

IBM Cloud Application Performance  
Management, Private  
Version 8.1.4 (updated March 2021)

*User's Guide*

**Note**

Before using this information and the product it supports, read the information in [“Notices” on page 1725](#).

This edition applies to version 8.1.4 of IBM® Cloud Application Performance Management, Base Private and IBM Cloud Application Performance Management, Advanced Private and to all subsequent releases and modifications until otherwise indicated in new editions.

|---|------------|
| <b>Chapter 1. What's new.....</b>                                 | <b>1</b>   |
| <b>Chapter 2. PDF documentation.....</b>                          | <b>49</b>  |
| <b>Chapter 3. Product overview.....</b>                           | <b>51</b>  |
| Architecture overview.....  | 51         |
| User interface.....   | 53         |
| Offerings and add-ons.....  | 54         |
| Offering details.....   | 56         |
| Agents and data collectors.....                                   | 58         |
| Change history.....   | 58         |
| Capabilities.....   | 60         |
| Descriptions.....   | 64         |
| Features.....   | 78         |
| Integration .....   | 85         |
| Documentation.....  | 86         |
| Conventions used in the documentation.....                        | 87         |
| <b>Chapter 4. Planning your deployment.....</b>                   | <b>89</b>  |
| System requirements.....  | 89         |
| Cloud APM server prerequisites.....                               | 90         |
| Cloud APM server ports.....                                       | 104        |
| Default ports used by agents and data collectors.....             | 107        |
| Cloud APM server hardware requirements.....                       | 111        |
| IBM monitoring agents.....  | 115        |
| Scenarios.....  | 116        |
| Scenario: Monitoring IBM API Connect.....                         | 116        |
| Scenario: Monitoring the IBM Java application stack .....         | 117        |
| Scenario: Monitoring the IBM integration stack.....               | 125        |
| Download instructions.....  | 131        |
| Cloud APM, Private components.....                                | 132        |
| Extension packs.....  | 133        |
| Tivoli Monitoring bundled products.....                           | 134        |
| Downloading from passport advantage.....                          | 134        |
| <b>Chapter 5. Installing your server.....</b>                     | <b>143</b> |
| Preparing to install your server.....                             | 143        |
| Configuring the firewall for incoming requests to the server..... | 145        |
| Setting HTTP or HTTPS communications.....                         | 145        |
| Connecting to a remote Db2 server.....                            | 146        |
| Changing Db2 authentication from server to server_encrypt.....    | 154        |
| Switching from one offering to another offering.....              | 155        |
| Installing on a system using an external directory service.....   | 156        |
| Creating Db2 users before you connect to a local Db2 server ..... | 158        |
| Downloading and installing the server.....                        | 159        |
| Uninstalling the server.....                                      | 165        |
| Cleaning up Db2 entries.....                                      | 166        |
| Prerequisite scanner.....   | 167        |
| Running the prerequisite scanner manually.....                    | 168        |
| Bypassing the prerequisite scanner.....                           | 169        |

|   |            |
|---|------------|
| Installing a remote MongoDB.....                                    | 169        |
| <b>Chapter 6. Agent and data collector deployment.....</b>          | <b>173</b> |
| <b>Chapter 7. Installing your agents.....</b>                       | <b>181</b> |
| Configuring the downloaded images.....                              | 182        |
| Installing agents on UNIX systems.....                              | 185        |
| Preinstallation on AIX systems.....                                 | 186        |
| Preinstallation on Solaris systems.....                             | 188        |
| Installing agents.....  | 189        |
| Installing agents on Linux systems.....                             | 191        |
| Preinstallation on Linux systems.....                               | 193        |
| Installing agents.....  | 199        |
| Installing agents on Windows systems.....                           | 201        |
| Preinstallation on Windows systems.....                             | 202        |
| Installing agents.....  | 204        |
| Installing agents as a non-root user.....                           | 206        |
| Securing the agent installation files.....                          | 207        |
| Installing agents silently.....                                     | 208        |
| Bypassing the prerequisite scanner.....                             | 210        |
| Uninstalling your agents.....                                       | 211        |
| WebSphere Applications agent: Unconfiguring the data collector..... | 213        |
| Node.js agent: Removing the monitoring plug-in.....                 | 221        |
| Microsoft .NET agent: Removing the .NET data collector.....         | 222        |
| <b>Chapter 8. Configuring your environment.....</b>                 | <b>223</b> |
| Common topics.....  | 223        |
| Network connectivity.....   | 223        |
| Managed system names.....   | 226        |
| Changing the agent managed system name.....                         | 229        |
| Configuring agents.....   | 235        |
| General procedure for configuring data collectors.....              | 257        |
| Configuring Amazon EC2 monitoring.....                              | 263        |
| Configuring the agent on Windows systems.....                       | 264        |
| Configuring the agent by responding to prompts.....                 | 267        |
| Configuring the agent by using the silent response file.....        | 268        |
| Configuration parameters for the Amazon EC2 agent.....              | 269        |
| Configuring AWS Elastic Load Balancer monitoring.....               | 270        |
| Configuring the agent on Windows systems.....                       | 271        |
| Configuring the agent by responding to prompts.....                 | 273        |
| Configuring the agent by using the silent response file.....        | 274        |
| Configuration parameters for the Amazon ELB agent.....              | 275        |
| Configuring Azure Compute monitoring.....                           | 275        |
| Azure Compute Configuration Information.....                        | 277        |
| Configuring the agent on Windows systems.....                       | 277        |
| Configuring the agent by responding to prompts.....                 | 280        |
| Configuring the agent by using the silent response file.....        | 282        |
| Configuration parameters for the Azure Compute agent.....           | 284        |
| Configuring Cassandra monitoring.....                               | 286        |
| Configuring the agent on Windows systems.....                       | 287        |
| Configuring the agent on Linux systems.....                         | 287        |
| Configuring the agent by using the silent response file.....        | 288        |
| Configuration parameters of the agent.....                          | 288        |
| Configuring Cisco UCS monitoring.....                               | 289        |
| Configuring the agent on Windows systems.....                       | 290        |
| Configuring the agent by using the silent response file.....        | 291        |
| Configuring the agent by responding to prompts.....                 | 292        |

|  |            |
|--|------------|
| Configuration parameters for the agent.....                              | 292        |
| Configuration parameters for the data provider.....                      | 293        |
| Enabling SSL communication with Cisco UCS data sources.....              | 294        |
| Increasing the Java heap size.....                                       | 295        |
| Configuring Citrix Virtual Desktop Infrastructure monitoring.....        | 295        |
| Enabling Citrix read-only administrator privileges.....                  | 297        |
| Configuring the agent on Windows systems.....                            | 298        |
| Configuring the agent by responding to prompts.....                      | 301        |
| Configuring the agent by using the silent response file.....             | 302        |
| Configuration parameters for the Citrix VDI agent.....                   | 303        |
| Enabling monitoring of Windows events and PowerShell metrics.....        | 305        |
| Configuring DataPower monitoring.....                                    | 306        |
| Configuring DataPower Appliances.....                                    | 306        |
| Configuring the DataPower agent.....                                     | 314        |
| Configuring Db2 monitoring .....   | 318        |
| Configuring the agent on Windows systems.....                            | 319        |
| Configuring the agent on Linux or UNIX systems.....                      | 320        |
| Configuring the agent by using the silent response file.....             | 321        |
| Granting privileges for viewing Db2 metrics.....                         | 323        |
| Configuring local environment variables.....                             | 324        |
| Prerequisites for Remote Monitoring.....                                 | 327        |
| Configuring Hadoop monitoring.....                                       | 328        |
| Configuring the agent on Windows systems .....                           | 329        |
| Configuring the agent on Linux and AIX systems.....                      | 333        |
| Configuring the agent by using the silent response file.....             | 336        |
| Configuring the dashboard for viewing Hadoop events.....                 | 338        |
| Granting permission to non-admin users.....                              | 338        |
| Configuring HMC Base monitoring.....                                     | 338        |
| Setting up the SSH connection.....                                       | 340        |
| Preparing SDK for HMC.....   | 341        |
| Configuring the HMC Console Server for monitoring Virtual I/O.....       | 342        |
| Enabling the CPU and memory utilization monitoring.....                  | 343        |
| Configuring HTTP Server monitoring.....                                  | 344        |
| Overview of HTTP Server monitoring.....                                  | 344        |
| Configuring the KHU module for HTTP Server monitoring.....               | 344        |
| Configuring the RT module for HTTP Server monitoring.....                | 346        |
| Reference: HTTP Server agent configuration file samples.....             | 346        |
| Configuring IBM Cloud monitoring.....                                    | 348        |
| Configuring the agent on Windows systems.....                            | 349        |
| Configuring the agent by responding to prompts.....                      | 349        |
| Configuring the agent by using the silent response file.....             | 350        |
| Configuration parameters for the IBM Cloud agent.....                    | 351        |
| <b>Configuring IBM Integration Bus monitoring.....</b>                   | <b>351</b> |
| Configuring the IBM Integration Bus agent.....                           | 352        |
| Configuring IBM Integration Bus for data enablement.....                 | 356        |
| Disabling snapshot data collection for the agent.....                    | 363        |
| Configuring transaction tracking for the IBM Integration Bus agent.....  | 363        |
| Specifying unique managed system name for IBM Integration Bus agent..... | 364        |
| Removing the KQIUserExit user exit.....                                  | 365        |
| Configuring IBM i OS monitoring.....                                     | 366        |
| Configuring IBM MQ Appliances monitoring.....                            | 370        |
| Configuring the agent by responding to prompts.....                      | 371        |
| Configuring the agent by using the silent response file.....             | 372        |
| Configuration parameters for the MQ Appliance agent.....                 | 373        |
| Configuring InfoSphere DataStage monitoring.....                         | 375        |
| Configuring the agent on Windows systems.....                            | 375        |
| Configuring the agent on Linux systems.....                              | 376        |
| Configuring environment variables.....                                   | 376        |

## **Chapter 10. Administering..... 1109**

|   |      |
|---|------|
| Starting the Cloud APM console.....   | 1109 |
| Thresholds and resource groups.....   | 1110 |
| Background information.....   | 1110 |
| Resource Group Manager.....   | 1114 |
| Tutorial: Defining a threshold.....   | 1116 |
| Tutorial: Defining a threshold to run a command on the managed resource.....          | 1118 |
| Threshold Manager.....  | 1119 |
| Customizing an event to forward to an EIF receiver.....                               | 1124 |
| Using the Resource Group Management Service API.....                                  | 1130 |
| Using the Threshold Management Service API.....                                       | 1133 |
| Managing user access.....   | 1136 |
| Roles and permissions.....  | 1137 |
| Configuring audit logging for role based access control activity.....                 | 1145 |
| Configuring certificates for the Cloud APM console.....                               | 1148 |
| Accessing and using the Role-Based Access Control Service API.....                    | 1156 |
| Administering your agents.....  | 1158 |
| Starting agents as a non-root user.....   | 1159 |
| Managing historical data retention values.....  | 1160 |
| Event thresholds for Transaction Monitoring .....                                     | 1164 |
| Managing OS agent events.....   | 1168 |
| Managing synthetic transactions and events .....                                      | 1177 |
| Guidelines to maximize agent and server performance for log file monitoring.....      | 1189 |
| Administering server components.....  | 1193 |
| Enabling virtual hosts for the server1 service.....                                   | 1193 |
| Passwords and user IDs for components.....  | 1194 |
| Changing your Db2 server version, location, or database names after installation..... | 1197 |
| Starting, stopping, and checking the status of server components.....                 | 1210 |
| Managing the maximum Java heap size and Db2 bufferpool.....                           | 1212 |
| Changing the server IP address and host name.....                                     | 1215 |
| Configuring the communications protocol for server agents.....                        | 1217 |
| Switching to a local MongoDB.....   | 1219 |
| Retaining middleware transactions.....  | 1220 |
| Configuring the server to return the Strict Transport Security header.....            | 1220 |
| Backing up and restoring components.....  | 1222 |
| Exploring the APIs.....   | 1237 |
| Adjusting the console timeout value.....  | 1238 |
| Advanced Configuration.....   | 1239 |
| Event email.....  | 1243 |
| Enabling advanced pruning of the Datamart database.....                               | 1246 |

|   |                 |
|---|-----------------|
| <b>Chapter 11. Using the dashboards.....</b>  | <b>1251</b>     |
| All My Applications - Application Performance Dashboard.....  | 1251            |
| Searching log files.....  | 1253            |
| Application - Application Performance Dashboard.....  | 1254            |
| Manipulating the Aggregate Transaction Topology widget.....   | 1257            |
| Group and Instance - Application Performance Dashboard.....   | 1259            |
| Editing the Components dashboard group widgets.....   | 1262            |
| Adjusting and comparing metrics over time.....  | 1263            |
| Viewing and managing custom charts and tables.....  | 1264            |
| Managing applications.....  | 1269            |

## **Chapter 14. Agent Builder..... 1385**

|   |      |
|---|------|
| Overview of Agent Builder.....                                    | 1385 |
| Common Agent Builder procedures.....                              | 1386 |
| Data sources and data sets.....                                   | 1387 |
| Monitoring multiple servers or instances of a server.....         | 1388 |
| Testing, installing, and configuring an agent.....                | 1389 |
| Operating system requirements.....                                | 1389 |
| Features specific to IBM Tivoli Monitoring.....                   | 1390 |
| Installing and starting Agent Builder.....                        | 1390 |
| Prerequisites for installing and running Agent Builder.....       | 1390 |
| Installing Agent Builder.....                                     | 1391 |
| Starting Agent Builder.....                                       | 1393 |
| Setting the default browser in Agent Builder.....                 | 1394 |
| Setting the default Time Stamping Authority in Agent Builder..... | 1394 |
| Uninstalling Agent Builder.....                                   | 1394 |
| Silent uninstallation.....  | 1395 |
| Creating an agent.....  | 1395 |
| Naming and configuring the agent.....                             | 1395 |
| Defining initial data sources.....                                | 1397 |
| Using the Agent Editor to modify the agent.....                   | 1398 |
| Default operating systems.....                                    | 1399 |
| Self-Describing Agent.....  | 1400 |
| Environment variables.....  | 1400 |
| Watchdog information.....   | 1410 |
| Cognos information.....   | 1411 |
| Generate Agent wizard link.....                                   | 1411 |
| The <b>Data Source Definition</b> page.....                       | 1412 |
| <b>Runtime Configuration Information</b> page.....                | 1413 |
| Agent XML Editor page.....  | 1413 |
| Saving your edits and changes.....                                | 1413 |
| Committing a version of the agent.....                            | 1413 |
| Setting a new version number for your agent.....                  | 1415 |
| Changing the product code.....                                    | 1415 |
| Editing data source and attribute properties.....                 | 1415 |
| Creating, modifying, and deleting attributes.....                 | 1417 |
| Filtering attribute groups.....                                   | 1425 |
| Formula Editor.....   | 1425 |
| Formula operators and functions.....                              | 1430 |
| Specifying operating systems.....                                 | 1436 |

|   |      |
|---|------|
| Configuring and Tuning data collection.....                                     | 1436 |
| Defining and testing data sources.....  | 1441 |
| Monitoring a process.....   | 1442 |
| Monitoring a Windows service.....   | 1446 |
| Monitoring data from Windows Management Instrumentation (WMI).....              | 1447 |
| Monitoring a Windows Performance Monitor (Perfmon).....                         | 1449 |
| Monitoring data from a Simple Network Management Protocol (SNMP) server.....    | 1452 |
| Monitoring events from Simple Network Management Protocol event senders.....    | 1456 |
| Monitoring Java Management Extensions (JMX) MBeans.....                         | 1461 |
| Monitoring data from a Common Information Model (CIM).....                      | 1480 |
| Monitoring a log file.....  | 1482 |
| Monitoring an AIX Binary Log.....   | 1493 |
| Monitoring a Windows Event Log.....   | 1494 |
| Monitoring a command return code.....   | 1496 |
| Monitor output from a script.....   | 1500 |
| Monitoring data from Java Database Connectivity (JDBC).....                     | 1505 |
| Monitoring system availability by using Ping.....                               | 1513 |
| Monitoring HTTP availability and response time.....                             | 1515 |
| Monitoring data from a SOAP or other HTTP data source.....                      | 1523 |
| Monitoring data by using a socket.....  | 1531 |
| Use the Java API to monitor data.....   | 1541 |
| Creating data sets from existing sources.....                                   | 1553 |
| Joining two attribute groups.....   | 1554 |
| Manipulating attributes in joined attribute groups.....                         | 1557 |
| Joined attributes.....  | 1558 |
| Creating a filtered attribute group.....  | 1559 |
| Creating a navigator group.....   | 1560 |
| Using subnodes.....   | 1561 |
| Creating subnodes.....  | 1567 |
| Subnode configuration.....  | 1568 |
| Customizing agent configuration.....  | 1578 |
| Changing configuration properties by using the Agent Editor.....                | 1581 |
| Configuring a Windows remote connection.....                                    | 1581 |
| Creating a user with Windows Management Instrumentation (WMI) permissions.....  | 1582 |
| Configuring a Secure Shell (SSH) remote connection.....                         | 1584 |
| Creating workspaces, Take Action commands, and situations.....                  | 1585 |
| Creating situations, Take Action commands, and queries.....                     | 1585 |
| Creating workspaces.....  | 1585 |
| Preparing the agent for Cloud APM.....  | 1590 |
| Preparing the agent for Cloud Pak for Multicloud Management.....                | 1593 |
| Defining resources.....   | 1593 |
| Building resource relationships.....  | 1594 |
| Data Definition Designer.....   | 1595 |
| Testing your agent in Agent Builder.....  | 1595 |
| Attribute group testing.....  | 1596 |
| Full agent testing.....   | 1599 |
| Test Environment variables.....   | 1603 |
| Installing your agent into a monitoring infrastructure for testing and use..... | 1603 |
| Installing an agent.....  | 1604 |
| Agent post-generation and installation results.....                             | 1611 |
| Uninstalling an agent.....  | 1619 |

# Chapter 1. What's new

New features, capabilities, and coverage are available in the latest release.

- For information about the agent version in each release or refresh, see [“Change history”](#) on page 58.
- For detailed system requirements, see the Software Product Compatibility Reports for [IBM Cloud Application Performance Management - Agents V8.1](#). Expand the **Report filters** twisty, click **Edit**, select the agents and data collectors that you want to view, and then click **Apply**. The detailed information such as operating systems, prerequisites, and supported software is displayed for you.

## What's new for the March 2021 refresh of V8.1.4.0.15

### Agent enhancements

#### Db2® agent

Fixed prerequisite issue on SLES 15.1 on zLinux platform.

#### Hadoop agent

- Added support for monitoring of additional Cloudera Manager services namely Hbase, Flume and Sqoop.
- Added support for monitoring of BigSQL service and BigSheets service on Hadoop BigInsights platform.
- Added new widget to display the roles present on each node/host in the configured Hadoop Cluster.
- Added the following new attribute groups:
  - BigSheets
  - ClouderaHbase
  - ClouderaFlume
  - ClouderaSqoop

#### Microsoft Active Directory agent

- Added the following attribute groups:
  - Expiring Certificates. The prerequisites for this attribute are:
    - PowerShell version 3.0
    - PSPKI Module
  - Logon Peak Hour Usage

#### Microsoft Exchange Server agent

- Added new attribute group - MS Exchange Email Transport Queues.
- Added widget to monitor email transport queue details.

#### Microsoft Office 365 agent

- Fixed display issue for attribute values of Reachability widget.
- Resolved alignment of Mailbox storage values in Mailbox Storage Utilization group widget.
- Fixed display issue for Mailbox users of Mailbox Policy Details group widget.

#### Microsoft SQL Server agent

- Added a new widget Database Write Transactions(history).
- Updated widget Database Transaction.

- The option for disabling Long Live Database connection is removed from the agent configuration. From release 8.1.4.0.15 onwards, Support Long Lived Database Connections is enabled by default.

#### **PostgreSQL agent**

The agent now supports PostgreSQL Server version 13.

#### **SAP agent**

- Added a new widget Database Write Transactions(history).
- Updated widget Database Transaction.
- The user needs to take backup of the configuration file before upgrading the SAP agent on Windows platform and non-Windows platforms.

## **What's new for the December 2020 refresh of V8.1.4.0.14**

### **Expanded platform support for agents**

#### **CentOS 7 x86-64**

- Cassandra agent
- DataStage agent
- MariaDB agent
- MongoDB agent
- MySql agent
- RabbitMQ agent

#### **CentOS 8 x86-64**

- Cassandra agent
- DataStage agent
- MariaDB agent
- MongoDB agent
- MySql agent
- RabbitMQ agent

#### **SUSE Linux Enterprise Server 15**

- MariaDB agent

#### **SUSE Linux Enterprise Server 12**

- MariaDB agent

#### **SUSE Linux Enterprise Server 11**

- MariaDB agent

### **Agent enhancements**

#### **DataStage® agent**

- Improved code quality and handled security vulnerabilities identified by SonarQube scan.

#### **Internet Service Monitoring**

- Added support to enable creation of data validation conditions based on MIB names from the selected OID group in the SNMP profile. After upgrading the agent to 8.1.4.0.14 version, you need to deploy any one profile for proper functioning.

#### **Hadoop agent**

Added Independent SSL/Non SSL modes for monitoring of the following Hadoop components:

- Name node, Secondary Namenode Resource Manager, Standby Resource Manager, Job History Server, Journal Node, ZKFC, Datanode, NodeManager
- Ambari Services
- Cloudera Manager Services

#### **Linux® KVM agent**

- Added support to configure retry count for connection attempts in the event of connection failure.

#### **MariaDB agent**

- Resolved high memory usage for Linux and Windows platforms.
- Resolved incorrect data display for attributes firstErrorSeen and lastErrorSeen of attribute group ErrorInfo in **Attribute Details** tab.
- Improved code quality and handled security vulnerabilities identified by SonarQube scan.
- Added support for the latest MariaDB 10.5.

#### **Microsoft Active Directory agent**

- New attribute DCA Virtual Domain Controller is added to the attribute group Domain Controller Availability.

#### **Microsoft .NET agent**

- Added support for IBM Cloud Application Performance Management .NET Core monitoring.
- Fixed Request Name URL in attribute group Database Call Details .
- Resolved conversion of Selective Filtering tool from 4.6.2 to 4.7.2 .Net Framework.
- Removed KQE\_SERVICEDetails from **Attribute Details** tab.
- Resolved application failure due to security trust level (APAR IJ28399).

#### **Microsoft Exchange Server agent**

- New attribute ContentIndexState is added to the attribute group MS Exchange Replication.
- Resolved the issue where Microsoft Exchange Server agent stopped working on the Edge Server (APAR ID -IJ29123).

#### **Microsoft IIS agent**

- Improved performance by changing data sources from PowerShell script to CDP (C# code) for reducing memory consumption for the following attribute groups:
  - IIS\_Web\_Sites\_Detail
  - WPROCESS
  - Website\_Inventory
  - Website\_Response\_Message
  - IIS\_FTP\_Sites\_Detail
  - IIS\_FTP\_Server\_Status
  - IIS\_Web\_Server\_Status
  - MEMIISUS
  - Web\_Applications
  - IIS\_Application\_Pools\_Details
  - ASP\_Garbage\_Collection
  - WebsiteErr
  - IIS\_Application\_Pools\_Setting
  - ASP\_NET\_Application\_Statistics

### **Microsoft Office 365 agent**

- Added the following new widgets:
  - Teams Details
  - Mailbox Policy Details
  - Available Licenses
  - Mailbox Size

### **MongoDB agent**

- Resolved help content for attribute FQDN of attribute group KKJ\_ROUTER\_LOCATION.
- Added support for the latest MongoDB Shell version 4.4.2.
- Improved code quality and handled security vulnerabilities identified by SonarQube scan.

### **MySQL agent**

- Resolved mismatched values between attribute values of attribute group KSE\_EVENTS and values in database.
- Improved logging for wrong credentials used during agent configuration.
- Improved code quality and handled security vulnerabilities identified by SonarQube scan.

### **PostgreSQL agent**

- Improved code quality and handled security vulnerabilities identified by SonarQube scan.

### **RabbitMQ agent**

- Improved code quality and handled security vulnerabilities identified by SonarQube scan.

### **SAP agent**

- The SAP agent is enhanced to monitor SAP S/4HANA 1809 , SAP S/4HANA 1909 and SAP S/4HANA 2020 flavors.

### **VMware VI agent**

- Resolved the issue of lagging in processing all events showed on vCenter by introducing 30 seconds of grace period for the agent to check the event history in each event collection cycle (APAR IJ28887).
- Enhanced with new timeout field KVM\_VIRTUAL\_MACHINE\_IP\_TIMEOUT in attribute group Virtual Machines to allow the agent to wait for the configured duration (in milliseconds) before returning the value of FQDN and subsequently all other attributes. The field KVM\_VIRTUAL\_MACHINE\_IP\_TIMEOUT can be configured in the environment variables. If this field is not configured or if this field is set to 0, the timeout functionality is disabled and attribute group collection follows the default behavior. See [“Configuring Environment Variables” on page 917](#).
- Enhanced with orphan disk monitoring. See [Orphan disk monitoring on APM](#).

## **What's new for the September 2020 refresh of V8.1.4.0.13**

### **Expanded platform support for agents**

#### **CentOS 7 x86-64**

- Hadoop agent

#### **CentOS 8 x86-64**

- Db2 agent
- Hadoop agent

**Ubuntu 16.04 x86-64**

- Hadoop agent

**Ubuntu 18.04.3 x86-64**

- Hadoop agent

**Ubuntu 20.04 x86-64**

- Hadoop agent

**Ubuntu 20.04 zLinux**

- Db2 agent

**SUSE Linux Enterprise Server 15 for zLinux**

- Oracle Database agent
- WebLogic agent

**RedHat Enterprise Linux 8 for zLinux**

- Oracle Database agent
- WebLogic agent

**SUSE Linux Enterprise Server 15**

- MySQL agent

**Agent enhancements****Cassandra agent**

Agent is now able to collect data for new node that is added to existing Cassandra cluster.

**Db2 agent**

- Added diagnostic information for failed SQL queries.
- Resolved the issue of crashing on pLinux LE platform.
- Resolved the issue of attachment failure due to password store limitation.

**Hadoop agent**

- Added support for monitoring of Journal Nodes and ZKFC on HDP 3.1.5 platform and Cloudera 5.4.3 Hadoop platforms.
- Added support for monitoring of Ambari services such as Infra Solr and Spark 2.
- Added support for monitoring of Cloudera Manager Services like: HDFS, Hive, Hue, Impala, Kafka, Oozie, Sentry, Solr, Spark, YARN and ZooKeeper.
- Added support for monitoring of Hortonworks HDP 3.1.5.

**Internet Service Monitoring**

Added the following enhancements:

- Added support for having URL length up to 2048 characters for HTTP and HTTPS protocols. (RFE 142342)
- Added support for handling 303 status code for HTTP and HTTPS monitors.

**Microsoft Active Directory agent**

Added three new attribute groups that are supported on Windows Server 2008 and later versions:

- User Group Computer Management

It shows count of changes made in user, group and computer accounts such as addition, deletion and modification.

- Enabled Disabled User

It shows count of enabled and disabled users.

- Logon Failure Count Per Error Code

It shows count of failed logon attempts such as bad user name and password, disabled and expired account.

#### **Microsoft IIS agent**

- Added following new attribute groups:
  - ASP .NET System Counter
  - HTTP method requests per second
  - Worker Process Requests
- Added following new group widgets:
  - ASP.Net Applications - Request Statistics
  - Requests/sec - By HTTP Method
  - Internal Server Error (history)
  - Internal Server Error (history)
  - Worker Process Requests - Last 15 mins

#### **Microsoft Cluster Server agent**

Added new attribute group HyperV Virtual Machine

Added new widget Cluster HperV VM

Added new situations

- VM\_CPU\_Usage\_Critical
- VM\_CPU\_Usage\_Warning

#### **Microsoft Exchange Server agent**

Added new attribute groups

- MS Exchange Retention Policy
- MS Exchange Litigation Policy
- MS Exchange Unhealthy Monitors

Added new widget User Count per Protocol

#### **Microsoft SharePoint Server agent**

Added new attribute group Document Library.

#### **NetApp Storage agent**

- Added support for Windows Server 2019 Datacenter and Windows Server 2019 Standard.
- Implemented retry count enhancement that limits the number of connection attempts in the event of connection failure. Connection attempts can be configured via the environment variable KNU\_DATA\_PROVIDER\_CONNECTION\_RETRY\_COUNT.
- Added a new configuration field KNU\_API\_SERVICES\_PORT to agent configuration panel of OCUM API Services tab.
- Fixed the issue when API Services configuration is unavailable. Agent is able to fetch the storage objects Disks, Storage-VMs and Qtrees without API Services configuration.

#### **Skype for Business Server agent**

Added new widget File Transfers

#### **VMware VI agent**

- Added support for Windows Server 2019 Datacenter and Windows Server 2019 Standard.
- Implemented retry count enhancement that limits the number of connection attempts in the event of connection failure. Connection attempts can be configured via the environment variable KVM\_DATA\_PROVIDER\_CONNECTION\_RETRY\_COUNT.

- Added new attribute Snapshot\_Age in the VM\_Snapshots group.
- Added new attribute Creation\_Timestamp that supersedes Creation\_Time.

## What's new for the June 2020 refresh of V8.1.4.0.12

### New agent

#### IBM i OS agent

The Monitoring Agent for IBM i OS provides you with the capability to monitor and perform basic actions on IBM i operating systems.

For more information, see [“IBM i OS monitoring” on page 67](#).

### Expanded platform support for agents

The following agents and platforms are now supported:

#### Ubuntu 20.04 LTS

- Linux for System x:
  - Cassandra agent
  - Linux OS agent
  - RabbitMQ agent
- Linux for System z:
  - Linux OS agent

**Note:** To support Ubuntu 20.04 LTS, you must apply core framework IF18 on the server and configure agent installation images. For more information, see the [“Specific operating systems” on page 193](#) section of [“Preinstallation on Linux systems” on page 193](#).

#### Cent OS 7.6, 8.0, and 8.1

- DataPower® agent
- Oracle Database agent
- VMware VI agent
- WebSphere® Applications agent

### Agent Builder enhancements

You can now create custom agents that can run on the IBM Cloud Pak for Multicloud Management.

You can also reconfigure existing custom agents to run on the Cloud Pak for Multicloud Management. For example, if you previously created a custom agent to run on IBM Tivoli Monitoring or IBM Cloud Application Performance Management, you can now reconfigure this agent and connect it to the Cloud Pak for Multicloud Management. For more information, see [“Preparing the agent for Cloud Pak for Multicloud Management” on page 1593](#).

### Agent enhancements

#### Cisco UCS agent

Added support for Windows Server 2019 Datacenter and Windows Server 2019 Standard.

#### Hadoop agent

- Label of widget **Block Capacity** is changed from **Block Capacity** to **Number of Blocks**.
- Added support for monitoring of Cloudera CDH 6.3.2 and 5.16

#### Internet Service Monitoring

- Added support for profileUpgrade tool for Windows platform.
- Two standalone utilities Properties Migration and Profile Migration have been made available for migrating Monitor properties and Internet Services profiles respectively from Legacy versions of the Internet Service Monitoring agent, such as 2.4 and ITM, to APM version of the agent. These

utilities are supported with ISM agent version 8.1.4.0.12 onwards. For more information on these utilities, refer to [“Migration support”](#) on page 525.

#### **Liberty data collector**

Added monitoring support for Liberty 19 and 20.

#### **Linux KVM agent**

- Added support for Ovirt Java SDK 4.3. From 8.1.4.0.12 onward, the agent will support RHVM 4.0. Versions older than RHVM 4.0 are not supported from 8.1.4.0.12.
- Data provider is optimized to decrease the overall CPU consumption on Ovirt engine.
- Live snapshot support attribute is deprecated in the Hosts attribute group.
- A limit is added on the number of retries the agent attempts to connect to the data source (RHVM or Hyper-V) if connection fails. The default number for retry attempt is 6. This value can be changed by setting the following variable in the agent instance specific environment file: `KV1_DATA_PROVIDER_CONNECTION_RETRY_COUNT`

#### **Microsoft .NET agent**

Added the CLR Remote Monitoring group widget.

#### **Microsoft Active Directory agent**

Added the new widget Group Membership for changes of users.

#### **Microsoft Cluster Server agent**

Added the following new widgets to the Overview page:

- Quorum Configuration
- CPU Performance
- Cluster Availability

Added the following new widget to the Cluster Node details page:

- Disk Read and Disk Write

Added the following attributes to the existing widget Resource Groups:

- Current RG Node
- Previous RG Node
- RG Node Changed

#### **Microsoft Exchange Server agent**

Added the following new widgets:

- Server Health Status
- Email Statistics

#### **Microsoft Hyper-V Server agent**

Enabled the help content for the following attributes and attribute groups on dashboard:

- Server Memory Available
- Server Maximum Processor utilization
- Virtual Machine Disk Details
- Processor Load Details
- Disk Details
- Virtual Machines Processor Load
- Network Virtual Switch Details

#### **Microsoft IIS agent**

Added three new attribute groups:

- ASP.NET Application Statistics

- Website Inventory
- Website Response Information

#### **Microsoft Office 365 agent**

Added support for the following service communication APIs:

- GetServices
- GetCurrentStatus
- GetHistoricalStatus
- GetMessages

#### **Microsoft SharePoint Server agent**

Added four new attribute groups:

- Crawl History details
- Active Crawls details
- Web Application information
- Status of Database Connection

#### **MySQL agent**

Improved the logging mechanism for incorrect agent configuration.

#### **SAP agent**

- Added support of Master Control Panel to handle various configurations of SAP agent at the server.
- Added support for conversion of data received from SAP system to UTF8 format.
- Added support for Solution Manager 7.2 SPS 11.

#### **SAP NetWeaver Java™ Stack agent**

Added support for SAP Netweaver 7.5 Application server Java SPS 018.

#### **Skype for Business Server agent**

Added the following new widgets to the Overview page:

- IM CCCP Processing
- User Services Conference Notification
- SIP Authentication
- Server Details
- Skype Topology

#### **Sterling File Gateway agent**

Added support for Windows Server 2019 Datacenter and Windows Server 2019 Standard.

#### **Sterling Connect Direct agent**

Added support for Windows Server 2019 Datacenter and Windows Server 2019 Standard.

#### **Tomcat agent**

Enhanced JMX connection implementation that improves the agent performance in terms of threads or memory.

#### **VMware**

Added support for CentOS 7 and CentOS 8.

## **What's new for the March 2020 refresh of V8.1.4.0.11**

### **Agent enhancements**

#### **Expanded platform support for agents**

Added Cent OS 7.6, 8.0, and 8.1 support for the following agents:

- HTTP Server agent

- JBoss agent
- Linux OS agent
- PostgreSQL agent

### **Internet Service Monitoring**

- Added support for SLES 15 on x86-64 (64 bit) platform.
- Enhanced the configuration panel to have Active and Description fields for every monitor element listed in profile edit dialog box.
- Added Activate and Deactivate buttons on profile edit grid, so that user can activate or deactivate multiple monitor elements at a time
- Enhanced **Delete** functionality in the profile edit dialog box for user to delete multiple monitor elements at a time.

### **Microsoft Active Directory agent**

Added New widget for Last Logon Information of privilege users.

### **Microsoft Exchange Server agent**

Added widget for DLPPolicyTips and show Data Loss Prevention Policies and Policy tips in Attribute details tab.

### **Microsoft IIS agent**

Added new attribute group called Web Application. For more information about prerequisites for this attribute group, see [“Prerequisite to install Web Application Attribute Group” on page 611](#)

### **Microsoft SQL Server agent**

Added tolerance support for SQL Server 2019

### **RabbitMQ agent**

- Added support to HTTPS protocol.
- Added configuration panel parameters Protocol and Path to truststore.

### **Documentation enhancement**

Added HTTP Server monitoring solution overview architecture. For more information, see [“Overview of HTTP Server monitoring” on page 344](#).

## **What's new for the December 2019 refresh of V8.1.4.0.10**

### **New Agent**

#### **MariaDB agent**

The Monitoring Agent for MariaDB offers a central point of management for your MariaDB environment or application. The software provides a comprehensive means for gathering the information required to detect problems early and to prevent them. Information is standardized across the system. You can monitor multiple servers from a single console. By using the Monitoring Agent for MariaDB you can easily collect and analyze MariaDB specific information.

- For information about configuring the agent after installation, see [“Configuring MariaDB monitoring” on page 580](#).
- For information about the dashboards, thresholds, and attributes, see the [MariaDB agent Reference](#).

### **Expanded platform support for agents**

The following agents and platforms are now supported:

#### **Solaris X86-64**

- Oracle Database agent
- WebLogic agent

## Agent enhancements

### Cassandra agent

Added two new attributes called Agent Hostname and Agent Instance Name in the Cluster Details, Node Statistics, and Keyspace Details attribute groups.

### Db2 agent

Added support to monitor Current Running SQL.

### IBM Integration Bus agent

Added two new group widgets, TCPIP Client Connections and TCPIP Server Connections in the Integration Server Status - Detail page.

### Internet Service Monitoring

- Added two new configuration panel variables:
  - *Active*: To select a state for profile element as active or inactive.
  - *sniServerName*: Indicates the name of host/server for which a certificate from SNI enabled web server is required.
- **Default settings** under **Data Validation** Tab for HTTP,HTTPS and DNS monitors are now editable
- Agent now supports & character in **page** field for HTTP and HTTPS monitors
- Agent now support Danish characters in **regex** field of HTTP and HTTPS monitors

**Note:** Set the locale to da\_DK on Linux platform before agent installation to use this feature

### Microsoft Active Directory agent

- Added a new widget called KCC details in the Status Overview page.
- Added following new attribute groups in the Attribute Details tab:
  - Directory Services
  - Kerberos Consistency Checker
  - Kerberos Key Distribution Center
  - Name Service Provider
  - Exchange Directory Service
- Added New widget for Last Logon Information of privilege users.

### Microsoft .NET agent

Added a new attribute called Request Name in the Database Call Details attribute group. This attribute displays the name of the request that fires the database query.

### Microsoft Exchange Server agent

- Added a new widget called Transport SMTP Recive in the Status Overview page.
- Added following new attribute groups in the Attribute Details tab:
  - MS Exchange AB
  - MS Exchange ADAccess Processes
  - MS Exchange ADAccess Caches
  - MS Exchange ADAccess Domain Controllers
  - MS Exchange ADAccess Forest Discovery
- Added the following in Attribute details tab.
  - Policyholders widget
  - Data Loss Prevention Policies
  - Policy tips

**Microsoft SQL Server agent**

Added tolerance support for SQL Server 2019.

**Microsoft Hyper-V Server agent**

Added support for Windows Server 2019.

**Microsoft IIS agent**

- Added new group widgets:
  - System-Main Memory Statistics
  - IIS Server- Assigned Memory Usage
  - IIS Server- Assigned CPU Usage
  - Worker Process Details
  - .Net Memory Management
- On each application pool name in Worker Process Details group widget a page is created that shows the historical trend of Requests processed per second, Elapsed time, Requests in Queue, Memory and CPU Utilization.
- On each application pool name in .Net Memory Management group widget a pop-up is added that shows the historical trend of percent time in GC.

**Microsoft SharePoint Server agent**

- Added a new attribute group called Trace\_Log that provides the high severity logs information.
- Added two new group widgets called Trace Log Details and Last 1 Hour Trace Log Count in the Overview page to display the details of recent 100 trace log events and last 1 hour count of unexpected, monitor-able and high level trace logs.

**MySQL agent**

The agent collects data consistently after server restarts.

**NetApp Storage agent**

The agent now shows exact list of Qtree that are mapped to Volume.

**PostgreSQL agent**

The agent now supports PostgreSQL Server version 12.

**Response Time Monitoring agent**

- A new configuration parameter KT5AARIPTOUSERID is added. It allows you to save Client IP address in User Name property in AAR raw data. By default, it is set as NO. To change the setting, you need to restart the Response Time Monitoring agent.
  - KT5AARIPTOUSERID=NO: If the value is NO, the Response Time Monitoring agent will save username of transaction to userID property of AAR.
  - KT5AARIPTOUSERID=YES: If the value is YES, the Response Time Monitoring agent will save Source IP address of transaction to userID property of AAR.
- The Response Time Monitoring agent now supports specifying KT5AARIPTOUSERID value in silent configuration.
- The title of existing group widget Worst By User - Top 5 is changed to Worst By User - Top 20. The group widget is changed to display top 20 users with highest percentage of transaction failures over the selected period.

**VMware**

- Agent now supports fetching of the IP address or Host name of vCenter from vSphere API call, instead of showing Configured Address as it is from configuration panel. User can activate this feature by setting the flag in agent environment to Y. For example, KVM\_RETRIEVE\_HOSTNAME\_FROM\_API=Y.
- Retry count now can be given a limit to restrict the connection attempts with data source. For example, KVM\_DATA\_PROVIDER\_CONNECTION\_RETRY\_COUNT=1000, adding this variable in agent environment file would put a lock on connection retry count in case of connection failure

with vCenter. 1000 indicates agent would try till 1000 subsequent unsuccessful connection attempts and then would bring down the data provider process with a log message NO MORE ATTEMPTS OF CONNECTION; STOPPING THE DATA COLLECTION, TO RESUME MONITORING PLEASE RESTART THE AGENT. TO HAVE MORE ATTEMPT OF CONNECTIONS, RESET THE VALUE OF THE VARIABLE KVM\_DATA\_PROVIDER\_CONNECTION\_RETRY\_COUNT. Default value to retry connection attempts is 6, user can set the desired threshold as per the requirement.

- Agent supports configuring of Instance specific heap size to efficiently utilize the allocated memory on the system. For example, KVM\_CUSTOM\_JVM\_ARGS= -Xmx512m, by setting this variable in instance's environment file would mean that instance is configured to use 512 MB of heap memory. The size can be changed based on the total count of vCenter objects an instance is monitoring.

## What's new for the September 2019 refresh of V8.1.4

### Expanded platform support for agents

The following agents and platforms are now supported:

#### Solaris X86-64

- Db2 agent
- SAP agent
- Sybase agent
- UNIX OS agent
- WebSphere Applications agent
- WebSphere MQ agent
- IBM Integration Bus agent

#### RHEL on x86-64 (64 bit)

- Internet Service Monitoring
- Microsoft SQL Server agent
- Sybase agent

#### RHEL on POWER Little Endian (ppc64le)

- RabbitMQ agent

### Agent enhancements

#### Db2 agent

- The agent now supports Db2 server version 11.5.

#### Hadoop agent

- A new configuration parameter **Unique Cluster Name** which is a unique name for Hadoop Cluster indicating its version and flavor is added in the configuration panel.
- The Hadoop agent now shows display item for the thresholds created on Ambari Services.
- The Hadoop agent now supports monitoring of Streaming Analytics Manager service in Hadoop cluster.
- The Hadoop agent now supports monitoring of Schema Registry service in Hadoop cluster.

#### HTTP Server agent

- The agent now supports Oracle HTTP server on Solaris Sparc.

#### Internet Service Monitoring

- The agent now supports IBM Tivoli® Netcool/OMNIbus.

- The agent is enhanced to delete profiles from the existing profiles and rename the existing profiles.

#### **MongoDB agent**

- The agent now supports MongoDB database version 4.x.

#### **MySQL agent**

- FQDN attribute is added for Application Availability in the Help section.
- Fixed Tooltip display for IP Address Agent Configuration parameter.
- The following new attributes are added for monitoring in IBM Cloud App Management.
  - Database Size Information
  - Error Information
  - Count of Db Instance Lock
  - User's connection details
  - Process list details
  - Events Information

#### **PostgreSQL agent**

- Two new situations called Deadlocks\_Count\_Crit and Deadlocks\_Count\_Warn are added to monitor number of deadlocks in a database, which will help you to address the exact issue for the deadlocks.
- One new attribute group called Deadlocks\_Info is added to check the deadlock details.

#### **Sybase agent**

- FQDN attribute is added for Application Availability in the Help section.

#### **Synthetic Playback agent**

- Firefox V68.0 ESR is now supported.
- System proxy, PAC proxy, and no proxy configurations are now supported.

#### **Tomcat agent**

- The agent is enhanced with metrics and UI views for monitoring Heap/Non-heap memory pool usage for JVM.
- The agent is enhanced with metrics and UI views for monitoring threads, and class loading information for JVM.
- The agent UI now displays FQDN on Server Information view.

#### **UNIX OS agent**

- The agent is now updated with the custom scripting feature. Shell scripts, PERL scripts and other types of scripts can be used.

#### **VMware VI agent**

- A new configuration field named **KEY\_STORE\_PASSWORD** is added. It allows user to configure the agent with new key-store password set for the agent JRE.

### **What's new for the June 2019 refresh of V8.1.4**

#### **Expanded platform support for agents**

The following agents and platforms are now supported:

##### **Red Hat Enterprise Linux (RHEL) 8**

The following agents and data collectors now support RHEL 8. Before installing agents on RHEL 8, be sure to read the [“Specific operating systems”](#) on page 193 section of [“Preinstallation on Linux systems”](#) on page 193.

**RHEL 8 on x86-64 (64 bit)**

- Cassandra agent
- Cisco UCS agent
- DataPower agent
- DataStage agent
- Db2 agent
- Hadoop agent
- HTTP Server agent
- Internet Service Monitoring agent
- J2SE data collector
- Linux KVM agent
- Linux OS agent
- MongoDB agent
- MQ Appliance agent
- MySQL agent
- NetApp Storage agent
- Node.js data collector
- PHP agent
- Python data collector
- PostgreSQL agent
- RabbitMQ agent
- Response Time Monitoring Agent
- Ruby agent
- SAP agent
- SAP HANA Database agent
- SAP NetWeaver Java Stack agent
- Sterling Connect Direct agent
- Sterling File Gateway agent
- Sybase agent
- Tomcat agent
- VMware VI agent
- WebSphere Applications agent
- WebSphere MQ agent

**RHEL 8 on System z**

- Db2 agent
- Linux OS agent
- Node.js data collector
- Python data collector
- Response Time Monitoring Agent
- WebSphere Applications agent
- WebSphere MQ agent

**RHEL 8 on POWER Little Endian (ppc64le)**

- Db2 agent

- Hadoop agent
- J2SE data collector
- Linux OS agent
- MySQL agent
- Node.js data collector
- SAP NetWeaver Java Stack agent
- WebSphere Applications agent
- WebSphere MQ agent

### **Solaris Sparc 10 and 11**

- JBoss agent
- Oracle Database agent
- WebLogic agent

### **Windows Server 2019**

- WebSphere Applications agent

### **Agent enhancements**

#### **Hadoop agent**

- The Hadoop agent now supports monitoring of HDF 3.3 (with HDP 3.1.0) Ambari service Big SQL 6.0.
- The Hadoop agent now supports SUSE Linux Enterprise Server (SLES) 15 on x86-64 platform.

#### **HMC Base agent**

The HMC Base agent supports HMC V9.1.

#### **Internet Service Monitoring agent**

The agent now has Service Assurance Agent monitor, which monitors Cisco Service Assurance Agent probes.

#### **Microsoft IIS agent**

The agent is enhanced with tolerance provision to the Windows 2019 server. This enhancement displays the FTP site data for agent that is installed on Windows 2019 server.

#### **MongoDB agent**

The agent now supports Red Hat Enterprise Linux (RHEL) 8 on x86-64 (64 bit) platform.

#### **Python data collector ifix02**

The data collector now supports Django 1.10 and higher.

#### **SAP agent**

The SAP agent now supports the following platforms:

- Red Hat Enterprise Linux (RHEL) 8 on x86-64 (64 bit)
- SAP NetWeaver Application Server 7.52 (SAP Basis 752)

#### **SAP HANA Database agent**

The SAP HANA Database agent is enhanced with the following features:

- Hostname is added in the :HDB Subnode node of SAP HANA Database agent for its unique identification.
- The agent now supports scale out architecture.
- Red Hat Enterprise Linux (RHEL) 8 on x86-64 (64 bit) and Linux ppc64le platforms.
- SUSE Linux Enterprise Server (SLES) 15 on x86-64 (64 bit) platform.
- A new attribute Trimmed Host is added under System Database attribute group.

### **SAP NetWeaver Java Stack agent**

The SAP NetWeaver Java Stack agent supports the following platforms:

- Red Hat Enterprise Linux (RHEL) 8 on x86-64 (64 bit)
- SUSE Linux Enterprise Server (SLES) 15 on x86-64 (64 bit)
- Windows Server 2019 DE and SE
- Windows Server 2016 DE and SE

### **Synthetic Playback agent**

- Supports .side script recorded by Selenium IDE 3.2.X, 3.3.X, or 3.5.X
- Supports playback by Firefox ESR 60.5.1
- Supports the **wait**, **flow control**, and **linkText locator type** Selenium IDE commands

### **Skype for Business Server agent**

The Skype for Business Server agent is enhanced with the following features:

- The agent now supports Skype for Business Server 2019.
- Two new group widgets such as Database-Throttled Requests (DBStore) and Database-Throttled Requests (SHAREDDBStore) are added on the Overview page that displays number of requests throttled by the Skype for Business Server due to high latency of the database queue for DBStore and shared DBStore.

### **Prerequisite scanner**

The **IGNORE\_PRECHECK\_WARNING** command is now available as an alternative to the **SKIP\_PRECHECK** command. For more information, see [“Bypassing the prerequisite scanner” on page 210](#).

### **Documentation enhancement**

A page is created to help you quickly find out the version information and change history for each agent and data collector. See [“Change history” on page 58](#).

## **What's new for the March 2019 refresh of V8.1.4**

### **Expanded platform support for agents**

The following agents and platforms are now supported:

#### **Windows Server 2019**

- Cassandra agent
- DataStage agent
- Db2 agent
- Hadoop agent
- Internet Service Monitoring
- Microsoft Active Directory agent
- Microsoft Cluster Server agent
- Microsoft IIS agent
- Microsoft Exchange Server agent
- Microsoft SQL Server agent
- MySQL agent
- PostgreSQL agent
- RabbitMQ agent

- SAP agent
- SAP HANA Database agent
- Sybase agent
- Tomcat agent
- Windows OS agent

### **Solaris SPARC 10 and 11**

- Db2 agent
- HTTP Server
- MySQL agent
- SAP agent
- Sybase agent
- UNIX OS agent
- WebSphere Applications agent

### **Monitoring Agent for Cassandra**

The Cassandra agent is enhanced with the following features:

- Added support for Windows Server 2019 Operating System.
- Added detailed logging for troubleshooting.

### **Monitoring Agent for Db2**

The Db2 agent is enhanced with the following features:

- The Db2 agent now supports Windows Server 2019.
- The Db2 agent now supports Solaris SPARC 10/11 platforms.

### **Monitoring Agent for Hadoop**

The Hadoop agent is enhanced with following features:

- Added support to monitor the SSL enabled Hadoop BigInsights®, Hortonworks and Cloudera clusters.
- Added support to test the connection to SSL enabled Hadoop cluster.
- Added support of Windows Server 2019 Operating System (Datacenter and Standard Editions).
- Added support for monitoring Hadoop offering: Cloudera 6.1.1 (CDH 6.1.1).
- Added support for monitoring Hadoop offering: Hortonworks 3.1.0 (HDP 3.1.0).

### **Monitoring Agent for IBM Integration Bus**

The IBM Integration Bus agent is enhanced with the following feature:

- Added tolerance support to monitor IBM App Connect Enterprise V11. For more information, see [“Configuring the IBM Integration Bus agent” on page 352.](#)

### **Monitoring Agent for Microsoft Internet Information Services**

The Microsoft IIS agent now supports Windows Server 2019 Operating System.

### **Monitoring Agent for InfoSphere® DataStage**

The DataStage agent is enhanced with the following features:

- Added support for Windows Server 2019 Operating System.
- Added query timeout to data collection queries for better performance of the agent.

### **Monitoring Agent for Microsoft Active Directory**

The Microsoft Active Directory agent is enhanced with the following features:

- Added support for Windows Server 2019.

- Added new attribute group AD\_Services\_Status that provides services state that are related to Active Directory Server.  
Based on the services state, it determines the Server Status of Active Directory.
- Added new situation AD\_Server\_Status that monitors Active Directory Server Status.
- Added new attribute group Root\_Directory\_server that provides active version and monitored OS name.

#### **Monitoring Agent for Microsoft Cluster Server**

The Microsoft Cluster Server agent is enhanced with the following features:

- Added support for Windows Server 2019 Operating System.
- Added the CLUSTER\_SERVICE\_VERSION attribute.

#### **Monitoring Agent for Microsoft Exchange Server**

The Microsoft Exchange Server agent is enhanced with the following features:

- Added support for MS Exchange Server 2019.
- Added new attribute group MExchange\_MAPIoverHTTP that provides information about MAPI over HTTP protocol statistics.

#### **Internet Service Monitoring**

The Internet Service Monitoring agent is enhanced with following features:

- Added support for LDAP, NTP, NNTP, SOAP, SNMP, SIP, RTSP, RPING, RADIUS and TFTP monitors.
- Added support for Windows 2008 R2 server OS and Windows server 2019.

#### **Monitoring Agent for Microsoft SQL Server**

The Microsoft SQL Server agent now supports Windows Server 2019.

#### **Monitoring Agent for MySQL**

The Monitoring Agent for MySQL is enhanced with the following features:

- Added support for Windows Server 2019.
- Added support for Solaris SPARC 10/11 platforms.
- Added capability to set additional properties to the agent initiated JDBC connection with the MySQL server.

#### **Monitoring Agent for PostgreSQL**

The PostgreSQL agent now supports Windows Server 2019 Operating System.

#### **Monitoring Agent for RabbitMQ**

The RabbitMQ agent now supports Windows Server 2019 Operating System.

#### **Monitoring Agent for Skype for Business Server**

The Skype for Business Server agent is enhanced with the following features:

- Added support for Windows Server 2019 Operating System.
- Added a new attribute group called KQL\_Server to display the Skype for Business Server product related information.
- Added a new situation called Skype\_Server\_Down to monitor the Skype for Business Server status based on the server front-end and IM conferencing services status.

#### **Monitoring Agent for SAP Applications**

The SAP agent is enhanced with following features:

- Added case sensitive password feature for application user being used between SAP agent and SAP server.

- Added support for Windows Server 2019 Operating System (Datacenter and Standard Editions).
- Added support to see the Long Running Jobs present in SAP System for more than 24 hours.
- Improved performance of /IBMMON/ITM\_MAIALRT\_INX function Module.
- Added support for Solaris v10 and v11 SPARC Operating Systems.
- Added trim feature to SAP host name in order to match the Managed System Name's maximum 32 characters limit.

### **Monitoring Agent for SAP HANA Database**

The SAP HANA Database agent is enhanced with following features:

- Added support to discover the tenant databases when the tenant db name and HANA system SID are same.
- Added support for Windows Server 2019 Operating System (Datacenter and Standard Editions).

### **Monitoring Agent for Sybase Server**

The Sybase agent is enhanced with the following features:

- Added support for Windows Server 2019.
- Added support for Solaris SPARC 10/11 platforms.
- Enhanced Sybase query for better concurrency and reduced locking.

### **Monitoring Agent for Tomcat**

The Tomcat agent now supports Windows Server 2019 Operating System (Datacenter and Standard Editions).

### **Monitoring Agent for UNIX OS**

The UNIX OS agent is enhanced with the following feature:

- Added support for Solaris SPARC 10 and 11.

### **Monitoring Agent for VMware VI**

The VMware VI agent has been refreshed to ignore the unavailable(-1) values while displaying the trend of average on the graph for all multi-line charts.

### **Monitoring Agent for WebSphere Applications**

The WebSphere Applications agent is enhanced with the following features:

- Added support for Solaris SPARC 10 and 11.
- Added support for monitoring WebSphere® Extreme Scale. You can configure monitoring for an Extreme Scale zone, or several zones, under the node for any server belonging to the zone or zones. You can drill down to view information for different servers, map sets, and partitions within the zone or zones. For more information, see [“Configuring the WebSphere Applications agent to monitor WebSphere Extreme Scale” on page 1012.](#)

### **Monitoring Agent for WebSphere MQ**

The WebSphere MQ agent is enhanced with the following features:

- Added support for SLES 15 xLinux.
- Added support to collect statistics for the queue manager and display the collected data. For more information, see [“Enabling queue statistics monitoring for the queue manager of IBM MQ” on page 1032.](#)

### **Data collector enhancements**

#### **J2SE data collector**

The J2SE data collector is enhanced with the following features:

- Added support for OpenJDK 9, 10, and 11 versions.
- Added support of Windows Server 2019 Operating System (Datacenter and Standard Editions).

- Added feature to auto-discover the J2SE application specific classes and methods for Transaction Tracking and Diagnostic Data monitoring.

### **Selenium IDE 3.2.X and 3.3.X for synthetic scripts**

Selenium IDE versions 3.2X and 3.3.X are now supported; scripts and test suites are saved in .side format rather than the .html format used by older versions of Selenium IDE. If you have existing .html scripts, you can still use them. In some instances, you might want to edit the .html scripts or re-record them in the new .side format.

For more information, see these subtopics of “Managing synthetic transactions and events ” on page 1177: “Recording synthetic scripts” on page 1177, “Structuring complex scripts” on page 1180, and “Updating scripts from earlier Selenium IDE versions” on page 1181.

## **What's new for the December 2018 refresh of V8.1.4**

### **New agent**

#### **Monitoring Agent for IBM Cloud**

The Monitoring Agent for IBM Cloud collects virtual machine inventory and metrics from your IBM Cloud (Softlayer) account. Use the IBM Cloud agent to track how many virtual devices you have configured and running in IBM Cloud. You can see what resources are allocated to each virtual device in the detailed dashboard page, which also shows information like the data center a device is located in, the operating system, and the projected public network bandwidth for the month.

### **Agent enhancements**

#### **Monitoring Agent for Cassandra**

The Cassandra agent is enhanced with the following features:

- Added a new threshold named `Cassandra_Cluster_Down` that monitors the state of the monitored instance.
- Added support for Ubuntu 18.04 operating system.
- Added support for SUSE Linux Enterprise Server 15 platform.

#### **Monitoring Agent for Db2**

The Db2 agent is enhanced with the following features:

- The Db2 agent now supports HADR Monitoring Capabilities for multiple standbys.
- The Db2 agent now supports new value `Stopped` for Database Status attribute. The `Stopped` status indicates that the database is not active and having zero active connections while it is healthy and ready to accept new connections.
- Added the new widget `Db2 Server Information` to display Db2 Server details.
- Added the new page `HADR Status – Local Databases` to display the information about partner databases in the following new widgets:
  - `HADR Databases Details` is the table widget which displays important attribute values for partner database.
  - `Log Gap (History)` is the graph widget which displays log gap trend vs time.
  - `Standby Flag Status` is the table widget which displays standby flag status values.
- Added the new predefined threshold `UDB_HADR_Aux_Standby_Disconnect` to monitor secondary standby databases in HADR environment.
- The Top 5 database memory usage widget is updated to show the correct value.
- The Db2 agent now supports the following platforms:
  - Ubuntu zLinux 18.04
  - SUSE Linux Enterprise Server 15 on x86-64 (64 bit)
  - SUSE Linux Enterprise Server 15 for zLinux
  - SUSE Linux Enterprise Server 15 for Power® Linux Little Endian

### **Monitoring Agent for InfoSphere DataStage**

The InfoSphere DataStage agent is enhanced with the following features:

- Added capability to disable data collection for selected attribute groups.
- Optimized data collection for Job Runs attribute group.
- Added support for SUSE Linux Enterprise Server 15 platform.

### **Internet Service Monitoring**

Internet Service Monitoring Agent now supports Windows 64-bit and Linux 64-bit platforms.

### **Monitoring Agent for Microsoft .NET**

The .NET agent is enhanced with the following features:

- The .NET agent now tracks the failed requests. The status of these requests is shown as failed under the Latest Requests group widget of the Middleware Transaction Details page. Also, the Latest Errors group widget lists the recent failed requests along with the status code and error description.
- The .NET agent also monitors the user data available through ASP .NET Identity and ASP .NET sessions. The user data is displayed in the Users Top–5 group widget of the Middleware Transaction Details page.

### **Monitoring Agent for MongoDB**

MongoDB agent now supports SUSE Linux Enterprise Server 15 platform.

### **Monitoring Agent for NetApp Storage**

The NetApp Storage agent is enhanced with the following features:

- A new Search box is added on the Event Details page that filters the event data based on the search criteria.
- A new Details page is added for LUNs.
- The user is now able to check the details of related device mapped to each storage object on the **Details** page.

### **Monitoring Agent for OpenStack**

Support was added for monitoring virtual machine instances, such as the usage of the virtual machine instance CPU, memory, disk, and network interface controller.

### **Monitoring Agent for PostgreSQL**

- Support added for SUSE Linux Enterprise Server 15
- Optimized data collection for CPU and Memory attribute groups

### **Monitoring Agent for RabbitMQ**

Support added for SUSE Linux Enterprise Server 15

### **Monitoring Agent for SAP Applications**

SAP agent now supports the following platforms:

- SUSE Linux Enterprise Server 15 platform
- SAP NW RFC SDK 7.50

### **Monitoring Agent for Skype for Business Server**

The Skype for Business Server is enhanced with the following features:

- Synthetic Transaction Commands in Synthetic Transaction Module are now executable by already configured Test Users. To avail this feature, disable the Use Agent Configuration Values in Agent configuration panel and provide value of Pool FQDN for which Synthetic Commands are to be executed. Make sure the Test User is configured through NewCsHealthMonitoringConfiguration command for Identity provided in Pool FQDN field of Agent Configuration Panel.
- Users can now disable Synthetic Commands. To disable any particular command from execution, provide false against that command name in

LyncSyntheticTrans.exe.config file present at location <CANDLE\_HOME>\tmaitm6 for 32-bit version and <CANDLE\_HOME>\TMAITM6\_x64 64-bit version.

### **Monitoring Agent for Tomcat**

- New attribute group Cluster is added. It contains information of properties of a cluster.
- New widget Cluster Information is added. This widget displays information of attribute group Cluster. It will not display any data if the agent is monitoring a non-cluster Tomcat setup.
- Configuration panel variable *Tomcat Server Port* is added. This variable represents the port on which Tomcat server is running. Default value of the variable is 8080.

### **Monitoring Agent for VMware VI**

- Component page has been enhanced to show the IP Address or Hostname of configured vCenter and its connectivity with the agent.

### **WebSphere Infrastructure Manager agent**

The WebSphere Infrastructure Manager agent now supports AIX®.

### **WebSphere MQ agent**

The WebSphere MQ agent is now supported on IBM WebSphere MQ 9.1.

## **Data collector enhancements**

### **J2SE data collector**

The J2SE data collector is enhanced with the following features:

- Added support for SUSE Linux Enterprise Server 11 for Power Linux Big Endian (64 bit).
- Added support for Power Linux Big Endian (pLinux BE) (64 bit).
- Added support for Power Linux Little Endian (pLinux LE) (64 bit).
- Added configuration module and Jetty server monitoring.

## **Expanded platform support for agents**

The following agents and platforms are now supported:

### **SUSE Linux Enterprise Server 15 platform**

- Cassandra agent
- DataPower agent
- DataStage agent
- Db2 agent
- HTTP Server
- IBM Integration Bus agent
- Linux OS agent
- MongoDB agent
- OpenStack agent
- PostgreSQL agent
- Monitoring Agent for RabbitMQ
- SAP agent
- WebSphere MQ agent

### **Power Linux**

- J2SE data collector

### **Ubuntu 18.04**

- Cassandra agent
- IBM Integration Bus agent
- OpenStack agent

- Linux OS agent
- RabbitMQ agent
- WebSphere MQ agent

### **Power 9 Support**

Power 9 is now supported for all agents.

## **What's new for the October 2018 refresh of V8.1.4**

### **Integration with Cloud Event Management**

Cloud Event Management provides real-time incident management across your services, applications, and infrastructure. Now, with the integration between Cloud Event Management and IBM Cloud Application Performance Management, all the events that are generated in Cloud APM are sent to Cloud Event Management.

To use the Cloud Event Management integration support, you must install the Cloud APM Version 8.1.4.0 Server Interim Fix 7 or later.

## **What's new for the September 2018 refresh of V8.1.4**

### **New agent available**

#### **Monitoring Agent for MQ Appliance**

The MQ Appliance agent provides monitoring information that is specific to the MQ appliance level on MQ Appliances, for example, CPU, memory, storage, sensors, and queue managers summary information.

### **Agent enhancements**

#### **Monitoring Agent for Db2**

The Db2 agent now supports Power Linux Big Endian operating system.

#### **Monitoring Agent for Hadoop**

- The Hadoop agent now monitors the status of two more services: SmartSense and Druid.
- The Hadoop agent now supports Hortonworks Data Platform (HDP) 3.0.0.

#### **Internet Service Monitoring Agent**

Edit functionality for Internet Service Monitoring Agent is enhanced. All the monitors which have configurable parameters can be edited.

#### **Monitoring Agent for MySQL**

The MySQL agent now supports monitoring MySQL v8.0.11.

#### **Monitoring Agent for NetApp Storage**

The NetApp Storage agent is enhanced with the following features:

- A new widget called Overall Events Summary is added on the NetApp Storage Instance page. It displays the cumulative count of events. You can view all the events that occurred across the environment, irrespective of severity or object by clicking the status bar represented as Total Events.

Also, an Event Status column is added in every objects table, which shows event status prioritized based on time and then the level of severity.

The NetApp Storage Instance page now displays Events Summary table rather than a chart.

- The Aggregate Details page is updated to display the related devices that are associated with the selected aggregate.

#### **Monitoring Agent for SAP Applications**

Support added for SAP NW RFC SDK 750.

#### **Monitoring Agent for SAP HANA Database**

Two new features are added:

- SAP HANA Database can be monitored in stand by mode.

- SAP HANA Database agent supports the Big Endian platform for Power System.

#### **Monitoring Agent for VMware VI**

- Monitoring of **HostVFlashManager** is now supported
- The ESX Server Dashboard now shows the count of virtual machines that are in their Critical, Warning and Normal status with respect to CPU utilization.

#### **New Platform: Linux on POWER Big Endian**

There is a new platform available. The following agents are now supported on Linux on POWER Big Endian:

- Db2 agent
- IBM Integration Bus agent
- Linux OS agent
- SAP HANA Database agent
- WebSphere MQ agent
- WebSphere Applications agent

### **What's new for the July 2018 refresh of V8.1.4**

#### **Cloud APM 8.1.4.0 Interim Fix 6 Server Patch**

After you apply Cloud APM 8.1.4.0 server Interim Fix 6, you can:

- Change the names of the Cloud APM server Db2 databases on the remote Db2 server.
- Change the remote Db2 server port number, host name or IP address.
- Move the Cloud APM server Db2 databases to a different computer system or to a different Db2 instance user.

#### **New agents available**

##### **Internet Service Monitoring**

The Internet Service Monitoring offers to determine whether a particular service is performing adequately, identify problem areas and report service performance measured against Service Level agreements. Internet Service Monitoring works by emulating the actions of a real user. It regularly polls or tests Internet services to check their status and performance.

##### **Monitoring Agent for Sybase Server**

The Sybase agent offers a central point of management for distributed databases. It collects the required information for database and system administrators to examine the performance of the Sybase server system, detect problems early and prevent them.

#### **Agent enhancements**

##### **Monitoring Agent for Hadoop**

- Support added for monitoring Hadoop services such as, Mahout, Atlas, and Falcon.
- Support added for monitoring Hadoop offering: Cloudera CDH 5.13.
- Support added for monitoring Hadoop offering: Hortonworks HDP 2.6.4.

##### **Monitoring Agent for HMC Base**

HMC V8 R8.7.0 is now supported.

##### **Monitoring Agent for HTTP Server**

Support for the 64-bit Apache HTTP Server on Windows was added.

##### **Monitoring Agent for Microsoft .NET**

The Monitoring Agent for Microsoft .NET is enhanced as follows:

- The IIS Response Time module now monitors the subtransaction and render time breakdown through JavaScript injection for ASP .NET web forms (.aspx pages) and ASP .NET MVC razor views, which satisfy following conditions:
  - The page meets the W3C HTML standards.
  - Response headers contain Content-Type: text/html, application/xml,application/json.
  - Response content includes the <head> element.
- The .NET agent uploads the deep dive data to Diagnostic Query Engine (DQE) service on the APM server. The DQE service deep dive dashboard quickly loads and displays the data.
- The new threshold **NET\_Slow\_IIS\_Request\_Crit** is added that triggers when the Slow Top 10 widget has requests with response time greater than 500 milliseconds.
- The selective filtering tool is updated with the search box to search an application pool from the list of application pools.
- The **ProcListCaller** utility is added to provide the list of processes that have loaded the .NET Agent CLR profiler (CorProfLog.dll).

### Monitoring Agent for Microsoft SQL Server

- The Microsoft SQL Server agent now supports multiple collations in ERRORLOG parsing based on collation settings in koqErrConfig.ini file. When the koqErrConfig.ini file does not contain any valid collation settings, you will be able to see only the default English error message with severity level more than the default severity level, if any. The default severity level is 17. All the collations exist in the koqErrConfig.ini file will be considered while parsing the ERRORLOG file. So only the collations that are in use should be added in the koqErrConfig.ini file. The ERRORLOG parsing is case sensitive, you must ensure the collation keyword values in the koqErrConfig.ini file are exactly the same as the keyword values found in ERRORLOG file or in the reference koqErrConfigSample.ini file. Note that the changes made in the koqErrConfig.ini file is not preserved during agent upgrade, you must make a backup before agent upgrade.
- The agent also provides the utility tool **koqVerifyPermissions.exe** to check if an existing SQL Server user has sufficient permissions to monitor the Microsoft SQL Server. If an existing SQL Server user does not have sufficient permissions, you can use the utility tool **permissions.cmd** as an alternative to grant the minimum permissions to an existing SQL Server user for data collection.

### Monitoring Agent for NetApp Storage

The Monitoring Agent for NetApp Storage is enhanced as follows:

- The new Component page is added to display the details of agent connection state whether the data provider is up or down, along with IP address of monitored data sources. The individual status bar represents the number of nodes, aggregates, volumes, and disks that are in critical, normal, warning, or unknown state.
- The new NetApp Storage Instance page is added to highlight key properties of clusters, aggregates, volumes, disks, and vServers. It also displays the Events Summary chart with count of events that are occurred on each available storage entity or object across the environment. For example, if there are 12 volumes that are configured and each volume has two events with severity as Critical, then the Event Summary chart depicts the total count of events that are occurred on all the volumes available in an environment. In this case, the chart shows a bar with 24 critical events against the volume as an entity plotted on the X-axis.
- The Node Details page is updated to show network port details.
- The Volume Detail page is updated to display details of the associated snap mirrors and LUNs count for each selected volume.
- The vServers Details page is updated to display information about network logical interfaces.

### Monitoring Agent for Tomcat

Tomcat V9.0.5 server is now supported.

### Monitoring Agent for WebSphere MQ

Remote monitoring is supported. Two configuration parameters are added for the agent to be able to collect monitoring data for a remote queue manager. However, these configuration parameters do not have any effect on a local queue manager. If you want to configure the agent to monitor a local queue manager, you can press Enter to skip specifying these parameters.

For more information about agent configuration, see [“Configuring the WebSphere MQ agent” on page 1026](#).

### EIF slot customization enhancement

You can now add multiple attribute values and literal values to the EIF slot. Instead of, say, a Disk free percent is **Disk\_Free\_Percent** message for a threshold that tests for low available disk space, you could have Disk free percent is **Disk\_Free\_Percent** and inodes free percent is **Inodes\_Free\_Percent**. The forwarded message might look like this: Disk free percent is 13 and inodes free percent is 9. For more information, see [“Customizing an event to forward to an EIF receiver” on page 1124](#).

### IBM Cloud® Application Business Insights

You can use the stand-alone IBM Cloud Application Business Insights application that promotes data democratization for business users and small and medium-sized enterprises. It provides advanced and powerful data visualization and exploration tool that functions beyond basic reporting.

Currently, the Dashboard Designer tool has default connectors to Cloud APM and IBM Tivoli Monitoring agents data sources to retrieve and render information on your custom dashboards. You can also connect many relational databases to create dashboards.

For more information, see IBM Cloud Application Business Insights documentation on [IBM Knowledge Center](#).

## What's new for the April 2018 refresh of V8.1.4

### New agent available

#### Monitoring Agent for AWS Elastic Load Balancer

The Amazon ELB agent provides you with a central point of monitoring for the health, availability, and performance of your AWS Elastic Load Balancers. The agent displays a comprehensive set of metrics for each load balancer type-application, network and classic-to help you make informed decisions about your AWS Elastic Load Balancer environment.

### Agent enhancements

#### Response Time Monitoring Agent

The IBM HTTP Server Response Time module now supports IBM HTTP Server version 7, 8, and 9 on Windows.

#### Monitoring Agent for Node.js

By default, user sensitive information, such as cookies, HTTP request contexts, and database request contexts are no longer collected by the Node.js data collector. You can change this default behavior by specifying the new environment variable, *SECURITY\_OFF*.

#### Monitoring Agent for Amazon EC2

The component name now reflects the agent name.

Extended data retention support is added.

#### Monitoring Agent for WebLogic

Transaction tracking and deep-dive diagnostics are enabled on AIX. Previously these features were only enabled on Linux and Windows.

The Request Summary drill-down for servlets that are implemented with annotations for transaction tracking and deep-dive diagnostics is enhanced.

### **Monitoring Agent for Skype for Business Server**

Support for Windows Server 2016.

### **Monitoring Agent for Sterling File Gateway**

Agent fetches events for failed file transfer as a default behavior. You can change this default behavior by specifying the appropriate value for the new environment variable

**KFG\_ALL\_FGEVENTS.**

### **Monitoring Agent for Sterling Connect Direct**

The agent logging feature is improved. For more information, see [Troubleshooting](#) section.

## **Data collector enhancements**

### **Node.js data collector**

By default, user sensitive information, such as cookies, HTTP request contexts, and database request contexts, are no longer collected by the Node.js data collector. You can change this default behavior by specifying the new environment variable, *SECURITY\_OFF*.

**Remember:** To get this enhancement, you must download and apply the IBM Cloud Application Performance Management Node.js data collector interim fix 1 from [IBM Fix Central](#). For more information, see [Interim Fix 1 Readme File](#).

### **J2SE data collector**

Support was added for auto-discovery of entry point class (main class) and alias name of the J2SE application.

Transaction tracking and deep-dive diagnostics can be enabled and disabled locally by using configuration scripts.

## **Documentation enhancements**

See [Agent version in Cloud APM, Private releases](#).

The Agent and data collector capabilities in each offering table is simplified to improve readability. For more information, see [“Capabilities” on page 60](#).

## **What's new for the February 2018 refresh of V8.1.4**

### **New agent available**

#### **Monitoring Agent for Azure Compute**

The Azure Compute agent provides you with a central point of monitoring for the health, availability, and performance of your Azure Compute instances. The agent displays a comprehensive set of metrics to help you make informed decisions about your Azure Compute environment. These metrics include CPU usage, network usage, and disk performance.

#### **Monitoring Agent for Sterling Connect Direct**

You can use the Sterling Connect Direct agent to monitor health and performance of Sterling Connect Direct server. It monitors Sterling Connect Direct server's features, such as file transfer activities, scheduled processes, hold and wait queue processes. The agent supports remote monitoring and it is multi-instance.

#### **Monitoring Agent for Sterling File Gateway**

The Sterling File Gateway agent monitors the Sterling File Gateway application, which is used for transferring files between internal and external partners by using different protocols, different file naming conventions, and different file formats. It also supports the remote monitoring feature.

## **Agent enhancements**

### **Monitoring Agent for DataPower**

Transaction tracking between the WebSphere MQ agent and DataPower agent is supported.

### **Monitoring Agent for Db2**

Support was added for remote monitoring.

**Monitoring Agent for Hadoop**

Support was added for monitoring the status of Hadoop services, such as HBase, MapReduce2, Tez, and Ranger.

Support was added for monitoring Hadoop offering: Cloudera CDH 5.12.

**Monitoring Agent for InfoSphere DataStage**

Support was added for MS SQL as metadata repository.

Support was added for Windows operating system.

**Monitoring Agent for Tomcat**

Transaction tracking and deep-dive support for PLinux by upgrading the agent framework with the 8.1.4.0-IBM-APM-SERVER-IF0001 patch.

**Monitoring Agent for SAP Applications**

Enhancement to CCMS feature: automation of idx file deletion. This automation works only when the SAP system is restarted.

**Monitoring Agent for Microsoft .NET**

Support was added for end user transactions by using IIS Response Time module.

**Monitoring Agent for Skype for Business Server**

The name of the agent is changed from Monitoring Agent for Microsoft Lync Server to Monitoring Agent for Skype for Business Server.

**Monitoring Agent for Linux KVM**

Support was added for RHEV-M 4.x.

**Monitoring Agent for Linux OS**

Memory upload interval is changed to 1 minute.

The IP address associated with the network interface is displayed on the Linux OS dashboard and System Information widget.

**Monitoring Agent for UNIX OS**

Memory upload interval is changed to 1 minute.

**Data collector enhancements****J2SE data collector**

Support was added for Spring Boot Applications.

**What's new for the December 2017 refresh of V8.1.4****New agent available****Monitoring Agent for InfoSphere DataStage**

You can use the DataStage agent to monitor the health and performance of the DataStage server resources, such as engine services, engine systems, job activity, job run status, and details of job runs. This agent supports remote monitoring.

**Agent enhancements****Monitoring Agent for Hadoop**

Support was added for monitoring a Hadoop cluster that is secured with the Kerberos SPNEGO-based authentication, which uses Active Directory Key Distribution Center (KDC).

Support was added for testing connection to hosts of a Hadoop cluster that is secured with Kerberos SPNEGO-based authentication, which uses MIT or Active Directory as Key Distribution Center (KDC).

Support was added for monitoring the following Hadoop offerings: Cloudera CDH 5.10 and CDH 5.11.

Support was added for monitoring the status of Hadoop services, such as Flume, Kafka, Titan, Spark, Knox, Pig, Slider, and Solr.

**Monitoring Agent for HTTP Server**

Support for the Windows 32-bit IBM HTTP Server and Apache HTTP Server was added.

Support for Linux for System z® was added (Transaction tracking is not supported).

Support for Oracle HTTP server on Linux for System x was added.

**Monitoring Agent for IBM Integration Bus**

Support for Linux for Power Systems (Little Endian) was added.

**Remember:** To get transaction tracking support on Linux for Power Systems (Little Endian), before you start the agent, you must download and apply IBM Cloud Application Performance Management 8.1.4 core framework interim fix 01 from [Fix Central](#).

**Monitoring Agent for Microsoft .NET**

Monitoring support for ODP.NET was added.

Method trace details were added for `HttpRequest.GetResponse()` method.

**Monitoring Agent for Microsoft SQL Server**

Tolerance support for SQL Server 2017 was added.

Support for Always On feature for the SQL Server developers edition was added.

**Monitoring Agent for MySQL**

Tolerance support for the information schema tables being migrated to performance schema was added.

Support was added for deprecated tables of information schema through performance schema.

**Monitoring Agent for Microsoft Internet Information Services**

Support was added for FTP websites monitoring.

**Monitoring Agent for MongoDB**

Support was added for remote monitoring.

Support for monitoring In-Memory storage engine was added.

**Monitoring Agent for OpenStack**

Support for OpenStack authentication V3 API was added.

**Monitoring Agent for Oracle Database**

Agent version is changed to 8.0.

The configuration parameter **Oracle JDBC jar file** was added and the configuration parameters **Oracle Home Directory** and **Oracle Instant Client Installation Directory** were removed.

**Monitoring Agent for PostgreSQL**

Support was added for remote monitoring.

**Monitoring Agent for SAP Applications**

Support for SNC communication was added.

New threshold for SAP system down was added.

**Monitoring Agent for SAP NetWeaver Java Stack**

The capability to restore the SAP NetWeaver Application Server instance was added.

**Monitoring Agent for Tomcat**

Support was added for Linux for Power Systems (Little Endian) (Resource monitoring only).

**Monitoring Agent for VMware VI**

Network Summary and Disk Count were added on the ESX Server overview page.

Events group widget was added on Cluster summary page.

**Monitoring Agent for WebSphere Applications**

Transaction tracking support for Linux for Power Systems (Little Endian) and for Linux for System z was added.

**Remember:** To get transaction tracking support on Linux for Power Systems (Little Endian) and Linux for System z, complete the following steps:

1. Download the agent installation image.
2. Install the WebSphere Applications agent.
3. Download the WebSphere Applications agent interim fix 2 from [Fix Central](#).
4. Follow the readme file of the interim fix to apply the fix.

### **Monitoring Agent for WebSphere MQ**

The MQ Service Status group widget was added to provide your MQ service details.

Support for Linux for Power Systems (Little Endian) was added.

**Remember:** To get transaction tracking support on Linux for Power Systems (Little Endian), before you start the agent, you must download and apply IBM Cloud Application Performance Management 8.1.4 core framework interim fix 01 from [Fix Central](#).

### **Response Time Monitoring Agent**

Support for the Windows 32-bit IBM HTTP Server and Apache HTTP Server was added.

## **Data collector enhancements**

### **Liberty data collector**

The managed system name (MSN) registered by the Liberty data collector is changed to reflect the host name and Liberty server name. The new MSN for this data collector is `BI:servname_hostname_md5:BLP`, where *md5* is the local application GUID based on MD5. The length of *servname\_hostname\_md5* is 25 characters.

**Remember:** To get this enhancement, you must download and apply the IBM Cloud Application Performance Management Liberty data collector Interim Fix 1 from [Fix Central](#).

### **J2SE data collector**

Transaction tracking support for J2SE applications was added.

## **Documentation enhancements**

The information about default ports that are used by agents and data collectors is provided to facilitate you to prepare the environment. See [“Default ports used by agents and data collectors”](#) on page 107.

The information about managed system names (MSN) of Cloud APM agents is provided. Instructions about how to change the hostname string in the MSN are also provided. See [“Managed system names”](#) on page 226.

The information about running agent as a non-admin user or permissions that are required to run the agent by non-admin user is provided in the configuration topics for the following agents:

- Microsoft .NET agent
- Microsoft Active Directory agent
- Microsoft Exchange Server agent
- Skype for Business Server agent
- Microsoft SharePoint Server agent
- Microsoft SQL Server agent
- Tomcat agent

## **What's new for V8.1.4**

### **Product rebranding and simplification**

The IBM Performance Management on-premises offerings were rebranded and consolidated into IBM Cloud Application Performance Management, Base Private and IBM Cloud Application Performance Management, Advanced Private as shown in the table.

| Offering name: V8.1.3 release and earlier   | Offering name: V8.1.4 and later |
|---|---------------------------------|
| Monitoring                                  | Cloud APM, Base Private         |
| Application Performance Management Advanced | Cloud APM, Advanced Private     |

Some component names also changed: Cloud APM console and Cloud APM server were called Performance Management console and Performance Management server in earlier releases.

Some product extensions were consolidated and renamed:

| Extension name: V8.1.3 release and earlier  | Extension name: V8.1.4 and later   |
|---|--|
| Base Extension Pack<br>(Hadoop agent)   | Base Extension Pack<br>(adds the new Cassandra agent and Microsoft Office 365 agent) |
| Advanced Extension Pack<br>(SAP HANA Database agent and SAP NetWeaver Java Stack agent) | Advanced Extension Pack<br>(adds the new RabbitMQ agent)                             |

### IBM API Connect® monitoring

Cloud APM agents and data collectors now support the monitoring of the IBM API Connect environment. You can deploy corresponding agents and data collectors to gain visibility of the health and performance of the components in your environment. Transaction tracking data is also available in addition to resource monitoring and deep-dive diagnostics data, which allows you to view topology information about your IBM API Connect environment. For more information, see [“Scenario: Monitoring IBM API Connect”](#) on page 116.

### IBM Cloud Private monitoring

You can monitor both your Cloud Private containers and your Cloud Private Liberty-based applications from the Cloud APM console. For more information, see [“Monitoring IBM Cloud Private”](#) on page 1077.

### OS support

#### Linux for System z

Added Linux for System z support for the following monitoring agents: Linux OS, WebSphere Application, Db2, WebSphere MQ, IBM Integration Bus, Tomcat, and Response Time Monitoring.

#### Linux for Power Systems (Little Endian)

Added Linux for Power Systems (Little Endian) support for the following monitoring agents: Linux OS, WebSphere Application, and Db2.

#### Linux for System x

Added Linux on System x to support the Liberty data collector.

#### Windows 2016 operating systems

Added support for Windows 2016 operating systems. For more information, see the [Software Product Compatibility Report \(SPCR\)](#) for all agents. In the Windows section of the report, find your operating system and click the component icon for a list of supported agents.

### IBM i OS agent support

Data for the IBM i OS agent can now be displayed in the Cloud APM console. This agent is an IBM Tivoli Monitoring V6 agent and remains as a V6 agent for the V8.1.4 release. You can use the Hybrid Gateway to retrieve the agent data and send it to the Cloud APM server. As a result, you can view monitoring data and events for this agent in the Cloud APM console. For more information about the IBM i OS agent, see [“Supported Tivoli Monitoring and OMEGAMON agents”](#) on page 1044..

### New agents available

#### Monitoring Agent for Amazon EC2

You can use the Amazon EC2 agent to monitor the health, availability, and performance of your Amazon Elastic Compute Cloud (EC2) Instance resources. You can monitor the following resources:

- CPU utilization
- Elastic Block Store (EBS) utilization
- Network utilization
- Amazon Web Services (AWS) maintenance updates
- Disk performance

This agent is in the Infrastructure Extension Pack.

### **Monitoring Agent for Cassandra**

You can use the Cassandra agent to monitor the health and performance of the Cassandra cluster resources, such as the nodes, keyspaces, and column families.

### **Monitoring Agent for Microsoft Office 365**

You can use the Microsoft Office 365 agent to monitor the health and performance of the Office 365 resources, such as the Office 365 subscribed services, Office 365 portal, mailbox users, SharePoint sites, and OneDrive storage.

### **Monitoring Agent for NetApp Storage**

You can use the NetApp Storage agent to monitor the health, availability, and performance of the NetApp storage systems by using the NetApp OnCommand Unified Manager (OCUM). The monitoring agent performs the following tasks:

- Identifies poorly performing storage system objects
- Performs discovery and monitoring by using the OCUM server at the focal point

### **Monitoring Agent for OpenStack**

You can use the OpenStack agent to monitor the health and performance of your OpenStack applications and view information such as information about API endpoints, SSH server connection, processes, and hypervisors.

### **Monitoring Agent for RabbitMQ**

You can use the RabbitMQ agent to monitor the health and performance of the RabbitMQ cluster resources, such as the nodes, queues, and channels of the cluster.

### **Monitoring Agent for SAP NetWeaver Java Stack**

You can use the SAP NetWeaver Java Stack agent to monitor the health, availability, and performance of your SAP NetWeaver Java Stack Cluster and Instance resources. You can use the agent to monitor the cluster resources, such as heap dumps, JVM Instance, transaction details, system information, and license details. You can use the agent to monitor the instance resources, such as CPU utilization, disk utilization, memory utilization, database collection, garbage collection, heap dumps, failed application, web container, and session information. You can also collect and view the transaction tracking and diagnostics data. This agent is in the Advanced Extension Pack and available if you have the Cloud APM, Advanced Private offering.

### **Monitoring Agent for Siebel**

You can use the Siebel agent to monitor the health and performance of Siebel resources, which includes Siebel statistics, user sessions, components, tasks, application server, Siebel Gateway Name Server, process CPU and memory usage, and log event monitoring.

### **New and enhanced data collectors available**

You can use the data collectors to monitor the health and performance of the following applications on IBM Cloud, on premises, or both:

#### **J2SE data collector**

You can use the J2SE data collector to monitor the health and performance of Java applications and view diagnostics data, such as response time, throughput, request context, and method trace of requests.

### **Liberty data collector**

The Liberty data collector monitors both the Liberty profile in IBM Cloud environment and the local Liberty profile on Linux for System x.

### **Node.js data collector**

The Node.js data collector monitors both IBM Cloud and on-premises applications. You can view both resource and diagnostics monitoring data, such as resource utilization, throughput, and detailed information about requests and methods.

### **Python data collector**

The Python data collector monitors IBM Cloud applications. You can view both resource and diagnostics monitoring data, such as resource utilization, throughput, and detailed information about requests and methods.

The Python agent is removed from the agent installation package in Cloud APM V8.1.4. You can use only the Python data collector to monitor your Python applications.

### **Ruby data collector**

The Ruby data collector monitors only IBM Cloud applications. You can view both resource and diagnostics monitoring data, such as resource utilization, throughput, and detailed information about requests and methods.

## **Agent enhancements**

### **Monitoring Agent for Citrix Virtual Desktop Infrastructure**

- Added the ability to retrieve Windows Event Log Events for Virtual Delivery Agent (VDA) and Desktop Delivery Controller (DDC) machines.
- The **VDA Sessions** page, which is accessible through the **VDA Machine Details** page was added.
- The Machine Metrics widget was added to the **VDA Machine Details** page.
- The Desktop Delivery Controller (DDC) configuration was enhanced to enable the agent to handle DDC fail-over in a distributed environment.

### **Monitoring Agent for Db2**

- Support for Linux for Power Systems (Little Endian) was added.
- Support for Ubuntu ZLinux was added.
- A script file was added to grant privileges to a Db2 user to view data for all the attributes of the Db2 agent for a monitored instance.
- Support for Linux for System z was added.

### **Monitoring Agent for Hadoop**

- Support for installing and configuring the agent on Windows 2016 and AIX 7.2 systems was added.
- Support for monitoring the following Hadoop offerings was added: Hortonworks HDP 2.5 and 2.6, Cloudera CDH 5.8 and 5.9, and IBM BigInsights 4.2.
- The test connection button for verifying connection to the Hadoop daemons that you specify when you configure the agent was added.
- The agent configuration process was improved to reduce the configuration time and complexity. The configuration is simplified because the following prerequisite and configuration tasks are not required:
  - Installing the plug-in on each node of the Hadoop cluster
  - Configuring and updating the `hadoop-metrics2.properties` file
  - Restarting the Hadoop daemons after you configure the `hadoop-metrics2.properties` file
  - Configuring all the DataNodes and NodeManagers in the cluster
  - Restarting the agent when more nodes are added to the cluster

- Support for monitoring the status of Hadoop services, such as are ZooKeeper, Sqoop, Hive, HDFS, YARN, Ambari Metrics, and Oozie was added.
- Support was added for monitoring a Hadoop cluster that is secured with the Kerberos SPNEGO-based authentication, which uses only MIT Kerberos V5 Key Distribution Center (KDC).

### Monitoring Agent for IBM Integration Bus

Support was added for Linux for System z (Transaction tracking is not supported).

### Monitoring Agent for JBoss

The following enhancements are added to the JBoss agent:

- Added transaction tracking and deep dive monitoring in the Advanced Agents offering
- Added a dashboard page to monitor datasource metrics
- Added support for monitoring the following JBoss offerings: WildFly 8.x/9.x/10.x, JBoss EAP 7.x, JBoss AS 7.x
- Added support for running the agent on the Windows operating system

### Monitoring Agent for Linux KVM

The following enhancements were added to the dashboard of the Linux KVM agent:

- The summary dashboard was updated to show the overall status of the hosts based on the CPU and memory utilization of your Linux Kernel-based virtual machines environment or application.
- The **Host Detail** dashboard was updated to show details about the selected host.
- The **Hosts, Clusters, and Storage** dashboard was updated to show details about the monitored virtual machines.
- The Hosts group widget in the **Hosts, Clusters, and Storage** dashboard was updated to display the Max Scheduling Memory (GB) and the Live Snapshot KPIs.
- The **Virtual Machine Details** dashboard was updated to show details about the virtual machine that you select on the Host Detail page.
- The **Storage Details** dashboard was added to display details about the disks and disk snapshots in the storage pool.
- The Network Transmitted/Received Data (GB) group widget was added to the **Host Detail** dashboard to display historical information of the total data (in GB) that is transmitted and received over the network.

### Monitoring Agent for Linux OS

Support for Linux for Power Systems (Little Endian) was added.

Docker V1.8.0 or later is supported. New attribute groups and widgets were added to enable the Linux OS agent to deliver docker monitoring capabilities.

### Monitoring Agent for Microsoft Active Directory

- Group widgets and pages to display the details of Group Policy Object, Netlogon, Local Security Authority, and LDAP details were added.
- The following data sets that you can view in the **Attribute details** tab were added:
  - Services Data Set
  - Replication
  - File Replication Service
  - Moved or Deleted Org. Unit
  - LDAP Attributes
  - Security Accounts Manager
  - DFS
  - Address Book

- Event Log
- Password Setting Objects
- Data sets for ADFS, ADFS Proxy, and Asynchronous Thread Queue were added.
- Group widgets and pages to display details of ADFS and ADFS Proxy were added.
- Support for installing and configuring the agent on Windows Server 2016 systems was added.

#### **Monitoring Agent for Microsoft Exchange Server**

The following enhancements were added to the dashboard of the Microsoft Exchange Server agent:

- The inbound time and outbound time attributes were added to the Reachability data set.
- Pages and group widgets to display reachability details were added.
- An eventing threshold for reachability was added.
- Support for installing and configuring the agent on Exchange Server 2016 and Windows Server 2016 systems were added.

#### **Monitoring Agent for Microsoft Internet Information Services**

Support for installing and configuring on a Microsoft Windows Server 2016 system was added.

#### **Monitoring Agent for Skype for Business Server**

- The Lync Usage Summary group widget was added to the Lync Server Overview dashboard to view the front-end registration status and the quality of poor calls.
- A dashboard to display the details of the Microsoft Lync Server usage was added.

#### **Monitoring Agent for Microsoft .NET**

The following enhancements were added to the dashboard of the Microsoft .NET agent:

- The MS .NET Status group widget on the **Component** page was updated to display the response times of database calls, status of .NET processes with high thread count, and Just in Time (JIT) compilation failures.
- Data sets, pages, and group widgets were added to show JIT compilation details, database call details, GC handles and pinned objects collection for a selected .NET process, thread contention rate, and thread queue length.
- Eventing thresholds were added for JIT failures, .NET request failures, slow commands, garbage collection, and the active threads in .NET processes.

