application Board Interface	Connect TDO of application board interface to PA_9	Disconnect TDO of application board interface	R54
R56	Application Board Interface	Connect SCIaRX of application board interface to PA_8	Disconnect SCIaRX of application board interface	R57
R57	Application Board Interface	Connect TDI of application board interface to PA_8	Disconnect TDI of application board interface	R56
R58	Application Board Interface	Connect SCIaCK of application board interface to PA_7	Disconnect SCIaCK of application board interface	R59, 60
R59	Application Board Interface	Connect IO_3 of application board interface to PA_7	Disconnect IO_3 of application board interface	R58, 60
R60	Application Board Interface	Connect TCK of application board interface to PA_7	Disconnect TCK of application board interface	R58, 59
R61	Application Board Interface	Connect TMR1 of application board interface to PE_0	Disconnect TMR1 of application board interface	R62
R62	Application Board Interface	Connect IO_4 of application board interface to PE_0	Disconnect IO_4 of application board interface	R61
R63	Application Board Interface	Connect TRIGb of application board interface to PE_2	Disconnect TRIGb of application board interface	R64
R64	Application Board Interface	Connect IO_6 of application board interface to PE_2	Disconnect IO_6 of application board interface	R63
R65	Application Board Interface	Connect MO_UD of application board interface to PB_1	Disconnect MO_UD of application board interface	R66
R66	Application Board Interface	Connect TRISTn of application board interface to PB_1	Disconnect TRISTn of application board interface	R65
R68	LCD module	Connect LCD_E of application board interface to PA_1	Disconnect LCD_E	
R69	LCD module	Connect LCD_D5 of application board interface to PE_9	Disconnect LCD_D5	

Table 6-5 Option Links

6.7.Oscillator Sources

A crystal oscillator is fitted on the CPU board and used to supply the main clock input to the Renesas microcontroller. Table 6- details the oscillators that are fitted and alternative footprints provided on this CPU board:

Component					
		Value : Package	Manufacturer		
Crystal (X1)	Fitted	10Mhz	Approved	See www.renesas.com for details	
			CPU board		

Table 6-6: Oscillators / Resonators

Warning: When replacing the default oscillator with that of another frequency, the debugging monitor will not function unless the following are corrected:

- FDT programming kernels supplied are rebuilt for the new frequency

6.8.Reset Circuit

The CPU Board includes a simple latch circuit that links the mode selection and reset circuit. This provides an easy method for swapping the device between Boot Mode and User mode. This circuit is not required on customers' boards as it is intended for providing easy evaluation of the operating modes of the device on the RSK. Please refer to the hardware manual for more information on the requirements of the reset circuit.

The reset circuit operates by latching the state of the boot switch on pressing the reset button. This control is subsequently used to modify the mode pin states as required.

The mode pins should change state only while the reset signal is active to avoid possible device damage.

The reset is held in the active state for a fixed period by a pair of resistors and a capacitor. Please check the reset requirements carefully to ensure the reset circuit on the user's board meets all the reset timing requirements.

Chapter 7.Modes

The CPU board can be configured in User mode and Boot mode. User mode may be used to run and debug user code, while Boot mode may only be used to program the Renesas microcontroller with program code via the SCI1 interface. Further details of programming the flash are available in the SH7124 device hardware manual.

The CPU board provides the capability of changing between User and Boot / User Boot modes using a simple latch circuit. This is only to provide a simple mode control on this board when the E10A debugger is not in use.

To manually enter boot mode, press and hold the SW1/BOOT. The mode pins are held in their boot states while reset is pressed and released. Release the boot button. The BOOT LED will be illuminated to indicate that the microcontroller is in boot mode.

More information on the operating modes can be found in the device hardware manual.

7.1.1. Boot mode

The boot mode settings for this CPU board are shown in Table 7-1 below:

FWE	MD1	**LSI State after Reset End**
1	0	Boot Mode

Table 7-1: Mode pin settings

7.1.2. User Mode

This is the default mode of SH7124. Following table details the mode pin settings for the user mode.