#### **Monitoring Agent for Microsoft SQL Server**

The following enhancements were added to the dashboard of the Microsoft SQL Server agent:

- The Expensive Queries group widget was added to the Server Performance - Detail page to view the top 10 cached query plans according to the performance statistics of the Microsoft SQL Server.
- Support for monitoring the Microsoft SQL Server 2016 was added.
- Support for installing and configuring the Microsoft SQL Server agent on a Microsoft Windows Server 2016 system was added.
- The new `COLL_ERRORLOG_RECYCLE_WAIT` environment variable was added to set the time interval (in seconds) for which the agent waits before it collects the MS SQL Error Event Detail attribute group data.

#### **Monitoring Agent for MongoDB**

The following enhancements were added to the dashboard of the MongoDB agent:

- The **Component** page was updated to display the number of MongoDB instances and their status.
- Pages for displaying details of the MMAPv1 and the WiredTiger storage engines were added.
- The **Input Output Information** page was added to display cursor details and historical data for the queued operations, active connections, data flow, and the data access of the selected host.

- Pages were added to display details of the locks of version 2.x and version 3.x, or later.
- The **Replication Details** page was added to display details of the replication member, oplog, and historical data of the replication lag and the space that is used by the oplog.
- Support was added for monitoring the MongoDB cluster or replication setup when the primary node fails.

### Monitoring Agent for MySQL

Data sets and a configuration parameter were added to remotely monitor MySQL resources.

### Monitoring Agent for Node.js

The following enhancements were added to the Node.js agent to leverage Node Application Metrics (Appmetrics):

- New dashboard and group widgets to view garbage collection details
- New dashboard and group widgets to view event loop details

### Monitoring Agent for Oracle Database

The Oracle Database agent dashboard includes the following new features on the Instance Details page:

- A table that displays information about the lock contention on the selected instance.
- A table that displays information about the Oracle Real Application Clusters GCS and GES.
- A table that displays details of the Automatic Storage Management (ASM) disk groups that are attached to the selected instance.
- A view that shows detailed information per table space, which is visible if you click **Bottom 5 Free Table Space**.
- A table that displays the historical details of the foreground and background processes that are attached to the selected instance. You can click the entity in the table and view a detailed table of all processes for that instance.
- A table that displays the Top 5 Worst SQL queries (by run time) on the selected instance. You can click in the table and view a detailed table of the top 50 worst SQL queries for that instance.

### Monitoring Agent for PostgreSQL

- Support for installing and configuring the agent on Windows systems.
- Support for monitoring PostgreSQL V9.6.
- The **Status Overview** page was updated so status is not critical when the buffer hit rate is zero.

### Monitoring Agent for SAP HANA Database

The License Expiry Days attribute and the HANA\_License\_Expiry\_Crit\_SYS and HANA\_License\_Expiry\_Warn\_SYS thresholds were added to monitor the number of days that are remaining before license expiration.

### Monitoring Agent for Synthetic Playback

The Synthetic Playback agent includes a new filtering feature for synthetic transactions. In the Synthetic Script Manager, configure blacklists and whitelists for your synthetic transactions that exclude or include requests to specified URLs and domains. Use blacklists and whitelists to filter out or include dependencies that affect the response times for your application, such as third-party metrics.

You can now prevent passwords that are stored in synthetic scripts from displaying in the Synthetic Script Manager.

### Monitoring Agent for Tomcat

- Support was added for Linux for System z
- Support for installing and configuring the Tomcat agent on Windows and SUSE Linux Enterprise 12 systems was added.

- Data sets, dashboards, and group widgets for transaction tracking and deep-dive diagnostics were added.

### Monitoring Agent for VMware VI

- The ESX Server group widget in the Server Summary dashboard was updated to show the SSH status.
- Agent decoupling feature was added to view and select the agent node and its subnodes in the same view. When the VMware Virtual Infrastructure component was selected in the Select Component window, the Component Editor displayed a tree structure of the agent node with all its subnodes.
  - If the tree was expanded and the agent node was selected, all subnodes were automatically selected. The subnodes that were to be monitored could be individually selected.
  - If an agent node was selected when the tree was collapsed, all subnodes were automatically excluded.
  - When the ESX Server component was selected in the Select Component window, along with subnodes, stand-alone ESX Servers were also displayed in the Component Editor.
  - With the subnodes, stand-alone ESX Servers could be selected for monitoring.
  - After the application was created, the APM UI dashboard displayed a tree structure of the agent instance as parent and its nodes as children.

### Monitoring Agent for WebLogic

Transaction tracking and deep-dive diagnostics were added to the agent in the Advanced Agents offering.

### Monitoring Agent for WebSphere Applications

Support for Linux for Power Systems (Little Endian) was added.

Support for Linux for System z was added (Transaction tracking is not supported).

Support for IBM WebSphere Application Server traditional V9 was added.

The Memory Analysis dashboard was added to help you diagnose possible memory leaks by checking the heap usage information for each heap dump. The diagnostics mode must be enabled for this dashboard to contain data.

Support was added to use the Application Health Status data set to create event thresholds for application status monitoring. The data collection for this usage is disabled by default. You must modify the data collector properties file to enable it before you create event thresholds.

The manual configuration of the data collector was simplified. For WebSphere Applications Server, you only need to add some JVM arguments and variables for the application server on the WebSphere administrative console. For Liberty, you only need to modify three files for the server.

### Monitoring Agent for WebSphere MQ

Support for Linux for System z was added (Transaction tracking is not supported).

Channel and queue long-term history data is supported. After the queue manager is configured to collect channel or queue statistics data, you can configure the agent to enable channel or queue long-term history data collection. Although there are no predefined dashboards or widgets to display the collected long-term history data, you can the **Attribute Details** tab to query the collected data in your custom tables.

### Response Time Monitoring Agent

- Support for the Windows 32-bit IBM HTTP Server and Apache HTTP Server is added (V8.1.4 Fix Pack 1).
- Support for configuring user tracking for applications on the **Agent Configuration** page was added.
- Support for configuring session tracking for applications on the **Agent Configuration** page was added.

- You can now customize the locations that are applied to specific IP addresses or address ranges in the End User Transaction dashboards for your particular environment. Use the **Geolocation** tab in the **Agent Configuration** to customize location values.

### IBM OMEGAMON® for Application Performance Management support

OMEGAMON for APM enables support for your IBM OMEGAMON agents in your Cloud APM offering. OMEGAMON agent data is sent to the Cloud APM server by the Hybrid Gateway. The Hybrid Gateway retrieves the OMEGAMON agent data and events from the IBM Tivoli Monitoring infrastructure that the OMEGAMON agents are connected to. As a result, you can view monitoring data and events for your OMEGAMON agents in the Cloud APM console.

OMEGAMON for APM support is available if you have either of the Cloud APM offerings. To install OMEGAMON for APM, complete the steps in [“Integrating with OMEGAMON”](#) on page 1071.

### Enhanced data retention

When you view the agent or data collector attribute descriptions in the help or reference guide, each data set includes a statement about the frequency with which data samples are sent to the Cloud APM server and how long those samples are stored for historical reporting, which is now 8 days by default. You can change the number of days that the data samples are saved for up to 32 days before the oldest samples are removed to make room for the new data samples. For more information, see [Managing historical data retention values](#).

### Cloud APM server enhancement

When you connect to a remote Db2 server, you can now specify a custom Db2 instance user name. In previous releases, the Db2 instance user db2apm was used. A custom Db2 instance user name cannot be used if you are completing a server upgrade from V8.1.3.

### Enhanced visualization

#### Custom Views

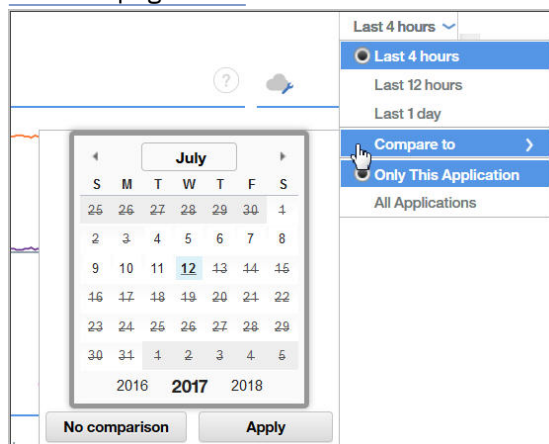

You can use the IBM Cloud Application Business Insights Universal View to create customized pages for the applications that you are monitoring. In the Custom Views tab, you can use an existing template or create customized templates for your page. You can choose from different chart and metric options to create widgets to monitor data according to your requirement.

By using the Universal View, you can create dashboards to monitor data from various agents. You can export the customized page data to a Raw Data file.

For more information, see [“Custom views”](#) on page 1283.

#### Calendar for comparing a previous day's data

When you are viewing line charts that show historical data, a calendar opens after you choose the time selector option to compare the time range from a previous day. The days that are unavailable for comparison are crossed out. For more information, see [“Adjusting and comparing metrics over time”](#) on page 1263.

## Application Performance Dashboard Status Overview

The Application Performance Dashboard page for the selected application is streamlined for improved viewing. A count of critical and warning severity events is displayed on the Events tab title and replaces the **Event Severity Summary** bar chart. For applications with topology views enabled, the **Aggregate Application Topology** view has a toggle button for switching to the Current<sup>®</sup> Component Status bar chart. For more information, see [“Status Overview” on page 1254](#).

## Application Performance Dashboard Attribute Details tab

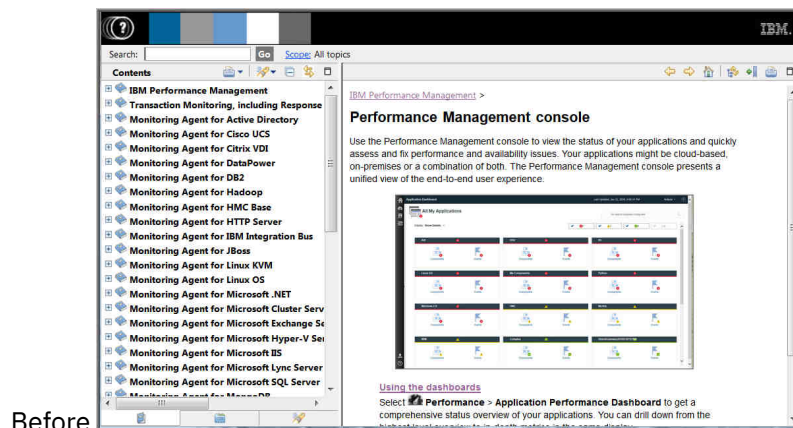

For visually impaired users, the ability to create historical tables provides an alternative to line charts, which assistive technologies such as screen-reader software cannot interpret. For this reason, the **Attribute Details** tab is available for Response Time Monitoring agent and Synthetic Playback agent transaction instances for creating historical tables. For more information, see [“Example of creating a custom table with keyboard controls” on page 1267](#).

## Dashboard Log

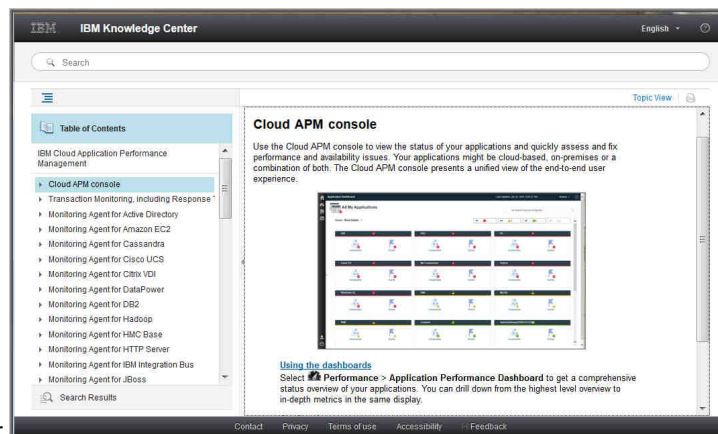

A **Dashboard Log** option was added to the **Actions** menu to review the list of agent dashboards that were updated since the last server restart. For more information, see [“All My Applications - Application Performance Dashboard” on page 1251](#).

## IBM Knowledge Center help server

In previous versions, the Cloud APM console help system was hosted on an Eclipse help server. The help system is now hosted by IBM Knowledge Center. You have the **Hide table of contents** tool, search and print capabilities, and links to support information and feedback options.

Before

After

## Agent Builder enhancements

Support is improved for building Cloud APM summary dashboards for Agent Builder agents. You must use single-row data sets to provide data for summary dashboards. You can provide such data sets from entire log files and from any sets of data that can be filtered to a single row.

When you create an agent to monitor data from a Java Database Connectivity (JDBC) database, you can modify the enumeration values that are set for Error, Missing data, and No value to avoid overlap with legitimate values in the database.

You can set the Time Stamping Authority for JAR files in the Agent Builder **Preferences** window. If the default Time Stamping Authority signing certificate expires, by setting a new authority, you can continue to verify JAR files.

## Enhanced integration

### Customizable EIF Slots for events

When you have event forwarding configured, you can customize the base EIF slot message and create custom EIF slots for events sent to a receiver such as Netcool/OMNIBus. The Threshold Editor has a new **Forward EIF Event?** field and **EIF Slot Customization** button for customizing how events are mapped to forwarded events. For more information, see [“Customizing an event to forward to an EIF receiver”](#) on page 1124.

### Multiple Hybrid Gateways

In previous releases, you were able to install the Hybrid Gateway on a single IBM Tivoli Monitoring domain, which has one hub Tivoli Enterprise Monitoring Server. You can now install a Hybrid Gateway on multiple Tivoli Monitoring domains. The Hybrid Gateway category in the Cloud APM console **Advanced Configuration** page has been moved to its own **Hybrid Gateway Manager** page. Here you can create and edit Hybrid Gateway profiles for monitoring managed systems from multiple Tivoli Monitoring domains, one profile for each domain. For more information, see [“Hybrid Gateway”](#) on page 1043.

## Enhanced scalability

An increase in the maximum number of managed systems that you can monitor from Cloud APM, Private from 4,000 managed systems to 10,000 managed systems.

### API

You can use APIs to create scripts for automating the onboarding of your Performance Management environment. For more information, see [“Exploring the APIs”](#) on page 1237.

## Previous releases

For information about new features, capabilities, and coverage in previous releases, see the following *What's new* topics:

- [What's new: V8.1.3](#)
- [What's new: V8.1.2](#)
- [What's new: V8.1.1](#)

## Considerations for GDPR Readiness

---

Information about features that you can configure, and aspects of the product's use, that you should consider to help your organization with GDPR readiness.

GDPR consideration for the following offerings:

- IBM Cloud Application Performance Management Private
- IBM Tivoli Monitoring
- IBM Tivoli Composite Application Manager
- IBM SmartCloud Monitoring
- Application Insight

For PID(s):

**5725-G70**

**5725-I45**

**5724-U17**

**5724-S79**

**5724-C04**

**5725-C20**

**5724-L92**

**5725-J97**

**5725-U05**

**5725-V20**

**5725-M99**

• **Notice:**

This document is intended to help you in your preparations for GDPR readiness. It provides information about features of the offerings that you can configure, and aspects of the product's use, that you should consider to help your organization with GDPR readiness. This information is not an exhaustive list, due to the many ways that clients can choose and configure features, and the large variety of ways that the product can be used in itself and with third-party applications and systems.

**Clients are responsible for ensuring their own compliance with various laws and regulations, including the European Union General Data Protection Regulation. Clients are solely responsible for obtaining advice of competent legal counsel as to the identification and interpretation of any relevant laws and regulations that may affect the clients' business and any actions the clients may need to take to comply with such laws and regulations.**

**The products, services, and other capabilities described herein are not suitable for all client situations and may have restricted availability. IBM does not provide legal, accounting, or auditing advice or represent or warrant that its services or products will ensure that clients are in compliance with any law or regulation.**

10. ["Responding to Data Subject Rights" on page 47](#)

## **GDPR**

General Data Protection Regulation has been adopted by the European Union ("EU") and applies from May 25, 2018.

Why is GDPR important?

GDPR establishes a stronger data protection regulatory framework for processing of personal data of individuals. GDPR brings:

GDPR brings:

- New and enhanced rights for individuals
- Widened definition of personal data

- New obligations for processors
- Potential for Significant financial penalties for non-compliance
- Compulsory data breach notification
- **Read more about GDPR**
  - [EU GDPR Information Portal] (<https://www.eugdpr.org/>)
  - [ibm.com/GDPR website] (<https://www.ibm.com/data-responsibility/gdpr/>)

## Product Configuration for GDPR Readiness

The following sections provide considerations for configuring the product to help your organization with GDPR readiness.

### • Configuration to support data handling requirements

The GDPR legislation requires that personal data is strictly controlled and that the integrity of the data is maintained. This requires the data to be secured against loss through system failure and also through unauthorized access or via theft of computer equipment or storage media.

### • How to configure our offering such that it could be used in a GDPR environment?

IBM® Cloud Application Performance Management Private (Cloud APM Private) is a comprehensive solution that helps you manage the performance and availability of applications that are deployed on premises (private), in a public cloud, or as a hybrid combination. This solution provides you with visibility, control, and automation of your applications, ensuring optimal performance and efficient use of resources.

IBM Tivoli Monitoring (ITM) monitors and manages system and network applications on a variety of operating systems, tracks the availability and performance of your enterprise system, and provides reports to track trends and troubleshoot problems.

The IBM Tivoli Composite Application Manager (ITCAM) for Applications offering is a package of component products that monitor and manage systems, application servers, and database servers; track availability and performance; and provide reports, in a browser-based graphical user interface, to track trends and troubleshoot problems.

Data is sent to the APM and ITM UI from the operating system, applications, coding language agents or data collectors. This data is then stored in an IBM Db2 database. The user creates events from this data for anomalous conditions that they want to monitor.

For Oracle or SQL databases please refer to the appropriate vendor's documentation.

## Data Life Cycle

GDPR requires that personal data is:

- Processed lawfully, fairly and in a transparent manner in relation to individuals.
- Collected for specified, explicit and legitimate purposes.
- Adequate, relevant and limited to what is necessary.
- Accurate and, where necessary, kept up to date. Every reasonable step must be taken to ensure that inaccurate personal data are erased or rectified without delay.
- Kept in a form which permits identification of the data subject for no longer than necessary.
- **What is the end-to-end process through which personal data go through when using our offering?**
- **Personal data used for online contact with IBM**

*The offering's* clients can submit online comments/feedback/requests to contact IBM about the offering's subjects in a variety of ways, primarily:

- Public comments area on pages of the offerings documentation in IBM Knowledge Center

- Public comments in the Offerings space of dWAnswers
- Feedback forms in the Offerings community

Typically, only the client name and email address are used, to enable personal replies for the subject of the contact, and the use of personal data conforms to the [IBM Online Privacy Statement] (<https://www.ibm.com/privacy/us/en/>).

- What types of data?

The Application Performance Management/Tivoli Monitoring offerings do not directly target or collect personal data. The type of data collected by the products is primarily performance management metrics that measure the performance of some underlying operating system, applications such as web servers and databases, or coding languages such as, .Net, python, or ruby.

The Application Performance Management/Tivoli Monitoring offerings provide authentication and handling of system users.

The Application Performance Management/Tivoli Monitoring offerings process the types of Personal Data shown here:

- Authentication Credentials (such as username and passwords).
- Technically Identifiable Personal Information such as, (device IDs, usage-based identifiers, or IP address, when linked to an individual) used to identify the systems or applications being monitored as part of the normal function of this product.

## Data Collection

This is not a definitive list of the types of data collected by the offerings. It is provided as an example for consideration. If you have any questions about the types of data, please contact IBM.

Data is collected by agents which connect to popular 3rd party and IBM operating systems and applications to help the end user ascertain the performance level of those systems or applications.

None of these target personal data however the following may be present in the product as part of the monitoring process:

- Authentication Credentials (such as username and passwords)
- Technically Identifiable Personal Information (such as device IDs, usage -based identifiers, IP address, when linked to an individual)

## Data Storage

- **How can the client control the storage of personal data?**

The Application Performance Management/Tivoli Monitoring offerings utilize a Db2 instance to store performance management data, which does not contain any personal data by default.

- Storage of account data

User names and Passwords can be managed in many ways with the Application Performance Management/Tivoli Monitoring offerings. Users can be authenticated against the TEPS server or an external repository, such as an LDAP directory or a file-based repository (maintained by the WebSphere Application Server). For ease of user administration, it is recommended that users are centrally managed using the organizations central directory service.

For more information about configuring the Application Performance Management/Tivoli Monitoring offerings to use an external directory service as an authentication source, see:

[https://www.ibm.com/support/knowledgecenter/en/SSHLNR\\_8.1.4/com.ibm.pm.doc/install/admin\\_ldap.htm](https://www.ibm.com/support/knowledgecenter/en/SSHLNR_8.1.4/com.ibm.pm.doc/install/admin_ldap.htm)

- Storage of client Data

The primary data processed by the Application Performance Management/Tivoli Monitoring offerings relate to performance metric data which, depending on the deployment environment, could be data that belongs to you or originates from your end client's environment. The Application Performance Management/Tivoli Monitoring offerings provide role and group-based access controls as well as restriction filters for controlling access to the live event data.

For more information, see:

[https://www.ibm.com/support/knowledgecenter/en/SSHLNR\\_8.1.4/com.ibm.pm.doc/install/admin\\_workingwithrolesusersandpermissions.htm](https://www.ibm.com/support/knowledgecenter/en/SSHLNR_8.1.4/com.ibm.pm.doc/install/admin_workingwithrolesusersandpermissions.htm)

- Storage in archives

For more information, see: [https://www.ibm.com/support/knowledgecenter/SSTFXA\\_6.3.0.2/com.ibm.itm.doc\\_6.3fp2/adminuse/historyconvert\\_zosmanarchive.htm](https://www.ibm.com/support/knowledgecenter/SSTFXA_6.3.0.2/com.ibm.itm.doc_6.3fp2/adminuse/historyconvert_zosmanarchive.htm)

- Data Encryption

For more information, see: [https://www.ibm.com/support/knowledgecenter/SSTFXA\\_6.3.0.2/com.ibm.itm.doc\\_6.3fp2/adminuse/security\\_encryptintro.htm](https://www.ibm.com/support/knowledgecenter/SSTFXA_6.3.0.2/com.ibm.itm.doc_6.3fp2/adminuse/security_encryptintro.htm)

## Data Access

Use the Role Based Access Control feature in IBM® Cloud Application Performance Management to grant users the access privileges they require for their role.

Security in Cloud APM Private is based on roles. A role is a group of permissions that control the actions you can perform in Cloud APM Private. You can create customized roles in Cloud APM Private. You can assign permissions to customized roles, or you can assign more permissions to existing default roles.

You can assign users and user groups to existing default roles or to customized roles. You can assign users and user groups to multiple roles. Permissions are cumulative, a user or user group is assigned all the permissions for all the roles they are assigned to. Cloud APM Private uses the WebSphere® Application Server Liberty profile basic registry as the default method for user authentication. Alternatively, you can use an LDAP registry for user authentication.

For more information, see:

- Managing user access

[https://www.ibm.com/support/knowledgecenter/SSHLNR\\_8.1.4/com.ibm.pm.doc/install/admin\\_security.htm](https://www.ibm.com/support/knowledgecenter/SSHLNR_8.1.4/com.ibm.pm.doc/install/admin_security.htm)

- Roles and access rights

## Data Processing

- **How can the client control processing of personal data?**

- Encryption in motion

Application Performance Management/Tivoli Monitoring offerings can be configured to use SSL communications for data transferred between components.

- Encrypting Agent Communication to the server

ITM agents running in autonomous or centrally managed modes present new additional options for highly secure deployments of monitoring agents. With a few small post-installation environment configuration steps, customers can achieve exceptionally secure monitoring agent deployments in highly constrained environments like DMZ's.

The Autonomous agent deployment model is similar to the standard centrally managed ITM agent deployment model where agents communicate with their infrastructure over secure connections and agents use local configuration files that administrators may manage.

In a secure environment, the agents are invisible to outside network traffic, minimize their communication pathways and lock down access to the agent files on the file system. A highly secure configuration also ensures strong authenticated encryption on any communication pathways.

This whitepaper enumerates the steps required to lock down open-by-default network connections and verify the installation is secure from within.

For more information, see: [https://www.ibm.com/support/knowledgecenter/en/SSHLNR\\_8.1.4/com.ibm.pm.doc/install/onprem\\_config\\_https.htm](https://www.ibm.com/support/knowledgecenter/en/SSHLNR_8.1.4/com.ibm.pm.doc/install/onprem_config_https.htm)

[https://www.ibm.com/support/knowledgecenter/SSTFXA\\_6.3.0.2/com.ibm.itm.doc\\_6.3fp2/install/unixconfig\\_ma.htm](https://www.ibm.com/support/knowledgecenter/SSTFXA_6.3.0.2/com.ibm.itm.doc_6.3fp2/install/unixconfig_ma.htm)

- Configuring TLS/SSL communication between the portal server and the LDAP server

For more information, see: [https://www.ibm.com/support/knowledgecenter/SSTFXA\\_6.3.0.2/com.ibm.itm.doc\\_6.3fp2/adminuse/userauthenticate\\_tepsldap\\_ssl.htm](https://www.ibm.com/support/knowledgecenter/SSTFXA_6.3.0.2/com.ibm.itm.doc_6.3fp2/adminuse/userauthenticate_tepsldap_ssl.htm)

## Data Deletion

- **How can the client control the deletion of personal data?**

- Client Data deletion

Removal of users from any of the Application Performance Management/Tivoli Monitoring offerings, file-based repository or external directory service will prevent the user from logging into the product. It will not remove the users' data (e.g. name) from active or historical events as there is an ongoing need from an operational/audit perspective to maintain this data. However, as part of your deployment you should review the period for which data is archived, backups are stored and logs are maintained to determine if they are reasonable based on your operational needs.

To remove data from the Db2 database, see the Db2 Knowledge Center:

[https://www.ibm.com/support/knowledgecenter/en/SSEPGG\\_11.1.0/com.ibm.db2.luw.welcome.doc/doc/welcome.html](https://www.ibm.com/support/knowledgecenter/en/SSEPGG_11.1.0/com.ibm.db2.luw.welcome.doc/doc/welcome.html)

For other databases, see the documentation that is provided by the database vendor.

- **Account Data deletion**

Removal of users from any of the Application Performance Management/Tivoli Monitoring bundles, file-based repository or external directory service will prevent the user from logging into the product. It will not remove the users' data (e.g. name) from active or historical events as there is an ongoing need from an operational/audit perspective to maintain this data. However, as part of your deployment you should review the period for which data is archived, backups are stored and logs are maintained to determine if they are reasonable based on your operational needs.

To remove a user and their access from the product, see: [https://www.ibm.com/support/knowledgecenter/en/SSHLNR\\_8.1.4/com.ibm.pm.doc/install/admin\\_workingwithrolesusersandpermissions.htm](https://www.ibm.com/support/knowledgecenter/en/SSHLNR_8.1.4/com.ibm.pm.doc/install/admin_workingwithrolesusersandpermissions.htm)

## **Data Monitoring**

- **How can the client monitor the processing of personal data?**

- Application Performance Management/Tivoli Monitoring offerings are used to monitor enterprise servers, operation systems, applications and code. Personal data in the product is limited to:
  - Basic Personal Information (e.g. usernames for authentication)
  - Technical Personal Information (e.g. IP addresses/hostnames from systems used by the user to access the solution and potentially captured in debug/trace logs).

The product's database can be configured to audit access to specific objects or actions performed by specific groups of users in audit logs, as previously mentioned.

Log files are not encrypted. If log files need to be archived for operational/audit requirements then consideration should be given to encrypting any archived logs.

## **Configuring Audit Logging**

For more information, see:

- APM: [https://www.ibm.com/support/knowledgecenter/en/SSHLNR\\_8.1.4/com.ibm.pm.doc/install/admin\\_configuringauditlogging.htm](https://www.ibm.com/support/knowledgecenter/en/SSHLNR_8.1.4/com.ibm.pm.doc/install/admin_configuringauditlogging.htm)[https://www.ibm.com/support/knowledgecenter/en/SSHLNR\\_8.1.4/com.ibm.pm.doc/install/admin\\_auditlogger.htm](https://www.ibm.com/support/knowledgecenter/en/SSHLNR_8.1.4/com.ibm.pm.doc/install/admin_auditlogger.htm)
- ITM: [https://www.ibm.com/support/knowledgecenter/SSTFXA\\_6.3.0.2/com.ibm.itm.doc\\_6.3fp2/adminuse/agentadmin\\_audit\\_intro.htm](https://www.ibm.com/support/knowledgecenter/SSTFXA_6.3.0.2/com.ibm.itm.doc_6.3fp2/adminuse/agentadmin_audit_intro.htm)
- Db2 Audit Logging: [https://www.ibm.com/support/knowledgecenter/en/SSEPGG\\_11.1.0/com.ibm.db2.luw.admin.sec.doc/doc/c0005483.html](https://www.ibm.com/support/knowledgecenter/en/SSEPGG_11.1.0/com.ibm.db2.luw.admin.sec.doc/doc/c0005483.html)

## **Responding to Data Subject Rights**

- **Does the offering facilitate being able to meet data subject rights?**

Personal data that is stored and processed by the product comes under the following categories:

- Basic Personal Data (e.g. usernames and passwords used for authentication and Name/ID to show ownership of an event)
- Technically Identifiable Personal Information (such as IP addresses and hostnames to which user activity could potentially be linked).

This data is intrinsic to the operation of an effective performance management workflow. Removal of data, modification of historical data and the sharing of this data is likely to be contrary to your enterprises policies.

However, consideration may need to be given to the following:

- Data is only retained for a reasonable period based on operational, compliance, and industry audit requirements that pertain.
- Data is secured appropriately when in archive format.
- That the contract terms are GDPR compatible for the following:
  - When the product is used for managing your enterprises or your own IT/network environment, applications.
  - When the users of the solution are employees/contractually engaged staff.
  - When the event schemas are customized to augment the defaults with additional data sourced from other data sources available in your environment, for example, personal data.

---

## Chapter 2. PDF documentation

The PDF documents are available for topics in this IBM Knowledge Center collection and for agent references.

### **IBM Knowledge Center in PDF format**

In addition to this User's Guide, you can download the [IBM Agent Builder User's Guide](#).

### **Agent Reference PDFs**

The References provide information about dashboards, eventing thresholds, and data sets. Data sets contain attributes, which are the metrics that are reported by the agent and that make up the key performance indicators (KPIs). For the Reference PDF for each agent, see [Agent metrics/Reference PDFs](#).

## Chapter 3. Product overview

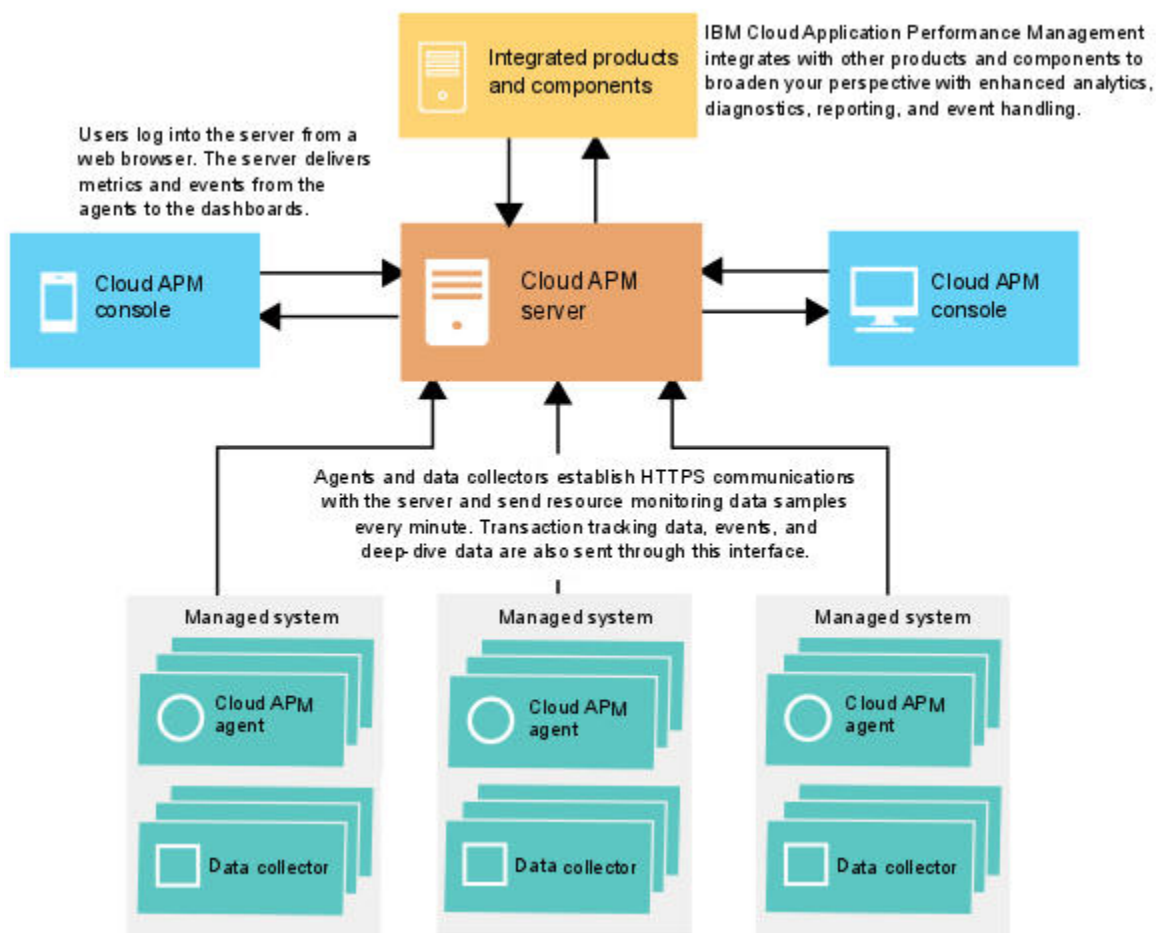

IBM Cloud Application Performance Management (Cloud APM) is a comprehensive solution that helps you manage the performance and availability of applications that are deployed on premises (private), in a public cloud, or as a hybrid combination. This solution provides you with visibility, control, and automation of your applications, ensuring optimal performance and efficient use of resources.

By using this solution, you manage your data center, cloud infrastructure, and workloads with cognitive intelligence. You can reduce and prevent outages and slowdowns around the clock in a hybrid application world as Cloud APM assists you in moving from identifying performance issues to isolating where the problem is occurring and diagnosing issues before your business is impacted.

Use the key features, which vary by offering, to work with data that is collected by the Cloud APM agents and data collectors. More features are available through integration with other products and components.

### Architecture overview

IBM Cloud Application Performance Management uses *agents* and *data collectors* to collect data on the monitored hosts. Agents and data collectors pass the data to the Cloud APM server, which collates it into the Cloud APM console.

### Data collection

Agents and data collectors monitor systems, subsystems, or applications and collect data. An agent or a data collector interacts with a single resource (for example, a system or application) and, in most cases, is

on the same computer or virtual machine where the system or application is running. For example, the Linux OS agent collects performance indicators for the operating system on the Linux host and the WebSphere Applications agent monitors the performance indicators of WebSphere application servers. Also, some agents track transactions between different resources.

You can set up thresholds on key performance indicators (KPIs). If an indicator changes to go over or under the threshold, the agent or data collector generates an alert, which is the server processes. You can also configure forwarding of events to a target, such as the Netcool/OMNIBus Probe for Tivoli EIF, Cloud Event Management, or an SMTP server.

Agents and data collectors are preconfigured to communicate with the Cloud APM server.

## Communication between the server and agents or data collectors

The agents and data collectors on every monitored host establish HTTP communication with the Cloud APM server. The agent or data collector is the client side of the connection.

If you configured HTTPS communications and your firewall rules do not allow transparent outbound HTTPS connections to external hosts, you can configure agents and data collectors to send traffic to a forward proxy. For more information, see [“Network connectivity” on page 223](#).

## Cloud APM server

The Cloud APM server receives and processes monitoring information from all agents and data collectors in your infrastructure. The server also provides the Cloud APM console. You can use a web browser to access the console and view the collated information.

When you install the Cloud APM server, the installer also deploys a Db2 database and a MongoDB database. You can use an existing Db2 server or MongoDB server as long as they are not on the same server as the Cloud APM server and they are a supported version for 8.1.4.0.

The installer also preconfigures a copy of the agents and data collectors to communicate with this server. You can use the server to generate a preconfigured copy of the agents and data collectors later.

## Data stored by the server

Agents and data collectors push data to the Cloud APM server at intervals ranging from 1 minute to 8 minutes, depending on the type of data. The server stores all values that are sent by the agents and data collectors for 8 days by default. Summarized transaction data is stored for longer periods.

Saved monitoring data is called *historical* data. The server uses historical data to display tables and graphs that you can use to analyze the trends in your environment. You can change the number of days that resource monitoring data samples are retained from the default 8 days to the best practices values (from 2 days to 32 days) that were established by the agent and data collector developers. For more information, see [Managing historical retention values](#).

Historical reports are also available for certain agents. For more information, see [“Reports” on page 1294](#).

## Scalability

You can monitor up to 10,000 managed systems from Cloud APM, Private. A managed system is a single operating system, subsystem, or application in your enterprise that an agent is monitoring.

The actual number of managed systems that your environment can support depends on the number and type of agents in your environment and the capacity of your Cloud APM server. A key consideration is the number of rows of agent data that is written to the databases per minute. Use the load projections spreadsheet to estimate the number of agent rows that are written per minute: [IBM Cloud App Management Load Projections Spreadsheet](#) . Compare the results with the range of values for the different environment sizes in [Table 1](#) or [Table 2](#) in [“Cloud APM server hardware requirements” on page 111](#). For the Cloud APM, Advanced Private offering, an extra consideration is the number of monitored user transactions per second.

## Integration

IBM Cloud Application Performance Management integrates with other products and components when they are configured for communication with the Cloud APM server.

Products that can be integrated include Netcool/OMNIbus, Tivoli Monitoring, OMEGAMON for APM, Operations Analytics - Log Analysis, Operations Analytics - Predictive Insights, Tivoli Common Reporting, and IBM Cloud.

Agent Builder is a component that can be used to create custom agents.

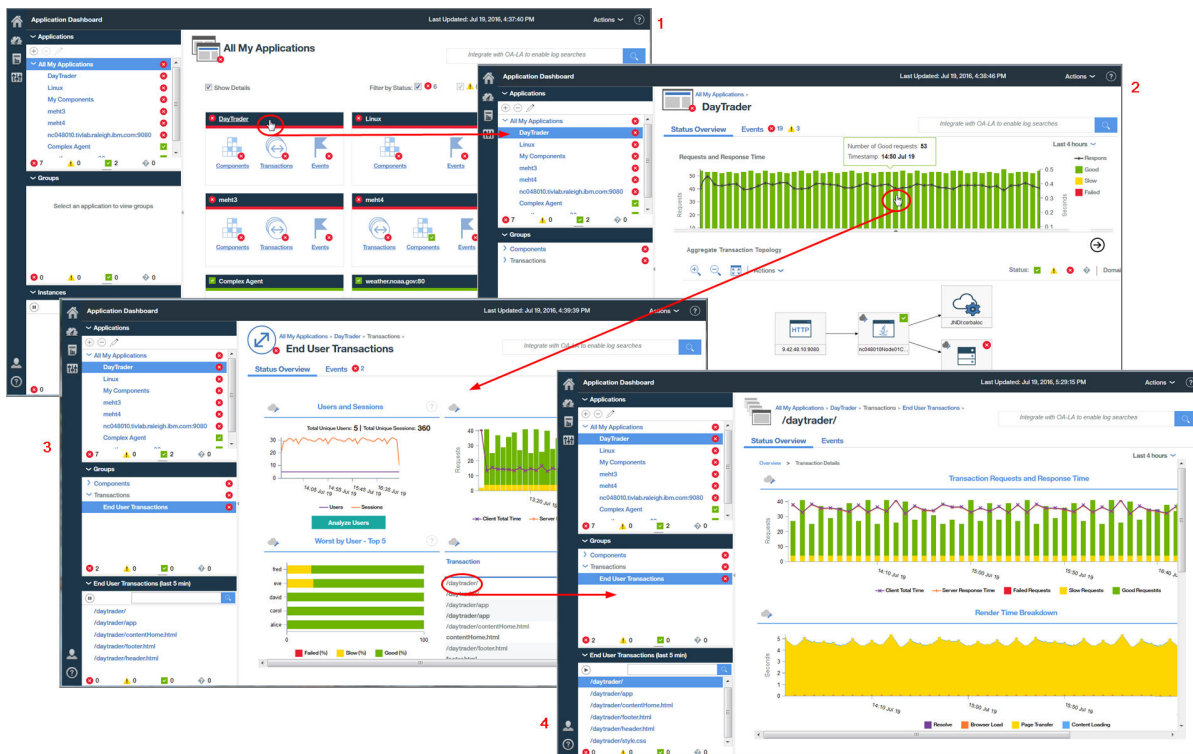

## User interface

The Cloud APM console is the user interface for Cloud APM. This unified user interface provides a single view across hybrid applications. You use the console to view the status of your applications and quickly assess and fix performance and availability issues.

The dashboards in the console simplify problem identification so you can isolate bottlenecks that affect application performance. With simple dashboard navigation, you move from a view of application status to code level detail. You have visibility into source code problems at the exact moment of an issue. You can search and diagnose problems by using integrated search analytics.

The Application Performance Dashboard navigator in the console is hierarchical, giving a status overview of your applications, the health of their components, and the quality of the user experience. For more details about your monitored resource, you can click a navigator item or a link in the dashboard views. Consider, for example, that your application has a slow response time. The issue is revealed in the dashboard. Starting from your dashboard, you can follow the problem to the source by clicking links to discover the cause: high CPU usage on a system due to an out-of-control process.

For more information about using the dashboards in the Cloud APM console, see [Chapter 11, “Using the dashboards,”](#) on page 1251.

# Offerings and add-ons

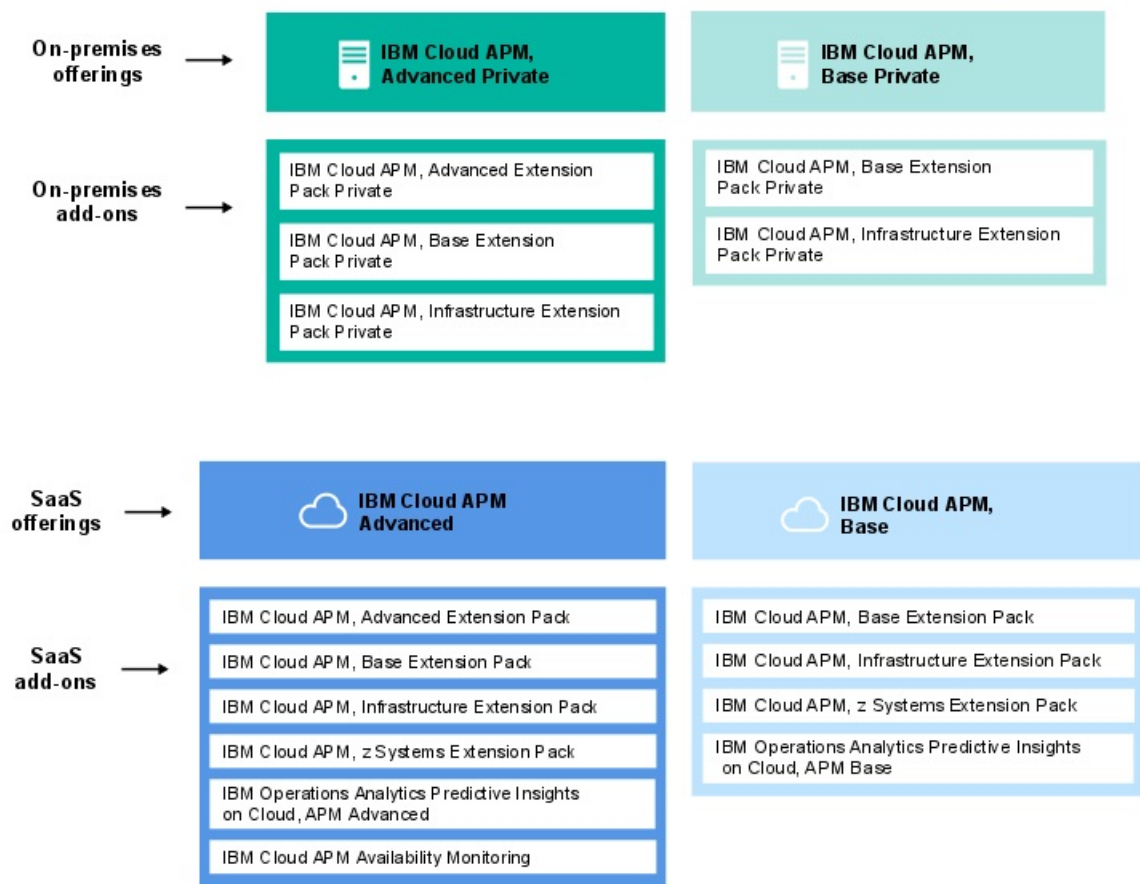

There are two IBM Cloud Application Performance Management, Private offerings, Base and Advanced, and multiple add-ons. The offerings and add-ons contain agents and data collectors. Specific add-ons can be used with each offering.

The IBM Cloud Application Performance Management, Private offerings (previously called IBM Performance Management) and some product extensions were rebranded and consolidated in the V8.1.4 release. For more information, see [“Product rebranding and simplification”](#) on page 31.

To see which agents are included in an offering or add-on and the agent and data collector capabilities, see [“Capabilities”](#) on page 60.

For each offering, add-ons are available in IBM Passport Advantage®. IBM Cloud Application Performance Management, Advanced Private is the most comprehensive offering, the one that includes all agents, data collectors, and dashboard pages. IBM Cloud Application Performance Management, Base Private is a subset of Cloud APM, Advanced. You can replace Cloud APM, Base with Cloud APM, Advanced at any time. The final installed offering after this replacement is Cloud APM, Advanced. The diagram shows which add-ons are available for each offering.

The add-ons are the same for all offerings, except for Availability Monitoring, which is an add-on only for the Cloud APM, Advanced offering.

## Offerings

### IBM Cloud Application Performance Management, Advanced

This offering is for end user experience, transaction tracking, and resource monitoring of all your application components. You have code level visibility into your applications and the health of your application servers. Use the diagnostics dashboards to find performance bottlenecks in the application code and for managing your critical applications in production.

The offering includes IBM Cloud Application Performance Management, Base, and contains agents and data collectors that you use to monitor applications, transactions, and other resources that are installed in your enterprise. For a list of agents and data collectors in this offering, see [“Capabilities” on page 60](#).

With this offering, DevOps has a complete solution that provides full visibility and control over your applications and infrastructure. Line of business owners can manage critical applications and end user experience in production. Application developers can view transaction details and diagnose application problems.

### **IBM Cloud Application Performance Management, Base**

This offering is for resource monitoring of infrastructure, application components, and cloud workloads. Resource monitoring helps you identify and address slow transactions, capacity issues, and outages. The offering contains agents and data collectors that you use to monitor applications and other resources that are installed in your enterprise. For a list of agents and data collectors in this offering, see [“Capabilities” on page 60](#).

With this offering, IT operators can deal with slow transactions, capacity issues, and outages.

## **Add-ons**

### **Advanced Extension Pack**

This extension pack contains the Monitoring Agent for SAP HANA Database, the SAP NetWeaver Java Stack agent, and the Monitoring Agent for RabbitMQ.

Use the SAP HANA Database agent to monitor the SAP HANA database. Use the SAP NetWeaver Java Stack agent to monitor the SAP NetWeaver Java Stack. Use the RabbitMQ agent to monitor RabbitMQ messaging. This extension pack is available if you have the IBM Cloud Application Performance Management, Advanced offering.

### **Base Extension Pack**

This extension pack contains the following agents:

- Monitoring Agent for Cassandra
- Monitoring Agent for InfoSphere DataStage
- Monitoring Agent for Hadoop
- Monitoring Agent for Microsoft Office 365
- Monitoring Agent for Sterling Connect Direct
- Monitoring Agent for Sterling File Gateway

Use these agents to monitor a Cassandra database, Hadoop cluster, DataStage server resources, Microsoft Office 365 applications, Connect Direct servers, and Sterling File Gateway application. This extension pack is available if you have either of the Cloud APM offerings.

### **Infrastructure Extension Pack**

This extension pack contains the following agents:

- Monitoring Agent for Amazon EC2
- Monitoring Agent for AWS Elastic Load Balancer
- Monitoring Agent for Azure Compute
- Monitoring Agent for Citrix Virtual Desktop Infrastructure
- Monitoring Agent for IBM Cloud

Use the Amazon EC2 agent to monitor your Amazon EC2 instances. Use the Amazon ELB agent to monitor your AWS Elastic Load Balancers. Use the Azure Compute agent to monitor your Azure Compute virtual machines. Use the Citrix VDI agent to monitor your Citrix virtual desktop infrastructure.

This extension pack is available if you have either of the Cloud APM offerings.

## Operations Analytics - Predictive Insights

This add-on is for analyzing the metric data that is collected by Cloud APM, and generating alarms when anomalies are detected. The add-on is available if you have either of the Cloud APM offerings.

For an overview of the features in each offering, see [“Offering details”](#) on page 56.

For a description of each agent and data collector and links to information that is specific to each one, see [“Descriptions”](#) on page 64.

## Offering details

Some features are available for all offerings and others are available only for certain offerings.

[Table 1](#) on page 56 shows key features that are available for each offering at-a-glance.

| Table 1. Features in each offering   |   |                                     |
|--|---|-------------------------------------|
| Feature  | Cloud APM, Advanced<br>(For DevOps,<br>Developers, and Line of<br>Business) | Cloud APM, Base<br>(For Operations) |
| Application resource monitoring:<br>Languages, middleware ( <a href="#">coverage varies by offering</a> ).   | ✓   | ✓                                   |
| Operating system monitoring:<br>Linux, UNIX, Windows systems   | ✓   | ✓                                   |
| Log file monitoring:<br>Use the OS Agents to monitor application log files.  | ✓   | ✓                                   |
| Dashboards: <ul style="list-style-type: none"><li>• View Tivoli Monitoring and Cloud APM KPIs in the same dashboards</li><li>• Historical metrics</li><li>• Customizable dashboards</li></ul>                          | ✓   | ✓                                   |
| APIs:<br>Manage your environment by using APIs.  | ✓   | ✓                                   |
| Role-based access control:<br>Manage the access and privilege of your IBM Cloud Application Performance Management users.  | ✓   | ✓                                   |
| Historical reporting:<br>Generate reports for the performance and response time of your applications that are broken down by transaction, device, browser, and others ( <a href="#">coverage varies by offering</a> ). | ✓   | ✓                                   |
| IBM Agent Builder:<br>Build custom agents to monitor any platform or technology.   | ✓   | ✓                                   |
| Database resource monitoring:<br>( <a href="#">coverage varies by offering</a> )   | ✓   | ✓                                   |
| Infrastructure resource monitoring:<br>Hypervisors, storage, and network ( <a href="#">coverage varies by offering</a> ).  | ✓   | ✓                                   |

| Table 1. Features in each offering (continued)   |   |                                     |
|--|---|-------------------------------------|
| Feature  | Cloud APM, Advanced<br>(For DevOps,<br>Developers, and Line of<br>Business) | Cloud APM, Base<br>(For Operations) |
| Commercial applications resource monitoring:<br>Business and collaboration applications ( <u>coverage varies by offering</u> ).  | ✓   | ✓                                   |
| Response time monitoring:<br>See how your application performance is affecting your users.   | ✓   | ✓                                   |
| Integration with search analytics:<br>Find the insights to quickly isolate, diagnose, and resolve problems.  | ✓   | ✓                                   |
| Operations Analytics - Predictive Insights (add-on):<br>Determine application performance anomalies before they impact your users.   | ✓   | ✓                                   |
| Real end user experience monitoring:<br>See what your users experience from your infrastructure to their device.   | ✓   | —                                   |
| Transaction tracking:<br>Track end-to-end transactions through your application environment.<br><ul style="list-style-type: none"> <li>• Application topology: See how all components are connected in your application environment.</li> <li>• Transaction instance topology: See the path that is followed through your environment for each instance of a transaction.</li> </ul> | ✓   | —                                   |
| Synthetic Playback:<br>Monitor the availability of your internal websites.   | ✓   | —                                   |
| Deep-dive diagnostics:<br><ul style="list-style-type: none"> <li>• Drill down from summary dashboards to view code-level, stack trace, and SQL query detail for specific agents.</li> <li>• Detect, diagnose, and kill hung or slow transactions that are still in progress.</li> </ul>  | ✓   | —                                   |
| Thresholds:<br>Detect specific application behaviors and conditions based on actively monitored definitions.   | ✓   | ✓                                   |
| Resource groups:<br>Categorize managed systems in your monitored enterprise by their purpose.  | ✓   | ✓                                   |

Extra features such as the following are available for all offerings through integration with other products and components. See [“Integration ” on page 85](#), and for more details, see [Chapter 9, “Integrating with other products and components,” on page 1039](#)).

- Tivoli Monitoring and OMEGAMON agents: Use the Hybrid Gateway to retrieve monitoring data and events so this information is displayed in the Cloud APM console.

- Agent coexistence: Install Cloud APM agents on the same computer where Tivoli Monitoring agents are installed.
- Netcool/OMNIBus and other EIF receivers: Forward events to IBM Tivoli Netcool/OMNIBus.
- Tivoli Common Reporting
- IBM Cloud: Monitor IBM Cloud applications.

## Agents and data collectors

IBM Cloud Application Performance Management agents and data collectors are available in both the offerings and the add-ons.

Many resources in your environment can be monitored by agents. Some resources on IBM Cloud and on premises can be monitored by data collectors. Corresponding agents exist for all data collectors, except the J2SE and Python data collectors. For a list of agents and data collectors and their descriptions, see “Descriptions” on page 64. To figure out the capabilities that the agent or data collector can provide in each offering, see “Capabilities” on page 60. To find out the change history of each agent and data collector, see “Change history” on page 58.

You can install these agents or data collectors, depending on your environment and requirements. Data collectors send data directly to the Cloud APM server. When an agent is configured, data collectors send data to the agent, which forwards it to the server. Data collectors operate within the application process space, whereas agents run as a separate process outside the application process space.

Install data collectors in the following situations:

- You want a simpler installation process.
- You use containers.

Install agents in the following situations:

- You want greater scalability.
- You want to limit sockets from end points to the server.
- When you add a threshold in the threshold editor, you want a clear list, which contains only the attributes for the environment you want to monitor. If you use a data collector, you must choose from the attributes of several data collectors.
- You want to turn on or off some of the data collection functions on the UI, such as diagnostics, transaction tracking, or method trace.
- You want to view on-demand diagnostics data, such as in-flight requests and heap dump at the current time.

## Change history

Find out the information about versions and change history for each agent and data collector.

The following table lists the agent and data collector names with change history technote links. Click the links to view change history details.

| <i>Table 2. Agent and data collector change history</i> |                                |
|---|--------------------------------|
| <b>Agents and data collectors</b>                       | <b>Links</b>                   |
| Amazon EC2 agent  | <a href="#">Change history</a> |
| Amazon ELB agent  | <a href="#">Change history</a> |

## Capabilities

Agent and data collector capabilities vary depending on your offering. The key agent and data collector capabilities are resource monitoring, transaction tracking, and diagnostics. You can purchase any of the offerings and add-ons in the IBM Cloud Application Performance Management solution. Specific offerings are required for add-ons.

Each agent and data collector monitors the resources for which the agent or the data collector is named, for example, the Monitoring Agent for Cisco UCS monitors Cisco UCS resources.

Depending on whether you are a developer, in operations, or a line-of-business owner, you use different Cloud APM capabilities.

- Resource monitoring capability includes response time monitoring, application resource monitoring, and infrastructure resource monitoring. All agents and data collectors can provide resource monitoring capability.
- Transaction tracking capability provides transaction instance and topology information.

- Diagnostics capability includes tracing and analyzing individual requests, and when necessary, method calls.

**Remember:** The resource monitoring capability is common to all offerings and add-ons. The diagnostics and transaction tracking capabilities are available only in the Cloud APM, Advanced Private offering and add-ons.

The agents and data collectors for the applications that you want to monitor are available for download from Passport Advantage. The agents take minutes to install. The data collectors require no installation, and you need to only configure them after the download completes. For instructions about installing the agents, see Chapter 7, “Installing your agents,” on page 181.

Table 3 on page 61 provides a comprehensive list of the agents and data collectors, shows which offering or add-on contains the agent or data collector, and shows the capabilities of the agent or data collector. When add-ons (such as Infrastructure Extension Pack) are noted for an agent or a data collector, they are required. Agents and data collectors that support transaction tracking and/or diagnostics capabilities are also noted in the Cloud APM, Advanced Private column.

✓ indicates the agent or data collector is available in the offering and can provide resource monitoring capability.

— indicates the data or capability is not available in this offering, or the add-on is not required for the agent or data collector.

TT indicates transaction tracking.

DD indicates diagnostics.

| Table 3. Agent and data collector capabilities in each offering |                         |                             |                               |
|---|-------------------------|-----------------------------|-------------------------------|

For more information about whether transaction tracking or diagnostics is enabled by default for the agent or data collector, see [Transaction tracking enablement for agents and data collectors table](#). For information about the predefined diagnostics dashboards, see [Diagnostics dashboards of agents and data collectors](#).

## Descriptions

The descriptions of the agents and data collectors provide information about what each of these components monitors and links to more information about each component.

Each agent and data collector has a version number, which changes each time the agent or data collector is updated. In any release, new agents and data collectors might be added, and existing agents and data collectors might be updated. If you do not have the latest version of an agent or data collector, consider updating it. For information about how to check the version of an agent or data collector in your environment, see [Agent version command](#).

Each agent and data collector description contains links to the following types of details about these components:

- Agent or data collector configuration and other information about specific agent or data collector capabilities
- Reference PDF that contains descriptions of the Cloud APM agent or data collector dashboards, group widgets, thresholds, data sets, and attributes (metrics and KPIs)

For links to documentation for IBM Tivoli Monitoring V6 and V7 agents that can coexist with Cloud APM V8 agents and data collector, see [Table 264 on page 1041](#).

### Amazon EC2 monitoring

The Monitoring Agent for Amazon EC2 provides you with a central point of monitoring for the health, availability, and performance of your Amazon Elastic Compute Cloud (EC2) instances. The agent displays a comprehensive set of metrics to help you make informed decisions about your EC2 environment, including CPU utilization, Elastic Block Store (EBS) utilization, network utilization, Amazon Web Services (AWS) maintenance updates, and disk performance.

- For information about configuring the agent after installation, see [“Configuring Amazon EC2 monitoring” on page 263](#).

- For information about the dashboards, thresholds, and attributes, see the [Amazon EC2 agent Reference](#).

### **AWS Elastic Load Balancer monitoring**

The Amazon ELB agent provides you with a central point of monitoring for the health, availability, and performance of your AWS Elastic Load Balancers. The agent displays a comprehensive set of metrics for each load balancer type-application, network and classic-to help you make informed decisions about your AWS Elastic Load Balancer environment.

- For information about configuring the agent after installation, see [“Configuring AWS Elastic Load Balancer monitoring” on page 270](#).
- For information about the dashboards, thresholds, and attributes, see the [Amazon ELB agent Reference](#).

### **Azure Compute monitoring**

The Azure Compute agent provides you with a central point of monitoring for the health, availability, and performance of your Azure Compute instances. The agent displays a comprehensive set of metrics to help you make informed decisions about your Azure Compute environment. These metrics include CPU usage, network usage, and disk performance.

- For information about configuring the agent after installation, see [“Configuring Azure Compute monitoring” on page 275](#).
- For information about the dashboards, thresholds, and attributes, see the [Azure Compute agent Reference](#).

### **Cassandra monitoring**

The Monitoring Agent for Cassandra provides you with the capability to monitor the Cassandra cluster. You can collect and analyze information about the nodes, keyspaces, and column families of the Cassandra cluster.

- For information about configuring the agent after installation, see [“Configuring Cassandra monitoring” on page 286](#).
- For information about the dashboards, thresholds, and attributes, see the [Cassandra agent Reference](#).

### **Cisco UCS monitoring**

The Monitoring Agent for Cisco UCS provides you with an environment to monitor the health, network, and performance of Cisco UCS. The Cisco UCS agent provides a comprehensive way for collecting and analyzing information that is specific to Cisco UCS and required to detect problems early and prevent them.

- For information about configuring the agent after installation, see [“Configuring Cisco UCS monitoring” on page 289](#).
- For information about the dashboards, thresholds, and attributes, see the [Cisco UCS agent Reference](#).

### **Citrix Virtual Desktop Infrastructure monitoring**

The Monitoring Agent for Citrix Virtual Desktop Infrastructure provides you with a central point of monitoring for the health, availability, and performance of your Citrix virtual desktop infrastructure. The agent displays a comprehensive set of metrics to help you make informed decisions about your XenDesktop or XenApp resources, including sites, machines, applications, desktops, sessions, users, and more.

- For information about configuring the agent after installation, see [“Configuring Citrix Virtual Desktop Infrastructure monitoring” on page 295](#).
- For information about the dashboards, thresholds, and attributes, see the [Citrix VDI agent Reference](#).

### **DataPower monitoring**

The Monitoring Agent for DataPower provides a central point of monitoring for the DataPower Appliances in your enterprise environment. You can identify and receive notifications about common

problems with the appliances. The agent also provides information about performance, resource, and workload for the appliances.

- For information about configuring the agent after installation, see [“Configuring the DataPower agent”](#) on page 314.
- For information about the dashboards, thresholds, and attributes, see the [DataPower agent Reference](#).
- For information about monitoring DataPower appliances as part of the IBM integration stack, see [“Monitoring the IBM integration stack”](#) on page 125.

### **Db2 monitoring**

The Monitoring Agent for Db2 offers a central point of monitoring for your Db2 environment. You can monitor a multitude of servers from a single IBM Performance Management console, with each server monitored by a Db2 agent. You can collect and analyze information in relation to applications, databases, and system resources.

- For information before you upgrade to a new version of the agent, see [“Agents on AIX: Stopping the agent and running slibclean before you upgrade”](#) on page 1344
- For information about configuring the agent after installation, see [“Configuring Db2 monitoring”](#) on page 318.
- For information about the dashboards, thresholds, and attributes, see the [Db2 agent Reference](#).
- For information about monitoring database transactions as part of the IBM Java application stack, see [“Monitoring the IBM Java application stack”](#) on page 118.

### **Hadoop monitoring**

The Monitoring Agent for Hadoop provides capabilities to monitor the Hadoop cluster in your organization. You can use the agent to collect and analyze information about the Hadoop cluster, such as status of data nodes and Java virtual machine, memory heap and non-heap information, and information about Hadoop nodes, file systems, and queues.

- For information about configuring the agent after installation, see [“Configuring Hadoop monitoring”](#) on page 328.
- For information about the dashboards, thresholds, and attributes, see the [Hadoop agent Reference](#).

### **HMC Base monitoring**

The Monitoring Agent for HMC Base provides you with the capability to monitor the Hardware Management Console (HMC). The agent monitors the availability and health of the HMC resources: CPU, memory, storage, and network. The agent also reports on the HMC inventory and configuration of Power servers, CPU pools, and LPARs. The CPU utilization of the Power servers, LPARs, and pools are monitored by using HMC performance sample data.

- For information about configuring the agent after installation, see [“Configuring HMC Base monitoring”](#) on page 338.
- For information about the dashboards, thresholds, and attributes, see the [HMC Base agent Reference](#).

### **HTTP Server monitoring**

The Monitoring Agent for HTTP Server collects performance data about the IBM HTTP Server. For example, server information, such as the status and type of server, the number of server errors, and the number of successful and failed logins to the server are shown. A data collector gathers the data that is sent to the HTTP Server agent. The agent runs on the same system with the IBM HTTP Server that it monitors. Each monitored server is registered as a subnode. The IBM HTTP Server Response Time module is installed with the HTTP Server agent. When you use the HTTP Server agent with the Response Time Monitoring agent, the WebSphere Application agent, and a database agent, you can see transaction monitoring information from the browser to the database for the IBM Java application stack.

- Before you begin the agent installation, see [Preinstallation on AIX systems - HTTP Server agent](#) and [Preinstallation on Linux systems HTTP Server agent](#).

- For instructions on how to review the data collector settings and activate the data collector after agent installation, see [“Configuring HTTP Server monitoring”](#) on page 344.
- For information about the dashboards, thresholds, and attributes, see the [HTTP Server agent Reference](#).
- For information about monitoring HTTP server transactions as part of the IBM Java application stack, see [“Monitoring the IBM Java application stack”](#) on page 118.

### **IBM Cloud monitoring**

The Monitoring Agent for IBM Cloud collects virtual machine inventory and metrics from your IBM Cloud (Softlayer) account. Use the IBM Cloud agent to track how many virtual devices you have configured and running in IBM Cloud. You can see what resources are allocated to each virtual device in the detailed dashboard page, which also shows information like the data center a device is located in, the operating system, and the projected public network bandwidth for the month.

- For information about configuring the agent after installation, see [Configuring IBM Cloud monitoring](#).
- For information about the dashboards, thresholds, and attributes, see the [IBM Cloud agent Reference](#).

### **IBM Integration Bus monitoring**

The Monitoring Agent for IBM Integration Bus is a monitoring and management tool that provides you with the means to verify, analyze, and tune message broker topologies that are associated with the IBM WebSphere Message Broker and IBM Integration Bus products.

- For information about configuring the agent after installation, see [“Configuring IBM Integration Bus monitoring”](#) on page 351.
- For information about the dashboards, thresholds, and attributes, see the [IBM Integration Bus agent Reference](#).
- For information about monitoring IBM Integration Bus brokers as part of the IBM integration stack, see [“Monitoring the IBM integration stack”](#) on page 125.

### **IBM i OS monitoring**

The Monitoring Agent for IBM i OS provides monitoring capabilities for the availability, performance, and resource usage of your IBM i OS environment. Information is standardized across the system. You can monitor multiple servers from a single console. By using the IBM i OS agent you can easily collect and analyze IBM i OS specific information.

- For information about configuring the agent after installation, see [“Configuring IBM i OS monitoring”](#) on page 366.
- For information about the dashboards, thresholds, and attributes, see the [IBM i OS agent Reference](#).

### **InfoSphere DataStage monitoring**

The monitoring agent for InfoSphere DataStage monitors the availability, resource usage, and performance of the DataStage Server. The agent monitors health status of the engine nodes and jobs. You can analyze the information that the agent collects and take appropriate actions to resolve issues in the DataStage Server.

- For information about configuring the agent after installation, see [Configuring InfoSphere DataStage monitoring](#).
- For information about the dashboards, thresholds, and attributes, see the [DataStage agent Reference](#).

### **Internet Service Monitoring**

The Internet Service Monitoring offers to determine whether a particular service is performing adequately, identify problem areas and report service performance measured against Service Level Agreements. Internet Service Monitoring works by emulating the actions of a real user. It regularly poll or test Internet services to check their status and performance.

- For information about configuring the agent after installation see [“Configuring the agent on Windows systems”](#) on page 521

- For information about the dashboards, thresholds, and attributes, see the [Internet Service Monitoring agent Reference](#)

### **J2SE data collector monitoring**

The J2SE data collector collects resource monitoring and deep-dive diagnostics data for Java applications. The deep-dive diagnostics data is shown in the dashboards based on requests and aggregated information to support various drill-down views. Both resource monitoring and deep-dive diagnostics are supported, which helps detect, isolate, and diagnose issues with Java applications. You can configure the data collector to diagnose slow requests.

- For information about configuring the data collector, see [Configuring the J2SE data collector](#).
- For information about the dashboards, thresholds, and attributes, see the [J2SE data collector Reference](#).

### **JBoss monitoring**

The Monitoring Agent for JBoss monitors the resources of JBoss application servers and the JBoss Enterprise Application platform. Use the dashboards that are provided with the JBoss agent to identify the slowest applications, slowest requests, thread pool bottlenecks, JVM heap memory and garbage collection issues, busiest sessions, and other bottlenecks on the JBoss application server.

- For information about configuring the agent after installation, see [“Configuring JBoss monitoring” on page 531](#).
- For information about the dashboards, thresholds, and attributes, see the [JBoss agent Reference](#).

### **Linux KVM monitoring**

The Monitoring Agent for Linux KVM is a multi-instance and multi-connection agent and supports connections to the Enterprise Linux based KVM hypervisor and Red Hat Enterprise Virtualization Manager (RHEV-M) environments. You can create multiple instances of this agent to monitor multiple hypervisors in an RHEV-M or KVM hypervisor environment. You can monitor virtualized workloads and analyze the resource capacity across different virtual machines. To connect the agent to a virtual machine in the KVM hypervisor environment, you must install the prerequisites: `libvirt*.rpm` and Korn Shell Interpreter (`pdksh`). The agent collects metrics by connecting remotely to a libvirt hypervisor that manages the virtual machines.

- For information about configuring the agent after installation, see [“Configuring Linux KVM monitoring” on page 568](#).
- For information about the dashboards, thresholds, and attributes, see the [Linux KVM agent Reference](#).

### **Linux OS monitoring**

The Monitoring Agent for Linux OS provides monitoring capabilities for the availability, performance, and resource usage of the Linux OS environment. This agent supports Docker container monitoring. For example, detailed information such as the CPU usage, memory, network and I/O usage information that relates to the docker container is shown. General information about the docker containers running on the server, such as the docker ID and instance name is also shown. Also, you can configure log file monitoring to monitor application log files. You can collect and analyze server-specific information, such as operating system and CPU performance, Linux disk information and performance analysis, process status analysis, and network performance.

- For information about configuring log file monitoring after installation, see [“Configuring OS agent log file monitoring” on page 727](#).
- For information about the dashboards, thresholds, and attributes, see the [Linux OS agent Reference](#).

### **MariaDB monitoring**

The Monitoring Agent for MariaDB offers a central point of management for your MariaDB environment or application. The software provides a comprehensive means for gathering the information required to detect problems early and to prevent them. Information is standardized across the system. You can monitor multiple servers from a single console. By using the Monitoring Agent for MariaDB you can easily collect and analyze MariaDB specific information.

- For information about configuring the agent after installation, see [“Configuring MariaDB monitoring”](#) on page 580.
- For information about the dashboards, thresholds, and attributes, see the [MariaDB agent Reference](#).

### **Microsoft Active Directory monitoring**

The Monitoring Agent for Microsoft Active Directory provides capabilities to monitor the Active Directory in your organization. You can use the agent to collect and analyze information that is specific to Active Directory, such as network status, Sysvol replication, address book performance, and directory system usage.

- For information about configuring the agent after installation, see [“Configuring Microsoft Active Directory monitoring”](#) on page 583.
- For information about the dashboards, thresholds, and attributes, see the [Microsoft Active Directory agent Reference](#).

### **Microsoft Cluster Server monitoring**

The Monitoring Agent for Microsoft Cluster Server provides capabilities to monitor the Microsoft Cluster Server in your organization. You can use the Microsoft Cluster Server agent to collect information that is related to cluster resource availability, such as cluster level, cluster nodes, cluster resource groups, cluster resources, and cluster networks. The agent also provides statistics for cluster resources usage, such as processor usage, memory usage, disk usage, and network usage.

- For information about configuring the agent after installation, see [“Configuring Microsoft Cluster Server monitoring”](#) on page 589 .
- For information about the dashboards, thresholds, and attributes, see the [Microsoft Cluster Server agent Reference](#).

### **Microsoft Exchange Server monitoring**

The Monitoring Agent for Microsoft Exchange Server provides capabilities to monitor the health, availability, and performance of the Exchange Servers in your organization. You can use the Microsoft Exchange Server agent to collect server-specific information, such as mail traffic, state of mailbox databases, and activities of clients. Additionally, the agent provides statistics of cache usage, mail usage, database usage, and client activities to help you analyze the performance of Exchange Servers.

- For information about configuring the agent after installation, see [“Configuring Microsoft Exchange monitoring”](#) on page 591.
- For information about the dashboards, thresholds, and attributes, see the [Microsoft Exchange Server agent Reference](#).

### **Microsoft Hyper-V Server monitoring**

The Monitoring Agent for Microsoft Hyper-V Server provides capability to monitor the availability and performance of all the Hyper-V systems in your organization. The Microsoft Hyper-V Server agent provides configuration information such as the number of virtual machines, the state of the virtual machines, the number of allocated virtual disks, the allocated virtual memory, and the number of allocated virtual processors. Additionally, the agent provides statistics of physical processor usage, memory usage, network usage, logical processor usage, and virtual processor usage.

- For information about configuring the agent after installation, see [“Configuring Microsoft Hyper-V monitoring”](#) on page 605.
- For information about the dashboards, thresholds, and attributes, see the [Microsoft Hyper-V Server agent Reference](#).

### **Microsoft Internet Information Services monitoring**

The Monitoring Agent for Microsoft Internet Information Services provides you with the capability to monitor the availability and performance of Microsoft Internet Information Server. You can use the Microsoft Internet Information Server agent to monitor website details such as request rate, data transfer rate, error statistics, and connections statistics.

- For information about configuring the agent after installation, see [“Configuring Microsoft IIS monitoring”](#) on page 609.

- For information about the dashboards, thresholds, and attributes, see the [Microsoft IIS agent Reference](#).

### **Microsoft .NET monitoring**

The Monitoring Agent for Microsoft .NET monitors Microsoft .NET applications that are based on Internet Information Services (IIS) and Microsoft .NET Framework resources. The data collector component collects data from incoming HTTP requests. The data collector collects method calls and constructs a call tree, and collects request context and stack trace data. Use the dashboards that are provided with the Microsoft .NET agent to identify the problems that are associated with Microsoft .NET Framework, and also to identify the slowest HTTP requests from where you can drill down to stack trace information to isolate problems.

- For information about configuring the agent after installation, see [“Registering the data collector” on page 618](#).
- For information about the dashboards, thresholds, and attributes, see the [Microsoft .NET agent Reference](#).

### **Microsoft Office 365 monitoring**

The Monitoring Agent for Microsoft Office 365 provides you with the capability to monitor the Microsoft Office 365. You can collect and analyze information about Microsoft Exchange Online, SharePoint Online, Skype for Business, and OneDrive for Business.

- For information about configuring the agent after installation, see [“Configuring Microsoft Office 365 monitoring” on page 628](#).
- For information about the dashboards, thresholds, and attributes, see the [Microsoft Office 365 agent Reference](#).

### **Microsoft SharePoint Server monitoring**

The Monitoring Agent for Microsoft SharePoint Server provides you with the environment to monitor the availability, events, and performance of the Microsoft SharePoint Server. Use this agent to gather data from the Microsoft SharePoint Server and manage operations.

- For information about configuring the agent after installation, see [“Configuring Microsoft SharePoint Server monitoring” on page 634](#).
- For information about the dashboards, thresholds, and attributes, see the [Microsoft SharePoint Server agent Reference](#).

### **Microsoft SQL Server monitoring**

The Monitoring Agent for Microsoft SQL Server provides you with the capability to monitor the Microsoft SQL Server. The Microsoft SQL Server agent offers a central point of management for distributed databases. Use the Microsoft SQL Server agent dashboards to monitor the availability, performance, resource usage, and the overall status of all the SQL Server instances that are being monitored.

- For information about configuring the agent after installation, see [“Configuring Microsoft SQL Server monitoring” on page 637](#).
- For information about the dashboards, thresholds, and attributes, see the [Microsoft SQL Server agent Reference](#).

### **MongoDB monitoring**

The Monitoring Agent for MongoDB provides monitoring capabilities for the usage, status, and performance of the MongoDB deployment. You can collect and analyze information such as database capacity usage, percentage of connections open, memory usage, instance status, and response time in visualized dashboards.

- For information about configuring the agent after installation, see [“Configuring MongoDB monitoring” on page 668](#).
- For information about the dashboards, thresholds, and attributes, see the [MongoDB agent Reference](#).

## MQ Appliances monitoring

The Monitoring Agent for MQ Appliance provides monitoring information that focuses on the MQ appliance level on MQ Appliances, for example, CPU, memory, storage, sensors, and queue managers summary information.

- For information about configuring the agent after installation, see [“Configuring IBM MQ Appliances monitoring”](#) on page 370.
- For information about the dashboards, thresholds, and attributes, see the [MQ Appliance agent Reference](#).

## MySQL monitoring

The Monitoring Agent for MySQL provides monitoring capabilities for the status, usage, and performance of the MySQL deployment. You can collect and analyze information such as Bytes Received vs Sent, InnoDB Buffer Pool Pages, and Historical Performance.

- Before you begin the agent installation, see [Preinstallation on Linux systems - MySQL agent](#) or [Preinstallation on Windows systems - MySQL agent](#).
- For information about configuring the agent after installation, see [“Configuring MySQL monitoring”](#) on page 673.
- For information about the dashboards, thresholds, and attributes, see the [MySQL agent Reference](#).

## NetApp storage monitoring

The Monitoring Agent for NetApp Storage provides you with the capability to monitor the NetApp storage systems by using the NetApp OnCommand Unified Manager (OCUM). You can collect and analyze information about the aggregates, nodes, disks, and volumes of the NetApp storage systems.

- For information about configuring the agent after installation, see [“Configuring NetApp Storage monitoring”](#) on page 677.
- For information about the dashboards, thresholds, and attributes, see the [NetApp Storage agent Reference](#).

## Node.js monitoring

The Monitoring Agent for Node.js or the stand-alone Node.js data collector can be used to measure and collect data about the performance of Node.js applications. For example, throughput and response times for HTTP requests, and other measurements that relate to resource usage, are monitored and stored for display and analysis. To choose between the Node.js agent and the Node.js data collector, see [“Configuring Node.js monitoring”](#) on page 683 for instructions.

### Node.js agent

- Before you begin the installation, see [Preinstallation on Linux systems - Node.js agent](#).
- For information about configuring the agent after installation, see [“Configuring the Node.js agent”](#) on page 684.
- For information about the dashboards, thresholds, and attributes, see the [Node.js agent Reference](#).

### Node.js data collector (stand-alone)

The Node.js data collector monitors IBM Cloud and on-premises applications. Resource monitoring and deep-dive diagnostics are supported, which helps detect, isolate, and diagnose issues of your applications. You can configure the data collector to track the performance of individual request and method calls, and use the information to diagnose slow requests and take actions accordingly.

### IBM Cloud applications

- For information about configuring the data collector, see [“Configuring the stand-alone Node.js data collector for IBM Cloud\(formerly Bluemix\) applications”](#) on page 690.
- For information about the dashboards, thresholds, and attributes, see the [Data collectors Reference](#).

## On-premises applications

- For information about configuring the data collector, see [“Configuring the stand-alone Node.js data collector for on-premises applications”](#) on page 695.
- For information about the dashboards, thresholds, and attributes, see the [Data collectors Reference](#).

## OpenStack monitoring

The Monitoring Agent for OpenStack provides with you the capabilities to monitor your OpenStack applications. Use the dashboards to view the performance of your OpenStack applications, such as information about API endpoints, SSH sever connection, processes, and hypervisors.

- For information about configuring the agent after installation, see [“Configuring the OpenStack agent”](#) on page 706.
- For information about the dashboards, thresholds, and attributes, see the [OpenStack agent Reference](#).

## Oracle Database monitoring

The Monitoring Agent for Oracle Database provides monitoring capabilities for the availability, performance, and resource usage of the Oracle database. You can configure more than one Oracle Database agent instance to monitor different Oracle databases. Remote monitoring capability is also provided by this agent.

- Before you begin the agent installation, see [Preinstallation on AIX systems - Oracle Database agent](#), [Preinstallation on Linux systems - Oracle Database agent](#), or [Preinstallation on Windows systems - Oracle Database agent \(Windows\)](#).
- For instructions on configuring the agent after installation, see [“Configuring Oracle Database monitoring”](#) on page 710.
- For information about the dashboards, thresholds, and attributes, see the [Oracle Database agent Reference](#).
- For information about monitoring database transactions as part of the IBM Java application stack, see [“Monitoring the IBM Java application stack”](#) on page 118.

## PHP monitoring

The Monitoring Agent for PHP monitors PHP web applications by collecting web access metrics through an Apache web server and performance statistics data from MySQL. The agent discovers all WordPress applications on an Apache server and provides WordPress application statistics information. Use the PHP agent to monitor web server availability, Apache server status, and GET/POST requests. The agent evaluates only the performance of PHP requests in WordPress applications. CSS and JS loading are not evaluated. The agent does not use URL arguments to identify URLs.

- For information about configuring the agent after installation, see [“Configuring PHP monitoring”](#) on page 759.
- For information about the dashboards, thresholds, and attributes, see the [PHP agent Reference](#).

## PostgreSQL monitoring

The Monitoring Agent for PostgreSQL monitors the PostgreSQL database by collecting PostgreSQL metrics through a JDBC driver. The agent provides data about system resource usage, database capacity, connections that are used, individual status of running instances, statistics for operations, response time for SQL query statements, database size details, and lock information.

- For information about configuring the agent after installation, see [“Configuring PostgreSQL monitoring”](#) on page 761.
- For information about the dashboards, thresholds, and attributes, see the [PostgreSQL agent Reference](#).

## Python monitoring

The Python data collector monitors both on-prem and IBM Cloud Python applications. Both resource monitoring and deep-dive diagnostics are supported, which provides monitoring data such as CPU and memory usage, garbage collection, and threads. You can configure the data collector to track the

performance of individual request and method calls, and use the information to diagnose slow requests and take actions accordingly.

### **IBM Cloud applications**

- For information about configuring the data collector, see [“Configuring the Python data collector for IBM Cloud applications”](#) on page 765.
- For information about the dashboards, thresholds, and attributes, see the [Data collectors Reference](#).

### **On-premises applications**

- For information about configuring the data collector, see [“Configuring the Python data collector for on-premises applications”](#) on page 770.
- For information about the dashboards, thresholds, and attributes, see the [Data collectors Reference](#).

### **RabbitMQ monitoring**

The Monitoring Agent for RabbitMQ provides you with the capability to monitor the RabbitMQ cluster. You can collect and analyze information about the nodes, queues, and channels of the RabbitMQ cluster.

- For information about configuring the agent after installation, see [“Configuring RabbitMQ monitoring”](#) on page 775.
- For information about the dashboards, thresholds, and attributes, see the [RabbitMQ agent Reference](#).

### **Response Time monitoring**

The Response Time Monitoring Agent uses network monitoring to capture HTTP and HTTPS transaction data such as response times and status codes. Use the Response Time Monitoring agent to monitor the performance and availability of web applications for users, including transaction request, application, and server information. Also, use this agent to monitor devices and session information.

- Before you begin the Response Time Monitoring agent installation, see [Preinstallation on AIX systems - Response Time Monitoring agent](#), [Preinstallation on Linux systems - Response Time Monitoring agent](#), or [Preinstallation on Windows systems - Response Time Monitoring agent](#).
- For information about configuring the agent after installation, see [“JavaScript Injection”](#) on page 782.
- For information about the dashboards, thresholds, and attributes, see the [Transaction Monitoring Reference](#).
- For information about using Response Time Monitoring as part of the IBM Java application stack, see [“Monitoring the IBM Java application stack”](#) on page 118.

### **Ruby monitoring**

The Monitoring Agent for Ruby or the stand-alone Ruby data collectors monitor the performance of your Ruby on Rails applications, including request traffic and configuration statistics. You can also use the diagnostic function to get a deeper view into each application.

The standalone Ruby data collector monitors only IBM Cloud applications.

#### **Ruby agent**

- For information about configuring the agent after installation, see [“Configuring Ruby monitoring”](#) on page 810.
- For information about the dashboards, thresholds, and attributes, see the [Ruby agent Reference](#).

#### **Ruby data collector (stand-alone)**

You can use the Ruby data collector to monitor IBM Cloud applications. Both resource monitoring and deep-dive diagnostics are supported, which helps detect, isolate, and diagnose issues of your

applications. You can configure the data collector to track the performance of individual request and method calls, and use the information to diagnose slow requests and take actions accordingly.

### **IBM Cloud applications**

- For information about configuring the data collector, see [Configuring the Ruby data collector](#).
- For information about the dashboards, thresholds, and attributes, see the [Data collectors Reference](#).

### **SAP applications monitoring**

The Monitoring Agent for SAP Applications provides you the capability to monitor your SAP applications that run on the Advanced Business Application Programming (ABAP) stack. The agent also monitors the SAP Solution Manager, which is an SAP lifecycle management tool, and the SAP NetWeaver Process Integration (SAP PI), which is an enterprise integration software for SAP. It offers a central point of management for gathering the information that you need to detect problems early, and to take steps to prevent them from recurring. It enables effective systems management across SAP releases, applications, and components; and the underlying databases, operating systems, and external interfaces.

- For information about configuring the agent after installation, see [“Configuring SAP monitoring” on page 821](#).
- For information about the dashboards, thresholds, and attributes, see the [SAP agent Reference](#).

### **SAP HANA Database monitoring**

The Monitoring Agent for SAP HANA Database monitors the availability, resource usage, and performance of the SAP HANA database. The agent can monitor HANA deployment scenarios such as single host - single database, single host - multiple tenant databases, multiple hosts - single database, and multiple hosts - multiple tenant databases. You can analyze the information that the agent collects and take appropriate actions to resolve issues in the SAP HANA database.

- Before you begin the agent installation, see [Preinstallation on AIX systems - SAP HANA Database agent](#) or [Preinstallation on Linux systems - SAP HANA Database agent](#) or [Preinstallation on Windows systems - SAP HANA Database agent](#).
- For information about configuring the agent after installation, see [“Configuring SAP HANA Database monitoring” on page 860](#).
- For information about the dashboards, thresholds, and attributes, see the [SAP HANA Database agent Reference](#).

### **SAP NetWeaver Java Stack monitoring**

The Monitoring Agent for SAP NetWeaver Java Stack monitors the availability, resource usage, and performance of the SAP NetWeaver Java Stack. The agent can monitor SAP NetWeaver Java Stack deployment scenarios such as single host - single instance, single host - multiple instances, multiple hosts - single instances, and multiple hosts - multiple instances. You can analyze the information that the agent collects and take appropriate actions to resolve issues in the SAP NetWeaver Java Stack.

- For information about configuring the agent after installation, see [“Configuring SAP NetWeaver Java Stack monitoring” on page 862](#).
- For information about the dashboards, thresholds, and attributes, see the [SAP NetWeaver Java Stack agent Reference](#).

### **Siebel monitoring**

The Monitoring Agent for Siebel provides a central point of monitoring for your Siebel resources, which includes Siebel statistics, user sessions, components, tasks, application server, Siebel Gateway Name Server, process CPU and memory usage, and log event monitoring.

- For information about configuring the agent after installation, see [“Configuring Siebel monitoring” on page 869](#).
- For information about the dashboards, thresholds, and attributes, see the [Siebel agent Reference](#).

### **Skype for Business Server (formerly known as Microsoft Lync Server) monitoring**

The Monitoring Agent for Skype for Business Server provides you with the capability to monitor the health, availability, and performance of the Skype for Business Server. You can use the Skype for Business Server agent to collect server-specific information, such as latency, synthetic transactions, call details recording (CDR) service write operations, state of throttled requests, and session initiation protocol (SIP) peers. Additionally, the agent provides historical usage statistics of instant messaging and mediation server to help you analyze the performance of Lync or Skype for Business Servers.

- For information about configuring the agent after installation, see [“Configuring Skype for Business Server monitoring” on page 611](#).
- For information about the dashboards, thresholds, and attributes, see the [Skype for Business Server agent Reference](#).

### **Sterling Connect Direct monitoring**

The Monitoring Agent for Sterling Connect Direct provides monitoring of Connect Direct nodes. It provides you with health and performance of the servers. Also, it gives analysis of file transfer activity.

- For information about configuring the agent after installation, see [“Configuring Sterling Connect Direct monitoring” on page 881](#).
- For information about the dashboards, thresholds, and attributes, see the [Sterling Connect Direct agent Reference](#).

### **Sterling File Gateway monitoring**

The Monitoring Agent for Sterling File Gateway monitors the Sterling File Gateway application, which is used for transferring files between internal and external partners by using different protocols, different file naming conventions, and different file formats. It also supports the remote monitoring feature.

- For information about configuring the agent after installation, see [“Configuring Sterling File Gateway monitoring” on page 883](#).
- For information about the dashboards, thresholds, and attributes, see the [Sterling File Gateway agent Reference](#).

### **Sybase Server monitoring**

The Monitoring Agent for Sybase Server offers a central point of management for distributed databases. It collects the required information for database and system administrators to examine the performance of the Sybase server system, detect problems early and prevent them.

- For information about configuring the agent after installation, see [“Configuring Sybase Server monitoring” on page 889](#).
- For information about the dashboards, thresholds, and attributes, see the [Sybase agent Reference](#).

### **Synthetic Playback monitoring**

The Monitoring Agent for Synthetic Playback monitors the availability and performance of private internal applications and external applications. Record test scripts by using Selenium IDE and upload your scripts to create synthetic transactions for your applications. To replicate your end-user experience, you can replay your synthetic transactions at various intervals and in multiple locations. View metrics about the status and performance of the synthetic transactions on the dashboards. Run reports to view data about the historical performance of your applications.

The Monitoring Agent for Synthetic Playback differs from other Cloud APM agents in the way that it sends data to the Cloud APM server. The Synthetic Playback agent does not send playback data directly to the Cloud APM server. The Synthetic Playback agent sends JSON data to a Kafka platform. The data is then stored in the MongoDB database. A customized data provider sends calculated attributes from the MongoDB database to the Application Performance Dashboard widgets for synthetic transactions.

The Synthetic Playback agent does not use the Cloud APM thresholds and events monitoring framework. Threshold support for the Synthetic Playback agent is provided by the Synthetic Events agent which runs on the Cloud APM server side. For more information, see [“Managing synthetic events” on page 1187](#).

- Before you begin the installation, see [Preinstallation on Linux systems - Synthetic Playback agent](#).
- For information about configuring the agent after installation, see [“Configuring Synthetic Playback monitoring” on page 896](#).
- For information about the dashboards, thresholds, and attributes, see the [Synthetic Playback agent Reference](#).

### **Tomcat monitoring**

The Monitoring Agent for Tomcat monitors the resources of Tomcat application servers. Use the dashboards that are provided with the Tomcat agent to identify the slowest applications, slowest requests, thread pool bottlenecks, JVM heap memory and garbage collection issues, the busiest sessions, and other bottlenecks on the Tomcat application server.

- For information about configuring the agent after installation, see [“Configuring Tomcat monitoring” on page 898](#).
- For information about the dashboards, thresholds, and attributes, see the [Tomcat agent Reference](#).

### **UNIX OS monitoring**

The Monitoring Agent for UNIX OS provides monitoring capabilities for the availability, performance, and resource usage of the UNIX OS environment . Also, you can configure log file monitoring to monitor application log files. You can collect and analyze server-specific information, such as operating system and CPU performance, UNIX disk information and performance analysis, process status analysis, and network performance.

- For information about configuring log file monitoring after installation, see [“Configuring OS agent log file monitoring” on page 727](#).
- For information about the dashboards, thresholds, and attributes, see the [UNIX OS agent Reference](#).

### **VMware VI monitoring**

The Monitoring Agent for VMware VI monitors the VMware Virtual Infrastructure by connecting to the VMware Virtual Center. You can use the VMware VI agent to view the status summary for clusters and monitor multiple components, such as clusters, virtual machines, data stores, and ESX servers from a single console.

- For information about configuring the agent after installation, see [“Configuring VMware VI monitoring” on page 909](#).
- For information about the dashboards, thresholds, and attributes, see the [VMware VI agent Reference](#).

### **WebLogic monitoring**

The Monitoring Agent for WebLogic provides you with a central point of monitoring for the health, availability, and performance of your WebLogic server environment. The agent displays a comprehensive set of metrics to help you make informed decisions about your WebLogic resources, including Java virtual machines (JVMs), Java messaging service (JMS), Java Database Connectivity (JDBC).

- For information about configuring the agent after installation, see [“Configuring WebLogic monitoring” on page 917](#).
- For information about the dashboards, thresholds, and attributes, see the [WebLogic agent Reference](#).

### **WebSphere Applications monitoring**

The Monitoring Agent for WebSphere Applications with the embedded data collector, or the stand-alone Liberty data collector monitor the resources of WebSphere application servers. These monitoring components can be configured to do the following things:

- Gather PMI metrics for resource monitoring through a JMX interface on the application server.
- Gather aggregated request performance metrics.
- Track the performance of individual request and method calls.

The monitoring data is displayed in the dashboards. You can use the provided dashboards to isolate specific problem areas of your application server. Drill down to determine whether a problem lies with an underlying resource or if it relates to the application's code.

For information about whether to use the agent or one of the data collectors, see [“Configuring WebSphere Applications monitoring”](#) on page 933.

### **WebSphere Applications agent and embedded data collector**

- For information about configuring the agent after installation, see [“Configuring the data collector for WebSphere Applications agent”](#) on page 934.
- For information about the dashboards, thresholds, and attributes, see the [WebSphere Applications agent Reference](#).
- For information about monitoring WebSphere application server transactions as part of the IBM Java application stack, see [“Monitoring the IBM Java application stack”](#) on page 118.

### **Liberty data collector (stand-alone)**

You can use the Liberty data collector to monitor WebSphere Liberty profile on IBM Cloud or to monitor WebSphere Application Server Liberty on Linux for System x. Resource monitoring, diagnostics, and transaction tracking are all supported, which helps detect, isolate, and diagnose issues of your applications. You can configure the stand-alone data collector to track the performance of individual request and method calls, and use the information to diagnose slow requests and take actions accordingly.

#### **IBM Cloud applications**

- For information about configuring the data collector, see [“Configuring the Liberty data collector in IBM Cloud environment \(Liberty V18.\\* and older versions\)”](#) on page 562.
- For information about the dashboards, thresholds, and attributes, see the [Data collectors Reference](#).

#### **On-premises applications (Linux for System x only)**

- For information about configuring the data collector, see [“Configuring the Liberty data collector in on-premises environments \(Liberty V18.\\* and older versions\)”](#) on page 558.
- For information about the dashboards, thresholds, and attributes, see the [Data collectors Reference](#).

### **WebSphere Infrastructure Manager monitoring**

The Monitoring Agent for WebSphere Infrastructure Manager provides the monitoring capabilities for the WebSphere Application Server Deployment Manager and Node Agent, including server status, resources, and transactions. You can use the data that is collected by the WebSphere Infrastructure Manager agent to analyze the performance of your Deployment Manager and Node Agent, and whether a problem occurred.

- For information about configuring the agent after installation, see [“Configuring WebSphere Infrastructure Manager monitoring”](#) on page 1020.
- For information about the dashboards, thresholds, and attributes, see the [WebSphere Infrastructure Manager agent Reference](#).

### **WebSphere MQ monitoring**

With the Monitoring Agent for WebSphere MQ, you can easily collect and analyze data that is specific to WebSphere MQ for your queue managers from a single vantage point. You can then track trends in the data that is collected and troubleshoot system problems by using the predefined dashboards.

- For information about configuring the agent after installation, see [“Configuring WebSphere MQ monitoring”](#) on page 1021.
- For information about the dashboards, thresholds, and attributes, see the [WebSphere MQ agent Reference](#).
- For information about monitoring message queues as part of the IBM integration stack, see [“Monitoring the IBM integration stack”](#) on page 125.

## Windows OS monitoring

The Monitoring Agent for Windows OS provides monitoring capabilities for the availability, performance, and resource usage of the Windows OS environment. Also, you can configure log file monitoring to monitor application log files. You can collect and analyze server-specific information, such as operating system and CPU performance, disk information and performance analysis, process status analysis, Internet session data, monitored logs information, Internet server statistics, message queuing statistics, printer and job status data, Remote Access Services statistics, and services information. The KNTCMA\_FCPProvider service is installed with the agent.

- For information about configuring log file monitoring after installation, see [“Configuring OS agent log file monitoring”](#) on page 727.
- For information about the dashboards, thresholds, and attributes, see the [Windows OS agent Reference](#).

## Features

---

The key features vary by offering. Some features are available in one or both offerings, in an add-on, or through integration with other products and components.

### Application resource monitoring

Use resource monitoring agents to monitor languages and middleware. Coverage varies by offering. See [“Capabilities”](#) on page 60.

### Operating system monitoring

Use resource monitoring agents to monitor Linux, UNIX, and Windows operating systems. See [“Capabilities”](#) on page 60.

### Log file monitoring

The OS agents contain a feature to monitor application log files. This feature includes the capability to configure log file monitoring based on regular expressions.

For compatibility, the OS agent consumes the following information and formats:

- Configuration information and the format file that was used by the IBM Tivoli Monitoring Log File Agent V6.x
- Configuration information and format strings that were used by the Tivoli Event Console Log File Adapter

These format strings allow the agent to filter the log data according to patterns in the format file, and submit only the relevant data to an event consumer. The OS agent sends data to the Cloud APM server or through the Event Integration Facility (EIF) to any EIF receiver, such as the Netcool/OMNIBus Probe for Tivoli EIF.

### Dashboards

The **Application Performance Dashboard** gives you a high-level status of the applications in your environment. View areas of interest either by selecting from the navigator or by clicking in a summary box to drill down to the next level.

To learn about the features that are available at each dashboard level, see [“All My Applications - Application Performance Dashboard”](#) on page 1251, [“Application - Application Performance Dashboard”](#) on page 1254, and [“Group and Instance - Application Performance Dashboard”](#) on page 1259.

### View KPIs from the Tivoli Monitoring and Cloud APM domains in the same dashboards

In an environment that includes both IBM Tivoli Monitoring and IBM Cloud Application Performance Management products, you can install the IBM Cloud Application Performance Management Hybrid Gateway to provide a consolidated view of managed systems from both domains. To view your hybrid environment in the Cloud APM console, you must create a managed system group, install the Hybrid Gateway in your Tivoli Monitoring environment, and configure communications with the Hybrid Gateway.

For more information, see [“Integrating with IBM Tivoli Monitoring V6.3 ”](#) on page 1039.

## Historical metrics

Get visualizations of up to 24 hours of historical data on the Application Performance Dashboard. When a time selector is displayed in a dashboard's **Status Overview** tab, you can adjust the time range for the charts and tables whose values are derived from historical data samples. For line charts, you can also compare the current data, up to the past 24 hours, with up to 8 days of historical data to spot abnormalities.

For more information, see [“Adjusting and comparing metrics over time” on page 1263](#).

## IBM Cloud Application Business Insights Universal View

You can use the Universal View to create customized pages for the applications you are monitoring. Choose from different chart and metric options to create widgets to monitor data according to your requirements. With Universal View, you can customize a dashboard to view consolidated data from multiple agents.

When you are viewing data on the dashboard, you can change the chart type dynamically. On the grid widget, you can filter data dynamically.

You can export the customized page data to a Raw Data file.

For more information, see [“Custom views” on page 1283](#).

## Application Details

After you drill down from the **All My Applications** dashboard to a detailed dashboard for a managed system instance, the Attribute Details tab is displayed for you to create and manage custom historical line charts and tables that can be saved. You can save more chart or table pages for your viewing only or to be shared with all users in the same environment.

For more information, see [“Creating a custom chart or table page” on page 1264](#).

## APIs

Cloud APM APIs are available for managing your environment such as to assign users roles and to create thresholds. For more information, see [“Exploring the APIs” on page 1237](#).

## Role-based access control

In Cloud APM, a role is a group of permissions that control the actions you can take. Use the Role Based Access Control feature to create customized roles, which are the basis of security. The following four predefined roles are also available: Role Administrator, Monitoring Administrator, System Administrator, and Monitoring User. You can assign users to both customized roles or predefined roles, and users can be assigned to multiple roles. You can assign permissions to customized roles, or you can assign more permissions to existing default roles. Permissions are cumulative. A user is assigned all the permissions for all the roles they are assigned to.

You can assign the View permission and the Modify permission to individual applications, system resource groups, and custom resource groups. For example, if you are a member of a role that has View permission for an application, you can view all the supporting components within that application.

You can assign the View permission and Modify permission to system administration tasks. For example, if you are a member of a role that has View permission for Advanced Configuration, you can make and save changes in the **Advanced Configuration** window.

For more information, see [“Roles and permissions” on page 1137](#).

## Historical Reporting

Reports are available for data that is collected by the WebSphere Applications agent, the Response Time Monitoring Agent, and the Synthetic Playback agent. Transaction tracking is required for Response Time Monitoring agent reports (Not available with Cloud APM, Base Private) For more information about installing reports, see [“Integrating with Tivoli Common Reporting” on page 1083](#). For report descriptions, see [“Reports” on page 1294](#).

If you have an IBM Tivoli Monitoring environment that is configured with the Tivoli Data Warehouse, you can send data from the Cloud APM agents to the data warehouse for use in Tivoli Common Reporting reports.

## Agent Builder

Build custom agents to monitor any platform or technology. See [https://www.ibm.com/support/knowledgecenter/SSMKFH/com.ibm.apmaas.doc/install/agent\\_builder\\_guide.htm](https://www.ibm.com/support/knowledgecenter/SSMKFH/com.ibm.apmaas.doc/install/agent_builder_guide.htm).

## Database resource monitoring

Coverage varies by offering. See [“Capabilities” on page 60](#) for the names of the databases that can be monitored,

## Infrastructure resource monitoring

Use resource monitoring agents to monitor hypervisors, storage, and networks. Coverage varies by offering. See [“Capabilities” on page 60](#).

## Commercial applications resource monitoring

Use resource monitoring agents to monitor business and collaboration applications. Coverage varies by offering. See [“Capabilities” on page 60](#).

## Response time and end user experience monitoring

See what your users experience from your infrastructure to their device. Use response time monitoring to monitor the performance and availability of websites and web applications from the browser through to the database, and to monitor mobile devices. After you install the Response Time Monitoring agent on any web servers that you want to monitor, data that is collected by these agents is displayed in the Application Performance Dashboard with little or no further configuration required. Data from the Response Time Monitoring agent is used for the **End User Transactions** dashboards. In you can measure response time from the Browser, and data from the Response Time Monitoring agent is also used in the **Aggregate Transaction Topology**. For more information, see [“Scenario: Monitoring the IBM Java application stack” on page 117](#).

## Transaction tracking

This feature is available with Cloud APM, Advanced Private. The transaction tracking feature enables topology views and instance level transaction monitoring. Transaction tracking is installed as part of the Cloud APM server. Transaction tracking is automatically enabled for some agents but must be manually enabled for others. [Table 4 on page 80](#) provides more information about agents that support transaction tracking.

| Table 4. Transaction tracking enablement for agents and data collectors |                    |  |
|---|--------------------|--|
| Agent or data collector   | Enabled by default | How to enable  |
| DataPower agent   | ✓                  | <a href="#">“Configuring transaction tracking for the DataPower agent” on page 317</a>   |
| IBM Integration Bus agent   | —                  | <a href="#">“Configuring transaction tracking for the IBM Integration Bus agent” on page 363</a><br><b>Note:</b> TT is not supported if you deploy this agent on Solaris X86.  |
| J2SE data collector   | ✓                  | <a href="#">“Configuring J2SE monitoring” on page 525</a>  |
| JBoss agent   | —                  | <a href="#">“Setup the JBoss agent transaction tracking or diagnostics data collector” on page 543</a>   |
| Liberty data collector  | ✓                  | <a href="#">“Configuring the Liberty data collector in on-premises environments (Liberty V18.* and older versions)” on page 558</a> <a href="#">“Configuring the Liberty data collector in IBM Cloud environment (Liberty V18.* and older versions)” on page 562</a> |
| Microsoft .NET agent  | —                  | <a href="#">“Enabling collection of transaction tracking and diagnostics data” on page 621</a>   |

| Table 4. Transaction tracking enablement for agents and data collectors (continued) |                    |   |
|---|--------------------|---|
| Agent or data collector   | Enabled by default | How to enable   |
| Node.js data collector  | —                  | <a href="#">“Customizing the stand-alone Node.js data collector for IBM Cloud applications” on page 691</a> <a href="#">“Customizing the Node.js data collector for on-premises applications” on page 697</a> |
| Response Time Monitoring agent + HTTP Server agent                                  | —                  | <a href="#">“Planning the installation ” on page 780</a>  |
| SAP NetWeaver Java Stack agent  | —                  | <a href="#">“Enabling the collection of transaction tracking and diagnostics data” on page 866</a>  |
| Tomcat agent  | —                  | <a href="#">“Enabling the collection of transaction tracking and diagnostics data” on page 903</a>  |
| WebLogic agent  | —                  | <a href="#">“Configuring WebLogic monitoring” on page 917</a>   |
| WebSphere Applications agent  | —                  | <a href="#">“Configuring the data collector interactively” on page 941</a><br><b>Note:</b> TT is not supported if you deploy this agent on Solaris X86.   |
| WebSphere MQ agent  | —                  | <a href="#">“Configuring transaction tracking for the WebSphere MQ agent” on page 1030</a><br><b>Note:</b> TT is not supported if you deploy this agent on Solaris X86.                                       |

Data is shown in both the **Aggregate Transaction Topology** and **Transaction Instance Topology** views for all agents that support transaction tracking.

#### Application topology

See how all components are connected in your application environment. For more information, see [“Application - Application Performance Dashboard” on page 1254](#).

#### Transaction instance topology

Visualize the path followed through your environment for each instance of a transaction. For more information, see [“Transaction Instance Topology ” on page 123](#)

#### Synthetic Playback

You can monitor the availability of your internal and external websites by using the Synthetic Playback agent.

For more information about using synthetic transactions, see [“Managing synthetic transactions and events ” on page 1177](#).

#### Deep-dive diagnostics

For specific agents, you can drill-down from summary dashboards to deep-dive diagnostics dashboards and view information about individual requests. Drill down from summary dashboards to view code-level, stack trace, and SQL query detail. Use the diagnostics dashboards to identify which requests have a problem and to debug the problematic transaction. You can also detect, diagnose, and kill hung or slow transactions that are still in progress (see the [WebSphere Applications agent Reference](#)). [Table 5 on page 82](#) provides more information about the diagnostics agents.

Table 5. Diagnostics dashboards of agents and data collectors

| Agent or data collector | Diagnostic data configured by default | Available diagnostics dashboards   | How to access diagnostics dashboards  | How to configure the agent or data collector to collect diagnostic data   |
|-------------------------|---------------------------------------|--|---|---|
| J2SE data collector     | ✓                                     | Detail, Web Modules, Request Instances, Request Summary, Request Traces  | Click <b>Diagnose</b> in the <b>Overview</b> dashboard or <b>Web Modules</b> dashboard.                                   | <a href="#">“Configuring J2SE monitoring” on page 525</a>   |
| JBoss agent             | —                                     | Diagnostic Dashboard, In-flight Requests Summary, In-flight Request Stack Trace Dashboard, JVM Garbage Collection, Heap dump, Heap Dump Comparison | Click <b>Diagnose</b> , <b>Inflight Requests</b> , <b>Details</b> , or <b>Heap Dump</b> in the <b>Overview</b> dashboard. | <a href="#">“Setup the JBoss agent transaction tracking or diagnostics data collector” on page 543</a>  |
| Liberty data collector  | ✓                                     | Detail, Heap dump, Heap Dump Comparison, Memory Analysis   | Click <b>Diagnose</b> , <b>View Heap Dump</b> , or <b>View Memory Analysis</b> in the <b>Overview</b> dashboard.          | <ul style="list-style-type: none"> <li>• <a href="#">“Configuring the Liberty data collector in IBM Cloud environment (Liberty V18.* and older versions)” on page 562</a></li> <li>• <a href="#">“Configuring the Liberty data collector in on-premises environments (Liberty V18.* and older versions)” on page 558</a></li> </ul> |
| Microsoft .NET agent    | —                                     | Request Instances, Request Summary, Request Traces   | Click <b>Diagnose</b> in the <b>Overview</b> dashboard.   | <a href="#">“Enabling the collection of diagnostics data by using the configdc command” on page 622</a>   |
| Node.js agent           | ✓                                     | GC Details, Request Instances, Request Summary, Request Traces   | Click <b>Diagnose</b> in the <b>Overview</b> dashboard.   | <a href="#">“Configuring the Node.js agent” on page 684</a>   |

Table 5. Diagnostics dashboards of agents and data collectors (continued)

| Agent or data collector        | Diagnostic data configured by default | Available diagnostics dashboards   | How to access diagnostics dashboards  | How to configure the agent or data collector to collect diagnostic data  |
|--------------------------------|---------------------------------------|--|---|--|
| Node.js data collector         | ✓                                     | GC Details, Slowest Requests Detail, Request Instances, Request Traces   | Click <b>Diagnose</b> or <b>GC Details</b> in the Overview dashboard.                                     | <ul style="list-style-type: none"> <li>• “Configuring the stand-alone Node.js data collector for IBM Cloud(formerly Bluemix) applications” on <a href="#">page 690</a></li> <li>• “Configuring the stand-alone Node.js data collector for on-premises applications” on <a href="#">page 695</a></li> </ul> |
| Python data collector          | ✓                                     | Slowest Requests Details, Request Instances Detail, Request Traces Detail, Python Thread Details, Python Garbage Collection, Python Heap Details | Click <b>Diagnose</b> , <b>Threads Detail</b> , or <b>Memory Detail</b> in the <b>Overview</b> dashboard. | <ul style="list-style-type: none"> <li>• “Configuring the Python data collector for IBM Cloud applications” on <a href="#">page 765</a></li> <li>• “Configuring the Python data collector for on-premises applications” on <a href="#">page 770</a></li> </ul>   |
| Ruby agent                     | —                                     | Request Summary Detail, Sampled Request Instances, Request Traces  | Click <b>Diagnose</b> in the <b>Overview</b> dashboard.   | “Configuring Ruby monitoring” on <a href="#">page 810</a>  |
| Ruby data collector            | ✓                                     | Request Instances, Request Summary, Request Traces   | Click <b>Diagnose</b> in the <b>Overview</b> dashboard.   | “Configuring the Ruby data collector for IBM Cloud applications” on <a href="#">page 817</a>   |
| SAP NetWeaver Java Stack agent | ✓                                     | Request Instances, Request Summary, Request Traces   | Click <b>Diagnose</b> in the <b>Overview</b> dashboard.   | “Enabling the collection of transaction tracking and diagnostics data” on <a href="#">page 866</a>   |

| Table 5. Diagnostics dashboards of agents and data collectors (continued) |  |  |   |   |
|---|--|--|---|---|
| Agent or data collector   | Diagnostics data configured by default | Available diagnostics dashboards   | How to access diagnostics dashboards  | How to configure the agent or data collector to collect diagnostic data   |
| Tomcat agent  | —                                      | Request Instances, Request Summary, Request Traces   | Click <b>Diagnose</b> in the <b>Overview</b> dashboard.   | <a href="#">“Enabling the collection of transaction tracking and diagnostics data” on page 903</a>  |
| WebLogic agent  | —                                      | Diagnostic Dashboard, In-flight Requests Summary, In-flight Request Stack Trace Dashboard, JVM GC Detail, Heap Dump, Heap Dump Comparison                    | Click <b>Diagnose</b> , <b>View Requests</b> , <b>Details</b> , or <b>Heap Dump</b> in the <b>Overview</b> dashboard.   | <a href="#">“Configuring WebLogic monitoring” on page 917</a>   |
| WebSphere Applications agent  | —                                      | Diagnostics, Request Instance, Request Sequence, In-flight Requests Summary, In-flight Request Stack Trace, Heap dump, Heap Dump Comparison, Memory Analysis | Click <b>Diagnose</b> , <b>View Requests</b> , <b>View Heap Dump</b> , or <b>View Memory Analysis</b> in the <b>Overview</b> dashboard.<br><br>The <b>View Memory Analysis</b> button works only after memory leak monitoring is enabled. | <ul style="list-style-type: none"> <li>• <a href="#">“Configuring the data collector with the simple configuration utility” on page 938</a></li> <li>• <a href="#">“Enabling memory leak monitoring” on page 977</a></li> </ul> |

The **Diagnose** button is enabled only when deep-dive diagnostics is configured for your agent and you are a member of the Role Administrator role, Monitoring Administrator role, or some other custom role that has view permission for Diagnostics Dashboards.

### Thresholds

With thresholds, you can detect specific application behaviors and conditions based on actively monitored definitions. Predefined thresholds are available for each agent and you can define new thresholds for monitoring. For more information, see [“Threshold Manager” on page 1119](#).

When you have event forwarding configured, events are sent to the EIF receiver. You can use the default mapping between thresholds and events forwarded to the event server or customize how thresholds are mapped. For more information, see [“Customizing an event to forward to an EIF receiver” on page 1124](#).

In the **Application Performance Dashboard**, after you select an application, the **Events** tab is displayed. The **Events** tab shows the open events for the current application. You can drill down to detailed dashboards with performance metrics to help you determine the cause of the event. For more information, see [“Event Status” on page 1280](#).

### Resource groups

Managed systems in your monitored enterprise can be categorized by their purpose. Such managed systems often have the same threshold requirements. Use the Resource Group Manager to organize monitored systems into groups that you can assign eventing thresholds to. For more information, see [“Resource Group Manager” on page 1114](#).

### Getting started page

After you log in to the Cloud APM console, you are presented with a Getting Started page. Click any of the **User Tasks** or **Administrator Tasks** to link to a scenario-based tour or video demonstration. "Start now" links take you directly to the feature, such as the Threshold Manager. **Community Resources** links go to **Frequently Asked Questions**, the Cloud APM forum, and more.

Extra features are available through integration with other products and components. For more information, see [“Integration” on page 85](#) and more details in [Chapter 9, “Integrating with other products and components,” on page 1039](#).

## Integration

---

Extra features are provided through integration with other products and components:

Tivoli Monitoring, OMEGAMON, Netcool/OMNIbus, Operations Analytics - Log Analysis, Operations Analytics - Predictive Insights, IBM Cloud, Cloud Private, Tivoli Common Reporting, Cloud Event Management, Agent Builder, and LDAP.

### IBM Tivoli Monitoring

Agent coexistence is supported. You can install IBM Cloud Application Performance Management agents on the same computer where IBM Tivoli Monitoring agents are installed. However, both agent types cannot be installed in the same directory. For more information, see [“Cloud APM agent and Tivoli Monitoring agent coexistence” on page 1040](#).

If your environment has both IBM Tivoli Monitoring and Cloud APM products (cloud, on premises, or both), you can install the IBM Cloud Application Performance Management Hybrid Gateway to provide a consolidated view of managed systems from both environments. For more information, see [“Hybrid Gateway” on page 1043](#). For the list of supported Tivoli Monitoring agents, see [“Supported Tivoli Monitoring and OMEGAMON agents” on page 1044](#).

You can also configure Cloud APM agents to send history information to the Tivoli Data Warehouse component of Tivoli Monitoring for long-term storage. Then, you can use the Tivoli Monitoring version of Tivoli Common Reporting to produce reports that include history information for these agents. For more information, see [“Tivoli Data Warehouse for historical reporting” on page 1055](#).

### IBM OMEGAMON

With OMEGAMON for APM, you can connect one or more OMEGAMON agents that are running on your z Systems® mainframe to Cloud APM. By using OMEGAMON for APM and the Hybrid Gateway to connect your deployed OMEGAMON agents to Cloud APM, you can view monitoring data and events for your OMEGAMON application components in the Cloud APM console.

For more information, see [“Integrating with OMEGAMON” on page 1071](#).

### IBM Netcool/OMNIbus

You can forward your events from Cloud APM into your on-premises Netcool/OMNIbus event manager. For more information, see [“Integrating with Netcool/OMNIbus” on page 1071](#).

### IBM Operations Analytics - Log Analysis

When your environment includes IBM Operations Analytics - Log Analysis, you can bring together application log data and performance data to help find the root cause of problems that are experienced by your applications. You can search through log data that is associated with your applications to find the cause of a problem, such as slowness or a failure. For more information, see [“Integrating with Operations Analytics - Log Analysis” on page 1076](#).

### IBM Operations Analytics - Predictive Insights

Operations Analytics - Predictive Insights analyzes data and learns the normal behavior of a system. It creates a performance model and uses it to detect or forecast behavior outside the modeled range, and generates alarms when anomalous behavior occurs. IBM Cloud Application Performance Management can be integrated with Operations Analytics - Predictive Insights in your environment. You can then view anomalies in the Application Performance Dashboard and drill down to the Operations Analytics - Predictive Insights user interface to view more details. For more information, see [“Integrating with Operations Analytics - Predictive Insights” on page 1077](#).

## IBM Cloud

You can view monitoring information for your applications within the IBM Cloud environment by using the stand-alone data collectors. The data collectors enable the integration of monitoring capabilities with IBM Cloud by transferring resource and deep-dive diagnostics monitoring data about your IBM Cloud applications to the Cloud APM server. The Cloud APM server receives and processes monitoring information that is gathered by the data collectors. The following types of IBM Cloud applications can be monitored:

- Liberty applications
- Node.js applications
- Python applications
- Ruby applications

After configuring a data collector, you can view monitoring data on the Cloud APM console. For more information, see [“General procedure for configuring data collectors”](#) on page 257.

## IBM Cloud Private

You can monitor your Cloud Private environment from the Cloud APM console. For more information, see [“Monitoring IBM Cloud Private”](#) on page 1077.

## Tivoli Common Reporting

Integrate IBM Cloud Application Performance Management with Tivoli Common Reporting to generate reports on data provided by the following agents:

- Response Time Monitoring Agent
- Monitoring Agent for Synthetic Playback
- Monitoring Agent for WebSphere Applications

For more information about integrating with Tivoli Common Reporting, see [“Integrating with Tivoli Common Reporting”](#) on page 1083.

## Dashboard Application Services Hub

Jazz® for Service Management has a Dashboard Application Services Hub console with features for building custom dashboards. You can integrate your Cloud APM server with DASH, then create dashboards in the DASH console with data from your Cloud APM agents and data collectors. For more information, see [“Integrating with Dashboard Application Services Hub”](#) on page 1091.

## Cloud Event Management

You can forward your events from Cloud APM into Cloud Event Management. For more information, see [Integrating with Cloud Event Management](#).

## IBM Agent Builder

You can use Agent Builder to build custom agents for any technology. For more information, see [https://www.ibm.com/support/knowledgecenter/SSMKFH/com.ibm.apmaas.doc/install/agent\\_builder\\_guide.htm](https://www.ibm.com/support/knowledgecenter/SSMKFH/com.ibm.apmaas.doc/install/agent_builder_guide.htm).

## LDAP

You can leverage your LDAP repository in Cloud APM. For configuration instructions, see [“Integrating with LDAP”](#) on page 1097.

# Documentation

---

You can find information for IBM Cloud Application Performance Management in the IBM Knowledge Center and Cloud APM console.

## IBM Knowledge Center

[Cloud APM, Private](#) in the IBM Knowledge Center is the official source of technical information for the product.

## User interface help

When you are logged in to the Cloud APM console or exploring the [Guided Demo](#), you can access the help system:

- Click **Help Contents** from the navigation bar.  Help menu.
- Click  in the Application Performance Dashboard banner.
- Click the **Learn more** link in the System Configuration pages.
- Click  in a dashboard widget.

### IBM Cloud Application Performance Management Forum and dwAnswers

The [Cloud Application Performance Management Forum](#) and [dwAnswers](#) contain technical discussions of product issues, including troubleshooting problems and solutions.

Information is also available at the following websites:

### Software Product Compatibility Reports (SPCR) tool

You can use the SPCR tool to generate various types of reports that are related to offering and component requirements. Search for one of the Cloud Application Performance Management offering names or for IBM Cloud Application Performance Management - Agents.

### IBM Marketplace

Resources such as video demonstrations and FAQs are available in [IBM Marketplace](#).

### IBM API Explorer

For documentation about the Cloud APM APIs, see [“Exploring the APIs” on page 1237](#).

### IBM Terminology

The [IBM Terminology](#) website contains terminology that is relevant to IBM products and consolidated in one convenient location.

### IBM Redbooks®

The IBM Redbooks website contains Redbooks publications, Redpapers, and Redbooks technotes that provide information about products from platform and solution perspectives.

## Conventions used in the documentation

Several conventions are used in the documentation for special terms, actions, commands, paths that are dependent on your operating system, and for platform-specific and product-specific information.

### Typeface conventions

The following typeface conventions are used in the documentation:

#### **Bold**

- Lowercase commands, mixed-case commands, parameters, and environment variables that are otherwise difficult to distinguish from the surrounding text
- Interface controls (check boxes, push buttons, radio buttons, spin buttons, fields, folders, icons, list boxes, items inside list boxes, multicolumn lists, containers, menu choices, menu names, tabs, property sheets), labels (such as **Tip:**)
- Keywords and parameters in text

#### *Italic*

- Citations (examples: titles of publications, diskettes, and CDs)
- Words and phrases defined in text (example: a nonswitched line is called a *point-to-point line*)
- Emphasis of words and letters (example: The LUN address must start with the letter *L*.)
- New terms in text, except in a definition list (example: a *view* is a frame in a workspace that contains data.)
- Variables and values you must provide (example: where *myname* represents...)

#### **Monospace**

- Examples and code examples

- File names, directory names, path names, programming keywords, properties, and other elements that are difficult to distinguish from the surrounding text
- Message text and prompts
- Text that you must type
- Values for arguments or command options

### **Bold monospace**

- Command names, and names of macros and utilities that you can type as commands
- Environment variable names in text
- Keywords
- Parameter names in text: API structure parameters, command parameters and arguments, and configuration parameters
- Process names
- Registry variable names in text
- Script names

### **Operating system-dependent variables and paths**

The direction of the slash for directory paths might vary in the documentation. Regardless of what you see in the documentation, follow these guidelines:

- **Linux** **UNIX** Use a forward slash (/).
- **Windows** Use a backslash (\).

The names of environment variables are not always the same in Windows and AIX. For example, %TEMP % in Windows is equivalent to \$TMPDIR in AIX or Linux.

For environment variables, follow these guidelines:

- **Linux** **UNIX** Use `$variable`.
- **Windows** Use `%variable%`.

**Windows** If you are using the bash shell on a Windows system, you can use the AIX conventions.

### **Installation directory variable and paths for IBM Cloud Application Performance Management server**

`install_dir` is the installation directory for the IBM Cloud Application Performance Management server. For Red Hat Enterprise Linux operating systems, `/opt/ibm` is the default location.

### **Installation directory variable and paths for agents**

`install_dir` is the installation directory for the agents. The default location depends on the operating system:

- **Windows** `C:\IBM\APM`
- **Linux** `/opt/ibm/apm/agent`
- **AIX** `/opt/ibm/apm/agent`

---

## Chapter 4. Planning your deployment

To ensure that your IBM Cloud Application Performance Management deployment is successful, planning is critical.

### System requirements

---

For the IBM Cloud Application Performance Management agents and data collectors, various operating systems are supported and each component has specific requirements. The Cloud APM server requirements vary depending on the number of agents you want to use for monitoring data sources and whether you use your own Db2 server.

#### Permissions

You must have root permissions to install and run the Cloud APM server. Running the Cloud APM server as a non-root user is not supported.

After the Cloud APM server is installed, you cannot change the permissions of the Cloud APM files and directories. In addition, you cannot change the user or group owners of these files and directories.

#### Time zone

Use Network Time Protocol (NTP) on managed systems and on the system where the Cloud APM server is installed to ensure that the time is accurate. Setting the time to match the physical location of the servers (such as UTC-03:00 for Brasilia and UTC +06:30 for Yangon) helps ensure accurate time stamps for events and transactions.

#### Cloud APM agent and data collector requirements

Obtain information about the requirements for each monitoring agent and stand-alone data collector that you plan to install.

Cloud APM agent and data collectors in general are hypervisor transparent, which means they can be installed and deployed on any supported operating systems regardless of the hypervisors that the operating systems are hosted on, such as Hyper-V, IBM PowerVM, KVM, VMWare ESX, and so on.

For the agent and data collector requirements, generate a report from for the selected agent or data collector:

1. Open the IBM Software Product Compatibility Reports for [IBM Cloud Application Performance Management - Agents V8.1](#).
2. Expand the **Report filters** twisty and click the **Edit** button.
3. Edit the report filters for the agent or data collector that you want to review and click **Apply** to generate the report.

For example, if you want to see the requirements for the Cisco UCS agent, clear all the **Agent or Client** check boxes and select the Monitoring Agent for Cisco UCS check box before you click **Apply**.

The local computer system where the agent is installed must support UTF-8 encoding if the agent sends globalized data to the Cloud APM server.

#### Cloud APM server requirements

For up-to-date information about server requirements, such as operating systems and their versions, databases, and web browsers, select the Software Product Compatibility Report for your offering:

- [IBM Cloud Application Performance Management, Base Private V8.1.4](#)
- [IBM Cloud Application Performance Management, Advanced Private V8.1.4](#)

When the report is displayed, click the **Prerequisites** tab to see the browser and database requirements. Click the **Operating Systems** tab to see the operating system requirements for the server.

For information about the Db2 server users and groups that are created by the Cloud APM server installation, see the [“Preparing to install your server” on page 143](#) topic.

## Cloud APM server prerequisites

The Cloud APM server and supporting components are installed by a root user on a Red Hat Enterprise Linux system. Review the Cloud APM server prerequisites to ensure a successful installation.

After you start the installation of the Cloud APM server, a prerequisite scanner runs automatically and checks that all of the Cloud APM server prerequisites are met. A warning or failure message is displayed in the prerequisite scanner results if any of the prerequisites are not met. For more information about running the prerequisite scanner, see [“Prerequisite scanner” on page 167](#).

Table 6 on page 90 displays the Cloud APM server prerequisites, describes failure and warning conditions for each prerequisite, and suggests some corrective action to take.

| Table 6. Cloud APM server prerequisites |   |                                    |   |
|---|---|------------------------------------|---|
| Prerequisite                            | Description   | Failure description in scan report | Correction action   |
| OS version                              | The OS version must be either Red Hat Enterprise Linux V6.* or Red Hat Enterprise Linux V7.*. | The OS is not a supported version. | Install the Cloud APM server on a supported operating system. |

Table 6. Cloud APM server prerequisites (continued)

| Prerequisite | Description   | Failure description in scan report | Correction action   |
|--------------|---|------------------------------------|---|
| os.RAMSize   | <p>The amount of available memory that is required depends on whether you are installing the base or advanced offering and whether the Db2 database is local or remote. The available memory requirements are:</p> <ul style="list-style-type: none"> <li>• For the advanced offering and a local Db2, 24 GB</li> <li>• For the advanced offering and a remote Db2, 20 GB</li> <li>• For the base offering and a local Db2, 16 GB</li> <li>• For the base offering and a remote Db2, 12 GB</li> </ul> | Not enough memory.                 | Extend the memory size on the system to the required level. |

Table 6. Cloud APM server prerequisites (continued)

| Prerequisite  | Description   | Failure description in scan report            | Correction action                                      |
|---------------|---|---|--|
| Disk          | The amount of free disk space that is required depends on whether you are installing the base or advanced offering and whether the Db2 database is local or remote. The free disk space requirements are in <a href="#">“Cloud APM server hardware requirements”</a> on page 111.           | Not enough disk space for the installation.   | Delete any unused files or enlarge the disk partition. |
| os.swapSize   | 4 GB or more of free swap space is recommended for the installation.<br><br>A warning is displayed if the swap size is 2 - 4 GB. The installation can continue but the server might experience poorer performance.<br><br>A FAIL condition is displayed if the swap size is less than 2 GB. | Not enough swap space available.              | Create or increase the available swap space.           |
| numLogicalCPU | The system must have at least 4 logical CPUs.<br><br>A warning is displayed if the number of CPUs is 2 - 4.   | The system must have at least 4 logical CPUs. | Increase the number of logical CPUs.                   |

Table 6. Cloud APM server prerequisites (continued)

| Prerequisite        | Description  | Failure description in scan report  | Correction action                                      |
|---------------------|--|---|--|
| os.space.homedir    | At least 1 GB of space is required in the <i>/home</i> directory.  | Not enough disk space in the <i>/home</i> directory.  | Delete any unused files or enlarge the disk partition. |
| os.space.installdir | <p>The amount of free space that is required in the <i>/install_dir</i> directory depends on whether you are installing the base or advanced offering and whether the Db2 database is local or remote. The free space requirements are:</p> <ul style="list-style-type: none"> <li>• For the advanced offering and a local Db2, 80 GB</li> <li>• For the advanced offering and a remote Db2, 30 GB</li> <li>• For the base offering and a local Db2, 60 GB</li> <li>• For the base offering and a remote Db2, 20 GB</li> </ul> | Not enough disk space in the <i>/install_dir</i> directory.   | Delete any unused files or enlarge the disk partition. |
| os.space.tmpdir     | 2 to 3 GB of free space is required in the system's temp directory for the installation.   | Not enough disk space in the system's temporary directory (for example, <i>/tmp/</i> on Linux/AIX). | Delete any unused files or enlarge the disk partition. |

Table 6. Cloud APM server prerequisites (continued)

| Prerequisite                                    | Description  | Failure description in scan report   | Correction action   |
|---|--|--|---|
| os.dir.opt=dir:/opt/ibm,<br>type:permission755+ | The /install_dir directory must have at least read/write/execute permissions for the owner and at least read/execute permissions for the group and others. | A permissions issue was found with install_dir.  | Check whether the install_dir partition directory has at least read/write/execute permissions for the owner and read/execute permissions for group and other. Modify install_dir permissions. For example: <code>chmod u+rxwx,go+rx /install_dir</code> . |
| os.umask  | The shell umask must be set to 0022.   | The shell umask is set to a different value than 0022. Some components, for example, the Db2 server, do not install properly if there are insufficient permissions on certain files. | Set umask to 0022 before you run the installer: <code>umask 0022; ./install.sh</code>   |
| os.dir.tmp=dir:/tmp,<br>type:permission777+     | The /tmp directory must have at least read/write/execute permissions for the owner and at least read/execute permissions for the group and others.         | A permissions issue was found with the /tmp directory.   | Check whether the /tmp partition directory has at least read/write/execute permissions for the owner and read/execute permissions for group and other. Modify permissions for /tmp. For example: <code>chmod u+rxwx,go+rx /tmp</code>                     |
| CpuArchitecture                                 | The CPU processor architecture must be an Intel or AMD 64-bit CPU.   | Processor architecture is not either an Intel or AMD 64-bit CPU.   | Run the server installation on an Intel or AMD 64-bit compatible system.  |

Table 6. Cloud APM server prerequisites (continued)

| Prerequisite                                | Description  | Failure description in scan report  | Correction action   |
|---|--|---|---|
| rpmdbStatusCorrect                          | The RPM package database must be intact.   | The RPM package database is not intact.                                       | To solve this problem, complete the following steps:<br><br>1. Remove the <code>rm -rf /var/lib/rpm/__db.00*</code> rpm lock files.<br><br>2. To rebuild the RPM database, enter the <code>rpm --rebuilddb</code> command.<br><br>3. To uninstall all the components that you installed to the <code>/opt/ibm/</code> directory, enter the <code>/opt/ibm/ccm/uninstall.sh</code> command.<br><br>4. To restart the installation, run <code>./install.sh</code> . |
| os.localhostInHostFile                      | The localhost host name must be specified in the <code>/etc/hosts</code> file.   | The localhost host name is not available in the <code>/etc/hosts</code> file. | Add an entry to the <code>/etc/hosts</code> file to define the localhost host name.   |
| os.ulimit=[type:maxprocesseslimit] 4096+    | The operating system must allow a user to have at least 4096 processes running. If less than that value, a FAIL condition is returned and the Cloud APM server installation fails. | The maximum number of user processes is set too low on this operating system. | For more information about checking the limits and changing them, see <a href="#">“Resolving maximum number of user processes, open files, and core file dependency failures” on page 102.</a>  |
| os.ulimit=[type:filedescriptorlimit] 32768+ | The operating system must allow a user to have at least 32,768 open files. If less than that value, a FAIL condition is returned and the Cloud APM server installation fails.      | The maximum number of open files is set too low on this operating system.     | For more information about checking the limits and changing them, see <a href="#">“Resolving maximum number of user processes, open files, and core file dependency failures” on page 102.</a>  |

Table 6. Cloud APM server prerequisites (continued)

| Prerequisite   | Description  | Failure description in scan report  | Correction action   |
|--|--|---|---|
| os.ulimit=[type:corefilesizelimit] 390000+   | The operating system must allow a user to create a core dump of at least 390000 KB. If less than that value, a FAIL condition is returned and the Cloud APM server installation fails. | The maximum size of the core file is set too low on this operating system.                          | For more information about checking the limits and changing them, see <a href="#">“Resolving maximum number of user processes, open files, and core file dependency failures”</a> on page 102.  |
| os.mountcheck.tmp_nosuid, s.mountcheck.home_noexec, os.mountcheck.tmp_nosuid, and os.mountcheck.tmp_noexec | The /tmp or /home partitions must not be mounted with nosuid or noexec flags or both.  | The /tmp or /home partitions are mounted with nosuid or noexec options. The installation will fail. | Remount /tmp or /home and remove nosuid or noexec flags.  |
| network.availablePorts.*   | The ports in <a href="#">Table 9 on page 104</a> and <a href="#">Table 10 on page 106</a> in <a href="#">“Cloud APM server ports”</a> on page 104 must be available.                   | The specified port is not available.  | If a firewall is blocking the ports, you can either configure the firewall to allow traffic on certain ports or disable the firewall. For more information, see <a href="#">“Configuring the firewall for incoming requests to the server”</a> on page 145. |

Table 6. Cloud APM server prerequisites (continued)

| Prerequisite      | Description  | Failure description in scan report   | Correction action   |
|-------------------|--|--|---|
| network.ping.Self | It must be possible to resolve the host name of the local computer system.                       | The host name of the local computer system cannot be resolved.                       | <p>If the self-ping test fails, complete one of these steps:</p> <ol style="list-style-type: none"> <li>1. If you use a DNS server for host name resolution, complete these steps: <ul style="list-style-type: none"> <li>• Check that the <code>/etc/resolv.conf</code> file exists and that it has entries for your DNS servers.</li> <li>• Verify that your DNS servers are reachable. Open a command prompt and enter: <pre>ping DNS_server_IP_address</pre> </li> </ul> </li> <li>2. If you use the <code>/etc/hosts</code> file for host name resolution, check that the <code>/etc/hosts</code> file has an entry for your local computer system.</li> <li>3. If the IP address of your local computer system is assigned by a DHCP server, check that network interfaces are configured and that an IP address and a netmask are assigned to each interface in the DHCP configuration.</li> </ol> |
| os.package.ksh    | The KornShell (ksh) package that is required for the Summarization and Pruning agent is missing. | The ksh package that is required for the Summarization and Pruning agent is missing. | You must first install the missing package, and start the installation again. (See "Tips for resolving unmet dependencies" in "Cloud APM server prerequisites" on page 90.)   |
| os.package.bash   | A bash package that is required for the Cloud APM server is missing.                             | The bash package that is required for the Cloud APM server is missing.               | You must first install the missing package, and start the installation again. (See "Tips for resolving unmet dependencies" in "Cloud APM server prerequisites" on page 90.)   |
| os.package.lsof   | The List Open Files (lsof) package that is required for the Cloud APM server is missing.         | The lsof package that is required for the Cloud APM server is missing.               | You must first install the missing package, and start the installation again. (See "Tips for resolving unmet dependencies" in "Cloud APM server prerequisites" on page 90.)   |

Table 6. Cloud APM server prerequisites (continued)

(See "Tips for resolving unmet dependencies" in <a href="#">"Cloud APM server prerequisites"</a> on page 90.) |
| os.lib.libstdc_64=regex {libstdc++\.so\.5} | A library that is required for the Cloud APM server is missing.             | A library that is required for the Cloud APM server is missing.             | You must first install the missing libraries, and start the installation again. (See "Tips for resolving unmet dependencies" in <a href="#">"Cloud APM server prerequisites"</a> on page 90.) |
| os.lib.libstdc_64=regex {libstdc++\.so\.6} | A library that is required for the Cloud APM server is missing.             | A library that is required for the Cloud APM server is missing.             | You must first install the missing libraries, and start the installation again. (See "Tips for resolving unmet dependencies" in <a href="#">"Cloud APM server prerequisites"</a> on page 90.) |

Table 7 on page 99 displays the Db2-related Cloud APM server prerequisites, describes failure and warning conditions for each prerequisite, and suggests some corrective action to take.

| Table 7. Db2-related prerequisites |  |  |  |
|------------------------------------|--|--|--|
| Prerequisite                       | Description  | Failure description in scan report                                 | Corrective action  |
| db2.isInstalled                    | A Db2 server must not exist on the local system.   | An existing Db2 server installation was discovered on system.      | Uninstall the existing Db2 server or choose a different system.  |
| db2.usersNotPresent                | A warning is displayed if users that are required by the Db2 server are detected on the system. The users are as follows: <ul style="list-style-type: none"> <li>• itmuser</li> <li>• dasusr1</li> <li>• db2apm</li> <li>• db2fenc1</li> </ul> | Users that are required by Db2 server were detected on the system. | Remove users or provide valid passwords for the users in the <code>install_dir/install.properties</code> file, which is available in the root directory of the installation media. If you do not remove the users then ensure the db2apm user is not a member of the root group. |
| db2.groupsNotPresent               | A warning is displayed if groups that are required by the Db2 server are detected on the system.   | Groups that are required by Db2 server are detected on the system. | Remove existing groups or allow the installer use the groups for Db2 installation.   |
| db2.servicesNotPresent             | Db2 services must not be running on the system.  | Running Db2 services were discovered on the system.                | Uninstall the existing Db2 server, clean up all remaining services, or choose a different system.  |
| os.isUnixServiceRunning .crond     | The Db2 server requires that the crond service is running.   | The crond service is not running.                                  | Start crond service.<br><br>If you create a Db2 database on an external system or if you connect to a MongoDB database on an external system, you must verify that the cron service is running on these systems.   |
| os.kernelversion                   | The Db2 installation requires Linux kernel version 2.6.16 or higher.   | The kernel version is not supported.                               | Use a supported kernel version.  |

Table 7. Db2-related prerequisites (continued)

| Prerequisite                                 | Description  | Failure description in scan report             | Corrective action   |
|--|--|--|---|
| os.kernelsNotSupported                       | When you install the Db2 agent on the Db2 server and on some VMs, the installation requires that the Linux Kernel versions not be in the range from 2.6.32-434 to 2.6.32-504.7.1 | The kernel version is not supported.           | You must upgrade to one of the supported versions. Any other kernel starting from 2.6.16 or higher is valid.  |
| os.isLDAPConfigured                          | A warning is displayed if LDAP is configured on the system.  | System is configured to work with LDAP.        | The /etc/nsswitch.conf file contains sss (System Security Services) or ldap, or winbind (Windows Active Directory) entries for password. It may cause problems when existing Db2-related users are present in LDAP and have different password than the one defined in the install_dir/install.properties file. If an itmuser and Db2 instance users are configured in your LDAP directory and you plan to install the Cloud APM server with a local Db2 server, follow the instructions in <a href="#">“Installing on a system using an external directory service” on page 156.</a> |
| os.lib.libstdc++_32=regex {libstdc++\.so\.6} | A library that is required for Db2 is missing.   | A library that is required for Db2 is missing. | You must first install the missing libraries, and start the installation again. (See <a href="#">“Tips for resolving unmet dependencies” in “Cloud APM server prerequisites” on page 90.</a> )  |
| os.lib.pam_64=regex {libpam\.so\.*}          | A library that is required for Db2 is missing.   | A library that is required for Db2 is missing. | You must first install the missing libraries, and start the installation again. (See <a href="#">“Tips for resolving unmet dependencies” in “Cloud APM server prerequisites” on page 90.</a> )  |
| os.lib.pam_32=regex {libpam\.so\.*}          | A library that is required for Db2 is missing.   | A library that is required for Db2 is missing. | You must first install the missing libraries, and start the installation again. (See <a href="#">“Tips for resolving unmet dependencies” in “Cloud APM server prerequisites” on page 90.</a> )  |

| Table 7. Db2-related prerequisites (continued)      |   |   |  |
|---|---|---|--|
| Prerequisite  | Description   | Failure description in scan report                      | Corrective action  |
| os.package.sg3_utils<br>=sg3_utils                  | A library that is required for Db2 is missing.  | A library that is required for Db2 is missing.          | You must first install the missing libraries, and start the installation again. (See "Tips for resolving unmet dependencies" in "Cloud APM server prerequisites" on page 90.)  |
| os.dir.home<br>=[dir:/home,type:permission]<br>755+ | The /home directory of the Db2 users itmuser, dasusr1, db2apm, and db2fenc1 must have at least read/write/execute permissions for the owner and at least read/execute permissions for the group and others. | A permissions issue was found with the /home directory. | Check whether the /home directory has at least read/write/execute permissions for the owner and read/execute permissions for group and other. Modify /home permissions. For example: <code>chmod u+rw,go+rx /home</code> . |

## Tips for resolving unmet dependencies

You must meet all of the Cloud APM server dependencies for a successful installation.

## Resolving RPM dependency failures

The Cloud APM server uses Red Hat Package Manager (RPM) files to install the software. Without the required libraries and other software, the prerequisite scanner fails and displays a failure explanation, such as:

|                                  |                                 |                |                      |
|----------------------------------|---------------------------------|----------------|----------------------|
| Expected<br>regex(libstdc++.so.6 | Property<br>os.lib.libstdc++_32 | Result<br>FAIL | Found<br>Unavailable |
|----------------------------------|---------------------------------|----------------|----------------------|

A Red Hat Enterprise Linux client that is correctly configured to use the yum (Yellowdog Updater, Modified) package manager can resolve and install any missing dependencies that are required by the RPMs. For more information about yum commands, see [What is yum? How do I use it?](#).

When the prerequisite scanner returns errors because of failed dependencies, you can run the yum provides *feature\_name* command to learn what is required, and the yum install *feature\_name* command to install the missing dependency. For example:

### Error

The prerequisite scanner shows the following failure message:

```
error: Failed dependencies:
libstdc++.so.6 is needed by...
```

### Command "yum provides"

Enter the following command:

```
yum provides libstdc++.so.6
```

The following report is displayed:

```
libstdc++-4.4.7-3.el6.i686 : GNU Standard C++ Library
Repo      : installed
Matched from:
Other     : Provides-match: libstdc++.so.6
```

### Command "yum install"

Enter the following command to satisfy the missing feature:

```
yum install libstdc++-4.4.7-3.el6.i686
```

### Command "yum install"

Enter the following command to install all prerequisites:

```
yum -y install --setopt=protected_multilib=false ksh libstdc++.i686 pam.i686
pam.x86_64 sg3_utils bc rsync lsof net-tools unzip zip nmap libaio
```

Table 8 on page 102 displays some of the failure message you might see for missing files and libraries on Linux and the RPM that you can install to resolve them.

| Table 8. Sample error messages for failed dependencies on Linux and the possible resolution RPM  |  |
|--|--|
| Failure message  | Possible resolution                              |
| error: Failed dependencies: libstdc++-4.4.6-4.el6.i686 is needed by...   | rpm -Uhv libstdc++-4.4.6-4.el6.i686.rpm          |
| error: Failed dependencies:<br>libgcc_s.so.1 is needed by libstdc++-4.4.6-4.el6.i686<br>libgcc_s.so.1(GCC_3.0) is needed by libstdc++-4.4.6-4.el6.i686<br>libgcc_s.so.1(GCC_3.3) is needed by libstdc++-4.4.6-4.el6.i686<br>libgcc_s.so.1(GCC_4.2.0) is needed by libstdc++-4.4.6-4.el6.i686<br>libgcc_s.so.1(GLIBC_2.0) is needed by libstdc++-4.4.6-4.el6.i686 | rpm -Uhv libgcc-4.4.6-4.el6.i686.rpm             |
| error: Failed dependencies: compat-libstdc++-33(i686) is needed by...  | rpm -Uhv compat-libstdc++-33-3.2-69.el6.i686.rpm |

## Resolving maximum number of user processes, open files, and core file dependency failures

Limits are set on the maximum number of user processes, the maximum number of open files, and maximum size of a core file on the system where you plan to install the Cloud APM server. For the limits, see “Cloud APM server prerequisites” on page 90. You might want to check or change these limits.

**Important:** You must set or change the limits permanently rather than for the current shell session only by editing the `/etc/security/limits.conf` file. Then, the changes are applied to new sessions and processes. You must reboot your system to ensure that the changes occur. A suggested setup for the `/etc/security/limits.conf` file is shown here:

```
* soft nofile 32768
* hard nofile 65536
* soft core unlimited
```

**Attention:** If you use the following ulimit commands to set or change the ulimits, the updates are only temporary for the current user session.

To check the current system limits, enter the following commands:

- **ulimit -a** returns all limits
- **ulimit -u** returns the maximum number of processes available to a single user
- **ulimit -n** returns the maximum number of open file descriptors
- **ulimit -c** returns the maximum core file size

To increase the limit for the current shell session, enter the following commands:

- **ulimit -u *new\_limit*** sets the maximum number of processes. Example: `ulimit -u 4096`
- **ulimit -n *new\_limit*** sets the maximum number of open files descriptors. Example: `ulimit -n 32768`
- **ulimit -c *new\_limit*** sets the maximum core file size. Example: `ulimit -c 390000`

## Resolving IPv4 and IPv6 protocol dependencies in the loopback interface

If `localhost` is defined for the IPv4 and IPv6 interfaces in `/etc/hosts`, but the IPv4 and/or IPv6 protocols are disabled in the loopback interface, then the prerequisite scanner test will fail.

For example, the prerequisite scanner displays the following result:

| Property<br>=====                 | Result<br>===== | Found<br>===== | Expected<br>===== |
|-----------------------------------|-----------------|----------------|-------------------|
| network.loopbackMatchesHosts.ipv6 | FAIL            | False          | True              |

This result indicates that the IPv4 and IPv6 protocols in the loopback interface do not match the values for `localhost` in the `/etc/hosts` file. To fix this issue, you can either remove the IPv4/IPv6 `localhost` definition in the hosts file, or else enable the IPv4/IPv6 protocol in the loopback interface.

To check to see if the IPv4 and IPv6 protocols are defined in the loopback interface, run **ifconfig** for your loopback interface. For example, if your loopback interface is called `lo`, run the command `ifconfig lo` in the terminal.

To remove the IPv4/IPv6 `localhost` definition from the hosts file, complete the following steps:

1. Open the `/etc/hosts` file for editing.
2. Locate the lines that contain the defined values for your IPv4 and IPv6 interfaces. For example,

```
127.0.0.1 localhost localhost.localdomain localhost4 localhost4.localdomain4
::1 localhost localhost.localdomain localhost6 localhost6.localdomain6
```

3. Remove the words `localhost` and `localhost.localdomain` from the line that contains the IPv4 or IPv6 interface that caused the prerequisite scanner to fail. For example, change the following line:

```
::1 localhost localhost.localdomain localhost6 localhost6.localdomain6
```

to

```
::1 localhost6 localhost6.localdomain6
```

4. Save your updated hosts file and reboot your machine.

To enable the IPv4 or IPv6 protocol on the loopback interface, run the appropriate command:

- To enable the IPv4 protocol, run the following command:

```
sysctl -w net.ipv4.conf.Io.disable_ipv4=0
```

where `Io` is the name of your loopback interface.

- To enable the IPv6 protocol, run the following command:

```
sysctl -w net.ipv6.conf.Io.disable_ipv6=0
```

where `Io` is the name of your loopback interface.

After enabling the protocol, reboot your machine.

## Cloud APM server ports

The prerequisite scanner checks whether internal and external ports are available for communication on the Cloud APM server.

Two types of ports are used by the Cloud APM server:

- One type of port must be available and opened on the firewall. Such ports are for external communication, and you must open them on the firewall or disable the firewall. See [Table 9 on page 104](#).
- The other type of port is used for internal communication between components. Such ports must be available but can be blocked by the firewall because they do not require external communication. It is necessary to keep these ports from being used by any applications that are installed on the Cloud APM server. See [Table 10 on page 106](#).

For each port that is used for external communication, one side sends a request and the other side provides a response. The side that initiates the connection is indicated for each port in [Table 9 on page 104](#).

For the list of ports that must be available for external communication on a Hybrid Gateway, see [“Installing the Hybrid Gateway” on page 1046](#).

The prerequisite scanner checks whether the ports in [Table 9 on page 104](#) and [Table 10 on page 106](#) are available and returns FAIL for each port that is not available.

| <i>Table 9. Ports for external communication</i> |   |
|--|---|
| Port   | Description   |
| 80   | <p>If you use HTTP to communicate with the Cloud APM server, open port 80. The agents and the Hybrid Gateway initiate a unidirectional connection with the Cloud APM server on port 80. HTTP communication is the default option.</p> <p>A firewall can be used to block external access to this port if you want to use HTTPS only for agent to Cloud APM server.</p> <p>The port is labeled MINHTTP in the prerequisite scanner output.</p> |
| 443  | <p>If you use HTTPS to communicate with the Cloud APM server, open port 443. The agents and the Hybrid Gateway initiate a unidirectional connection with the Cloud APM server on port 443.</p> <p>The port is labeled MINHTTPS in the prerequisite scanner output.</p>  |
| 9443   | <p>If you use HTTPS to communicate with the Cloud APM server, open port 9443. The Cloud APM console browser initiates a unidirectional connection with the Cloud APM server on port 9443.</p> <p>The port is labeled APMUIHTTPS in the prerequisite scanner output.</p>   |
| 8099   | <p>Open port 8099 for Open ID Connect (OIDC) authentication. As part of the Cloud APM console user authentication process, a user's browser might be redirected to port 8099. The Cloud APM console browser initiates a unidirectional connection with the Cloud APM server on port 8099.</p> <p>The port is labeled OIDCHTTPS in the prerequisite scanner output.</p>  |
| 50000  | <p>If you configure the Cloud APM server to connect to a remote Db2 server, open port 50000. Either the Db2 server or the Cloud APM server can initiate a connection on this port.</p> <p>The port is labeled DB2 in the prerequisite scanner output.</p>   |

Table 9. Ports for external communication (continued)

| Port          | Description   |
|---------------|---|
| 27000         | <p>If you configure the Cloud APM server to connect to a remote MongoDB, a firewall must allow access to port 27000. The Cloud APM server initiates a unidirectional connection with MongoDB on port 27000.</p> <p>If you use the local MongoDB, then external access to port 27000 can be blocked.</p> <p>The port is labeled MONGODB in the prerequisite scanner output.</p>  |
| 8091 and 8099 | <p>To use the Threshold Manager API or the Resource Group Management Service API, or both, open ports 8091 and 8099.</p> <p>API users initiate a unidirectional connection with the Cloud APM server.</p> <p>Port 8091 is labeled SERVER1HTTPS in the prerequisite scanner output. Port 8099 is labeled OIHTTPS in the prerequisite scanner output.</p>   |
| 9443 and 8099 | <p>To use the Role Based Access Control (RBAC) API, open ports 9443 and 8099. For more information about the RBAC API, see <a href="#">“Accessing and using the Role-Based Access Control Service API”</a> on page 1156.</p> <p>API users initiate a unidirectional connection with the Cloud APM server.</p> <p>Port 9443 is labeled APMUIHTTPS in the prerequisite scanner output. Port 8099 is labeled OIHTTPS in the prerequisite scanner output.</p>   |
| 9998          | <p>If you configure the Cloud APM server to send EIF messages to an EIF receiver, such as the Probe for Tivoli EIF, open port 9998. To use a custom port, update the value of the <b>EIF Port</b> setting in the Event Manager category of the <b>Advanced Configuration</b> window (see <a href="#">“Event Manager”</a> on page 1240). The Cloud APM server initiates a unidirectional connection with the EIF receiver.</p> <p>The port is labeled FNEIFRCVR in the prerequisite scanner output.</p>      |
| 389 or 636    | <p>If you plan to use LDAP to authenticate users of the Cloud APM console, open the port that is used by your LDAP server. Usually, you open port 389 but if you set up the LDAP server to require SSL/TLS encrypted connections, open port 636. Contact your LDAP server team to confirm which port numbers are used by your LDAP servers. The Cloud APM server initiates this unidirectional connection with the LDAP server.</p> <p>These ports are not included in the prerequisite scanner output.</p> |
| 8093          | <p>If you plan to use the Universal View feature for defining dashboard pages in the <b>Custom Views</b> tab of the Application Performance Dashboard, open port 8093 through a firewall. The Cloud APM console browser initiates a unidirectional connection with the Cloud APM server on port 8093.</p> <p>The port is labeled UVIEWSHTTPS in the prerequisite scanner output.</p>  |

**Note:**

- Other ports may be used for external communication if you integrate the Cloud APM server with other products such as Tivoli Common Reporting. See the documentation for these products that you plan to integrate with the Cloud APM server to determine what ports they use. For links to the related documentation, see [Table 21 on page 139](#) in the *Part numbers* topic.
- If a firewall is blocking the ports, you can either configure the firewall to allow traffic on certain ports or disable the firewall. For more information, see [“Configuring the firewall for incoming requests to the server”](#) on page 145.

*Table 10. Ports for internal communication between server components*

| <b>Port</b> | <b>Component</b>   |
|-------------|--|
| 80          | Port used by APM services to send requests to the min service.<br>The port is labeled MINHTTP in the prerequisite scanner output.  |
| 1527        | Port for Service Component Registry database.<br>The port is labeled SCRDERBYDB in the prerequisite scanner output.  |
| 2181        | Port for the Zookeeper process of Kafka Message Broker.<br>The port is labeled ZOOKEEPER in the prerequisite scanner output.   |
| 50000       | Port for the Db2 server. If you connect to a local Db2 server, this port must be unblocked for internal communication.<br>The port is labeled DB2 in the prerequisite scanner output.  |
| 6066        | Port for Spark applications 2.<br>The port is labeled SPARKAAPPS2 in the prerequisite scanner output.  |
| 6414        | Port for Gaian database.<br>The port is labeled FNGAIANDB in the prerequisite scanner output.  |
| 7077        | Port for the Spark applications 1.<br>The port is labeled SPARKAAPPS1 in the prerequisite scanner output.  |
| 8080        | This is the HTTP port for the Cloud APM console. However, if you attempt to connect to the console using HTTP and port 8080, you are redirected to use HTTPS and port 9443.<br>The port is labeled APMUIHTTP in the prerequisite scanner output. |
| 18080       | Port for the Spark master.<br>The port is labeled SPARKMASTER in the prerequisite scanner output.  |
| 18085       | Port for the Spark worker.<br>The port is labeled SPARKWORKER in the prerequisite scanner output.  |
| 8090        | Port for Cloud APM console back end connection.<br>The port is labeled SERVER1HTTP in the prerequisite scanner output.   |
| 8091        | Port for secure Cloud APM console back end connection.<br>The port is labeled SERVER1HTTPS in the prerequisite scanner output.   |
| 8092        | This is the HTTP port for the uviews service, which is used for the <b>Custom Views</b> tab of the Application Performance Dashboard.<br>The ports is labeled UVIEWSHHTTP in the prerequisite scanner output.                                    |
| 9090        | Port for Cloud APM data collector back end   |
| 9453        | Port for secure Cloud APM data collector back end  |
| 9092        | Port for Kafka Message Broker<br>The port is labeled KAFKA1 in the prerequisite scanner output.  |

| <i>Table 10. Ports for internal communication between server components (continued)</i> |  |
|---|--|
| <b>Port</b>   | <b>Component</b>   |
| 9989  | Port for Kafka Message Broker<br>The port is labeled KAFKA2 in the prerequisite scanner output.  |
| 10001   | Port for Open Services for Lifecycle Collaboration service provider.<br>The port is labeled OSLCPM in the prerequisite scanner output.   |
| 12315   | Port for Service Component Registry Java back end.<br>The port is labeled SCRJAVABKEND in the prerequisite scanner output.   |
| 27000   | Port for the MongoDB database. If you connect to a local MongoDB, this port must be unblocked for internal communication.<br>The port is labeled MONGODB in the prerequisite scanner output. |
| 13245   | Port 1 for role-based access control.<br>The port is labeled RBACSERVER1 in the prerequisite scanner output.   |
| 13246   | Port 2 for role-based access control.<br>The port is labeled RBACSERVER2 in the prerequisite scanner output.   |
| 13247   | Port 3 for role-based access control.<br>The port is labeled RBACSERVER3 in the prerequisite scanner output.   |
| 13248   | Port 4 for role-based access control.<br>The port is labeled RBACSERVER4 in the prerequisite scanner output.   |
| 32105   | Port for internal messaging.<br>The port is labeled FNINTMSG in the prerequisite scanner output.   |

## Default ports used by agents and data collectors

Various ports are used for communication between the Cloud APM component and the application or system (either local or remote) that is being monitored. In most cases, default ports are provided to facilitate configuration. Most defaults can be customized by using configuration parameters.

Table 11 on page 108 lists the default ports that are used by the Cloud APM agents and data collectors to communicate with the applications or systems that they are monitoring. N/A in the table indicates one of the following situations:

- The agent or data collector does not use any port to communicate with the monitored application or system.
- The port used for communication is determined by configuration of the monitored application.
- Ports used by the agent or data collector are dynamically assigned and no static defaults are provided.
- All ports to be used must be specified by the user and no defaults are provided.

For the ports used for communication between the Cloud APM server and the agents or data collectors, see [“Cloud APM server ports” on page 104](#).

| Table 11. Default ports used by agents and data collectors |   |              |       |        |
|--|---|--------------|-------|--------|
| Agents and data collectors                                 | Default ports   | Configurable | Local | Remote |
| Amazon EC2 agent   | <ul style="list-style-type: none"> <li>TCP port 80 (for HTTP)</li> <li>TCP port 443 (for HTTPS)</li> </ul>  | N/A          | Yes   | No     |
| Amazon ELB agent   | <ul style="list-style-type: none"> <li>TCP port 80 (for HTTP)</li> <li>TCP port 443 (for HTTPS)</li> </ul>  | N/A          | No    | No     |
| Azure Compute agent  | <ul style="list-style-type: none"> <li>TCP port 80 (for HTTP)</li> <li>TCP port 443 (for HTTPS)</li> </ul>  | No           | No    | No     |
| Cassandra agent  | 7199 (for JMX server, local and remote)   | Yes          | Yes   | Yes    |
| Cisco UCS agent  | <ul style="list-style-type: none"> <li>TCP port 80 (for HTTP)</li> <li>TCP port 443 (for HTTPS)</li> </ul>  | No           | Yes   | No     |
| Citrix VDI agent   | For PowerShell calls: <ul style="list-style-type: none"> <li>5985 (for HTTP)</li> <li>5986 (for HTTPS)</li> </ul>   | Yes          | Yes   | Yes    |
| Db2 agent  | <ul style="list-style-type: none"> <li>50000 (default port of Db2 server)</li> <li>Remote Monitoring supported: Uses port number given by the user while cataloging the remote server instance.</li> </ul>  | Yes          | Yes   | Yes    |
| DataPower agent  | 5550 (for connecting to remote DataPower appliance)   | Yes          | No    | Yes    |
| Hadoop agent   | <ul style="list-style-type: none"> <li>Local monitoring: <b>CP_PORT</b> environment variable value</li> <li>Remote monitoring:               <ul style="list-style-type: none"> <li>50070 (Standby Namenode)</li> <li>50090 (Secondary Namenode)</li> <li>8088 (ResourceManager)</li> <li>19888 (JobHistory Server)</li> <li>8080 (Ambari)</li> </ul> </li> </ul> | Yes          | Yes   | Yes    |
| HMC Base agent   | 12443 (for downloading SDK from HMC)  | No           | Yes   | No     |
| HTTP Server agent  | HTTP server might be configured to different port, but the agent itself has no default port.  | N/A          | Yes   | No     |
| IBM Cloud agent  | Outgoing connection to api.softlayer.com port 443.  | N/A          | No    | Yes    |
| IBM Integration Bus agent                                  | N/A   | N/A          | Yes   | No     |

Table 11. Default ports used by agents and data collectors (continued)

| Agents and data collectors        | Default ports  | Configurable               | Local | Remote |
|-----------------------------------|--|----------------------------|-------|--------|
| Internet Service Monitoring       | For databridge: <ul style="list-style-type: none"> <li>• 9510</li> <li>• 9520</li> </ul>   | Yes                        | No    | Yes    |
| DataStage agent                   | <ul style="list-style-type: none"> <li>• 9443 (WAS HTTPS port)</li> <li>• 50000 (Database JDBC port)</li> <li>• 1433 (Microsoft SQL)</li> <li>• 1521 (Oracle)</li> </ul> | Yes                        | Yes   | Yes    |
| J2SE data collector               | N/A  | N/A                        | No    | No     |
| JBoss agent                       | Varies according to the version of the JBoss server: <ul style="list-style-type: none"> <li>• 9990</li> <li>• 9994</li> <li>• 9999</li> </ul>                            | No                         | Yes   | No     |
| Liberty data collector            | N/A  | N/A                        | No    | No     |
| Linux KVM agent                   | <ul style="list-style-type: none"> <li>• 8080 (for HTTP)</li> <li>• 8443 (for HTTPS)</li> </ul>  | Yes                        | Yes   | No     |
| Linux OS agent                    | 22 (for remote log monitoring with SSH)  | Yes                        | Yes   | No     |
| MariaDB agent                     | 3306   | Yes                        | Yes   | Yes    |
| Microsoft Active Directory agent  | The port number depends on the listener setting for monitoring usage.  | N/A                        | Yes   | Yes    |
| Microsoft Cluster Server agent    | N/A  | N/A                        | No    | No     |
| Microsoft Exchange Server agent   | N/A  | N/A                        | No    | No     |
| Microsoft Hyper-V Server agent    | N/A  | N/A                        | No    | No     |
| Microsoft IIS agent               | N/A  | N/A                        | No    | No     |
| Microsoft .NET agent              | To send transaction tracking data, port 5456 is used by default.   | Yes                        | Yes   | No     |
| Microsoft Office 365 agent        | 7799 (for Skype synthetic transaction)   | Yes                        | Yes   | No     |
| Microsoft SharePoint Server agent | 1433 (for SQL server)  | No                         | Yes   | Yes    |
| Microsoft SQL Server agent        | 1433 (default of SQL server)   | Yes (by <b>COLL_PORT</b> ) | Yes   | No     |

Table 11. Default ports used by agents and data collectors (continued)

| Agents and data collectors     | Default ports  | Configurable | Local | Remote |
|--------------------------------|--|--------------|-------|--------|
| MQ Appliance agent             | <ul style="list-style-type: none"> <li>• 162 (for receiving SNMP events)</li> <li>• 5554 (for connecting to MQ Appliances)</li> </ul>                              | Yes          | Yes   | Yes    |
| MongoDB agent                  | <ul style="list-style-type: none"> <li>• 27017 (for single instance)</li> <li>• 27019 (for cluster)</li> </ul>   | Yes          | Yes   | No     |
| MySQL agent                    | 3306 (for JDBC connection)   | Yes          | Yes   | Yes    |
| NetApp Storage agent           | For remote monitoring: <ul style="list-style-type: none"> <li>• 8088</li> <li>• 8488</li> <li>• 443</li> <li>• 8443</li> </ul>                                     | No           | No    | Yes    |
| Node.js agent                  | 63336  | Yes          | Yes   | No     |
| Node.js data collector         | N/A  | N/A          | No    | No     |
| OpenStack agent                | 5000 (for connecting OpenStack identity service)   | Yes          | No    | Yes    |
| Oracle Database agent          | 1521 (for SQL connection)  | Yes          | Yes   | No     |
| PHP agent                      | <ul style="list-style-type: none"> <li>• Apache connection</li> <li>• Port number is based on the Apache configuration</li> </ul>                                  | Yes          | Yes   | No     |
| PostgreSQL agent               | 5432 (for JDBC connection)   | Yes          | Yes   | Yes    |
| Python data collector          | N/A  | N/A          | No    | No     |
| RabbitMQ agent                 | Port number where the RabbitMQ management plug-in is enabled (local and remote): 15672   | Yes          | Yes   | Yes    |
| Response Time Monitoring Agent | <ul style="list-style-type: none"> <li>• Package analyzer model monitors HTTP transactions at port 80.</li> <li>• HTTP server model monitors all ports.</li> </ul> | Yes          | Yes   | No     |
| Ruby agent                     | Dynamically generated  | N/A          | Yes   | No     |
| Ruby data collector            | N/A  | N/A          | No    | No     |
| SAP agent                      | 33nn (where nn is the SAP instance number)   | No           | Yes   | No     |
| SAP HANA Database agent        | Default: 30013. Range: 30013-39913.  | Yes          | Yes   | No     |
| SAP NetWeaver Java Stack agent | Default: 50004. Range: 50004-59904.  | Yes          | Yes   | No     |
| Siebel agent                   | N/A  | N/A          | Yes   | No     |

| Table 11. Default ports used by agents and data collectors (continued)          |   |                   |       |        |
|---|---|-------------------|-------|--------|
| Agents and data collectors  | Default ports   | Configurable      | Local | Remote |
| Skype for Business Server agent (formerly known as Microsoft Lync Server agent) | <ul style="list-style-type: none"> <li>Business server default port 5061</li> <li>SQL server port 1433 (local or remote depending on environment).</li> </ul>   | No                | Yes   | No     |
| Sterling Connect Direct agent   | 1363  | Yes               | No    | Yes    |
| Sterling File Gateway agent   | 50000<br><br>The IBM B2B Integrator REST API port number and Database port number are both required and are configurable.   | Yes               | Yes   | Yes    |
| Sybase agent  | 5000  | N/A               | Yes   | No     |
| Synthetic Playback agent  | <ul style="list-style-type: none"> <li>4444 (for connecting internal selenium server)</li> <li>Remote ports are specified in the http URL of monitored websites, typically HTTP 80 and HTTPS 443</li> </ul>             | No                | Yes   | No     |
| Tomcat agent  | 8686 (for Tomcat MBean server)  | Yes (by JMX port) | Yes   | No     |
| UNIX OS agent   | 22 (for remote log monitoring with SSH)   | Yes               | Yes   | No     |
| VMware VI agent   | <ul style="list-style-type: none"> <li>443 (for remote monitoring)</li> <li>80 (for local monitoring)</li> </ul>  | No                | Yes   | Yes    |
| WebLogic agent  | 7003 (JMX Management HTTP traffic)  | Yes               | Yes   | No     |
| WebSphere Applications agent  | <ul style="list-style-type: none"> <li>63335 (for V8 monitoring agent)</li> <li>63336 (for V6 monitoring agent)</li> <li>63355 (for resource monitoring)</li> <li>5457 (for Transaction Framework Extension)</li> </ul> | Yes               | Yes   | No     |
| WebSphere Infrastructure Manager agent  | N/A   | N/A               | Yes   | No     |
| WebSphere MQ agent  | The port number depends on the listener setting for monitoring usage.   | N/A               | No    | Yes    |
| Windows OS agent  | 22 (for remote log monitoring with SSH)   | Yes               | Yes   | No     |

## Cloud APM server hardware requirements

IBM Cloud Application Performance Management, Private can be installed on systems with different memory, processor, and disk configurations. The installer adjusts the Cloud APM configuration and sets

the maximum Java heap size for the different server components based on the size of the server hardware. The server size and configuration can be changed after installation.

The Cloud APM server must be installed on a supported version of Red Hat Enterprise Linux. For a list of supported operating systems, see the software product compatibility report for your offering:

- [IBM Cloud Application Performance Management, Base Private V8.1.4](#)
- [IBM Cloud Application Performance Management, Advanced Private V8.1.4](#)

When the report is displayed, click the **Prerequisites** tab to see the browser and database requirements. Click the **Operating Systems** tab to see the operating system requirements for the server.

## Server requirements based on system configuration

IBM Cloud Application Performance Management maintains several databases and can drive thousands of disk transfers per second. When you choose a system to run the Cloud APM server, select a system with multiple hard disk drives (HDD) available (as shown in [Table 12 on page 113](#) and [Table 13 on page 114](#)), and avoid the use of disk drives that are shared with other disk intensive workloads. In virtual environments, consult with the virtual host owner to ensure adequate I/O capacity is available on the host.

The results of scale testing indicate that a Cloud APM server installed on a medium or large configuration server as shown in these tables can support up to 20 concurrent users.

### Agent rows written per minute and disk space estimates for databases

To estimate the number of agent rows of data that is uploaded per minute and the disk space required for the Db2 and MongoDB databases, use the spreadsheet here: [IBM Cloud App Management Load Projections Spreadsheet](#) .

### Number of processors

The suggested core count is based on enterprise class CPUs released in the past 1-5 years. Older CPUs might require extra cores to achieve the same performance. You can consult the Standard Performance Evaluation Corporation website (<http://www.spec.org>) and look for a processor with a SPECint2006 value greater than 30. Increasing the number and speed of the processor cores improves performance and reduces the time that is required to stop and restart the server components.

### Memory

The suggested amount of memory (RAM) for the system that is running the Cloud APM server (in gigabytes). Systems with less memory may experience decreased performance as a result of less file caching and increased swapping.

At least 4 GB of free swap space is recommended for the installation of the Cloud APM server components.

### Disk space

This estimate is for the amount of disk space that is required for an average installation of this monitored environment size. Your disk space usages might vary based on the number and types of agents that are installed and the monitored transaction count (not in the Cloud APM, Base Private environment). For a more detailed estimate of disk usage for your environment, use the spreadsheet here: [IBM Cloud App Management Load Projections Spreadsheet](#) .

At least 3 GB of space is required in the system's temporary directory for the installation of the Cloud APM server components.

### HDD count

The hard disk drive (HDD) count is the total number of drives a workload is spread over in a striped or RAID 0 array (for improved I/O performance). For data protection, it is best to use RAID 10, which doubles the HDD count required. RAID 5 is not advisable for the Db2 server due to the write penalty that is incurred. Best practice is to use RAID controller or hard disk caching (with battery backup) to achieve the disk latency that is critical for database operations. The drive counts can be adjusted based on the speed and latency of your I/O system drives and controllers.

### Disk I/O TPS

Disk I/O Transfers Per Second (TPS) is the average number of disk transfers (reads or writes) per second that the Cloud APM server generates to the I/O subsystem (disks) for this monitored environment size.

### Monitored user transactions per second

When a user interacts with an application like a web page, multiple monitored components can be involved with each transaction. An application can have various levels of complexity. These estimates assume 5 - 7 monitored components are involved in an average user transaction.

### Remote Db2 server

For more information about using an external Db2 server in the Cloud APM server configuration, see [“Connecting to a remote Db2 server” on page 146.](#)

*Table 12. IBM Cloud Application Performance Management, Base Private: Server requirements based on system configuration*

| IBM Cloud Application Performance Management, Base Private offering |  | Cloud APM environment size classification |              |               |
|---|--|---|--------------|---------------|
|   |  | Small                                     | Medium       | Large         |
| Monitored environment attributes                                    | Number of managed systems              | Fewer than 400                            | 400 - 2000   | 2000 - 10000  |
|   | Agent rows that are written per minute | Fewer than 20 K                           | 20 K - 150 K | 150 K - 500 K |
| Single server - All components are on the same system               | Number of processors                   | 4   | 6            | 8             |
|   | Memory (GB)                            | 16  | 20           | 28            |
|   | Disk space (GB)                        | 60  | 60 - 500     | 500 - 2000    |
|   | HDD count                              | 1   | 2 - 3        | 5 - 6         |
|   | Disk I/O TPS                           | 200                                       | 200 - 500    | 500 - 3000    |
| Cloud APM server with Db2 installed on remote system                | Number of processors                   | 4   | 6            | 8             |
|   | Memory (GB)                            | 12  | 16           | 20            |
|   | Disk space (GB)                        | 20  | 20 - 50      | 50 - 100      |
|   | HDD count                              | 1   | 1            | 2             |
|   | Disk I/O TPS                           | 100                                       | 100 - 200    | 200 - 500     |
| Remote Db2 server   | Number of processors                   | 2   | 2            | 4             |
|   | Memory (GB)                            | 2   | 4            | 8             |
|   | Disk space (GB)                        | 40  | 40 - 500     | 500 - 2000    |
|   | HDD count                              | 1   | 2            | 4             |
|   | Disk I/O TPS                           | 100                                       | 100 - 400    | 400 - 2500    |

**Note:** A managed system is a single operating system, subsystem, or application in your enterprise that an agent is monitoring.

*Table 13. IBM Cloud Application Performance Management, Advanced Private: Server requirements based on system configuration*

| IBM Cloud Application Performance Management, Advanced Private offering |  | Cloud APM environment size classification |              |               |
|---|--|---|--------------|---------------|
|   |  | Small                                     | Medium       | Large         |
| Monitored environment attributes  | Number of managed systems              | Fewer than 400                            | 400 - 2000   | 2000 -10000   |
|   | Agent rows that are written per minute | Fewer than 20 K                           | 20 K - 150 K | 150 K - 500 K |
|   | Monitored user transactions per second | Fewer than 50                             | 50 - 150     | 150 - 600     |
| Single server - All components are on the same system                   | Number of processors                   | 6   | 8            | 16            |
|   | Memory (GB)                            | 24  | 32           | 40            |
|   | Disk space (GB)                        | 80  | 80 - 1000    | 1000 - 3000   |
|   | HDD count                              | 1   | 3 - 4        | 6 - 8         |
|   | Disk I/O TPS                           | 500                                       | 500 - 1500   | 1500 - 4500   |
| Cloud APM server with Db2 installed on remote system                    | Number of processors                   | 6   | 8            | 12            |
|   | Memory (GB)                            | 20  | 24           | 28            |
|   | Disk space (GB)                        | 30  | 30 - 100     | 100 - 400     |
|   | HDD count                              | 1   | 2            | 3             |
|   | Disk I/O TPS                           | 200                                       | 200 - 500    | 500 - 1500    |
| Remote Db2 server   | Number of processors                   | 2   | 2            | 4             |
|   | Memory (GB)                            | 2   | 8            | 16            |
|   | Disk space (GB)                        | 50  | 50 - 1000    | 1000 - 3000   |
|   | HDD count                              | 1   | 2-3          | 4-6           |
|   | Disk I/O TPS                           | 300                                       | 300 - 1000   | 1000 - 3000   |

### Maximum Java heap size

Based on how the installer classifies the system, the maximum Java heap size is set for the Cloud APM services to the values shown in [Table 14 on page 114](#). If you update the environment after installation by adding memory or processors such that it matches a different size classification (for example, from small to medium), run the **server\_size.sh** script to reconfigure the maximum Java heap size settings. For more information, see [“Managing the maximum Java heap size and Db2 bufferpool” on page 1212](#).

*Table 14. Maximum Java heap size setting*

| Cloud APM server components      | Small              | Medium  | Large   |
|----------------------------------|--------------------|---------|---------|
| Server1 application server       | 1526 MB or 1536 MB | 2048 MB | 3072 MB |
| APMUI service                    | 1526 MB or 1536 MB | 3072 MB | 4096 MB |
| Uviews (Liberty server instance) | 1024 MB            | 1024 MB | 1024 MB |

| Table 14. Maximum Java heap size setting (continued) |  |         |         |
|--|--|---------|---------|
| Cloud APM server components                          | Small  | Medium  | Large   |
| MIN (Liberty server instance)                        | 512 MB if you have Cloud APM server V8.1.4.0 with no interim fix or interim fix 6 or earlier; 768 MB if you have Cloud APM server V8.1.4.0 with interim fix 6 or later | 1536 MB | 2048 MB |
| OIDC   | 128 MB   | 128 MB  | 256 MB  |
| Kafka  | 256 MB   | 512 MB  | 512 MB  |
| Zookeeper  | 256 MB   | 256 MB  | 256 MB  |
| MongoDB Cache  | 1024 MB for all Cloud APM, Base Private install  | 2048 MB | 4096 MB |

## IBM monitoring agents

Use this information to download the documents for the IBM monitoring agents.

Download the documents for a specific monitoring agent from these links:

[IBM Monitoring Agent for Hadoop V7.10](#)

[IBM Monitoring Agent for SAP HANA Database V7.1](#)

What does each document provide?

### Installation and configuration information

See the agent-specific *Installation and Configuration Guide* for the following specific information:

- Requirements
- Prerequisites checking
- Installing language packs
- Installing and configuring: agent-specific

### Reference information

See the Reference information for the following agent-specific information:

- Attribute groups and attributes
- Workspaces
- Situations
- Take Action commands
- Policies
- Event mapping

### Troubleshooting information

See the *Troubleshooting Guide* for the following agent-specific information:

- Trace logging
- Problems and workarounds
- Support information
- Informational, warning and error messages overview

## Scenarios

---

Depending on the complexity of your environment, you must install different agents to monitor different components. Use these deployment scenarios to help you understand what you must install where to get the best results from IBM Cloud Application Performance Management.

### Scenario: Monitoring IBM API Connect

You can monitor and troubleshoot your IBM API Connect environment by using APM agents and data collectors.

The Cloud APM product helps you manage the performance and availability of your API Connect environment. By using Cloud APM agents and data collectors, you are provided with visibility and control of both the API Connect infrastructure and the application APIs, ensuring optimal performance and efficient use of resources. When you encounter performance issues within the API Connect environment, the Cloud APM product can assist you in detecting, diagnosing, and isolating them.

For example, you can install the OS agents on all applicable systems. Use the OS agents to collect and analyze server-specific performance, including CPU performance, disk I/O and utilization, process availability and performance, and network performance. In addition, the OS agents can be configured to monitor the key API Connect logs and system logs.

Additionally, you can deploy the Synthetic Playback agent and create synthetic transactions and events to monitor the availability and performance of your internal and external applications. For more information about this agent, see [Synthetic Playback monitoring](#).

If you have other middleware products deployed, the transaction tracking feature, which is installed as part of the Cloud APM server, can provide you with topology views to see transaction tracking information for the middleware products and the services they expose and troubleshoot when problems arise.

The following picture shows API Connect components and the corresponding Cloud APM agents and data collectors that can monitor them. To enable these agents and data collectors, complete installation and configuration tasks that are listed under the agent and data collector name. Click the rectangular boxes in the picture that contains the task name to go to the installation or configuration tasks.

**Note:**

- Install a Node.js data collector to each published IBM API Connect application on the collective member.
- When monitoring the DataPower Gateway, the DataPower agent runs remotely from the DataPower appliance.

## Scenario: Monitoring the IBM Java application stack

You can monitor and troubleshoot the IBM Java application stack to see transaction monitoring information from the browser through to the database, including resource monitoring from individual

components. The IBM Java application stack includes the IBM HTTP Server, the WebSphere Application Server, and the IBM Db2 or Oracle database.

## Monitoring the IBM Java application stack

To monitor the IBM Java application stack, install the agents that are listed for each component in the order given.

Optionally, if you also want to monitor the system, install OS agents on all components.

For the web server, complete the following steps:

1. Install the HTTP Server agent.

**Fast path:** This installation also installs IBM HTTP Server Response Time module and automatically configures JavaScript injection.

2. Configure the HTTP Server agent installation..
3. Install the Response Time Monitoring agent.

For the application server, install the WebSphere Applications agent.

For the database, install the Oracle Database agent or Db2 agent, depending on your database.

## Adding web applications to the Application Performance Dashboard

Add the web applications that you want to monitor to the Application Performance Dashboard.

### Procedure

To add web applications, complete the following steps:

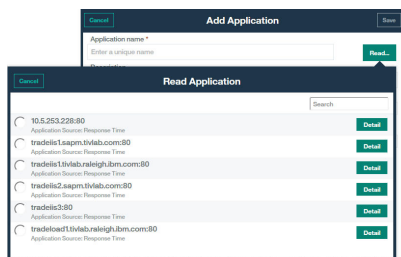

1. In the Application Performance Dashboard, click **Add Application**.

2. Click **Read** to open a list of discovered applications.

3. Select the web application that you want to monitor.

4. Click **Save**.

## Associating the IBM Java application stack with the web application

Edit the web application to associate the WebSphere Application Server and database components that you want to monitor with it.

### Procedure

To display the components in the Java application stack, complete the following steps in the Application Performance Dashboard:

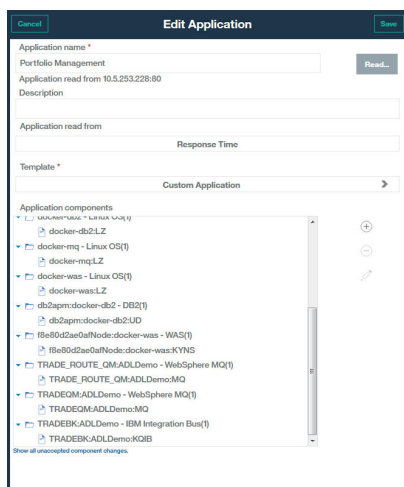

1. Select the web server and click **Edit Application**.

2. In the **Edit Application** window, click **Add components** .
3. In the **Select Component** window, select WebSphere Application Server.
4. In the **Component Editor**, select the required component instances and click **Add**.

Any detected WebSphere Application Server instances are automatically added to this list.

5. Click **Back** and repeat steps “3” on page 119 - “4” on page 119 for your database. Continue adding WebSphere Application Server and database instances until the Java application stack is complete.

6. Click **Close**, then **Save** to return to the Application Performance Dashboard.

## Results

**Tip:** If the Aggregate Transaction Topology does not initially show the topology that you expect, wait for it to refresh and check again in a few minutes. If the topology is still not what you expect, your application might not be communicating with the expected components. Check your environment.

## Viewing results of IBM Java application stack monitoring

You can view the results of IBM Java application stack monitoring in the topologies.

### About this task

In the topologies, you will see transaction monitoring information from the browser to the database, including resource monitoring from individual components. The following nodes are displayed in the Aggregate Transaction Topology and Transaction Instance Topology:

- Browser, displayed only when JavaScript Injection is enabled
- HTTP server
- WebSphere Application Server
- Database

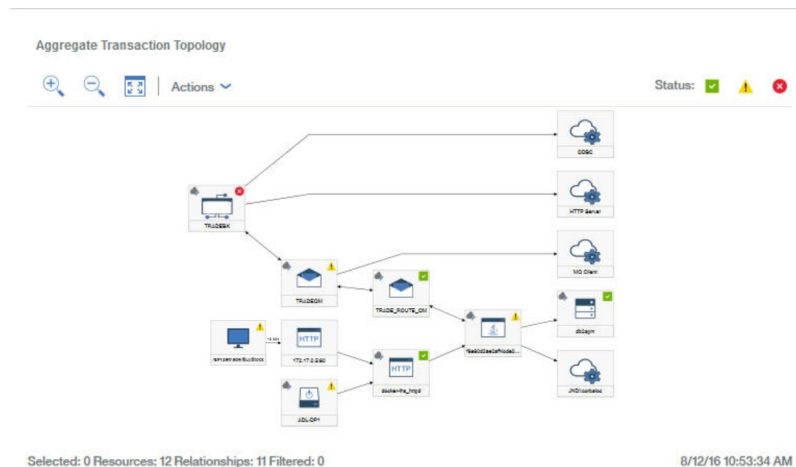

### Procedure

You can link from nodes in the topology to more details about that node:

1. Hover your mouse over a node to display a window with additional information.
2. To drill down to a more detailed dashboard for the node, right-click the node and select the link.

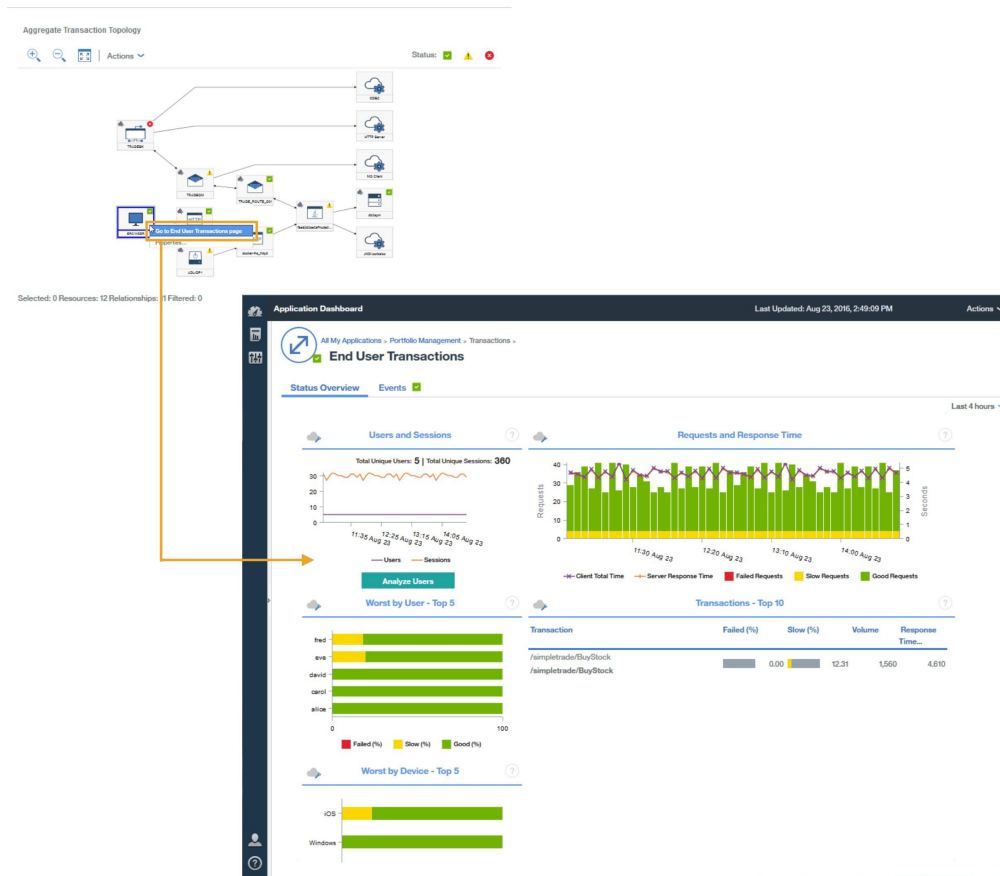

### Aggregate Transaction Topology

The Aggregate Transaction Topology is displayed in the Application summary dashboard.