FWE	MD1	**LSI State after Reset End**
0	1	User Mode

Table 7-2: Mode pin settings

Chapter 8. Programming Methods

The board is intended for use with HEW and the supplied E10A debugger only. Please refer to S*H7124 Group Hardware Manual* for details of the programming methods using on-chip serial port SCI1 and without using E10A debugger.

8.1. E10A Header

The E10A provides additional debugging features including hardware breakpoints and hardware trace capability.

Modifications to support E10A Debugger on old RSKSH7124 boards	
J9	Fit
J11	Fit: connect jumper between pins 2 & 3.
R51	Remove
R54	Remove
R55	Fit 0R Resistor
R56	Remove
R57	Fit 0R Resistor
R58	Remove
R59	Do not fit.
R60	Fit 0R Resistor

Table 8-1: E10A connections

Chapter 9.Headers

9.1.Microcontroller Headers

Table 9-1 to Table 9-4 show the microcontroller pin headers and their corresponding microcontroller connections. The header pins connect directly to the microcontroller pin unless otherwise stated.

J1					
Pin	Circuit Net Name	Device Pin	Pin	Circuit Net Name	Device Pin
1	MO_Wn	1	2	MO_Vn	2
3	MO_Wp	3	4	UC_VCC	4, 17
5	MO_Vp	5	6	Ground	6, 19
7	MO_Un	7	8	NC	-
9	MO_Up	9	10	TRIGa	10
11	TMR0	11	12	IO_7	12

Table 9-1: J1

J2					
Pin	Circuit Net Name	Device Pin	Pin	Circuit Net Name	Device Pin
1	TRIGb/IO_6	13	2	IO_5	14
3	TMR1/IO_4	15	4	SCIaTx/TDO	16
5	UC_VCC	4, 17	6	SCIaRx/TDI	18
7	Ground	6, 19	8	SCIaCK/IO_3/TCK	20
9	IO_2	21	10	E8_TTX/TMS	22
11	E8_TRX/TRST	23	12	IO_1	24

Chapter 10.Code Development

10.1.Overview

Note: For all code debugging using Renesas software tools, the CPU board must either be connected to a PC serial port via a serial cable or a PC USB port via an E10A. An E10A is supplied with the RSK product.

Due to the continuous process of improvements undertaken by Renesas the user is recommended to review the information provided on the Renesas website at www.renesas.com to check for the latest updates to the Compiler and Debugger manuals.

10.2.Compiler Restrictions

The compiler supplied with this RSK is fully functional for a period of 60 days from first use. After the first 60 days of use have expired, the compiler will default to a maximum of 256k code and data. To use the compiler with programs greater than this size you will need to purchase the full tools from your distributor.

Warning: The protection software for the compiler will detect changes to the system clock. Changes to the system clock back in time may cause the trial period to expire prematurely.

10.3.Breakpoint Support

This RSK is supplied with E10A emulator which supports breakpoints in ROM. For more details on breakpoints & E10A functions please refer to '*SuperH Family E10A-USB Emulator User's Manual*'.

10.4.Memory Map

The memory map shown in this section visually describes the locations of the each memory areas when operating the RSK in the default mode (Mode 3).