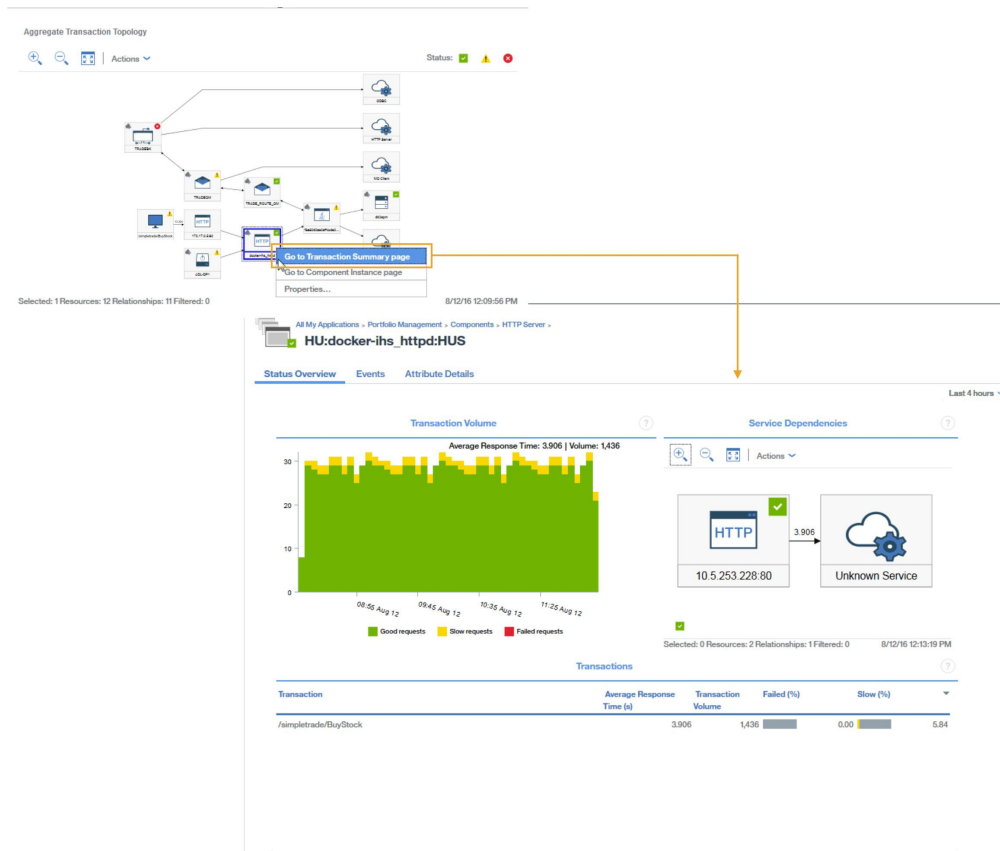

Aggregate Transaction topologies display the following information:

- Node for browser-based clients, drill down to the end-user experience

**Remember:** This node is displayed only when automatic JavaScript injection is measuring data from the browser.

- Nodes for HTTP-based applications, drill down to the web server resource page or a transaction summary page

- Nodes for WebSphere Application Server based applications, drill down to an application resource page, or a transaction summary page

- Nodes for specific database servers, drill down to a database resource page if available

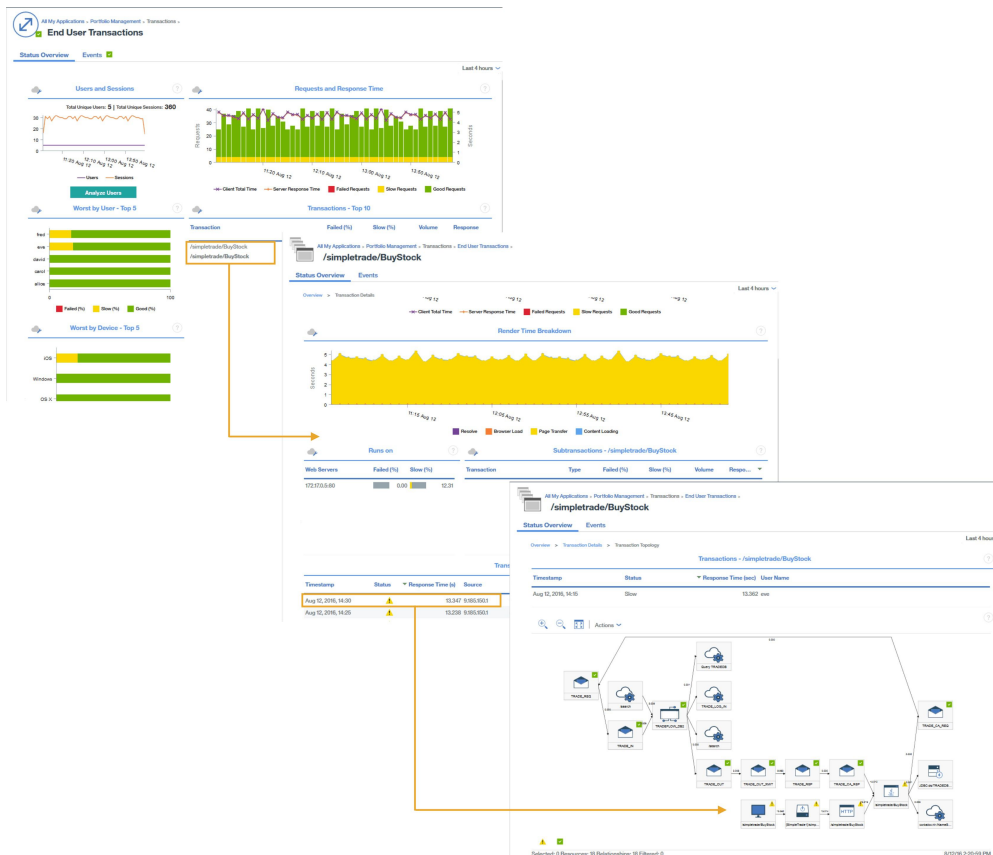

## Transaction Instance Topology

Transaction instance topologies are displayed for real end-user transactions.

Drill down from the **End User Transactions** summary through the following widgets:

1. Select a transaction in the Transactions - Top 10 table
2. Select an instance in the Transactions Instances table

Transaction instance topologies for the Java application stack display the following nodes. Click the node to display information about the node.

- Node for browser-based clients

**Remember:** This node is displayed only when automatic JavaScript injection is measuring data from the browser.

- HTTP nodes, including response times from the browser
- DataPower nodes, if instrumented
- WebSphere Application Server nodes, from which you can drill down to an application resource page
- Database server nodes, from which you can drill down to a database resource status, and SQL statement diagnostic information for JDBC requests

**Tip:** When the topology indicates that most of the response time is spent in the database, SQL statement information is opened directly when you click **Diagnose**.

Also displayed are Gantt charts, which summarize instance timings.

## Diagnosing problems in your environment

If transaction instances for one of the components in your environment are slow or failing, the affected component is assigned an appropriate status.

A node might have one of the following statuses:

- `docker-its_http` Good, the node has a tick surrounded by a green square in the upper right corner

- `TRADEQM` Warning, the node has an exclamation point surrounded by a yellow triangle in the upper right corner

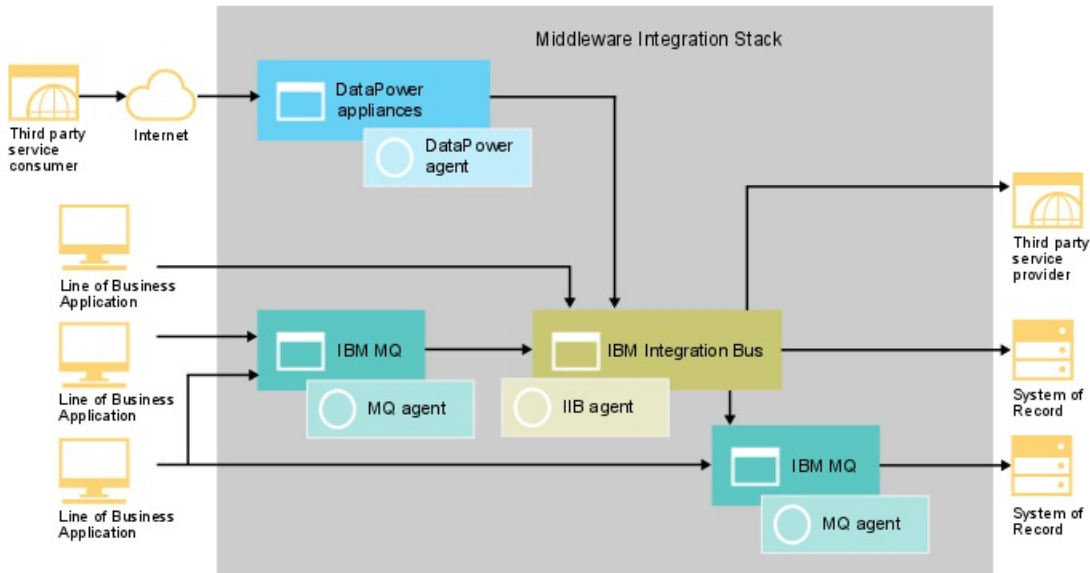

- Critical, the node has a red background and a cross that is encircled with red in the upper right corner

To identify the cause of the problems for these components with a warning or critical status, right-click the node and drill down to see more information about what might be causing the failures.

## Scenario: Monitoring the IBM integration stack

You can monitor the IBM integration stack to see transaction tracking information for the middleware products and the services they expose and troubleshoot if any problems arise. The IBM integration stack includes IBM MQ, IBM Integration Bus, and DataPower appliance.

## Monitoring the IBM integration stack

To monitor the IBM integration stack, install the agents that are listed for each component in the order given.

Optionally, if you also want to monitor a system, install OS agents on that system.

For IBM MQ, complete the following steps:

1. Install the Monitoring Agent for WebSphere MQ.
2. Configure the WebSphere MQ agent to connect to the queue manager.
3. Enable **MQ Application Activity Trace** in the queue manager.

For IBM Integration Bus, complete the following steps:

1. Install the Monitoring Agent for IBM Integration Bus.
2. Enable IBM Integration Bus for transaction tracking.
3. Configure transaction tracking for the required IBM Integration Bus agent instances.

For DataPower appliance, complete the following steps:

1. Install the Monitoring Agent for DataPower.
2. Configure the DataPower agent to connect to the DataPower appliance.
3. Ensure that transaction tracking is enabled for the required DataPower agent instances.
4. Set up the DataPower appliance.

## Adding middleware applications to the Application Performance Dashboard

Create an IBM integration stack application and add the IBM MQ, IBM Integration Bus, and DataPower appliance instances that you want to monitor to it.

### Procedure

To display the components in the IBM integration stack, complete the following steps in the Application Performance Dashboard:

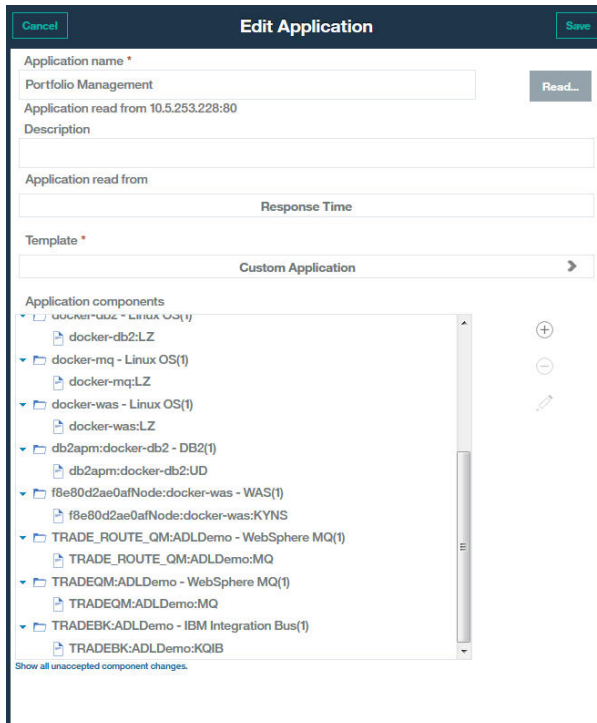

1. In the Application Performance Dashboard, click **Add Application**.

2. In the **Edit Application** window, add an application name and click **Add components** .
3. In the **Select Component** window, select **IBM Integration Bus**.
4. In the **Component Editor**, select the required component instances and click **Add**.

Any detected IBM Integration Bus instances are automatically added to this list.

5. Click **Back** and repeat steps 3 - 4 for **WebSphere MQ** and **DataPower Appliance**. Continue adding IBM Integration Bus, IBM MQ, and DataPower appliance instances until the IBM integration stack is complete.

6. Click **Close**, then **Save** to return to the Application Performance Dashboard.

### Results

**Tip:** If the Aggregate Transaction Topology does not initially show the topology that you expect, wait for it to refresh and check again in a few minutes. If the topology is still not what you expect, there might be a problem with your application not communicating with the expected components. Check your environment.

## Viewing results of IBM integration stack monitoring

You can view the results of IBM integration stack monitoring in the topologies and middleware pages. You can also view events that are generated when a transaction violates a defined threshold.

### About this task

In the topologies, you can see interactions between middleware components. The following middleware nodes are displayed in the Aggregate Transaction Topology and Transaction Instance Topology:

- IBM Integration Bus
- IBM MQ
- DataPower appliance

Hover your mouse over a node to display a Properties window that shows you information to explain why a node has a particular status. The status is determined by situations; the situations with a bad status are displayed.

### Procedure

You can link from nodes in the topology to more details about that node:

1. Right-click a node.

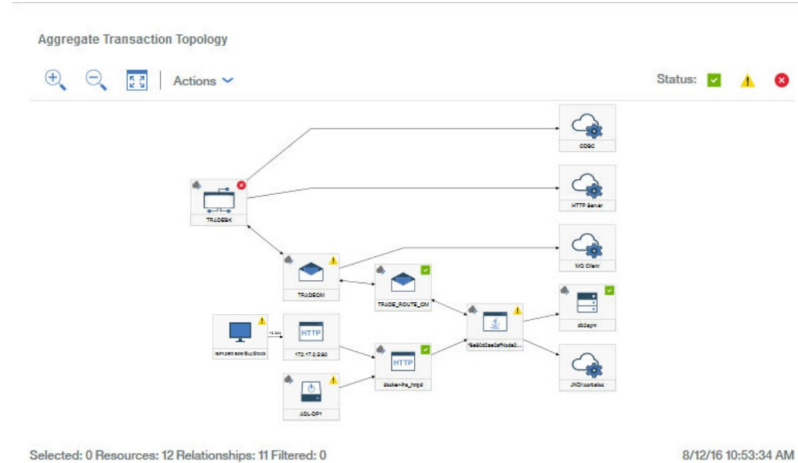

2. Select **Go to Component page** to display information about the component.
3. Select **Go to Transaction Summary page** to display information about the middleware transactions.

**Tip:** Select **Groups > Components > *middleware component*** in the navigator and select a request period in the volume widget to go to the same dashboard.

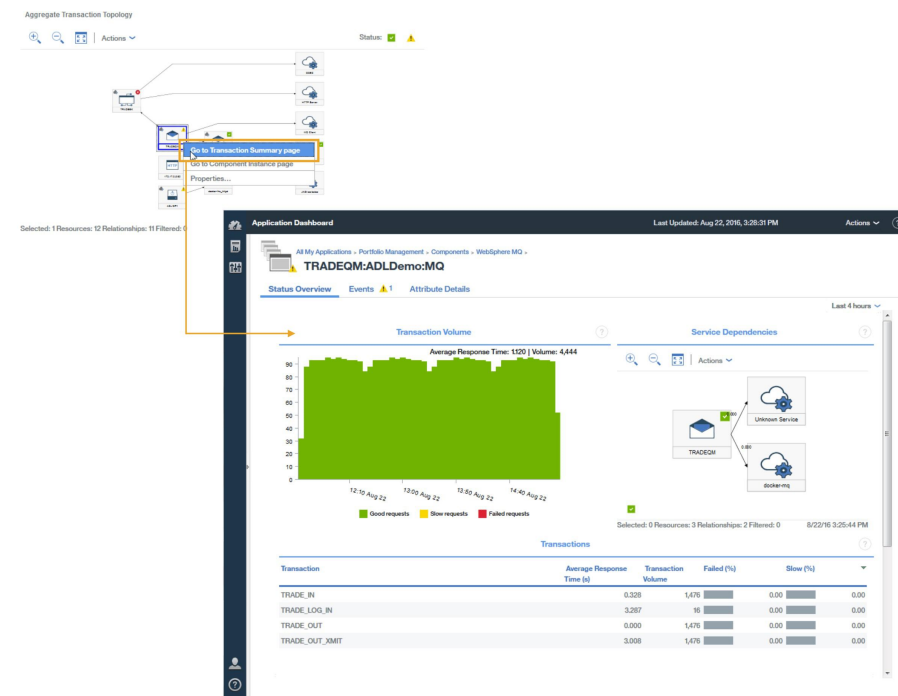

## Aggregate Transaction Topology

The Aggregate Transaction Topology is displayed in the Application summary dashboard.

Aggregate Transaction topologies can display IBM MQ, IBM Integration Bus, and DataPower appliance nodes. Drill down from these nodes to more information about the middleware integration stack.

To drill down, right-click a middleware node in the Aggregate Transaction Topology and select **Go to Transaction Summary page**. Alternatively, select **Groups > Components > *middleware component*** in the navigator and select a request period in the volume widget to access the same information.

## Middleware transaction details

From the middleware Transactions Summary page, you can drill down to middleware transaction details.

To drill down to middleware transaction details for the component, complete the following steps:

1. In the middleware Transactions Summary page for the component, select a monitoring interval in the **Message or Volume** chart.
2. On the **Middleware Transaction Summary**, in the **Queues, Brokers, or Appliances** widget, select a queue, broker, or appliance.

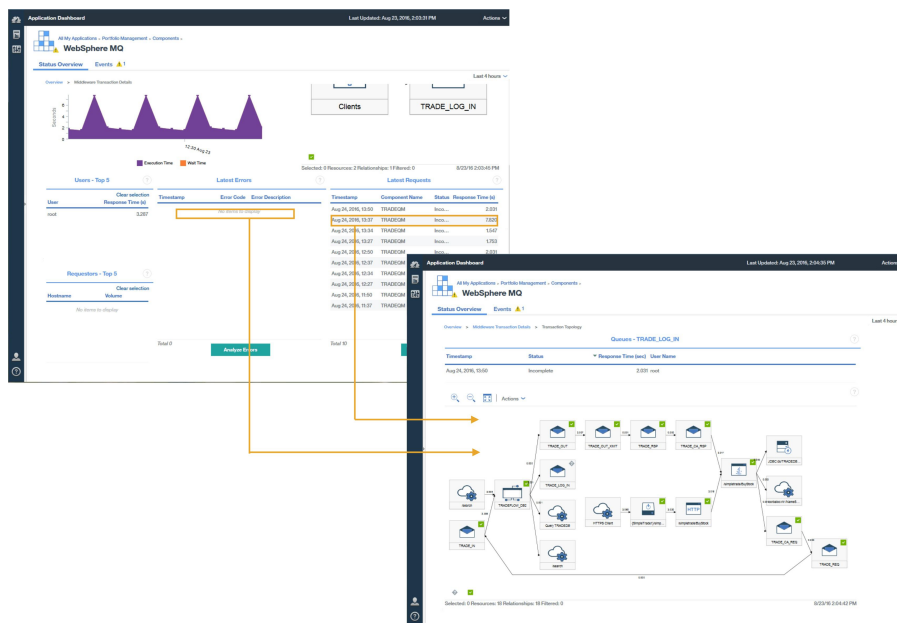

## Analyzing errors and instances

From the middleware Transactions Details page, you can drill down further to information that helps you to analyze errors and instances and access the Transaction Instance topology.

To drill down to errors and instances for middleware components and then to the Transaction Instance Topology, on the **Transaction Details** page complete one of the following steps:

- Click **Analyze Errors** to display the **Error Analysis** page, then select an error.
- Click **Analyze Requests** to display the **Instance Analysis** page, then select an instance.

Alternatively, in the **Transaction Details** page, select an error or an instance to go directly to the Transaction Instance Topology.

Transaction instance topologies display the following middleware nodes:

- Message queue managers
- IBM Integration Bus brokers
- DataPower Appliances

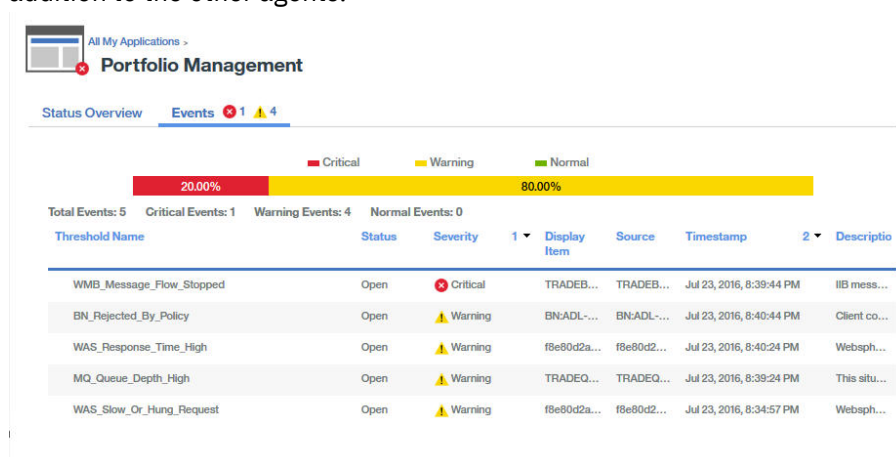

Select a node to display its properties that explain why a node has a particular status.

A Transaction Gantt Chart is displayed for the selected queue or broker. The Gantt chart helps you isolate the most significant contributors to the overall response time of the transaction.

## Events

Events are generated for the IBM integration stack by the default Transaction Tracking thresholds in addition to the other agents.

For more information about Transaction Tracking default events, see [“Event thresholds for Transaction Monitoring”](#) on page 1164.

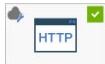

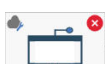

You can add thresholds to create more events, for example for transaction rates that are slow or fall below a certain threshold.

For more information about adding events, see [“Creating thresholds to generate events for transaction monitoring”](#) on page 1167.

## Diagnosing problems in your environment

If transaction instances for one of the components in your environment are slow or failing, the affected component is assigned an appropriate status.

A node might have one of the following statuses:

-  Good, the node has a tick surrounded by a green square in the upper right corner
-  Warning, the node has an exclamation point surrounded by a yellow triangle in the upper right corner
-  Critical, the node has a red background and a cross that is encircled with red in the upper right corner

To identify the cause of the problems for these components with a warning or critical status, right-click the node and drill down to see more information about what might be causing the failures.

## Download instructions

Download the IBM Cloud Application Performance Management installation images from the IBM Passport Advantage website.

Installation images are available for the Performance Management components, extension packs, and Tivoli Monitoring bundled products, one set of images for each offering type.

## Cloud APM, Private components

Review the descriptions of the IBM Cloud Application Performance Management, Private images to identify which components to download.

Both of the Cloud APM, Private offerings have a set of downloadable component images. Download the images for your offering.

**Important:** Do not change the installation image file name for the agents or Hybrid Gateway during or after download unless you adhere to these requirements: The name must be no more than 40 characters and retain the words "agents" or "hybrid\_gateway" from the original name in the new name. Otherwise, the configuration tools do not recognize the file and configuration fails.

### Cloud APM server

- Server install RHEL 64-bit image, which includes the server components:
  - Cloud APM server, including the Db2 database, the Summarization and Pruning agent, the MongoDB database, and the agent offering framework.
    - The Db2 database stores agent resource, attribute, and relationship information in the Service Component Repository (SCR). The Db2 prefetch database is a warehouse for agent metric data.
    - The Summarization and Pruning agent is configured and performs the aggregation and pruning functions for the historical data in the Db2 database.
    - The MongoDB database stores threshold event and transaction tracking data.
    - The agent offering framework is installed in the AgentFrameworks directory during the Cloud APM server installation. The agent framework is injected into agent installation images during configuration.
  - Cloud APM console, which is the user interface for the dashboards.
  - KC-CI Help server, which supports the Cloud APM console and monitoring agent help systems.

Download and install the Cloud APM server on a computer system or VM where you want the monitoring infrastructure to be installed.

For instructions on installing the Cloud APM server and supporting components, see [Chapter 5, “Installing your server,”](#) on page 143.

### Cloud APM agents

- Agents install image for Linux 64-bit
- Agents install image for AIX

For instructions on installing these agents, see [“Installing agents on Linux systems”](#) on page 191 and [“Installing agents on UNIX systems”](#) on page 185.

- Agents install image for Windows 64-bit
- Agents install image for Windows 32-bit

For instructions on installing these agents on Windows systems, see [“Installing agents on Windows systems”](#) on page 201.

You have three options for downloading the agent images:

- Download the agent images to the system where you downloaded the Cloud APM server installation image. The agent images can be mounted on an NFS partition but must be accessible by using the file system. You can configure the agent images when prompted during the installation of the server and copy the configured images to the system where the applications that you want to monitor are installed.
- Download the agent images to the system where the applications that you want to monitor are installed. After you install the server, create configuration packages for connecting the agents to the server. Copy the configuration packages to the system where you downloaded the agent images, and configure the agent images.

- Download the agent images to any system in your environment. On the system where you installed the server, create configuration packages for connecting the agents to the server. Copy the configuration packages to the system where the agent images are downloaded, configure the agent images, and download them to the system where the applications that you want to monitor are installed.

The monitoring agents are autonomous and have no infrastructure other than what is provided by the Cloud APM server for data sharing. Both the performance and size footprint on individual nodes is small. Data retention is local and short term.

### **Cloud APM data collectors (available only in Cloud APM, Advanced Private)**

- Data collectors image for AIX
- Data collectors image for Linux
- Data collectors image for Windows

Download the data collector images, configure the downloaded images for server communication, and then configure the data collector for monitoring your applications. For instructions about how to configure the image for server communication, see [“Configuring the downloaded images” on page 182](#). For instructions about how to configure the data collector for monitoring, see the subsections for your concerned applications in [Chapter 8, “Configuring your environment,” on page 223](#).

### **Cloud APM reports**

- Cloud APM reports image, which contains Cognos-based reports for examining device statistics and application performance in detail.

You must install Tivoli Common Reporting before you install the reports image. For more information about the version of Tivoli Common Reporting to install and how to configure and install the Cloud APM reports, see [“Integrating with Tivoli Common Reporting” on page 1083](#).

### **Agent Builder**

- Agent Builder image, which contains the Agent Builder toolkit for creating custom agents to extend the resources that you can monitor.
- Agent Builder language pack.

For instructions on installing the Agent Builder stand-alone toolkit for multiple platforms, see the [IBM Agent Builder User's Guide](#).

### **Hybrid Gateway**

- Hybrid Gateway image, which contains a component for environments with IBM Tivoli Monitoring agents.

If your environment includes IBM Tivoli Monitoring products that you want to view in the Cloud APM console, you can download and install the IBM Cloud Application Performance Management Hybrid Gateway image. You have the same choices as for the agent images to download and configure the Hybrid Gateway image, and you can download the Hybrid Gateway at the same time and to the same system as the agent images. The only difference is that the Hybrid Gateway is installed in your Tivoli Monitoring environment on a single Red Hat Enterprise Linux (RHEL) system.

For instructions on installing the Hybrid Gateway, see [“Integrating with IBM Tivoli Monitoring V6.3 ” on page 1039](#).

## **Extension packs**

Review the descriptions of the extension pack images to identify which extension pack images to download for your offering.

For a list of the agents that are included each extension pack, see [“Offerings and add-ons” on page 54](#).

### **Advanced Extension Pack**

(Not available with Cloud APM, Base Private)

- Advanced Extension Pack for Linux 64 bit

- Advanced Extension Pack for Windows 64 bit
- Advanced Extension Pack for AIX
- Monitoring Agent for SAP HANA Database V7.1

#### **Base Extension Pack**

- Base Extension Pack for Linux 64 bit
- Base Extension Pack for Windows 64 bit
- Base Extension Pack for AIX

#### **Infrastructure Extension Pack**

- Infrastructure Extension Pack for Linux 64 bit
- Infrastructure Extension Pack for Windows 64 bit

For instructions on downloading the images, see [“Downloading from Passport Advantage” on page 134](#).  
For instructions on installing extension packs, see [Chapter 7, “Installing your agents,” on page 181](#).

## **Tivoli Monitoring bundled products**

Available with the IBM Cloud Application Performance Management offerings are the bundled products based on the IBM Tivoli Monitoring infrastructure. Review the guidelines to determine which Tivoli Monitoring bundled product to install for your offering.

If you don’t currently have any of the Tivoli Monitoring bundled products installed, install the Cloud APM components.

If you currently use any of the included Tivoli Monitoring products, follow these guidelines:

- If you have a system (virtual or physical) that already has Tivoli Monitoring based agents installed and you’d like to install more agents, you can use either the Tivoli Monitoring based agents or the Cloud APM agents. With the agent coexistence feature, you can install the Cloud APM agents on the same system as Tivoli Monitoring agents, but not in the same directory.
- If you want to monitor systems that do not currently have any of the Tivoli Monitoring based agents installed, you can use either the IBM Tivoli Monitoring agents or Cloud APM agents.

If no Cloud APM agent exists for the particular operating system or middleware that you want to monitor, install the Tivoli Monitoring agent and Tivoli Monitoring infrastructure.

Connect the Tivoli Monitoring agents to the Tivoli Monitoring infrastructure and the Cloud APM agents to the Cloud APM infrastructure. When the Cloud APM server and the Hybrid Gateway components are installed, you can view monitored resources from your Tivoli Monitoring and Cloud APM domains in the same dashboards on the Cloud APM console. For a list of Tivoli Monitoring agents that are available through the Hybrid Gateway, see [“Supported Tivoli Monitoring and OMEGAMON agents” on page 1044](#).

The Tivoli Monitoring bundle products that are available with each offering are listed in [Table 21 on page 139](#) in *Part numbers*. For instructions on downloading the images, see [“Downloading from Passport Advantage” on page 134](#).

## **Downloading from Passport Advantage**

You can purchase and download the software and production license from IBM Passport Advantage.

### **About this task**

Refer to the IBM Cloud Application Performance Management, Private announcement letter for license information (see [IBM Offering Information](#)).

For help with IBM Passport Advantage, search for "passport advantage support" in your browser and select the link, "Contact us" or go to [IBM Passport Advantage - Contact us](#).

## Procedure

1. Identify the Cloud APM components that you want to download.

For a description of the component images, see [“Cloud APM, Private components” on page 132](#).

2. Identify the Cloud APM extension packs that you want to download.

For a description of the extension pack images, see [“Extension packs” on page 133](#).

3. Identify the Tivoli bundled products that you want to download.

For a description of the Tivoli product images, see [“Tivoli Monitoring bundled products” on page 134](#).

4. Locate the associated eAssembly and eImage part numbers in [“Part numbers” on page 135](#).

5. Go to IBM Passport Advantage website, sign in, and search for the part numbers.

6. Download the images.

## Part numbers

Review the part numbers to identify the components to download for your IBM Cloud Application Performance Management, Private V8.1.4 installation.

### IBM Cloud Application Performance Management, Private components

The part numbers and file names for the Cloud APM, Private components are in [Table 15 on page 135](#).

| <i>Table 15. Cloud APM, Private component file names, eAssembly part numbers (in parentheses), and eImage part numbers</i> |   |  |
|--|---|--|

## IBM Tivoli Monitoring bundled products

After you purchase your Cloud APM, Private license, you can download any or all of the Tivoli Monitoring bundled software. The eAssembly part numbers for the Tivoli Monitoring bundled products that are available with your offering are listed in Table 21 on page 139.

You must connect Tivoli Monitoring agents to the Tivoli Monitoring infrastructure. Data from these agents can only be displayed in the Cloud APM console if you install the Cloud APM server and the Hybrid Gateway components and if the agents are available through the Hybrid Gateway. For a list of the agents that the Hybrid Gateway supports, see “Supported Tivoli Monitoring and OMEGAMON agents” on page 1044..

---

## Chapter 5. Installing your server

The Cloud APM server and supporting components provide the infrastructure for monitoring with the Cloud APM console. Install the Cloud APM server as the first step in setting up your IBM Cloud Application Performance Management environment.

The Cloud APM server must be installed by a root user on a supported version of Red Hat Enterprise Linux.

After the Cloud APM server is installed, you cannot change the permissions of the Cloud APM files and directories. In addition, you cannot change the user or group owners of these files and directories.

For a list of supported operating systems, see the software product compatibility report for your offering:

[IBM Cloud Application Performance Management, Base Private V8.1.4](#)

[IBM Cloud Application Performance Management, Advanced Private V8.1.4](#)

If you downloaded the monitoring agent images, you can configure the images as part of the monitoring infrastructure installation process. If you intend to monitor with agents from your IBM Tivoli Monitoring environment, you can also download the IBM Cloud Application Performance Management Hybrid Gateway image and configure the image as part of the installation process.

For information about installing in a high availability environment, see [https://github.com/IBM/ibm-cloud-apm-samples/blob/master/APM\\_High\\_Availability\\_V4.8.pdf](https://github.com/IBM/ibm-cloud-apm-samples/blob/master/APM_High_Availability_V4.8.pdf).

For more information about installing in a high availability environment, see the [APM\\_High\\_Availability\\_V<version>.pdf](#) document in the IBM-cloud-apm-samples github repository, where <version> is the latest version published, only the latest version is available in the github repository.

---

### Preparing to install your server

To monitor your environment, you must first install the Cloud APM server and supporting components. Review the options and requirements to help you plan your installation of the Cloud APM server.

#### **What gets installed with the Cloud APM server**

The installation also installs a Db2 server, a Summarization and Pruning agent, and a MongoDB database on the same system as the Cloud APM server. The Db2 database stores application definitions and relationship and metric data. The MongoDB database stores threshold event and transaction tracking data.

#### **Requirements and supported operating systems**

You must have root permissions to install and run the Cloud APM server. Running the Cloud APM server as a non-root user is not supported.

Review the [“System requirements”](#) on page 89 and [Dependencies](#) topics for the supported operating systems and requirements for the Cloud APM server.

#### **Configuring the downloaded images while you are installing the server**

Before you can install agents, install the IBM Cloud Application Performance Management Hybrid Gateway, or configure the data collector, you must configure the downloaded images for communication with the Cloud APM server. The downloaded images can be configured automatically during server installation if you download the images to the system where the server will be installed.

The downloaded images can be mounted on an NFS partition but the images must be accessible by the file system. Do not change the installation image file names during or after download. If an installation image file name is changed, it is not recognized by image configuration tools and configuration fails. For more information, see [“Download instructions”](#) on page 131.

### **Configuring your virus scan program to exclude Db2 database files**

If you are using a virus scan program such as McAfee Virus Scan for Linux or Sophos, you must configure the virus scan program to exclude all Db2 database files; including storage groups, table spaces, and buffer pools. Configure the virus scan program before you install the Cloud APM server. The Db2 database files are installed in the *install\_dir/db2* directory by default, for example, */opt/ibm/db2*.

### **Creating Db2 users before you install the Cloud APM server**

The Cloud APM server installation creates a Db2 server on your local system. Several Db2 instance users and groups are created during installation and each user assigned to its respective group. To adhere to your organization's database server administration policies, you might want to create the Db2 instance users before the Db2 server is installed. For more information, see [“Creating Db2 users before you connect to a local Db2 server”](#) on page 158.

### **Connecting to a remote Db2 server**

If you have a remote Db2 server, you can use it for the Cloud APM server databases rather than installing the local default Db2 server with the Cloud APM server installation.

You might want to connect to a remote Db2 server on an external system to adhere to your organization's database server administration policies. Connecting to a remote Db2 server also reduces the load on the Cloud APM server, which improves performance. Consider a remote Db2 setup when the necessary disk I/O performance cannot be achieved on the hardware that is allocated for your Cloud APM server.

The Db2 installer creates the *dasuser1* user and the *dasadm1* group and assigns the *dasuser1* user to the *dasadm1* group. You must manually create all other users and groups and assign the users to the appropriate groups.

For more information, see [“Connecting to a remote Db2 server”](#) on page 146.

### **Installing MongoDB on a remote system**

For scalability purposes, you can install MongoDB on another system. For more information, see [“Installing a remote MongoDB”](#) on page 169.

### **Installing the Cloud APM server on a computer system where LDAP authentication is used**

If the system where you plan to install the Cloud APM server with a local Db2 server is using an external directory service with LDAP for user authentication, you must update *itmuser* and Db2 instance user passwords if they are configured in your directory service. You must update these passwords before you install the Cloud APM server. After you install the Cloud APM server, you must configure the LDAP security plug-in on the local Db2 server. For more information, see [“Installing on a system using an external directory service”](#) on page 156.

If you plan to use transparent LDAP authentication on the system where you are installing the Cloud APM server, you must use a remote Db2 server rather than installing the Db2 server locally with the Cloud APM server. For more information, see [“Connecting to a remote Db2 server”](#) on page 146 and [LDAP-based authentication and group lookup support](#).

### **OIDC**

OpenID Connect (OIDC) is a simple identity protocol over OAuth 2.0. OIDC is enabled in Cloud APM console. With OIDC, a client application can request the identity of the user as an ID token in a standardized, REST-like manner. In addition, the client application can use access tokens to access REST-like Services.

A self-signed certificate is created for OIDC during installation. You can configure a self-signed certificate or a CA signed certificate for OIDC. For more information, see [“Configuring certificates by using a Third-Party Root Certificate Authority”](#) on page 1151 and [“Configuring certificates by using a private root certificate authority”](#) on page 1148.

### **Replacing Cloud APM, Base with the Cloud APM, Advanced offering**

You can replace Cloud APM, Base with the Cloud APM, Advanced offering at any time after you installed the Cloud APM, Base offering or upgraded to the Cloud APM, Base offering. Replacing Cloud

APM, Base with Cloud APM, Advanced can take longer than installing Cloud APM, Advanced only. For more information, see [“Switching from one offering to another offering”](#) on page 155.

#### APMUI

APMUI is the Cloud APM console component that handles incoming user interface requests. It is built on WebSphere Liberty. The `server.xml` file contains an include statement for `user-exit.xml`. All customization should be done on `user-exit.xml` so that customization is not lost during an upgrade.

## Configuring the firewall for incoming requests to the server

---

Before you install the Cloud APM server, you might want to temporarily disable your firewall or configure ports for incoming and outgoing requests.

### Before you begin

TCP connections are initiated from monitoring agents, API users, and Cloud APM console users to the Cloud APM server. The Cloud APM server can also initiate TCP connections to other servers such as remote database servers. Thus, any firewall must allow the TCP connection to be initiated and a response to be provided.

### Procedure

Take one of the following steps to either open ports or disable the firewall:

- Set your firewall for incoming requests on ports that are used by the Cloud APM server and for outgoing requests that are initiated by the Cloud APM server. Ensure that the ports in [Table 9 on page 104](#) in “Cloud APM server ports” on page 104 are free (no application is listening on them).
- Disable your firewall by running the following Red Hat Linux commands:

```
service iptables stop
chkconfig iptables off
```

For Red Hat Linux version 7.4, disable your firewall by running the following commands:

```
service firewalld stop
systemctl disable firewalld
```

### What to do next

Install the Cloud APM server and monitoring agents.

## Setting HTTP or HTTPS communications

---

The default communications protocol between the Cloud APM server and agents is HTTP. Before installing the server, you can use an environment variable to change the protocol to HTTPS for secure communications between the server and monitoring agents.

### Before you begin

- Communications between the server and agents must be consistently HTTP or HTTPS.
- If you configure the agent images during server installation, the communications protocol for the agents is set to match what is set for the server. However, if you choose to configure the agent images at a later time, be sure to set the communications protocol to the same setting as the server is using.
- If you change the protocol that is used to communicate between the server and the monitoring agents, change the protocol that is used to communicate between the server and the server agents to match. For details, see [“Configuring the communications protocol for server agents”](#) on page 1217.

- The Cloud APM server keystore that is used for HTTPS communication with the agents is the same keystore that is used by the SMTP forwarder for SSL communication with the SMTP server. If a new keystore is created and a CA certificate was added for the SMTP forwarder, the SMTP CA certificate must be re-added to the new keystore. For instructions, see [Event Manager](#) in [“Advanced Configuration”](#) on page 1239.

## Procedure

Complete the following step before you install the Cloud APM server to change the communications protocol:

- On the system where you plan to install the server, enter one of the following commands:
  - To set HTTPS (secure) communications: `export APM_SECURE_COMMUNICATION=y`
  - To set HTTP (non-secure) communications: `export APM_SECURE_COMMUNICATION=n` (Unless the `APM_SECURE_COMMUNICATION` environment variable was used to set HTTPS, this step is not necessary because the default protocol is HTTP. Thus, while you are using a clean shell session, such as just after logging in, you can start the server installation to establish HTTP communications.)

## What to do next

- Run the installation script to begin installing the server.
- If you decide to enable HTTPS communication after the Cloud APM server is installed or you do not want to use the default certificates that are created during Cloud APM server installation, see [“Configuring certificates between the server and agents for HTTPS communication”](#) on page 244 after Cloud APM server installation completes.

## Related tasks

[“Downloading and installing the server”](#) on page 159

[“Configuring certificates between the server and agents for HTTPS communication”](#) on page 244

To enable communication between the Cloud APM server and agents, you can configure default, custom, or self-signed certificates and then configure the agents to use HTTPS communication and the certificates.

[“Configuring the communications protocol for server agents”](#) on page 1217

Either the HTTP or HTTPS protocol is used to communicate between the Cloud APM server and the server agents. The Cloud APM server allows connections from server agents that authenticate themselves with a valid certificate. If you change the communication protocol that is used by the server to communicate with monitoring agents, you must change the protocol used by the server agents.

## Connecting to a remote Db2 server

---

By default, the Db2 server (Db2 Advanced Enterprise Server Edition version 10.5 fix pack 6) is installed locally with the Cloud APM server. If you are already running a supported fixpack of Db2 Advanced Enterprise Server Edition version 10.5, Db2 Advanced Workgroup Server Edition V11.1, or Db2 Advanced Enterprise Server Edition version 11.1 on an external system, you can choose to use this existing remote Db2 server for the databases that are required by the Cloud APM server instead of installing the default local Db2 server.

## Before you begin

- Ensure that the external system where your remote Db2 server is installed is running a supported fix pack of one of these Db2 products:
  - Db2 Advanced Enterprise Server Edition V10.5
  - Db2 Advanced Workgroup Server Edition V11.1
  - Db2 Advanced Enterprise Server Edition V11.1

For the list of supported Db2 fix packs, open the Software Product Compatibility Report for your offering and click the **Prerequisites** tab to view the database requirements:

[IBM Cloud Application Performance Management, Base Private V8.1.4](#)

[IBM Cloud Application Performance Management, Advanced Private V8.1.4](#)

If you plan to use the Db2 Advanced Enterprise Server Edition V10.5 fix pack 9 or later or one of the supported Db2 V11.1 editions, ensure that you install the IBM Cloud Application Performance Management, V8.1.4.0 interim fix 4, or a later server interim fix after you complete the Cloud APM server installation. Interim fixes for the Cloud APM server version 8.1.4 are available to download from [IBM Fix Central](#).

- Ensure that your remote Db2 server is running Red Hat Enterprise Linux version 6.\* or version 7.\* or AIX version 7.1 or version 7.2.
- For more information about sizing your servers, see the [“System requirements” on page 89](#). Use the information to estimate the amount of disk I/O to expect based on your environment size. A low latency network connection from the Cloud APM server to the remote Db2 server is also required. Keep ping times in the range of 1 ms or less.
- The Db2 installer creates the dasuser1 user and the dasadm1 group and assigns the dasuser1 user to the dasadm1 group. You must manually create all other users and groups and assign the users to the appropriate groups.
- If you are using a virus scan program (such as McAfee Virus Scan for Linux or Sophos), you must configure the virus scan program to exclude all Db2 database files; including storage groups, table spaces, and buffer pools. Configure the virus scan program before you create the Cloud APM databases.
- Check that the cron service is running on the Db2 server. The cron service is used to schedule Datamart database aggregation and pruning jobs.
- The authentication=server configuration is the default authentication for the Cloud APM installation when the remote Db2 databases are cataloged and when a Db2 database is created. You can switch to authentication=server\_encrypt if you prefer or if your security policies require it. For more information, see [“Changing Db2 authentication from server to server\\_encrypt” on page 154](#).

## About this task

These steps are performed on two systems: the system where you are installing the Cloud APM server and an external system where the remote Db2 server is installed.

The IBM Data Server Client is installed on the same system as the Cloud APM server. It manages applications on the existing Db2 databases on the Cloud APM server. The DATAMART, SCR32, and WAREHOUS databases are created on the external system. These databases are required by the Cloud APM server. Normally, they are created during the Cloud APM server installation when the default local Db2 server is installed. However, you must create them when you are connecting to a remoteDb2 server on an external system. You can specify custom names for these databases when using a remote Db2 server.

## Procedure

Complete these steps to configure an external Db2 server to use for the Cloud APM server databases:

1. On the system where you are installing the Cloud APM server, copy the database scripts from the Cloud APM server installation image to the external system:
  - a) Download the Cloud APM server installation image.  
For more information, see the [“Download instructions” on page 131](#) topic.
  - b) Extract the server installation files as described in [step 3 of “Downloading and installing the server” on page 159](#).
  - c) Copy the following scripts to the external system. Ensure that the *external\_db2\_instance* user has access to the remote Db2 server directory on the external system where the SQL files are copied to.

*external\_db2\_instance* is the remote Db2 server instance user name. Specify a user name or accept the default user name, which is db2apm.

#### Linux

```
/installation_media/files/sql/create/create_tdw_db.sql  
/installation_media/files/sql/create/create_scr_db.sql  
/installation_media/files/sql/create/create_datamart_db.sql  
/installation_media/files/sql/update/update_tdw_performance.sql  
/installation_media/packages/SCR/setup-dbconfig-linux_64.bin
```

#### AIX

```
/installation_media/files/sql/create/create_tdw_db.sql  
/installation_media/files/sql/create/create_scr_db.sql  
/installation_media/files/sql/create/create_datamart_db.sql  
/installation_media/files/sql/update/update_tdw_performance.sql  
/installation_media/packages/SCR/setup-dbconfig-aix_64.bin
```

where *installation\_media* is the directory where the Cloud APM server installation files are located.

The scripts are used later in this procedure to create the DATAMART, SCR32, and WAREHOUS databases on the external system.

2. On the external system, create the databases and set up the remote Db2 server:

- a) Find the Db2 server installation path and verify the Db2 version that is installed:

```
db2ls
```

- b) Verify that the Db2 license is installed:

```
Db2_install_dir/Db2_version/adm/db2licm -l
```

where *Db2\_install\_dir* is the Db2 installation path that you retrieved in [step 2.a](#).

- c) Create the *external\_db2\_instance* user, add the user to the db2iadm1 group, and create the database instance:

#### Linux

```
useradd -g db2iadm1 -m external_db2_instance
```

```
/Db2_install_dir/Db2_version/instance/db2icrt -u db2fenc1  
external_db2_instance
```

#### AIX

```
mkuser id=value pgrp=db2iadm1 groups=db2iadm1  
home=/home/external_db2_instance external_db2_instance
```

```
chown -R external_db2_instance:db2iadm1 /home/external_db2_instance  
/Db2_install_dir/Db2_version/instance/db2icrt -u db2fenc1  
external_db2_instance
```

where *value* is the user ID. 1000 and 1001 are usually used. You can check whether these IDs are available in SMIT: **smitty > Security & Users > Users > List All Users**. *Db2\_version* is the Db2 version that is installed. *Db2\_version* might not be included in the path when you install the Db2 server yourself. For more information, see the [“Default users and passwords”](#) on page 1194 topic.

- d) Create the *itmuser* user. Add the *itmuser* user to the *dasadm1* group (applicable only if you are running Db2 version 10.5 fix pack 6 or fix pack 9). Run one set of the following commands depending on the Db2 version that you are running:

- For Db2 version 10.5 fix pack 6 or fix pack 9, issue the following commands:

#### Linux

```
useradd -g dasadm1 -m itmuser
```

```
AIX mkuser id=value pgrp=dasadm1 groups=dasadm1 home=/home/itmuser itmuser
```

```
AIX chown -R itmuser:dasadm1 /home/itmuser
```

AIX where *value* is the user ID.

- For Db2 version 11.1.2 fix pack 2b or 11.1.3 fix pack 3, issue the following commands:

Linux

```
useradd -m itmuser
```

```
AIX mkuser id=value home=/home/itmuser itmuser
```

```
AIX chown -R /home/itmuser
```

AIX where *value* is the user ID.

- e) As the root user, set the passwords for the *external\_db2\_instance* user and itmuser accounts:

```
passwd external_db2_instance
```

```
passwd itmuser
```

Record the passwords somewhere because you need these values when you start the Cloud APM server installation.

- f) In a text editor, open the */etc/services* file and add a service name and the port number for the *external\_db2\_instance* user instance.

For example:

```
db2c_external_db2_instance port_number/tcp
```

where *port\_number* is the port number that you want the *external\_db2\_instance* instance to listen on. Record the port number values somewhere because you need these values when you start the Cloud APM server installation.

- g) Log in to the *external\_db2\_instance* user account.

For example:

```
su - db2apm
```

- h) Update the Db2 configuration with the service name by entering the following commands:

```
db2 update database manager configuration using svcename  
db2c_external_db2_instance
```

```
db2stop
```

```
db2start
```

- i) If you plan to use transparent LDAP authentication on the system where you are installing the Cloud APM server, set the DB2AUTH miscellaneous registry variable to OSAUTHDB on the Db2 instance:

```
db2set DB2AUTH=OSAUTHDB
```

```
db2stop
```

```
db2start
```

Transparent LDAP authentication enables the Db2 instance to authenticate users and acquire their groups through the operating system. The operating system, in turn, performs the authentication through an LDAP server.

- j) Turn on TCP/IP communications:

```
db2set DB2COMM=tcPIP
```

```
db2stop
```

```
db2start
```

- k) Verify that the WAREHOUS, SCR32, and DATAMART databases do not exist:

```
db2 list db directory
```

If any of the databases exist, remove each with the following command:

```
db2 drop db database_name
```

where *database\_name* is the name of the database.

- l) Complete the following optional steps:

- i) If you want the Cloud APM databases to use a non-default path for the database, or you want to change the default database names, edit the `create_tdw_db.sql`, `create_scr_db.sql`, and `create_datamart_db.sql` files to specify the changes before starting the SQL scripts to create the databases (next step “2.m” on page 150). For example, to use the `/data/apmserver1` database path for the three databases for a Cloud APM server called `apmserver1`, edit the SQL files to include the new path by adding **ON** `/data/apmserver1`:

```
CREATE DATABASE DATAMART ON /data/apmserver1 USING CODESET UTF8 TERRITORY US
PAGESET 8 K
CREATE DATABASE SCR32 AUTOMATIC STORAGE YES ON /data/apmserver1 USING CODESET
UTF-8 TERRITORY US COLLATE USING SYSTEM PAGESET 8192
CREATE DATABASE WAREHOUS AUTOMATIC STORAGE YES ON /data/apmserver1
USING CODESET UTF-8 TERRITORY US COLLATE USING SYSTEM PAGESET 8192
```

If you updated the directory paths, make sure the instance ID is the owner of the path and has write access to the directory.

- ii) If you want to change the names of the database, use an editor, such as `vi`, to change the default database names in the `create_tdw_db.sql`, `create_scr_db.sql`, and `create_datamart_db.sql` files. If you change the name of the `WAREHOUS` database, the `/installation_media/files/sql/update/update_tdw_performance.sql` file is also impacted.

- m) Create the DATAMART, SCR32, and WAREHOUS databases by starting the following scripts:

```
db2 -vf /path/create_tdw_db.sql
db2 -vf /path/create_scr_db.sql
db2 -vf /path/create_datamart_db.sql
db2 -vf /path/update_tdw_performance.sql
```

where *path* is the path and directory where you stored the script after you copied it from the Cloud APM server.

These scripts create the databases in the home directory of the *external\_db2\_instance*.

- n) If this is the first Cloud APM SCR database that you are creating for the Db2 instance, run the `setup-dbconfig-operating_system_64.bin` script to complete the steps that are required for the SCR32 database. If you already ran the `setup-dbconfig-`

operating\_system\_64.bin.script for this Db2 instance, skip this step and perform step “2.o” on page 152 instead.

```
/path/setup-dbconfig-operating_system_64.bin -i console
```

where *operating\_system* is either *aix* or *linux*. Follow the console prompts:

- i) When you are prompted to choose a locale, enter 2 to select English.
- ii) Enter 1 to accept the license agreement.
- iii) Enter the absolute path to the installation directory. The setup-dbconfig executable program installs a program that is used for the creation of the SCR database into this directory. It is useful to specify a directory under your home directory. For example, if the Db2 instance is *db2apm* and the **db2apm** user is running the setup-dbconfig program, then specify this path: */home/db2apm/tbsmdb*. The program requires 170 MB of disk space, approximately.

Press **Enter** if you want to accept the default path, */opt/IBM/tivoli/tbsmdb*. If you accept the default path, before continuing with the installation, ensure that the Db2 instance user has permission to create a directory here: */opt/IBM* or that this */opt/IBM/tivoli/tbsmdb* directory exists already and that the DB2 instance user has write permission to the directory.

If you intend to have multiple SCR32 databases on this remote Db2 server, use a path that is unique for each Db2 instance. For example, if your Db2 instance name is *db2apmg* then use the */home/db2apmg/tbsmdb* path. The path is not used for the SCR database.

The Cloud APM SCR database configuration tools installed by the *setup\_dbconfig-platform\_64.bin* script should not be installed into the same directory as the Tivoli Business Service Manager database configuration tools if the databases for both products reside on the same remote Db2 server.

- iv) Enter 1 to select IBM Cloud Application Performance Management (APM) as the product that uses the database.
- v) Enter 1 to select Simple as the type of installation to run.
- vi) Enter 1 to instruct the installer to create the database schema, including the tables, table spaces, and views.
- vii) Enter the following database configuration details when you are prompted:

```
Database Name (maximum 8 characters) (DEFAULT: SCR32): scr-database-name
Database Hostname or IP Address(DEFAULT:): host_name_or_IP_address
Port (DEFAULT: 50000): port
Database User ID: database_user_ID
Database password: database_password
Confirm password: database_password
Database Path (Default: <default>): default_path
```

where:

**scr\_database\_name**

The name of the SCR database in the *create\_scr\_db.sql* file that you used in step “2.m” on page 150. The default is *SCR32*.

**port**

The port number that you specified in step 2e.

**database\_user\_id**

The user ID is usually *itmuser*, although the *external\_db2\_instance* user ID can be used.

**default\_path**

The file system where the database is written. The default is the user's home directory. If you modified the scripts in step 2k to use a different path, you must specify the same file system in the *default\_path*.

**Note:** If the default name is not used in step “2.l” on page 150, update the database name.

viii) At the prompt Does the specified user have SYSCTRL or SYSADM authority?, enter 2 "No" if ituser was specified or 1 "Yes" if the *external\_db2\_instance* user was specified.

ix) Enter 2 to specify not to encrypt the database.

x) If the database user you specified did not have SYSCTRL or SYSADM authority, then enter a database user that has this authority. Specify the *external\_db2\_instance* user name.

**Note:** Continue to step “2.p” on page 152.

o) Run the `setup-dbconfig-operating_system_64.bin` script only once for each Db2 instance. If you already ran the `setup-dbconfig-operating_system_64.bin` script for this Db2 instance, when creating a new SCR database for another Cloud APM server, perform the following steps:

i) Change directory to the path that you entered in step “3.n.iii” on page 151 for the Db2 instance user, for example:

```
cd /home/db2apmg/tbsmdb
```

ii) Run the following **grep** commands:

```
grep "DL_DBManager.ObjectURL="
tools/XMLtoolkit/bin/xmltoolkitsvc.properties
grep "TBSM.UDF.DatabaseName=" sql/tbsmudf_db.properties
grep "TBSM.DatabaseName=" sql/tbsm_db.properties
grep "TBSM.OnPath=" sql/tbsm_db.properties
grep "TBSM.Port=" sql/tbsm_db.properties
```

The following output is displayed:

```
[db2apmg@db21056 ~]$ cd /home/db2apmg/tbsmdb
[db2apmg@db21056 tbsmdb]$ grep "DL_DBManager.ObjectURL="
tools/XMLtoolkit/bin/xmltoolkitsvc.properties
DL_DBManager.ObjectURL=jdbc:db2://db21056.rtp.raleigh.ibm.com:50005/SCgmmg
[db2apmg@db21056 tbsmdb]$ grep "TBSM.UDF.DatabaseName=" sql/tbsmudf_db.properties
TBSM.UDF.DatabaseName=SCgmmg
[db2apmg@db21056 tbsmdb]$ grep "TBSM.DatabaseName=" sql/tbsm_db.properties
TBSM.DatabaseName=SCgmmg
[db2apmg@db21056 tbsmdb]$ grep "TBSM.OnPath=" sql/tbsm_db.properties
TBSM.OnPath= ON /db2/SCgmmg_data
[db2apmg@db21056 tbsmdb]$ grep "TBSM.Port=" sql/tbsm_db.properties
TBSM.Port=50005
```

iii) Update the files to match your port and SCR database name.

iv) Use the **tbsm\_db.sh** command to create tables and views associated with the database:

```
./bin/tbsm_db.sh -s sc -U dbUserId -f c
```

where: *dbUserId* is the Db2 instance user. The bufferpools and tablespaces are also created.

p) Enter the following command to enable the DB2 scheduler that Datamart uses for aggregation and pruning.

```
db2set DB2_ATS_ENABLE=YES
```

For detailed information, see the [db2set - DB2 profile registry command](#) topic in the DB2 IBM Knowledge Center.

q) Enter the following command as the *external\_db2\_instance* user for each database to adjust the buffer pool and transaction log after you determine the size of your environment.

```
db2 connect to WAREHOUS
db2 update database configuration for WAREHOUS using LOGSECOND WAREHOUS_LOGSECOND
db2 alter bufferpool IBMDEFAULTBP IMMEDIATE size WAREHOUS_PAGE_COUNT
db2 disconnect WAREHOUS
db2 connect to DATAMART
db2 alter bufferpool IBMDEFAULTBP IMMEDIATE size DATAMART_PAGE_COUNT
db2 disconnect DATAMART
db2 connect to SCR32
db2 update database configuration for SCR32 using LOGSECOND SCR_LOGSECOND
```

```
db2 alter bufferpool IBMDEFAULTBP IMMEDIATE size 5000
db2 alter bufferpool TBSMCFG16KBP IMMEDIATE size SCR_CFG_PAGE_COUNT
db2 alter bufferpool TBSM4KBP IMMEDIATE size 1000
db2 alter bufferpool TBSM32KBP IMMEDIATE size 1000
db2 alter bufferpool TBSMSCR16KBP IMMEDIATE size SCR_PAGE_COUNT
db2 disconnect SCR32
```

where:

#### **WAREHOUS\_LOGSECOND**

The number of secondary transaction logs: 25 for a small environment; 50 for a medium environment; or 100 for a large environment.

#### **WAREHOUS\_PAGE\_COUNT**

The buffer pool page count (8-KB page sizes): 50000 for a small environment; 100000 for a medium environment; or 200000 for a large environment.

#### **DATAMART\_PAGE\_COUNT**

The buffer pool page count (8-KB page sizes): 100000 for a small environment; 200000 for a medium environment; or 300000 for a large environment.

#### **SCR\_LOGSECOND**

The number of secondary transaction logs: 25 for a small environment; 50 for a medium environment; or 100 for a large environment.

#### **SCR\_CFG\_PAGE\_COUNT**

The buffer pool page count (16-KB page sizes): 1000 for a small environment; 5000 for a medium environment; or 10000 for a large environment.

#### **SCR\_PAGE\_COUNT**

The buffer pool page count (16-KB page sizes): 30000 for a small environment, 50000 for a medium environment, and 100000 for a large environment.

Estimate the size of your environment (small, medium, or large) from the Cloud APM server requirements table in [“Cloud APM server hardware requirements” on page 111](#).

**Note:** If you are not using the default database names, then replace the *WAREHOUS*, *DATAMART*, and *SCR32* names with the database names you used in step [“2.1” on page 150](#).

- r) If you want to run with Db2 authentication set to **server\_encrypt**, complete steps [“1” on page 155](#) and [“2” on page 155](#) in *Changing Db2 authentication from server to server\_encrypt*.
3. As the root user, install the IBM Data Server Client on the system where you plan to install the Cloud APM server (the version of the Data Server Client should match the version of the Db2 server that is mentioned in the Before you begin section).

The IBM Data Server Client requires the local Db2 Cloud APM server user to run Db2 commands. This local Db2 user name is always set to db2apm. Do not confuse this db2apm user with the remote *external\_db2\_instance* user that was created in the previous steps.

- a) Create the db2apm user and add the db2apm user to the db2iadm1 group:

```
groupadd db2iadm1
```

```
useradd -g db2iadm1 -m db2apm
```

- b) Create the db2fenc1 user and add the db2fenc1 user to the db2fadm1 group:

```
groupadd db2fadm1
```

```
useradd -g db2fadm1 -m db2fenc1
```

- c) Install the IBM Data Server Client component from the Db2 installation package, which is located in the Cloud APM server installation image : `packages/DB2/v10.5fp6_linuxx64_server_t.tar.gz`. Extract the package using `tar -xzf v10.5fp6_linuxx64_server_t.tar.gz` and change to the `server_t` directory. If you are using the local version of Db2 server installed with the Cloud APM server, ensure the version of the Data Server Client matches that Db2 server version. If you are using a remote Db2 server, ensure

the version of the Data Server Client matches that remote Db2 server version. Review the Db2 server versions for local and remote in the [Before you begin](#) section.

**Note:** Ensure the version of the Data Server Client matches the remote Db2 server version.

- d) Start the db2setup script:

```
./db2setup
```

To run the db2setup script, you must set the *DISPLAY* environment variable to establish a connection to an X11 server.

- e) After the Db2 Launchpad opens, select **Install a Product**, then select the client that you want to install and follow the prompts in the Db2 Setup wizard.
- f) Accept the license agreement.
- g) Click **Typical** as the installation type.
- h) In the Setup a Db2 instance window, select **Create a DB2 instance**.
- i) Click **Existing User** and enter db2apm for the user name. Alternatively, enter the following command from the command line after the installation finishes:

```
/opt/ibm/db2/Db2_version/instance/db2icrt -u db2fenc1 db2apm
```

where *Db2\_version* is the Db2 version that is installed.

- j) Click **Next** and **Finish**.

## What to do next

Install the Cloud APM server. Start from step “4” on page 159 in [“Downloading and installing the server”](#) on page 159.

If your environment includes IBM Tivoli Business Service Manager and the database resides on the same remote Db2 server used for the Cloud APM databases, also install the Cloud APM Version 8.1.4.0 Server Interim Fix 8 or later after the Cloud APM server is installed and follow the interim fix post-installation instructions to run the procedure that updates the Cloud APM Java user defined functions (UDFs). Interim fixes for the Cloud APM server Version 8.1.4 are available to download from [IBM Fix Central](#).

## Related tasks

[“Changing passwords on a remote Db2 server”](#) on page 1196

If your Cloud APM server uses a remote Db2 server on an external system, you must complete this procedure to change the Db2 user passwords on the Db2 server and configure the Cloud APM server with the updated `itmuser` password. These steps differ slightly to the steps for changing Db2 user passwords on the Cloud APM server that is connected to the default local Db2 server.

## Changing Db2 authentication from server to server\_encrypt

You might not want or be allowed because of corporate security policies to run with Db2 authentication configured as `authentication=server`. When you create a remote Db2 database or switch from the local Cloud APM Db2 database to a remote Db2 server, you can change to `authentication=server_encrypt` to protect the user ID and password.

## About this task

The `authentication=server` configuration is the default authentication for the Cloud APM installation when the remote Db2 databases are cataloged and when a Db2 database is created. The procedure has you update the Db2 authentication configuration to `server_encrypt` and edit the `install.properties` file that is in the Cloud APM server installation package.

## Procedure

Complete these steps on the remote Db2 server as the Db2 instance user (db2apm is the instance user in the commands):

1. Check the Db2 authentication configuration:

- a) db2 attach to db2apm
- b) db2 get dbm cfg | grep AUTHENTICATION

The grep command prints Database manager authentication (AUTHENTICATION) = SERVER. If, instead, you get Database manager authentication (AUTHENTICATION) = SERVER\_ENCRYPT, you can skip step “2” on page 155.

- c) db2 attach to db2apm
- d) db2 detach

2. Change Db2 authentication to server\_encrypt:

- a) db2 attach to db2apm
- b) db2 update dbm cfg using authentication server\_encrypt
- c) db2 get dbm cfg | grep AUTHENTICATION

The grep command prints Database manager authentication (AUTHENTICATION) = SERVER\_ENCRYPT.

- d) db2 attach to db2apm
- e) db2 detach

## Results

User authentication to the database server is now set to server\_encrypt.

### Related tasks

[“Connecting to a remote Db2 server” on page 146](#)

By default, the Db2 server (Db2 Advanced Enterprise Server Edition version 10.5 fix pack 6) is installed locally with the Cloud APM server. If you are already running a supported fixpack of Db2 Advanced Enterprise Server Edition version 10.5, Db2 Advanced Workgroup Server Edition V11.1, or Db2 Advanced Enterprise Server Edition version 11.1 on an external system, you can choose to use this existing remote Db2 server for the databases that are required by the Cloud APM server instead of installing the default local Db2 server.

[“Moving Db2 databases to a different Db2 server or Db2 instance” on page 1199](#)

## Switching from one offering to another offering

---

In V8.1.4, as a result of rebranding, two offerings are supported instead of four offerings that were supported in the V8.1.3 release. These offerings are IBM Cloud Application Performance Management, Base Private and IBM Cloud Application Performance Management, Advanced Private. You can switch from the Cloud APM, Base offering to the Cloud APM, Advanced offering at any time after you have installed the Cloud APM, Base offering or upgraded to the Cloud APM, Base offering.

### About this task

When you start the installation script, you receive a report that shows what offering is installed now and what the resulting offering is after installation is complete. Switching from Cloud APM, Base to Cloud APM, Advanced can take longer than installing Cloud APM, Advanced only because various components are being stopped and started to replace Cloud APM, Base with Cloud APM, Advanced. The Cloud APM, Advanced offering replaces the Cloud APM, Base offering. The final installed offering is Cloud APM, Advanced.

### Procedure

Download and install the Cloud APM, Advanced offering.

For more information, see [“Downloading and installing the server” on page 159](#).

## Results

The Cloud APM, Advanced offering is installed replacing the existing Cloud APM, Base offering.

## What to do next

To use the WebSphere Applications agent capabilities that are provided in the new offering, you must reconfigure the data collector. For instructions, see [“Reconfiguring the data collector if you change the offering type on Cloud APM server” on page 965.](#)

## Installing on a system using an external directory service

---

If the system where you plan to install the Cloud APM server with a local Db2 server is using an external LDAP directory service to authenticate users who log into the Cloud APM server such as your root user and your Db2 users, you must create local Db2 users before you install the Cloud APM server.

### Before you begin

Although this procedure is generally applicable to any directory service and access protocol, the following steps cover an external directory service in use with LDAP. It is possible that your chosen directory service and access protocol are not recognized by Db2 and the Cloud APM server installation software. In such a scenario, when you try to manage resources in this directory service, an error is returned because you are not authorized to complete these tasks. The steps that differ depending on directory service type are emphasized in this procedure but they are not documented.

### About this task

Complete the following steps to:

- Temporarily disable LDAP authentication for the Cloud APM server.
- Create local Db2 users and groups.
- Configure the Db2 users and passwords in the `install.properties` file used for the Cloud APM server installation.
- Re-enable LDAP authentication.
- Install the Cloud APM server.
- Configure the LDAP security plug-in on the local Db2 server.
- Update `itmuser` and Db2 instance user passwords if these passwords are configured in your external directory service that is being used with LDAP.
- Install a local Db2 server for use with LDAP for user authentication.

**Note:** The Cloud APM server installation does not configure the local Db2 server to use the LDAP security plug-in. After you install the Cloud APM server, you must configure the LDAP security plug-in on the local Db2 server.

### Procedure

1. Enter the following command and save the output for later reference:

```
id user_name
```

where `user_name` is `itmuser`, `db2apm`, `db2fenc1`, or `dasusr1`. See the following sample output:

```
# id itmuser
uid=1188800003(itmuser) gid=1188800003(itmuser) groups=1188800003(itmuser)
# id db2apm
uid=1188800004(db2apm) gid=1188800004(db2apm) groups=1188800004(db2apm)
# id db2fenc1
uid=1188800005(db2fenc1) gid=1188800005(db2fenc1) groups=1188800005(db2fenc1)
# id dasusr1
uid=1188800006(dasusr1) gid=1188800006(dasusr1) groups=1188800006(dasusr1)
```

**Important:** The message `id: <username>: No such user` indicates that the user is not defined in the LDAP directory. If none of the users are defined in the LDAP directory, skip the remaining steps. If a subset of the others are defined in the LDAP directory then only perform the remaining steps for the users that are in the LDAP directory.

2. Disable the LDAP authentication service by entering the following command:

```
service sssd stop
```

The command to run for this step might differ depending on your chosen directory service.

3. Perform an SSSD cache cleanup for the users that you identified in step 1.

For example:

```
sss_cache -u itmuser
sss_cache -u db2apm
sss_cache -u db2fenc1
sss_cache -u dasusr1
```

This step might differ depending on your chosen directory service.

4. Create new groups and users on your local system for the users that you identified in step 1. Reuse the group names and group IDs, and user names and user IDs from the output of the `id` command in step 1. Use the same passwords that were specified in the LDAP directory.

```
groupadd -g 1188800003 itmuser
useradd -u 1188800003 -g 1188800003 itmuser
passwd itmuser

groupadd -g 1188800004 db2apm
useradd -u 1188800004 -g 1188800004 db2apm
passwd db2apm

groupadd -g 1188800005 db2fenc1
useradd -u 1188800005 -g 1188800005 db2fenc1
passwd db2fenc1

groupadd -g 1188800006 dasusr1
useradd -u 1188800006 -g 1188800006 dasusr1
passwd dasusr1
```

5. Update the passwords in the `install_image/install.properties` file for the users that you identified in step 1. Use the same passwords that were specified in LDAP directory.

For example:

```
db2apm.password=db2Usrpasswd@08
itmuser.password=db2Usrpasswd@08
db2fenc1.password=db2Usrpasswd@08
dasusr1.password=db2Usrpasswd@08
```

6. Update the group names in the `install_image/files/db2wse.rsp` file for the users that you identified in step 1. No property exists for the `itmuser` user.

- a) Update the `apm.GROUP_NAME` property with the name of the primary group of the `db2apm` user.

For example: `apm.GROUP_NAME = db2apm`

- b) Update the `apm.FENCED_GROUP_NAME` property with the name of the primary group of the `db2fenc1` user.

For example: `apm.FENCED_GROUP_NAME = db2fenc1`

- c) Update the `DAS_GROUP_NAME` property with the name of the primary group of the `dasusr1` user.

For example: `DAS_GROUP_NAME = dasusr1`

7. Enable the LDAP authentication service by entering the following command:

```
service sssd start
```

The command to run for this step might differ depending on your chosen directory service.

8. Install the Cloud APM server and choose the option to install the default Db2 server. For instructions, see [“Downloading and installing the server” on page 159](#).

9. Configure the LDAP security plug-in on the local Db2 server. For instructions, see [LDAP-based authentication and group lookup support](#).

This step might differ depending on your chosen directory service.

## Results

The Cloud APM server is installed on a computer system or VM where LDAP is used for user authentication and a local Db2 server is used.

## What to do next

Verify that data from your agents is displaying in the Cloud APM console. If you are not logged in, follow the instructions in [“Starting the Cloud APM console”](#) on page 1109.

## Creating Db2 users before you connect to a local Db2 server

---

If you plan to connect to a local Db2 server, you might want to create Db2 instance users before you install the Cloud APM server to adhere to your organization's database server administration policies or to specify custom passwords. You must assign the Db2 users to their primary groups when you create each user ID.

### About this task

After you select to install the Db2 database during Cloud APM server installation, a Db2 server is created with Db2 instance users `dasusr1`, `db2apm`, and `db2fenc1`, `itmuser`, and groups `dasadm1`, `db2iadm1`, `db2fadm1`. The installation assigns users to groups:

- `dasusr1` user is assigned to the `dasadm1` group
- `db2apm` user is assigned to the `db2iadm1` and `dasadm1` groups
- `db2fenc1` user is assigned to the `db2fadm1` group
- `itmuser` user is assigned to the `dasadm1` group

Instead of user and group creation during server installation, these instructions have you create the Db2 instance users before you install the Cloud APM server and Db2 server. When you create each user, you must assign the user to its primary group and update the default user password for each user in the `install.properties` file. The users can also be added to other groups that are used in your environment.

**Note:** The Cloud APM server does not support custom Db2 usernames and groups for a local Db2 server so you must create the Db2 user names and groups listed in the procedure.

### Procedure

As the root user, complete these steps:

1. Create the primary groups.

For example,

```
groupadd dasadm1
groupadd db2iadm1
groupadd db2fadm1
```

2. Create the user IDs and assign each user ID to a primary group.

For example,

```
useradd -g dasadm1 -m dasusr1
useradd -g db2iadm1 -m db2apm
useradd -g db2fadm1 -m db2fenc1
useradd -g dasadm1 -m itmuser
```

3. Set the passwords for the user IDs.

For example,

```
passwd dasusr1
passwd db2apm
passwd db2fenc1
passwd itmuser
```

4. Update the passwords in the `APM_server_install_image/install.properties` file for each user.

## What to do next

Review the options and requirements in [“Preparing to install your server” on page 143](#) to help you plan your installation of the Cloud APM server.

## Downloading and installing the server

The installation procedure involves downloading the Cloud APM server installation media, extracting the installation files on the system, and running the installation script. Before you install the monitoring agents or Hybrid Gateway, or configure data collectors, install the Cloud APM server on a virtual machine or computer in your network that is running Red Hat Enterprise Linux.

## Before you begin

Review the requirements and options in [“Preparing to install your server” on page 143](#).

## Procedure

While logged on as the root user (root permissions are required to install and run the Cloud APM server), complete the following steps to download, decompress, and install the server and supporting components on a Red Hat Enterprise Linux system:

1. Download the Cloud APM server installation image from the download site to a staging location of your choosing.

See [“Downloading from Passport Advantage” on page 134](#).

2. If you plan to configure the agent images or Hybrid Gateway image (or both) during the server installation, download the images to the same system where the server will be installed.

For details, see [“Download instructions” on page 131](#).

3. Extract the server installation files for your offering:

**IBM Cloud Application Performance Management, Advanced Private**

`advanced_8.1.4.0.tar`

**IBM Cloud Application Performance Management, Base Private**

`base_8.1.4.0.tar`

4. Go to the directory where you extracted the server installation files.

5. Verify that the default permissions are set correctly. Open a command prompt and enter `umask`.

A value of `0022` is returned if the permissions are set correctly. If any other value is returned, set the permissions by entering the following command:

```
umask 0022
```

6. If you want to change the protocol from the default HTTP to HTTPS (secure) communications, enter the following command:

```
export APM_SECURE_COMMUNICATION=y
```

(See [“Setting HTTP or HTTPS communications” on page 145](#).)

7. If you chose to use a remote Db2 database rather than install a Db2 server locally with the Cloud APM server ([“Connecting to a remote Db2 server” on page 146](#)) and you created the Cloud APM databases with Db2 authentication set to `server_encrypt` rather than the default `server`, take the following steps:

- a) Change to the directory where you decompressed the Cloud APM server installation tar file.
  - b) Edit the `install.properties` file to set `db2.authentication=server_encrypt`.
8. If you chose to use a remote Db2 database rather than install a Db2 server locally with the Cloud APM server and you created databases with custom names on the remote Db2 server, complete the following steps:

- a) Login as the `db2apm` user on the Cloud APM server.
- b) If you are not using the default database names, you must create alias catalog entries for the default names to reference your database names. Catalog the node and databases, for example:

```
db2 CATALOG TCPIP NODE APM5 REMOTE 9.42.13.5 SERVER 50005
```

where:

- *APM5* is the node name. Use any name (up to 8 characters) except *APM\_NODE* because Cloud APM uses the *APM\_NODE* name.
  - *9.42.13.5* is the IP address or hostname of the remote Db2 server.
  - *50005* is the port number configured for the Db2 instance on the remote Db2 server.
- c) If the default entries are already cataloged from a previous install, uncatalog the default databases as follows:

```
db2 uncatalog db warehouse
db2 uncatalog db datamart
db2 uncatalog db scr32
```

- d) Catalog your database names as the new default database names:

```
db2 CATALOG DB WHOUS5 as WAREHOUS at NODE APM5
db2 CATALOG DB DMART5 as DATAMART at NODE APM5
db2 CATALOG DB SCR5 as SCR32 at NODE APM5
```

where *WHOUS5* is your name for the WAREHOUS database. *DMART5* is your name for the DATAMART database. *SCR5* is your name for the SCR32 database. *APM5* is the node that you created in step “8.b” on page 160.

**Note:** If you added `db2.authentication=server_encrypt` to the `install.properties` file in step “7.b” on page 160, then append **authentication server\_encrypt** to each **db2 CATALOG** command.

- e) Test the connection to the remote database, for example:

```
db2 connect to warehouse user itmuser
db2 terminate
```

Output similar to the following is displayed:

```
[db2apm@APM814c ~]$ db2 connect to warehouse user itmuser
Enter current password for itmuser:

Database Connection Information

Database server          = DB2/LINUX8664 10.5.6
SQL authorization ID     = ITMUSER
Local database alias     = WAREHOUS

[db2apm@APM814c ~]$ db2 terminate
DB20000I The TERMINATE command completed successfully.
```

- f) Login as the root user on the Cloud APM server.
- g) Locate the `install.properties` file in the installation media package. It is in the same directory as the `install.sh` script. Save a backup copy of the file and then edit it. In the file there are three lines that contain the names of the Cloud APM databases:

```
datamartdb.name=DATAMART
metriccachedb.name=WAREHOUS
topologydb.name=SCR32
```

Change the names to match your database names and save the file:

```
datamartdb.name=DMART5
metriccachedb.name=WHOUS5
topologydb.name=SCR5
```

9. Install the Cloud APM server on the virtual machine or your computer system:

- a) The *TMOUT* environment variable should not be set when the Cloud APM server `install.sh` script is executed because it may cause the install process to exit before the install has completed. To confirm that the variable is not set, perform these steps:

Enter the following command and confirm that the *TMOUT* environment variable is not set:

```
env | grep TMOUT
```

If the variable is set then enter this command to unset it:

```
unset TMOUT
```

If the `unset` command fails then your OS administrator may have defined the *TMOUT* variable as read-only so work with your administrator to unset it before you install the Cloud APM server. You can set the *TMOUT* environment variable back to its original value after the Cloud APM server install completes.

- b) Enter one of the following commands to run the installation script:

- Install the server in the default `/opt/ibm` directory:

```
./install.sh
```

- Install the server in a directory of your choosing:

```
./install.sh -d /custom/path/
```

where `/custom/path/` is the path to the directory where you want the server to be installed.

- Install the server and view the output on the console:

```
./install.sh -v
```

The output is saved to the installation log file whether you choose the verbose (**-v**) option or not. You can enter both the directory (**-d**) and verbose (**-v**) options in the command: `./install.sh -d -v`.

- c) When asked whether you want to upgrade from an existing installation, enter 2 (no).  
The installer checks for an existing installed offering and the offering you are installing now, and requests confirmation that you want to continue.
- d) Review the offering that is displayed and enter 1 (yes) to continue with the installation or 2 (no) to stop the installation.
- e) If you are asked whether you want to change the default installation directory, enter 1 to specify a different directory or 2 to accept the default `/opt/ibm`.
- f) When you are asked whether you accept the license agreement, enter 1 to accept the agreement and continue, or enter 2 to decline.
- g) When you are prompted to change the default password for the administrator account, enter either 1 (yes) and create a new encrypted password, or 2 (no) to keep the default "apmpass" unencrypted password.

If you change the password, keep a copy in a safe place; you cannot recover the password if you forget it.

When you answer the prompt to change the administrator password, the installation continues.

- h) When you are asked whether you want to configure your agent installation images, data collector images, and Hybrid Gateway installation image (if used) to connect to the server, enter either 1 (yes) to configure the images now or 2 (no) to defer configuration of the agent, data collector, and Hybrid Gateway images.
- i) If you entered 1 (yes), you are prompted to confirm the following information:
- The path to the directory on the server where the agent images, data collector images, and Hybrid Gateway (if used) are stored.  
The agent images, data collector images, and Hybrid Gateway images can be mounted on an NFS partition but must be accessible using the file system.
  - Whether to change the directory for the configured images (1 - yes) or to accept the default *install\_dir/ccm/depot* (2 - no). If you selected 1 (yes), enter the directory for the configured images to be stored.
  - If you accepted the default directory for storing the configured agent, data collector, and Hybrid Gateway images, the installer creates the directory *install\_dir/ccm/depot* for storing the configured agent, data collector, and Hybrid Gateway images. However, if you chose to change the directory or if the installer fails to create the directory or the directory is not writable, you are prompted to specify the output directory.

If you entered 2 (no), this step is skipped.

- j) When you are prompted to enter the IP address and host name that the agents will use to communicate with the server, enter the server IP address or host name for the agents and Hybrid Gateway to use. The format of the IP address can be IPv4 or the fully qualified domain name.  
You can change the IP address and host name later. See [“Changing the server IP address and host name” on page 1215](#).
- k) When you are prompted for the following values, enter the values for the server that is used in a web browser to log in to the Cloud APM console. This value corresponds to the address that users enter to start the Cloud APM console from their web browsers.
- Fully qualified domain name, for example: *myserver.example.com*.
  - Short host name
  - IP address

**Tip:** The fully qualified domain name and short host name are resolved by using DNS. If your system does not have good DNS resolution, enter the IP for all three values.

You can change the IP address and host name later. See [“Changing the server IP address and host name” on page 1215](#).

- l) When you are prompted to install the database or connect to an existing Db2 database, enter either 1 to install the default database or 2 to connect to an existing Db2 database.

If you entered 2 (connect to existing database), complete the following steps:

- You are prompted to provide or accept the default values for the *hostname/IP address* and *port number* Db2 parameters to establish the connection.
- Enter the password for the *itmuser* that you created when you set up the remote Db2 system.
- Enter the remote *external\_db2\_instance* user name or accept the default *db2apm* name.  
where *external\_db2\_instance* is the remote Db2 server instance user name that you created when you set up the remote Db2 server.
- Enter the password for this *external\_db2\_instance* user.

If you entered 1 and transparent LDAP is configured for this system, the server installation fails. For more information, see [“Installing the Cloud APM server on a computer system where LDAP authentication is used” on page 144](#).

If the installer detects any agent configuration packages in *install\_dir/ccm/depot* from a previous installation of the Cloud APM server, it warns you that it renamed the old packages and created new agent packages. The old packages are named *install\_dir/ccm/depot.old*.

If the installer detects a *keyfiles* directory in *install\_dir* from a previous installation of the Cloud APM server, it warns you that it renamed the old *keyfiles* directory and created a new directory. The old *keyfiles* directory is named *install\_dir/keyfiles.old*.

A prerequisite scan of your environment starts and takes a few moments to complete. If any requirements are missing, a message directs you to a log file with the reason for the failure. A prerequisite such as a missing library or insufficient disk space stops the installation. You must address the failure and start the installation again. A "soft" prerequisite such as low available memory does not stop the installation, but you must enter 1 to continue installing or 2 to stop. For more information about the `yum provides feature_name` and `yum install feature_name` commands, see [Dependencies](#). If the prerequisite scan detects that the RPM database is corrupted, the **rpm.dbStatusCorrect** property returns a FAIL status. For a possible solution, search the [IBM Support Forums](#) for Cloud Application Performance Management .

10. If the Cloud APM server installation fails, review the log messages displayed by the `install.sh` script and correct any problems identified by the prerequisite scanner.
  - If you need help from IBM support, run the *install\_dir/ccm/collectLogs.sh* script and provide the output file.
  - If you want to re-install the Cloud APM server, perform these steps:
    - a. Run the *install\_dir/ccm/uninstall.sh* script on the Cloud APM server.
    - b. If the Cloud APM server install failed after the prerequisite scanner ran and you configured the server to use a remote Db2 server, you must drop the three Cloud APM server databases and recreate them before re-installing the Cloud APM server. Perform steps “2.k” on page 150 through “2.q” on page 152 in “Connecting to a remote Db2 server” on page 146 to drop the databases and recreate them.
    - c. Re-install the Cloud APM server, starting with step “4” on page 159.

## Results

The installer installs the server components and support files; no further user input is required. After server installation, the installer configures the components, which can take 30 minutes or more to complete. The portion of the installation that involves creating and configuring the databases can take as little as 2 minutes or as much as 2 hours, depending on your hard drive I/O speed and drive caching.

Two server agents, the Monitoring Agent for Transactions Event and the Monitoring Agent for Synthetic Events, are installed and started automatically, regardless of which offerings you installed. The Transactions Event agent provides services for transaction tracking and the Synthetic Events agent provides services for synthetic transactions.

After the Cloud APM server is installed, you cannot change the permissions of the Cloud APM files and directories. In addition, you cannot change the user or group owners of these files and directories.

## What to do next

- If you are using custom database names, ensure that you install the IBM Cloud Application Performance Management, Private V8.1.4.0 interim fix 5, or a later server interim fix, after you complete the Cloud APM server installation. Interim fixes for the Cloud APM server V8.1.4 are available to download from [IBM Fix Central](#).
- If you are using a remote Db2 server with your Cloud APM server, ensure that you verify the following requirements are met during the installation process:
  - If you plan to use the Db2 Advanced Enterprise Server Edition V10.5 fix pack 9 or later or one of the supported Db2 V11.1 editions, ensure that you install the IBM Cloud Application Performance Management, V8.1.4.0 interim fix 4, or a later server interim fix after you complete the Cloud APM server installation. Interim fixes for the Cloud APM server version 8.1.4 are available to download

from IBM Fix Central. For the list of supported Db2 fix packs, click the **Prerequisites** tab in the Software Product Compatibility Report for your offering to view the database requirements: [IBM Cloud Application Performance Management, Base Private V8.1.4](#) or [IBM Cloud Application Performance Management, Advanced Private V8.1.4](#).

- Ensure that the `KQZ_JDBC_JAR_PATHS` variable is set to the path where the Db2 client JDBC driver is located. This path depends on where you installed the Db2 IBM Data Server Client in [step 3](#) in the [“Connecting to a remote Db2 server”](#) on [page 146](#) topic and the Db2 version (V10.5 or V11.1) that is being used. If the `KQZ_JDBC_JAR_PATHS` variable is not set to the path where the Db2 client JDBC driver is located, then set the variable to this path now and restart the Transaction Event agent by completing the following steps:
  - Go to the `install_dir/serveragents/config` directory. `install_dir` is the directory where the Cloud APM server is installed.
  - Back up the `hostname_te.cfg` file. `hostname` is the Cloud APM server hostname.
  - Open the `hostname_te.cfg` file and find the following line:

```
KQZ_JDBC_JAR_PATHS=/opt/ibm/db2/Db2_version/java
```

`Db2_version` is the Db2 version that is installed.

- Edit the path to point to where your JDBC driver jars are located. For example, if you are using Db2 V11.1, and your IBM Data Server Client is installed in the default `/opt/ibm` directory, the path looks like the following line:

```
KQZ_JDBC_JAR_PATHS=/opt/ibm/db2/V11.1/java
```

- Save the `hostname_te.cfg` file.
- Restart the Transaction Event agent by issuing the following command:

```
apm restart txagent
```

The Transaction Event agent connects to the remote Db2 database and the thresholds are working.

- The **install.sh** script modifies the buffer pool sizes for `TBSMCFG16KBP` and `TBSMSCR16KBP` and the log `LOGSECOND` size, these must be reset.

To reset the buffer pool sizes, return to the remote DB2 and run the following:

```
db2 connect to SCR32
db2 UPDATE DATABASE CONFIGURATION FOR SCR32 USING LOGSECOND 25
db2 alter bufferpool TBSMCFG16KBP IMMEDIATE size 10000
db2 alter bufferpool TBSMSCR16KBP IMMEDIATE size SCR32_PAGE_COUNT
db2 disconnect SCR32

SCR32_PAGE_COUNT
The buffer pool page count (16 K page sizes): 15000 for small, 30000 for medium, and 30000 for large.
```

- If you did not configure the agent installation images, data collector images and Hybrid Gateway installation images (if used) during installation of the server, follow the instructions in [“Configuring the downloaded images”](#) on [page 182](#).
- If you want to use the old agent configuration packages from a previous installation for the agent installation, complete these steps:
  1. Go to the `install_dir/ccm` directory.
  2. Delete the depot file.
  3. Change the name of the depot.old file to depot.
- If you want to use the old keystore from a previous installation for the Cloud APM server, complete these steps:
  1. Go to the `install_dir` directory.
  2. Delete the keyfiles directory.

3. Change the name of the `keyfiles.old` directory to `keyfiles`.
  4. Update the certificates that are used by the monitoring agents to connect to the Cloud APM server to use the new keystore. For instructions, see [“Configuring certificates between the server and agents for HTTPS communication”](#) on page 244.
  5. Update the certificates that are used by the server agents to connect to the Cloud APM server to use the new keystore. For instructions, see [“Configuring certificates between the server and agents for HTTPS communication”](#) on page 244.
- Install the agents on the systems where the applications that you want to monitor are installed, as described in Chapter 7, “Installing your agents,” on page 181.
  - Configure the data collector to deploy monitoring for your applications. For instructions, see Chapter 8, “Configuring your environment,” on page 223.
  - If you forgot to set the correct password for `itmuser` before installation, run the script to provide the correct password. See [“Changing a password”](#) on page 1195.
  - If you are having issues reinstalling the server after uninstallation, check that the uninstallation was completed successfully. For more information about uninstalling the server, see [“Uninstalling the server”](#) on page 165.
  - If the server installation does not progress or complete after 30 minutes (or longer if your hard drive I/O speed is slow), review the most recent `install_dir/ccm/logs/apm-server-yyyyymmdd_hhmmss.log` file where `install_dir` is the server installation directory, `yyyyymmdd` is the year, month, and day, and `hhmmss` is the hour, minute, and second.
  - If another Cloud APM server is installed with agents that connect to it, you can change the agents on each managed system to connect to your newly installed server. For more information, see [“Configuring agents to connect to a different server or to use HTTPS communication”](#) on page 255.
  - If you changed the offering type of the Cloud APM server from Cloud APM, Base to Cloud APM, Advanced and meanwhile the WebSphere Applications agent and the Node.js agent were installed and configured with the Cloud APM, Base offering, to use the agent advanced capabilities that are provided in the Cloud APM, Advanced offering, you have two choices:
    - Remove the agent that you installed with the Cloud APM, Base offering and install the agent again with the Cloud APM, Advanced offering. For information about removing and reinstalling the agent, see [“Uninstalling your agents”](#) on page 211 and Chapter 7, “Installing your agents,” on page 181.
    - Reconfigure the data collector. See the following instructions for different agents:
      - WebSphere Applications agent: [“Reconfiguring the data collector if you change the offering type on Cloud APM server”](#) on page 965
      - Node.js agent: [“Configuring the Node.js agent diagnostics data collector”](#) on page 688.
  - The Cloud APM server is configured to use the WebSphere® Application Server Liberty profile basic registry as the default method for user authentication. The `apmadmin` user is added to the basic registry during installation, and you can add more users. For more information, see [“Managing user access”](#) on page 1136. However, because the basic registry does not perform user account lockout or enable you to control user password expiration, it is good for test and demonstration environments only. An LDAP server provides additional security controls. For production environments, you should configure Cloud APM to use an LDAP server for authentication instead of the basic registry. For more information, see [“Integrating with LDAP”](#) on page 1097.

## Uninstalling the server

---

If you no longer want the Cloud APM server on your system, you can uninstall it. The procedure does not remove the monitoring agents that are manually installed. Agents that are automatically installed as part of the Cloud APM server are removed. These include: Summarization and Pruning agent, Bluemix® Integration agent, Synthetic Events agent, and Transactions Event agent.

## Before you begin

If the Db2 agent is installed on the Cloud APM server system and is monitoring the Cloud APM server Db2 database, the agent must be stopped before you uninstall the server. Otherwise, the uninstallation might fail. If you want to check whether the Db2 agent is installed on the system, you can run the agent version command. For more information, see [“Using agent commands”](#) on page 236.

## Procedure

You must be the root user to uninstall the server.

1. On the system where the Cloud APM server is installed, open the command prompt.
2. Run the following command in the `/opt/ibm/ccm` directory (or `/custom_path/ccm` if you installed the server in a different path):

```
./uninstall.sh
```

3. Specify the uninstallation log file directory or press enter to accept the default directory.  
The default log file directory is `/tmp/apm/uninstall`.
4. The uninstaller output displays the Cloud APM offering that you can uninstall, which is either IBM Cloud Application Performance Management, Base or IBM Cloud Application Performance Management, Advanced. Press enter to proceed or enter q (quit) to cancel the uninstall operation.

**Note:** All digital certificates are backed up to `install_dir/ccm/`. This is the only directory that remains after the uninstallation.

## Results

The Cloud APM server components are uninstalled.

## What to do next

Before you attempt to reinstall your Cloud APM server, you must confirm that the uninstall was successful. The `uninstallation finished` output message is displayed when the uninstall was successful. Alternatively, you can check the `/tmp/apm/uninstall/apm-server-uninstall_yyyymmdd_hhmmss.log` log file.

You must also confirm whether the Db2 database uninstall was successful by checking for the word `Success` in the `/tmp/db2_deinstall.log.pid` Db2 log file. You can find the full name of this Db2 log file (including the `pid` at the end of this file) in the `/tmp/apm/uninstall/apm-server-uninstall_yyyymmdd_hhmmss.log` log file. If the Db2 database uninstallation failed, clean up all Db2 entries. For more information, see [“Cleaning up Db2 entries”](#) on page 166.

## Cleaning up Db2 entries

When uninstalling the Cloud APM server, the Db2 database might fail to uninstall correctly. If the Db2 database is not uninstalled correctly, clean up Db2 entries before you attempt to reinstall the Cloud APM server.

## Before you begin

If you are connected to a remote Db2 database, no action is required. If you installed a Db2 database during the Cloud APM server installation, check the `/tmp/db2_deinstall.log.pid` log file to determine if the Db2 database failed to uninstall. If the Db2 database uninstallation failed, complete the following steps:

## Procedure

1. Run the following command:

```
ps aux | grep db2
```

2. Stop all running Db2 processes, which are returned by the **ps** command, by entering the following command:

```
kill -9 <processID>
```

3. Remove all Db2 users (for example, dasusr1, db2apm, db2fenc1, itmuser users) by running the following command:

```
userdel -r <username>
```

4. Change to the /var directory and remove the /var/db2 directory.
5. Edit the /etc/services file and remove all Db2 services (last services in the file, prefixed with db2).

## Results

The Db2 entries are cleaned up and you can reinstall your Cloud APM server. For more information, see Chapter 5, “Installing your server,” on page 143.

## Prerequisite scanner

After you start the installation script for the Cloud APM server, a prerequisite scanner runs automatically and displays the scan results. The scanner displays a path to a log file that you can review if any of the prerequisites are not met. You must address the unmet prerequisites before you can start the installation again.

A "soft" prerequisite, such as low available memory, does not stop the installation, but is displayed in the results. An out-of-date library or insufficient disk space stops the installation. The minimum requirements for installation are provided in Table 12 on page 113 and Table 13 on page 114 in “Cloud APM server hardware requirements” on page 111. See the "Small" column in the table for the applicable offering.

The following prerequisite scanner results show an example where the prerequisite checks failed. You must correct the problems that are found and start the installation again. (See “Tips for resolving unmet dependencies” on page 101.)

```
Version: 1.2.0.18
Build : 20160602
OS name: Linux
User name: root
```

```
Machine Information
Machine name: somehost
Serial number: ...
```

Scenario: Prerequisite Scan

Overall result: FAIL

Detailed results are also available in /tmp/smai\_prs\_20141203\_053249/result.txt

See Table 6 on page 90 in [“Cloud APM server prerequisites”](#) on page 90 for a list of the prerequisites that are checked, an understanding of what a failure means for each prerequisite, and an indication of the action to take to resolve each failure.

## Running the prerequisite scanner manually

When you install the Cloud APM server, a prerequisite scan of your environment starts and takes a few moments to complete. If any requirements are missing, a message directs you to a log file with the reason for the failure. You can enter a command to run a prerequisite check at any time before you install the Cloud APM server.

### About this task

For more information about the Cloud APM server requirements for the server, see [“System requirements”](#) on page 89.

### Procedure

1. To download and extract the server installation files from IBM Passport Advantage, follow Steps [“1”](#) on page 159 to [“5”](#) on page 159 in the *Downloading and installing the server* topic.
2. Go to the directory where you extracted the server installation files.
3. Run the prerequisite scanner:

- To run the prerequisite scanner with prompts, complete these steps:
  - a. Enter the command:

```
./install.sh -p product_code
```

where

#### **product\_code**

Specify whether the Db2 server is installed locally or remotely. A value of IPDB2 specifies a prerequisite scan for a Cloud APM server installation with a local Db2 server, which is the default. A value of IPM specifies a prerequisite scan for a Cloud APM server installation with an external Db2 server (see [“Connecting to a remote Db2 server”](#) on page 146).

- b. When prompted, enter the installation directory or accept the default value.

- To run the prerequisite scanner without prompts, enter:

```
./install.sh -p product_code -d install_dir
```

For example:

```
./install.sh -p IPM -d /root/nondefault/dir
```

### Results

The prerequisite scanner prints the results. The possible results from running the prerequisite scanner are as follows:

#### **PASS**

If the target environment meets all prerequisite checks, the scan returns an overall PASS result for the environment.

#### **WARN**

If the target environment doesn't meet requirements that are considered "soft" prerequisites and no other requirements have a FAIL status, the installation can proceed. However, server performance might be less than optimal.

## FAIL

If the target environment does not meet any of the prerequisite checks, the scan returns an overall FAIL result for the environment. Take the appropriate actions. For example, install the missing operating system packages or increase disk space.

## What to do next

Run the installation script to install the Cloud APM server.

## Bypassing the prerequisite scanner

When you install the Cloud APM server, a prerequisite scan of your environment starts and takes a few moments to complete. If any requirements are missing, a message directs you to a log file with the reason for the failure. You can enter a command to bypass the prerequisite check. Best practice is to enable the prerequisite scan but, for certain test scenarios, you can bypass the prerequisite scan to save time.

## About this task

After downloading and extracting the installation files, take this step to bypass the prerequisite scan.

## Procedure

- On the system where you plan to install the server, enter the following command:

```
export SKIP_PRECHECK=YES
```

## What to do next

Run the installation script to begin installing the server without the prerequisite scan.

## Installing a remote MongoDB

MongoDB is a NoSQL open source database that is installed with the Cloud APM server. The MongoDB stores data for the transaction tracking feature that is available with the offering, as well as threshold event data. You can install and configure the MongoDB on a remote system from the server. In large-scale environments, an external MongoDB can be used to reduce load at the server.

## Before you begin

To check whether MongoDB that was installed with the Cloud APM server is available, enter `/usr/bin/apm status mongodb`. The output of `Service mongodb started (PID 7574)` indicates that MongoDB is installed with the Cloud APM server. The installation directory for MongoDB is `install_dir/mongodb` (default is `/opt/ibm/mongodb`). MongoDB requires one TCP port that must be available, and is verified during the prerequisite check: 27000.

Check that the cron service is running on the external system. The MongoDB database uses this service for its cron jobs.

## About this task

Use this procedure to complete the following tasks:

- Install the MongoDB on a separate system from the Cloud APM server.
- Configure communications between the MongoDB and the server.
- Disable the MongoDB that was locally installed with the server.

For the supported version of MongoDB, see the system requirements report for your offering: [IBM Cloud Application Performance Management, Base Private V8.1.4](#) or [IBM Cloud Application Performance Management, Advanced Private V8.1.4](#). The supported version is available from the Prerequisites tab of the report.

## Procedure

1. Copy the contents of the packages/MongoDB directory from the server installation image to the remote system.
2. Install and activate MongoDB on a remote system:
  - a) On the remote system, change to the directory where you downloaded the MongoDB directory and run one of the following commands:

- To install MongoDB in the default /opt/ibm/mongodb directory:

```
install-mongodb.sh
```

- To install MongoDB in a different directory:

```
install-mongodb.sh /custom/path
```

where */custom/path* is the path and directory that you specify.

- b) Run the following command:

```
activate-mongodb.sh
```

The MongoDB is configured and started.

3. Configure communications between the remote MongoDB and the Cloud APM server:
  - a) If you are not already logged in to the Cloud APM console, log in now.  
(See [“Starting the Cloud APM console”](#) on page 1109.)
  - b) Click  **System Configuration > Advanced Configuration** and click **Mongo Configuration**.
  - c) In the **Host Name** field, enter the IP address or fully qualified host name of the remote system where MongoDB is installed.
  - d) Click **Save** to save the configuration.After you click **Save**, the transaction tracking components begin communicating with the remote MongoDB.
4. Stop the MongoDB that was installed with the Cloud APM server, and disable cron jobs and automatic restart of the MongoDB after restart by running the following command on the system where the Cloud APM server is installed:

```
install_dir/mongodb/bin/deactivate-mongodb.sh
```

where *install\_dir* is the default /opt/ibm/ installation directory of the server or the custom directory that you specified when you installed the server.

5. To enable the remote MongoDB for transferring threshold event and transaction tracking data to the Cloud APM server, run the following command on the Cloud APM server system:

```
touch install_dir/mongodb/mongodb-remote
```

## Results

The MongoDB that is installed with the Cloud APM server is disabled and threshold event and transaction tracking data is transferred between the server and the remote MongoDB.

All *new* threshold events and *new* transaction tracking data are transferred between the Cloud APM server and the remote MongoDB.

Existing open events and existing transaction tracking data are not migrated to the new MongoDB. To view existing open events in the Cloud APM console, use the Linux **touch** command to modify the date and time of all of the *private\_situation.xml* files in the subdirectories under the *install\_dir/wlp/usr/servers/min/dropins/CentralConfigurationServer.war/data\_source* directory.

## What to do next

MongoDB is initially configured with two user IDs that share the default mongoUsrpasswd@08: **admin** who has the MongoDB *userAdmin* role for managing MongoDB user accounts; and **user** who has no special privileges. You can run the `mongopasswd .sh` script to change the password for both users simultaneously.

### Related concepts

[“Passwords and user IDs for components” on page 1194](#)

Various components require user IDs and passwords for access.

### Related tasks

[“Starting, stopping, and checking the status of server components” on page 1210](#)

Use the commands for checking the status or for starting, stopping, and recycling the Cloud APM server components when necessary for maintenance and troubleshooting tasks.

[“Switching to a local MongoDB” on page 1219](#)

If your Cloud APM server is connected to a MongoDB on a remote server, you can switch to use the local MongoDB at any time.

**After installation, some agents are configured and started automatically**

For any agent that is started, the agent is configured with the default settings. To determine which agents are configured and started manually, see [Table 23 on page 175](#).

**After installation, some agents require manual configuration but start automatically**

For information about how to configure your agents, see [Chapter 8, “Configuring your environment,” on page 223](#). To determine which agents are configured manually and started automatically, see [Table 23 on page 175](#).

**After installation, some agents must be configured and started manually**

For any agent that is not started automatically, you must configure the agent before it can be started. To determine which agents are configured and started manually, see [Table 23 on page 175](#).

**Multiple instance agents require creating a first instance and starting manually**

You must create the first instance and start the agent manually. A multiple instance agent means that a single installation of the agent instantiates a unique monitoring instance for each unique application instance. These instances are visualized from the Cloud APM console as a result. To determine which agents are multiple instance agents, see [Table 23 on page 175](#).

**OS agents and log file monitoring**

The Linux OS agent, UNIX OS agent, and Windows OS agent are configured and started automatically. However, you can configure log file monitoring for the OS agents, so that you can monitor application log files. For more information, see [“Configuring OS agent log file monitoring” on page 727](#).

**Agent and data collector configuration, startup, and instance characteristics**

---

## Chapter 7. Installing your agents

Install monitoring agents on the systems where the corresponding applications that you want to monitor are located. For agents that support remote monitoring, you can install these agents on a different machine than where the monitored resource is located. The stand-alone data collectors do not require installation.

If you choose stand-alone data collectors to monitor your applications, you can skip the installation procedure. However, you must first configure the downloaded data collector images for communication between the Cloud APM server and data collectors. If you did not select the option to configure the data collector images when you installed the server, follow the instructions as documented in [“Configuring the downloaded images” on page 182](#) to configure the downloaded image. Otherwise, continue to [Chapter 8, “Configuring your environment,” on page 223](#) for instructions about how to configure data collectors for monitoring your applications.

### Remote monitoring

Some agents can be installed remotely from the resource that they are monitoring. The following agents support remote monitoring:

- Monitoring Agent for Amazon EC2
- Monitoring Agent for AWS Elastic Load Balancer
- Monitoring Agent for Azure Compute
- Monitoring Agent for Cassandra
- Monitoring Agent for Cisco UCS
- Monitoring Agent for Citrix Virtual Desktop Infrastructure
- Monitoring Agent for DataPower - This agent can be installed only on a remote machine.
- Monitoring Agent for Db2
- Monitoring Agent for Hadoop
- Monitoring Agent for HMC Base
- Monitoring Agent for IBM Cloud
- Monitoring Agent for InfoSphere DataStage
- Monitoring Agent for JBoss - If you want to use this agent for resource monitoring, install it remotely or locally. If you want to use the agent for transaction tracking and deep dive diagnostics, install it locally.
- Monitoring Agent for Linux KVM
- Monitoring Agent for MariaDB
- Monitoring Agent for Microsoft Cluster Server
- Monitoring Agent for Microsoft Exchange Server
- Monitoring Agent for Microsoft Office 365
- Monitoring Agent for Microsoft SharePoint Server
- Monitoring Agent for MongoDB
- Monitoring Agent for MySQL
- Monitoring Agent for NetApp Storage
- Monitoring Agent for OpenStack
- Monitoring Agent for Oracle Database
- Monitoring Agent for PostgreSQL
- Monitoring Agent for RabbitMQ
- Monitoring Agent for SAP Applications

- Monitoring Agent for SAP HANA Database
- Monitoring Agent for SAP NetWeaver Java Stack - If you want to use this agent for resource monitoring, install it remotely or locally. If you want to use the agent for transaction tracking and deep dive diagnostics, install it locally.
- Monitoring Agent for Sterling Connect Direct
- Monitoring Agent for Sterling File Gateway
- Monitoring Agent for VMware VI
- Monitoring Agent for WebLogic - If you want to use this agent for resource monitoring, install it remotely or locally. If you want to use the agent for transaction tracking and deep dive diagnostics, install it locally.

## Configuring the downloaded images

Before you can install agents, install the IBM Cloud Application Performance Management Hybrid Gateway, or configure the data collector, you must configure the downloaded images for communication with the Cloud APM server. If you already configured your downloaded images, but want to change between HTTP and HTTPS protocol, you can configure images to specify HTTP or HTTPS.

### Before you begin

Before you configure the agent installation image for Linux for Power Systems™ (Big Endian), Solaris SPARC, or Solaris x86-64, be sure to apply a server side core framework interim fix that supports these operating system types. The server side core framework interim fixes are installed on the Cloud APM server and update the core framework that is included in the agent package when you run the `configure_agent_images.sh` script.

**Note:** You should consider installing the latest server-side core framework interim fix even if you do not have Linux for Power Systems™ (Big Endian), Solaris SPARC, or Solaris x86-64 agent systems so that your new agent images contain the latest fixes common for all agent types.

To determine which server side core framework interim fixes have already been installed on the Cloud APM server:

1. Change to the `install_dir/fixes` directory. `install_dir` is the directory where you installed the Cloud APM server.

**Note:** If the `fixes` directory does not exist, then you do not have a server side core framework interim fix installed.

2. Enter the command below to list the server side core framework interim fixes that have been applied:

```
ls -la server-core-framework-*.xml
```

- If you plan to configure the agent installation image for Linux for Power Systems™ (Big Endian), apply IBM Application Performance Management 8.1.4.0 core framework interim fix 6 or later.
- If you plan to configure the agent installation image for Solaris SPARC, apply IBM Application Performance Management 8.1.4.0 core framework interim fix 9 or later.
- If you plan to configure the agent installation image for Solaris x86-64, apply IBM Application Performance Management 8.1.4.0 core framework interim fix 13 or later.

To download a core framework interim fix, go to [IBM Fix Central](#) and search for `8.1.4.0-IBM-APM-CORE-FRAMEWORK-IF`.

### About this task

If you selected the option to configure your downloaded images when you installed the server, you can skip this task.

Before you can install agents, you must configure the downloaded agent installation images to apply the agent framework for communication with the Cloud APM server. The agent framework is installed in the `AgentFrameworks` directory during the Cloud APM server installation. It's not included in the downloaded agent installation images. Only after the agent image configuration, the agent framework is injected into the installation images.

Configuring the downloaded images for connecting to the Cloud APM server requires that you run two scripts:

- Run **make\_configuration\_packages** on the system where the Cloud APM server is installed. The script creates a configuration package TAR file and compressed file with information that the installer and the agents or data collectors need for communications with the server.
- Run **configure\_agent\_images** on the system where the Cloud APM server is installed. The script applies information from the configuration package to the image files that you downloaded for agent installation or data collector deployment.

You can choose to leave the images packed before you run the scripts or unpack them beforehand. You can also choose to run the scripts interactively, answering the prompts to complete each procedure, or in batch mode by adding command line arguments.

## Procedure

Complete these steps to download and configure the downloaded images:

1. Download the agent, the data collector, or Hybrid Gateway images to a Cloud APM server (see [“Download instructions”](#) on page 131).
2. Create the configuration package files by running the make configuration package script in interactive mode or batch mode:
  - Run the make configuration package script in interactive mode:
    - a. On the system where the Cloud APM server is installed, navigate to the default `/opt/ibm/ccm` directory or to the `custom_path/ccm` directory that you specified during server installation, and enter the following command:

```
./make_configuration_packages.sh
```

- b. When prompted, enter the IP address or host name of the Cloud APM server that you want the agent, data collector, or Hybrid Gateway to connect to or accept the default.
- c. Enter the directory where you want to store the configuration package after it is created or accept the default value of `/opt/ibm/ccm/mkcustpkg_workdir.process_ID_of_script`.
- d. Select the communication protocol. For secure communications, select the HTTPS protocol. For non-secure communications, select the HTTP protocol. The communication protocol between server and agents or data collectors must be the same. For more information, see [“Setting HTTP or HTTPS communications”](#) on page 145.

- Run the script in batch mode by entering the following command:

```
./make_configuration_packages.sh -s server_ip  
[-p communication_protocol] [-k key_file_dir] [-d config_package_dir]  
[-n]
```

### **-s server\_ip**

(Required) IP address or fully qualified domain name of the server.

### **-p communication\_protocol**

(Optional) Possible values are `http` and `https`. The default communication protocol is HTTP. If you set the protocol to secure HTTPS before you install the server, enter **-p https** to change the protocol for the agents or data collectors to HTTPS so that it matches what was set for the server. For more information, see [“Setting HTTP or HTTPS communications”](#) on page 145.

**-k *key\_file\_dir***

(Optional) Path to the keystore files to be used with the agents. The -k option is needed only if you have created a custom certificate for the agent to server HTTPS connection (“[Configuring a self-signed certificate](#)” on page 246 or “[Configuring a Third-Party Root CA custom certificate for HTTPS agent communications](#)” on page 250).

**-d *config\_package\_dir***

(Optional) Path to the directory where you want to store the configuration package after it is created.

**-n**

(Optional) Do not validate input parameters that are used in the agent configuration, for example, server host name.

A configuration package file, `onprem_config.tar`, is created in the default directory or where you specified.

3. Configure the downloaded images (agent, data collector, or Hybrid Gateway) on a Linux system interactively or in batch mode.

You can configure the image before or after you extract the image files. For AIX systems, run the script on a Linux system, preferably the Cloud APM server and copy the configured image archive file to your AIX® system.

- Run the configure images script in interactive mode:

- a. Enter the following command:

```
./configure_agent_images.sh
```

- b. If you unpacked the downloaded images, enter the path to the directory where you unpacked the image.
- c. If you did not unpack the downloaded images, enter the path to the directory where you downloaded the archive file.
- d. If you did not unpack the downloaded images, enter the path to the directory where you want to store the configured images archive file. Use the following default path or specify a different path:

```
/opt/ibm/ccm/depot
```

- e. If you run the script in an environment where the agent framework is not available in the default location, `server_install_dir/ccm/AgentFrameworks`, enter the path to the directory with the unpacked agent offering frameworks.
- Run the configure images script in batch mode by entering the following command:

```
./configure_agent_images.sh -p config_package_dir  
-s download_images_dir [-a agent_frameworks_dir] [-d configured_images_dir]
```

**-p *config\_package\_dir***

Required. If you did not unpack the configuration package, enter the path to the directory where the configuration package is located.

**-s *download\_images\_dir***

Required. Path to the directory where you downloaded the images archive file. If you unpacked the images, this variable is the path to the directory where the unpacked agent or data collector images are located.

**-a *agent\_frameworks\_dir***

Optional. Directory that contains unpacked agent offering frameworks packages. These files are available in the `server_install_dir/ccm/AgentFrameworks` directory on the Cloud APM server by default. If default agent offering frameworks packages are used, this variable is not required.

**-d *configured\_images\_dir***

Optional. If you did not unpack the images archive file, this variable is the path to the directory where you want to store the configured agent or data collector images archive file.

**-h**

Displays help for the **configure\_agent\_images.sh** command.

If you get a message that one or more agent images are skipped, upgrade your server installation. Then, run the configure agent images script. For more information, see [“Upgrading your server” on page 1307](#).

## Results

The installer configures the images or image archive file for the agent or data collector. A status message is displayed to indicate that the images or the images archive file are configured and provides the location of the files.

## What to do next

- For agent images, continue to [“Installing agents on UNIX systems” on page 185](#), [“Installing agents on Linux systems” on page 191](#), or [“Installing agents on Windows systems” on page 201](#).

If you configured the agent images archive file on the Cloud APM server, copy the configured agent images archive file to the system where the applications that you want to monitor are installed, and install the agents.

- For the Hybrid Gateway image, continue to [“Installing the Hybrid Gateway” on page 1046](#).

If you configured the Hybrid Gateway image archive file on the Cloud APM server, copy the configured image archive file to the system in your Tivoli Monitoring network where you want to install the Hybrid Gateway.

- For data collector images, continue to one of the following topics according to the type of applications that you want to monitor:
  - [“Configuring J2SE monitoring” on page 525](#)
  - [“Configuring Node.js monitoring” on page 683](#)
  - [“Configuring Python monitoring” on page 765](#)
  - [“Configuring Ruby monitoring” on page 810](#)
  - [“Configuring WebSphere Applications monitoring” on page 933](#)

## Installing agents on UNIX systems

---

Install monitoring agents on your AIX or Solaris systems for the resources that you want to manage.

### Agent list that you can install on AIX

- Monitoring Agent for DataPower
- Monitoring Agent for Cassandra
- Monitoring Agent for Db2
- Monitoring Agent for Hadoop
- Monitoring Agent for HMC Base
- Monitoring Agent for HTTP Server
- Monitoring Agent for IBM Integration Bus
- Monitoring Agent for MQ Appliance
- Monitoring Agent for Oracle Database
- Monitoring Agent for SAP Applications

- Monitoring Agent for SAP HANA Database
- Monitoring Agent for SAP NetWeaver Java Stack
- Monitoring Agent for Siebel
- Monitoring Agent for Sybase Server
- Monitoring Agent for UNIX OS
- Monitoring Agent for WebLogic
- Monitoring Agent for WebSphere Applications
- Monitoring Agent for WebSphere MQ
- Response Time Monitoring Agent

### **Agent list that you can install on Solaris Sparc**

- Monitoring Agent for Db2
- Monitoring Agent for HTTP Server
- Monitoring Agent for JBoss
- Monitoring Agent for MySQL
- Monitoring Agent for Oracle Database
- Monitoring Agent for SAP Applications
- Monitoring Agent for Sybase Server
- Monitoring Agent for UNIX OS
- Monitoring Agent for WebSphere Applications
- Monitoring Agent for WebLogic

### **Agent list that you can install on Solaris X86**

- Monitoring Agent for Db2
- Monitoring Agent for IBM Integration Bus
- Monitoring Agent for SAP Applications
- Monitoring Agent for Sybase Server
- Monitoring Agent for UNIX OS
- Monitoring Agent for WebSphere Applications
- Monitoring Agent for WebSphere MQ

## **Preinstallation on AIX systems**

You must complete the required preinstallation tasks before you install agents on AIX systems. Some preinstallation tasks are agent-specific and other tasks apply to multiple agents.

**Note:** These requirements are in addition to the requirements identified in the Software Product Compatibility Reports for your agent: For the current version requirements and dependencies for your agent, see the IBM Cloud Application Performance Management [Software Product Compatibility Report for agents on AIX](#).

### **All agents**

The following preinstallation tasks are applicable to all agents:

#### **Non-root user installation**

You must have read, write, and execute permissions for the installation directory. Otherwise, the installation is canceled. For more information about non-root user installation, see [“Installing agents as a non-root user”](#) on page 206.

### 70-character limitation for installation path

The installation directory and the path to it must be no more than 70 characters.

### 100-character limitation for .tar file names

The default **tar** command on AIX systems cannot handle file names that are longer than 100 characters. To avoid installation issues, complete the following steps:

1. Download and install the GNU version of the **tar** command from the [AIX Toolbox for Linux Applications](#) website.
2. Make the GNU version your default **tar** command. Complete one of the following steps:

- Add /opt/freeware/bin to the beginning of the current *PATH* environment variable. For example:

```
export PATH=/opt/freeware/bin:$PATH
```

where /opt/freeware/bin is the directory of GUN bin.

- Replace /bin/tar with a symbolic link to /opt/freeware/bin/tar as below:

```
ln -s /opt/freeware/bin/tar /bin/tar
```

Alternatively, upgrade to the latest version of AIX to receive the code fix for handling file names longer than 100 characters. For details, see the [TAR command Technote for AIX V6.1](#) or the [TAR command Technote for AIX V7.1](#).

## Specific agents

The following preinstallation tasks are applicable to the specified agents:

### DataPower agent

Before the agent is installed, the prerequisite checker checks that *ulimit* is set to **unlimited** on AIX. You must run the **ulimit -d unlimited** command to ensure that the *max data segment size* system environment variable is set to **unlimited**. This agent cannot be installed on the same machine as the DataPower appliance that you want to monitor.

### HMC Base agent

If you plan to install the agent as a root user, you must ensure that system TL07 is installed. If you plan to install the agent as a non-root user, you must ensure that system TL08 is installed for AIX version 6 only.

### HTTP Server agent

Install and run this agent as a root user. Use the same user ID to install and run the agent. If you install and run the agent as a non-root user, the non-root user must have the same user ID as the user who started the IBM HTTP Server. Otherwise, the agent has problems with discovering the IBM HTTP Server.

The installation fails on AIX because on the AIX system the default **.tar** command truncated a long path. For more information, see the "100-character limitation for .tar file names" section in this topic.

AIX only: Install the lynx utility or the curl application.

### Oracle Database agent

On Red Hat Enterprise Linux version 5 and version 6 and SUSE Linux Enterprise Server version 11 and version 12 x64, if the Oracle Database agent monitors the Oracle database remotely, you must install the Oracle instant clients first. Install the Oracle instant clients from [Oracle Technology Network - Instant Client Downloads](#).

The instant client v10.x, v11.x, and v12.x are supported by the Oracle Database agent.

### Response Time Monitoring Agent

Before you install the Response Time Monitoring agent, review the installation planning section here: ["Planning the installation "](#) on page 780.

## SAP HANA Database agent

1. Install SAP HANA database client HDBSQL version 1.00.102.06 or later on the AIX system.
2. Run the following command to add the path of the installation directory to the **LIBPATH** environment variable:

```
export LIBPATH=$LIBPATH:install_directory_path
```

Example: `export LIBPATH=$LIBPATH:/usr/sap/hdbclient`, where `/usr/sap/hdbclient` indicates the installation path of the SAP HANA database client.

### Important:

If the installation path of the SAP HANA database client is not added to the **LIBPATH** environment variable, the prerequisite scanner returns the FAIL result.

The environment variable that you added by using the export command persists only for a particular session of the terminal. Therefore, ensure that you run the agent installation script from the same terminal that was used for adding the environment variable.

## WebSphere Applications agent

Before the agent is installed, the prerequisite checker checks that *ulimit* is set to **524000** on the AIX system. You must run the **ulimit -d 524000** command to ensure that the *max data segment size* system environment variable is set to **524000**.

## Preinstallation on Solaris systems

You must complete the required preinstallation tasks before you install agents on Solaris systems. Some preinstallation tasks are agent-specific and other tasks apply to multiple agents.

**Note:** These requirements are in addition to the requirements identified in the Software Product Compatibility Reports for your agent: For the current version requirements and dependencies for your agent, see the IBM Cloud Application Performance Management [Software Product Compatibility Report for agents on Solaris](#).

## All agents

The following preinstallation tasks are applicable to all agents:

### Non-root user installation

You must have read, write, and execute permissions for the installation directory. Otherwise, the installation is canceled. For more information about non-root user installation, see [“Installing agents as a non-root user”](#) on page 206.

### 70-character limitation for installation path

The installation directory and the path to it must be no more than 70 characters.

### 100-character limitation for .tar file names

The default **tar** command on Solaris systems cannot handle file names that are longer than 100 characters. To avoid @LongLink error issues, complete the following steps:

1. Download and install the GNU version of the **tar** command from the <http://www.gnu.org> website.
2. Make the GNU version your default **tar** command. Complete one of the following steps:

- In the *PATH* environment variable, put the following variable first:

```
export PATH=/opt/freeware/bin:$PATH
```

- Replace `/bin/tar` with symbolic link to `/opt/freeware/bin/tar`

## Specific agents

The following preinstallation tasks are applicable to the specified agents:

## HTTP Server agent

Install and run this agent as a root user. Use the same user ID to install and run the agent. If you install and run the agent as a non-root user, the non-root user must have the same user ID as the user who started the IBM HTTP Server. Otherwise, the agent has problems with discovering the IBM HTTP Server.

## Installing agents

You can install any combination of monitoring agents on a managed system. For example, if you install the Ruby agent to monitor Ruby On Rails applications, you might want to also install the Response Time Monitoring Agent, the Linux OS agent, or both agents. With the Response Time Monitoring agent, you can gather more response time information for your Ruby applications. With the Linux OS agent, you can monitor other aspects of the system, such as the overall CPU, memory, and disk.

For a list of the agents that run on AIX and Solaris systems, see [“Installing agents on UNIX systems” on page 185](#).

## Before you begin

Download the agents. See [“Download instructions” on page 131](#).

Review the information in [“System requirements” on page 89](#) to make sure that you have met the requirements for the agents you plan to install.

Review the agent preinstallation tasks before you install the agents.

- For AIX systems, see [“Preinstallation on AIX systems” on page 186](#).
- For Solaris systems, see [“Preinstallation on Solaris systems” on page 188](#).

**Important:** Java Runtime is installed only when the agent requires it and is not always available. Also, ksh is no longer required for agent installation, and SELinux in enforcing mode is supported.

Before you install the agents, be sure to configure the agent images with the connection details for the Cloud APM server. If you downloaded the agent installation images to the same directory as the server installation image, the agent installation images are configured automatically. Otherwise, follow the procedure in [“Configuring the downloaded images” on page 182](#).

## About this task

You can install monitoring agents as a root user or non-root user. If you do not have root privileges and you want to install a monitoring agent, you can install the agent as a non-root user, see [“Installing agents as a non-root user” on page 206](#). Also, you can install the agent as a non-root user if you are a host administrator and you do not want to run the monitoring agent as a root user. Installation flow is the same as for a root user.

Agent coexistence is supported. You can install IBM Cloud Application Performance Management agents on the same computer where IBM Tivoli Monitoring agents are installed. However, both agent types cannot be installed in the same directory. For more information about agent coexistence see [“Cloud APM agent and Tivoli Monitoring agent coexistence” on page 1040](#).

## Procedure

1. Navigate to the directory where your configured agent images or extension packs are located.  
Make sure that the directory containing your agent images does not contain an older version of the archive file.
2. Extract the monitoring agent installation files by using the following command:

```
tar -xf ./installation files
```

where *installation files* is the installation file name for your offering. For a list of file names, see [“Part numbers” on page 135](#).

For more information, see [“Downloading from Passport Advantage” on page 134](#).

The installation script is extracted to a directory named for the archive file and version. For example: *offering\_Agent\_Install\_8.1.4.0*. Agent binary and configuration-related files are extracted into subdirectories within that directory.

3. Optional: This step is required ONLY for Solaris 10. You must create a soft link to ksh before you run the installation script on Solaris 10.

- a) Backup the /bin/sh command:

```
mv /bin/sh /bin/sh.bkup_origin
```

- b) Create a soft link to ksh command:

```
ln -s /bin/ksh /bin/sh
```

- c) Confirm that the result points to ksh:

```
ls -l /bin/sh
```

4. Run the installation script from the directory that is named for the archive file and version:

```
./installAPMAgents.sh
```

To install the agents in silent mode, see [“Installing agents silently” on page 208](#).

The installer checks that the agent images were configured with parameters for connecting to the Cloud APM server. If the agents images were not configured, the installation is stopped. You must configure the agent images ([“Configuring the downloaded images” on page 182](#)) and start the agent installation procedure from step 1.

5. Specify whether to install individual agents, a combination of the agents, or all of the agents.
6. Depending on whether you are installing or upgrading the agents, take one of the following steps:
  - If you are installing the agents, specify a different agent installation home directory or use the applicable default directory:
    - /opt/ibm/apm/agent
  - If you are upgrading the agents, after you are prompted for the agent installation home directory, enter the installation directory of the previous version of the agents.
7. When you are asked if you accept the license agreement, enter 1 to accept the agreement and continue, or enter 2 to decline.

After you enter 1 (accept), a prerequisite scan of your environment starts and takes a few moments to complete. If any requirements are missing, a message directs you to a log file with the reason for the failure. A prerequisite, such as a missing library or insufficient disk space, stops the installation. You must address the failure, and start the installation script again.
8. If you installed the agents by using a non-root user ID, you must update the system startup scripts (see [“Installing agents as a non-root user” on page 206](#)).
9. After installation is complete and the command line is available, you can repeat the steps in this procedure to install more monitoring agents on the managed system.

## What to do next

Configure the agent as required. If your monitoring agent requires configuration as described in [Chapter 6, “Agent and data collector deployment,” on page 173](#) or if you want to review the default settings, see [Chapter 8, “Configuring your environment,” on page 223](#).

- If a firewall is enabled, ensure that the ports that are used by the monitoring agent are open and available. For more information, see [“Cloud APM server ports” on page 104](#).
- If you upgraded an agent from a previous version, identify any reconfiguration or migration tasks that you must complete before logging in to the Cloud APM console. For information about those tasks, see

[“Upgrading your agents” on page 1340](#). After an upgrade, you must restart any agent that is not both automatically configured and started by the installer.

To start an agent, run the following command:

```
./name-agent.sh start
```

For information about the monitoring agent commands, including the *name* to use, see [“Using agent commands” on page 236](#). For information about which agents are started automatically and manually, see [Chapter 6, “Agent and data collector deployment,” on page 173](#).

After an upgrade, you must restart any agent that is not both automatically configured and started by the installer.

After you configure and start the agent, view the data that the agent is collecting.

- If you are not logged in, follow the instructions in [“Starting the Cloud APM console” on page 1109](#).
- If you want to view managed systems from your IBM Tivoli Monitoring domain in the Application Performance Dashboard, complete the tasks that are described in [“Integrating with IBM Tivoli Monitoring V6.3 ” on page 1039](#).
- Restart the apmui service on the Cloud APM server so that agent online help updates are displayed in the Cloud APM console. The apmui service is restarted by using the `apm restart apmui` command.

## Installing agents on Linux systems

---

Install monitoring agents on your Linux systems for the resources that you want to manage.

- Monitoring Agent for Amazon EC2
- Monitoring Agent for AWS Elastic Load Balancer
- Monitoring Agent for Azure Compute
- Monitoring Agent for Cassandra
- Monitoring Agent for Cisco UCS
- Monitoring Agent for Citrix Virtual Desktop Infrastructure
- Monitoring Agent for DataPower
- Monitoring Agent for Db2
- Monitoring Agent for Hadoop
- Monitoring Agent for HTTP Server
- Monitoring Agent for IBM Cloud
- Monitoring Agent for IBM Integration Bus
- Monitoring Agent for Internet Services
- Monitoring Agent for MQ Appliance
- Monitoring Agent for InfoSphere DataStage
- Monitoring Agent for JBoss
- Monitoring Agent for Linux OS
- Monitoring Agent for Linux KVM
- Monitoring Agent for MariaDB
- Monitoring Agent for Microsoft SQL Server
- Monitoring Agent for MongoDB
- Monitoring Agent for MySQL
- Monitoring Agent for NetApp Storage
- Monitoring Agent for Node.js
- Monitoring Agent for OpenStack

- Monitoring Agent for Oracle Database
- Monitoring Agent for PHP
- Monitoring Agent for PostgreSQL
- Monitoring Agent for RabbitMQ
- Monitoring Agent for Ruby
- Monitoring Agent for SAP Applications
- Monitoring Agent for SAP HANA Database
- Monitoring Agent for SAP NetWeaver Java Stack
- Monitoring Agent for Siebel
- Monitoring Agent for Sterling Connect Direct
- Monitoring Agent for Sterling File Gateway
- Monitoring Agent for Sybase Server
- Monitoring Agent for Synthetic Playback
- Monitoring Agent for Tomcat
- Monitoring Agent for VMware VI
- Monitoring Agent for WebLogic
- Monitoring Agent for WebSphere Applications
- Monitoring Agent for WebSphere Infrastructure Manager
- Monitoring Agent for WebSphere MQ
- Response Time Monitoring Agent

The following agents are supported on Linux on Power Little Endian (pLinux LE) systems:

- Monitoring Agent for Db2
- Monitoring Agent for IBM Integration Bus
- Monitoring Agent for Linux OS
- Monitoring Agent for Tomcat - Support available for resource monitoring.
- Monitoring Agent for WebSphere Applications
- Monitoring Agent for WebSphere MQ

The following agents are supported on Linux for System z systems:

- Monitoring Agent for Db2
- Monitoring Agent for HTTP Server - Transaction tracking is not supported.
- Monitoring Agent for IBM Integration Bus
- Monitoring Agent for Linux OS
- Response Time Monitoring Agent
- Monitoring Agent for Tomcat
- Monitoring Agent for WebSphere Applications
- Monitoring Agent for WebSphere MQ

The following agent is supported on Linux for System x systems:

- Monitoring Agent for HTTP Server - Transaction tracking is not supported.

## Preinstallation on Linux systems

You must complete the required preinstallation tasks before you install agents on Linux systems. Some preinstallation tasks are agent-specific and other tasks apply to multiple agents.

**Note:** These requirements are in addition to the requirements identified in the Software Product Compatibility Reports for your agent: For the current version requirements and dependencies for your agent, see the IBM Cloud Application Performance Management [Software Product Compatibility Report for agents on Linux](#).

### All agents

The following preinstallation tasks are applicable to all agents:

#### Non-root user installation

You must have read, write, and execute permissions for the installation directory. Otherwise, the installation is canceled. For more information about non-root user installation, see [“Installing agents as a non-root user”](#) on page 206.

#### 70-character limitation for installation path

The installation directory and the path to it must be no more than 70 characters.

#### Ensure that the binary for bc is available on your system

The binary for bc is required to run `prereq_checker` when installing agents. But bc is missing on some Linux platforms, for example, SUSE Linux Enterprise Server 15 and CentOS 7.6. You must install bc and set it in the PATH environment variable. You can run `# which bc` to check. If it is available, you can see the following message:

```
# which bc
/usr/bin/bc
```

If bc is not found, you can see the following message:

```
# which bc
which: no bc in (/sbin:/usr/sbin:/usr/local/sbin:/root/bin:/usr/local/bin:/usr/bin:/bin)
```

## Specific operating systems

### Red Hat Enterprise Linux (RHEL) 8

#### IBM APM 8.1.4.0 core framework IF11 or later is needed on RHEL 8

To support RHEL 8, you must apply core framework IF11 or later on the server and configure agent installation images. Because you are installing agents, the server side patch is enough in this scenario.

1. Go to fix central and find 8.1.4.0-IBM-APM-CORE-Framework-APM-IF0011 (<http://www.ibm.com/support/fixcentral/quickorder?product=ibm%2FTivoli%2FIBM+Application+Performance+Management+Advanced&fixids=8.1.4.0-IBM-APM-CORE-Framework-APM-IF0011>).
2. Among the eImages that display, locate and download the patch bundle 8.1.4.0-IBM-APM-CORE-Framework-Server-IF0011.tar.
3. Decompress the 8.1.4.0-IBM-APM-CORE-Framework-Server-IF0011.tar file.
4. In the directory where you saved the extracted files, install the core framework server patch on the Cloud APM server by running the `apmpatch.sh` script:

```
./apmpatch.sh
```

You can also read the core framework IF11 readme file at <https://www-01.ibm.com/support/docview.wss?uid=ibm10957243>.

5. Configure the agent images (see [“Configuring the downloaded images”](#) on page 182).

6. Proceed with agent installation on RHEL 8.

### **The libnsl.so.1 package is needed on RHEL 8**

By default, `libnsl.so.1` is not installed in Red Hat Enterprise Linux release 8.0. Without this package, no agent can be installed successfully. Have your administrator set up a yum repository for you, and then run this command:

```
yum install libnsl
```

After successful installation, you can see `/usr/lib64/libnsl.so.1`.

**Note:** The `libnsl.so.1` package is required only for agents. You do not need to do this step for data collectors.

### **Linux version 5 Bypassing the prerequisite scanner for some agents**

Before the prerequisite scanner is updated to be compatible with the latest requirements, for some agents, you can bypass the prerequisite scanner. For suitable scenarios and instructions, see [“Bypassing the prerequisite scanner”](#) on page 210.

**Note:** You do not need to do this step for data collectors.

## **SUSE Linux Enterprise 15**

### **The binary for bc is needed on SUSE Linux Enterprise 15**

The binary for `bc` is required to run `prereq_checker` when installing agents. By default, `bc` is not installed on SUSE Linux Enterprise 15. You must install `bc` and set it in the `PATH` environment variable. You can run `# which bc` to check. If it is available, you can see the following message:

```
# which bc
/usr/bin/bc
```

If `bc` is not found, you can see the following message:

```
# which bc
which: no bc in (/sbin:/usr/sbin:/usr/local/sbin:/root/bin:/usr/local/bin:/usr/bin:/bin)
```

## **CentOS 7.6**

### **The binary for bc is needed on CentOS 7.6**

The binary for `bc` is required to run `prereq_checker` when installing agents. By default, `bc` is not installed on CentOS 7.6. You must install `bc` and set it in the `PATH` environment variable. You can run `# which bc` to check. If it is available, you can see the following message:

```
# which bc
/usr/bin/bc
```

If `bc` is not found, you can see the following message:

```
# which bc
which: no bc in (/sbin:/usr/sbin:/usr/local/sbin:/root/bin:/usr/local/bin:/usr/bin:/bin)
```

## **CentOS 8.1**

### **The libnsl.so.1 package is needed on CentOS 8.1**

By default, `libnsl.so.1` is not installed in CentOS 8.1. Without this package, no agent can be installed successfully. Have your administrator set up a yum repository for you, and then run this command:

```
yum install libnsl
```

After successful installation, you can see `/lib64/libnsl.so.1`.

**Note:** The `libnsl.so.1` package is required only for agents. You do not need to do this step for data collectors.

## Ubuntu 20.04 LTS

To support Ubuntu 20.04 LTS, you must apply core framework IF18 on the server and configure agent installation images. Because you are installing agents, the server side patch is enough in this scenario.

1. Go to fix central and find 8.1.4.0-IBM-APM-CORE-FRAMEWORK-APM-IF0018 (<https://www.ibm.com/support/fixcentral/swg/selectFixes?product=ibm%2FTivoli%2FIBM+Application+Performance+Management+Advanced&fixids=8.1.4.0-IBM-APM-CORE-FRAMEWORK-IF0018&source=SAR&function=fixId&parent=IBM%20Performance%20Management%20family>).
2. Among the eImages that display, locate and download the patch bundle 8.1.4.0-IBM-APM-CORE-FRAMEWORK-SERVER-IF0018.tar.
3. Decompress the 8.1.4.0-IBM-APM-CORE-FRAMEWORK-SERVER-IF0018.tar file.
4. In the directory where you saved the extracted files, install the core framework server patch on the Cloud APM server by running the apmpatch.sh script:

```
./apmpatch.sh
```

You can also read the core framework IF18 readme file at <https://www-01.ibm.com/support/docview.wss?uid=ibm10957243>.

5. Configure the agent images (see “Configuring the downloaded images” on page 182).
6. Proceed with agent installation on Ubuntu 20.04 LTS.

## Specific agents

The following preinstallation tasks are applicable to the specified agents:

### DataPower agent

You must run the **ulimit -d unlimited** command to ensure that the *max data segment size* system environment variable is set to **unlimited**. This agent cannot be installed on the same machine as the DataPower appliance that you want to monitor.

### DataStage agent

1. Enable parameters in the DSODBConfig.cfg file. Complete the following steps:
  - a. Open the DSODBConfig.cfg file at the following location in an editor:  
infosphere\_information\_server\_install\_dir/Server/DSODB
  - b. Uncomment the following parameters by removing # symbol:  
**MonitorLinks=1**  
**JobRunUsage=1**  
**ResourceMonitor=1**  
**DSODBON=1**
  - c. Edit values of these parameters equal to 1.
2. Copy the JDBC driver of the database that is used for metadata repository configuration on the agent computer.
  - a. Type 4 JDBC 4, or later. Example: db2jcc4.jar
  - b. Type 4 JDBC driver for Oracle. Example: ojdbc6.jar
  - c. JDBC driver for MS SQL:
    - Sqljdbc41.jar requires a JRE of 7 and supports the JDBC 4.1 API.
    - Sqljdbc42.jar requires a JRE of 8 and supports the JDBC 4.2 API.

### HTTP Server agent

If you install this agent as a root user, you must use the same user ID to run and configure the agent.

If you install and run the agent as a non-root user, the non-root user must have the same user ID as the user who started the IBM HTTP Server. Otherwise, the agent has problems with discovering the IBM HTTP Server. You can use the same user ID to run and configure the agent.

### Linux KVM agent

The Monitoring Agent for Linux KVM is a multi-instance and multi-connection agent and supports connections to the Enterprise Linux based KVM hypervisor and Red Hat Enterprise Virtualization Manager (RHEV-M) environments. You can create multiple instances of this agent to monitor multiple hypervisors in an RHEV-M or KVM hypervisor environment. You can monitor virtualized workloads and analyze the resource capacity across different virtual machines. To connect the agent to a virtual machine in the KVM hypervisor environment, you must install the prerequisites: `libvirt*.rpm` and Korn Shell Interpreter (`pdksh`). The agent collects metrics by connecting remotely to a `libvirt` hypervisor that manages the virtual machines.

### Microsoft SQL Server agent

To monitor a Microsoft SQL environment, the Microsoft SQL Server and Microsoft SQL ODBC driver must be installed before you install the Monitoring Agent for Microsoft SQL Server. For example, to install the ODBC driver on Red Hat Enterprise Linux, use the following command:

```
sudo yum install unixODBC
sudo yum install msodbcsql17
```

To complete the execution of prerequisite checker, the agent needs to be configured on the Cloud Application Performance Management Version 8.1.4.0 Server Interim Fix 15 (8.1.4.0-IBM-APM-SERVER-IF0015. tar) or later.

### MongoDB agent

You must install and configure the MongoDB agent on the system where the MongoDB database server is installed.

### MySQL agent

To monitor a MySQL environment, the MySQL server and MySQL JDBC driver must be installed before you install the Monitoring Agent for MySQL. For example, to install the JDBC driver on Red Hat Enterprise Linux, use the following command:

```
yum install mysql-connector-java
```

After you start the agent installation and during the prerequisite check for the MySQL package name, you might get a warning if a provider other than Red Hat is used, such as Oracle. If the MySQL Server and JDBC driver are available, the warning does not cause the installation to fail, and you can disregard the message. Sample output:

```
Scenario: Prerequisite Scan
KSE - Monitoring Agent for MySQL Prerequisite Checker [version 01000005]:
Property                Result Found      Expected
=====
os.package.mysql-server  WARN Unavailable  mysql-server-5.1.12+
os.package.mysql-connector-java WARN Unavailable  mysql-connector-java-5.1.12+
```

### Node.js agent

The version of Node.js that you use to run your monitored application must be the same as the default installed version.

Currently Node.js v5 is not supported.

### OpenStack agent

Before you can use the OpenStack agent, you must have the following software on the server where you install the agent:

- Python 2.6.0 or later, or Python 2.7.0 or later
- Latest OpenStack clients:
  - OpenStack
  - Keystone

- Neutron
- Swift

To install the OpenStack command-line clients, see [Install the OpenStack command-line clients](#).

- Paramiko library for remote access in Python.

**Note:** If you want to install the OpenStack agent on a clean RedHat Linux server, before you install the Paramiko library, run the following command to install the required software:

```
wget https://ftp.dlitz.net/pub/dlitz/crypto/pycrypto/pycrypto-2.6.1.tar.gz
yum install gcc/openssl-devel/libffi-devel
```

- KornShell

### Oracle Database agent

On Red Hat Enterprise Linux version 5 and version 6 and SUSE Linux Enterprise Server version 11 and version 12 x64, if the Oracle Database agent monitors the Oracle database remotely, you must install the Oracle instant clients first. Install the Oracle instant clients from [Oracle Technology Network - Instant Client Downloads](#).

The instant client v10.x, v11.x, and v12.x are supported by the Oracle Database agent.

libstdc++.so.5 is required when you install the Oracle Database agent on Linux for IBM Z. On SUSE Linux Enterprise Server 12 and 15 for IBM Z and RedHat Enterprise Linux 8 for IBM Z, libstdc++.so.5 is not installed by default. Ask your system admin to install before you deploy the Oracle Database agent.

### PHP agent

If the PHP application is deployed by using the root user, you must use the root user to install, configure, start, or stop the agent. If the PHP application is deployed by using a non-root user, you can use root user or the same non-root user to install, configure, start, or stop the agent.

You must have an existing WordPress application installed. The PHP agent monitors WordPress V3.7.1 or later.

The agent evaluates only the performance of PHP requests in WordPress applications. CSS and JS loading are not evaluated.

The agent does not use URL arguments to identify URLs.

### Python data collector

The Python data collector monitors Django applications.

### Response Time Monitoring Agent

Before you install the Response Time Monitoring agent, review the installation planning section here: [“Planning the installation ” on page 780](#).

### SAP HANA Database agent

1. Install SAP HANA database client HDBSQL version 1.00.102.06 or later on the Linux system.

**Important:** For the RHEL 5.x 64-bit operating system, install the Linux SUSE 9 on x86\_64 64bit SAP HANA database client instead of Linux on x86\_64 64bit. For the RHEL 6.x, or later 64-bit operating systems, install the Linux on x86\_64 64bit SAP HANA database client.

2. Run the following command to add the path of the installation directory to the **LD\_LIBRARY\_PATH** environment variable:

```
export LD_LIBRARY_PATH=$LD_LIBRARY_PATH:install_directory_path
```

Example: export LD\_LIBRARY\_PATH=\$LD\_LIBRARY\_PATH:/usr/sap/hdbclient,  
where /usr/sap/hdbclient indicates the installation path of the SAP HANA database client.

### Important:

If the installation path of the SAP HANA database client is not added to the **LD\_LIBRARY\_PATH** environment variable, the prerequisite scanner returns the FAIL result.

The environment variable that you added by using the export command persists only for a particular session of the terminal. Therefore, ensure that you run the agent installation script from the same terminal that was used for adding the environment variable.

### Synthetic Playback agent

To install the Synthetic Playback agent, the operating system user requires the following permissions:

- Enable read and execution permission for the installation image
- Enable write permission for the agent home

To run the Synthetic Playback agent, the operating system user requires the following permissions:

- Enable read, write, and execution permission for the agent installation location and its subdirectories and files.
- Enable permission to run Mozilla Firefox.
- Ensure that the Mozilla Firefox execution binary is in the PATH environment variable of the user's profile.

Before you install the Synthetic Playback agent, you must complete the following steps:

1. Synchronize agent installation locations with the Cloud APM console.
2. Install Mozilla Firefox and the Xvfb display server.
3. Verify that the Xvfb display server is working. Run the command:

```
# Xvfb -ac
```

There should be no error output.

4. Check that the Xvfb process is running. Run the following command:

```
# ps -ef|grep Xvfb
```

Sample output:

```
root 7192 1 0 Jan14 ? 00:00:14 Xvfb -ac
root 20393 17900 0 02:05 pts/0 00:00:00 grep -i xvfb
```

5. Stop the Xvfb process. Run the following command:

```
# kill -9 7192
```

6. Navigate to `install_dir/etc/hosts` and edit the beginning of the hosts file to include the following parameters:

```
127.0.0.1 localhost
```

Then, save and close the hosts file.

### WebSphere Applications agent

- Before the agent is installed, the prerequisite checker checks that `ulimit` is set to **524000** on the Linux system. You must run the **`ulimit -d 524000`** command to ensure that the *max data segment size* system environment variable is set to **524000**.
- `libstdc++.so.5` is required when installing the WebSphere Applications agent on Linux for IBM Z. On SUSE Linux Enterprise Server 12 and 15 for IBM Z, `libstdc++.so.5` is not installed by default. Ask your system admin to install before deploying the WebSphere Applications agent. Otherwise, you will meet the following error:

```
KYN - WAS Monitoring Agent [version 07301410]:

Property          Result          Found           Expected
=====          =====          =====          =====
os.lib.libstdc++_64 FAIL           Unavailable     regex{libstdc++.so.5}
```

## Installing agents

You can install any combination of monitoring agents on a managed system. For example, if you install the Ruby agent to monitor Ruby On Rails applications, you might want to also install the Response Time Monitoring Agent, the Linux OS agent, or both agents. With the Response Time Monitoring agent, you can gather more response time information for your Ruby applications. With the Linux OS agent, you can monitor other aspects of the system, such as the overall CPU, memory, and disk.

For a list of the agents that run on Linux systems, see [“Installing agents on Linux systems” on page 191](#).

### Before you begin

Download the agents. See [“Download instructions” on page 131](#).

Review the information in [“System requirements” on page 89](#) to make sure that you have met the requirements for the agents you plan to install.

Review the agent preinstallation tasks before you install the agents. For details, see [“Preinstallation on Linux systems” on page 193](#).

**Note:** Java Runtime is installed only when the agent requires it and is not always available. Also, ksh is no longer required for agent installation, except for installation of the Summarization and Pruning agent, which is installed during Cloud APM server installation. SELinux in enforcing mode is supported.

Before you install the agents, be sure to configure the agent images with the connection details for the Cloud APM server. If you downloaded the agent installation images to the same directory as the server installation image, the agent installation images are configured automatically. Otherwise, follow the procedure in [“Configuring the downloaded images” on page 182](#).

### About this task

You can install monitoring agents as a root user or non-root user. If you do not have root privileges and you want to install a monitoring agent, you can install the agent as a non-root user, see [“Installing agents as a non-root user” on page 206](#). Also, you can install the agent as a non-root user if you are a host administrator and you do not want to run the monitoring agent as a root user. Installation flow is the same as for a root user.

Agent coexistence is supported. You can install IBM Cloud Application Performance Management agents on the same computer where IBM Tivoli Monitoring agents are installed. However, both agent types cannot be installed in the same directory. For more information about agent coexistence see [“Cloud APM agent and Tivoli Monitoring agent coexistence” on page 1040](#).

### Procedure

1. Navigate to the directory where your configured agent images or extension packs are located.  
Make sure that the directory containing your agent images does not contain an older version of the archive file.
2. Extract the monitoring agent installation files by using the following commands, which depend on your offering:

```
tar -xf ./installation_files.tar
```

where *installation\_files* is the installation file name for your offering. For a list of file names, see [“Part numbers” on page 135](#).

For more information, see [“Downloading from Passport Advantage” on page 134](#).

The installation script is extracted to a directory named for the archive file and version. For example: *offering\_Agent\_Install\_8.1.4*. Agent binary and configuration-related files are extracted into subdirectories within that directory.

3. Run the installation script from the directory that is named for the archive file and version:

```
./installAPMAgents.sh
```

To install the agents in silent mode, see [“Installing agents silently”](#) on page 208.

The installer checks that the agent images were configured with parameters for connecting to the Cloud APM server. If the agents images were not configured, the installation is stopped. You must configure the agent images ([“Configuring the downloaded images”](#) on page 182) and start the agent installation procedure from step 1.

4. Specify whether to install individual agents, a combination of the agents, or all of the agents.
5. Depending on whether you are installing or upgrading the agents, take one of the following steps:
  - If you are installing the agents, specify a different agent installation home directory or use the applicable default directory:
    - /opt/ibm/apm/agent
  - If you are upgrading the agents, after you are prompted for the agent installation home directory, enter the installation directory of the previous version of the agents.
6. When you are asked if you accept the license agreement, enter 1 to accept the agreement and continue, or enter 2 to decline.

After you enter 1 (accept), a prerequisite scan of your environment starts and takes a few moments to complete. If any requirements are missing, a message directs you to a log file with the reason for the failure. A missing prerequisite, such as a missing library or insufficient disk space, stops the installation. You must address the failure, and start the installation script again.

**Note:** If the installation exits with the following message, check whether the Server service is started (Start -> Administrative Tools -> Services). If not, start the Server service and run `installAPMAgents.bat` again.

```
This script [installAPMAgents.bat] must be run as Administrator.
```

7. If you installed the agents by using a non-root user ID, you must update the system startup scripts (see [“Installing agents as a non-root user”](#) on page 206).
8. After installation is complete and the command line is available, you can repeat the steps in this procedure to install more monitoring agents on the managed system.

## What to do next

Configure the agent as required. If your monitoring agent requires configuration as described in Chapter 6, [“Agent and data collector deployment,”](#) on page 173 or if you want to review the default settings, see Chapter 8, [“Configuring your environment,”](#) on page 223.

- If a firewall is enabled, ensure that the ports that are used by the monitoring agent are open and available. For more information, see [“Cloud APM server ports”](#) on page 104.
- If you upgraded an agent from a previous version, identify any reconfiguration or migration tasks that you must complete before logging in to the Cloud APM console. For information about those tasks, see [“Upgrading your agents”](#) on page 1340. After an upgrade, you must restart any agent that is not both automatically configured and started by the installer.

To start an agent, run the following command:

```
./name-agent.sh start
```

For information about the monitoring agent commands, including the name to use, see [“Using agent commands”](#) on page 236. For information about which agents are started automatically and manually, see Chapter 6, [“Agent and data collector deployment,”](#) on page 173.

After an upgrade, you must restart any agent that is not both automatically configured and started by the installer.

After you configure and start the agent, view the data that the agent is collecting.

- If you are not logged in, follow the instructions in [“Starting the Cloud APM console” on page 1109](#).
- If you want to view managed systems from your IBM Tivoli Monitoring domain in the Application Performance Dashboard, complete the tasks that are described in [“Integrating with IBM Tivoli Monitoring V6.3 ” on page 1039](#).
- Restart the apmui service on the Cloud APM server so that agent online help updates are displayed in the Cloud APM console. The apmui service is restarted by using the `apm restart apmui` command.

## Installing agents on Windows systems

---

You can install some of the Cloud APM monitoring agents on Windows systems.

The following monitoring agents are supported on Windows 64-bit systems. Where indicated, agents are also supported on Windows 32-bit systems.

- Monitoring Agent for Amazon EC2
- Monitoring Agent for AWS Elastic Load Balancer
- Monitoring Agent for Azure Compute
- Monitoring Agent for Cassandra
- Monitoring Agent for Cisco UCS
- Monitoring Agent for Citrix Virtual Desktop Infrastructure
- Monitoring Agent for Db2
- Monitoring Agent for Hadoop
- Monitoring Agent for HTTP Server\*
- Monitoring Agent for IBM Cloud
- Monitoring Agent for IBM Integration Bus
- Monitoring Agent for Internet Services\*
- Monitoring Agent for MQ Appliance
- Monitoring Agent for JBoss
- Monitoring Agent for MariaDB
- Monitoring Agent for Microsoft Active Directory\*
- Monitoring Agent for Microsoft Cluster Server\*
- Monitoring Agent for Microsoft Exchange Server
- Monitoring Agent for Microsoft Hyper-V Server
- Monitoring Agent for Microsoft Internet Information Services
- Monitoring Agent for Skype for Business Server (formerly known as Microsoft Lync Server)\*
- Monitoring Agent for Microsoft .NET
- Monitoring Agent for Microsoft Office 365
- Monitoring Agent for Microsoft SharePoint Server
- Monitoring Agent for Microsoft SQL Server\*
- Monitoring Agent for MySQL
- Monitoring Agent for NetApp Storage
- Monitoring Agent for Oracle Database
- Monitoring Agent for PostgreSQL
- Monitoring Agent for RabbitMQ
- Monitoring Agent for SAP Applications
- Monitoring Agent for SAP HANA Database
- Monitoring Agent for SAP NetWeaver Java Stack

- Monitoring Agent for Siebel
- Monitoring Agent for Sterling Connect Direct
- Monitoring Agent for Sterling File Gateway
- Monitoring Agent for Sybase Server
- Monitoring Agent for Tomcat
- Monitoring Agent for VMware VI
- Monitoring Agent for WebLogic
- Monitoring Agent for WebSphere Applications
- Monitoring Agent for WebSphere MQ
- Monitoring Agent for Windows OS\*
- Response Time Monitoring Agent\*

\* Supported on both 64-bit and 32-bit Windows systems.

## Preinstallation on Windows systems

You must complete the required preinstallation tasks before you install agents on Windows systems. Some preinstallation tasks are agent-specific and other tasks apply to multiple agents.

**Note:** These requirements are in addition to the requirements identified in the Software Product Compatibility Reports for your agent: For the current version requirements and dependencies for your agent, see the IBM Cloud Application Performance Management [Software Product Compatibility Report for agents on Windows](#).

### All agents

The following preinstallation tasks are applicable to all agents:

#### Installing from the command prompt on a local drive

Use the Windows command prompt to start the installation script. Do not use Windows PowerShell to start the installation script.

Copy the installation files to a local disk or a mapped network drive, and then start the installation script. Do not start the installation script from a network location.

Start the installation script from a new command prompt. Do not start the installation script from an existing command prompt because the command prompt might have outdated environment variables.

### Specific agents

The following preinstallation tasks are applicable to the specified agents:

#### DataStage agent

1. Enable parameters in the DSODBCConfig.cfg file. Complete the following steps:

- a. Open the DSODBCConfig.cfg file at the following location in an editor:

infosphere\_information\_server\_install\_dir\Server\DSODB

- b. Uncomment the following parameters by removing # symbol:

**MonitorLinks=1**

**JobRunUsage=1**

**ResourceMonitor=1**

**DSODBON=1**

- c. Edit values of these parameters equal to 1.

2. Copy the JDBC driver of the database that is used for metadata repository configuration on the agent computer.

- a. Type 4 JDBC 4, or later. Example: db2jcc4.jar
- b. Type 4 JDBC driver for Oracle. Example: ojdbc6.jar
- c. JDBC driver for MS SQL:
  - Sqljdbc41.jar requires a JRE of 7 and supports the JDBC 4.1 API.
  - Sqljdbc42.jar requires a JRE of 8 and supports the JDBC 4.2 API.

### **IBM Integration Bus agent**

Make sure the user id to install the IBM Integration Bus agent is in the mqbrkrs user group.

### **Internet Service Monitoring**

For the Internet Service Monitoring, you must apply IBM Cloud Application Performance Management 8.1.4.0 core framework Interim Fix 3 on the APM Server from [here](#) and then preconfigure the agent. The Agent and the bridge module uses ports 9510 and 9520. In case these ports are already in use the installation will not progress.

#### **Note:**

- For existing users it is recommended to install Internet Service Monitoring agent on 64-bit platforms either Windows or Linux rather than upgrading the agent on Windows 32-bit platform to a newer version.
- Internet Service Monitoring Agent do not support Windows 2008 R2 on Windows 64-bit platform.

### **MySQL agent**

For the Monitoring Agent for MySQL, you must install the MySQL server and MySQL JDBC driver before you install the MySQL agent on that system. To install the JDBC driver, see [MySQL Connector/J JDBC driver](#).

If you are installing the agent on a VM that you plan to use as the base library image, do not configure the MySQL agent before you instantiate the other VMs. The MySQL agent must be configured on each instantiated VM.

### **Oracle Database agent**

If the Oracle Database agent monitors the Oracle database remotely, you must install the Oracle instant clients first from [Oracle Technology Network - Instant Client Downloads](#) on the following systems:

- Windows Server 2012 64-bits
- Windows Server 2012 R2 64-bits
- Windows Server 2008 R2 Datacenter 64-bits
- Windows Server 2008 R2 Enterprise 64-bits
- Windows Server 2008 R2 Standard 64-bits

The instant clients v10.x, v11.x, and v12.x are supported by the Oracle Database agent.

### **Response Time Monitoring Agent**

Before you install the Response Time Monitoring agent, review the installation planning section here: [“Planning the installation ” on page 780](#).

### **SAP HANA Database agent**

1. Install SAP HANA database client HDBSQL version 1.00.102.06 or later on the Windows system.
2. Add the installation path of the SAP HANA client to the **PATH** environment variable.

Example: Add C:\Program Files\sap\hdbclient to the **PATH** environment variable, where C:\Program Files\sap\hdbclient indicates the installation path of the SAP HANA database client.

### **Tomcat agent**

1. Java SDK is installed on the Tomcat server where the agent is installed.

2. The SDK path is added to the *PATH* variable directly or by using the **set path** command before installing the agent.
3. The **JAR** command is working.

## Installing agents

You can install any combination of monitoring agents on a managed system. For example, if you install the Monitoring Agent for MySQL for monitoring MySQL servers, you might want to also install the Response Time Monitoring Agent to gather more response time information for your Ruby applications. You might also want to install the Monitoring Agent for Windows OS to monitor other aspects of your system, such as the overall CPU, memory, and disk.

Your offering determines which monitoring agents are available for installation. For a list of the agents included in each offering, see [“Capabilities” on page 60](#).

For a list of the agents that run on a Windows system, see [“Preinstallation on Windows systems” on page 202](#).

### Before you begin

Download the agents. See [“Download instructions” on page 131](#).

Review the information in [“System requirements” on page 89](#) to make sure that you have met the requirements for the agents you plan to install.

Review the agent prerequisite tasks before you install the agents. For details, see [“Preinstallation on Windows systems” on page 202](#).

Before you install the agents, you must configure the agent images with the connection details for the Cloud APM server. If you downloaded the agent installation images to the same directory as the server installation image, the agent installation images are configured automatically. Otherwise, follow the procedure in [“Configuring the downloaded images” on page 182](#).

### About this task

Ensure that you have adequate permission to run the agent installation script and agent commands. You must be logged in using one of the following user account types:

- default Windows administrator user account
- administrator user account
- user account, which is a member of the administrators group
- user account, which is registered as an administrator in Active Directory services

Agent coexistence is supported. You can install IBM Cloud Application Performance Management agents on the same computer where IBM Tivoli Monitoring agents are installed. However, both agent types cannot be installed in the same directory. For more information about agent coexistence, see [“Cloud APM agent and Tivoli Monitoring agent coexistence” on page 1040](#).

### Procedure

Complete these steps to install monitoring agents on VMs and systems where the Windows operating system is installed:

1. On your system, navigate to the directory where your configured agent images are located.
2. Extract the agent installation files for your offering (or offerings) to the location where you want to install the monitoring agent software.

For a list of file names, see [“Part numbers” on page 135](#).

For more information, see [“Downloading from Passport Advantage” on page 134](#).

The .bat installation script is extracted to a directory named for the archive file and version. For example: *offering\_Agent\_Install\_8.1.4.0*. Agent binary and configuration-related files are extracted into subdirectories within that directory.

3. Open a command prompt as administrator.
  - a) From the **Start** menu, type command in the search box.
  - b) Right-click **Command Prompt** from the list that displays and select **Run as administrator**.
4. From the command prompt, run the installation script with Administrator privileges from the directory that is named for the archive file and version:

```
cd offering_Agent_Install_version
installAPMAgents.bat
```

The installer checks that the agent images were configured with parameters for connecting to the Cloud APM server. If the agents images were not configured, the installation is stopped. You must configure the agent images ([“Configuring the downloaded images” on page 182](#)) and start the agent installation procedure from step 1.

**Restriction:** For the WebSphere Applications agent, the Administrator privileges must be the same privileges that were used to install the WebSphere Application Server.

To install the agents in silent mode, see [“Installing agents silently” on page 208](#).

5. If you are installing the agents, provide the name of the installation directory.

The default installation path is C:\IBM\APM. The name of the installation directory cannot exceed 80 characters or contain non-ASCII, special, or double-byte characters. Directory names in the path can contain only the following characters:  
abcdefghijklmnopqrstuvwxyzABCDEFGHIJKLMNOPQRSTUVWXYZ \_\:0123456789()~-. /.

**Note:** When short file name creation (*8dot3Name*) is disabled, if directory names in the path contain spaces, installation is not supported.

If you are upgrading the agent, this step is skipped, and the agent installs into the previous installation directory.

6. When you are asked if you accept the license agreement, enter 1 to accept the agreement and continue, or enter 2 to decline.

After you enter 1 (accept), a prerequisite scan of your environment starts and takes a few moments to complete. If any requirements are missing, a message directs you to a log file with the reason for the failure. A missing prerequisite, such as a missing library or insufficient disk space, stops the installation. You must address the failure, and start the installation script again.

**Note:** If the installation exits with the following message, check whether the Server service is started (Start -> Administrative Tools -> Services). If not, start the Server service and run `installAPMAgents.bat` again.

```
This script [installAPMAgents.bat] must be run as Administrator.
```

7. After installation is complete and the command prompt is available, repeat these steps to install more monitoring agents.

## What to do next

Configure your agents as required. To check if your monitoring agent requires manual configuration, see Chapter 6, “Agent and data collector deployment,” on page 173. For configuration instructions, or, if you want to review default configuration settings, see [Chapter 8, “Configuring your environment,” on page 223](#).

Before installing new agents, Windows Installer temporarily stops all agents currently running in the installed product location. After installation completes, the installer restarts any stopped agents. You must manually restart any monitoring agent that is not automatically started by the installer.

- If a firewall is enabled, ensure that the ports that are used by the monitoring agent are open and available. For more information, see [“Cloud APM server ports”](#) on page 104.
- If you upgraded an agent from a previous version, identify any reconfiguration or migration tasks that you must complete before you log in to the Cloud APM console. For information about those tasks, see [“Upgrading your agents”](#) on page 1340.

Use one of the following methods to start the agent:

- Click **Start > All Programs > IBM Monitoring agents > IBM Cloud Application Performance Management**. Right-click on an agent and click **Start**.
- Run the following command

```
name-agent.bat start
```

For information about the monitoring agent commands, including the name to use, see [“Using agent commands”](#) on page 236. For information about which agents are started automatically and manually, see [Chapter 6, “Agent and data collector deployment,”](#) on page 173

After an upgrade, you must restart any agent that is not both automatically configured and started by the installer.

After you configure and start the agent, view the data that the agent is collecting.

- If you are not logged in, follow the instructions in [“Starting the Cloud APM console”](#) on page 1109.
- If you want to view managed systems from your IBM Tivoli Monitoring domain in the Application Performance Dashboard, complete the tasks that are described in [“Integrating with IBM Tivoli Monitoring V6.3 ”](#) on page 1039.
- Restart the apmui service on the Cloud APM server so that agent online help updates are displayed in the Cloud APM console. The apmui service is restarted by using the `apm restart apmui` command.

## Installing agents as a non-root user

If you do not have root privileges and you want to install a monitoring agent, you can install the agent as a non-root user. Also, you can install the agent as a non-root user if you are a host administrator and you do not want to run the monitoring agent as a root user. Installation flow is the same as for a root user. After a non-root installation, run the **UpdateAutoRun.sh** script with root user or sudo user access.

### Before you begin

To uniquely identify the computer system, the Linux OS agent must identify the computer system board Universal Unique Identifier (UUID), manufacturer, model, and serial number. This information is required before the agent is added to an application in the Cloud APM console.

Obtain the computer system information by verifying the following entities exist on the computer system:

1. Check whether the **/usr/bin/hal-get-property** command is installed on the computer system and the hald process (HAL daemon) is running. If the command is not installed, continue to [step 2](#). If the command is installed, skip [step 2](#) and [step 3](#). Note: If the OS version is Red Hat 7, the hald process is not available.
2. If the **/usr/bin/hal-get-property** command is not installed on the computer system, then confirm that the `/sys/class/dmi/id/product_uuid` file exists and contains the computer system UUID, and the user who installs the Linux OS agent has read access to this file. If this file does not exist, continue to [step 3](#). If the file exists, skip [step 3](#).
3. If the **/usr/bin/hal-get-property** command is not installed and the `/sys/class/dmi/id/product_uuid` file does not exist, you must ensure that the **hostname** or **hostnamectl** commands return the fully qualified hostname. If these commands return the short hostname without the domain, you must set the fully qualified hostname by entering the **"hostname <fqhn>"** or **"hostnamectl set-hostname <fqhn>"** commands where *<fqhn>* must be replaced with the fully qualified hostname.

**Note:** The Linux OS agent retrieves this information periodically so the commands or files in the previous steps must remain in place even after installation.

**Note:** The Linux OS Agent does not support monitoring of Docker when running as non-root.

## Procedure

1. Install your monitoring agents on Linux or UNIX systems, as described in [“Installing agents on Linux systems” on page 191](#) and [“Installing agents on UNIX systems” on page 185](#).
2. Optional: If you installed your agent as a selected user and want to configure the agent as a different user, run the `./secure.sh` script.  
For more information about the `./secure.sh` script, see [“Configuring agents as a non-root user” on page 243](#) and [Securing the agent installation files](#).  
For example: `./secure.sh -g db2iadm1`
3. Optional: Configure your monitoring agents on Linux or UNIX as necessary, see [Chapter 8, “Configuring your environment,” on page 223](#).
4. To update the system startup scripts, run the following script with root user or sudo user access:  
`install_dir/bin/UpdateAutoRun.sh`

## What to do next

If you installed your agent as a non-root user and you want to configure the agent as the same user, no special action is required. If you installed your agent as a selected user and want to configure the agent as a different user, see [“Configuring agents as a non-root user” on page 243](#).

If you installed and configured your agent as a non-root user and you want to start the agent as the same user, no special action is required. If you installed and configured your agent as a selected user and want to start the agent as a different user, see [“Starting agents as a non-root user” on page 1159](#).

Use the same user ID for agent installation and upgrades.

If you run the `UpdateAutoRun.sh` script as root user, the agent is configured to automatically start after the operating system restart. If you do not want this agent behavior, you can disable the automatic agent start. For more information, see [“Disabling automatic agent start on UNIX and Linux systems” on page 244](#).

## Securing the agent installation files

---

After you install monitoring agents as a non-root user on Linux or UNIX systems, you can run the `secure.sh` script to secure the agent installation by removing world write permissions and setting correct file ownership.

### Before you begin

- You must have read, write, and execute permissions for the installation directory.
- Installation of the monitoring agents and any agent configuration must be completed on the system and the agents must be successfully started.
- If you are running agents as different user accounts, they must be members of the same group. (See option `-g`.)

### About this task

Complete this step to lock down the file permissions in your installation. Options are available to require no root password, to specify a group name, and to view help for the command.

## Procedure

- Run the following command from the `install_dir/bin` directory. Usage:

```
secure.sh [-g common_group] [-n] [-h]
```

- In the simplest mode, run the **./secure.sh** script, which removes world write permissions, and sets the current user and user's group as the file owners. If the script is run by a non-root user, the user is prompted for the root password.
- If a non-root user runs the **./secure.sh** script with the **-n** option, this user is not prompted for a root password. In this case, changing file permissions and changing ownership are done by using this user's privileges. If the installation directory contains files that are owned by different users and the current user has no privileges to modify permissions and ownership of other user's files, this mode can fail.
- If you want to set a certain group as the group owner, the owner must provide the **-g** option with a valid group name as an argument to that option. (See [Example](#).)  
Run `secure.sh -g common_group`.  
The command changes ownership of the files and directories recursively.

If the *common\_group* group is not the user's primary group, you can set the *common\_group* group to be the group owner of new files created in a directory, by running the following command:

```
chmod g+s install_dir/bin/sub_dir
```

where, *sub\_dir* is any sub-directory, for example, `/opt/ibm/ccm/agent`.

- Run the **./secure.sh** script with the **-h** option to get help information for the script.

## Results

The installation directory allows access to only the user who ran the script or to only the users in the specified group.

## Example

If user Alice is a member of the system group that is named "apmgroup", she can use the group to set file group ownership with the following command:

```
./secure.sh -g apmgroup
```

After the script is run, the group is set as "apmgroup" for all files in *install\_dir* for the group.

## What to do next

Running the **./secure.sh** script should result in the following permissions being set for the agents.

```
rwX rwX ---
```

After you run the script, check the permissions for the agent files. For example, for Response Time Monitoring, check the files in *install\_dir/arch/hu/lib/mod\_wrt.so*. If the permissions for these files are not set correctly, update the permissions manually. For example, for the Response Time Monitoring agent:

1. Set the permissions, run:

```
chmod g+rx $AGENT_HOME/bin/rt-agent.sh
```

2. Set the user and group, run:

```
chown newuser:newgroup $AGENT_HOME/bin/rt-agent.sh
```

## Installing agents silently

Installing agents silently reduces installation time. To install a monitoring agent in silent mode, you must download an agent installation image archive file from the IBM download site, preconfigure the agent

images, extract the agent installation files, prepare a silent response file, and run the installation script in silent mode.

## Before you begin

1. Review the prerequisite tasks for installing the monitoring agents, and download and extract the agent installation files. For details, see [Installing agents on UNIX systems](#), [Installing agents on Linux systems](#), or [Installing agents on Windows systems](#).
2. Complete the following steps to prepare a silent response file for installing agents:
  - a. Locate the silent installation file for your offering (or offerings) *offering\_silent\_install.txt*, make a copy of this file, and open it in a text editor.
  - b. Uncomment the license agreement.
  - c. Complete one of the following steps to specify the agents that you want to install:

- Uncomment the individual agents to be installed. For example:

```
INSTALL_AGENT=os
```

```
INSTALL_AGENT=ruby
```

- Uncomment `INSTALL_AGENT=all` to install all agents.
- d. Uncomment `AGENT_HOME` and specify the directory where you want to install the agents.
  - e. Save the file.

## Procedure

1. On the command line, change to the directory where you extracted the installation script and run the following command:

```
cd offering_Agent_Install_version
```

2. Optional: This step is required ONLY for Solaris 10. You must create a soft link to ksh before you run the installation script on Solaris 10.

- a) Backup the `/bin/sh` command:

```
mv /bin/sh /bin/sh.bkup_origin
```

- b) Create a soft link to ksh command:

```
ln -s /bin/ksh /bin/sh
```

- c) Confirm that the result points to ksh:

```
ls -l /bin/sh
```

3. Run the installation command:

- **Linux** | **UNIX**

```
./installAPMAgents.sh -p path_to_silent_response_file
```

- **Windows**

```
installAPMAgents.bat -p path_to_silent_response_file
```

The agents installation will fail on Windows if the prerequisite scanner can't obtain the type of disk where the agent will be installed to. If this occurs, you will see a fail result for the `validDestLocation`

property in the installation log file. In this case, you can skip the prerequisite scanning by adding `SKIP_PRECHECK=1` to the installation command. For example:

```
installAPMAgents.bat -p path_to_silent_response_file SKIP_PRECHECK=1
```

**Note:** **Windows** When short file name creation (*8dot3Name*) is disabled, if directory names in the path contain spaces, installation is not supported.

## Results

The agents are installed.

## What to do next

Configure the agents. See the procedure and table of commands for [Linux and UNIX systems](#) and for [Windows systems](#).

## Bypassing the prerequisite scanner

---

When you install monitoring agents, a prerequisite scan of your environment starts and takes a few moments to complete. If any requirements are missing, a message directs you to a log file with the reason for the failure. In some installation scenarios, you might want to either ignore warning messages or completely bypass the prerequisite check.

### About this task

There are two levels of failure messages, **WARN** and **FAIL**, and there are two levels of bypassing:

- Setting the **IGNORE\_PRECHECK\_WARNING** variable causes the installer to ignore the warning (**WARN**) messages.
- Setting the **SKIP\_PRECHECK** variable causes the installer to ignore all failure messages.

If your agent installation failed and you received a warning (**WARN**) from the prerequisite checker, review the warning. If you want to continue with the installation, set **IGNORE\_PRECHECK\_WARNING** and install again.

In an environment where you have virtual machine images that serve as templates, the prerequisite scan that is undertaken before installation begins can be done on only the first template image. If a VM image passes the scan, the other VMs created from that image will also pass. You can save time by bypassing the prerequisite check for other VMs that were created from the same image. Set **SKIP\_PRECHECK** variable and install again.

The **SKIP\_PRECHECK** setting is also appropriate for the scenario where you have a new operating system that IBM Support or the Software Product Compatibility Reports indicate that it is supported but the prerequisite checker has not yet been updated. Be sure to first try to install the agent, check the log, and make sure that this new OS is the only item failing – and the only item that you are bypassing – because **SKIP\_PRECHECK** causes the installer to bypass every item in the prerequisite checklist.

After downloading and extracting the installation files, complete this procedure to ignore the warning messages or to bypass the prerequisite scan.

### Procedure

On the system where you plan to install monitoring agents, enter one of the following commands:

- Ignore the warning (**WARN**) messages during the prerequisite check:
  - **Linux** | **UNIX** `export IGNORE_PRECHECK_WARNING=1`
  - **Windows** `set IGNORE_PRECHECK_WARNING=1`
- Bypass the prerequisite scan:

- **Linux** | **UNIX** `export SKIP_PRECHECK=1`
- **Windows** `set SKIP_PRECHECK=1`

## What to do next

To restore the default setting the next time you want to install the agent with the prerequisite scanner, turn off the **IGNORE\_PRECHECK\_WARNING** or **SKIP\_PRECHECK** variable:

- **Linux** | **UNIX** `unset IGNORE_PRECHECK_WARNING`
  - **Windows** `set IGNORE_PRECHECK_WARNING=`
- or
- **Linux** | **UNIX** `unset SKIP_PRECHECK`
  - **Windows** `set SKIP_PRECHECK=`

## Uninstalling your agents

---

Uninstall a single agent or all the agents from a managed system.

### Before you begin

For multi-instance agents, you must remove all agent instances before you uninstall the agent. Otherwise, agent entries are not cleared from the registry. To remove instances, run the following command:

- **Windows** `name-agent.bat remove instance_name`
- **Linux** | **UNIX** `./name-agent.sh remove instance_name`

where, *name* is the name of the agent and *instance\_name* is the instance name. For more information, see [“Using agent commands” on page 236](#). For a list of multiple-instance agents, see [Table 23 on page 175](#).

For the following agents, an agent-specific task must be completed before you complete the uninstallation procedure:

- For the Monitoring Agent for HTTP Server, you must delete the Include statement in the `http.conf` file, for example, `"Include "/opt/ibm/apm/agent/tmp/khu/kvm65s2_8044.conf"`, before you restart the IBM HTTP server.
- For the Monitoring Agent for Python, run `install_dir/lx8266/pg/bin/uninstall.sh` to remove injection codes before you uninstall the agent.
- For the Monitoring Agent for PHP, run `install_dir/bin/lx8266/pj/lib/uninstall.instance_name.sh` to move injection codes before you uninstall the agent.
- For the Monitoring Agent for WebSphere Applications, you must unconfigure the data collector for all monitored server instances before you uninstall the agent. Follow the instructions in [“WebSphere Applications agent: Unconfiguring the data collector” on page 213](#).

For the WebSphere Applications agent, make sure that the user ID, which is used to uninstall the agent, has full read and write permissions to the `logs` and `runtime` directories and all their contained subdirectories and files within the data collector home directory. The data collector home directory is as follows:

- **Windows** `install_dir\dchome\7.3.0.14.08`
- **Linux** | **UNIX** `install_dir/yndchome/7.3.0.14.08`
- For the Node.js agent, you must remove the monitoring plug-in from your Node.js application before you uninstall the agent. Follow the instructions in [“Node.js agent: Removing the monitoring plug-in” on page 221](#).
- For the Microsoft .NET agent, you must complete the following before you uninstall the agent:

1. Disable the modules for .NET Core Applications. Follow the instructions in [“Disabling Modules for .NET Core Applications”](#) on page 628.
  2. Remove the data collector from your .NET applications. Follow the instructions in [“Microsoft .NET agent: Removing the .NET data collector”](#) on page 222.
- For the IBM Integration Bus agent, if you configured transaction tracking for brokers with the agent provided user exit, you must remove the user exit before you uninstall the agent. Follow the instructions in [“Removing the KQIUserExit user exit”](#) on page 365.
  - For the Internet Service Monitoring, go to <andle\_home>\BIN and run the ism-agent.bat file with uninstall as an argument. In case you want to uninstall all monitoring agents on the server using smai-agent.bat, first run the ism-agent.bat with uninstall as an argument and then run the smai-agent.bat
  - For the Monitoring Agent for SAP NetWeaver Java Stack, before you uninstall the agent, stop all SAP NetWeaver Java Stack agent instances by using the following command:
    - **Windows** sap\_netweaver\_java\_stack-agent.bat stop instance\_name

## About this task

The Oracle agent on Windows systems can be uninstalled only by using the command prompt.

## Procedure

1. On the VM or system where the monitoring agent (or agents) is installed, start a command line and change to the binary directory:

- **Linux** | **UNIX** `install_dir/bin`
- **Windows** `install_dir\BIN`

where *install\_dir* the installation directory of the monitoring agent or agents.

2. To uninstall a specific monitoring agent, enter the agent script name and the uninstall option where *name* is the agent script name:

- **Linux** | **UNIX** `./name-agent.sh uninstall`
- **Windows** `name-agent.bat uninstall`

For a list of the agent script names, see [“Using agent commands”](#) on page 236.

**Remember:** For the Monitoring Agent for Microsoft .NET, you must run the command with Administrator privileges.

The monitoring agent is uninstalled from the managed system.

If you have uninstalled all of your monitoring agents individually, continue to remove the framework files. See [What to do next](#).

3. To uninstall all the monitoring agents from the managed system with a confirmation prompt, enter the script name and uninstall all option:

- **Linux** | **UNIX** `./smi-agent.sh uninstall_all`
- **Windows** `smi-agent.bat uninstall_all`

A confirmation prompt is displayed. Type 1 to continue, or type 2 to cancel.

All monitoring agents are uninstalled from the system or VM.

4. **Linux** | **UNIX**
  - On Linux, and UNIX, to force the uninstall of all the monitoring agents without a prompt for confirmation, enter the script name and the force uninstall all option:
  - `./smi-agent.sh uninstall_all force`

## What to do next

For the Monitoring Agent for HTTP Server, after you uninstall the agent, you must remove the following files manually:

- /tmp/khu\_cps.properties
- /tmp/httpserver-disc.error

For the Monitoring Agent for Python:

1. Delete the Django pyc configuration file to ensure the restored Django pyc file generates its binary.
2. Restart the Apache server to remove the loaded middleware in the Apache processes.

For the Monitoring Agent for Ruby, to uninstall the diagnostics data collector:

1. Navigate to the home directory of your application, open its Gemfile, and remove the following line from the file: `gem 'stacktracer'`
2. Restart your Ruby on Rails application.
3. Uninstall the diagnostics data collector. Enter: `gem uninstall Gemfile`
4. Remove the runtime directory of the data collector. The default location of this directory is `install_dir/install-images/kkm/dchome`

For the Monitoring Agent for Microsoft .NET, complete these steps:

1. Remove the data collector dll files using one of the following options:
  - Reboot your operating system.
  - Try to delete the file `install_dir\qe\bin64\CorProfLog.dll`.  
A File in Use dialog is displayed. It identifies the .NET processes that are currently running.
  - Restart each of the .NET processes.
2. Restart your .NET applications.

## WebSphere Applications agent: Unconfiguring the data collector

If you uninstall the WebSphere Applications agent before you unconfigure the data collector, the agent uninstallation fails. You can remove the data collector from an application server instance manually or by using the interactive utility or the silent unconfiguration process.

For instances monitored with PMI resource monitoring, unconfiguration is not available. Monitoring of PMI data continues while the server is available.

### Unconfiguring the data collector interactively

If you no longer want the data collector to monitor one or more application server instances, you can unconfigure the data collector for them.

### Before you begin

Use the user ID for configuring the data collector to unconfigure the data collector, which is also the user ID for installing the application server. Verify that this user ID has read and write permissions to the data collector home directory and all its sub-directories. The data collector home directory is as follows, where `install_dir` is the WebSphere Applications agent installation directory.

- **Windows** `install_dir\dchome\7.3.0.14.08`
- **Linux** **UNIX** `install_dir/yndchome/7.3.0.14.08`

## About this task

The unconfiguration utility (`unconfig.sh` or `unconfig.bat`) is a menu driven command-line utility for unconfiguring the data collector.

## Procedure

1. Log in to the system as the user ID that is used to configure the data collector.
2. Navigate to the following bin directory:

- **Windows** `install_dir\dchome\7.3.0.14.08\bin`
- **Linux** | **UNIX** `install_dir/yndchome/7.3.0.14.08/bin`

3. Optional: Set the location of the Java home directory before you start the utility.

For example:

**Linux** | **UNIX** `export JAVA_HOME=/opt/IBM/AppServer80/java`

**Windows** `set JAVA_HOME=C:\Progra~1\IBM\WebSphere\AppServer80\java`

4. Start the unconfiguration utility by issue the following command:

**Linux** | **UNIX** `./unconfig.sh`

**Windows** `unconfig.bat`

5. The utility searches for all server instances that are monitored by the data collector. Enter the number that corresponds to the application server instance to unconfigure for data collection or enter an asterisk (\*) to unconfigure data collection for all application server instances. To specify a subset of servers, enter the numbers, separated by commas, that represent the servers. For example: 1, 2, 3.

### Remember:

- For a stand-alone environment, application server instances must be running during the configuration. (A WebSphere Application Server Liberty instance does not need to be running).
  - For a Network Deployment environment, the Node Agent and Deployment Manager must be running.
6. The utility prompts you to specify whether you want to create a backup of your current WebSphere Application Server configuration. Enter 1 to create a backup of the current configuration. Otherwise, enter 2 and skip to step 8.
  7. The utility prompts you to specify the directory in which to store the backup of the configuration. Specify a directory in which to store the backup of the configuration or accept the default directory. The utility displays the name of the WebSphere home directory and the WebSphere profile for which a backup is created.
  8. The utility indicates whether WebSphere Global Security is enabled for the WebSphere Application profile that you specified. If global security is not enabled, skip to step 10.
  9. The utility prompts you to specify whether to retrieve security settings from a client properties file. Enter 1 to allow the utility to retrieve the user name and password from the appropriate client properties file and skip to step “10” on page 215. Otherwise, enter 2 to enter the user name and password.

The data collector communicates with the WebSphere Administrative Services using the RMI or the SOAP protocol. If global security is enabled for a profile, you must specify the user ID and password of a user who is authorized to log in to the IBM WebSphere Application Server administrative console for the profile. Alternatively, you can encrypt the user name and password and store them in client properties files before configuring the data collector. You must use the `sas.client.props` file for an RMI connection, or the `soap.client.props` file for an SOAP connection.

If you selected the option to back up the current WebSphere configuration, the utility starts backing up the configuration.

10. The utility unconfigures the data collector for the specified application server instances. A status message is displayed to indicate that the data collector was successfully unconfigured.
11. After the data collector unconfiguration completes, restart the application server instances.  
The data collector configuration takes effect when the application server instances are restarted. PMI resource monitoring for the server instance is still available.
12. Optional: If you want to use resource monitoring for a server instance after unconfiguring the data collector, restart the monitoring agent by running the following commands:

- **Windows**

```
cd install_dir\bin
was-agent.bat stop
was-agent.bat start
```

- **Linux**    **UNIX**

```
cd install_dir/bin
./was-agent.sh stop
./was-agent.sh start
```

## Results

The data collector is unconfigured for the specified application server instances.

## Unconfiguring the data collector in silent mode

You can unconfigure the data collector using the unconfiguration utility in silent mode.

### Before you begin

Use the user ID for configuring the data collector to unconfigure the data collector, which is also the user ID for installing the application server. Verify that this user ID has read and write permissions to the data collector home directory and all its sub-directories. The data collector home directory is as follows, where *install\_dir* is the WebSphere Applications agent installation directory.

- **Windows** `install_dir\dchome\7.3.0.14.08`
- **Linux**    **UNIX** `install_dir/yndchome/7.3.0.14.08`

### About this task

When you unconfigure the data collector in silent mode, you first specify configuration options in a properties file. A sample properties file, `sample_silent_unconfig.txt`, is packaged with the unconfiguration utility. The file is available in `bin` directory within data collector home directory.

## Procedure

1. Log in to the system with the user ID that is used to configure the data collector.
2. Specify the configuration options in the `properties.txt` file.

The following properties are available for unconfiguring the data collector in silent mode:

#### WebSphere Application Server connecting settings

##### **was.wsadmin.connection.host**

Specifies the name of the host to which the wsadmin tool is connecting.

#### WebSphere Application Server global security settings

##### **was.wsadmin.username**

Specifies the user ID of a user who is authorized to log on to the IBM WebSphere Application Server administrative console. This user must have the agent role on the application server.

**was.wsadmin.password**

Specifies the password that corresponds to the user specified in the `was.wsadmin.username` property.

**WebSphere Application Server settings****was.appserver.profile.name**

Specifies the name of the application server profile you want to unconfigure.

**was.appserver.home**

Specifies the WebSphere Application Server home directory.

**was.appserver.cell.name**

Specifies the WebSphere Application Server cell name.

**was.appserver.node.name**

Specifies the WebSphere Application Server node name.

**Backup of the WebSphere Application Server configuration****was.backup.configuration**

Specifies whether to back up the current configuration of the WebSphere Application Server data collector before unconfiguring the data collector. Valid values are `True` and `False`.

**was.backup.configuration.dir**

Specifies the location of the backup directory.

**WebSphere Application Server runtime instance settings****was.appserver.server.name**

Specifies an application server instance within the application server profile for which you want to unconfigure the data collector.

**Tip:** The silent response file can have multiple instances of this property.

3. Navigate to the following directory:

- **Windows** `install_dir\dchome\7.3.0.14.08\bin`
- **Linux** | **UNIX** `install_dir/yndchome/7.3.0.14.08/bin`

4. Run the following command:

- **Windows**

```
unconfig.bat -silent path_to_silent_file
```

- **Linux** | **UNIX**

```
unconfig.sh -silent path_to_silent_file
```

5. After the data collector unconfiguration completes, restart the application server instances.

The data collector configuration takes effect when the application server instances are restarted. PMI resource monitoring for the server instance is still available.

6. Optional: If you want to use resource monitoring for a server instance after unconfiguring the data collector, restart the monitoring agent by running the following commands:

- **Windows**

```
cd install_dir\bin
was-agent.bat stop
was-agent.bat start
```

- **Linux** | **UNIX**

```
cd install_dir/bin
./was-agent.sh stop
./was-agent.sh start
```

## Manually removing data collector configuration from an application server instance

To manually remove the data collector configuration from an application server instance, you must be able to connect to the application server by using the wsadmin tool. This is possible only if you are using WebSphere Application Server Network Deployment and the Deployment Manager is running. If the WebSphere application server cannot start, you must restore the WebSphere application server from the backup taken when you run the configuration utility.

### About this task

You can manually remove the data collector configuration from an application server instance, if any of the following conditions apply:

- In a non-Network Deployment environment, you manually added the data collector configuration to the application server instance and you want to unconfigure data collection. The application server instance must be running.
- In a Network Deployment environment, you manually added the data collector configuration to the application server instance and you want to unconfigure data collection. The Node Agent and Deployment Manager on the application server must be running.
- In a Network Deployment environment, you configured the application server instance for data collection manually and the application server fails to start. The Node Agent and Deployment Manager on the application server must be running.

If you configured a stand-alone application server instance for data collection either manually or with the configuration or migration utility and the application server fails to start, you must restore your WebSphere Application Server configuration with your backup configuration. For more information, see [“Restoring the application server configuration from a backup” on page 979](#).

### Remember:

- You must make manual changes to the WebSphere application server configuration for data collectors as the WebSphere administrative user.
- Making manual changes to the WebSphere application server for data collection must be performed by an experienced WebSphere administrator only. Any error in the manual configuration change can result in the application server not starting.
- If you manually configure the data collector to monitor application server instances, you cannot use the unconfiguration utility to unconfigure the data collector.

### Procedure

To manually remove the data collector configuration, complete the following procedure:

1. Log in to the WebSphere Administration Server Console.
2. Click **Servers**.
3. Expand **Server Type** and select **WebSphere application servers**.
4. Click the name of the server.
5. In the Configuration tab, go to **Server Infrastructure > Java and Process Management > Process Definition > Java Virtual Machine > Additional Properties: Custom Properties**.
6. Remove any of the following JVM Custom Properties, if they are present:
  - `am.home`
  - `ITCAM.DC.ENABLED`
  - `TEMAGCCollector.gclog.path`
  - `com.ibm.tivoli.itcam.toolkit.ai.runtimebuilder.enable.rebuild`
  - `com.ibm.tivoli.jiti.injector.ProbeInjectorManagerChain.primaryInjectorFile`
7. Identify the JVM arguments that were added for the data collector.