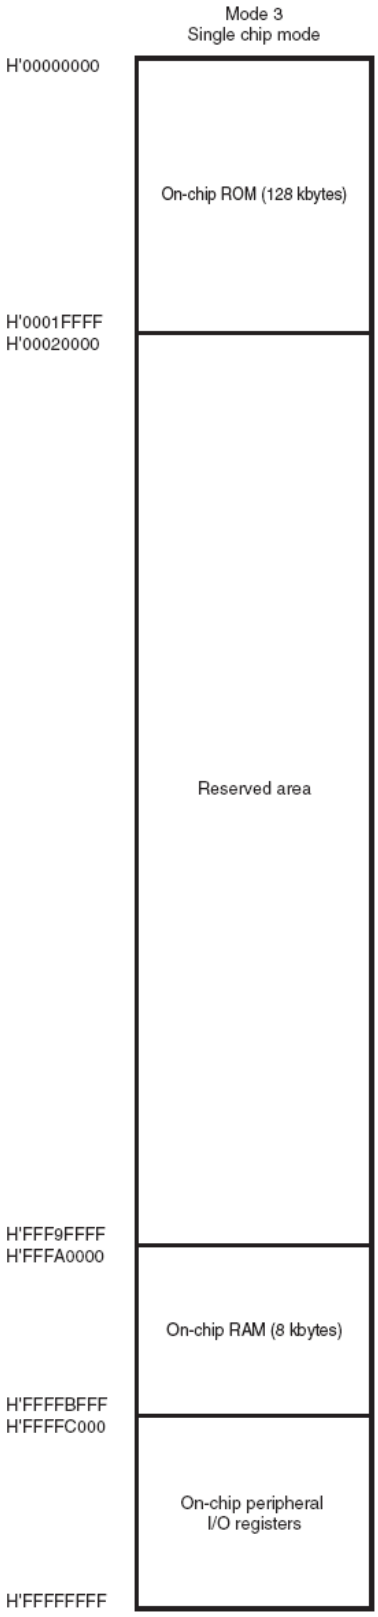

Figure 10-1: Memory Map

Chapter 11.Component Placement

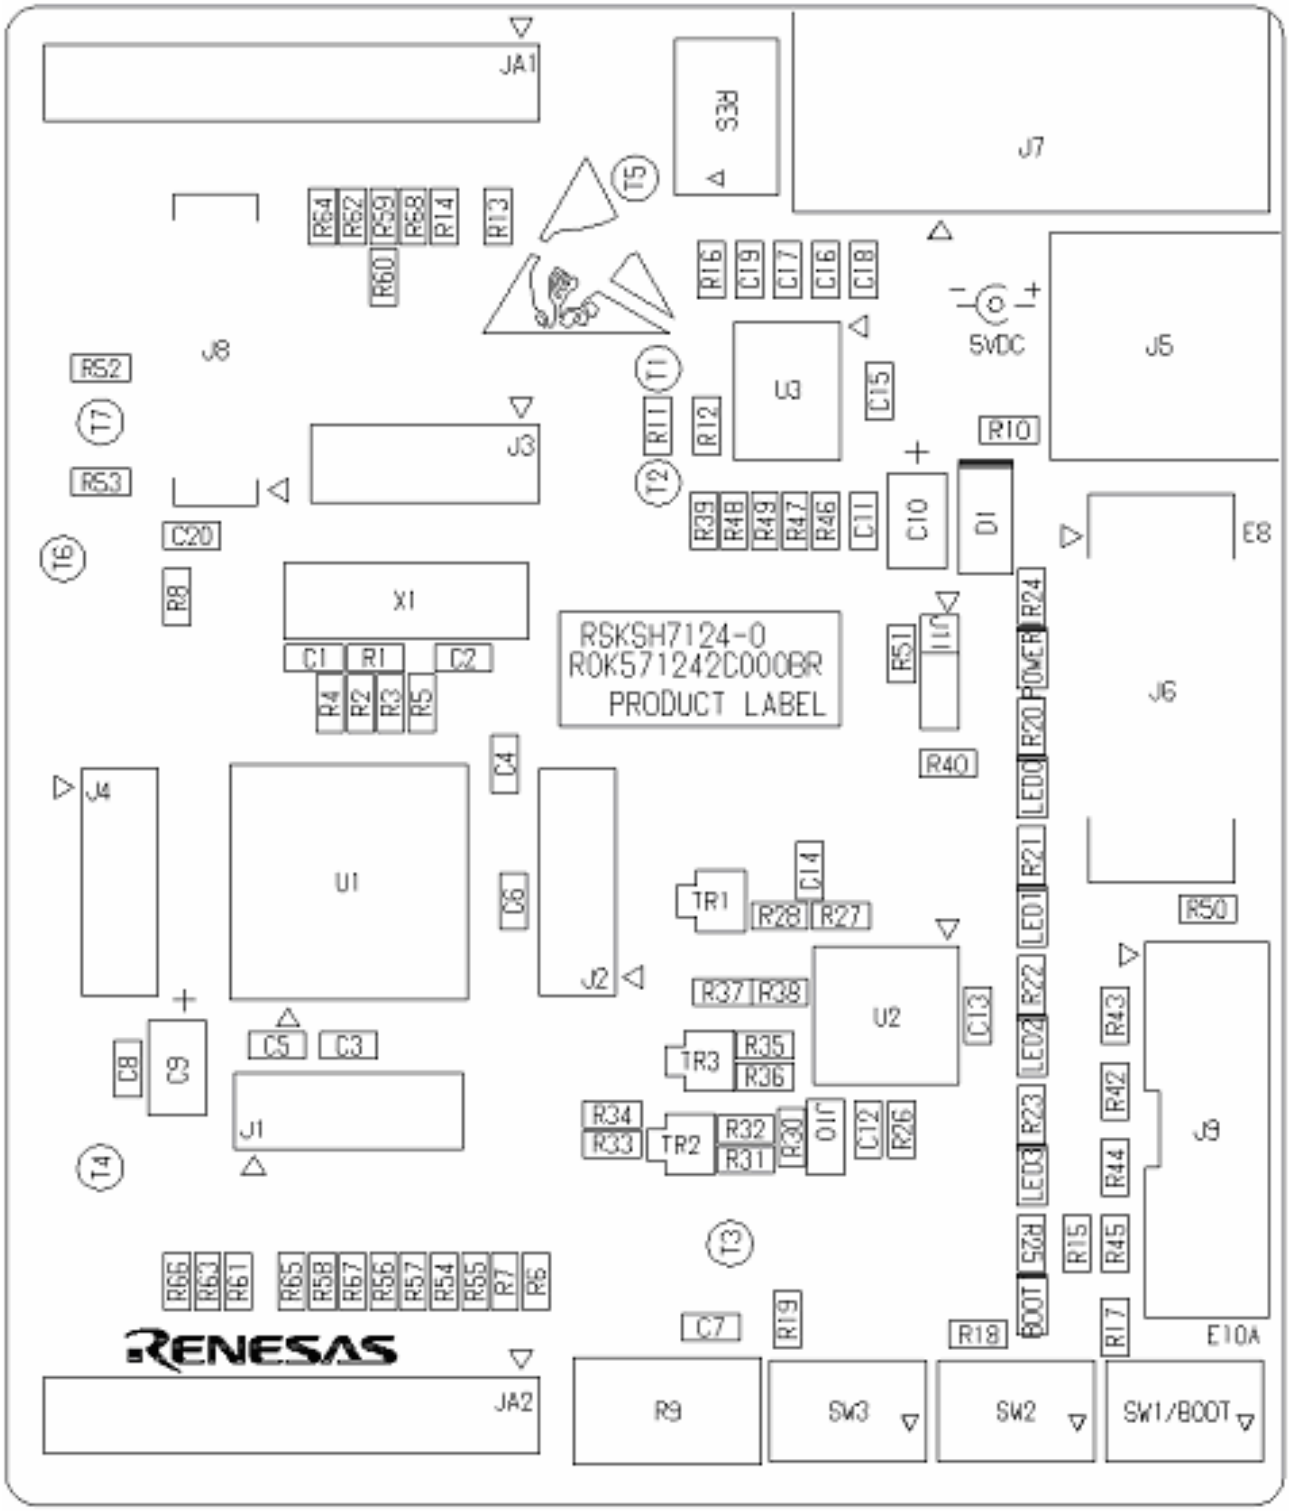

Figure 11-1: Component Placement

Chapter 12. Additional Information

For details on how to use High-performance Embedded Workshop (HEW), refer to the HEW manual available on the CD or installed in the Manual Navigator.

For information about the SH7124 series microcontrollers refer to the SH7125 Group, SH7124 Group *Hardware Manual*

For information about the SH7124 assembly language, refer to the SH *Series Programming Manual*

For information about the E10A Emulator, please refer to the S*H Family E10A-USB Emulator User's Manual.*