- a) In the navigation pane, click **Environment > WebSphere Variables**.
- b) If you manually configured the application server for data collection, locate the JVM arguments you added manually.  
If you configured the application server for data collection with the configuration utilities, compare the values of the **AM\_OLD\_ARGS** and **AM\_CONFIG\_JVM\_ARGS** arguments to determine which arguments were added by the configuration utility.
8. Click **Server > Application Server** and select the appropriate server name.
9. In the Configuration tab, go to **Server Infrastructure > Java and Process Management > Process Definition > Java Virtual Machine**.
10. In **Generic JVM Arguments** field, remove the JVM arguments that you identified in Step 7 for the data collector.
11. Click **Apply** or **OK**.
12. In the **Messages** dialog box, click **Save**.
13. In the **Save to Master Configuration** dialog box, complete one of the following steps:
  - If you are under a Network Deployment environment, make sure that the **Synchronize changes with Nodes** check box is selected, and then click **Save**.
  - If you are not under a Network Deployment environment, click **Save**.
14. Remove environment entries that were added for the data collector.
  - a) In the Configuration tab, go to **Server Infrastructure > Java and Process Management > Process Definition > Environment Entries**.
  - b) Depending on the operating system, delete the following environment entry:
    - **UNIX LIBPATH**
    - **Linux LD\_LIBRARY\_PATH**
    - **Windows PATH**
  - c) Remove the **NLSPATH** environment entry.
15. Click **Apply** or **OK**.
16. In the **Messages** dialog box, click **Save**.
17. In the **Save to Master Configuration** dialog box, complete one of the following steps:
  - If you are under a Network Deployment environment, make sure the check box **Synchronize changes with Nodes** is selected, and then click **Save**.
  - If you are not under a Network Deployment environment, click **Save**.
18. In the navigation pane, click **Environment > WebSphere Variables**.
19. Delete the following variables:
  - **AM\_CONFIG\_JVM\_ARGS**
  - **AM\_OLD\_JVM\_ARGS**
  - **ITCAMDCHOME**
  - **ITCAMDCVERSION**
20. In the **Messages** dialog box, click **Save**.
21. In the **Save to Master Configuration** dialog box, complete one of the following steps:
  - If you are under a Network Deployment environment, make sure the check box **Synchronize changes with Nodes** is selected, and then click **Save**.
  - If you are not under a Network Deployment environment, click **Save**.
22. If you configured the server instance for data collection with the data collector configuration tool, rather than manually, complete the following steps:
  - a) Navigate to the `dc_home/runtime` directory.

- b) Rename the `$profile.$cell.$node.$server.input.properties` file to `$profile.$cell.$node.$server.input.properties.bak`.
- 23. If you are manually removing the data collector configuration from all application server instances in a profile, perform the following steps:
  - a) Navigate to the `$appserverhome/bin` directory.
  - b) Run the **`osgiCfgInit.sh/bat -all`** command on Windows systems or the **`osgiCfgInit.sh -all`** command on UNIX and Linux systems.
- 24. Restart the application server instance that was monitored by the data collector.

## Manually unconfigure the data collector

After you manually configure the data collector for the WebSphere Applications agent, to remove data collection within the configured application server, you must manually unconfigure the data collector.

### About this task

The following procedure applies only after you manually configure the data collector following the instructions in [“Manually configure the data collector if the configuration utilities fail” on page 955](#). If you used the configuration utilities to configure the data collector, you must also use the unconfiguration utility to unconfigure the data collector. For instructions, see [“Unconfiguring the data collector interactively” on page 213](#) or [“Unconfiguring the data collector in silent mode” on page 215](#).

### Procedure

- To manually unconfigure the data collector for the WebSphere application server, see [“Manually unconfiguring the data collector for WebSphere Application Server traditional” on page 219](#).
- To manually unconfigure the data collector for the Liberty server, see [“Manually unconfiguring the data collector for WebSphere Application Server Liberty” on page 220](#).

### *Manually unconfiguring the data collector for WebSphere Application Server traditional*

#### Procedure

1. Log in to the WebSphere Administrative Console as the administrator.
2. In the navigation pane, click **Servers**, expand **Server Type** and select **WebSphere application servers**.
3. Click the name of the application server.
4. Under the **Server Infrastructure** section in the Configuration tab, expand **Java Virtual Machine** and click **Process Definition**.
5. Under the **Additional Properties** section, click **Java Virtual Machine**.
6. In the **Generic JVM arguments** field, remove the following entries from the content.

```
-agentlib:am_ibm_16=${WAS_SERVER_NAME} -Xbootclasspath/p:${ITCAMDCHOME}/
toolkit/lib/bcm-bootstrap.jar -Djava.security.policy=${ITCAMDCHOME}/itcamdc/
etc/datacollector.policy -verbosegc
```

7. Click **Apply** and click **Save**. In the Save to Master Configuration dialog box, complete the following steps:
  - If you are under a Network Deployment environment, ensure that **Synchronize changes with Nodes** is selected and then click **Save**.
  - If you are not under a Network Deployment environment, click **Save**.
8. In the navigation pane, click **Servers**, expand **Server Types**, click **WebSphere application servers** and then click the server name.

9. In the Configuration tab, go to **Server Infrastructure > Java and Process Management > Process Definition > Environment Entries**.
10. Depending on the operating system, the hardware platform, and the application server JVM, remove the following environment entry.
  - **UNIX** LIBPATH
  - **Linux** LD\_LIBRARY\_PATH
  - **Windows** PATH
11. In the navigation pane, click **Environment > WebSphere Variables**.
12. Remove the *ITCAMDCHOME* variable if it exists.
13. Click **Apply** and click **Save**. In the Save to Master Configuration dialog box, complete the following steps:
  - If you are under a Network Deployment environment, ensure that **Synchronize changes with Nodes** is selected and then click **Save**.
  - If you are not under a Network Deployment environment, click **Save**.
14. Restart the application server instance.
15. Go to the runtime directory in the agent installation directory and remove the *profile\_name.cell\_name.node\_name.server\_name.manual.input.properties* file.
  - **Linux** **UNIX** `install_dir/yndchome/7.3.0.14.08/runtime/profile_name.cell_name.node_name.server_name.manual.input.properties`
  - **Windows** `install_dir\dchome\7.3.0.14.08\runtime\profile_name.cell_name.node_name.server_name.manual.input.properties`

## Manually unconfiguring the data collector for WebSphere Application Server Liberty

### Procedure

1. Navigate to the liberty server directory and open the *jvm.options* file in the *server\_name* directory within the Liberty server installation directory. For example, `/opt/ibm/wlp/usr/servers/defaultServer`.
2. Remove the following parameters from the *jvm.options* file.

```
-agentlib:am_ibm_16=server_name
-Xbootclasspath/p:dc_home/toolkit/lib/bcm-bootstrap.jar
-Djava.security.policy=dc_home/itcamdc/etc/datacollector.policy
-verbosegc
```

where, *server\_name* is the name of the Liberty server; *dc\_home* is the data collector home directory.

3. Open the *server.xml* file and remove the following lines:

```
<feature>webProfile-7.0</feature>
<feature>monitor-1.0</feature>
<feature>usr:itcam-730.140</feature>
```

4. Open the *server.env* file and remove the following entry value from the environment entry per the operating system:

| Table 24. Environment entry |                        |                                     |
|-----------------------------|------------------------|-------------------------------------|
| Platform                    | Environment entry name | Environment entry value             |
| AIX R6.1 (64-bit JVM)       | LIBPATH                | /lib:dc_home/<br>toolkit/lib/aix536 |

| Table 24. Environment entry (continued) |                        |                                     |
|---|------------------------|-------------------------------------|
| Platform                                | Environment entry name | Environment entry value             |
| AIX R7.1 (64 bit JVM)                   | LIBPATH                | /lib:dc_home/<br>toolkit/lib/aix536 |
| Solaris 10 (64-bit JVM)                 | LIBPATH                | /lib:dc_home/<br>toolkit/lib/sol296 |
| Solaris 11 (64-bit JVM)                 | LIBPATH                | /lib:dc_home/<br>toolkit/lib/sol296 |
| Linux x86_64 R2.6 (64-bit JVM)          | LD_LIBRARY_PATH        | /lib:dc_home/<br>toolkit/lib/lx8266 |
| Linux Intel R2.6 (32-bit JVM)           | LD_LIBRARY_PATH        | /lib:dc_home/<br>toolkit/lib/li6263 |
| Windows (32-bit JVM)                    | PATH                   | /lib;dc_home/<br>toolkit/lib/win32  |
| Windows (64-bit JVM)                    | PATH                   | /lib;dc_home/<br>toolkit/lib/win64  |

5. Restart the Liberty server.
6. Go to the runtime directory in the WebSphere Applications agent installation directory and remove the `cell_name.node_name.server_name.manual.input.properties` file.
  - **Linux** **UNIX** `install_dir/yndchome/7.3.0.14.08/runtime/  
cell_name.node_name.server_name.manual.input.properties`
  - **Windows** `install_dir\dchome\7.3.0.14.08\runtime  
\cell_name.node_name.server_name.manual.input.properties`

## Node.js agent: Removing the monitoring plug-in

Before you uninstall the Node.js agent, you must remove the monitoring plug-in from your Node.js application.

### Procedure

1. Remove data collector plug-ins from the beginning of the Node.js application file.
  - If you upgrade the Node.js agent from Cloud APM V8.1.3.2 to V8.1.4, complete the following procedure:
    - If you enabled resource data collection, remove the following line from the beginning of the Node.js application file:

```
require('KNJ_NPM_LIB_LOCATION/node_modules/ibm-apm/knj_index.js');
```

where `KNJ_NPM_LIB_LOCATION` is the directory to the `lib` folder of your npm package global installation directory. The default directory is `/usr/local/lib`.

- If you enabled resource data collection and deep-dive diagnostics data collection, remove the following line from the beginning of the Node.js application file:

```
require('KNJ_NPM_LIB_LOCATION/node_modules/ibm-apm/knj_deepdive.js');
```

- If you enabled resource data collection, deep-dive diagnostics data collection, and method traces collection, remove the following line from the beginning of the Node.js application file:

```
require('KNJ_NPM_LIB_LOCATION/node_modules/ibm-apm/knj_methodtrace.js');
```

- If you upgrade the Node.js agent from Cloud APM V8.1.3 to V8.1.4, complete the following procedure:
  - If you enabled resource data collection, remove the following line from the beginning of the Node.js application file.

```
require('install_dir/lx8266/nj/bin/plugin/knj_index.js');
```

, where *install\_dir* is the installation directory of Node.js agent.

- If you enabled resource data collection and deep-dive diagnostics data collection, remove the following line from the beginning of the Node.js application file.

```
require('install_dir/lx8266/nj/bin/plugin/knj_deepdive.js');
```

- If you enabled resource data collection, deep-dive diagnostics data collection, and method traces collection, remove the following line from the beginning of the Node.js application file.

```
require('install_dir/lx8266/nj/bin/plugin/knj_methodtrace.js');
```

2. Restart your Node.js application to disable the data collector plug-ins.
  - If the version of your current Node.js agent is Cloud APM V8.1.3, till now the data collector plug-ins are successfully removed.
  - If the version of your current Node.js agent is Cloud APM V8.1.3.2, continue to the following step.
3. Run the `./uninstall.sh` command from the *install\_dir/lx8266/nj/bin* directory to remove your previous agent settings.

## What to do next

For more information about uninstalling the Node.js agent, see [“Uninstalling your agents” on page 211](#).

## Microsoft .NET agent: Removing the .NET data collector

Before you uninstall the Microsoft .NET agent, you must remove the .NET data collector from your .NET applications.

### Procedure

1. Unregister the data collector.

As an administrator, enter:

```
cd install_dir\qe\bin configdc unregisterdc
```

Where *install\_dir* is the installation directory of the Microsoft .NET agent.

2. Stop all of your .NET applications to disable the data collector.

Enter `net stop was /y`

3. To ensure the complete clean-up of the .NET Data Collector after uninstallation, follow these steps:

- a) On the command prompt, go to the `<APM_HOME>\qe\bin` directory.
- b) Run the `ProcListCaller.bat` file.
- c) Verify the `CorProfAttach.Log` log file at the `<APM_HOME>\qe\logs` directory. The log file lists the processes to which .NET DC profiler component is attached.
- d) Before you uninstall the agent, stop the processes from the `CorProfAttach.Log` file.
- e) If no processes are listed, then continue with the agent uninstallation.

## What to do next

Uninstall the Microsoft .NET agent. See [“Uninstalling your agents” on page 211](#).

---

## Chapter 8. Configuring your environment

If your monitoring agent requires configuration or you want to review the default settings for an agent, follow the steps provided for your agent.

### Common topics

---

Some topics are common when you configure agents and data collectors.

#### Network connectivity

In certain situations, connectivity to the Performance Management server must be manually configured. If you want to use HTTPS, or if your firewall rules block certain connections, you must configure your system.

If you are using HTTPS for secure communication, you must enable TLS 1.2 and ciphers. For more information, see [Secure communication](#).

If your firewall rules do not allow transparent outbound HTTPS connections to external hosts, you can configure your agents to send traffic to a forward proxy. For more information, see [Configuring agents to communicate through a forward proxy](#).

#### Secure communication

Communication between the agents and Cloud APM server uses HTTP by default.

If you choose to use HTTPS for server agent communication, TLS 1.2 and the FIPS Suite-B cipher suites must be enabled. The following ciphers are used:

```
TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256  
TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384
```

If you are using HTTPS, communication from the browser to the server requires TLS 1.2. TLS 1.2 is not enabled by default in some browsers and it must be enabled manually.

#### Configuring agents to communicate through a forward proxy

If your firewall rules do not allow transparent outbound HTTPS connections to external hosts, you can configure IBM monitoring agents to send traffic to a forward proxy. Edit the `KDH_FORWARDPROXY` environment variable to configure agents to communicate through the forward proxy.

#### About this task

When a forward proxy is used, the agent first opens a TCP connection with the proxy. The agent sends an HTTP CONNECT request and the target endpoint (Cloud APM server) URL to the forward proxy. Then, the forward proxy establishes a TCP connection with the target endpoint and sets up an HTTP or HTTPS tunneling session between the agent and the Cloud APM server.

Figure 1. Connection diagram for using a forward proxy

The monitoring agent does not support authenticating proxies, which means the agent does not support logging on to a forward proxy by using a configured proxy user ID and password.

## Procedure

Complete these steps to configure agents to communicate through a forward proxy.

1. Open the agent environment configuration file in a text editor:

**Linux** **UNIX** `install_dir/config/global.environment` file, where `install_dir` is the installation home directory of the agents. The `global.environment` file configures all agents in the installation directory.

The customized settings in the `.global.environment` file are lost after agent upgrade. To preserve your settings, make customization changes in the `global.environment` files. The settings in this file are not overwritten by agent upgrade.

**Windows** `install_dir\TMAITM6_x64\KpcENV` file for 64-bit agents, and `install_dir\TMAITM6\KpcENV` for 32-bit agents, where `pc` is the agent product code. Configure the `KpcENV` file for each agent.

For a list of product codes, see [“Using agent commands”](#) on page 236.

2. Edit the `KDH_FORWARDPROXY` environment variable to specify the proxy address and port:

```
KDH_FORWARDPROXY=http://proxy-address:proxy-port-number
```

For example:

```
KDH_FORWARDPROXY=http://HostA:8085
```

3. Restart the agent to implement your changes. See [“Using agent commands”](#) on page 236.

## Configuring data collectors to communicate through a forward proxy

If your firewall rules do not allow transparent outbound HTTPS connections to external hosts, you can configure data collectors to send traffic to a forward proxy. Edit the `APM_GW_PROXY_CONNECTION` environment variable to configure data collectors to communicate through the forward proxy.

### About this task

When a forward proxy is used, the data collector first opens a TCP connection with the proxy. The data collector sends a connection request and the target endpoint (Cloud APM, Private server) URL to the forward proxy. Then, the forward proxy establishes a TCP connection with the target endpoint and sets up an HTTP or HTTPS tunneling session between the data collector and the Cloud APM, Private server.

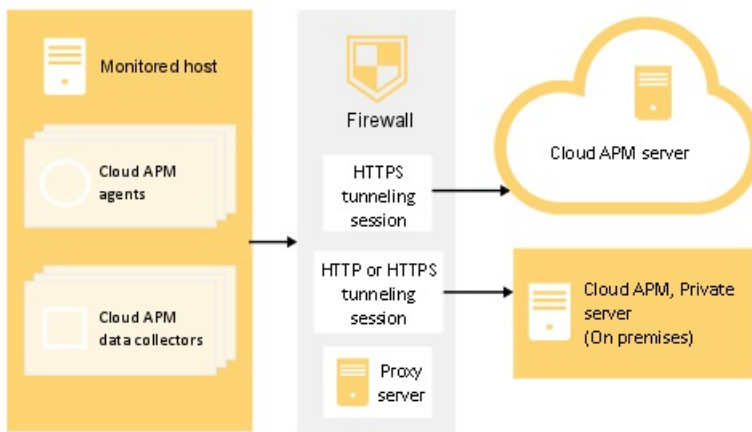

Figure 2. Connection diagram for using a forward proxy

Some data collectors support authenticating proxies, for example Node.js and Liberty data collectors. These data collectors support logging on to a forward proxy by using a configured proxy user ID and password.

## Procedure

1. To configure forward proxy communication for Python data collectors, complete one of the following steps:
  - Open the `<dc home>/config.properties` data collector properties file in a text editor, where `<dc home>` is the installation home directory of the data collectors, for example, `/usr/lib/python2.7/site-packages/ibm_python_dc`. Update the `APM_GW_PROXY_CONNECTION` variable with the proxy host and port number, for example, `APM_GW_PROXY_CONNECTION=http://9.181.138.247:8085`. Editing the variable in this file impacts all applications with the Python data collector enabled.

**Note:** To configure forward proxy communication for a single application, copy the `<dc home>/config.properties` file to the directory of the single application. Update the `APM_GW_PROXY_CONNECTION` variable in the application directory.

- Run the following command on Linux systems:

```
export APM_GW_PROXY_CONNECTION =http://<http proxy host>:<http proxy port>
```

for example,

```
export APM_GW_PROXY_CONNECTION =http://9.181.138.247:8085
```

2. To configure forward proxy communication for Node.js data collectors, complete one of the following steps:

- Run the following command on Linux systems:

```
export APM_GW_PROXY_CONNECTION =http://<http proxy host>:<http proxy port>
```

for example,

```
export APM_GW_PROXY_CONNECTION =http://9.181.138.247:8085
```

- If a user name and password is required to access the forward proxy server for Node.js data collectors, run the following command on Linux systems:

```
export APM_GW_PROXY_CONNECTION =http://<http proxy user>:  
<http proxy password>@<http proxy host>:<http proxy port>
```

for example,

```
export APM_GW_PROXY_CONNECTION =http://Joe:passw0rd@9.181.138.247:8085
```

3. To configure forward proxy communication for Liberty data collectors, edit the *<Liberty server home>/jvm.options* file, where *<Liberty server home>* is the Liberty server home directory, for example: */opt/ibm/wlp/usr/servers/defaultServer/jvm.options*. Complete one of the following steps:

- If authentication is not required, add the following code to the *jvm.options* file:

```
-Dhttp.proxyHost=<http proxy host>  
-Dhttp.proxyPort=<http proxy port>  
-Dhttps.proxyHost=<https proxy host>  
-Dhttps.proxyPort=<https proxy port>  
-Djava.net.useSystemProxies=true
```

- If a user name and password is required to access the forward proxy server, add the following code to the *jvm.options* file:

```
-Dhttp.proxyHost=<http proxy host>  
-Dhttp.proxyPort=<http proxy port>  
-Dhttp.proxyUser=<http proxy user>  
-Dhttp.proxyPassword=<http proxy password>  
-Dhttps.proxyHost=<https proxy host>  
-Dhttps.proxyPort=<https proxy port>  
-Dhttps.proxyUser=<https proxy user>  
-Dhttps.proxyPassword=<https proxy password>  
-Djava.net.useSystemProxies=true
```

4. Restart the local application to implement your changes.

## Results

You configured your data collectors to communicate through a forward proxy.

## Managed system names

The managed system name (MSN) is used to uniquely identify each Cloud APM agent within your environment. It is also the instance name that you see on the Application Performance Dashboard when you select a group for each managed system from the navigator **Groups** section. To avoid conflicts in your environment, assign unique MSNs to your agents.

The agent MSN format differs, depending on your agent type. It falls into one of the following categories:

- [“Common MSN format for single-instance agents” on page 226](#)
- [“Common MSN format for multi-instance agents” on page 227](#)
- [“Special MSN format” on page 227](#)

### Common MSN format for single-instance agents

For most single-instance agents, the common form of the MSN follows this format:

```
hostname:pc
```

where:

- *hostname* is the name of the computer where the agent is installed. This part can be changed if needed.
- *pc* is the uppercase two-character agent code, which cannot be changed. For more information about agent codes, see [“Using agent commands” on page 236](#).
- *:* is the separator, which cannot be changed.

**Example:** `linuxhost01:LZ` is the MSN of the Linux OS agent.

Some single-instance agents that do not follow this MSN format are listed in [Table 25 on page 228](#).

The MSN is limited to 32 characters. For this MSN category, 29 characters are available for the host name because the agent code and separator cannot be changed.

**Important:** If the length of the MSN exceeds 32 characters, part of the MSN is truncated and it does not display correctly in the Cloud APM console. For example, if your host name is VeryLongSalesDivisionServerName03, your managed system name should be VeryLongSalesDivisionServerName03:PC. However, it is truncated to VeryLongSalesDivisionServerName0.

## Common MSN format for multi-instance agents

For most multi-instance agents, the common form of the MSN follows this format:

```
instancename:hostname:pc
```

where:

- *instancename* is the agent instance name that you specify during agent configuration. Use this variable to ensure a unique MSN for each instance of each agent type on each agent host computer.

### Remember:

- Letters from the Latin alphabet (a-z, A-Z), Arabic numerals (0-9), and the hyphen-minus character (-) can be used to create agent instance names.
- The underscore character (\_) is not allowed in agent instance names.
- The instance name that you specify is limited as follows:
  - **Linux** **UNIX** 28 characters minus the length of your host name on Linux or AIX systems.
  - **Windows** 28 characters minus the length of your host name when using the silent response file for configuration on Windows systems. Example, Server-Name is 11 characters long. So agent instances on the Server-Name host must be less than or equal to 17 characters in length.
  - **Windows** 20 characters minus the length by which your host name exceeds 8 characters when using the Cloud APM console configuration on Windows systems. Example, TestServer is 10 characters long, which exceeds 8 by 2. So agent instances on the TestServer host must be less than or equal to 18 characters in length.
- *hostname* is the name of the computer where the agent is installed. The host name component of the MSN can be changed if necessary.
- *pc* is the uppercase two-character agent code, which cannot be changed. For more information about agent codes, see [“Using agent commands” on page 236](#).
- *:* is the separator, which cannot be changed.

**Example:** jboss1:win2016:JE is the MSN for the JBoss agent.

Some multi-instance agents that do not follow this MSN format are listed in [Table 25 on page 228](#).

The MSN is limited to 32 characters. For this MSN category, 28 characters are available between the instance name and the host name because the agent code and separators cannot be changed.

**Important:** If the length of the MSN exceeds 32 characters, part of the MSN is truncated and it does not display correctly in the Cloud APM console. For example, if you specify VeryLongInstanceName as your instance name, and your server name is Production09, your managed system name should be VeryLongInstanceName:Production09:PC. However, it is truncated to VeryLongInstanceName:Production0.

## Special MSN format

Special MSN format applies to the agents whose MSNs do not follow the above two common MSN formats. These agents are listed in [Table 25 on page 228](#).

The special MSN is limited to 32 characters. In [Table 25 on page 228](#), only the italic strings in the MSN format column can be changed.

Table 25. Special MSN format

| Agents                         | MSN format   | MSN example  |
|--------------------------------|--|--|
| Amazon EC2 agent               | B5:ec2subnodename:INS  | B5:sales:INS   |
| Amazon ELB agent               | <ul style="list-style-type: none"> <li>AL:instancenameA:APP</li> <li>AL:instancenameC:CLA</li> <li>AL:instancenameN:NET</li> </ul>   | <ul style="list-style-type: none"> <li>AL:elb-inst3A:APP</li> <li>AL:elb-inst3C:CLA</li> <li>AL:elb-inst3N:NET</li> </ul>                                  |
| Azure Compute agent            | AK:azure_compute_subnode_name:AVM  | AK:azc-inst3:AVM   |
| Citrix VDI agent               | VD:citrixsitename:XDS  | VD:xds1:XDS  |
| DataPower agent                | BN:datapowersystemname:DPS   | BN:datapower23:DPS   |
| HTTP Server agent              | HU:hostname_alias:HUS  | HU:docker-ihs_httpd:HUS  |
| IBM Integration Bus agent      | monitoredbrokername:agentID:KQIB   | TRADEBRK:AGT1:KQIB   |
| MQ Appliance agent             | MK:hostname_sectionname:ARM  | MK:bvtmin_linux150:ARM   |
| Node.js agent                  | NJ:hostname_port:NJA   | NJ:KVM-014179_3000:NJA   |
| Oracle Database agent          | <ul style="list-style-type: none"> <li>RZ:dbconnection-instancename-hostname:ASM</li> <li>RZ:dbconnection-instancename-hostname:DG</li> <li>RZ:dbconnection-instancename-hostname:RDB</li> </ul>   | RZ:11g-oracledbdemo-GVT-1BL:RDB  |
| Ruby agent                     | KM:hostname_appname:RAP  | KM:nc9098036112_Blog:RAP   |
| SAP agent                      | <ul style="list-style-type: none"> <li>SAP Instance: instancename-hostname_sid_instancenumbr:Ins</li> <li>SAP Process Integration: instancename-hostname:PI</li> <li>SAP Solution Manager: instancename-hostname:S1m</li> <li>SAP System: instancename-hostname:Sys</li> </ul> | <ul style="list-style-type: none"> <li>PS5-IBMSAP3V1_PS5_11:Ins</li> <li>PS5-IBMSAP3V1:PI</li> <li>PS8-IBMSAP3V3:S1m</li> <li>PS5-IBMSAP3V1:Sys</li> </ul> |
| SAP HANA Database agent        | <ul style="list-style-type: none"> <li>SAP Hana Database: S7:dbname-systemsid:HDB</li> <li>SAP Hana System: instancename-hostname:S7</li> </ul>  | <ul style="list-style-type: none"> <li>S7:HNA-HNA:HDB</li> <li>HNA:PS8760:S7</li> </ul>  |
| SAP NetWeaver Java Stack agent | <ul style="list-style-type: none"> <li>SAP NW Java AS Cluster: instancename-hostname:SV</li> <li>SAP NW Java AS Instance: SV:systemsid-jvmid:NWJ</li> </ul>  | <ul style="list-style-type: none"> <li>J01:VPT02F17:SV</li> <li>SV:J01-83309750:NWJ</li> </ul>   |

| Table 25. Special MSN format (continued) |  |                              |
|--|--|------------------------------|
| Agents                                   | MSN format   | MSN example                  |
| UNIX OS agent                            | <i>hostname</i> :KUX   | worklight17:KUX              |
| WebLogic agent                           | WB: <i>instancename</i> :WLS   | WB:Server1:WLS               |
| WebSphere Applications agent             | <ul style="list-style-type: none"> <li>WebSphere Application Server:<br/><i>serveralias</i>:<i>hostname</i>:KYNS</li> <li>WebSphere Portal Server:<br/><i>serveralias</i>:<i>hostname</i>:KYNR</li> <li>WebSphere Process Server:<br/><i>serveralias</i>:<i>hostname</i>:KYNP</li> </ul> | simpletrade:worklight17:KYNS |

| Windows OS agent                         | Primary: <i>hostname</i> :NT   | Primary:TRADEIIS1:NT         |

## Changing the agent managed system name

Different procedures apply to change the managed system name for different Cloud APM agents. For some agents, changing the managed system name means changing the host name or agent instance name (or both) in the managed system name. For other agents, specific procedures are required to change the managed system name.

### Before you begin

Get familiar with the managed system name formats and naming restrictions as described in [“Managed system names”](#) on page 226.

### About this task

For most Cloud APM agents, you can use the **CTIRA\_HOSTNAME** parameter to change the host name used in the managed system name. To change the agent instance name in the managed system name for multi-instance agents, you can use the agent configuration parameter. If you have configured the agent, you must reconfigure it to assign a different agent instance name. After you reconfigure the agent, you will not be able to retrieve the data collected by the previous agent instance.

You might not be able to change the managed system name in one single procedure, depending on which part of the managed system name you want to change.

To find out the managed system name change method for the agent of your interest, refer to [Table 26 on page 229](#).

**Exception:** Changing the managed system name is not supported by the HTTP Server agent, Node.js agent, or the Synthetic Playback agent

| Table 26. Changing managed system name methods for Cloud APM agents |   |
|---|---|
| Agent   | managed system name change method   |
| Amazon EC2 agent  | Use agent configuration parameter to change the EC2 subnode name in the managed system name, see <a href="#">“Configuration parameters for the Amazon EC2 agent”</a> on page 269. |
| Amazon ELB agent  | Create a new agent instance with a new instance name to change the managed system name.   |

## Changing the host name in managed system name

### About this task

It is not a common practice to change the host name in the managed system name. The host name is automatically detected and set during agent configuration. Change the host name in the managed system name only when necessary and make sure the value that you specify does not cause any truncations due to managed system name naming restrictions.

### Procedure

1. Stop all existing instances of the agent and wait for the Cloud APM console to show that the agent or its subnodes are offline. If you do not have any existing agent instances, proceed to the next step.  
  
For more information about stopping agent instances, see [“Using agent commands”](#) on page 236.
2. If the agent is a single-instance agent, complete the following steps to change the **CTIRA\_HOSTNAME** parameter. The value that you specify for the **CTIRA\_HOSTNAME** parameter is the value that is applied to all new agent instances.

a) Make a backup copy of the following file:

- **Linux** | **UNIX** `install_dir/config/pc.environment`
- **Windows** `install_dir/TMAITM6_x64/kpccma.ini`

where:

- `install_dir` is the agent installation directory.
  - `pc` is the two character agent code. See [Agent names and agent codes table](#).
- b) Edit the file by changing the **CTIRA\_HOSTNAME** parameter value as follows, where `newhostname` is the custom string that is used instead of the actual host name of the computer where the agent is installed.

- **Linux** | **UNIX** `CTIRA_HOSTNAME=newhostname`
- **Windows** `CTIRA_HOSTNAME=newhostname .TYPE=REG_EXPAND_SZ`

- c) Save your changes.
3. If the agent is a multi-instance agent, complete the following steps to change the **CTIRA\_HOSTNAME** parameter. Normally all agent instances on a computer use the same host name value. If you need agent instances to use differing values, vary the value that you assign to **CTIRA\_HOSTNAME** when you perform this step.
- a) Make a backup copy of the following files:
- **Linux** **UNIX** `install_dir/config/pc_instance.environment`
  - **Windows** `install_dir/TMAITM6_x64/kpccma_instance.ini`
- b) Edit the file the change the **CTIRA\_HOSTNAME** parameter value as follows:
- **Linux** **UNIX** `CTIRA_HOSTNAME=newhostname`
  - **Windows** `CTIRA_HOSTNAME=newhostname .TYPE=REG_EXPAND_SZ`
- c) Save your changes.
4. **Windows**
- Reconfigure existing agent instances. You can either reconfigure the agent using the procedure in [Using the IBM Cloud Application Performance Management window on Windows systems](#) or use the agent `.bat` script to configure the agent. See “Using agent commands” on page 236 for more details on using the agent `.bat` script. If the agent `.bat` script does not provide a config option, use the IBM Cloud Application Performance Management GUI to reconfigure the agent.
5. Start all agent instances.

## What to do next

After you change the agent managed system name, start the Cloud APM console and modify your applications by removing the old managed system name from applications and adding the new managed system name in its place.

## Configuring agents

After installation, some agents are configured and started automatically, while some agents require manual configuration but start automatically. Some agents must be configured and started manually. Multiple instance agents require creating a first instance and starting manually.

### Before you begin

When you install an agent, a sample silent configuration file is placed in the `/opt/ibm/apm/agent/samples` directory, for example, `ynv_silent_config_agent.txt` and `datapower_silent_config.txt`.

**Note:** Some agents, for example Monitoring Agent for WebSphere Applications, have multiple silent configuration files for different tasks such as configuring the data collector.

### About this task

For specific deployment details for agents, see [Chapter 6, “Agent and data collector deployment,”](#) on page 173.

To configure an agent, you can use the command line or a silent response file as described in this procedure.

Configuration methods vary across agents; use the procedure that is provided for your agent.

### Procedure

- Run the `agent-name.sh config` command.  
For more commands, see [Table 28 on page 238](#) and [Table 29 on page 239](#).

- Edit the silent response file and then run one of the following commands:

- For single instance agents, run the following command:

```
agent-name.sh config response_file
```

- For multiple-instance agents, run the following command:

```
agent-name.sh config instance_name response_file
```

- where *instance\_name* is the instance name, which can be assigned to indicate what you are monitoring.

#### Windows

For agents that are supported on Windows systems, you can perform certain configuration tasks by using the IBM Cloud Application Performance Management window. Click **Start > All Programs > IBM Monitoring agents > IBM Cloud Application Performance Management**. For more information, see [“Using the IBM Cloud Application Performance Management window on Windows systems” on page 242](#).

- To perform advanced configuration for certain agents such as configuring transaction tracking or data collection, and enabling diagnostic data, use the **Agent Configuration** window. For more information, see [“Agent Configuration page” on page 242](#).

## Using agent commands

The same scripts that you use to install monitoring agents are also used to check the status of an installed agent, stop or start it, or uninstall the agent.

### About this task

The agent name and agent codes are provided for your reference.

Use the agent name in the following commands:

```
Linux | UNIX name-agent.sh
```

```
Windows name-agent.bat
```

Where *name* is the name of the agent that is specified in [Table 27 on page 236](#).

| Table 27. Agent names and agent codes                      |               |                       |
|--|---------------|-----------------------|
| Monitoring agent   | <i>name</i>   | Two letter agent code |
| Monitoring Agent for Amazon EC2                            | amazon_ec2    | b5                    |
| Monitoring Agent for Azure Compute                         | azure_compute | ak                    |

## Procedure

- Linux | UNIX

On the system or VM where you want to send a command to the monitoring agent, change to the `install_dir/bin` directory. Enter any of the commands in [Table 28 on page 238](#) where *name* is the agent name that is specified in [Table 27 on page 236](#).

Table 28. Commands for UNIX and Linux systems

| Command                             | Description  |
|-------------------------------------|--|
| <code>./name-agent.sh status</code> | Checks the agent status. Status can be either running or not running. When the agent is running, the connection status between the agent and the Cloud APM server is also checked. Possible negative connection statuses are: Connection failed, Error detected, Disconnected-error. The positive status is Connected, this is the expected status. The transitional status is Connecting. A status of Unknown means that the agent status cannot be recognized, possible due to errors in the file system or in the agent log file. |
| <code>./name-agent.sh start</code>  | Starts the monitoring agent. If the agent has instances, enter an instance name after the command.   |
| <code>./name-agent.sh stop</code>   | Stops the agent. If the agent has instances, enter an instance name after the command.   |

| Table 28. Commands for UNIX and Linux systems (continued)                    |  |
|--|--|
| Command  | Description  |
| <code>./name-agent.sh prereqcheck</code>                                     | Runs a prerequisite scan. This command option is available for most agents.  |
| <code>./name-agent.sh install</code>   | Installs the monitoring agent. For more information, see <a href="#">“Installing agents on UNIX systems” on page 185</a> and <a href="#">“Installing agents on Linux systems” on page 191</a> .  |
| <code>./name-agent.sh config instance_name path_to_silent_config_file</code> | <p>Configures the monitoring agent. Run the command from the <code>install_dir/bin</code> directory and add the response file path if required.</p> <p>If the agent has instances, enter an instance name. For more information about which agents are multiple instance agents, see the <a href="#">Table 23 on page 175</a>.</p> <p>The <code>silent_config_file</code> is optional. If you do not specify a file for silent configuration, you can configure the monitoring agent interactively by following the prompts.</p> |
| <code>./name-agent.sh uninstall</code>                                       | Uninstalls the monitoring agent. For more information, see <a href="#">“Uninstalling your agents” on page 211</a> .  |
| <code>./smal-agent.sh uninstall_all</code>                                   | Uninstalls all the monitoring agents on the managed system.  |
| <code>./name-agent.sh remove instance_name</code>                            | Removes an instance of a multiple instance agent.  |
| <code>./name-agent.sh</code>   | View a description of the functions that are available with the script.  |

- **Windows**

On the system or VM where you want to send a command to the monitoring agent, change to the `install_dir\BIN` directory at the command prompt, for example: `C:\IBM\APM\bin`. Enter any of the commands in [Table 29 on page 239](#) where *name* is the agent name that is specified in [Table 27 on page 236](#).

| Table 29. Commands for Windows systems |   |
|--|---|
| Command                                | Description   |
| <code>name-agent.bat status</code>     | <p>Checks the agent status.</p> <p>Checks the connection status between the agent and the Cloud APM server. Possible negative connection statuses are: Connection failed, Error detected, Disconnected-error. The positive status is Connected, this is the expected status. The transitional status is Connecting. A status of Unknown means that the agent status cannot be recognized, possible due to errors in the file system or in the agent log file.</p> |

| Table 29. Commands for Windows systems (continued)                          |  |
|---|--|
| Command   | Description  |
| <code>name-agent.bat start</code>   | Starts the monitoring agent. If the agent has instances, enter an instance name after the command.   |
| <code>name-agent.bat stop</code>  | Stops the agent. If the agent has instances, enter an instance name after the command.   |
| <code>name-agent.bat prereqcheck</code>                                     | Runs a prerequisite scan. This command option is available for most agents.  |
| <code>name-agent.bat install</code>   | Installs the monitoring agent. For more information, see <a href="#">“Installing agents” on page 204</a> .   |
| <code>name-agent.bat config instance_name path_to_silent_config_file</code> | <p>Configures the monitoring agent. Run the command from <code>install_dir\bin</code> directory and add the response file path if required.</p> <p>If the agent has instances, enter an instance name. If you do not specify a file for silent configuration, you can configure the monitoring agent interactively by following the prompts.</p> |
| <code>name-agent.bat uninstall</code>                                       | Uninstalls the monitoring agent. For more information, see <a href="#">“Uninstalling your agents” on page 211</a> .  |
| <code>smai-agent.bat uninstall_all</code>                                   | Uninstalls all monitoring agents on the managed system.  |
| <code>name-agent.bat remove instance_name</code>                            | Removes an instance of a multiple instance agent.  |
| <code>name-agent.bat</code>   | View a description of the functions that are available with the script.  |

Agent version command

- To see the version of an agent in your environment, run the following commands:

- Linux | UNIX

```
install_dir/bin/cinfo
```

Enter 1 to show the versions.

- Windows

```
install_dir/InstallITM/kincinfo
```

## Related tasks

## Enabling virtual hosts for agent traffic

The Cloud APM server's monitoring infrastructure node (min) process is susceptible to the External service interaction (DNS) vulnerability for agent traffic. An artificially modified HTTP HOST header value

might cause the Cloud APM server to query its DNS to resolve the address of the HOST value passed. This is because the server supports agent traffic on all network interfaces by default. You can mitigate this vulnerability by defining the host names and ports for agent traffic.

## Procedure

Complete these steps to add virtual host alias definitions to the `user-exit.xml` file:

1. Open the `install_dir/wlp/usr/servers/min/user-exit.xml` file in a text editor.
2. Add a `<hostAlias>` element for each Cloud APM server fully qualified host name or IP address and port combination that agents can connect to:

```
<virtualHost id="default_host">
  <hostAlias>apm-server-host-ip:80</hostAlias>
  <hostAlias>apm-server-host-ip:443</hostAlias>
  <hostAlias>localhost:80</hostAlias>
  <hostAlias>localhost:443</hostAlias>
</virtualHost>
```

where `apm-server-host-ip` is the host name or IP address that your agents are configured to connect to. (The agents connect using the host name or IP address that you specified during the Cloud APM server installation or when you ran the `install_dir/ccm/make_configuration_packages.sh` script.)

Also check the **Host Name Override** configuration setting ( **System Configuration > Advanced Configuration > Agent Central Configuration**). Create additional `<hostAlias>` lines for port 80 and port 443 for the host name override value if it is different from the value that was specified when the agent packages were configured.

This example shows the virtual host alias definitions when the agents were configured to connect to the Cloud APM server with the `my_server.ibm.com` host name:

```
<virtualHost id="default_host" >
  <hostAlias>my_server.ibm.com:80</hostAlias>
  <hostAlias>my_server.ibm.com:443</hostAlias>
  <hostAlias>localhost:80</hostAlias>
  <hostAlias>localhost:443</hostAlias>
</virtualHost>
```

3. After you save `use-exit.xml`, restart the `min` component of the Cloud APM server:

```
apm restart min
```

## Results

The defined virtual hosts are now enabled. From now on, if a monitoring agent sends a HOST header value that is not defined by a `<hostAlias>` entry, the Cloud APM server returns an HTTP 404 error.

### Related tasks

[“Starting, stopping, and checking the status of server components” on page 1210](#)

Use the commands for checking the status or for starting, stopping, and recycling the Cloud APM server components when necessary for maintenance and troubleshooting tasks.

[“Configuring the communications protocol for server agents” on page 1217](#)

Either the HTTP or HTTPS protocol is used to communicate between the Cloud APM server and the server agents. The Cloud APM server allows connections from server agents that authenticate themselves with a valid certificate. If you change the communication protocol that is used by the server to communicate with monitoring agents, you must change the protocol used by the server agents.

## Using the IBM Cloud Application Performance Management window on Windows systems

Windows supported agents have a GUI utility that you can use to perform agent configuration and check the connection status.

The GUI configuration utility is not available for the Monitoring Agent for WebSphere MQ or Monitoring Agent for IBM Integration Bus.

### Procedure

- Click **Start > All Programs > IBM Monitoring agents > IBM Cloud Application Performance Management**.

### Results

The IBM Cloud Application Performance Management window is displayed. Each installed agent component is listed with its configuration status, whether it is started or stopped, the connection status, the version number, and other information.

### What to do next

Start or stop an agent or configure the parameters by right-clicking the agent and selecting an option.

### Agent Configuration page

Use the **Agent Configuration** page to centrally configure settings for such agents as the Response Time Monitoring Agent and WebSphere Applications agent.

### General usage

After you click  **System Configuration > Agent Configuration** from the navigation bar, a tabbed dashboard is displayed with one tab for each configurable monitoring agent. The table shows columns of configuration information, such as the name and IP address for each managed system, one row for each managed system.

#### Actions

Use the Actions options to enable or disable such functions as transaction tracking or data collection.

#### Column resize

Drag a column heading border to adjust the column width.

#### Column sort

Click inside a column heading to sort by that column. Click the same column heading again to switch between ascending and descending sort order.

#### Table filter

Click inside the filter text box  and type the beginning of the value to filter the table by. As you type, the table rows that do not fit the criteria are filtered out and the row **Total** is updated for the number of rows found.

Click the "x" in the filter box  or press the Backspace key to clear the filter.

### Agent configuration

For more information about the settings for the specific agents, see the following topics:

## Configuring agents as a non-root user

If you want to configure your agent as a non-root user, create a common group on the system and make each user a member of this group.

### Before you begin

If you installed your agent as a root or non-root user and you want to configure the agent as the same user, no special action is required.

If you installed your agent as a selected user and want to configure the agent as a different user, create a common group on the system. Make all agent management users members of this common group. Transfer ownership of all agent files and directories to this group.

#### Note:

- For the HTTP Server agent, if you configure the agent as a non-root user, the non-root user must have the same user ID as the user who started the IBM HTTP Server. Otherwise, the agent has problems with discovering the IBM HTTP Server.
- For the IBM Integration Bus agent, if IBM Integration Bus installation is a single-user deployment, use the same user ID as the user who installed IBM Integration Bus to configure the agent. Before you configure the agent, complete the following steps for this user ID.

## Procedure

1. Install your monitoring agents on Linux or UNIX as described in [“Installing agents on Linux systems” on page 191](#) and [“Installing agents on UNIX systems” on page 185](#).
2. Run the `./secure.sh` script with the group name of the non-root user to secure the files and set the file group ownership to the files.  
For example: `./secure.sh -g db2iadm1`
3. Configure your monitoring agents on Linux or AIX as necessary, see [Chapter 8, “Configuring your environment,” on page 223](#).
4. To update the system startup scripts, run the following script with root user or sudo user access:  
`install_dir/bin/UpdateAutoRun.sh`

## What to do next

For more information about the `./secure.sh` script, see [Securing the agent installation files](#).

Use the same user ID for agent installation and upgrades.

## Disabling automatic agent start on UNIX and Linux systems

On the UNIX or Linux system, an agent can automatically start after an operating system restart. If you don't want the agent to start automatically after system restart, you can disable automatic agent start.

### About this task

If you install an agent as root user on the UNIX or Linux system, the agent can automatically start after system restart. Or, if you install an agent as non-root user but run the **UpdateAutoRun.sh** script as root after installation, the agent can automatically start after system restart.

### Procedure

1. Complete the following steps to disable the automatic start on some agents:
  - a. For the Linux OS agent and the WebSphere® Applications agent, add the following code to the `agent_install_dir/registry/kcirunas.cfg` file:

```
<productCode>lz</productCode>
<default>
  <autoStart>no</autoStart>
</default>
<productCode>yn</productCode>
<default>
  <autoStart>no</autoStart>
</default>
```

- b. Run the **agent\_install\_dir/bin/UpdateAutoRun.sh** command.
2. Complete the following steps to enable the automatic start on some agents:
  - a. For the Linux OS agent and the WebSphere® Applications agent, in the `agent_install_dir/registry/kcirunas.cfg` file, change the value of the `<autoStart>` tag to **yes**.
  - b. Open the `agent_install_dir/registry/AutoStart` file and check the content.
  - c. Delete the `/etc/init.d/ITMAgents{ $Num }` file, where `{ $Num }` is a positive number in the `agent_install_dir/registry/AutoStart` file. If the value is 1, you must delete the `/etc/init.d/ITMAgents1` file.
  - d. Run the **agent\_install\_dir/bin/UpdateAutoRun.sh** command.

### Results

After system restart, an agent script will not automatically run to start the agent.

## Configuring certificates between the server and agents for HTTPS communication

To enable communication between the Cloud APM server and agents, you can configure default, custom, or self-signed certificates and then configure the agents to use HTTPS communication and the certificates.

### About this task

- If you enabled HTTPS communication for agents when you installed the Cloud APM server, the agents are already configured to use HTTPS and the default certificates were created during the Cloud APM server installation. The default certificates expire 10 years after the Cloud APM server is installed. If you do not want to use the default certificates or you want to update them before they expire, you can configure new certificates and update the agent configuration using one of the following procedures: [“Configuring a self-signed certificate” on page 246](#) or [“Configuring a Third-Party Root CA custom certificate for HTTPS agent communications” on page 250](#).
- If you did not enable HTTPS communication for agents when you installed the Cloud APM server, you can choose which type of certificates you want to use and then reconfigure the agents for HTTPS

communication. If you want to use the default certificates that were created by the Cloud APM server installation, follow the instructions in [“Configuring a default certificate” on page 245](#) to enable HTTPS communications for agents. The default certificates expire 10 years after the Cloud APM server is installed. If you do not want to use the default certificates or you want to update certificates before they expire, you can configure new certificates and update the agent configuration to use HTTPS and the new certificates using the one of the following procedures: [“Configuring a self-signed certificate” on page 246](#) or [“Configuring a Third-Party Root CA custom certificate for HTTPS agent communications” on page 250](#).

## **Configuring a default certificate**

If you use the HTTPS protocol to communicate between the Cloud APM server and the agents, the Cloud APM server allows connections from the resources that authenticate themselves with a valid certificate. You can configure HTTPS communication based on default certificates that are generated during the installation of the Cloud APM server. The default certificates expire 10 years after the Cloud APM server is installed.

## **Before you begin**

During Cloud APM server installation, the local root certificate authority (CA) agent and server certificates that are signed by that local root CA are always generated unless the `/opt/ibm/ccm/keyfiles` directory exists before starting installation.

- The local root certificate authority (CA) is established and two keystores are generated. One keystore contains the key that is used by the server and the other keystore contains the keys that are used by the agents.
- The keys from the keystores are signed by the local root CA. The public key certificates are exchanged between those keystores, for example, the signed server public key is added to the agent keystore and the signed agent public key is added to the server keystore.
- The Local root CA public key is added to both keystores so that both the agent and the server can trust their certificates.
- The HTTPS protocol uses Elliptic Curve ciphers that are 256 bits and it conforms to the Suite-B FIPS standard.
- Ensure that the firewalls or network filtering devices that are located between the Cloud APM server and the monitoring agents enable communication on port **443**.

## **About this task**

The following scenarios apply:

- If you configured the agents during the server installation and set `APM_SECURE_COMMUNICATION=y` that turns on the HTTPS communication, you do not have to complete any additional steps now to use the HTTPS communication protocol.
- If you did not configure agents for HTTPS communication when you installed the Cloud APM server, you must reconfigure the agent images to create new configuration packages that use the HTTPS communication protocol. Next, you must use the updated configuration package to re-configure existing agents and to install new agents.

To enable communication between the server and agents by using the default certificates that were generated during the Cloud APM server installation, complete the following steps:

## **Procedure**

1. To configure the agent images manually, see [“Configuring the downloaded images” on page 182](#). Ensure that you select **HTTPS** communication when you run the `make_configuration_packages.sh` script to create the configuration packages.
2. Copy the `ssl <xml>` element that contains the `enabledCiphers` attribute from the `install_dir/wlp/usr/servers/min/server.xml` file to the `install_dir/wlp/usr/`

servers/min/user-exit.xml file. Then add the following line after the enabledCiphers line in the user-exit.xml file:

```
clientAuthentication="true"
```

3. To change the communication protocol for the Agent Central Configuration to https, complete the following steps:
  - a) Log in to the Cloud APM console.
  - b) Select **System Configuration > Advanced Configuration**.
  - c) Click **Agent Central Configuration**.
  - d) Set the **Protocol** to include "https", and click **Save**.
4. When you install new agents, use the agent images that are configured in [step 1](#).
5. Reconfigure existing agents to use HTTPS by completing the steps in [“Configuring agents to connect to a different server or to use HTTPS communication”](#) on page 255.
6. You must configure the Cloud APM server agents to use HTTPS and certificates. See [“Configuring the communications protocol for server agents”](#) on page 1217 for instructions.

### **Configuring a self-signed certificate**

You might want to configure HTTPS communication for agents to use your own certificate instead of a certificate that is generated by a third party certificate authority (CA) or the default certificate that is generated by the Cloud APM server.

### **Before you begin**

- Ensure that the firewalls or network filtering devices that are located between the Cloud APM server and the monitoring agents enable communication on port **443**. You must prepare two passwords: one for the server keystore and another for the agent keystore.
- The new certificates expire 10 years after they are created.
- The command examples in this procedure use these values:
  - Install directory: /opt/ibm
  - Keystore working directory: /opt/ibm/ccm/keyfiles

### **Procedure**

If you want to use a certificate that is signed by you, complete the following steps:

1. Log in to the operating system of the Cloud APM server machine. Rename /opt/ibm/ccm/keyfiles to /opt/ibm/ccm/keyfiles-backup, and set the location of the new key files by running the following command:

```
export KEYFILES_DIR=/opt/ibm/ccm/keyfiles
```

2. To generate a local root (CA) certificate authority to sign the certificate signing requests (CSRs) for the server and the agent certificates, you must choose a password. The password enciphers the root CA private key and keystore. Then, you must set the password as an environment variable. The security tool that is used for certificate management uses the password:

```
export ROOTCAPASS="put_your_password_here"
/opt/ibm/ccm/create_security_artifacts.sh -genrootca -workdir
"${KEYFILES_DIR}" -keyalg EC -hostname
APM_MIN_server -dname "APM_Root_CA" -label "Root_CA_Cert"
```

**Important:** For step 2, 3, and 4 you can replace the key label with a different label. The following labels are used as an example only in these steps:

- Root\_CA\_Cert
- APM\_Agent\_Certificate

- server\_key

You can replace the host name with a user-defined host name.

When you are finished, you remove the password from the environment variable: enter **export -n ROOTCAPASS**.

The Root CA is created in the "\${KEYFILES\_DIR}"/apmCA directory. It contains two subdirectories: keyfiles and exports. The keyfiles/ subdirectory contains the root CA keystore and the exports/ subdirectory contains the root CA public certificate.

3. To create the agent keystore and a CSR, you must set the host name to a generic name. You do not have to use the default.agent host name. The certificate is used by all agents that communicate with a specific server. You must create a password for the agent keystore and a private key to export to the environment before you run the script:

```
export APMPASS="put_your_agent_keystore_password_here"
/opt/ibm/ccm/create_security_artifacts.sh -gencsr -workdir "${KEYFILES_DIR}"
-keyalg EC -hostname default.agent -dname "APM_Root_CA" -label
"APM_Agent_Certificate"
```

A message is printed on the console that contains the path to the CSR file. After you are finished, you must remove the password from the environment variable: **export -n APMPASS**.

4. To create a server keystore and a CSR, you must provide a hostname for the *-hostname* option. It might be a generic host name such as default.server or the real hostname of the Cloud APM server. In the remaining steps in this procedure, replace default.server with the name that you specified for the *-hostname* option.

```
export APMPASS="put_your_server_keystore_password_here"
/opt/ibm/ccm/create_security_artifacts.sh -gencsr -workdir "${KEYFILES_DIR}"
-keyalg EC -hostname default.server -dname "APM_Root_CA" -label "server_key"
```

A message is printed on the console with the path to the CSR file. After you are finished, you must remove the password from the environment variable: **export -n APMPASS**.

5. Sign the agent CSR by using the root CA that you created in step 2. Then, the agent keystore signed agent certificate and the root CA public certificate is added automatically to the agent keystore:

```
/opt/ibm/ccm/create_security_artifacts.sh -signcsr -keyalg EC -rootcakdb
"${KEYFILES_DIR}"/apmCA/keyfiles/keyfile.kdb -rootcalabel "Root_CA_Cert"
-csrfile
"${KEYFILES_DIR}"/default.agent/exports/default.agent.arm
```

**Important:** In step 5 and 6, *-rootcalabel* must match the label that is specified in step 2.

6. Sign the server CSR. Then, the signed server certificate and the root CA public certificate are added automatically to the server keystore:

```
/opt/ibm/ccm/create_security_artifacts.sh -signcsr -keyalg EC -rootcakdb
"${KEYFILES_DIR}"/apmCA/keyfiles/keyfile.kdb -rootcalabel "Root_CA_Cert"
-csrfile
"${KEYFILES_DIR}"/default.server/exports/default.server.arm
```

7. Add the agent public key to the server keystore. The Cloud APM server is configured to accept connections only from clients or agents that authenticate themselves with a known certificate.

```
/opt/ibm/ccm/create_security_artifacts.sh -addkeytodb -destkdb
"${KEYFILES_DIR}"/default.server/keyfiles/keyfile.kdb
-importfile "${KEYFILES_DIR}"/default.agent/exports/default.agent.cer
-label "APM_Agent_Certificate"
```

8. Add the server public key to the agent keystore so that the agent is able to authenticate server:

```
/opt/ibm/ccm/create_security_artifacts.sh -addkeytodb -destkdb
"${KEYFILES_DIR}"/default.agent/keyfiles/keyfile.kdb -importfile
"${KEYFILES_DIR}"/default.server/exports/default.server.cer -label "server_key"
```

9. Convert the server keystore from the GSKit format (\*.kdb) to the Java keystore format (\*.jks). You must set the server keystore password:

```
export APMPASS="put_your_server_keystore_password_here"
/opt/ibm/ccm/create_security_artifacts.sh -kdb2jks -sourcekdb
"${KEYFILES_DIR}"/default.server/keyfiles/keyfile.kdb
```

The `${KEYFILES_DIR}"/default.server/keyfiles/keyfile.jks"` file is created. When you are finished you must remove the password from the environment: **export -n APMPASS**.

10. Convert the agent keystore from the GSKit format (\*.kdb) to the Java keystore format (\*.jks). You must set the agent keystore password:

```
export APMPASS= "put_your_agent_keystore_password_here"
/opt/ibm/ccm/create_security_artifacts.sh -kdb2jks -sourcekdb
"${KEYFILES_DIR}"/default.agent/keyfiles/keyfile.kdb
```

When you are finished, you must remove the password from the environment: **export -n APMPASS**.

11. If you did not set the `KEYFILES_DIR` directory to `/opt/ibm/ccm/keyfiles`, copy the created keyfiles to the main keyfiles directory.

```
/bin/cp "${KEYFILES_DIR}"/default.agent/keyfiles/keyfile.* /opt/ibm/ccm/
keyfiles/
/bin/cp "${KEYFILES_DIR}"/default.agent/keyfiles/KAES256.ser /opt/ibm/ccm/
keyfiles/
/bin/cp "${KEYFILES_DIR}"/default.server/keyfiles/keyfile.jks /opt/ibm/ccm/
keyfiles/server.jks
```

12. Copy the server `keyfile.jks` file to the security directory for the min service:

```
/bin/cp "${KEYFILES_DIR}"/default.server/keyfiles/keyfile.jks /opt/ibm/wlp/usr/
servers/min/resources/security/key.jks
```

If you previously added a CA certificate to the `key.jks` file to forward events using an SSL connection to your SMTP Server, you must re-add the CA certificate to the new keystore. For instructions, see [Event Manager](#) in “Advanced Configuration” on page 1239.

13. Encode the (xor) server keystore password from [step 4](#).

```
/opt/ibm/wlp/bin/securityUtility encode
```

14. Copy the `keyStore` xml element that contains the "defaultKeyStore" definition of the keystore from `install_dir/wlp/usr/servers/min/server.xml` to `install_dir/wlp/usr/servers/min/user-exit.xml` if it does not already exist in the `user-exit.xml` file. (`user-exit.xml` is an override file for `server.xml`) Replace the password entry in `user-exit.xml` with the newly encoded password from [step 13](#). Remove the `keyStore` xml element from the `server.xml` file.
15. Copy the `ssl` xml element that contains the `enabledCiphers` attribute from the `install_dir/wlp/usr/servers/min/server.xml` file to the `install_dir/wlp/usr/servers/min/user-exit.xml` file if it does not already exist in the `user-exit.xml` file. Then add this `clientAuthentication="true"` line after the `enabledCiphers` line in the `user-exit.xml` file. Remove the `ssl` xml element from the `server.xml` file.
16. Edit the values of the `serverKeyAlias` and `clientKeyAlias` attributes in the `user-exit.xml` file as shown to the values of the key labels specified in [step 3](#) and [step 4](#).

```
serverKeyAlias="put_server_key_label_here"
clientKeyAlias="put_agent_key_label_here"
```

**Note:** If the "serverKeyAlias" and the "clientKeyAlias" key alias entries do not exist in the `user-exit.xml` file, you must add the entries to the `<ssl>` section after the "enabledCiphers="TLS\_ECDHE\_ECDSA\_WITH\_AES\_128\_GCM\_SHA256" property.

17. Restart the **min** server:

```
apm stop min
apm start min
```

18. If the IBM Cloud Application Performance Management Hybrid Gateway is installed in your Tivoli Monitoring environment, copy the contents of the `/opt/ibm/ccm/keyfiles/default.server/keyfile` directory on your Cloud APM server to the `/opt/ibm/wlp/usr/servers/hybridgateway/resources/security/` directory on the computer system where the Hybrid Gateway is installed and restart the Hybrid Gateway.
19. Complete one of the following steps depending on whether you have installed agents:
- If you installed agents, reconfigure the existing agents to use the new certificates by following the steps in [“Configuring agents to connect to a different server or to use HTTPS communication” on page 255](#).
    - Modify the agent configuration file to show which certificate should be used by the agent. The following variable must be modified or added to the configuration file:

```
KDEBE_KEY_LABEL="agent_key_label"
```

For example, `KDEBE_KEY_LABEL="APM_Agent_Certificate"`

      - For Windows 64-bit installation, modify the variable in the `\TMAITM6_x64\KPCENV` file where *PC* is the agent product code.
      - For Windows 32-bit installation, modify the variable in the `\TMAITM6\KPCENV` file where *PC* is the agent product code.

For example, for an agent that is installed to `C:\IBM\APM`, to modify the OS agent configuration on a 64-bit installation, you must change the following file: `C:\IBM\APM\TMAITM6_x64\KNTENV`.

      - On Linux/AIX, modify the variable in the following file: `agent_installation_path/config/global.environment`.
    - Before you install new agents, use the agent configuration tool to modify the agent images to contain the new certificates.
  - Before you install new agents, use the agent configuration tool to modify the agent images to contain the new certificates.
    - a. To create the configuration packages, use the `/opt/ibm/ccm/make_configuration_packages.sh` tool, including the `-k` parameter to specify the location of agent keystore files. For more information, see step “2” on page 183 in [“Configuring the downloaded images” on page 182](#).
    - b. To configure the agent images, use the `/opt/ibm/ccm/configure_agent_images` script.
    - c. Unpack the resulting agent image and modify the configuration file to show which certificate should be used by the agents:
      - The `KDEBE_KEY_LABEL = agent_key_label` variable must be added to the configuration files in an unpacked agent image:

For example, `KDEBE_KEY_LABEL="APM_Agent_Certificate"`.
      - On Linux/AIX, modify the variable in the following file:  
`unpacked_agent_image_path/.apm_config/agent_global.environment`

For example, `APM_Agent_Install_8.1.4.0/.apm_config/agent_global.environment`.
      - On Windows, modify the variable in the `[CMA_CONFIG_VARIABLES]` section of the following file: `unpacked_agent_image_path\apm_config\framework_silent_install.txt`.
      - Compress the unpacked agent installation image.
- The agent configuration package that you create with the `make_configuration_packages.sh` script also contains the Windows package with the configuration data and the Windows script.
20. You must configure the Cloud APM server agents to use HTTPS and certificates. See [“Configuring the communications protocol for server agents” on page 1217](#) for instructions.

## Configuring a Third-Party Root CA custom certificate for HTTPS agent communications

You might want to configure HTTPS communication for agents to use third-party Certificate Authority (CA) issued certificates if this is required by your local security policy.

### Before you begin

Ensure that the firewalls or network filtering devices that are located between the Cloud APM server and the agents enable communication on port **443**.

### About this task

You will create a set of keystore files that hold encryption keys and certificates: one set for the Cloud APM server and one set for the agents. You must prepare two passwords: one for the Cloud APM server keystore and another for the agent keystore. In the following examples, the agent and server keyfile database passwords are the same. The examples use these values:

- Install directory: `/opt/ibm`
- Cloud APM server hostname: `serverhostname`
- Keystore working directory: `/opt/ibm/ccm/keyfiles`

### Procedure

If you want to use a certificate that is generated by a third-party CA, complete the following steps:

1. Log in to the Cloud APM server and create your own keystore working directory under `/opt/ibm/ccm` (such as `/opt/ibm/ccm/working_directory`). Alternatively, use the existing `/opt/ibm/ccm/keyfiles` directory and keep your keyfiles directories unique by selecting **hostname** parameters other than **default.server**, **default.agent**, and **apmCA**. These working directories are used by the installer to create the self signed certificate keyfiles that are used by default. The **hostname** value is used as the name of the subdirectory to store the keystore files. You specify the **hostname** value in the `create_security_artifacts.sh`.

During a reinstallation of the Cloud APM server, if the installer finds an existing `/opt/ibm/ccm/keyfiles` directory, it will not replace the keyfiles in this directory. But if an alternative directory other than `/opt/ibm/ccm/keyfiles` was used during the previous installation, the keyfiles are replaced. For example, if you used a subdirectory of `/keyfiles`, these keyfiles are replaced during the reinstallation.

In subsequent steps, the **create\_security\_artifacts.sh** script creates a Certificate Signing Request (CSR) in the `working_directory/exports` directory as an `.arm` file. You must send the `.arm` file to your third-party CA for signing. Your third-party CA returns your new certificate, the issuing certificate, and any other certificates in the issuer's certificate chain of trust.

The **create\_security\_artifacts.sh** script also creates a set of files in the `working_directory/keyfiles` directory that need to be updated when you get your certificates back from the third-party CA and import them into the keystore. These files are important to keep.

2. To create the agent keystore and CSR, first set the `APMPASS` environment variable to the keystore password.

This variable is used by the **create\_security\_artifacts.sh** script. Example:

```
export APMPASS="put_your_agent_keystore_password_here"
```

3. Create the agent keystore and CSR.

Because the agent certificate is used by all agents, create a generic **hostname** by using the Cloud APM server hostname. We recommend incorporating the Cloud APM server **hostname** for easy identification. The value that is used for the **hostname** parameter will become the name of the subdirectory in `/working_directory` where the agent keystore and CSRs are created.

For the following examples, the Cloud APM server **hostname** variable is **serverhostname**. If your Certificate Authority requires a Subject Alternative Name (SAN) in the CSR request, add the -

**san\_name** parameter followed by the DNS domain name for your agents (for example, ibm.com) to the `/opt/ibm/ccm/create_security_artifacts.sh` command. If you need to specify multiple DNS domain names with the **-san\_name** parameter, separate each domain name with a comma.

The **-keyalg EC** parameter indicates that your third party CA uses ciphers that are compliant with the Suite-B security standard. By default, the following cipher suite is accepted by the Cloud APM server: `TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256`. You must ensure that all the certificates in the chain of trust contain the **namedCurve** parameter with the name of the curve that is used for signing: (rfc 5480 section 2.1.1 states that **implicitCurve** and **specifiedCurve** must not be used in PKIX). If your third-party CA only supports the RSA signature algorithm, specify **-keyalg RSA** in place of **-keyalg EC**.

Set the **-dname** parameter to a standard x509 name that identifies your domain. For example,

```
/opt/ibm/ccm/create_security_artifacts.sh -gencsr -workdir /opt/ibm/ccm/keyfiles
-keyalg EC -hostname serverhostname.agent
-dname OU=ou,O=o,L=l,ST=st,C=c -label APM_Agent_Certificate
```

You receive the following message:

```
Certificate signing request has been created and is available in the following file:
/opt/ibm/ccm/keyfiles/serverhostname.agent/exports/serverhostname.agent.arm
Send it to your Certificate Authority for signing
```

4. If your server keystore password is different from the agent password, unset the `APMPASS` variable and reexport it using the server password.

Example:

```
export -n APMPASS
```

```
export APMPASS ="put_your_server_keystore_password_here"
```

5. Create the server keystore and CSR:

```
/opt/ibm/ccm/create_security_artifacts.sh -gencsr -workdir /opt/ibm/ccm/keyfiles
-keyalg EC -hostname serverhostname
-dname OU=ou,O=o,L=l,ST=st,C=c -label APM_Server_Certificate
```

You receive the following message:

```
Certificate signing request has been created and is available in the following file:
/opt/ibm/ccm/keyfiles/serverhostname/exports/myhost.com.arm
Send it to your Certificate Authority for signing.
```

Creating the CSRs also creates a private key that is initially in the `working_directory/keyfiles/` `keyfile.rdb` file. It is moved to the `keyfile.kdb` file later when you import the certificate. All other keyfiles must remain in the `working_directory/keyfiles/` directory because they are used in subsequent steps, even though you specify only the path to the `keyfile.kdb` file.

**Note:**

- The **-keyalg EC** parameter indicates that your third party CA uses ciphers that are compliant with the Suite-B security standard. By default, the following cipher suite is accepted by the Cloud APM server: `TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256`. You must ensure that all the certificates in the chain of trust contain the **namedCurve** parameter with the name of the curve that is used for signing: (rfc 5480 section 2.1.1 states that **implicitCurve** and **specifiedCurve** must not be used in PKIX). If your third-party CA only supports the RSA signature algorithm, specify **-keyalg RSA** in place of **-keyalg EC**.
  - If your Certificate Authority requires a Subject Alternative Name (SAN) in the CSR request, add the **-san\_name** parameter followed by the Cloud APM server hostname to the `/opt/ibm/ccm/create_security_artifacts.sh` command. If you need to specify multiple hostnames with the **-san\_name** parameter, separate each hostname with a comma.
6. Send the CSR files to the private third-party CA for signing. Copy all certificates you receive for both the server and agent back to the `working_directory/exports` directory for safe keeping.

- a) Copy the server, signer, and root certificates to the following directory: `/opt/ibm/ccm/keyfiles/serverhostname/exports`
- b) Copy the agent, signer, and root certificates to the following directory: `/opt/ibm/ccm/keyfiles/serverhostname.agent/exports`

If you are working with certificates for only a brief amount of time, such as when you are waiting for your CA to create certificates, you should unset `APMPASS` or logout of your session. These steps remove the password from the environment. Ensure that the `APMPASS` environment variable is set appropriately when running the `create_security_artifacts.sh` script.

7. Add your third-party CA root certificate to the agent and server keystore .kdb files unless the root certificate is the signing certificate.

If your chain of trust contains only the single certificate, then the signing certificate is the root certificate and you can skip this step.

```
/opt/ibm/ccm/create_security_artifacts.sh -addkeytodb -destkdb
working_directory/keyfiles/keyfile.kdb -importfile
your_CA's_root_cert_path -label your_CA's_root_label
```

- a) Example for the agent:

```
/opt/ibm/ccm/create_security_artifacts.sh -addkeytodb -destkdb
/opt/ibm/ccm/cust_certs/custom.agent/keyfiles/keyfile.kdb -importfile
/opt/ibm/ccm/keyfiles/serverhostname.agent/exports/rootca.crt -label RootCA
```

You receive the following message:

```
Certificate added successfully.
```

- b) Example for the server:

```
/opt/ibm/ccm/create_security_artifacts.sh -addkeytodb -destkdb
/opt/ibm/ccm/keyfiles/myhost.com/keyfiles/keyfile.kdb -importfile
/opt/ibm/ccm/keyfiles/serverhostname/exports/rootca.crt -label RootCA
```

You receive the following message:

```
Certificate added successfully.
```

8. (Optional) Add your third-party CA intermediate certificate that is not the issuing (Signer) certificate:

```
/opt/ibm/ccm/create_security_artifacts.sh -addkeytodb
-destkdb working_directory/keyfiles/keyfile.kdb
-importfile your_CA's_intermediate_cert_path -label your_CA's_intermediate_label
```

Repeat this step for any intermediate certificates your third-party CA provides that are not the issuing certificate.

9. Import your new certificate and the signing certificate. This command is unusual because it uses **rootca** for the parameter names of the signer, and Root CA certificates are not usually the signers when a private third-party CA is issuing your certificates.

```
/opt/ibm/ccm/create_security_artifacts.sh -importcert
-rootcacert path_to_CAissuer_certificate
-rootcalabel issuer_certificate_label
-destkdb working_directory/hostname/keyfiles/keyfile.kdb
-importfile path_to_new_signed_certificate
```

- a) Add your new server certificate to the server keystore .kdb file:

```
/opt/ibm/ccm/create_security_artifacts.sh -importcert
-importfile /opt/ibm/ccm/keyfiles/serverhostname/exports/server.crt
-rootcacert /opt/ibm/ccm/keyfiles/serverhostname/exports/signca.crt
-destkdb /opt/ibm/ccm/keyfiles/serverhostname/keyfiles/keyfile.kdb -rootcalabel
"SignerCA"
```

You receive the following message:

```
Certificate import successful.
```

b) Add your new agent certificate to the agent keystore .kdb file:

```
/opt/ibm/ccm/create_security_artifacts.sh -importcert
-importfile /opt/ibm/ccm/keyfiles/serverhostname.agent/exports/agent.crt
-rootcacert /opt/ibm/ccm/keyfiles/serverhostname.agent/exports/signca.crt
-destkdb /opt/ibm/ccm/keyfiles/serverhostname.agent/keyfiles/keyfile.kdb
-rootcalabel "SignerCA"
```

You receive the following message:

```
Certificate import successful.
```

10. Add the agent certificate to the server keystore. The Cloud APM server is configured to accept connections only from clients or agents that authenticate themselves with a known certificate.

```
/opt/ibm/ccm/create_security_artifacts.sh -addkeytodb -destkdb
/opt/ibm/ccm/keyfiles/serverhostname.agent/keyfiles/keyfile.kdb
-importfile /opt/ibm/ccm/keyfiles/serverhostname.agent/exports
/serverhostname.agent.crt -label "APM_Agent_Certificate"
```

11. Add the server certificate to the agent keystore so that the agent is able to authenticate to the server:

```
/opt/ibm/ccm/create_security_artifacts.sh -addkeytodb -destkdb
/opt/ibm/ccm/keyfiles/serverhostname.agent/keyfiles/keyfile.kdb
-importfile /opt/ibm/ccm/keyfiles/serverhostname/exports
/serverhostname.crt -label "APM_Server_Certificate"
```

12. Convert the agent and server keystores from the GSKit format (\*.kdb) to the Java™ keystore format (\*.jks).

Agent example:

```
/opt/ibm/ccm/create_security_artifacts.sh -kdb2jks -sourcekdb
/opt/ibm/ccm/keyfiles/serverhostname.agent/keyfiles/keyfile.kdb
```

The /opt/ibm/ccm/keyfiles/serverhostname.agent/keyfiles/keyfile.jks file is created.

Server example:

```
/opt/ibm/ccm/create_security_artifacts.sh -kdb2jks -sourcekdb
/opt/ibm/ccm/keyfiles/serverhostname/keyfiles/keyfile.kdb
```

The /opt/ibm/ccm/keyfiles/serverhostname/keyfiles/keyfile.jks file is created.

13. Remove the keystore password from the environment:

```
export -n APMPASS
```

14. The keyfiles that are used by the Cloud APM server for agent communication are in the /opt/ibm/wlp/usr/servers/min/resources/security directory. Back up the key.jks file already there and replace it with your new version.

```
cp /opt/ibm/wlp/usr/servers/min/resources/security/key.jks
/opt/ibm/wlp/usr/servers/min/resources/security/key.jks.orig
cp /opt/ibm/ccm/keyfiles/serverhostname/keyfiles/keyfile.jks
/opt/ibm/wlp/usr/servers/min/resources/security/key.jks
```

If you previously added a third-party CA certificate to the key.jks file to forward events that use an SSL connection to your SMTP Server, you must re-add the third-party CA certificate to the new keystore. For instructions, see Event Manager in [Advanced Configuration](#).

15. Encode the (xor) server keystore password:

```
/opt/ibm/wlp/bin/securityUtility encode
```

The next few steps involve user-exit.xml, which is an override file for server.xml.

16. If it is not already in user-exit.xml, move the <ssl> element with the "defaultKeyStore" definition of the keystore from server.xml:

- a) Copy the <keyStore> xml element that contains the "defaultKeyStore" definition of the keystore from *install\_dir/wlp/usr/servers/min/server.xml* to *install\_dir/wlp/usr/servers/min/user-exit.xml*.
  - b) Replace the value of the password attribute in *user-exit.xml* with the newly encoded password from step 15.
  - c) Remove the <keyStore> xml element from the *server.xml* file.
17. Move and configure the <ssl> element that contains the enabledCiphers attribute from *server.xml* to *user-exit.xml*:
- a) Copy the <ssl> xml element with the enabledCiphers attribute from the *install\_dir/wlp/usr/servers/min/server.xml* file to *install\_dir/wlp/usr/servers/min/user-exit.xml*.
  - b) In *user-exit.xml*, add new line `clientAuthentication="true"` after the `enabledCiphers` line.
  - c) Remove the <ssl> xml element from the *server.xml* file.
  - d) If your third-party CA provides only an RSA signature, set `enabledCiphers=""` instead of `enabledCiphers="TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256"` in *user-exit.xml*, since your certificate does not support Elliptical Curve encryption.
18. Update the certificate labels in the Cloud APM server *install\_dir/wlp/usr/servers/min/user-exit.xml* file and edit as shown:

```
serverKeyAlias="APM_Server_Certificate"
clientKeyAlias="APM_Agent_Certificate"
```

If the `serverKeyAlias` and the `clientKeyAlias` key alias entries do not exist in the *user-exit.xml* file, you must add the entries to the <ssl> section after the line with the `enabledCiphers` attribute..

19. Restart the Cloud APM server:

```
apm stop min
```

```
apm start min
```

20. If the Hybrid Gateway is installed in your Tivoli Monitoring environment, copy the JKS agent keystore to the Hybrid Gateway location:

```
/opt/ibm/wlp/usr/servers/hybridgateway/resources/security/
```

21. Complete one of the following steps to install the agent keyfiles, depending on whether you installed agents:

- If you installed agents, reconfigure the existing agents to use the new certificates by following the steps in [“Configuring agents to connect to a different server or to use HTTPS communication” on page 255](#).
- Before you install new agents, use the agent configuration tool to modify the agent images to contain the new certificates.
  - a. To create the configuration packages, use the `/opt/ibm/ccm/make_configuration_packages.sh` tool, including the `-k` parameter to specify the location of agent keystore files. For more information, see step “2” on page 183 in [“Configuring the downloaded images” on page 182](#).
  - b. To configure the agent images, use the `/opt/ibm/ccm/configure_agent_images` script.
  - c. Unpack the resulting agent image and modify the configuration file to show which certificate should be used by the agents:
    - The `KDEBE_KEY_LABEL = agent_key_label` variable must be added to the configuration files in an unpacked agent image:
 

For example, `KDEBE_KEY_LABEL="APM_Agent_Certificate"`.

If your third-party CA provides only an RSA signature, change  
KDEBE\_FIPS\_MODE\_ENABLED=SuiteB-128 to KDEBE\_FIPS\_MODE\_ENABLED=NO.

- On Linux/AIX, modify the variable in the following file:  
*unpacked\_agent\_image\_path/.apm\_config/agent\_global.environment*.  
For example, *APM\_Agent\_Install\_8.1.4.0/.apm\_config/agent\_global.environment*.
- On Windows, modify the variable in the [CMA\_CONFIG\_VARIABLES] section of the following file: *unpacked\_agent\_image\_path\apm\_config\framework\_silent\_install.txt*.
- Compress the unpacked agent installation image.

The agent configuration package that you create with the `make_configuration_packages.sh` script also contains the Windows package with the configuration data and the Windows script.

22. You must configure the Cloud APM server agents to use HTTPS and certificates. See [“Configuring the communications protocol for server agents”](#) on page 1217 for instructions.

## Configuring agents to connect to a different server or to use HTTPS communication

Before you install agents, you must configure the installation package to connect to the Cloud APM server. Agent package configuration is done automatically during server installation or done manually at another time. If you want to change the Cloud APM server that the agents connect to or to connect the agents using HTTP communication, run the **agent2server** script.

### About this task

- The **agent2server** script is run on each managed system that you want to connect to a different Cloud APM server or if you want to use HTTPS communication to connect with the current Cloud APM server.
- The change in server connection affects all agents that are installed on the managed system. For example, if you have the Linux OS agent, IBM Integration Bus agent, and WebSphere MQ agent on the same system, all three agents are reconnected to a different Cloud APM server.
- The script is run with a different option, depending on whether agent communication with the server uses the HTTP or secure HTTPS protocol.
- For HTTPS communications, determine the type of certificates you plan to use. See [“Configuring certificates between the server and agents for HTTPS communication”](#) on page 244 for more details. After you configure the Cloud APM server to use certificates for agent to server communication, you then continue using the instructions in this procedure to reconfigure existing agents to use HTTPS communication and the certificates that you chose to deploy. Before reconfiguring the agents, an extra step is required to copy the agent configuration package from the Cloud APM server to the managed system. The server information in the agent configuration package is used to modify the managed system for the Cloud APM server address and signer certificate.

### Procedure

Take the following steps to change the Cloud APM server connection of all agents that are installed on the managed system to connect to a different Cloud APM server or to use HTTPS communication to connect with the current Cloud APM server:

1. If the managed system uses secure HTTPS communications, copy the agent configuration package from the Cloud APM server to the managed system.

The agent configuration package is the output of the `make_configuration_packages` script, which was run during the server installation. If you want to configure the agent images see ([“Downloading and installing the server”](#) on page 159) or run manually later, see ([“Configuring the downloaded images”](#) on page 182).

If you configured HTTPS communication during the Cloud APM server installation, you must copy the `onprem_config` compressed file from the `install_dir/ccm/agentconfig` directory on the Cloud APM server to a managed system directory, such as `/opt/ibm/apm/newagentconfig/onprem_config.tar` for Linux, AIX, or Solaris or `\IBM\APM\newagentconfig\onprem_config.zip` for Windows.

If you configured HTTPS communication or new certificates after the Cloud APM server installation, you must copy the `onprem_config` compressed file from the configuration package directory that was specified when you ran the `make_configuration_packages.sh` script.

2. On the managed system, change to the `install_dir/bin` directory. Examples:

- **Linux** | **UNIX**

```
cd /opt/ibm/apm/agent/bin
```

- **Windows**

```
cd \IBM\APM\agent\bin
```

3. For nonsecure HTTP communications, run the following command to reconfigure the agents to connect to the specified Cloud APM server. Otherwise, continue to the next step for secure HTTPS communications.

- **Linux** | **UNIX**

```
./agent2server.sh -s host_name
```

- **Windows**

```
agent2server.bat -s host_name
```

where `host_name` is the IP address or fully qualified host name of the system where the Cloud APM server is installed that you want to connect to.

4. For secure HTTPS communications, complete the following steps:

- a) If you are not using the default certificates, you must modify the agent configuration file to show which certificate the agent must use. Modify the `KDEBE_KEY_LABEL=agent_key_label` variable or add it to the configuration file if it does not exist. Replace `agent_key_label` with the label that you entered when you created the agent keystore in [“Configuring a self-signed certificate” on page 246](#) or [“Configuring a Third-Party Root CA custom certificate for HTTPS agent communications” on page 250](#).

If your third-party CA provides only an RSA signature, change the `KDEBE_FIPS_MODE_ENABLED=SuiteB-128` variable to `KDEBE_FIPS_MODE_ENABLED=NO`. The configuration file is platform dependent:

- **Windows** For a 64-bit installation, modify the variable in the `\TMAITM6_x64\KPCENV` file where `PC` is the agent product code. For example, for an agent that is installed in the `C:\IBM\APM` directory, to modify the OS agent configuration on a 64-bit installation, you must change the `C:\IBM\APM\TMAITM6_x64\KNTENV` file.
- **Windows** For a 32-bit installation, modify the variable in the `\TMAITM6\KPCENV` file where `PC` is the agent product code.
- **Linux** | **UNIX** Modify the variable in the `agent_installation_path/config/global.environment` file.

- b) Run the `agent2server` script to reconfigure the agents to use HTTPS communication to the Cloud APM server:

- **Linux** | **UNIX** `./agent2server.sh -f path`

- **Windows** `agent2server.bat -f path`

where *path* is the path to the agent configuration package that you copied to the agent system in step 1.

The following examples specify the full path to the agent configuration packages on Linux and Windows managed systems:

```
Linux agent2server.sh -f /opt/ibm/apm/newagentconfig/onprem_config.tar
```

```
Windows agent2server.bat -f ..\..\newagentconfig\onprem_config.zip
```

5. If you change the agent configuration from using `http` to `https` or vice versa for connecting to the Cloud APM server, perform the following steps to configure the protocol and hostname that the agents use to download configuration files from the Cloud APM server:
  - a) If you are not logged in to the Cloud APM console, log in now. For more information, see [Starting the Cloud APM console](#).
  - b) Click **System Configuration** > **Advanced Configuration** and click **Agent Central Configuration**.
  - c) Ensure that the **Host Name Override** field specifies the same IP address or fully qualified host name that you use to configure the agents when you run the `agent2server.sh` script.
  - d) Ensure that the **Protocol** field specifies the same protocol that you use to configure the agents when you run the `agent2server.sh` script.
  - e) After you click **Save**, the Cloud APM server sends the new central configuration URL to the agents.

**Note:** All agents are configured to use the same Central Configuration URL to download their configuration files from the Cloud APM server when you perform the procedure. It is not possible to configure a subset of the agents to use a different Central Configuration URL.

## Results

The agents are reconfigured to connect to a different Cloud APM server or HTTPS communications are established with the server. If you ran the script for using secure HTTPS communications, the agents are also configured with the signer certificate for the new server. The agents no longer connect to the original server.

## What to do next

You must configure the Cloud APM server agents to use HTTPS and certificates. See [“Configuring the communications protocol for server agents” on page 1217](#) for instructions.

## General procedure for configuring data collectors

To use a data collector to view monitoring data in the Cloud APM console for your applications, you must complete several configuration tasks.

### About this task

This procedure is a roadmap for configuring the monitoring for your applications, which includes both required, conditional, and optional steps. Complete the necessary steps according to your needs.

### Procedure

1. Download and configure the data collector installation images. For instructions, see [“Configuring the downloaded images” on page 182](#).
2. If you are monitoring your IBM Cloud Private Liberty-based applications, see [“Configuring Liberty monitoring” on page 548](#).
3. Configure the data collector to collect monitoring data about IBM Cloud and on-premises applications and send it to the Cloud APM server. Complete one or more of the following tasks according to the type of your application:

## Liberty applications

- [“Configuring the Liberty data collector in on-premises environments \(Liberty V18.\\* and older versions\)” on page 558](#)
- [“Configuring the Liberty data collector in IBM Cloud environment \(Liberty V18.\\* and older versions\)” on page 562](#)

## Node.js applications

- [“Configuring the stand-alone Node.js data collector for IBM Cloud\(formerly Bluemix\) applications” on page 690](#)
- [“Configuring the stand-alone Node.js data collector for on-premises applications” on page 695](#)

## Python applications

- [“Configuring the Python data collector for IBM Cloud applications” on page 765](#)
- [“Configuring the Python data collector for on-premises applications” on page 770](#)

## Ruby applications

- [“Configuring the Ruby data collector for IBM Cloud applications” on page 817](#)

## Java applications

- [“Configuring J2SE monitoring” on page 525](#)
4. If you are an IBM Cloud Public user, after you configure the data collector, you must configure the IBM Cloud Secure Gateway to enable it to connect to the Cloud APM server. For instructions, see [“Configuring the IBM Cloud Secure Gateway” on page 258](#).
  5. If the key file or the Cloud APM server changes, reconnect the data collector to the Cloud APM server. For instructions, see [“Reconnecting the data collector to the Cloud APM server” on page 259](#).

## What to do next

After you complete all necessary configuration tasks, you can verify that the monitoring data for your IBM Cloud application is displayed in the Cloud APM console.

## Configuring the IBM Cloud Secure Gateway

If you are an IBM Cloud Public user and want to connect the data collector to the on-premises Cloud APM server, configure the IBM Cloud Secure Gateway.

## About this task

If the data collector cannot directly connect to the on-premises Cloud APM server, for example, when there is a firewall, you must configure the Secure Gateway.

## Procedure

1. Set up the Secure Gateway. For instructions, see [Getting started with the Secure Gateway](#).

**Important:** The host where you install the Secure Gateway Client must have network connectivity with the your Cloud APM server.

2. Click **Secure Gateway** from the list of services for the application to open the Secure Gateway UI.
3. In the Secure Gateway UI, set the following variables to add a destination:

- a) Set the **Resource Hostname** value to the host name of the Cloud APM server (as seen from your on-premises network).
- b) Set the **Resource Port** to 80.
- c) Set the **Protocol** to HTTP.

When you save the destination, the Secure Gateway assigns and displays a **Cloud Host : Port** value for the destination, which is required in step [“5” on page 259](#).

4. In the IBM Cloud dashboard for the application, click **Environment Variables** > **USER-DEFINED** and add a variable named `APM_BM_GATEWAY_URL`.
5. Set the value of the `APM_BM_GATEWAY_URL` variable to the following format:

```
http://Cloud_Host:Port_value_of_your_destination
```

For example:

```
APM_BM_GATEWAY_URL=http://cap-sg-stage-2.integration.ibmcloud.com:15450
```

6. Start the Secure Gateway client. Check the log file of the client to ensure that there are no error messages that indicate a configuration or communication problem.

## Results

The data collector is connected to the on-premises Cloud APM server.

## Reconnecting the data collector to the Cloud APM server

If the Cloud APM server, key file, or the key file password is changed, you must set several environment variables to reconnect the data collector to the Cloud APM server.

### Before you begin

If the key file is changed, encrypt the plain text password of your key file by using Base64 first. If you are a Linux user, run the following command:

```
echo -n keyfile_password | base64
```

The command output is your encrypted password. For example, if your plain text password is `password`, the command output `cGFzc3dvcmQ=` is your encrypted password. You then use the encrypted password to set `APM_KEYFILE_PSWD`: `encrypted_keyfile_password` and `APM_KEYFILE_PSWD=encrypted_keyfile_password` in the following configurations.

## Procedure

- To reconnect the data collectors to the Cloud APM server for IBM Cloud applications, see [“Reconnecting the data collectors for IBM Cloud applications” on page 259](#).
- To reconnect the data collectors to the Cloud APM server for on-premises, see [“Reconnecting the data collector for on-premises applications” on page 260](#).

## Reconnecting the data collectors for IBM Cloud applications

### About this task

You have the following two options to reconnect the data collector to the Cloud APM server:

- Edit the `manifest.yml` of your application to set the variables.
- Set the variables on the IBM Cloud UI.

## Procedure

- To use the `manifest.yml` file of your IBM Cloud application to reconnect the data collector, complete the following steps:
  - a) Edit the variables in the `manifest.yml` file of your IBM Cloud application according to the changes.
    - To configure the Gateway to use `HTTP`, set the following variable:

```
APM_BM_GATEWAY_URL: http://server_ip_or_hostname:80
```

- To configure the Gateway to use *HTTPS*, set the following three variables:

```
APM_BM_GATEWAY_URL: https://server_ip_or_hostname:443
APM_KEYFILE_PSWD: encrypted_keyfile_password
APM_KEYFILE_URL: http://hosted_http_server:port/keyfile_name
```

**Tip:** The key file for the Liberty data collector is a .jks file. For the Python, Node.js, and Liberty data collectors, the key files are .p12 files.

- b) Change to the directory of your IBM Cloud application, and run the following command:

```
cf push
```

- To use the IBM Cloud UI to reconnect the data collector, complete the following steps:
  - a) Log in to the IBM Cloud UI.
  - b) Click the IBM Cloud application.
  - c) Click **Runtime** on the left panel.
  - d) Switch to the **Environment variable** tab.
  - e) In the **user-defined** section, use one of the following methods to define the variables according to your needs:
    - To configure the Gateway to use *HTTP*, set the following variable:

```
APM_BM_GATEWAY_URL: http://server_ip_or_hostname:80
```

- To configure the Gateway to use *HTTPS*, set the following three variables:

```
APM_BM_GATEWAY_URL: https://server_ip_or_hostname:443
APM_KEYFILE_PSWD: encrypted_keyfile_password
APM_KEYFILE_URL: http://hosted_http_server:port/keyfile_name
```

**Tip:** The key file for the Liberty data collector is a .jks file. For the Python, Node.js, and Liberty data collectors, the key files are .p12 files.

- f) From the directory where you run the **cf push** command to push your application, run the following command for your changes to take effect:

```
cf restage <app_name>
```

## Results

The values of the variables are properly set to connect the data collector to the Cloud APM server.

## Reconnecting the data collector for on-premises applications

### About this task

By modifying the `global.environment` or the `dc.java.properties` file, you can customize the connection between the data collector and the Cloud APM server.

### Procedure

1. Find the corresponding file that contains the connection variables.
  - a) For the Liberty data collector, Node.js data collector, and Python data collector, find the `global.environment` file according to the information in the following table:

| Data collector name    | Directory to the <code>global.environment</code> file  |
|------------------------|--|
| Liberty data collector | The <code>itcamdc/etc/global.environment</code> folder where your Liberty data collector is installed. |
| Node.js data collector | The <code>ibmapm/etc</code> folder where your Node.js data collector is installed.                     |
| Python data collector  | The <code>etc</code> folder where your Python data collector is installed.                             |

- b) For the J2SE data collector, find the `dc.java.properties` file in the `DC_HOME/itcamdc/etc` folder. `DC_HOME` is the directory where your J2SE data collector is installed.
2. Edit the variables in the corresponding file according to the changes.
  - a) For the Liberty data collector, Node.js data collector, and Python data collector, edit the `global.environment` file according to the following instruction:

- To configure the Gateway to use *HTTP*, set the following variable:

```
APM_BM_GATEWAY_URL=http://server_ip_or_hostname:80
```

- To configure the Gateway to use *HTTPS*, set the following variables:

```
APM_BM_GATEWAY_URL=https://server_ip_or_hostname:443
APM_KEYFILE_PSWD=encrypted_keyfile_password
APM_KEYFILE_URL=http://hosted_http_server_:port/keyfile_name
```

**Tip:** The key file for the Liberty data collector is a `.jks` file. For the Python, Node.js, and Liberty data collectors, the key files are `.p12` files.

- b) For the J2SE data collector, edit the `dc.java.properties` file according to the following instruction:
  - To configure the Gateway to use *HTTP*, set the following variable:

```
apm.http.type=http
```

If the value of this variable is left empty, `http` is the default value

- To configure the Gateway to use *HTTPS*, set the following variables:

```
apm.ssl.password=encrypted_keyfile_password
apm.http.type=https
```

**Important:** If the password is changed, replace the `DC_HOME/itcamdc/etc/keyfile.jks` file with the `/opt/ibm/ccm/keyfiles/default.agent/keyfiles/keyfile.jks` file from the Cloud APM server, where `DC_HOME` is the home directory of your J2SE data collector.

3. Optional: If you do not use the default key file for your Node.js data collector, set the following variable:

```
APM_SNI=owner_host_in_the_key_file
```

**Tip:** To find out the value of the *owner host* variable, open the key file that you use and search for `owner`. And then set the `APM_SNI` variable to the same value of *owner*.

4. Restart the application for the change to take effect.

## Results

The values of the variables are properly set to connect the data collector to the Cloud APM server.

## Sample manifest.yml file

Refer to the following lines for the content of the `manifest.yml` file of an IBM Cloud application:

```
applications:
- disk_quota: 1024M
  host: myBluemixApp
  name: myBluemixApp
  path: .
  domain: mybluemix.net

  instances: 1
  memory: 512M

  env:
    KNJ_ENABLE_TT: "true"
    KNJ_SAMPLING: 1
```

**Note:** The `env :` section is required only when you do not use default settings to connect the data collector to the Cloud APM server. Specify the variables that are listed in the `env :` according to your situation. For more information, see [“Reconnecting the data collector to the Cloud APM server” on page 259](#).

## Removing data collectors from Cloud APM console

After you unconfigure a data collector, you should also remove the data collector from the applications and from the resource groups that it was added to. Otherwise, the Cloud APM console will show that no data is available for the application and will not indicate that the data collector is offline.

### Procedure

1. Remove the data collector from any applications that you added it to by manually editing the applications.  
It is similar to removing offline agents from your application, see [“Viewing and removing offline agents” on page 1275](#).
2. Remove the data collector from any custom resource groups that you added it to.  
For more information, see [“Resource Group Manager” on page 1114](#).
3. On the Cloud APM server, complete the following steps:
  - a) Edit the `install_dir/serveragents/config/hostname_bi.cfg` file to remove the lines for the data collector that has been unconfigured.
  - b) Restart the server component for data collectors by running the following command as root user:

```
apm restart biagent
```

### Results

After a few minutes, the Cloud APM console will indicate that the data collector is offline in the **My Components** application and in the **Resource Group Manager** UI when you select the system resource group for the data collector.

After the interval specified by the **Remove Offline System Delay** configuration property in the **Advanced Configuration** page, the data collector will automatically be removed from **My Components** and from its system resource group.

**Tip:** You can adjust the **Remove Offline System Delay** setting in the **Advanced Configuration** page to increase or decrease the wait time before the offline agent is removed from view. For more information, see [“Agent Subscription Facility” on page 1242](#).

**Remember:** If the data collector provided transaction tracking data to the Cloud APM server, the Cloud APM console might continue to display the data collector in the **My Components** application and display the message of The agent is invalid for the data collector after the time period specified by the

**Remove Offline System Delay** setting has expired. If you have installed Cloud APM 8.1.4.0 Server Interim Fix 3 or later, an invalid data collector will eventually be removed from the **My Components** application 8 days after transaction tracking data stops being received from the data collector.

## Configuring Amazon EC2 monitoring

The Amazon EC2 agent provides you with a central point of monitoring for the health, availability, and performance of your Amazon Elastic Compute Cloud (EC2) Instances. The agent displays a comprehensive set of metrics to help you make informed decisions about your EC2 environment. These metrics include CPU usage, Elastic Block Store (EBS) usage, network usage, Amazon Web Services (AWS) maintenance updates, and disk performance.

### Before you begin

- Read the entire [“Configuring Amazon EC2 monitoring” on page 263](#) topic to determine what is needed to complete the configuration.
- The product version and the agent version often differ. The directions here are for the most current release of this agent. To access the documentation for earlier agent releases, see the [Table 30 on page 263](#) table.

| Table 30. Agent versions           |                                 |
|------------------------------------|---------------------------------|
| Agent version                      | Documentation                   |
| 8.1.3.1, 8.1.3.2, 8.1.3.3, 8.1.3.4 | <a href="#">Cloud APM 8.1.4</a> |

- Make sure that the system requirements for the Amazon EC2 agent are met in your environment. For the up-to-date system requirement information, see the [Software Product Compatibility Reports \(SPCR\) for the Amazon EC2 agent](#).
- Ensure that the following information is available:
  - A list of the AWS region names that contain EC2 instances to monitor.
  - The AWS security credentials (Access Key ID and Secret Access Key) with permission to access each AWS region.
- Ensure that the AWS security credentials that are used for each AWS region are a member of a group that includes at least the *AmazonEC2ReadOnlyAccess* policy.

### About this task

The Amazon EC2 agent is both a multiple instance agent and also a subnode agent. You can create one agent instance with multiple subnodes – one for each Amazon EC2 region, or you can create an agent instance for each Amazon EC2 region with one subnode for that region. Or you can create a combination of each type of configuration. After you configure agent instances, you must start each agent instance manually. If you have more than 50 resources per Amazon EC2 region, it is suggested that you create an agent instance per region or use tagging on your EC2 instances and filter agent instances by the tags you create by using the agent's [filtering condition parameter](#).

### Procedure

1. Configure the agent on Windows systems with the **IBM Performance Management** window or the silent response file.
  - [“Configuring the agent on Windows systems” on page 264](#).
  - [“Configuring the agent by using the silent response file” on page 268](#).
2. Configure the agent on Linux systems with the script that prompts for responses or the silent response file.
  - [“Configuring the agent by responding to prompts” on page 267](#).

- [“Configuring the agent by using the silent response file” on page 268.](#)

## What to do next

In the Cloud APM console, go to your Application Performance Dashboard to view the data that was collected. For more information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109.](#)

If you are unable to view the data in the agent dashboards, first check the server connection logs and then the data provider logs. The default paths to these logs are listed here:

- **Linux** /opt/ibm/apm/agent/logs
- **Windows** C:\IBM\APM\TMAITM6\_x64\logs

For help with troubleshooting, see the [Cloud Application Performance Management Forum.](#)

## Configuring the agent on Windows systems

You can configure the Amazon EC2 agent on Windows operating systems by using the IBM Cloud Application Performance Management window. After you update the configuration values, you must start the agent to save the updated values.

### Procedure

1. Click **Start > All Programs > IBM Monitoring agents > IBM Cloud Application Performance Management.**
2. In the **IBM Performance Management** window, right-click the **Monitoring Agent for Amazon EC2** template, and then click **Configure agent.**

**Remember:** After you configure an agent instance for the first time, the **Configure agent** option is disabled. To configure the agent instance again, right-click on it and then click **Reconfigure.**

3. Enter a unique instance name then click **OK.** Use only Latin letters, Arabic numerals, and the hyphen-minus character in the instance name. Example, ec2-inst3.

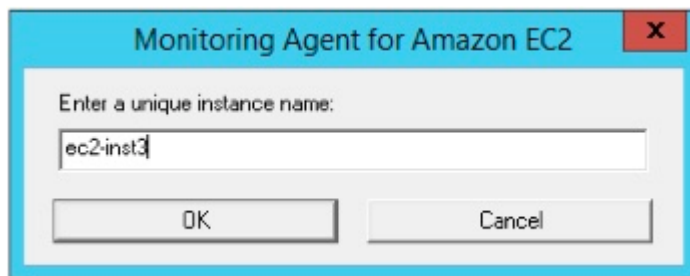

Figure 3. The window to enter a unique instance name.

4. Click **Next** on the agent instance name window.

The image shows a Windows-style application window titled "Monitoring Agent for Amazon EC2". The window has a blue title bar with standard minimize, maximize, and close buttons. The main content area is divided into two panes. The left pane, titled "Instance Name", contains a list of instance names, with "Amazon EC2 Region Configuration" highlighted at the bottom. The right pane, titled "The name of the instance.", contains a text input field labeled "\* Instance Name" with the value "ec2-inst3" entered. At the bottom right of the window, there are four buttons: "Back", "Next", "OK", and "Cancel".

Figure 4. The agent instance name window.

5. Enter the **Amazon EC2 Region Configuration** instance template settings.

**Note:** This section is not the Amazon EC2 region instance configuration. It is a template section for settings that are used as the default values when you add the actual Amazon EC2 region instance configurations in [step 6](#).

See [Table 31 on page 269](#) for an explanation of each of the configuration parameters.

**Monitoring Agent for Amazon EC2**

**Instance Name**

**Amazon EC2 Region Configuration**

The configuration that is required to monitor Amazon EC2 instances remotely. Instances will be automatically discovered in the specified region that you want to configure.

**EC2 Connection Information** New...

\* Access ID ? AKIAIOSFODNN7EXAMPLE

\* Secret Key ? MDENG/bPxRfiCYEXAMPLEKEY

\* Region (For example: 'us-west-2') ? us-west-2

Figure 5. The window to specify Amazon EC2 region instance template settings.

6. Press **New** and enter Amazon EC2 region instance settings, then click **Next**.  
See [Table 31 on page 269](#) for an explanation of each of the configuration parameters.

Figure 6. The window to specify Amazon EC2 region instance settings.

7. Click **OK** to complete the configuration.
8. In the IBM Cloud Application Performance Management window, right-click the instance that you configured, and then click **Start**.

## Configuring the agent by responding to prompts

After installation of the Amazon EC2 agent, you must configure it before you start the agent. If the Amazon EC2 agent is installed on a local Linux computer, you can follow these instructions to configure it interactively through command line prompts.

### About this task

**Remember:** If you are reconfiguring a configured agent instance, the value that is set in the last configuration is displayed for each setting. If you want to clear an existing value, press the space key when the setting is displayed.

### Procedure

Follow these steps to configure the Amazon EC2 agent by running a script and responding to prompts.

1. Run the following command:

```
install_dir/bin/amazonec2-agent.sh config instance_name
```

where *install\_dir* is the path where the agent is installed and *instance\_name* is the name that you want to give to the agent instance.

Example

```
/opt/ibm/apm/agent/bin/amazonec2-agent.sh config ec2-inst3
```

2. Respond to the prompts to set configuration values for the agent.

See [“Configuration parameters for the Amazon EC2 agent” on page 269](#) for an explanation of each of the configuration parameters.

3. Run the following command to start the agent:

```
install_dir/bin/amazonec2-agent.sh start instance_name
```

where *install\_dir* is the path where the agent is installed and *instance\_name* is the name of the agent instance.

Example

```
/opt/ibm/apm/agent/bin/amazonec2-agent.sh start ec2-inst3
```

## Configuring the agent by using the silent response file

The silent response file contains the agent configuration parameters. You can edit the silent response file to modify the values of these parameters, and run the configuration script to create an instance and update the agent configuration values. This mode of configuration is called the silent mode.

### About this task

The silent response file contains the agent configuration parameters with default values that are defined for some parameters. You can edit the silent response file to specify different values for the configuration parameters.

After you update the configuration values in the silent response file, you must run the configuration script to configure the agent with these updated values.

### Procedure

- Configure the Amazon EC2 agent in the silent mode:
  - a) Open the amazonec2\_silent\_config.txt file at one of the following paths in a text editor.
    - **Linux** `install_dir/samples/amazonec2_silent_config.txt`  
Example, `/opt/ibm/apm/agent/samples/amazonec2_silent_config.txt`
    - **Windows** `install_dir\samples\amazonec2_silent_config.txt`  
Example, `C:\IBM\APM\samples\amazonec2_silent_config.txt`where *install\_dir* is the path where the agent is installed.
  - b) In the amazonec2\_silent\_config.txt file, specify values for all mandatory parameters and modify the default values of other parameters as needed.  
  
See [“Configuration parameters for the Amazon EC2 agent” on page 269](#) for an explanation of each of the configuration parameters.
  - c) Save and close the amazonec2\_silent\_config.txt file, and run the following command:
    - **Linux** `install_dir/bin/amazonec2-agent.sh config instance_name install_dir/samples/amazonec2_silent_config.txt`  
Example, `/opt/ibm/apm/agent/bin/amazonec2-agent.sh config ec2-inst3 /opt/ibm/apm/agent/samples/amazonec2_silent_config.txt`
    - **Windows** `install_dir\bin\amazonec2-agent.bat config instance_name install_dir\samples\amazonec2_silent_config.txt`

Example, **C:\IBM\APM\bin\amazonec2-agent.bat config ec2-inst3 C:\IBM\APM\samples\amazonec2\_silent\_config.txt**

where *install\_dir* is the path where the agent is installed and *instance\_name* is the name that you want to give to the agent instance.

**Important:** Ensure that you include the absolute path to the silent response file. Otherwise, the agent data is not shown in the dashboards.

d) Run the following command to start the agent:

- **Linux** `install_dir/bin/amazonec2-agent.sh start instance_name`  
Example, `/opt/ibm/apm/agent/bin/amazonec2-agent.sh start ec2-inst3`
- **Windows** `install_dir\bin\amazonec2-agent.bat start instance_name`  
Example, `C:\IBM\APM\bin\amazonec2-agent.bat start ec2-inst3`

where *install\_dir* is the path where the agent is installed and *instance\_name* is the name of the agent instance.

## Configuration parameters for the Amazon EC2 agent

The configuration parameters for the Amazon EC2 agent are displayed in a table.

1. [Amazon EC2 Region Configuration](#) - Settings to monitor Amazon EC2 instances remotely. Instances are automatically discovered in the specified region that you want to configure.

| Table 31. Amazon EC2 Region Configuration |   |   |
|---|---|---|
| Parameter name                            | Description   | Silent configuration file parameter name  |
| EC2 Subnode Name                          | <p>Name of the EC2 Subnode for collection of data. Example, <i>usw2a</i>.</p> <p>This alias is part of the managed system name (MSN) and it is used to visually identify the monitored environment in the Cloud APM console.</p> <p><b>Note:</b> This alias can be anything that you choose to represent the Amazon EC2 subnode instance with the following restrictions. Letters from the Latin alphabet (a-z, A-Z), Arabic numerals (0-9), the hyphen-minus character (-), and the underscore character (_) can be used to create agent subnode instance names. The maximum length of an EC2 subnode name is 25 characters.</p> | Each of the following parameters must have an agent subnode name suffix that is the same for each parameter of an agent subnode instance. New agent subnode instances must use a unique name for its set of parameters. For example, one agent subnode instance can use <i>.usw2a</i> and another agent subnode instance can use <i>.usw2b</i> in place of <i>.subnode_name</i> in the parameter names that follow. |
| Access ID                                 | AWS security credentials Access Key ID that is used to authenticate with the specified Amazon Region. For example, 'AKIAxxxxxxxxxxxxxxxx'.  | <b>KB5_INS_ACCESS_ID.subnode_name</b>   |
| Secret Key                                | AWS security credentials Secret Access Key that is used to authenticate with the specified Amazon Region. For example, 'kK7txxxxxxxxxxxxxxxxxxxxxxxx'.  | <b>KB5_INS_SECRET_KEY.subnode_name</b>  |
| Region                                    | AWS Region to monitor. For example, 'us-west-2'.  | <b>KB5_INS_REGION.subnode_name</b>  |

Table 31. Amazon EC2 Region Configuration (continued)

| Parameter name      | Description   | Silent configuration file parameter name   |
|---------------------|---|--|
| Filtering Condition | <p>The type of filtering that is being done.</p> <p>You can use custom tags on EC2 instances to limit which EC2 instances are monitored by the agent. For more information, see <a href="#">Tagging Your Amazon EC2 Resources</a>.</p> <p>Filtering options,</p> <p><b>none</b><br/>All EC2 instances within the region are monitored. <b>Filter Value</b> is ignored.</p> <p><b>tagName</b><br/>EC2 instances with the tag key that is specified in <b>Filter Value</b> are monitored, regardless of the actual value in the corresponding EC2 instance tag value. For example, to monitor all EC2 instances that have the tag key <i>Stack</i>, regardless of the value in its tag value, specify <i>Stack</i> in <b>Filter Value</b>.</p> <p><b>tagName tagValue</b><br/>EC2 instances with the tag key and tag value pair that is separated with a vertical bar ( ), and that is specified in <b>Filter Value</b> are monitored. For example, to monitor all EC2 instances that have the tag key <i>Stack</i> and the tag value <i>Production</i>, specify <i>Stack Production</i> in <b>Filter Value</b>.</p> <p><b>monitoring-tag</b><br/>EC2 instances that have at least one tag are monitored. <b>Filter Value</b> is ignored.</p> | <p><b>FILTER_CONDITION.subnode_name</b></p> <p>Valid values,</p> <p><b>none</b><br/>none</p> <p><b>tagName</b><br/>tagName</p> <p><b>tagName tagValue</b><br/>tagName tagValue</p> <p><b>monitoring-tag</b><br/>monitoring-tag</p> |
| Filter Value        | <p>The value of the tag by which the EC2 instances are filtered when either tagName or tagName   tagValue are selected for <b>Filtering Condition</b>.</p>  | <p><b>FILTER_VALUE.subnode_name</b></p>  |

## Configuring AWS Elastic Load Balancer monitoring

The Amazon ELB agent provides you with a central point of monitoring for the health, availability, and performance of your AWS Elastic Load Balancers. The agent displays a comprehensive set of metrics for each load balancer type-application, network and classic-to help you make informed decisions about your AWS Elastic Load Balancer environment.

### Before you begin

- Read the entire [“Configuring AWS Elastic Load Balancer monitoring” on page 270](#) topic to determine what is needed to complete the configuration.

- The product version and the agent version often differ. The directions here are for the most current release of this agent. To access the documentation for earlier agent releases, see [Table 32 on page 271](#).

| Table 32. Agent versions |                                 |
|--------------------------|---------------------------------|
| Agent version            | Documentation                   |
| 1.0.0.0, 1.0.0.1         | <a href="#">Cloud APM 8.1.4</a> |

- Make sure that the system requirements for the Amazon ELB agent are met in your environment. For the up-to-date system requirement information, see the [Software Product Compatibility Reports \(SPCR\)](#) for the Amazon ELB agent.
- Ensure that the following information is available:
  - The AWS security credentials (Access Key ID and Secret Access Key) with permission to access each AWS region with Elastic Load Balancers.

## About this task

The Amazon ELB agent is both a multiple instance agent and also a subnode agent. The subnodes are created automatically for each type of Elastic Load Balancer that is available in your AWS environment.

## Procedure

1. Configure the agent on Windows systems with the **IBM Performance Management** window or the silent response file.
  - [“Configuring the agent on Windows systems” on page 271](#).
  - [“Configuring the agent by using the silent response file” on page 274](#).
2. Configure the agent on Linux systems with the script that prompts for responses or the silent response file.
  - [“Configuring the agent by responding to prompts” on page 273](#).
  - [“Configuring the agent by using the silent response file” on page 274](#).

## What to do next

In the Cloud APM console, go to your Application Performance Dashboard to view the data that was collected. For more information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

If you are unable to view the data in the agent dashboards, first check the server connection logs and then the data provider logs. The default paths to these logs are listed here:

- **Linux** /opt/ibm/apm/agent/logs
- **Windows** C:\IBM\APM\TMAITM6\_x64\logs

For help with troubleshooting, see the [Cloud Application Performance Management Forum](#).

## Configuring the agent on Windows systems

You can configure the Amazon ELB agent on Windows operating systems by using the IBM Cloud Application Performance Management window. After you update the configuration values, you must start the agent to save the updated values.

## Procedure

1. Click **Start > All Programs > IBM Monitoring agents > IBM Cloud Application Performance Management**.

2. In the **IBM Performance Management** window, right-click the **Monitoring Agent for AWS Elastic Load Balancer** template, and then click **Configure agent**.

**Remember:** After you configure an agent instance for the first time, the **Configure agent** option is disabled. To configure the agent instance again, right-click on it and then click **Reconfigure**.

3. Enter a unique instance name then click **OK**. Use only Latin letters, Arabic numerals, and the hyphen-minus character in the instance name. Example, `elb-inst3`. For more information, see [instancename](#) under “Common MSN format for multi-instance agents” on page 227.

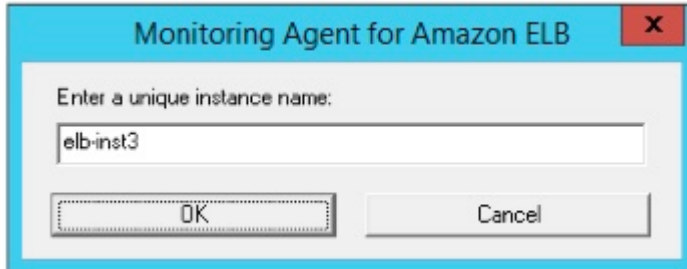

A dialog box titled "Monitoring Agent for Amazon ELB" with a red close button. It contains a text input field with the label "Enter a unique instance name:" and the text "elb-inst3". Below the input field are two buttons: "OK" and "Cancel".

Figure 7. The window to enter a unique agent instance name.

4. Enter the **Amazon ELB Subscription Credentials**, then click **Next**.

See “Configuration parameters for the Amazon ELB agent” on page 275 for an explanation of each of the configuration parameters.

**Important:** **Windows** If your **Secret Key/Password** contains an equal sign (=), you must reenter it each time that you reconfigure the agent.

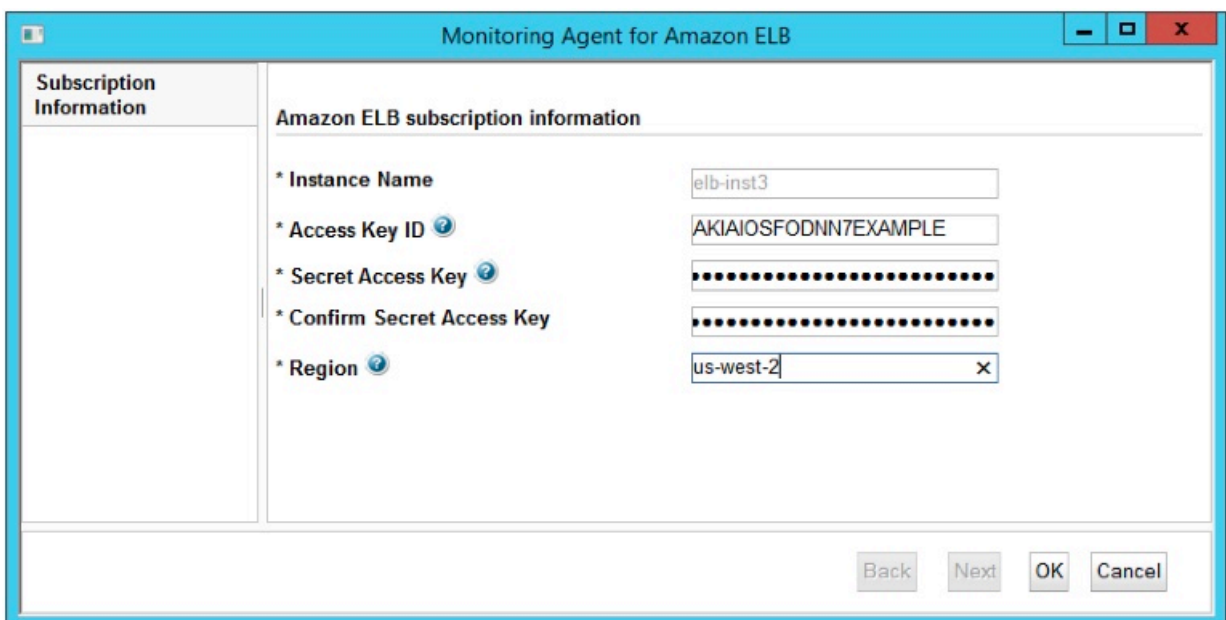

A window titled "Monitoring Agent for Amazon ELB" with a blue header bar. It has a sidebar on the left with "Subscription Information" selected. The main area is titled "Amazon ELB subscription information" and contains five fields: "Instance Name" (elb-inst3), "Access Key ID" (AKIAIOSFODNN7EXAMPLE), "Secret Access Key" (masked with dots), "Confirm Secret Access Key" (masked with dots), and "Region" (us-west-2). At the bottom are four buttons: "Back", "Next", "OK", and "Cancel".

Figure 8. The Amazon ELB subscription credentials window.

5. Click **OK** to complete the configuration.
6. In the IBM Cloud Application Performance Management window, right-click the instance that you configured, and then click **Start**.

## Configuring the agent by responding to prompts

After installation of the Amazon ELB agent, you must configure it before you start the agent. If the Amazon ELB agent is installed on a local Linux computer, you can follow these instructions to configure it interactively through command line prompts.

### About this task

**Remember:** If you are reconfiguring a configured agent instance, the value that is set in the last configuration is displayed for each setting. If you want to clear an existing value, press the space key when the setting is displayed.

### Procedure

Follow these steps to configure the Amazon ELB agent by running a script and responding to prompts.

1. Run the following command:

```
install_dir/bin/amazon_elb-agent.sh config instance-name
```

Where *install\_dir* is the path where the agent is installed and *instance-name* is the name that you want to give to the agent instance. Use only Latin letters, Arabic numerals, and the hyphen-minus character in the *instance-name*. For more information, see [instancename](#) under “Common MSN format for multi-instance agents” on page 227.

Example

```
/opt/ibm/apm/agent/bin/amazon_elb-agent.sh config elb-inst3
```

2. Respond to the prompts to set configuration values for the agent.

See “Configuration parameters for the Amazon ELB agent” on page 275 for an explanation of each of the configuration parameters.

3. Run the following command to start the agent:

```
install_dir/bin/amazon_elb-agent.sh start instance-name
```

Where *install\_dir* is the path where the agent is installed and *instance-name* is the name of the agent instance.

Example

```
/opt/ibm/apm/agent/bin/amazon_elb-agent.sh start elb-inst3
```

### Example

Creating an agent instance that is named elb-inst3.

```
# ./amazon_elb-agent.sh config elb-inst3
Configuring Monitoring Agent for Amazon ELB

Edit 'Monitoring Agent for Amazon ELB' settings? [ 1=Yes, 2=No ] (default is: 1): 1

Subscription Information :
Amazon ELB subscription information

The access ID that is used to authenticate with the specified Amazon Region.
For example, 'AKIAxxxxxxxxxxxxxxxx'.
Access Key ID (default is: ): AKIAIOSFODNN7EXAMPLE

The secret access key that is used to authenticate with the specified Amazon
Region. For example, 'kK7txxxxxxxxxxxxxxxxxxxxxxxxxxxx'.
Enter Secret Access Key (default is: ): hidden

Re-type : Secret Access Key (default is: ): hidden

The Amazon region where the load balancers are located. For example, 'us-west-2'.
```

```
Region (default is: ): us-west-2
```

```
Configuration completed successfully.  
Automatic start at system initialization has been configured.  
Automatic stop at system shutdown has been configured.
```

## Configuring the agent by using the silent response file

The silent response file contains the agent configuration parameters. You can edit the silent response file to modify the values of these parameters, and run the configuration script to create an instance and update the agent configuration values. This mode of configuration is called the silent mode.

### About this task

The silent response file contains the agent configuration parameters with default values that are defined for some parameters. You can edit the silent response file to specify different values for the configuration parameters.

After you update the configuration values in the silent response file, you must run the configuration script to configure the agent with these updated values.

### Procedure

Follow these steps to configure the Amazon ELB agent in the silent mode.

1. Open the `amazon_elb_silent_config.txt` file at one of the following paths in a text editor.

- **Linux** `install_dir/samples/amazon_elb_silent_config.txt`  
Example, `/opt/ibm/apm/agent/samples/amazon_elb_silent_config.txt`
- **Windows** `install_dir\samples\amazon_elb_silent_config.txt`  
Example, `C:\IBM\APM\samples\amazon_elb_silent_config.txt`

Where `install_dir` is the path where the agent is installed.

2. In the `amazon_elb_silent_config.txt` file, specify values for all mandatory parameters and modify the default values of other parameters as needed.

See “[Configuration parameters for the Amazon ELB agent](#)” on page 275 for an explanation of each of the configuration parameters.

3. Save and close the `amazon_elb_silent_config.txt` file, and run the following command:

- **Linux** `install_dir/bin/amazon_elb-agent.sh config instance-name install_dir/samples/amazon_elb_silent_config.txt`  
Example, `/opt/ibm/apm/agent/bin/amazon_elb-agent.sh config elb-inst3 /opt/ibm/apm/agent/samples/amazon_elb_silent_config.txt`
- **Windows** `install_dir\bin\amazon_elb-agent.bat config instance-name install_dir\samples\amazon_elb_silent_config.txt`  
Example, `C:\IBM\APM\bin\amazon_elb-agent.bat config elb-inst3 C:\IBM\APM\samples\amazon_elb_silent_config.txt`

Where `install_dir` is the path where the agent is installed and `instance-name` is the name that you want to give to the agent instance. Use only Latin letters, Arabic numerals, and the hyphen-minus character in the `instance-name`. For more information, see [instancename](#) under “[Common MSN format for multi-instance agents](#)” on page 227.

**Important:** Ensure that you include the absolute path to the silent response file. Otherwise, the agent data is not shown in the dashboards.

4. Run the following command to start the agent:

- **Linux** `install_dir/bin/amazon_elb-agent.sh start instance-name`

Example, **/opt/ibm/apm/agent/bin/amazon\_elb-agent.sh start elb-inst3**

- **Windows** `install_dir\bin\amazon_elb-agent.bat start instance-name`

Example, **C:\IBM\APM\bin\amazon\_elb-agent.bat start elb-inst3**

Where `install_dir` is the path where the agent is installed and `instance-name` is the name of the agent instance.

## Example

Edited `amazon_elb_silent_config.txt`.

```
#
# This is a sample configuration response file for agent Amazon ELB.
#
# It contains an entry for every configuration property.
# Entries for optional properties that have no default value are included
# in comments.
# Ensure that all uncommented properties have a value before configuring
# the agent.
#

# Access Key ID: The access ID that is used to authenticate with the
# specified Amazon Region. For example, 'AKIAxxxxxxxxxxxxxx'.
KAL_ACCESS_KEY_ID=AKIAIOSFODNN7EXAMPLE

# Secret Access Key: The secret access key that is used to authenticate with
# the specified Amazon Region. For example, 'kK7txxxxxxxxxxxxxxxxxxxxxx'.
KAL_SECRET_ACCESS_KEY_PASSWORD=wJalrXUtnFEMI/K7MDENG/bPxrFiCYEXAMPLEKEY

# Region: The Amazon region where the load balancers are located. For
# example, 'us-west-2'.
KAL_REGION=us-west-2
```

## Configuration parameters for the Amazon ELB agent

The configuration parameters for the Amazon ELB agent are displayed in a table.

1. [Table 33 on page 275](#) - Credentials that are required for access to the Amazon Subscription that contains the AWS Elastic Load Balancers to monitor.

| Table 33. Subscription information |   |  |
|------------------------------------|---|--|
| Parameter name                     | Description   | Silent configuration file parameter name |
| Access Key ID                      | The access ID that is used to authenticate with the specified Amazon Region. For example, 'AKIAxxxxxxxxxxxxxx'.                 | KAL_ACCESS_KEY_ID                        |
| Secret Access Key                  | The secret access key that is used to authenticate with the specified Amazon Region. For example, 'kK7txxxxxxxxxxxxxxxxxxxxxx'. | KAL_SECRET_ACCESS_KEY_PASSWORD           |
| Region                             | The Amazon region where the load balancers are located. For example, 'us-west-2'.   | KAL_REGION                               |

## Configuring Azure Compute monitoring

The Azure Compute agent provides you with a central point of monitoring for the health, availability, and performance of your Azure Compute instances. The agent displays a comprehensive set of metrics to help

you make informed decisions about your Azure Compute environment. These metrics include CPU usage, network usage, and disk performance.

## Before you begin

- Read the entire [“Configuring Azure Compute monitoring” on page 275](#) topic to determine what is needed to complete the configuration.
- The product version and the agent version often differ. The directions here are for the most current release of this agent. To access the documentation for earlier agent releases, see [Table 34 on page 276](#).

| Table 34. Agent versions |                                 |
|--------------------------|---------------------------------|
| Agent version            | Documentation                   |
| 1.0.0.0                  | <a href="#">Cloud APM 8.1.4</a> |

- Make sure that the system requirements for the Azure Compute agent are met in your environment. For the up-to-date system requirement information, see the [Software Product Compatibility Reports \(SPCR\) for the Azure Compute agent](#).
- Ensure that the following information is available:
  - The Azure Subscription Credentials with permission to access the Azure Compute instances to monitor. See [“Azure Compute Configuration Information” on page 277](#) for more details.

## About this task

The Azure Compute agent is both a multiple instance agent and also a subnode agent. Each Azure Compute agent subnode monitors a grouping of Azure Compute virtual machines according to a filter you define. You can create one agent instance with multiple subnodes – one for each virtual machine grouping, or you can create an agent instance for each virtual machine grouping with one subnode for that grouping. Or you can create a combination of each type of configuration. After you configure agent instances, you must start each agent instance manually. It is suggested that you have no more than 50 resources per Azure Compute virtual machine grouping. Each Azure Compute agent subnode name must be unique within your environment.

## Procedure

1. Configure the agent on Windows systems with the **IBM Performance Management** window or the silent response file.
  - [“Configuring the agent on Windows systems” on page 277](#).
  - [“Configuring the agent by using the silent response file” on page 282](#).
2. Configure the agent on Linux systems with the script that prompts for responses or the silent response file.
  - [“Configuring the agent by responding to prompts” on page 280](#).
  - [“Configuring the agent by using the silent response file” on page 282](#).

## What to do next

In the Cloud APM console, go to your Application Performance Dashboard to view the data that was collected. For more information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

If you are unable to view the data in the agent dashboards, first check the server connection logs and then the data provider logs. The default paths to these logs are listed here:

- **Linux** /opt/ibm/apm/agent/logs
- **Windows** C:\IBM\APM\TMAITM6\_x64\logs

For help with troubleshooting, see the [Cloud Application Performance Management Forum](#).

## Azure Compute Configuration Information

The Azure Compute agent requires the some additional setup in the Azure Compute environment.

### About this task

To run these steps, you must login to the [Microsoft Azure console](#).

### Procedure

1. Subscription ID
  - On the left pane, select "Subscriptions" and chose the subscription you want to use for this agent.
  - Select "Overview", then copy the Subscription ID. This will be used as one of the Agent's configuration parameters.
2. Tenant ID
  - Navigate to "Azure Active Directory".
  - Select "Properties", then copy the Tenant ID.
3. Register an Application
  - Go to "All services" and search for "App registrations".
  - Click "New Application Registration".
  - Fill out a name, select Application Type "Web App/API", and a sign-on URL (this URL will not be used so chose whatever you'd like).
  - Click "Create"
  - Copy the Application ID - This will be used in the Agent's "Client ID" field.
4. Create Application Key
  - Click on the App you just created, then go to "Settings" followed by "Keys".
  - Enter a description (e.g., "IBM Key") and duration (e.g., "Never Expires"), then click "Save".
  - Copy the Secret Key and store it somewhere safe - you will only see this key one time and will need to generate a new one if you lose it.
5. Give the Application Permissions
  - Go to "Subscriptions" and select the subscription to be monitored.
  - Go to "Access Control (IAM) and click "Add".
  - Select "Reader" role or higher for monitoring.
  - Under "Select", find the App you just registered and select it, then click "Save".

## Configuring the agent on Windows systems

You can configure the Azure Compute agent on Windows operating systems by using the IBM Cloud Application Performance Management window. After you update the configuration values, you must start the agent to save the updated values.

### Procedure

1. Click **Start > All Programs > IBM Monitoring agents > IBM Cloud Application Performance Management**.
2. In the **IBM Performance Management** window, right-click the **Monitoring Agent for Azure Compute** template, and then click **Configure agent**.

**Remember:** After you configure an agent instance for the first time, the **Configure agent** option is disabled. To configure the agent instance again, right-click on it and then click **Reconfigure**.

3. Enter a unique instance name then click **OK**. Use only Latin letters, Arabic numerals, and the hyphen-minus character in the instance name. Example, azc-inst3. For more information, see [instancename](#) under “Common MSN format for multi-instance agents” on page 227.

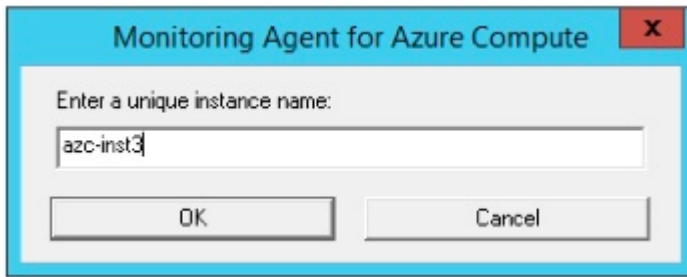

A small dialog box titled "Monitoring Agent for Azure Compute" with a red close button. It contains a label "Enter a unique instance name:" and a text input field with "azc-inst3" entered. Below the input field are "OK" and "Cancel" buttons.

Figure 9. The window to enter a unique agent instance name.

4. Enter the **Azure Subscription Credentials**, then click **Next**.  
See [Table 35](#) on page 284 for an explanation of each of the configuration parameters.

**Important:** Windows If your **Secret Key/Password** contains an equal sign (=), you must reenter it each time that you reconfigure the agent.

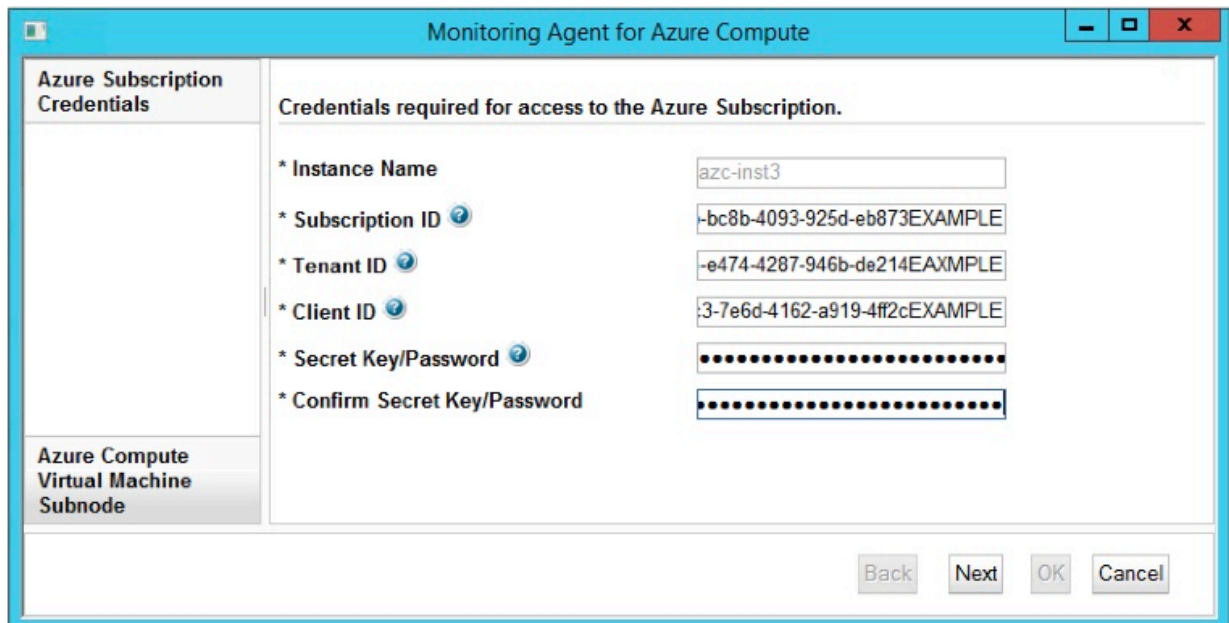

A window titled "Monitoring Agent for Azure Compute" with a sidebar on the left. The sidebar has two items: "Azure Subscription Credentials" (selected) and "Azure Compute Virtual Machine Subnode". The main area is titled "Credentials required for access to the Azure Subscription." and contains six fields: "\* Instance Name" (azc-inst3), "\* Subscription ID" (-bc8b-4093-925d-eb873EXAMPLE), "\* Tenant ID" (-e474-4287-946b-de214EXAMPLE), "\* Client ID" (-3-7e6d-4162-a919-4f2cEXAMPLE), "\* Secret Key/Password" (masked with dots), and "\* Confirm Secret Key/Password" (masked with dots). At the bottom right are "Back", "Next", "OK", and "Cancel" buttons.

Figure 10. The Azure subscription credentials window.

5. Enter the **Azure Compute Virtual Machine Subnode** template settings.  
See [Table 36](#) on page 285 for an explanation of each of the configuration parameters.

**Note:** This section is not the Azure Compute Virtual Machine Subnode instance configuration. It is a template section for setting what is used as the default values when you add the actual Azure Compute Virtual Machine Subnode instance configurations in [step 6](#).

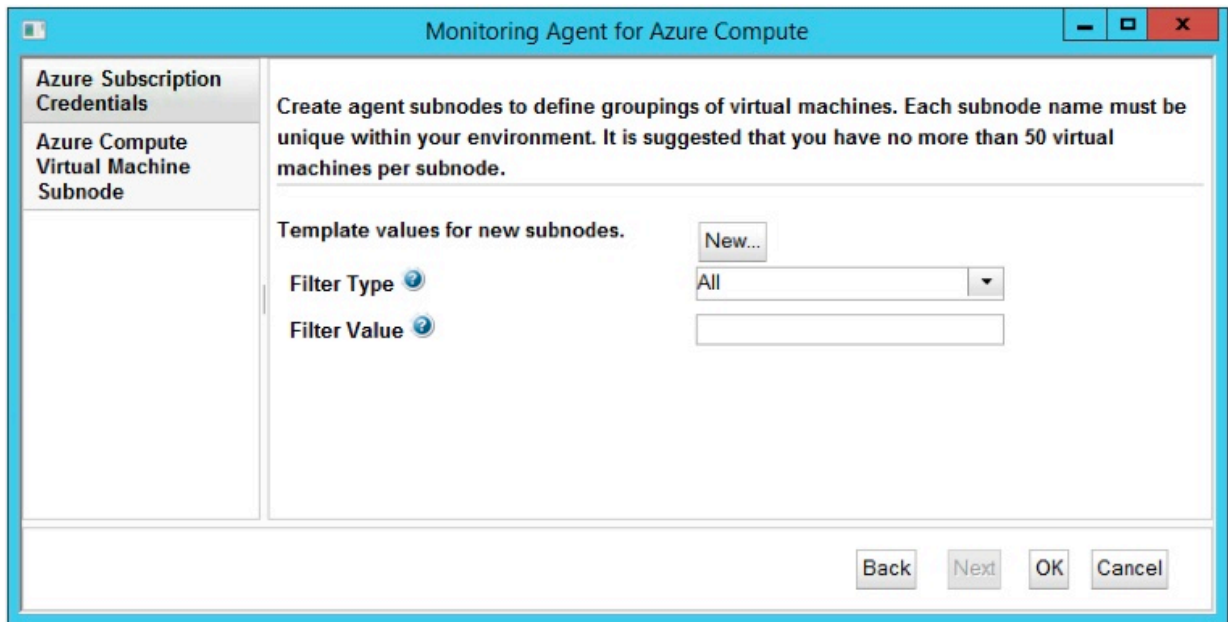

Figure 11. The window to specify Azure Compute virtual machine subnode template settings.

6. Press **New** and enter **Azure Compute Virtual Machine Subnode** instance settings, then click **Next**. See [Table 36 on page 285](#) for an explanation of each of the configuration parameters.

The screenshot shows a window titled "Monitoring Agent for Azure Compute". On the left is a sidebar with two sections: "Azure Subscription Credentials" and "Azure Compute Virtual Machine Subnode". The main area contains instructions: "Create agent subnodes to define groupings of virtual machines. Each subnode name must be unique within your environment. It is suggested that you have no more than 50 virtual machines per subnode." Below this is a "Template values for new subnodes" section with a "New..." button, a "Filter Type" dropdown set to "All", and an empty "Filter Value" text box. There are three subnode configuration blocks, each with a "Delete" button, a "\* Subnode Name" text box, a "Filter Type" dropdown, and a "Filter Value" text box. The first block has "account-all" as the name and "All" as the filter type. The second block has "env-prod" as the name, "Tag Name-Value Pair" as the filter type, and "DTAP:prod" as the filter value. The third block has "LG1" as the name, "Resource Group" as the filter type, and "linux-group1" as the filter value. At the bottom are "Back", "Next", "OK", and "Cancel" buttons.

Figure 12. The window to specify Azure Compute virtual machine subnode instance settings.

7. Click **OK** to complete the configuration.
8. In the IBM Cloud Application Performance Management window, right-click the instance that you configured, and then click **Start**.

## Configuring the agent by responding to prompts

After installation of the Azure Compute agent, you must configure it before you start the agent. If the Azure Compute agent is installed on a local Linux computer, you can follow these instructions to configure it interactively through command line prompts.

### About this task

**Remember:** If you are reconfiguring a configured agent instance, the value that is set in the last configuration is displayed for each setting. If you want to clear an existing value, press the space key when the setting is displayed.

## Procedure

Follow these steps to configure the Azure Compute agent by running a script and responding to prompts.

1. Run the following command:

```
install_dir/bin/azure_compute-agent.sh config instance-name
```

Where *install\_dir* is the path where the agent is installed and *instance-name* is the name that you want to give to the agent instance. Use only Latin letters, Arabic numerals, and the hyphen-minus character in the *instance-name*. For more information, see [instancename](#) under “Common MSN format for multi-instance agents” on page 227.

Example

```
/opt/ibm/apm/agent/bin/azure_compute-agent.sh config azc-inst3
```

2. Respond to the prompts to set configuration values for the agent.

See “Configuration parameters for the Azure Compute agent” on page 284 for an explanation of each of the configuration parameters.

**Remember:** When you first configure an agent instance, you must add at least one subnode when prompted to **Edit 'Azure Compute Virtual Machine Subnode' settings**.

3. Run the following command to start the agent:

```
install_dir/bin/azure_compute-agent.sh start instance-name
```

Where *install\_dir* is the path where the agent is installed and *instance-name* is the name of the agent instance.

Example

```
/opt/ibm/apm/agent/bin/azure_compute-agent.sh start azc-inst3
```

## Example

Creating an agent instance that is named `azc-inst3` and has one subnode instance that is named `azc1`.

```
# ./azure_compute-agent.sh config azc-inst3
Configuring Monitoring Agent for Azure Compute

Edit 'Monitoring Agent for Azure Compute' settings? [ 1=Yes, 2=No ] (default is: 1): 1

Azure Subscription Credentials :
Credentials required for access to the Azure Subscription.

The ID assigned by Azure for the Subscription that is monitored.
Subscription ID (default is: ): 09x73b6b-bcxb-40x3-92xd-ebx7-EXAMPLE

The tenant ID that is assigned by Azure. Used to log in to the Azure service API.
Tenant ID (default is: ): 75x2e745-e4x4-42x7-94xb-dex1-EXAMPLE

The client ID that is assigned by Azure to identify this agent as an external
application that monitors the Azure compute services.
Client ID (default is: ): 79x2e6c3-7exd-41x2-a9x9-4fx2-EXAMPLE

The secret access key or password that is created by Azure for the client application.
Enter Secret Key/Password (default is: ): hidden

Re-type : Secret Key/Password (default is: ): hidden

Azure Compute Virtual Machine Subnode :

Create agent subnodes to define groupings of virtual machines. Each subnode name
must be unique within your environment. It is suggested that you have no more
than 50 virtual machines per subnode.

No 'Azure Compute Virtual Machine Subnode' settings available.
Edit 'Azure Compute Virtual Machine Subnode' settings, [1=Add, 2=Edit, 3=Del,
4=Next, 5=Exit] (default is: 5): 1
Subnode Name (default is: ): azc1
```

```
The type of filter to be applied.
Filter Type [ 1=All, 2=Tag Name-Value Pair, 3=Resource Group ] (default is: 1): 2

The filter value corresponding to the selected Filter Type. This value can be a
Resource Group or Tag Name-Value Pair, for example Environment\:Production.
A backslash might appear in the example, do not enter a backslash in the value
you provide.
Filter Value (default is: ): Environment:Production
```

```
Azure Compute Virtual Machine Subnode settings: Subnode Name=azc1
Edit 'Azure Compute Virtual Machine Subnode' settings, [1=Add, 2=Edit, 3=Del,
4=Next, 5=Exit] (default is: 5): 5
Configuration completed successfully.
Automatic start at system initialization has been configured.
Automatic stop at system shutdown has been configured.
You have new mail in /var/spool/mail/root
```

## Configuring the agent by using the silent response file

The silent response file contains the agent configuration parameters. You can edit the silent response file to modify the values of these parameters, and run the configuration script to create an instance and update the agent configuration values. This mode of configuration is called the silent mode.

### About this task

The silent response file contains the agent configuration parameters with default values that are defined for some parameters. You can edit the silent response file to specify different values for the configuration parameters.

After you update the configuration values in the silent response file, you must run the configuration script to configure the agent with these updated values.

### Procedure

Follow these steps to configure the Azure Compute agent in the silent mode.

1. Open the `azure_compute_silent_config.txt` file at one of the following paths in a text editor.

- **Linux** `install_dir/samples/azure_compute_silent_config.txt`  
Example, `/opt/ibm/apm/agent/samples/azure_compute_silent_config.txt`
- **Windows** `install_dir\samples\azure_compute_silent_config.txt`  
Example, `C:\IBM\APM\samples\azure_compute_silent_config.txt`

Where `install_dir` is the path where the agent is installed.

2. In the `azure_compute_silent_config.txt` file, specify values for all mandatory parameters and modify the default values of other parameters as needed.

See [“Configuration parameters for the Azure Compute agent” on page 284](#) for an explanation of each of the configuration parameters.

**Important:** You must enable and specify the Filter Type and Filter Value parameters for at least one subnode name.

3. Save and close the `azure_compute_silent_config.txt` file, and run the following command:

- **Linux** `install_dir/bin/azure_compute-agent.sh config instance-name install_dir/samples/azure_compute_silent_config.txt`  
Example, `/opt/ibm/apm/agent/bin/azure_compute-agent.sh config azc-inst3 /opt/ibm/apm/agent/samples/azure_compute_silent_config.txt`
- **Windows** `install_dir\bin\azure_compute-agent.bat config instance-name install_dir\samples\azure_compute_silent_config.txt`

Example, **C:\IBM\APM\bin\azure\_compute-agent.bat config azc-inst3 C:\IBM\APM\samples\azure\_compute\_silent\_config.txt**

Where *install\_dir* is the path where the agent is installed and *instance-name* is the name that you want to give to the agent instance. Use only Latin letters, Arabic numerals, and the hyphen-minus character in the *instance-name*. For more information, see *instancename* under “Common MSN format for multi-instance agents” on page 227.

**Important:** Ensure that you include the absolute path to the silent response file. Otherwise, the agent data is not shown in the dashboards.

4. Run the following command to start the agent:

- **Linux** `install_dir/bin/azure_compute-agent.sh start instance-name`  
Example, `/opt/ibm/apm/agent/bin/azure_compute-agent.sh start azc-inst3`
- **Windows** `install_dir\bin\azure_compute-agent.bat start instance-name`  
Example, `C:\IBM\APM\bin\azure_compute-agent.bat start azc-inst3`

Where *install\_dir* is the path where the agent is installed and *instance-name* is the name of the agent instance.

### Example

Edited `azure_compute_silent_config.txt` with three subnodes that are named `account-all`, `env-prod`, and `LG1`.

```
#
# This is a sample configuration response file for agent Azure Compute.
#
# It contains an entry for every configuration property.
# Entries for optional properties that have no default value are included in
# comments.
# Entries for subnode AVM are given a sample subnode instance name of avm1.
# Ensure that all uncommented properties have a value before configuring the
# agent.
#

# Subscription ID: The ID assigned by Azure for the Subscription that is
# monitored.
KAK_SUBSCRIPTION_ID=09x73b6b-bcxb-40x3-92xd-ebx7-EXAMPLE
# Tenant ID: The tenant ID that is assigned by Azure. Used to log in to the
# Azure service API.
KAK_TENANT_ID=75x2e745-e4x4-42x7-94xb-dex1-EXAMPLE
# Client ID: The client ID that is assigned by Azure to identify this agent
# as an external
# application that monitors the Azure compute services.
KAK_CLIENT_ID=79x2e6c3-7exd-41x2-a9x9-4fx2-EXAMPLE
# Secret Key/Password: The secret access key or password that is created by
# Azure for the client application.
KAK_SECRET_PASSWORD=hZxWPq/I0x1nvg/wdxLwTf2Fs3x2sWQV/sCE-EXAMPLE

# Filter Type: The type of filter to be applied.
# Valid values: ALL (All), TAG_NAME_VALUE (Tag Name-Value Pair),
# RESOURCE_GROUP (Resource Group)
#KAK_FILTER_TYPE.avm1=ALL
# Filter Value: The filter value corresponding to the selected Filter Type.
# This value can be a Resource Group or Tag Name-Value Pair, for example
# Environment:Production. A backslash might appear in the example, do not
# enter a backslash in the value you provide.
#KAK_FILTER_VALUE.avm1=

# Filter Type: The type of filter to be applied.
# Valid values: ALL (All), TAG_NAME_VALUE (Tag Name-Value Pair),
# RESOURCE_GROUP (Resource Group)
KAK_FILTER_TYPE.account-all=ALL
# Filter Value: The filter value corresponding to the selected Filter Type.
# This value can be a Resource Group or Tag Name-Value Pair, for example
# Environment:Production. A backslash might appear in the example, do not
# enter a backslash in the value you provide.
KAK_FILTER_VALUE.account-all=

# Filter Type: The type of filter to be applied.
# Valid values: ALL (All), TAG_NAME_VALUE (Tag Name-Value Pair),
```

```
# RESOURCE_GROUP (Resource Group)
KAK_FILTER_TYPE.env-prod=TAG_NAME_VALUE
# Filter Value: The filter value corresponding to the selected Filter Type.
# This value can be a Resource Group or Tag Name-Value Pair, for example
# Environment:Production. A backslash might appear in the example, do not
# enter a backslash in the value you provide.
KAK_FILTER_VALUE.env-prod=DTAP:prod

# Filter Type: The type of filter to be applied.
# Valid values: ALL (All), TAG_NAME_VALUE (Tag Name-Value Pair),
# RESOURCE_GROUP (Resource Group)
KAK_FILTER_TYPE.LG1=RESOURCE_GROUP
# Filter Value: The filter value corresponding to the selected Filter Type.
# This value can be a Resource Group or Tag Name-Value Pair, for example
# Environment:Production. A backslash might appear in the example, do not
# enter a backslash in the value you provide.
KAK_FILTER_VALUE.LG1=linux-group1
```

## Configuration parameters for the Azure Compute agent

The configuration parameters for the Azure Compute agent are displayed in tables which group them according to sections.

1. [Table 35 on page 284](#) - Credentials that are required for access to the Azure Subscription that contains the Azure Compute resources to monitor.
2. [Table 36 on page 285](#) - Create agent subnodes to define groupings of virtual machines. Each subnode name must be unique within your environment. It is suggested that you have no more than 50 virtual machines per subnode.

| Table 35. Azure Subscription Credentials |  |  |
|--|--|--|
| Parameter name                           | Description  | Silent configuration file parameter name |
| Subscription ID                          | The ID assigned by Azure for the Subscription that is monitored.   | KAK_SUBSCRIPTION_ID                      |
| Tenant ID                                | The tenant ID that is assigned by Azure. Used to log in to the Azure service API.  | KAK_TENANT_ID                            |
| Client ID                                | The client ID that is assigned by Azure to identify this agent as an external application that monitors the Azure compute services.  | KAK_CLIENT_ID                            |
| Secret Key/<br>Password                  | <p>The secret access key or password that is created by Azure for the client application.</p> <p><b>Important:</b> <b>Windows</b> If your <b>Secret Key/Password</b> contains an equal sign (=), you must reenter it each time that you reconfigure the agent.</p> | KAK_SECRET_PASSWORD                      |

Table 36. Azure Compute Virtual Machine Subnode

| Parameter name | Description  | Silent configuration file parameter name  |
|----------------|--|---|
| Subnode Name   | <p>Name of the Azure Compute Subnode for collection of data. Example, <i>azc1</i>. Subnode name must be unique in your environment.</p> <p>This alias is part of the managed system name (MSN) and it is used to visually identify the monitored environment in the Cloud APM console.</p> <p><b>Note:</b> This alias can be anything that you choose to represent the Azure Compute subnode instance with the following restrictions. Letters from the Latin alphabet (a-z, A-Z), Arabic numerals (0-9), the hyphen-minus character (-), and the underscore character (_) can be used to create agent subnode instance names. The maximum length of an Azure Compute subnode name is 25 characters.</p> | <p>Each of the following parameters must use a period (.) followed by an agent <b>Subnode Name</b> as a suffix. The <b>Subnode Name</b> must be the same for each subnode parameter. New agent subnode instances must use a unique <b>Subnode Name</b> for its set of parameters. For example, one agent subnode instance can use <i>.azc1</i> and another agent subnode instance can use <i>.azc2</i> in place of <i>.subnode_name</i> in the parameter names that follow.</p> |
| Filter Type    | The type of filter to be applied.  | <p><b>KAK_FILTER_TYPE.subnode_name</b></p> <p>Valid values,</p> <p><b>ALL</b><br/>All</p> <p><b>TAG_NAME_VALUE</b><br/>Tag Name-Value Pair</p> <p><b>RESOURCE_GROUP</b><br/>Resource Group</p>  |

Table 36. Azure Compute Virtual Machine Subnode (continued)

| Parameter name | Description   | Silent configuration file parameter name |
|----------------|---|--|
| Filter Value   | <p>The filter value corresponding to the selected <b>Filter Type</b>. This value can be a <b>Resource Group</b> or <b>Tag Name-Value Pair</b>. Leave it empty for <b>Filter Type All</b>. For command line configuration, a backslash might appear in the example displayed. Do not enter a backslash in the value you provide.</p> <p>Examples of filter type and filter value pairs:</p> <ul style="list-style-type: none"> <li>• Azure Compute Subnode to monitor all virtual machines. Leave the filter value empty. Filter value is not needed and it is ignored for filter type <b>All</b>. <ul style="list-style-type: none"> <li>– Filter Type: <b>All</b></li> <li>– Filter Value:</li> </ul> </li> <li>• Azure Compute Subnode to monitor all virtual machines with a tag name of DTAP and a tag value that matches the string prod. <ul style="list-style-type: none"> <li>– Filter Type: <b>Tag Name-Value Pair</b></li> <li>– Filter Value: DTAP:prod</li> </ul> </li> <li>• Azure Compute Subnode to monitor all virtual machines with a resource group property that matches the string linux-group1. <ul style="list-style-type: none"> <li>– Filter Type: <b>Resource Group</b></li> <li>– Filter Value: linux-group1</li> </ul> </li> </ul> | KAK_FILTER_VALUE.subnode_name            |

## Configuring Cassandra monitoring

You must configure the Cassandra agent so that the agent can collect data from the nodes within the cluster to monitor the health of the Cassandra Database.

### Before you begin

Review the hardware and software prerequisites, see [Software Product Compatibility Reports for Cassandra agent](#)

### About this task

The Cassandra agent is a multiple instance agent. You must create the first instance and start the agent manually.

The product version and the agent version often differ. The directions here are for the most current release of this agent. For information about how to check the version of an agent in your environment, see [Agent version command](#). For detailed information about the agent version list and what's new for each version, see the [“Change history”](#) on page 58.

- To configure the agent on Windows systems, you can use the IBM Cloud Application Performance Management window or the silent response file.
- To configure the agent on Linux systems, you can run the script and respond to prompts, or use the silent response file.

## Configuring the agent on Windows systems

You can use the IBM Cloud Application Performance Management window to configure the agent on Windows systems.

### Procedure

1. Click **Start > All Programs > IBM Monitoring agents > IBM Performance Management**.
2. In the **IBM Performance Management** window, right-click **Template** in the **Task/SubSystem** column, and click **Configure Using Defaults**.  
The **Monitoring Agent for Cassandra** window opens.
3. In the **Enter a unique instance name** field, type an agent instance name and click **OK**.
4. In the **Monitoring Agent for Cassandra** window, specify values for the configuration parameters and click **OK**.

For information about the configuration parameters, see [“Configuration parameters of the agent” on page 288](#).

5. In the **IBM Performance Management** window, right-click the agent instance that you created and click **Start**.

### What to do next

Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the console, see [“Starting the Cloud APM console” on page 1109](#).

For help with troubleshooting, see the [Troubleshooting](#) section.

## Configuring the agent on Linux systems

To configure the agent on Linux operating systems, you must run the script and respond to prompts.

### Procedure

1. On the command line, change the path to the agent installation directory.  
Example: `/opt/ibm/apm/agent/bin`
2. Run the following command where `instance_name` is the name that you want to give to the instance:  
`./cassandra-agent.sh config instance_name`
3. When the command line displays the following message, type 1 and enter:  
Edit 'Monitoring Agent for Cassandra' setting? [1=Yes, 2=No]
4. Specify values for the configuration parameters when you are prompted.

For information about the configuration parameters, see [“Configuration parameters of the agent” on page 288](#).

5. Run the following command to start the agent:

```
./cassandra-agent.sh start instance_name
```

### What to do next

Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

For help with troubleshooting, see the [Troubleshooting](#) section.

## Configuring the agent by using the silent response file

The silent response file contains the agent configuration parameters. You can edit the silent response file to modify the values of these parameters, and run the configuration script to create an instance and update the agent configuration values. This mode of configuration is called the silent mode.

### About this task

You can use the silent response file to configure the Cassandra agent on Linux and Windows systems. After you update the configuration values in the silent response file, you must run the configuration script to configure the agent with these updated values.

### Procedure

1. In a text editor, open the silent config file that is available at the following location and specify values for all the parameters:

**Windows** `install_dir\samples\cassandra_silent_config_windows.txt`

**Linux** `install_dir\samples\cassandra_silent_config_UNIX.txt`

**Windows** `C:\IBM\APM\samples`

**Linux** `/opt/ibm/apm/agent/samples`

For information about the configuration parameters, see [“Configuration parameters of the agent”](#) on page 288.

2. On the command line, change the path to `install_dir\bin`.
3. Run the following command:

**Windows** `cassandra-agent.bat config instance_name install_dir\samples\cassandra_silent_config_windows.txt`

**Linux** `cassandra-agent.sh config instance_name install_dir\samples\cassandra_silent_config_UNIX.txt`

4. Start the agent.

**Windows** In the **IBM Performance Management** window, right-click the agent instance that you created, and click **Start**.

**Linux** Run the following command: `./cassandra-agent.sh start instance_name`

### What to do next

Log in to the Cloud APM console to view data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console”](#) on page 1109.

For help with troubleshooting, see the [Troubleshooting](#) section.

## Configuration parameters of the agent

While configuring the Cassandra agent, you can change the default value of the parameters, such as IP Address and JMX\_PORT.

The following table contains detailed descriptions of the configuration parameters of the Cassandra agent.

| Table 37. Names and descriptions of the configuration parameters |   |                 |
|--|---|-----------------|
| Parameter name   | Description   | Mandatory field |
| Instance Name  | The default value for this field is identical to the value that you specify in the <b>Enter a unique instance name</b> field. | Yes             |

| Table 37. Names and descriptions of the configuration parameters (continued) |   |                 |
|--|---|-----------------|
| Parameter name   | Description   | Mandatory field |
| IP Address   | The IP address of any node in the cluster.  | Yes             |
| JMX_PORT   | The JMX Port number to enable monitoring.<br><br><b>Important:</b> Ensure that you specify the JMX Port, JMX Username, and JMX Password throughout the cluster. If the node through which the agent is connected to the cluster, is not working, then the agent can collect data though a different node in the cluster by using the same parameters. | Yes             |
| JMX_Username   | The user name for accessing JMX.  | No              |
| JMX_Password   | The password for accessing the JMX.   | No              |

## Configuring Cisco UCS monitoring

The Monitoring Agent for Cisco UCS monitors the Cisco UCS Virtual Infrastructure by connecting to the Cisco UCSM. You must configure the Cisco UCS agent so that the agent can collect the Cisco UCS data.

### Before you begin

- Review the hardware and software prerequisites. For the up-to-date system requirement information, see the [Software Product Compatibility Reports \(SPCR\)](#) for the Cisco UCS agent.
- Ensure that the user, who connects to the Cisco UCSM infrastructure, has aaa or administrator privileges. Use an existing user ID, which has aaa or administrator privileges, or create a new user ID.
- If the Cisco UCS agent is configured to communicate with its Cisco UCS data sources that use the SSL agent, add the SSL certificate of each data source to the certificate truststore of the agent. For more information about enabling SSL communication with Cisco UCS data sources, see [“Enabling SSL communication with Cisco UCS data sources”](#) on page 294.

### About this task

The Cisco UCS agent is a multiple instance agent. You must create the first instance, and start the agent manually.

The product version and the agent version often differ. The directions here are for the most current release of this agent. For information about how to check the version of an agent in your environment, see [Agent version](#). To access the documentation for earlier agent releases, see the following table:

| Table 38. Agent versions and documentation |  |
|--|--|
| Cisco UCS agent version                    | Documentation  |
| 7.2.0.4, 7.2.0.3                           | <a href="#">IBM Cloud Application Performance Management</a><br><b>Note:</b> The link opens an on-premises Knowledge Center topic. |
| 7.2.0.2                                    | <a href="#">IBM Performance Management 8.1.3</a><br><b>Note:</b> The link opens an on-premises Knowledge Center topic.             |
| 7.2.0.1                                    | <a href="#">IBM Performance Management 8.1.2</a><br><b>Note:</b> The link opens an on-premises Knowledge Center topic.             |

The configuration attributes define which Cisco UCS Infrastructure is monitored. The attributes define a connection to Cisco UCSM 1.4, or later. You can configure more than one instance of the monitoring agent on a remote monitoring host system. You can also create separate instances to monitor specific Cisco UCS Infrastructure.

After the Cisco UCS agent is installed, you can start the agent. However, you must manually configure the agent to view data for all the agent attributes.

- To configure the agent on Windows systems, you can use the **IBM Performance Management** window or the silent response file.
- To configure the agent on Linux systems, you can run the script and respond to prompts, or use the silent response file.

## Configuring the agent on Windows systems

You can configure the agent on Windows operating systems by using the **IBM Performance Management** window. After you update the configuration values, you must start the agent to save the updated values.

### About this task

The Cisco UCS agent provides default values for some parameters. You can specify different values for these parameters.

### Procedure

1. Click **Start > All Programs > IBM Monitoring agents > IBM Performance Management**.
2. In the **IBM Performance Management** window, right-click **Monitoring Agent for Cisco UCS**, and then click **Configure agent**.

**Remember:** After you configure the agent for the first time, the **Configure agent** option is disabled. To configure the agent again, click **Reconfigure**.

3. In the Monitoring Agent for Cisco UCS window, complete the following steps:
  - a) Enter a unique name for the Cisco UCS agent instance, and click **OK**.
  - b) On the **CONFIG** tab, specify values for the configuration parameters, and then click **Next**.
  - c) On the **LOG\_CONFIG** tab, specify values for the configuration parameters, and then click **Next**.

For information about the configuration parameters in each tab of the Monitoring Agent for Cisco UCS window, see the following topics:

- [“Configuration parameters for the agent” on page 292](#)
- [“Configuration parameters for the data provider” on page 293](#)

4. In the **IBM Performance Management** window, right-click **Monitoring Agent for Cisco UCS**, and then click **Start**.

### What to do next

- Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

If you need help with troubleshooting, see the [Troubleshooting](#) section.

- If you are monitoring a large Cisco UCS environment, you might need to increase the heap size for the Java™ data provider. For more information, see [“Increasing the Java heap size” on page 295](#).

## Configuring the agent by using the silent response file

The silent response file contains the agent configuration parameters. You can edit the silent response file to modify the values of these parameters, and run the configuration script to create an instance and update the agent configuration values. This mode of configuration is called the silent mode.

### About this task

The silent response file contains the agent configuration parameters with default values that are defined for some parameters. You can edit the silent response file to specify different values for the configuration parameters.

After you update the configuration values in the silent response file, you must run the configuration script to configure the agent with these updated values.

### Procedure

- To configure the Cisco UCS agent in the silent mode, complete the following steps:
  - a) In a text editor, open the `cisco_ucs_silent_config.txt` file that is available at the following path:

- **Linux** `install_dir/samples/cisco_ucs_silent_config.txt`  
Example `/opt/ibm/apm/agent/samples/cisco_ucs_silent_config.txt`

- **Windows** `install_dir\samples\cisco_ucs_silent_config.txt`  
Example `C:\IBM\APM\samples\cisco_ucs_silent_config.txt`

- b) In the `cisco_ucs_silent_config.txt` file, specify values for all mandatory parameters. You can also modify the default values of other parameters.

For information about the configuration parameters, see the following topics:

- [“Configuration parameters for the agent” on page 292](#)
- [“Configuration parameters for the data provider” on page 293](#)

- c) Save and close the `cisco_ucs_silent_config.txt` file, and run the following command:

- **Linux** `install_dir/bin/cisco_ucs-agent.sh config instance_name install_dir/samples/cisco_ucs_silent_config.txt`

Example `/opt/ibm/apm/agent/bin/cisco_ucs-agent.sh config instance_name /opt/ibm/apm/agent/samples/cisco_ucs_silent_config.txt`

- **Windows** `install_dir\bin\cisco_ucs-agent.bat config instance_name install_dir\samples\cisco_ucs_silent_config.txt`

Example `C:\IBM\APM\bin\cisco_ucs-agent.bat config instance_name C:\IBM\APM\samples\cisco_ucs_silent_config.txt`

Where

**instance\_name**

Name that you want to give to the instance.

**install\_dir**

Path where the agent is installed.

**Important:** Ensure that you include the absolute path to the silent response file. Otherwise, the agent data is not shown in the dashboards.

- d) Run the following command to start the agent:

- **Linux** `install_dir/bin/cisco_ucs-agent.sh start instance_name`

Example `/opt/ibm/apm/agent/bin/cisco_ucs-agent.sh start instance_name`

- **Windows** `install_dir\bin\cisco_ucs-agent.bat start instance_name`

Example **C:\IBM\APM\bin\cisco\_ucs-agent.bat start instance\_name**

## What to do next

- Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

If you need help with troubleshooting, see the [Troubleshooting](#) section.

- If you are monitoring a large Cisco UCS environment, you might need to increase the heap size for the Java™ data provider. For more information, see [“Increasing the Java heap size” on page 295](#).

## Configuring the agent by responding to prompts

To configure the agent on Linux operating systems, you must run the script and respond to prompts.

### Procedure

- To configure the agent by running the script and responding to prompts, complete the following steps:

- a) On the command line, enter the following command:

```
install_dir/bin/cisco_ucs-agent.sh config instance_name
```

Example **/opt/ibm/apm/agent/bin/cisco\_ucs-agent.sh config instance\_name**

Where

#### **instance\_name**

Name that you want to give to the instance.

#### **install\_dir**

Path where the agent is installed.

- b) Respond to the prompts by referring to the following topics:

- [“Configuration parameters for the agent” on page 292](#)
- [“Configuration parameters for the data provider” on page 293](#)

- c) Run the following command to start the agent:

```
install_dir/bin/cisco_ucs-agent.sh start instance_name
```

Example **/opt/ibm/apm/agent/bin/cisco\_ucs-agent.sh start instance\_name**

## What to do next

- Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

If you need help with troubleshooting, see the [Troubleshooting](#) section.

- If you are monitoring a large Cisco UCS environment, you might need to increase the heap size for the Java™ data provider. For more information, see [“Increasing the Java heap size” on page 295](#).

## Configuration parameters for the agent

When you configure the Cisco UCS agent, you can change the default values of the parameters, such as the instance name and the SSL validation certificates.

The following table contains detailed descriptions of the configuration parameters for the Cisco UCS agent.

| <i>Table 39. Names and descriptions of the configuration parameters for the Cisco UCS agent</i> |   |                 |
|---|---|-----------------|
| Parameter name  | Description   | Mandatory field |
| Instance Name   | The name of the instance.<br><br><b>Restriction:</b> The <b>Instance Name</b> field displays the name of the instance that you specify when you configure the agent for the first time. When you configure the agent again, you cannot change the instance name of the agent.   | Yes             |
| URL   | The URL of the Cisco UCS Manager.<br><br>To set the URL of the Cisco UCS manager, enter the URL in the http://ip_address/nuova format.  | Yes             |
| Username  | The administrator user name of the Cisco UCS Manager.   | Yes             |
| Password  | The administrator password of the Cisco UCS Manager.  | Yes             |
| Confirm Password  | The same password that you entered in the <b>Password</b> field.  | Yes             |
| SSL truststore filepath   | The path of the secure socket layer (SSL) truststore file.<br><br>If you want the agent to validate SSL certificates when using SSL to communicate over the network, then specify the location where the secure socket layer (SSL) truststore file is located.  | Yes             |
| Validate SSL Certificates   | A Boolean value that indicates whether the agent validates SSL certificates when the agent uses SSL to communicate over the network.<br><br>Set the value to Yes if you want the agent to validate SSL certificates when the agent uses SSL to communicate over the network. Set the value to No to prevent the agent from validating SSL certificates.<br><br><b>Tip:</b> For more information about enabling SSL communication with Cisco UCS data sources, see <a href="#">“Enabling SSL communication with Cisco UCS data sources”</a> on page 294. | Yes             |

## Configuration parameters for the data provider

When you configure the Cisco UCS agent, you can change the default values of the parameters for the data provider, such as the maximum number of data provider log files, the maximum size of the log file, and the level of detail that is included in the log file.

The following table contains detailed descriptions of the configuration parameters for the data provider.

| <i>Table 40. Names and descriptions of the configuration parameters for the data provider</i> |  |                 |
|---|--|-----------------|
| Parameter name  | Description  | Mandatory field |
| Maximum number of Data Provider Log Files   | The maximum number of log files that the data provider creates before it overwrites the previous log files. The default value is 10.           | Yes             |
| Maximum Size in KB of Each Data Provider Log  | The maximum size in KB that a data provider log file must reach before the data provider creates a new log file. The default value is 5190 KB. | Yes             |

| Table 40. Names and descriptions of the configuration parameters for the data provider (continued) |   |                 |
|--|---|-----------------|
| Parameter name   | Description   | Mandatory field |
| Level of Detail in Data Provider Log   | The level of detail that can be included in the log file that the data provider creates. The default value is INFO. The following values are valid: OFF, SEVERE, WARNING, INFO, FINE, FINER, FINEST, and ALL. | Yes             |

## Enabling SSL communication with Cisco UCS data sources

The Cisco UCS agent can be configured to securely communicate with its Cisco UCS data sources by using SSL. In this configuration, you must add a data source SSL certificate to the certificate truststore of the agent.

### About this task

**Important:** The following information applies only if the agent is configured to validate SSL certificates.

If SSL certificate validation is turned off, the Cisco UCS agent connects to Cisco UCS data sources even if their SSL certificates are expired, untrusted, or invalid. However, turning off SSL certificate validation is potentially not secure and must be done with care.

If a Cisco UCS data source uses an SSL certificate that is signed by a common Certificate Authority (for example, Verisign, Entrust, or Thawte), then it is not necessary to add certificates to the Cisco UCS agent certificate truststore. However, if the data source uses a certificate that is not signed by a common Certificate Authority, as is the case by default, the certificate must be added to the truststore to allow the agent to successfully connect and collect data.

### Procedure

1. Copy the certificate file from your data source to the agent computer.
2. On the agent computer, place the certificate file in a directory of your choice. Do not overwrite the certificate files. Use a unique file name and label for each certificate that you add.
3. Use the `keytool` command to add the data source certificate to the certificate truststore of the agent:

```
keytool -import -noprompt -trustcacerts -alias CertificateAlias -file
CertificateFile -keystore Truststore -storepass TruststorePassword
```

Where

#### ***CertificateAlias***

Unique reference for each certificate added to the certificate truststore of the agent, for example, an appropriate alias for the certificate from *datasource.example.com* is *datasource*.

#### ***CertificateFile***

Complete path and file name to the Cisco UCS data source certificate to add to the truststore.

#### ***Truststore***

Complete path and file name to the Cisco UCS agent certificate database. Use the following path and file name:

- **Windows** (64 bit) *install\_dir\tmaitm6\_x64\kv6.truststore*
- **Linux** (64 bit) *install\_dir/1x8266/vm/etc/kv6.truststore*

#### ***TruststorePassword***

ITMFORVE is the default password for the Cisco UCS agent truststore. To change this password, consult the Java Runtime documentation for information about the tools to use.

**Important:** To use the `keytool` command, the Java Runtime bin directory must be in your path. Use the following commands:

- **Windows** (64 bit) `set PATH=%PATH%;install_dir\java\java70_x64\jre\bin`
- **Linux** (64 bit) `PATH="$PATH":/opt/ibm/apm/agent/JRE/1x8266/bin`

4. After you add all the data source certificates, start the monitoring agent.

## Increasing the Java heap size

After you configure the Cisco UCS agent, if you are monitoring a large Cisco UCS environment, then you might need to increase the heap size for the Java™ data provider.

### About this task

The default heap size for the Java data provider is 256 megabytes. In large Cisco UCS environments, if the following problems arise, then you might need to increase the heap size:

- The Java data provider stops because of a `javacore` problem, and creates a file that is named `javacore.date.time.number.txt` in the `CANDLEHOME\tmaitm6_x64` directory.
- The `javacore.date.time.number.txt` file contains the string `java/lang/OutOfMemoryError`.

### Procedure

- **Windows**

Complete the following steps to set a value of 1 GB as heap size:

1. Open the `%CANDLE_HOME%\TMAITM6_x64\kv6_data_provider.bat` file.
2. Add the following line before the line that starts with `KV6_JVM_ARGS="$KV6_CUSTOM_JVM_ARGS...`:

```
SET KV6_CUSTOM_JVM_ARGS=-Xmx1024m
```

3. Restart the agent.

- **Linux**

Complete the following steps to set a value of 1 GB as heap size:

1. Open the `$CANDLEHOME/1x8266/vm/bin/kv6_data_provider.sh` file.
2. Add the following line before the line that starts with `KV6_JVM_ARGS="$KV6_CUSTOM_JVM_ARGS...`:

```
KV6_CUSTOM_JVM_ARGS=-Xmx1024m
```

3. Restart the agent.

## Configuring Citrix Virtual Desktop Infrastructure monitoring

The Citrix VDI agent provides a central point of monitoring for your Citrix XenDesktop or XenApp resources, including delivery groups, catalogs, applications, desktops, users, and sessions. Before the agent can be used, you must configure the agent to collect data through the delivery controller.

### Before you begin

- The product version and the agent version often differ. The directions here are for the most current release of this agent. To access the documentation for earlier agent releases, see the [Table 41 on page 296](#) table.

| Table 41. Agent versions |   |
|--------------------------|---|
| Agent version            | Documentation   |
| 8.1.4                    | <a href="#">Cloud APM 8.1.4</a>                               |
| 8.1.3.1, 8.1.3.2         | <a href="#">IBM Performance Management 8.1.3</a> <sup>1</sup> |

<sup>1</sup> The link opens an on-premises Knowledge Center topic.

- Make sure that the system requirements for the Citrix VDI agent are met in your environment. For the up-to-date system requirement information, see the [Software Product Compatibility Reports \(SPCR\)](#) for the Citrix VDI agent.
- Ensure that the following information is available:
  - Host name of the delivery controller to which you plan to connect.
  - OData user name, password, and domain.
  - PowerShell user name, password, domain, PowerShell port, SSL verification type, and authentication mechanism if you enable Windows Event Log Event and PowerShell metric retrieval.
- Ensure that an agent operator user account has at least Citrix read-only administrator privileges. See [Enabling Citrix read-only administrator privileges](#).
- Starting with Citrix VDI agent version 8.1.3.1, the ability to retrieve Windows Event Log Events became available. To retrieve Windows Event Log Events from all Desktop Delivery Controller (DDC) and Virtual Delivery Agent (VDA) machines, remote PowerShell access needs to be enabled for the user account that is specified during the agent instance configuration. Follow these steps to ensure that the agent can perform this function:
  1. Log in to a Windows computer as the user specified in the agent instance configuration.
  2. Run the following PowerShell command, where *vda\_system* is the name of a VDA machine that is powered on:
 

```
Get-WinEvent -FilterHashtable
@{ProviderName='Citrix*';LogName='Citrix*';StartTime=((Get-
Date).AddDays(-10))} -ComputerName vda_system
```
- Ensure that the following load balancing policies are enabled for the monitored environment:
  - CPU Usage
  - Disk Usage
  - Memory Usage

These policies can be configured through the Citrix Studio application.

## About this task

The Citrix VDI agent is a multiple instance agent. You must create at least one instance, and start the agent instance manually.

The configuration for XenApp servers is the same as for XenDesktop servers. If a configuration parameter name or description mentions only "XenDesktop", it is also for XenApp.

## Procedure

1. Configure the agent on Windows systems with the **IBM Performance Management** window or the silent response file.
  - [“Configuring the agent on Windows systems” on page 298.](#)
  - [“Configuring the agent by using the silent response file” on page 302.](#)
2. Configure the agent on Linux systems with the script that prompts for responses or the silent response file.

- [“Configuring the agent by responding to prompts” on page 301.](#)
- [“Configuring the agent by using the silent response file” on page 302.](#)

## What to do next

In the Cloud APM console, go to your Application Performance Dashboard to view the data that was collected. For information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109.](#)

If you are unable to view the data in the agent dashboards, first check the server connection logs and then the data provider logs. The default paths to these logs are listed here:

- **Linux** /opt/ibm/apm/agent/logs
- **Windows** C:\IBM\APM\TMAITM6\_x64\logs

For help with troubleshooting, see the [Cloud Application Performance Management Forum](#).

## Enabling Citrix read-only administrator privileges

The Citrix VDI agent requires the agent operator user account have at least Citrix read-only administrator privileges.

### About this task

To run these steps remotely from a computer that has the Citrix Delegated Admin PowerShell Snap-in installed, use the `AdminAddress` parameter. For example, the command in step 2 would become `New-AdminAdministrator -Name "YOURDOMAIN\NewAdmin" -AdminAddress "controller1.YOURDOMAIN.com"`. Where `YOURDOMAIN` is the name of the network domain, `NewAdmin` is the user account that is being given Citrix administration privileges, and `controller1.YOURDOMAIN.com` is the fully qualified domain name of the Citrix site server.

### Procedure

1. Start a PowerShell session with an existing Citrix administrator account.
2. Load the Delegated Admin PowerShell Snap-in to manage the Citrix XenApp or XenDesktop site.

```
(Add-PSSnapin Citrix.DelegatedAdmin.Admin.V1)
```

3. Add the agent operator user account as a Citrix site administrator.

```
New-AdminAdministrator -Name "YOURDOMAIN\NewAdmin"
```

Where `YOURDOMAIN` is the name of the network domain and `NewAdmin` is the user account that is being given Citrix administration privileges.

4. Query for the available roles and scopes to assign to `NewAdmin`.

```
Get-AdminRole
Get-AdminScope
```

5. Assign roles to the agent operator user account, including read-only administrator permissions.

```
Add-AdminRight -Administrator "YOURDOMAIN\NewAdmin" -Role "Read Only Administrator" -Scope "All"
```

Where

- `YOURDOMAIN` is the name of the network domain.
- `NewAdmin` is the user account that is being given Citrix administration privileges.
- `Read Only Administrator` is the Citrix site administrator role that you are assigning.
- `All` is the Citrix site administrator scope that you are assigning.

6. Confirm the addition and changes of the administrator.

```
Get-AdminAdministrator -Name "YOURDOMAIN\NewAdmin"
```

Where *YOURDOMAIN* is the name of the network domain and *NewAdmin* is the user account that is being given Citrix administration privileges.

## Configuring the agent on Windows systems

You can configure the Citrix VDI agent on Windows operating systems by using the IBM Cloud Application Performance Management window. After you update the configuration values, you must start the agent to save the updated values.

### Procedure

1. Click **Start > All Programs > IBM Monitoring agents > IBM Cloud Application Performance Management**.
2. In the **IBM Performance Management** window, right-click the **Monitoring Agent for Citrix Virtual Desktop Infrastructure** template, and then click **Configure agent**.

**Remember:** After you configure an agent instance for the first time, the **Configure agent** option is disabled. To configure the agent instance again, right-click on it and then click **Reconfigure**.

3. Enter a unique instance name then click **OK**. Use only letters, Arabic numerals, the underline character, and the minus character in the instance name. Example, vdi\_inst2.

Figure 13. The window to enter a unique instance name.

4. Click **Next** on the agent instance name window.

The image shows a window titled "Monitoring Agent for Citrix VDI". On the left is a sidebar with two items: "Instance Name" (selected) and "XenApp and XenDesktop Site Configuration". The main area of the window is for the "Instance Name" configuration. It contains the text "The name of the instance." followed by a label "\* Instance Name" and a text input field containing "vdi\_inst2". At the bottom right of the window are four buttons: "Back", "Next", "OK", and "Cancel".

Figure 14. The agent instance name window.

5. Enter the **XenApp and XenDesktop Site Configuration** instance template settings.

**Note:** This section is not the XenApp or XenDesktop site instance configuration. It is a template section for setting what is used as the default values when you add the actual XenApp or XenDesktop site instance configurations in [step 6](#).

See [Table 42 on page 303](#) for an explanation of each of the configuration parameters.

**Monitoring Agent for Citrix VDI**

**Instance Name**

**XenApp and XenDesktop Site Configuration**

The configuration that is required to monitor a XenApp or XenDesktop site remotely. One instance is required for each XenApp or XenDesktop site that you want to configure.

**Xen Desktop Site Connection Information**

\* Delivery Controller

\* User Name

\* Confirm Password

\* Domain

PowerShell User name

PowerShell Password

Confirm PowerShell Password

PowerShell Domain

PowerShell Port

SSL Config

PowerShell Authentication Mechanism

Figure 15. The window to specify XenApp or XenDesktop site instance template settings.

- Press **New** and enter XenApp or XenDesktop site instance settings, then click **Next**.  
See [Table 42 on page 303](#) for an explanation of each of the configuration parameters.

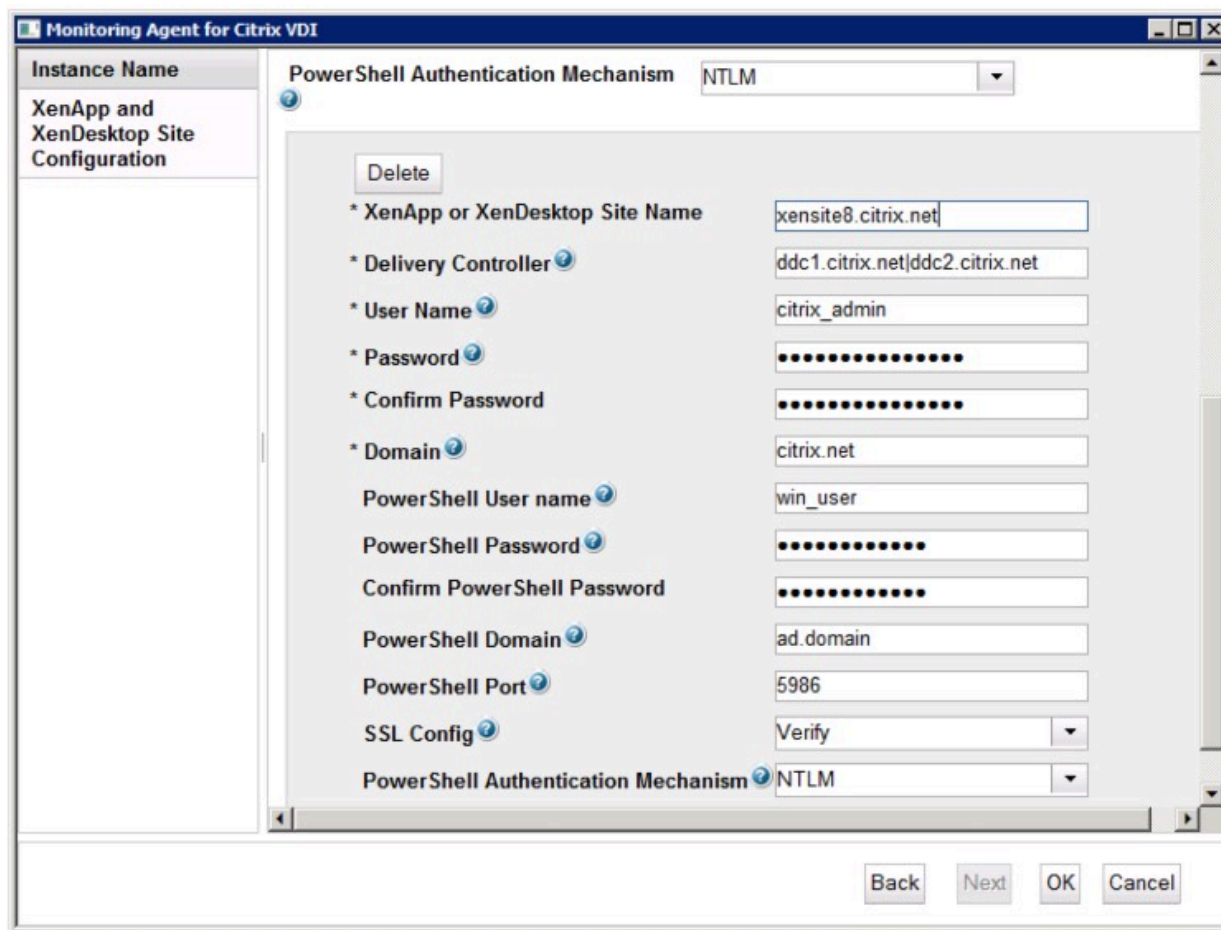

Figure 16. The window to specify XenApp or XenDesktop site instance settings.

**Note:** The **PowerShell User name** parameter and all following PowerShell parameters are only needed when “Enabling monitoring of Windows events and PowerShell metrics” on page 305. These advanced environment variables are off by default because of the significant load they put on the monitored system.

**Note:** Ensure the **SSL Config** and **PowerShell Authentication Mechanism** parameters are set correctly for each new XenApp or XenDesktop site instance. A defect causes the default values to be set instead of the template values.

7. Click **OK** to complete the configuration.
8. In the IBM Cloud Application Performance Management window, right-click the instance that you configured, and then click **Start**.

## Configuring the agent by responding to prompts

After installation of the Citrix VDI agent, you must configure it before you start the agent. If the Citrix VDI agent is installed on a local Linux machine, you can follow these instructions to configure it interactively through command line prompts.

### About this task

**Remember:** If you are reconfiguring a configured agent instance, the value that is set in the last configuration is displayed for each setting. If you want to clear an existing value, press the space key when the setting is displayed.

## Procedure

Follow these steps to configure the Citrix VDI agent by running a script and responding to prompts.

1. Run the following command:

```
install_dir/bin/citrixvdi-agent.sh config instance_name
```

where *install\_dir* is the path where the agent is installed and *instance\_name* is the name that you want to give to the agent instance.

Example

```
/opt/ibm/apm/agent/bin/citrixvdi-agent.sh config vdi_inst01
```

2. Respond to the prompts to set configuration values for the agent.

See [“Configuration parameters for the Citrix VDI agent” on page 303](#) for an explanation of each of the configuration parameters.

**Note:** The **PowerShell User name** parameter and all following PowerShell parameters are only needed when [“Enabling monitoring of Windows events and PowerShell metrics” on page 305](#). These advanced environment variables are off by default because of the significant load they put on the monitored system.

3. Run the following command to start the agent:

```
install_dir/bin/citrixvdi-agent.sh start instance_name
```

where *install\_dir* is the path where the agent is installed and *instance\_name* is the name of the agent instance.

Example

```
/opt/ibm/apm/agent/bin/citrixvdi-agent.sh start vdi_inst01
```

## Configuring the agent by using the silent response file

The silent response file contains the agent configuration parameters. You can edit the silent response file to modify the values of these parameters, and run the configuration script to create an instance and update the agent configuration values. This mode of configuration is called the silent mode.

### About this task

The silent response file contains the agent configuration parameters with default values that are defined for some parameters. You can edit the silent response file to specify different values for the configuration parameters.

After you update the configuration values in the silent response file, you must run the configuration script to configure the agent with these updated values.

## Procedure

- Configure the Citrix VDI agent in the silent mode:
  - a) Open the `citrixvdi_silent_config.txt` file at one of the following paths in a text editor.

– **Linux** `install_dir/samples/citrixvdi_silent_config.txt`

Example, `/opt/ibm/apm/agent/samples/citrixvdi_silent_config.txt`

– **Windows** `install_dir\samples\citrixvdi_silent_config.txt`

Example, `C:\IBM\APM\samples\citrixvdi_silent_config.txt`

where *install\_dir* is the path where the agent is installed.

- b) In the `citrixvdi_silent_config.txt` file, specify values for all mandatory parameters and modify the default values of other parameters as needed.

See “Configuration parameters for the Citrix VDI agent” on page 303 for an explanation of each of the configuration parameters.

**Note:** The **PowerShell User name** parameter and all following PowerShell parameters are only needed when “Enabling monitoring of Windows events and PowerShell metrics” on page 305. These advanced environment variables are off by default because of the significant load they put on the monitored system.

- c) Save and close the `citrixvdi_silent_config.txt` file, and run the following command:

– **Linux** `install_dir/bin/citrixvdi-agent.sh config instance_name  
install_dir/samples/citrixvdi_silent_config.txt`

Example, `/opt/ibm/apm/agent/bin/citrixvdi-agent.sh config  
vdi_inst01 /opt/ibm/apm/agent/samples/citrixvdi_silent_config.txt`

– **Windows** `install_dir\bin\citrixvdi-agent.bat config instance_name  
install_dir\samples\citrixvdi_silent_config.txt`

Example, `C:\IBM\APM\bin\citrixvdi-agent.bat config vdi_inst01 C:\IBM\APM  
\samples\citrixvdi_silent_config.txt`

where `install_dir` is the path where the agent is installed and `instance_name` is the name that you want to give to the agent instance.

**Important:** Ensure that you include the absolute path to the silent response file. Otherwise, the agent data is not shown in the dashboards.

- d) Run the following command to start the agent:

– **Linux** `install_dir/bin/citrixvdi-agent.sh start instance_name`

Example, `/opt/ibm/apm/agent/bin/citrixvdi-agent.sh start vdi_inst01`

– **Windows** `install_dir\bin\citrixvdi-agent.bat start instance_name`

Example, `C:\IBM\APM\bin\citrixvdi-agent.bat start vdi_inst01`

where `install_dir` is the path where the agent is installed and `instance_name` is the name of the agent instance.

## Configuration parameters for the Citrix VDI agent

The configuration parameters for the Citrix VDI agent are displayed in a table.

1. [Citrix VDI Agent Settings](#) - Citrix VDI agent environment settings.

| Table 42. Citrix VDI Agent Settings |   |  |
|-------------------------------------|---|--|
| Parameter name                      | Description   | Silent configuration file parameter name   |
| XenApp or XenDesktop Site Name      | <p>Provide a name to identify the XenApp or XenDesktop site agent instance. Example, <code>vdi_inst2</code></p> <p><b>Note:</b> This alias can be anything that you choose to represent the WebLogic server agent instance with the following restrictions. Only letters, Arabic numerals, the underline character, and the minus character can be used in the connection name. The maximum length of a connection name is 25 characters.</p> | Each of the following parameters must have an instance name suffix that is the same for each parameter of an agent instance. New agent instances must use a unique instance name for its set of parameters. For example, one agent instance can use <code>.vdi1</code> and another agent instance can use <code>.vdi2</code> in place of <code>.instance_name</code> in the parameter names that follow. |

Table 42. Citrix VDI Agent Settings (continued)

| Parameter name       | Description   | Silent configuration file parameter name   |
|----------------------|---|--|
| Delivery Controller  | Host name or IP address of the delivery controller. If multiple DDCs are set up in a cluster, a ' ' separated list of delivery controllers can be provided.   | <b>KVD_XDS_DELIVERY_CONTROLLER.instance_name</b>   |
| User Name            | User name that is used to authenticate with the OData API on the specified XenApp or XenDesktop delivery controller.  | <b>KVD_XDS_ODATA_USERNAME.instance_name</b>  |
| Password             | Password that is used to authenticate with the OData API on the specified XenApp or XenDesktop delivery controller.   | <b>KVD_XDS_ODATA_PASSWORD.instance_name</b>  |
| Domain               | Domain that is used to authenticate with the OData API on the specified XenApp or XenDesktop delivery controller.   | <b>KVD_XDS_ODATA_DOMAIN.instance_name</b>  |
| PowerShell User name | User name that is used to authenticate for PowerShell calls to remote VDA and DDC machines.<br><br><b>Note:</b> This and all following PowerShell parameters are only needed when <a href="#">“Enabling monitoring of Windows events and PowerShell metrics”</a> on page 305. These advanced environment variables are off by default because of the significant load they put on the monitored system. | <b>KVD_XDS_POWERSHELL_USERNAME.instance_name</b>   |
| PowerShell Password  | Password that is associated with PowerShell user name provided.   | <b>KVD_XDS_POWERSHELL_PASSWORD.instance_name</b>   |
| PowerShell Domain    | Domain that is associated with PowerShell user name provided.   | <b>KVD_XDS_POWERSHELL_DOMAIN.instance_name</b>   |
| PowerShell Port      | The SSL port that is open for use by WinRm. PowerShell default remote connection ports are 5985 for HTTP and 5986 for HTTPS.  | <b>KVD_XDS_POWERSHELL_PORT.instance_name</b>   |
| SSL Requirement      | Choose the SSL option required for your environment.  | <b>KVD_XDS_SSL_CONFIG.instance_name</b><br>Valid values,<br><b>KVD_XDS_SSL_CONFIG_VERIFY</b><br>Verify<br><b>KVD_XDS_SSL_CONFIG_NOVERIFY</b><br>No Verify<br><b>KVD_XDS_SSL_CONFIG_NOSSL</b><br>No SSL |

Table 42. Citrix VDI Agent Settings (continued)

| Parameter name                      | Description   | Silent configuration file parameter name   |
|-------------------------------------|---|--|
| PowerShell Authentication Mechanism | Defines the type of authentication that is used to create a credential to retrieve information from remote systems with PowerShell. | <b>KVD_XDS_POWERSHELL_AUTH_MECH.instance_name</b><br>Valid values,<br><b>KVD_XDS_POWERSHELL_BASIC</b><br>Basic<br><b>KVD_XDS_POWERSHELL_CREDSSP</b><br>CredSSP<br><b>KVD_XDS_POWERSHELL_NTLM</b><br>NTLM<br><b>KVD_XDS_POWERSHELL_DEFAULT</b><br>Default<br><b>KVD_XDS_POWERSHELL_DIGEST</b><br>Digest<br><b>KVD_XDS_POWERSHELL_KERBEROS</b><br>Kerberos<br><b>KVD_XDS_POWERSHELL_NEGOTIATE</b><br>Negotiate |

## Enabling monitoring of Windows events and PowerShell metrics

Enable monitoring of Windows events and PowerShell metrics with this procedure. Monitoring this data can have a significant performance impact to the monitored system.

### Before you begin

Ensure the agent's [PowerShell configuration parameters](#) are set.

### About this task

One or more of the following advanced environment variables must be enabled for the agent to monitor Windows events and PowerShell metrics.

#### GET\_SESSION\_LATENCY

Whether session latency and round-trip time are retrieved remotely from the connected VDA from PowerShell.

#### GET\_VDA\_MACHINE\_METRICS\_REMOTELY

Whether VDA machine metrics are retrieved remotely from PowerShell.

#### RETRIEVE\_WINDOWS\_EVENTS

Whether Windows Event Log Events are retrieved from PowerShell from Windows VDAs and DDCs.

### Procedure

1. Go to the agent installation directory of the Citrix VDI agent:

- **Linux** `install_dir/config`
- **Windows** `install_dir\TMAITM6_x64`

where `install_dir` is the path where the agent is installed.

2. Edit the Citrix VDI agent configuration file to set one or more of the `GET_SESSION_LATENCY`, `GET_VDA_MACHINE_METRICS_REMOTELY`, and `RETRIEVE_WINDOWS_EVENTS` variables to `true`.

- **Linux** `vd.environment`
- **Windows** `KVDENV_instance_name`

where `instance_name` is the name of the agent instance.

3. Restart the agent.

**Important:** To make these settings the default for all new agent instances, set them to `true` in the configuration template files:

- **Linux** This setting is already made the default for new agents instances by editing `vd.environment` in [Step 2](#).
- **Windows** `KVDENV`

### Example

```
GET_SESSION_LATENCY=true
GET_VDA_MACHINE_METRICS_REMOTELY=true
RETRIEVE_WINDOWS_EVENTS=true
```

## Configuring DataPower monitoring

To monitor DataPower appliances, you need to first complete some configuration tasks on your appliances, and then configure the Monitoring Agent for DataPower.

**Tip:** Click [APM v8: Configuring DataPower monitoring in IBM APM](#) to watch a video that covers the basic configuration process of DataPower monitoring.

## Configuring DataPower Appliances

Before you configure the Monitoring Agent for DataPower, you must complete some configuration tasks on your appliances.

**Tip:** For information about the supported DataPower Appliances, see the Prerequisites tab in [Software Product Compatibility Reports](#).

You can monitor DataPower appliances at three different levels. Configure the three levels according to your needs, on each DataPower appliance that you want to monitor to display DataPower appliance data in the Cloud APM console.

### 1. Resource monitoring

To see monitoring data, such as resource utilization, throughput, and connection statistics, enable resource monitoring. For instructions, see [“Resource monitoring”](#) on page 307.

### 2. Middleware transaction tracking

To see monitoring data for transactions, such as transaction detailed information, volume, and dependencies, enable middleware transaction tracking. For instructions, see [“Middleware transaction tracking”](#) on page 308.

### 3. Instance-level transaction tracking of the DataPower appliance

To display monitoring data for transactions in instance topologies, configure instance-level transaction tracking of the DataPower appliance. For instructions, see [“Instance-level transaction tracking of DataPower appliance”](#) on page 309.

**Important:** Make sure that the user ID has the proper permissions to configure the DataPower appliance. You can enter `*/*/*?Access=r` in the **Access profile** field for the user ID that is used to configure the DataPower appliance. And then use this user ID to configure the DataPower appliance.

## Exporting the public certificate

If the XML Management Interface of the DataPower Appliance has the SSL Proxy Profile enabled, you must export the public certificate that is used by the XML Management Interface of the DataPower Appliance to the machine that runs the DataPower agent.

### Procedure

1. To download the crypto certificate that is used by the XML Management Interface of the DataPower appliance, for example, `pubcert:///mycert.pem`, click **Administration > Main > File Management** and save the certificate to the machine that runs the DataPower agent.
2. When you configure the DataPower agent, there is an option to specify the **SSL Proxy Profile** field. Enter the absolute path of the public certificate.

**Note:** When more multi-protocol gateways are added, you need to repeat these steps.

## Resource monitoring

The first level of monitoring available for a DataPower appliance is to enable resource monitoring, such as SOAP management, statistics, and transaction rates.

The operation on the DataPower Gateway user interface (UI) in the following configuration tasks apply to DataPower Gateway Version 7.5.1 and former versions. If the version of the DataPower Gateway that you use is later than V 7.5.1, you can click the question mark on the upper right in the UI and choose **WebGUI** to return to the UI of the former version. And then follow the instructions to complete DataPower appliance configuration tasks.

### *Enabling SOAP management*

If you want the DataPower agent to collect data from DataPower Appliances, you must configure the XML Management Interface and enable SOAP Management.

### Procedure

To enable SOAP:

1. Log on to the WebGUI for the DataPower Appliance that you want to monitor.
2. Click **Objects > Device Management > XML Management Interface**.  
**Note:** Ensure that the Administrative state is enabled.
3. For **Port Number**, enter the port number on which the DataPower agent listens for notification reports. The port number is 5550 by default.
4. For **Enabled Services**, ensure that **SOAP Management** is selected.

### *Enabling Statistics*

If you want the DataPower agent to collect data from DataPower Appliances, Statistics must be enabled.

### Procedure

To enable Statistics, complete the following steps:

1. Log on to the WebGUI for the DataPower Appliance that you want to monitor.
2. Click **Administration > Device > Statistics Settings**.
3. Enable **Statistics Settings** and click **Apply**.

## Enabling Transaction Rate

If you want the DataPower agent to collect data from DataPower Appliances, the Transaction Rate must be enabled.

### Procedure

To enable Transaction Rate, complete the following steps:

1. Log on to the WebGUI for the DataPower Appliance that you want to monitor.
2. Select the default domain.
3. Click **Status > Connection > Transaction Rate**.
4. If **Statistics is currently disabled** is displayed, click **disabled** and in the Statistic Settings, set the **Administrative state** to **enabled**.
5. If you have multiple domains, click **Show All Domains** and repeat steps 3-4 to enable the Transaction Rate for all applicable domains.
6. Click **Apply**.

## Middleware transaction tracking

The second level of monitoring available for a DataPower appliance is to display Middleware transaction tracking in the workspaces.

The operation on the DataPower Gateway user interface (UI) in the following configuration tasks apply to DataPower Gateway Version 7.5.1 and former versions. If the version of the DataPower Gateway that you use is later than V 7.5.1, you can click the question mark on the upper right in the UI and choose **WebGUI** to return to the UI of the former version. And then follow the instructions to complete DataPower appliance configuration tasks.

Both transaction tracking of SOAP traffic and REST traffic through the DataPower appliance is supported. DataPower transaction tracking supports SOAP using files `store:///soapreq.xml`, `store:///soaprsp.xml`, and `store:///soaperror.xml`. These XSL files instrument the Web Service Proxy to add and report on `kd4:KD4SoapHeaderV2` in the SOAP Envelope.

In addition to the `soap*.xml` files, DataPower transaction tracking also includes `apm_req.xml`, `apm_rsp.xml`, and `apm_error.xml`, which support incoming HTTP requests containing an `ARM_CORRELATOR: HTTP Header`, or a SOAP Envelope containing `ITCAMCorrelator` or `kd4:KD4SoapHeaderV2`. The Web Service Proxy updates or sets the outgoing request to contain an `ARM_CORRELATOR: HTTP Header`, and removes the SOAP correlators.

**Note:** If DataPower appliances are added to a business application, and the appliance carries traffic for multiple applications, after Transaction tracking is enabled, the application topology displayed for those business applications includes paths to nodes for all applications.

## Configuring Web Service Management

Complete these steps for each DataPower appliance for which you want to display tracking data.

1. Log on to the WebGUI for the DataPower Appliance that you want to monitor.
2. Select the default domain.
3. Search for **XML Management Interface**. Set the following values and click **Apply**.
  - On the **Main** tab, in the **Enabled services** section, enable **WS-Management endpoint**
4. Search for **Web Services Management Agent**. Set the following values and click **Apply**.
  - Set the **Administrative state** to **enabled**
  - Set the **Capture Mode** to **None**
  - Set the **Buffering Mode (deprecated)** to **Discard**
5. Configure the Web Service Proxy or Multi-Protocol Gateway as described in the following topics.

### *Configuring Web Service Proxy*

Complete these steps for each Web Service Proxy for which you want to display tracking data.

#### **Procedure**

1. Select the domain of which the Web Service Proxy is a part.
2. On the **Proxy Settings** tab, set the following values and click **Apply**:
  - Set the **Monitor via Web Services Management Agent** to **on**
3. To report SOAP faults, disable error processing and enable error reporting in Cloud APM console: on the **Advanced Proxy Settings** tab, set **Process HTTP Errors** to **off**, and click **Apply**.

### *Configuring Multi-Protocol Gateway*

Complete these steps for each Multi-Protocol Gateway for which you want to display transaction tracking data.

#### **Procedure**

1. Select the domain of which the Multi-Protocol Gateway is a part.
2. On the **Advanced** tab for the Multi-Protocol Gateway, set the following values and click **Apply**:
  - Set the **Monitor via Web Services Management Agent** to **on**
  - If the web server uses redirects, set **Follow Redirects** to **off**. Then set the **Rewrite Location URL** to **on**.
3. If you are monitoring a Multi-Protocol Gateway with Response Type or Request Type of Non-XML, you must define a Multi-Protocol Gateway Policy with rules covering both Client to Server and Server to Client directions. If a Non-XML Multi-Protocol Gateway does not have rules in its policy, no traffic is captured by either the Web Services Management Agent or a DataPower debug Probe (if enabled).
4. To propagate the HTTP Response Code from the back-end server and to report SOAP faults, on the **Advanced Settings** tab, set **Process Backend Errors** to **off**, and click **Apply**.

## **Instance-level transaction tracking of DataPower appliance**

The third level of monitoring available for a DataPower appliance is to display its data in instance topologies.

The operation on the DataPower Gateway user interface (UI) in the following configuration tasks apply to DataPower Gateway Version 7.5.1 and former versions. If the version of the DataPower Gateway that you use is later than V 7.5.1, you can click the question mark on the upper right in the UI and choose **WebGUI** to return to the UI of the former version. And then follow the instructions to complete DataPower appliance configuration tasks.

### **Configuring transforms**

Complete these steps on each DataPower appliance that you want to display in instance topologies.

#### **About this task**

For IBM Performance Management V8.1.2 Fix Pack 1, transaction tracking of SOAP traffic through the DataPower appliance is supported. DataPower transaction tracking supports SOAP using files `store:///soapreq.xml`, `store:///soaprsp.xml`, and `store:///soaperror.xml`. These XSL files instrument the Web Service Proxy to add and report on `kd4:KD4SoapHeaderV2` in the SOAP Envelope.

For IBM Performance Management V8.1.3 and later, transaction tracking of REST traffic through the DataPower appliance is also supported. In addition to the `soap*.xml` files, DataPower transaction tracking also includes `apm_req.xml`, `apm_rsp.xml`, and `apm_error.xml`, which support incoming HTTP requests containing an `ARM_CORRELATOR: HTTP Header`, or a SOAP Envelope containing `ITCAMCorrelator` or `kd4:KD4SoapHeaderV2`. The Web Service Proxy updates or sets the outgoing request to contain an `ARM_CORRELATOR: HTTP Header`, and removes the SOAP correlators.

The DataPower agent supports transaction tracking for SOAP traffic through the DataPower appliance, REST traffic through the DataPower appliance, and the traffic between DataPower and WebSphere MQ.

- If you want to enable transaction tracking for SOAP and REST traffic through the DataPower appliance, apply `apm_req.xml`, `apm_rsp.xml`, and `apm_error.xml`, which support incoming HTTP requests containing an `ARM_CORRELATOR: HTTP Header`, or a SOAP Envelope containing `ITCAMCorrelator` or `kd4:KD4SoapHeaderV2`. The Web Service Proxy updates or sets the outgoing request to contain an `ARM_CORRELATOR: HTTP Header`, and removes the SOAP correlators.
- In addition to SOAP and REST traffic through the DataPower appliance, if you want to enable transaction tracking between DataPower and WebSphere MQ, apply the `apm_req_MQ.xml`, `apm_rsp_MQ.xml`, and `apm_error_MQ.xml` files. Transaction tracking for SOAP and REST traffic is also enabled automatically after you apply these files.

## Procedure

To track REST traffic and enable transaction tracking between DataPower and WebSphere MQ, complete the following steps:

1. Download the files from the following location:
  - For Linux systems, `/opt/ibm/apm/agent/lx8266/bn/bin`
  - For AIX systems, `/opt/ibm/apm/agent/aix536/bn/bin`
2. Upload the XSL files to each DataPower appliance that you want to monitor as part of the IBM integration stack.
3. Configure the Web Service Proxy or Multi-Protocol Gateway as described in the following topics.
4. For each Domain you want to monitor, configure it with the following steps:
  - a) Select the Domain from the drop-down list in the DataPower Gateway header.
  - b) In the Control Panel navigator, select **Objects > Device Management > Web Services Management Agent**.
  - c) Set the **Buffering Mode (deprecated)** to Discard.
  - d) Click **Apply**.

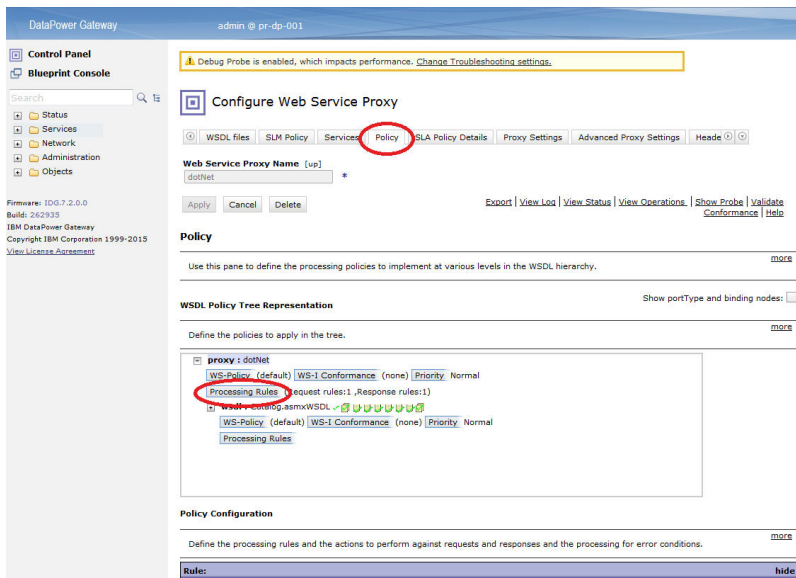

### *Configuring Web Service Proxy*

Complete these steps on each Web Service Proxy that you want to display in instance topologies.

## Procedure

In the WebGUI, complete the following steps for each Web Service Proxy that you want to monitor:

1. In the **Configure Web Service Proxy** page, select the name of the Web Service Proxy to configure.
2. On the **Policy** tab, expand **proxy : domain** and click **Processing Rules**.

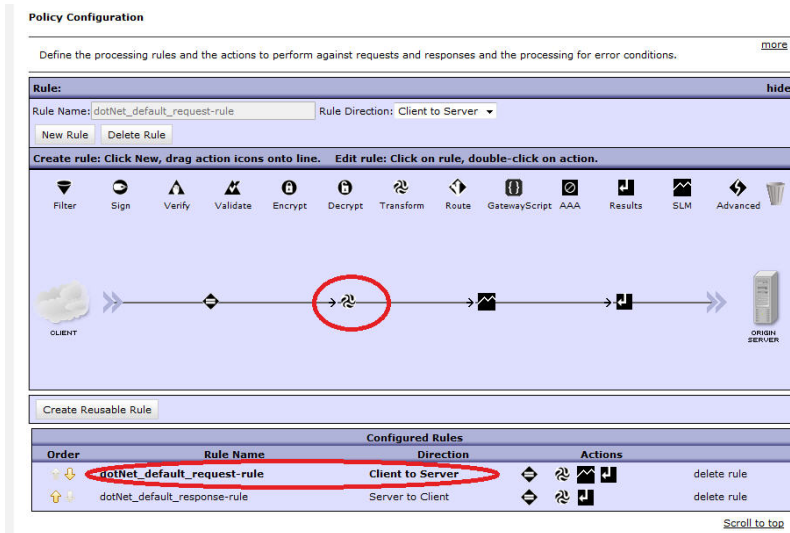

3. In the **Policy Configuration** section, select an existing **Client** to **Server** rule, or click **New Rule** to create one.

a. Drag a **Transform** to the timeline.

**Note:**

- i) If a **Client** to **Server** rule already exists, add the transform node to it.
- ii) If the **Client** to **Server** rule has an **Authentication**, **Authorization**, and **Audit (AAA)** node, ensure that the transform node that includes the DataPower agent xslt file precedes the AAA node.

b. Double-click the **Transform** to edit it.

c. In the **Configure Transform with XSLT style sheet Action** window, next to **Transform File**, select **apm\_req.xsl** from the data store that you uploaded it to. For example, **local:///**

If the file does not exist, click **Upload** to get it from the installed location.

**Tip:** In addition to SOAP and REST traffic through the DataPower appliance, if you want to configure a `Client` to `Server` rule to monitor the traffic between DataPower and WebSphere MQ, apply the `apm_req_MQ.xml` file instead of the `apm_req.xml` file in this step.

- d. Click **Done**.
4. Back in the **Policy Configuration** section, repeat Step 3 to configure a `Server` to `Client` rule, or click **New Rule** to create one.
  - a. Drag a Transform to the timeline.
  - b. Double-click the Transform to edit it.
  - c. In the **Configure Transform with XSLT style sheet Action** window, next to Transform File, select `apm_rsp.xml` from the data store that you uploaded it to. For example, `local:///`

If the file does not exist, click **Upload** to get it from the installed location.

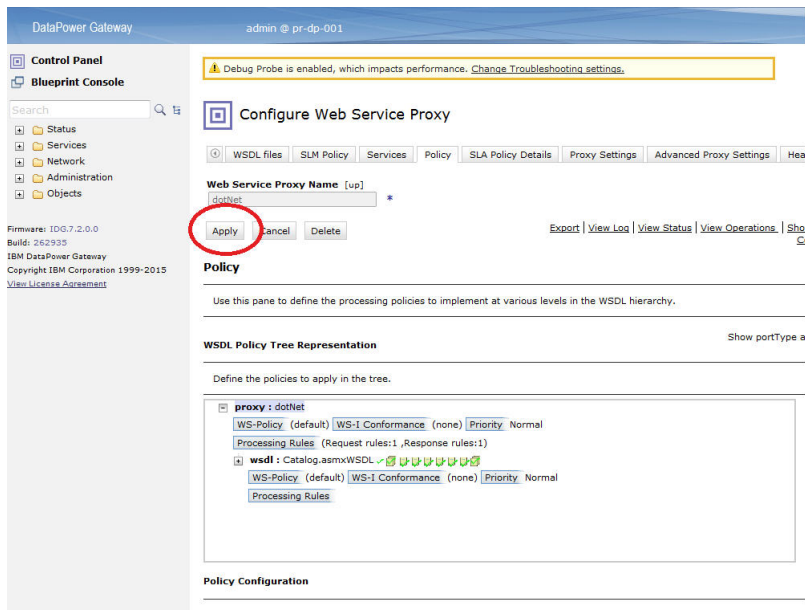

**Tip:** In addition to SOAP and REST traffic through the DataPower appliance, if you want to configure a `Server` to `Client` rule to monitor the traffic between DataPower and WebSphere MQ, apply the `apm_rsp_MQ.xml` file instead of the `apm_rsp.xml` file in this step.

- d. Click **Done**.
5. Back in the **Policy Configuration** section, repeat Step 3 to configure an `Error` rule, or click **New Rule** to create one.
  - a. Drag a Transform to the timeline.
  - b. Double-click the Transform rule to edit it.
  - c. In the **Configure Transform with XSLT style sheet Action** window, next to Transform File, select `apm_error.xml` from the data store that you uploaded it to. For example, `local:///`

If the file does not exist, click **Upload** to get it from the installed location.

**Tip:** In addition to SOAP and REST traffic through the DataPower appliance, if you want to configure an error rule to monitor the traffic between DataPower and WebSphere MQ, apply the `apm_error_mq.xml` file instead of the `apm_error.xml` file in this step.

- d. Click **Done**.
6. Back in the **Configure Web Service Proxy** page, click **Apply**.

### Configuring Multi-Protocol Gateway

Complete these steps on each Multi-Protocol Gateway that you want to display in instance topologies.

## Procedure

In the WebGUI, complete the following steps for each Multi-Protocol Gateway that you want to monitor.

1. In the **Configure Multi-Protocol Gateway** page, click the name of the Multi-Protocol Gateway that you want to configure.
2. On the **Multi-Protocol Gateway Policy** page, configure the policy. Click ....
3. On the **Configure Multi-Protocol Gateway Style Policy** page, select an existing **Client to Server** rule, or click **New Rule** to create one.
  - a. Drag a Transform to the timeline.

#### Note:

- i) If a **Client to Server** rule already exists, add the transform node to it.
  - ii) If the **Client to Server** rule has an Authentication, Authorization, and Audit (AAA) node, ensure that the transform node that includes the DataPower agent xslt file precedes the AAA node.
- b. Double-click the Transform rule to edit it.
  - c. In the **Configure Transform with XSLT style sheet Action** window, next to Transform File, select `apm_req.xsl` from the data store that you uploaded it to. For example, `local:///`  
If the file does not exist, click **Upload** to get it from the installed location.

**Tip:** In addition to SOAP and REST traffic through the DataPower appliance, if you want to configure a **Client to Server** rule to monitor the traffic between DataPower and WebSphere MQ, apply the `apm_req_MQ.xsl` file instead of the `apm_req.xsl` file in this step.

- d. Click **Done**.
4. Back on the **Configure Multi-Protocol Gateway Style Policy** page, select an existing **Server to Client** rule, or click **New Rule** to create one.
    - a. Drag a Transform to the timeline.
    - b. Double-click the Transform rule to edit it.
    - c. In the **Configure Transform with XSLT style sheet Action** window, next to Transform File, select `apm_rsp.xsl` from the data store that you uploaded it to. For example, `local:///`

If the file does not exist, click **Upload** to get it from the installed location.

**Tip:** In addition to SOAP and REST traffic through the DataPower appliance, if you want to configure a `Server to Client` rule to monitor the traffic between DataPower and WebSphere MQ, apply the `apm_rsp_MQ.xml` file instead of the `apm_rsp.xml` file in this step.

- d. Click **Done**.
5. Back on the **Configure Multi-Protocol Gateway Style Policy** page, select an existing Error rule, or click **New Rule** to create one.
  - a. Drag a Transform to the timeline.
  - b. Double-click the Transform rule to edit it.
  - c. In the **Configure Transform with XSLT style sheet Action** window, next to Transform File, select `apm_error.xml` from the data store that you uploaded it to. For example, `local:///`  
If the file does not exist, click **Upload** to get it from the installed location.  
**Tip:** In addition to SOAP and REST traffic through the DataPower appliance, if you want to configure an error rule to monitor the traffic between DataPower and WebSphere MQ, apply the `apm_error_mq.xml` file instead of the `apm_error.xml` file in this step.
  - d. Click **Done**.
6. Back on the **Configure Multi-Protocol Gateway Style Policy** page, on the **Advanced** tab, set the **Monitor via Web Services Management Agent** to **on**, and click **Apply**.
7. Click **Apply**.

## What to do next

In some cases, adding transforms for Transaction Tracking may result in DataPower changing the value of HTTP Content-Type headers. You may see web pages with images that do not load, or binary files being rendered as garbled HTML text.

The behavior of DataPower changes when comparing a rule with no XSL transforms to a rule with one or more XSL transforms. If the service handles MIME, MTOM, XOP or other encoded messages, this behavior may be desired, otherwise modify your DataPower configuration to prevent the behavior.

To prevent DataPower from modifying the HTTP Content-Type header, set the variable in each affected rule (`var://service/mpgw/proxy-content-type`):

1. Drag an Advanced object to the rule.
2. Double click the Advanced object to edit it.
3. Select **Set Variable** and click **Next**.
4. Enter the Variable Name `service/mpgw/proxy-content-type` and Variable Value `1` and click **Done**.
5. Apply the policy and service configuration changes.
6. Repeat steps 1-5 for each affected rule.

## Configuring the DataPower agent

The Monitoring Agent for DataPower provides a central point of monitoring for the DataPower Appliances in your enterprise environment. You can identify and receive notifications about common problems with the appliances. The agent also provides information about performance, resource, and workload for the appliances.

### About this task

The DataPower agent is a multiple instance agent; you must create the first instance and start the agent manually. The Managed System Name includes the instance name that you specify, for example, `instance_name: host_name: pc`, where `pc` is your two character product code. The Managed System Name is limited to 32 characters.

The instance name that you specify is limited to 28 characters, minus the length of your host name. For example, if you specify DataPower as your instance name, your managed system name is DataPower:hostname:BN.

**Important:** If you specify a long instance name, the Managed System name is truncated and the agent code does not display correctly.

**Note:** The DataPower agent's XSLT does not parse BLOB characters that are used for mainframe applications.

For each production DataPower appliance, configure one instance. If your DataPower appliances are non-production or small ones, you can configure only one agent instance to monitor them all. Multiple instances can run on the same machine. You can run the configuration script to create an instance and change any configuration settings. You can edit the agent silent response file before you run the script to bypass the prompts and responses that are required.

## Procedure

- To configure the DataPower agent, complete one of the following procedures:
  -   To configure the agent by responding to prompts, complete the following steps:
    1. Go to the *install\_dir*/bin directory, where *install\_dir* is the installation directory for the DataPower agent.
    2. Run the `./datapower-agent.sh config instance_name` command.  
Choose an *instance\_name* that is unique on the server.
    3. When prompted to edit the DataPower agent settings, enter 1 to proceed.
    4. When prompted to edit the **Managed System Details**, enter one of the following options:
      - 1=Add
      - 2=Edit
      - 3=Del
      - 4=Next
      - 5=Exit

If it is the first time that you configure a DataPower agent instance on your system, the No 'DataPower Appliances' settings available message is displayed. Enter 1 to add a DataPower Appliances setting. The default is option 5=Exit.

5. Enter the properties for the DataPower appliance:

### Managed System Name

For **Managed System Name**, enter the managed system name of the agent.

Choose a **Managed System Name** that is unique among all instances of the agent and that can be used to easily identify an appliance. The name should contain only alphanumeric characters, for example, the host name of the DataPower appliance.

### Device Host

For **Device Host**, enter the IP address of the monitored DataPower Appliance.

### XML Management Interface Port

For **XML Management Interface Port**, enter the port number for the XML Management Interface. The default number is 5550.

### User ID

For **User ID**, enter the User ID to log in to the monitored DataPower Appliance. The default value is admin.

### Password

For **Password**, enter the password to log in to the monitored DataPower Appliance and then confirm the password.

### SSL Proxy Profile

For **SSL Proxy Profile**, enter the absolute path of the public certificate for your SSL proxy profile, if the XML management interface of the device is configured to use the profile. For example,

```
the location of the .pem file exported from datapower appliances/mycert.pem
```

where *the location of the .pem file exported from datapower appliances* is the absolute path of the public certificate. To export the public certificate, see [Exporting public certificate](#).

### SSL Proxy Option

For **SSL Proxy Option**, set to Yes if the XML management interface of the monitored device is configured to use a custom SSL proxy profile. Otherwise, set it to No.

6. To monitor multiple DataPower appliances, repeat “4” on page 315 and “5” on page 315 to configure one agent instance for each DataPower appliance. Otherwise, type 5 and press **Enter** to complete the configuration.

7. Run the following command to start the agent:

```
./datapower-agent.sh start instance_name
```

- Silent configuration

1. To configure the agent by editing the silent response file and running the script with no interaction, complete the following steps:

- **Linux** **UNIX** Open *install\_dir/samples/datapower\_silent\_config.txt* in a text editor.
- **Windows** Open *install\_dir/samples/datapower\_silent\_config.txt* in a text editor.

2. To configure the DataPower agent to monitor an appliance, enter the following properties:

#### Device Host

Enter the host name or IP address of the device. For example,

**SOAP\_HOST.ManageSystemName= datapower01.**

#### XML Management Interface Port

Enter the port number for the XML Management Interface. The default value is 5550. For example, **DP\_PORT.ManageSystemName= 5550.**

#### User ID

Enter the User ID that is used to connect to the device. The default value is admin. For

example, **DP\_UID.ManageSystemName= admin.**

#### Password

Enter the password of the User ID. For example, **DP\_PASSWORD.ManageSystemName= password.**

#### SSL Proxy Profile

Enter the absolute path of the public certificate for your SSL proxy profile, if the XML management interface of the device is configured to use the profile. For example,

```
the location of the .pem file exported from datapower appliances/mycert.pem
```

where *the location of the .pem file exported from datapower appliances* is the absolute path of the public certificate. To export the public certificate, see [Exporting public certificate](#).

#### SSL Proxy Option

For **SSL Proxy Option**, set to Yes if the XML management interface of the monitored device is configured to use a custom SSL proxy profile. Otherwise, set it to No. For example, **DP\_SSL\_OPTION.ManageSystemName1= Yes.**

**Important:** ManageSystemName is unique. You must replace it with your own system name in all entries. If you want to monitor multiple appliances, copy and repeat the steps that are shown to monitor an appliance. Remember to set the appropriate ManageSystemName and DataPower Appliance parameters.

3. Go to the installation directory for the agent and run the following command to start the agent:

```
./datapower-agent.sh start instance_name
```

## What to do next

- To check the names and settings of the configured agent instances, run the **./cinfo -s bn** command.
- You can verify that the DataPower agent data is displayed in the Cloud APM console. For instructions on how to start the Cloud APM console, see [Starting the Cloud APM console](#). For information about using the Applications editor, see [Managing applications](#).
- To display transaction tracking data in the Cloud APM console, configure transaction tracking for the DataPower agent. For instructions, see [Configuring transaction tracking for the DataPower agent](#).
- To display monitoring at different levels, configure the DataPower appliance accordingly. For instructions, see [Resource monitoring](#), [Middleware transaction tracking](#), and [Instance-level transaction tracking](#) of DataPower appliances.

## Configuring transaction tracking for the DataPower agent

To display transaction tracking data for DataPower appliances in the middleware and topology dashboards, you must enable transaction tracking for the DataPower agent.

### Before you begin

- Install the DataPower agent and configure it to connect to the DataPower appliance.
- Enable monitoring for SOAP or ARM in the DataPower appliance.

### Procedure

To enable transaction tracking for the DataPower agent, complete the following steps:

1. In the navigation bar, click  **System Configuration > Agent Configuration**.
2. On the **DataPower** tab, select the agent instances for which you want to enable transaction tracking.
3. Select **Actions > Set Transaction Tracking > Enabled** to enable transaction tracking. The status of the agent in the **Transaction Tracking** column is updated to **Enabled**.

### Results

You have enabled transaction tracking for the selected agent instances.

## What to do next

To see data for a DataPower appliance in the middleware and topology dashboards, you must now add the appliances that you want to monitor to the Application Performance Dashboard. For further information about adding a DataPower appliance to the Application Performance Dashboard, see [“Adding middleware applications to the Application Performance Dashboard”](#) on page 126.

**Note:** If you are using Integration Services and you want to monitor the data that is transmitted between IBM Integration Bus and DataPower, additional configuration is required to show an accurate Aggregate Transaction Topology. The IBM Integration Bus agent cannot include correlation support for SOAP messages without a SOAP envelope. SOAPRequest nodes, SOAPAsyncRequest nodes, and SOAPReply nodes may accept messages without SOAP Envelopes as input messages. For these nodes, there is no relationship displayed in the topology view from the mediation to the downstream mediation or the application server. To avoid this problem, insert a SOAPEnvelope node immediately before the SOAPRequest, SOAPAsyncRequest, or SOAPReply nodes in your IBM Integration Bus message flow,

and select the **Create new envelope** option for the SOAPEnvelope node to add a SOAP envelope for the SOAP message.

## Configuring Db2 monitoring

---

The Monitoring Agent for Db2 monitors the availability and performance of the Db2 server. You can monitor multiple servers from the Cloud APM console; each server is monitored by a Db2 agent instance. Remote monitoring is also supported by Db2 agent.

### Before you begin

Review hardware and software prerequisites. For the up-to-date system requirement information, see the [Software Product Compatibility Reports \(SPCR\)](#) for the Db2 agent.

### About this task

The Db2 agent is a multiple instance agent, you must first create the instance and then start the agent manually.

The managed system name includes the agent instance name that you specify, for example, *instance\_name:hostname:pc*.

Where:

- The *pc* is your two character product code.
- The *instance\_name* is the agent instance name, and it must be the same as the Db2 instance name that is to be monitored.

The managed system name can contain up to 32 characters. The agent instance name that you specify can contain up to 8 characters, excluding the length of your host name. For example, if you specify DB2inst1 as your agent instance name, your managed system name is DB2inst1:hostname:ud.

**Important:** If you specify a long agent instance name, the managed system name is truncated and the agent code is not displayed completely.

To avoid permission issues when you configure the agent, be sure to use the same root user or non-root user ID that was used for installing the agent. If you installed your agent as a selected user and want to configure the agent as a different user, see [“Configuring agents as a non-root user”](#) on page 243. If you installed and configured your agent as a selected user and want to start the agent as a different user, see [“Starting agents as a non-root user”](#) on page 1159.

Run the configuration script to create an instance and change the configuration settings. You can edit the Db2 silent response file before you run the configuration script to bypass the prompts and responses that are otherwise necessary.

After you configure the Db2 agent, be sure to start the agent with a user ID that has the Db2 SYSADM authority for the monitored instance. The agent requires the SYSADM authority to turn on all monitor switches and collect the monitoring data. Therefore, a user with the SYSADM authority must start the agent. Use the instance owner user, which has the SYSADM authority, to start the agent.

The directions here are for the most current release of this agent. For information about how to check the version of an agent in your environment, see [Agent version command](#). For detailed information about the agent version list and what's new for each version, see [“Change history”](#) on page 58.

### Procedure

To configure the agent with the default settings, complete the following steps:

1. Run the following command where *instance\_name* is the name that you want to give to the instance:

```
install_dir/bin/db2-agent.sh config instance_name
install_dir/samples/db2_silent_config.txt
```

The agent instance name *instance\_name* is always the same as the Db2 instance name that is being monitored. For more details about the existing agent instances, refer [“Agent Configuration page” on page 242](#)

2. Run the following command to start the Db2 agent:

```
install_dir/bin/db2-agent.sh start instance_name
```

## What to do next

- Grant privileges to the Db2 user to view data for some attributes of the Db2. For information about granting these privileges, see [“Granting privileges for viewing Db2 metrics” on page 323](#).
- Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

## Configuring the agent on Windows systems

You can use the IBM Cloud Application Performance Management window to configure the agent on Windows systems.

### Before you begin

Before you start configuring the Db2 agent for local and remote monitoring, ensure that following task is completed for remote monitoring.

- Set up client/server environment for remote monitoring, refer [“Prerequisites for Remote Monitoring” on page 327](#).

### Procedure

1. Click **Start > All Programs > IBM Monitoring agents > IBM Cloud Application Performance Management**.
2. In the IBM Cloud Application Performance Management window, right-click **Monitoring Agent for DB2**, and then click **Configure agent**.
3. In the **Enter a unique instance name** field, type the agent instance name and click **OK**.

**Important:** For local monitoring, the agent instance name must match the name of the Db2 instance that is being monitored.

For remote monitoring, the agent instance name must be the unique catalog node name.

4. In the **Monitoring Agent for DB2** window, complete these steps:

- a) In the **Username**, enter the user name of Db2 instance.

For Local Db2, enter the name of Db2 instance owner.

For Remote Db2, enter Actual Db2 instance owner name from remote Db2 machine.

**Important:** This parameter is mandatory for monitoring remote Db2 instance.

- b) In the **Password**, enter the password of Db2 instance.

For Local Db2, enter the password of Db2 instance owner.

For Remote Db2, enter Actual Db2 instance owner password from remote Db2 machine.

**Important:** This parameter is mandatory for monitoring remote Db2 instance.

- c) In the **DB2Customized SQL Definition File** field, enter the full file path name for the SQL definition file. If the SQL definition file is in the default directory, leave this field blank. Otherwise, enter the full file path name of the file. The default file name with path is as follows:

**Linux** | **UNIX** CANDLEHOME/config/kudcussql.properties

**Windows** CANDLEHOME\TMAITM6\_x64\kudcussql.properties

- d) In the **db2diag Log File Path** field, enter the directory path for the db2diag log file. If the db2diag log file is in the default directory, leave this field blank. Otherwise, enter the path of the directory. The default directory path is as follows:

|         |      |   |
|---------|------|---|
| Linux   | UNIX | /home/DB2owner_home_dir/sqlllib/db2dump         |
| Windows |      | C:\ProgramData\IBM\DB2\DB2COPY\DB2INSTANCE\NAME |

**Note:** This parameter is not applicable for remote monitoring.

- e) In the **MSGID Filter in Regular Expression** field, enter the *MSGID* to filter the diagnostic log. The *MSGID* is a combination of the message type, message number, and severity level. Use a regular expression to filter the log based on message type, message number, or severity level, for example, `ADM1\d*1E|ADM222\d2W`.
- f) From the **Enable Monitoring for Partitions in Remote Hosts** list, select Yes to specify that the Db2 agent can monitor partitions in remote hosts.
- g) From the **Enable Monitoring All Databases** list, select Yes to specify that the Db2 agent can monitor all databases.
- h) Click **OK**.

The agent instance is displayed in the IBM Cloud Application Performance Management window.

5. Run following steps to configure remote monitoring.

- a) Open `install_dir\TMAITM6_x64\KUDENV_<instanceName>`.
- b) Set `KUD_DB2_CLIENT_INST` to Db2 client instance name under which remote Db2 server instance is cataloged.

6. Right-click the **Monitoring Agent for DB2** instance, and click **Start**.

## What to do next

- Grant privileges to the Db2 user to view data for some attributes of the Db2 agent. For information about granting these privileges, see [“Granting privileges for viewing Db2 metrics” on page 323](#).
- Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

## Configuring the agent on Linux or UNIX systems

You run the configuration script to configure the agent on Linux systems.

### Before you begin

Before you start configuring the Db2 agent for local and remote monitoring, ensure that following task is completed for remote monitoring.

- Set up client/server environment for remote monitoring, refer [“Prerequisites for Remote Monitoring” on page 327](#).

### Procedure

1. Run the command `install_dir/bin/db2-agent.sh config instance_name`

Where *instance\_name* is the name that you want to give to the instance:

**Important:** For local monitoring, the agent instance name must match the name of the Db2 instance that is being monitored.

For remote monitoring, the local cataloged node of remote Db2 server instance that is to be monitored.

2. When you are prompted to provide a value for the following parameters, press Enter to accept the default value, or specify a value and then press Enter:

- Username
- Password

- DB2® SQL path
  - Diaglog path
  - Diaglog message ID filter
  - Monitor remote partitions
  - Monitor all databases
3. Run the following command to start the agent:
- For local monitoring run `install_dir/bin/db2-agent.sh start instance_name` by Db2 instance owner user.
- For remote monitoring, run `install_dir/bin/db2-agent.sh start node_name` with the instance owner of Db2 client instance under which remote Db2 server instance is cataloged.

## What to do next

- Grant privileges to the Db2 user to view data for some attributes of the Db2 agent. For information about granting these privileges, see [“Granting privileges for viewing Db2 metrics” on page 323](#).
- Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

## Configuring the agent by using the silent response file

Use the silent response file to configure the agent without responding to prompts when you run the configuration script. You can use the silent response file for configuring the agent on both Windows and Linux systems.

### Before you begin

Before you start configuring the Db2 agent for local and remote monitoring, ensure that following task is completed for remote monitoring.

- Set up client/server environment for remote monitoring, refer [“Prerequisites for Remote Monitoring” on page 327](#).

### About this task

The silent response file contains the configuration parameters. You edit the parameter values in the response file, and run the configuration script to create an agent instance and update the configuration values.

### Procedure

1. In a text editor, open the `db2_silent_config.txt` file that is available at the following path:

|         |      |  |
|---------|------|--|
| Linux   | UNIX | <code>install_dir/samples/db2_silent_config.txt</code>             |
| Windows |      | <code>install_dir\tmaitm6_x64\samples\db2_silent_config.txt</code> |

2. In the response file, specify a value for the following parameters:

- In the **Username**, enter the user name of Db2 instance.

For Local Db2, enter the name of Db2 instance owner.

For Remote Db2, enter Actual Db2 instance owner name from remote Db2 machine.

**Important:** This parameter is mandatory for monitoring remote Db2 instance.

- In the **Password**, enter the password of Db2 instance.

For Local Db2, enter the password of Db2 instance owner.

For Remote Db2, enter Actual Db2 instance owner password from remote Db2 machine.

**Important:** This parameter is mandatory for monitoring remote Db2 instance.

- For the **DB2 SQL path** parameter, leave this field blank if the SQL definition file is available at the default directory. Otherwise, enter the correct directory path. The SQL definition file is available at the following default path:

**Linux** | **UNIX** CANDLEHOME/config/kudcussql.properties For example,  
**KUD\_DB2\_SQL\_PATH=** /opt/ibm/apm/agent/config/kudcussql.properties

**Windows** CANDLEHOME\TMAITM6\_x64\kudcussql.properties For example,  
**KUD\_DB2\_SQL\_PATH=** C:\IBM\ITM\TMAITM6\_x64\kudcussql.properties

- For the **dialog path** parameter, leave this field blank if the db2diag log file is available at the default directory. Otherwise, enter the correct directory path. The log file is available at the following default path:

**Linux** | **UNIX** /home/DB2owner\_home\_dir/sqlllib/db2dump  
For example, **KUD\_DIAGLOG\_PATH=** /home/db2inst1/sqlllib/db2dump.

**Windows** Windows Install\_Driver:\ProgramData\IBM\DB2\DB2COPY  
\DB2INSTANCENAME  
For example, **KUD\_DIAGLOG\_PATH=** C:\ProgramData\IBM\DB2\DB2COPY1\DB2

**Note:** This parameter is not applicable for remote monitoring.

- For the **dialog message ID filter** parameter, specify the *MSGID* to filter the diagnostic log. The MSGID is a combination of the message type, message number, and severity level. You can also use a regular expression, for example, **KUD\_DIAGLOG\_MSGID\_FILTER=** ADM1\d\*1E|ADM222\d2W.
  - For the **monitor remote partitions** parameter, enter Yes to specify that the Db2 agent monitors partitions in remote hosts. For example, **KUD\_MONITOR\_REMOTE\_PARTITIONS=** Yes.
  - For the **monitor all databases** parameter, enter Yes to specify that you want the Db2 agent to monitor all databases. For example, **KUD\_MONITOR\_ALL\_DATABASES=** Yes.
3. Save and close the db2\_silent\_config.txt file, and run the following command

**Linux** | **UNIX** *install\_dir/bin/db2-agent.sh config instance\_name*  
*install\_dir/samples/*  
*db2\_silent\_config.txt*

**Windows** *install\_dir\bin\db2-agent.bat config instance\_name*  
*\tmaitm6\_x64\samples\db2\_silent\_config.txt*

<instance\_name> is

- For monitoring Local Db2 server : The Db2 server instance name that you want to monitor.
- For monitoring Remote Db2 server : The catalog node name of remote Db2 server instance.

**Important:** Ensure that you include the absolute path to the silent response file. Otherwise, agent data is not shown in the dashboards.

4. For Windows, Open the CANDLEHOME\TMAITM6\_x64\KUDENV\_<instance\_name> file. And edit the line, KUD\_DB2\_CLIENT\_INST as KUD\_DB2\_CLIENT\_INST=<client instance name under which remote Db2 server instance is cataloged>
5. Run the following command to start the agent:

**Linux** | **UNIX** *install\_dir/bin/db2-agent.sh start instance\_name*  
**Windows** *install\_dir\bin\db2-agent.bat start instance\_name*

**Remember:** While monitoring remote Db2 server instance from UNIX or Linux, the command must be executed with the client instance owner under which remote server instance is cataloged.

## What to do next

- Grant privileges to the Db2 user to view data for some attributes of the Db2 agent. For information about granting these privileges, see [“Granting privileges for viewing Db2 metrics” on page 323](#).

- Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

## Granting privileges for viewing Db2 metrics

To monitor the Db2 resources, a Db2 user must have the Db2 SYSADM, SYSCTRL, SYSMANT, and SYSMON authorities for the monitored instance to view data for some attributes of the Db2 agent.

### About this task

To view the monitoring data that the agent collects for all the attributes on the dashboard, the Db2 user must have specific privileges. To assign these privileges to the Db2 user, run the script file that is present at the following location:

```
Linux | UNIX | install_dir/config/KudGrantUserPermissions.sh
Windows | install_dir\TMAITM6_x64\KudGrantUserPermissions.bat
```

A Db2 user with the SYSADM authority can run the script to grant privileges to itself or to any other Db2 user. For a Db2 instance, use the instance owner, which already has the SYSADM authority, to run the script to grant other permissions to itself or to grant all the permissions to any other Db2 user.

### Procedure

1. For local monitoring, refer the following steps.
  - a) On the system where the Db2 agent is installed, open the Db2 command-line interface.
  - b) Run the following command where *instance\_name* is the name of the Db2 instance and *username* is the name of the Db2 user:

```
Linux | UNIX | install_dir/config/KudGrantUserPermissions.sh
instance_name username
Windows | install_dir\TMAITM6_x64\KudGrantUserPermissions.bat
instance_name username
```

**Note:** For Windows systems, *username* is optional in the command. If a user name is not specified in the command, the privileges are assigned to the default user (system).

2. For remote monitoring, refer the following steps.
  - a) Copy KudGrantUserPermissions.sh for Unix or Linux and KudGrantUserPermissions.bat for Windows from *install\_dir/TMAITM6\_x64/* from agent workstation to Db2 server machine.
  - b) Run the following command from Db2 instance owner user where *instance\_name* is the name of the Db2 instance and *username* is the name of the Db2 user:

```
Linux | UNIX | ./KudGrantUserPermissions.sh instance_name username
Windows | KudGrantUserPermissions.bat instance_name username
```

**Remember:** For remote Db2 monitoring on Windows, the *username* must be the user name that is provided during the Db2 agent configuration at client workstation.

3. On HADR standby database, refer the following steps.
  - a) Copy KudGrantUserPermissions.sh for Unix or Linux and KudGrantUserPermissions.bat for Windows from *install\_dir/TMAITM6\_x64/* of agent workstation to Db2 server machine where the primary node of HADR is configured.
  - b) Run the following command from Db2 instance owner user where *instance\_name* is the name of the Db2 instance and *username* is the name of the standby Db2 user:

Windows

```
KudGrantUserPermissions.bat instance_name username
```

Linux

```
./KudGrantUserPermissions.sh instance_name username
```

- c) Switch to HADR standby instance to deactivate standby database and re-activate it. Deactivation and re-activation enable the privilege granting to take effect.

## Configuring local environment variables

You can configure local environment variables to change the behavior of the Db2 agent.

### Procedure

1. On Windows systems, click **Start > All Programs > IBM Monitoring agents > IBM Performance Management**.
2. In the **IBM Performance Management** window, from the **Actions** menu, click **Advanced > Edit ENV File**.
3. On Linux or AIX systems, go to the command line and edit the `ud.environment` file from the `install_dir/config` directory. Where, `install_dir` is the agent installation directory.

**Note:** The `ud.environment` file is a hidden file.

4. In the environment variable file, enter values for the environment variables.

For information about the environment variables that you can configure, see [“Local environment variables”](#) on page 324.

## Local environment variables

You can change the behavior of the Db2 agent by configuring the local environment variables.

### Variables for defining the data collection method for the tablespace data set

To set the method for data collection of the tablespace data set, use the following environment variables:

- **KUD\_T1\_BY\_SQL**: Use this variable to set the method of data collection for the tablespace data set by using SQL queries. To enable data collection by using SQL queries, set the value of this variable as Y. To collect data for the tablespace data set by using the snapshot method, set the value of this variable as N. The default value of this variable is N.

**Important:** To collect data by using SQL queries, the Db2 version must be 9.7, or later. Also, the user who starts the Db2 agent must have the SYSADM authority for all databases.

- **KUD\_T1\_DISABLE**: Use this variable to disable the data collection for the tablespace data set. To enable the data collection for the tablespace data set, set the value of this variable as N. To disable the data collection for the tablespace data set, set the value of this variable as Y. The default value of this variable is N.

### Variable for excluding the caching facility (CF) nodes from data collection

To exclude caching facility (CF) nodes from the data collection algorithm in pureScale® environment, use the **DB2\_CF\_PARTITION\_NUMS** variable. In the agent environment file, set the **DB2\_CF\_PARTITION\_NUMS** variable as `DB2_CF_PARTITION_NUMS=<CF node number>`. For example, `DB2_CF_PARTITION_NUMS=1`. For more than one CF node, set the **DB2\_CF\_PARTITION\_NUMS** variable value as a list that uses any special symbol from `# . : , ; | @` as delimiter. For example, `DB2_CF_PARTITION_NUMS=12,13,23,34`. No default value is set for this variable.

### Variable for limiting data collection for the Db2 Table data set

To set the maximum number of rows that the Db2 agent must return, while collecting data for the Db2 Table data set, use the **KUD\_TABLE\_NUMBER** environment variable. The default value is 10000.

## Variable for setting the reload interval of the customized SQL properties file

To set the reload time interval (in seconds) for the customized SQL properties file, use the **KUD\_CUS\_SQL\_INTERVAL** variable. The default value is 20 seconds.

## Variable for limiting the rows in the data collection for Agent Event data set

To set the number of rows for data collection of the Agent Event data set, use the **KUD\_AGENT\_EVENT\_CACHE** variable. The Agent Event data set provides detailed information about predefined and triggered events and determines problems with the health of the monitored database. The default value is 50.

## Variable for limiting the rows in the data collection for Db2 Log Record data set

To set the number of rows for data collection of the Db2 Log Record data set, use the **KUD\_DBHISTORY\_MAXROW** variable. The Db2 Log Record data set provides historical information about the Db2 archive log. The default value is 500.

## Variables for defining the data collection for the Db2 Diagnostic Log data set

To set the method for data collection of the Db2 Diagnostic Log data set, use the following environment variables:

- **KUD\_DIAGLOG\_BY\_TABLE**: Use this variable to set the method of data collection for the Db2 Diagnostic Log data set. If the value of this variable is set to Y, then data for the Db2 Diagnostic Log data set is collected by using SQL queries. If the value of this variable is set to N, then data for the Db2 Diagnostic Log data set is collected by parsing the `db2diag.log`. The default value of this variable is Y.

**Important:** To collect data by using SQL queries, the Db2 version must be 10, or later.

- **KUD\_DIAGLOG\_TAILCOUNT**: Use this variable to define the number of lines of the `db2diag.log` file that the Db2 agent parses for collecting data for the Db2 Diagnostic Log data set. This variable limits the Db2 agent to process the Db2 agent log file so that only the latest messages and events are monitored. The default value of this variable is 1000.
- **KUD\_DIAGLOG\_CACHE**: Use this variable to limit the number of log records that are displayed on the dashboard for the Db2 Diagnostic Log data set. The default value of this variable is 20.
- **KUD\_DIAGLOG\_INTERVAL**: Use this variable to define the reload time interval (in seconds) for the `db2diag.log` file for data collection for the Db2 Diagnostic Log data set. The default value of this variable is 30 seconds.
- **KUD\_DISABLE\_DIAGLOG**: Use this variable to disable the data collection for the Db2 Diagnostic Log data set. To enable the data collection for the Db2 Diagnostic Log data set, set the value of this variable as N. To disable the data collection for the Db2 Diagnostic Log data set, set the value of this variable as Y. The default value of this variable is N.

## Variable for setting the query timeout interval

If an SQL query takes a very long time to complete, it affects the performance of the Db2 agent. To set the query timeout interval for the Db2 agent, use the **KUD\_QUERY\_TIMEOUT** variable. Use this variable to define the maximum amount of time (in seconds) that the Db2 agent waits to receive a response for a query that is sent to the Db2 server. The value for this variable must be less than 300 seconds. The default value of this variable is 45 seconds.

## Variable for defining the data collection for the DB2 Database01 (Superseded) data set

The agent must not trigger ASN queries to collect data for the DB2 Database01 (Superseded) data set when ASN schemas are not present. To enable the execution of the ASN queries, use the **KUD\_REPLICATION\_ON** variable. If the value of this variable is set to Y, the Db2 agent runs ASN queries

even when the ASN schemas are not present. If the value of this variable is set to N, the Db2 agent does not run the ASN queries. The default value of this variable is Y.

### **Variable for configuring the monitor switches when collecting data by using the snapshot method**

If you want to collect the Db2 agent monitoring data by using the snapshot method, enable the Db2 monitor switch for the data set. To enable the Db2 monitor switch, use the **KUD\_MON\_SWITCH\_OVERRIDE** variable. The list of Db2 monitor switches is as follows:

**LOCK**

Lock Information

**SORT**

Sorting Information

**STATEMENT**

SQL Statement Information

**TABLE**

Table Activity Information

**TIMESTAMP**

Take Timestamp Information

**UOW**

Unit of Work Information

If the value of this variable is set to Y, the Db2 agent retains the configuration setting of the Db2 monitor switches. If the value of this variable is set to N, the Db2 agent enables all the monitor switches to collect data. The default value of this variable is N.

### **Variable for tracing the Db2 snapshot buffer data of an data set**

To view the data that is collected for an data set by using the snapshot method, use the **KUD\_SNAPSHOT\_DUMPOUT** variable. If the value of this variable is set to Y, the Db2 agent dumps the snapshot buffer data for attribute groups in the agent log file. If the value of this variable is set to N, the Db2 agent does not dump the snapshot buffer data in the agent log file. The default value of this variable is N.

### **Variable for tracing the Db2 agent by using the snapshot buffer data of an data set**

To trace the Db2 agent by using the snapshot buffer data that is collected for an data set, use the **KUD\_SNAPSHOT\_READIN** variable. To enable the tracing of Db2 agent, set the value of this variable as Y. To disable the tracing of Db2 agent, set the value of this variable as N.

### **Variable for defining the data collection method for the Locking Conflict data set**

To set the method of data collection for the Locking Conflict data set, use the **KUD\_LOCKCONFLICT\_BY\_SQL** variable. To collect data for the Locking Conflict data set by using SQL queries, set the value of this variable as Y. To collect data for the Locking Conflict data set by using the snapshot method, set the value of this variable as N. The default value of this variable is Y.

**Important:** To collect data by using SQL queries, the Db2 version must be 9.7 FP1, or later. Also, the user who starts the Db2 agent must have SYSADM authority for all databases.

### **Variable to monitor remote Db2 server on Windows**

**KUD\_DB2\_CLIENT\_INST:** Set this variable to Db2 client instance name under which remote Db2 server instance is cataloged. You need to set this variable only if you are using remote monitoring where agent is on Windows.

## Prerequisites for Remote Monitoring

You can use Monitoring Agent for Db2 for remote monitoring. Refer the topic for prerequisites of remote monitoring of Db2.

### About this task

For remote monitoring of Db2, you must first do the basic Db2 client/server environment setup. Do this setup for Windows and UNIX or Linux.

For this set up a user must have Db2 SYSADM or SYSCTRL authority.

**Remember:** Run all the steps on agent workstation except for step 2.

### Procedure

1. On the Db2 agent workstation, install Db2 client. The version of this client must be greater than or equal to that of Db2 server instance version that is to be monitored.
2. Verify that the communication protocol for Db2 instance is TCPIP.
  - a) To verify, run the command **db2set** on the Db2 command line.
  - b) If it is not set to TCPIP, then run **db2set DB2COMM=tcPIP** in Db2 command line.

**Important:** This step is done at the server side.

3. Catalog the remote server instance at Db2 agent workstation with following command.

**Important:** The server instance is to be cataloged under the client instance. So run following command on the client instance.

```
db2=>CATALOG TCPIP NODE<node_name> REMOTE <hostname/ip_address> SERVER  
<service_name/port_number>
```

on Db2 where

- a. <node\_name> represents a local nickname of Db2 instance on client component.

**Note:** For UNIX or Linux, <node\_name> must not be same as of any Db2 client or Db2 server instance name available on the same workstation.

- b. <hostname/ip\_address> represents name or IP address of the Db2 server workstation.
- c. <service\_name/port\_number> at which Db2 TCPIP configured.

To catalog Db2 server instance running on port number 50000 on remote server "myserver" as node "db2node", enter the following command from a Db2 command line

```
db2 => CATALOG TCPIP NODE db2node REMOTE myserver SERVER 50000
```

For more details on catalog node, refer [https://www.ibm.com/support/knowledgecenter/SSEPGG\\_11.1.0/com.ibm.db2.luw.qb.client.doc/doc/t0005621.html](https://www.ibm.com/support/knowledgecenter/SSEPGG_11.1.0/com.ibm.db2.luw.qb.client.doc/doc/t0005621.html)

4. If Db2 agent workstation is UNIX/Linux,

- Create a user with node name, which is used in cataloging command

Issue the command

```
useradd -g <group> -m -d <home_dir> <user> -p <password>
```

where

- <group> represents a group for the DB2 UDB instance owners.
- <user> represents a local **username** on client workstation. **Username** must be same as node name by which the server instance has been cataloged on agent machine.
- Check the Db2 client instance name under which remote Db2 server instance is cataloged and assign the read, write, execute permissions of the newly created user's home directory to the owner of this

instance. This step is necessary to make the client Db2 environment available for operations on remote node

- Issue the command

```
chmod -R 775 /home/<nodename>
```

where

- **<nodename>** represents a local username of Db2 instance on client component

5. Catalog all the databases that you want to monitor on the client instance present at Db2 agent workstation.

Issue the command in the Db2 CLP to catalog the database.

```
CATALOG DATABASE <db_name> AS <db_alias> AT NODE <node_name>authentication server
```

- a. **<db\_name>** represents server database name.
- b. **<db\_alias>** represents local nickname for database at Db2 client.
- c. **<node\_name>** represents a local nickname of Db2 instance on client component at which database is cataloged.

To catalog a database called "sample" on catalog node "db2node" with alias as "dbAlias1", enter the following command from a Db2 prompt.

```
db2 => CATALOG DATABASE sample AS dbAlias1 AT NODE db2node authentication server
```

## Configuring Hadoop monitoring

---

You must configure the Monitoring Agent for Hadoop so that the agent can collect data of a Hadoop cluster that it monitors. The agent can monitor a single node Hadoop cluster and a multi-node Hadoop cluster.

### Before you begin

Review the hardware and software prerequisites. For the up-to-date system requirement information, see the [Software Product Compatibility Reports \(SPCR\)](#) for the Hadoop agent.

Ensure that the following hosts can be resolved from the computer where the Hadoop agent is installed:

- All the Hadoop hosts that you want to configure, such as NameNode, ResourceManager, and so on
- Hadoop hosts with only the NodeManager role

For example, you can complete these steps to resolve hosts:

- Add the IP address, host name, and fully qualified domain name of all the Hadoop hosts to the hosts file that is available at the following path:

```
– Windows C:\Windows\System32\drivers\etc\hosts
```

```
– AIX Linux /etc/hosts
```

- Add the computer where the Hadoop agent is installed in the same domain as that of Hadoop hosts.

**Remember:** To monitor a Hadoop cluster that is secured with Kerberos SPNEGO-based authentication, ensure that all the hosts can be resolved from the computer where the Hadoop agent is installed.

### About this task

The Hadoop agent is a single instance agent. You must configure the agent manually after it is installed. The Hadoop agent can be configured on Windows, Linux, and AIX systems.

**Remember:**

- For a single node Hadoop cluster, the same node performs all the roles, such as NameNode, ResourceManager, and secondary NameNode according to configuration of the Hadoop cluster. However, for a multi-node Hadoop cluster, different Hadoop nodes perform these roles.
- When you configure the agent, the agent automatically detects DataNodes and NodeManagers in the Hadoop cluster that is being monitored.
- Restart the agent if additional **namenodes** are configured in the HA enabled Hadoop cluster after the agent is started.
- If the Hadoop flavor configured with Hadoop Agent is Cloudera, the **name** and **displayname** of the Hadoop cluster must not contain the character %.

When you upgrade from the socket - based agent (8.1.2 Fix Pack 2, or earlier) to the REST API - based agent (8.1.3, or later), complete the configuration steps that are specified in the subsequent topics. However, ensure that you specify the host names according to the following guidelines when you configure the agent.

- The host name of various daemon processes (NameNode, ResourceManager, and so on) that you specify must be the same (case and format) as the host names that are configured for the socket - based agent.
- The fully qualified domain name (FQDN) must be used when you specify a host name. For example, `hos1.ibm.com`. If the length of the FQDN exceeds 25 characters, specify only the short host name without the domain name. For example, if the FQDN of a host is `myhadoopclustersetupnode.ibm.com`, the short host name is `myhadoopclustersetupnode`.

After you configure the agent that is upgraded, and view data in the Cloud APM console, revert the changes that were made in the `hadoop-metrics2.properties` file for the Hadoop agent. For details, see [“Upgrading your agents” on page 1340](#).

On Windows systems, you can run the Hadoop agent with a non-administrator user. However, such user requires a specific permission to view data in the dashboards. For information about how to grant this permission, see [“Granting permission to non-admin users” on page 338](#).

The product version and the agent version often differ. The directions here are for the most current release of this agent. For information about how to check the version of an agent in your environment, see [Agent version command](#). For detailed information about the agent version list and what's new for each version, see the [“Change history” on page 58](#).

## Configuring the agent on Windows systems

You can configure the agent on Windows systems by using the **IBM Performance Management** window.

### Procedure

1. Click **Start > All Programs > IBM Monitoring agents > IBM Performance Management**.
2. In the **IBM Performance Management** window, right-click **Monitoring Agent for Hadoop**.
3. Click **Configure agent**.

**Attention:** If **Configure agent** is disabled, click **Reconfigure**.

The **Configure Monitoring Agent for Hadoop** window opens.

4. To monitor the Hadoop cluster with the Kerberos SPNEGO-based authentication enabled, complete these steps:
  - a) Under **Is Kerberos SPNEGO-based authentication for HTTP based Hadoop services in Hadoop cluster enabled**, click **Yes**.  
If you do not have Kerberos SPNEGO-based authentication to secure REST endpoints of HTTP based Hadoop services in the Hadoop cluster, click **No** and then the values for the **Realm name**, **KDC Hostname**, **SPNEGO principal name** and **SPNEGO keytab file** fields can be kept as blank.
  - b) In the **Realm name** field, enter the name of the Kerberos realm that is used to create service principals.

Usually, a realm name is the same as your domain name. For instance, if your computer is in the `tivoli.ibm.com` domain, the Kerberos realm name is `TIVOLI.IBM.COM`. This name is case sensitive.

- c) In the **KDC Hostname** field, enter the fully qualified domain name (FQDN) of the Key Distribution Center (KDC) host for the specified realm.  
You can also specify the IP address of the KDC host instead of FQDN. In case of Active Directory KDC, Domain controller is the KDC host.
  - d) In the **SPNEGO principal name** field, enter the name of the Kerberos principal that is used to access SPNEGO authenticated REST endpoints of HTTP-based services.  
The name is case sensitive, and the name format is `HTTP/fully_qualified_host_name@kerberos_realm`
  - e) In the **SPNEGO keytab file** field, enter the name of the keytab file for the SPNEGO service with its full path, or click **Browse** and select it.  
The keytab file contains the names of Kerberos service principals and keys. This file provides direct access to Hadoop services without requiring a password for each service. The file can be located at the following path: `etc/security/keytabs/`  
Ensure that the SPNEGO principal name and the keytab file belong to the same host. For instance, if the principal name is `HTTP/abc.ibm.com@IBM.COM`, the keytab file that is used must belong to the `abc.ibm.com` host.  
If the agent is installed on a remote computer, copy the keytab file of the principal to the remote computer at any path, and then specify this path in the **SPNEGO keytab file** field.
  - f) Click **Next**.
5. To monitor Hadoop cluster with HTTPS/SSL enabled, complete these steps:
- a) Under **Are Hadoop daemons-HDFS, YARN and MapReduce/MapReduce2 SSL enabled**, click **Yes**  
If you do not want the SSL enabled Hadoop cluster select **No** and then the values for the **TrustStore file path**, **TrustStore Password** fields can be kept as blank.
  - b) In **TrustStore file path**, select the TrustStore file stored at your local machine.  
This file can be copied from the Hadoop cluster to your local machine and then used for configuration.
  - c) In **TrustStore Password**, enter the password you created while configuring the TrustStore file.
6. To specify values for the parameters of the Hadoop cluster, complete these steps:
- a) In the **Unique Hadoop Cluster Name** field, enter the unique name for the Hadoop cluster indicating Hadoop version and flavor. The maximum character limit for this field is 12.
  - b) In the **NameNode Hostname** field, enter the host name of the node where the daemon process for NameNode runs.
  - c) In the **NameNode Port** field, enter the port number that is associated with the daemon process for NameNode. The default port number is 50070.
  - d) In the **ResourceManager Hostname** field, enter the host name of the node where the daemon process for ResourceManager runs.
  - e) In the **ResourceManager Port** field, enter the port number that is associated with the daemon process for ResourceManager. The default port number is 8088.
  - f) Optional: In the **JobHistoryServer Hostname** field, enter the host name of the node where the daemon process for JobHistoryServer runs.
  - g) Optional: In the **JobHistoryServer Port** field, enter the port number that is associated with the daemon process for JobHistoryServer. The default port number is 19888.
  - h) Optional: In the **Additional NameNode Hostname** field, enter the host name where the daemon process for a Standby NameNode or a Secondary NameNode runs.
  - i) Optional: In the **Additional NameNode Port** field, enter the port number that is associated with the daemon process for a Standby NameNode or a Secondary NameNode.

**Remember:** If the additional NameNode is a Standby NameNode, the default port number that is associated with the Standby NameNode daemon process is 50070. If the additional NameNode is a Secondary NameNode, the default port number that is associated with the Secondary NameNode daemon process is 50090.

- j) Click **Test Connection** to verify connection to the specified host names and ports.

After you click **Test Connection**, an appropriate validation message is displayed when:

- The connection to the specified host names and ports is made or failed.
- A value for a host name is kept as blank.
- A value for a port is kept as blank.
- A non-integer value is specified for a port number.

Update the configuration values as suggested in the validation messages, and verify the connection again.

- k) Optional: To add Standby ResourceManagers in the Hadoop cluster, click **Yes** under **Standby ResourceManager (s) in Hadoop Cluster**.

You are prompted to add the details of Standby ResourceManagers later.

- l) Optional: To monitor Hadoop services in the Hadoop cluster that is managed by Apache Ambari, click **Yes** under **Monitoring of Hadoop services for Ambari based Hadoop installations**, and then click **Next**.
- m) Optional: To monitor Cloudera Manager services in the Cloudera Hadoop cluster, click **Yes** under **Monitoring of Cloudera Manager services for Cloudera Hadoop installations**, and then click **Next**.

7. Optional: To specify the details of the Ambari server for monitoring Hadoop services, complete the following steps:

- a) In the **Ambari server Hostname** field, enter the host name where the Ambari server runs.
- b) In the **Ambari server Port** field, enter the port number that is associated with the Ambari server. The default port number is 8080.
- c) In the **Username of Ambari user** field, enter the name of the Ambari user.
- d) In the **Password of Ambari user** field, enter the password of the Ambari user.
- e) In the **Are Ambari Services SSL enabled** user field, click **Yes**.

If you do not want the SSL enabled Ambari Services select **No** and then the values for the TrustStore file path, TrustStore Password fields can be kept as blank.

- f) In **TrustStore file path**, select the TrustStore file stored at your local machine. This file can be copied from the Hadoop cluster to your local machine and then used for configuration.
- g) In **TrustStore Password**, enter the password you created while configuring the TrustStore file.

**Note:** If the values for the fields **TrustStore file path** and **TrustStore Password** are provided in Step 5 and are same, then the values for fields **TrustStore file path** and **TrustStore Password** can be kept as blank.

- h) Click **Next**.

8. Optional: To specify the details of the Cloudera Manager server for monitoring Cloudera Manager services, complete the following steps:

- a) In the **Cloudera Manager server Hostname** field, enter the host name where the Cloudera Manager server runs.
- b) In the **Cloudera Manager server Port** field, enter the port number that is associated with the Cloudera Manager server. The default port number for HTTP based Cloudera Manager server is 7180.
- c) In the **Username of Cloudera Manager server** user field, enter the name of the Cloudera Manager server's user.

- d) In the **Password of Cloudera Manager server user** field, enter the password of the Cloudera Manager server's user.
  - e) In the **Are Cloudera Manager Services SSL enabled** user field, click **Yes**.  
If you do not want the SSL enabled Cloudera Manager Services select **No** and then the values for the **TrustStore file path**, **TrustStore Password** fields can be kept as blank.
  - f) In **TrustStore file path**, select the **TrustStore** file stored at your local machine. This file can be copied from the Hadoop cluster to your local machine and then used for configuration.
  - g) In **TrustStore Password**, enter the password you created while configuring the **TrustStore** file.  
**Note:** If the values for the fields **TrustStore file path** and **TrustStore Password** are provided in Step 5 and are same, then the values for fields **TrustStore file path** and **TrustStore Password** can be kept as blank.
  - h) Click **Next**.
9. To specify values for the Java parameters, complete these steps:
    - a) From the **Java trace level** list, select a value for the trace level that is used by Java providers.
    - b) Optional: In the **JVM arguments** field, specify a list of arguments for the Java virtual machine.  
The list of arguments must be compatible with the version of Java that is installed along with the agent.
    - c) Click **Next**.
  10. Optional: To add Standby ResourceManagers, complete the following steps:
    - a) Click **New**.
    - b) In the **Standby ResourceManager Hostname** field, enter the host name of the node where the daemon process for Standby ResourceManager runs.
    - c) In the **Standby ResourceManager Port** field, enter the port number that is associated with the daemon process for Standby ResourceManager. The default port number is 8088.
    - d) Click **Test Connection** to validate connection to the specified host name and the port number.  
After you click **Test Connection**, an appropriate validation message is displayed when:
      - The connection to the specified host names and ports is made or failed.
      - A value for a host name is kept as blank.
      - A value for a port is kept as blank.
      - A non-integer value is specified for a port number.
 Update the configuration values as suggested in the validation messages, and verify the connection again.
    - e) Repeat steps a, b, and c to add more Standby ResourceManagers.  
If you want to remove any of the Standby ResourceManagers, click **Delete** corresponding to the Standby ResourceManager that you want to remove.
    - f) Click **Next**.
  11. In the **Class path for external jars** field, specify the class path for JAR files.  
This class path is added to the class path that is generated by the agent. You can keep this field blank.
  12. Click **OK**.  
The specified configuration settings are saved.
  13. Right-click **Monitoring Agent for Hadoop** and click **Start**.

## What to do next

1. Enable the subnode events to view eventing thresholds of the Hadoop agent. For information about enabling subnode events, see [“Configuring the dashboard for viewing Hadoop events” on page 338](#).

2. Log in to the Cloud APM console to view data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

## Configuring the agent on Linux and AIX systems

You run the configuration script and respond to prompts to configure the agent on Linux and AIX systems.

### Procedure

1. On the command line, run the following command: `install_dir/bin/hadoop-agent.sh config`  
Where `install_dir` is the installation directory of Hadoop agent.  
The agent is installed at the following default installation directory:  
`/opt/ibm/apm/agent`
2. When the command line displays the following message, type 1 to continue with the configuration steps and press Enter.  
Edit "Monitoring Agent for Hadoop" setting? [1= yes, 2= No]
3. When the command line displays the following message, type 1 to specify values for monitoring the Hadoop cluster with the Kerberos SPNEGO-based authentication enabled, and press Enter.  
Otherwise, type 2 and press Enter, and you can keep a blank value for the **Realm name**, **KDC Hostname**, **SPNEGO principal name**, and **SPNEGO keytab file** fields:  
Is Kerberos SPNEGO-based authentication for HTTP based Hadoop services in Hadoop cluster enabled\?: [ 1=Yes, 2=No (default is: 2)]
  - a) For the **Realm name** parameter, enter the name of the Kerberos realm that is used to create service principals.  
Usually, a realm name is the same as your domain name. For instance, if your computer is in the `tivoli.ibm.com` domain, the Kerberos realm name is `TIVOLI.IBM.COM`. This name is case sensitive.
  - b) In the **KDC Hostname** field, enter the fully qualified domain name (FQDN) of the Key Distribution Center (KDC) host for the specified realm. You can also specify the IP address of the KDC host instead of FQDN. In case of Active Directory KDC, Domain controller is the KDC host
  - c) For the **SPNEGO principal name** parameter, enter the name of the Kerberos principal that is used to access SPNEGO authenticated REST endpoints of HTTP-based services.  
The name is case sensitive, and the name format is `HTTP/fully_qualified_host_name@kerberos_realm`
  - d) For the **SPNEGO keytab file** parameter, enter the name of the keytab file for the SPNEGO service with its full path.  
The keytab file contains the names of Kerberos service principals and keys. This file provides direct access to Hadoop services without requiring a password for each service. The file can be located at the following path: `etc/security/keytabs/`  
Ensure that the SPNEGO principal name and the keytab file belong to the same host. For instance, if the principal name is `HTTP/abc.ibm.com@IBM.COM`, the keytab file that is used must belong to the `abc.ibm.com` host.  
If the agent is installed on a remote computer, copy the keytab file of the principal to the remote computer at any path, and then specify this path for the **SPNEGO keytab file** parameter.
4. When the command line displays the following message, type 1 to specify values for monitoring the Hadoop **daemons-HDFS**, **YARN** and **MapReduce/MapReduce2** with the SSL enabled, and press **Enter**. Otherwise, type 2 and press **Enter**, and you can keep a blank value for the **TrustStore file path** and **TrustStore Password** fields:  
Are Hadoop **daemons-HDFS**, **YARN** and **MapReduce/MapReduce2** SSL enabled [ 1=Yes, 2=No (default is: 2)]
  - a) In **TrustStore file path**, specify the path of TrustStore file stored at your local machine.  
This file can be copied from the Hadoop cluster to your local machine and then used for configuration.

- b) In **TrustStore Password**, specify the password you created while configuring the TrustStore file.
- 5. When you are prompted to enter the details of the Hadoop cluster, specify an appropriate value for each of the following parameters, and press Enter.
  - a) In the **Unique Hadoop Cluster Name**, specify the unique name for the Hadoop cluster indicating Hadoop version and flavor. The maximum character limit for this field is 12.
  - b) For the **NameNode Hostname** parameter, specify the host name of the node where the daemon process for NameNode runs, and press Enter.

**Attention:** If you press Enter without specifying a host name, you are prompted to enter the host name.

- c) For the **NameNode Port** parameter, specify the port number that is associated with the daemon process for NameNode, and press Enter. The default port number is 50070.
- d) For the **ResourceManager Hostname** parameter, specify the host name of the node where the daemon process for ResourceManager runs, and press Enter.

**Attention:** If you press Enter without specifying a host name, you are prompted to enter the host name.

- e) For the **ResourceManager Port** parameter, enter the port number that is associated with the daemon process for ResourceManager. The default port number is 8088.
- 6. Optional: When you are prompted to add the details of the following parameters of the Hadoop cluster, accept the default value or specify an appropriate value for each of the following parameters, and press Enter:
  - a) For the **JobHistoryServer Hostname** parameter, enter the host name of the node where the daemon process for JobHistoryServer runs.
  - b) For the **JobHistoryServer Port** parameter, enter the port number that is associated with the daemon process for JobHistoryServer. The default port number is 19888.
  - c) For the **Additional NameNode Hostname** parameter, enter the host name of the node where the daemon process for a Secondary or a Standby NameNode runs.
  - d) For the **Additional NameNode Port** parameter, enter the port number that is associated with the daemon process for a Secondary or a Standby NameNode. The default port number for a Secondary NameNode is 50090. For a Standby NameNode, the default port number is 50070.
- 7. Optional: When the command line displays the following message, enter 1 to add details of Standby ResourceManagers for high-availability cluster, and press Enter.  
 Standby ResourceManager(s) in Hadoop Cluster [ 1=Yes, 2=No ] (default is: 2):
- 8. When the command line displays the following message, specify 1 and press Enter to monitor Hadoop services in the Hadoop cluster that is managed by Ambari:  
 Monitoring of Hadoop services for Ambari based Hadoop installations  
 [ 1=Yes, 2=No ] (default is: 2):  
 Otherwise, retain the default value of 2 and press Enter. If you enable the monitoring of Hadoop services, specify a value for each of the following parameters of Ambari server, and press Enter:
  - a) For the **Ambari server Hostname** parameter, enter the host name where the Ambari server runs.
  - b) For the **Ambari server Port** parameter, enter the port number that is associated with the Ambari server.  
 The default port number is 8080.
  - c) For the **Username of Ambari user** parameter, enter the name of the Ambari user.
  - d) For the **Password of Ambari user** parameter, enter the password of the Ambari user.
  - e) When the command line displays the following message, type 1 to specify values for monitoring the Ambari services with SSL enabled, and press Enter. Otherwise, type 2 and press Enter, and you can keep a blank value for the **TrustStore file path** and **TrustStore Password** fields:  
 Are Ambari Services SSL enabled [ 1=Yes, 2=No (default is: 2)

- i) In **TrustStore file path**, specify the path of TrustStore file stored at your local machine. This file can be copied from the Hadoop cluster to your local machine and then used for configuration.
- ii) In **TrustStore Password**, specify the password you created while configuring the TrustStore file.

**Note:** If the values for the fields **TrustStore file path** and **TrustStore Password** are provided in Step 4 and are same, then the values for fields **TrustStore file path** and **TrustStore Password** can be kept as blank.

9. When the command line displays the following message, specify 1 and press Enter to monitor Cloudera Manager services in the Hadoop cluster:  
Monitoring of Cloudera Manager services for Cloudera Hadoop installations  
[ 1=Yes, 2=No ] (default is: 2):  
Otherwise, retain the default value of 2 and press Enter. If you enable the monitoring of Cloudera Manager services, specify a value for each of the following parameters of Cloudera Manager server, and press Enter:
  - a) For the **Cloudera Manager server Hostname** parameter, enter the host name where the Cloudera Manager server runs.
  - b) For the **Cloudera Manager server Port** parameter, enter the port number that is associated with the Cloudera Manager server.  
The default port number for HTTP based Cloudera Manager server is 7180.
  - c) For the **Username of Cloudera Manager server** user parameter, enter the name of the Cloudera Manager server's user.
  - d) For the **Password of Cloudera Manager server** user parameter, enter the password of the Cloudera Manager server's user.
  - e) When the command line displays the following message, type 1 to specify values for monitoring the Cloudera Manager services with SSL enabled, and press Enter. Otherwise, type 2 and press Enter, and you can keep a blank value for the **TrustStore file path** and **TrustStore Password** fields:  
Are Cloudera Manager Services SSL enabled [ 1=Yes, 2=No (default is: 2)
    - i) In **TrustStore file path**, specify the path of TrustStore file stored at your local machine. This file can be copied from the Hadoop cluster to your local machine and then used for configuration.
    - ii) In **TrustStore Password**, specify the password you created while configuring the TrustStore file.

**Note:** If the values for the fields **TrustStore file path** and **TrustStore Password** are provided in Step 4 and are same, then the values for fields **TrustStore file path** and **TrustStore Password** can be kept as blank.
10. When the command line displays the following message, select the appropriate Java trace level and press Enter:  
This parameter allows you to specify the trace level used by the Java providers Java trace level [ 1=Off, 2=Error, 3=Warning, 4=Information, 5=Minimum Debug, 6=Medium Debug, 7=Maximum Debug, 8=All ] (default is: 2)
11. Optional: When the command line displays the following message, specify the arguments for the Java virtual machine, and press Enter. The list of arguments must be compatible with the version of Java that is installed along with the agent.  
This parameter allows you to specify an optional list of arguments to the java virtual machine JVM arguments (default is:)
12. Optional: When the command line displays the following message, enter 1 to add the following details of Standby ResourceManagers, and press Enter:  
Edit "Hadoop High Availability(HA) Cluster with Standby ResourceManagers" settings, [1=Add, 2=Edit, 3=Del, 4=Next, 5=Exit] (default is: 5): 1

- a) For the **Standby ResourceManager Hostname** parameter, enter the host name of the node where the daemon process for Standby ResourceManager runs.
  - b) For **Standby ResourceManager Port**, enter the port number that is associated with the daemon process for Standby ResourceManager. The default port number is 8088.
  - c) When you are prompted, enter 1 to add more Standby ResourceManagers, and repeat steps [a](#) and [b](#), or enter 5 to go to the next step.
    - To edit the configuration settings of a specific Standby ResourceManager, type 4 and press Enter until you see the host name of the required Standby ResourceManager.
    - To remove a Standby ResourceManager, type 3 and press Enter after you see the host name of the Standby ResourceManager that you want to remove.
13. When you are prompted, enter the class path for the JAR files that the Java API data provider requires, and press Enter.
- The specified configuration values are saved, and a confirmation message is displayed.
14. Run the following command to start the agent: `install_dir/bin/hadoop-agent.sh start`

## What to do next

1. Enable the subnode events to view eventing thresholds of the Hadoop agent. For information about enabling subnode events, see [“Configuring the dashboard for viewing Hadoop events” on page 338](#).
2. Log in to the Cloud APM console to view data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

## Configuring the agent by using the silent response file

The silent response file contains the agent configuration parameters. For some parameters, the default values are provided in comments. You can specify different values for these parameters, and remove the comment tags that are placed at the beginning of the parameters.

### About this task

You can use the silent response file to configure the Hadoop agent on Linux, AIX, and Windows systems.

### Procedure

1. Open the silent response file that is available at this path: `install_dir\samples\hadoop_silent_config.txt`
2. In the response file, complete the following steps:
  - a) When you want to monitor the Hadoop Cluster that is enabled for Kerberos SPNEGO-based authentication, specify yes and enter values for the following parameters:

```
HADOOP_REALM_NAME
HADOOP_KDC_HOSTNAME
HADOOP_PRINCIPAL_NAME
HADOOP_SPNEGO_KEYTAB
```

- b) To monitor SSL enabled Hadoop **daemons - HDFS, YARN** and **MapReduce/MapReduce2**, specify Yes for **HADOOP\_SSL** parameter and enter the values for the following parameters:

```
HADOOP_TRUSTSTORE_PATH
HADOOP_TRUSTSTORE_PASSWORD
```

- c) Enter values for the following parameters of Cluster, NameNode (NN), ResourceManager (RM), and Job History Server (JHS):

```
HADOOP_CLUSTER_NAME (optional)
HADOOP_NN_HOSTNAME
HADOOP_NN_PORT
HADOOP_RM_HOSTNAME
HADOOP_RM_PORT
```

```
HADOOP_JHS_HOSTNAME (optional)
HADOOP_JHS_PORT (optional)
```

- d) Optional: For the **HADOOP\_ADDITIONAL\_NN\_HOSTNAME** parameter, specify the host name of the Standby or Secondary NameNode.

- e) Optional: For the **HADOOP\_ADDITIONAL\_NN\_PORT** parameter, specify the port number of the Standby or Secondary NameNode.

**Remember:** If the additional NameNode is a Standby NameNode, the default port number that is associated with the Standby NameNode daemon process is 50070. If the additional NameNode is a Secondary NameNode, the default port number that is associated with the Secondary NameNode daemon process is 50090.

- f) Optional: For the **Hadoop\_SRM** parameter, specify Yes to add Standby ResourceManagers for a high-availability cluster, and go to [step g](#).
- g) Optional: To monitor SSL enabled Ambari services, specify Yes for the **AMBARI\_SSL** parameter and enter the values of following parameters:

```
HADOOP_AMBARI=YES
AMBARI_SERVER_HOSTNAME
AMBARI_SERVER_PORT
USERNAME_OF_AMBARI_USER
PASSWORD_OF_AMBARI_USER
AMBARI_TRUSTSTORE_PATH (optional)
AMBARI_TRUSTSTORE_PASSWORD (optional)
```

**Note:** If the values for the fields **TrustStore file path** and **TrustStore Password** are provided in sub-step b and are same, then the values for fields **TrustStore file path** and **TrustStore Password** can be kept as blank.

- h) Optional: To monitor SSL enabled Cloudera Manager services, specify Yes for **CDH\_SSL** parameter and enter the values of following parameters:

```
HADOOP_CMSERVICE=Yes
HADOOP_CM_HOSTNAME
HADOOP_CM_PORT
USERNAME_OF_CM
PASSWORD_OF_CM_USER
CDH_TRUSTSTORE_PATH (optional)
CDH_TRUSTSTORE_PASSWORD (optional)
```

**Note:** If the values for the fields **TrustStore file path** and **TrustStore Password** are provided in sub-step b and are same, then the values for fields **TrustStore file path** and **TrustStore Password** can be kept as blank.

- i) For the **JAVA\_TRACE\_LEVEL** parameter, specify the appropriate trace level.
- j) Optional: For the **JAVA\_JVM\_ARGS** parameter, specify arguments for the Java™ virtual machine.
- k) Optional: Add the host name and the port number of a Standby ResourceManager in the following format: `HADOOP_SRM_PORT.hadoop_srm_config_sec_1=8088`

Where, *hadoop\_srm\_config\_sec\_1* is the host name of the node where the daemon process for Standby ResourceManager runs, and 8088 is the default port number. To add more Standby ResourceManagers, add the host name and port number of other Standby ResourceManagers on new lines in the same format.

3. Save the response file, and run the following command:

```
Linux | UNIX install_dir/bin/hadoop-agent.sh config install_dir/
samples/hadoop_silent_config.txt
Windows install_dir/bin/hadoop-agent.bat config install_dir/samples/
hadoop_silent_config.txt
```

4. Start the agent:

```
Linux | UNIX Run the following command: install_dir\bin\hadoop-agent.sh start
Windows Right-click Monitoring Agent for Hadoop and then click Start.
```

## What to do next

1. Enable the subnode events to view eventing thresholds of the Hadoop agent. For information about enabling subnode events, see [“Configuring the dashboard for viewing Hadoop events”](#) on page 338.
2. Log in to the Cloud APM console to view data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console”](#) on page 1109.

## Configuring the dashboard for viewing Hadoop events

You must configure the dashboard to enable the subnode events so that the **Events** tab can display Hadoop events.

### About this task

The default value for **Enable Subnode Events** is false. Change this value to true for viewing Hadoop events.

### Procedure

1. Open the Cloud APM console and go to **System Configuration**.
2. On the **Advanced Configuration** page, click **UI Integration** under **Configuration Categories**.
3. From the **Enable Subnode Events** list, select **True**.
4. Click **Save**.

## Granting permission to non-admin users

On Windows systems, grant the *Debug program* permission to a non-admin user for running the Hadoop agent. This permission is required to view data in the Hadoop agent dashboards.

### Procedure

Complete the following steps on the computer where the Hadoop agent is installed:

1. Click **Start > Control Panel > Administrative Tools**.
2. Double-click **Local Security Policy**.
3. In the Security Settings pane, expand **Local Policies** and click **User Rights Assignment**.
4. Right-click **Debug programs** and click **Properties**.
5. Click **Add User or Group**, and add the non-admin user name to which you want to grant this permission.
6. Click **OK**.

### What to do next

Configure and run the Hadoop agent with the non-admin user.

## Configuring HMC Base monitoring

---

The Monitoring Agent for HMC Base provides you with the capability to monitor the Hardware Management Console (HMC). The agent monitors the availability and health of the HMC resources: CPU, memory, storage, and network. The agent also reports on the HMC inventory and configuration of Power servers, CPU pools, and LPARs. The CPU utilization of the Power servers, LPARs, and pools are monitored by using HMC performance sample data.

### Before you begin

Before you configure the HMC Base agent, you must complete the following tasks:

- Set up SSH connection between the system that is running the agent and the HMC. For more information, see [“Setting up the SSH connection”](#) on page 340.

- Prepare HMC SDK before you start the first agent instance. For more information, see [“Preparing SDK for HMC”](#) on page 341.

## Procedure

- To configure the agent by editing the silent response file and running the script with no interaction, complete the following steps:
  1. Open the `hmc_base_silent_config.txt` file in a text editor:
    -  `install_dir/samples/hmc_base_silent_config.txt`.
  2. For **HMC Hostname**, you can specify the IP address or host name.
  3. For **HMC Username**, you must enter the logon user name for the HMC, for example, **HMC\_USERNAME= hscroot**.
 

**Note:** The logon user name that you assign to the HMC requires hscviewer authority at a minimum.
  4. For **HMC Password**, you must enter the password of the user.
  5. For **Maximum Number of Data Provider Log Files:**, you must specify the maximum number of data provider log files that are created. For example, **KPH\_LOG\_FILE\_MAX\_COUNT=10**.
  6. For **Maximum Size in KB of Each Data Provider Log**, you must enter the maximum size in KB that a data provider log file might reach before a new log file is created, for example, **KPH\_LOG\_FILE\_MAX\_SIZE= 5190**.
  7. For **Level of Detail in Data Provider Log**, you must enter the amount of detail that the data provider includes in the data provider log files, for example, **KPH\_LOG\_LEVEL=Fine**. You must specify one of the following values:
    - 1= Off
    - 2=Severe
    - 3=Warning
    - 4=Info
    - 5=Fine
    - 6=Finer
    - 7=Finest
    - 8=All

**Important:** The default value is 4.
  8. Save and close the `hmc_base_silent_config.txt` file, then enter: `./hmc_base-agent.sh config instance_name install_dir/samples/hmc_base_silent_config.txt` where *instance\_name* is the name you want to give the instance and *install\_dir* is the HMC Base agent installation directory. The default installation directory is `/opt/ibm/apm/agent`.
-  To configure the agent by responding to prompts, complete the following steps:
  1. Open the `install_dir/bin` directory, where *install\_dir* is the installation directory for the HMC Base agent.
  2. To configure the HMC Base agent, run the following command: **`./hmc_base-agent.sh config instance_name`**.
  3. When prompted to **edit the Monitoring Agent for HMC Base settings**, press **Enter**. The default value is Yes.
  4. To enter the HMC configuration information, complete the following steps.
    - a. When prompted for the **HMC Hostname**, type the host name or IP address and press **Enter**.
    - b. When prompted for **HMC Username**, type the logon user name that is associated with the HMC, and press **Enter**.
  5. When prompted for **HMC Password**, type the password of the user.

6. To enter the data provider information, complete the following steps:
  - a. When prompted for the **maximum number of data provider log files**, type the amount of log files and press **Enter**.

The default maximum number of data provider log files is 10.
  - b. When prompted for the **maximum size in KB of each data provider log**, type the size and press **Enter**.

The default maximum size in KB is 5190.
  - c. When prompted for the **Level of detail in data provider log**, type one of the following levels and press **Enter**:
    - 1= Off
    - 2=Severe
    - 3=Warning
    - 4=Info
    - 5=Fine
    - 6=Finer
    - 7=Finest
    - 8=All

## What to do next

- To start the agent, enter: `./hmc_base-agent.sh start InstanceName`.
- Configure the HMC Console Server according to the instruction in [“Configuring the HMC Console Server for monitoring Virtual I/O”](#) on page 342 for monitoring Virtual I/O.
- Enable the CPU and memory utilization monitoring according to the instruction in [“Enabling the CPU and memory utilization monitoring”](#) on page 343.

## Setting up the SSH connection

You must set up SSH connection between the system that is running the agent and the HMC for the agent to collect data.

### About this task

The agent data provider collects data from the management console by running CLI commands over SSH. By default, the data provider waits up to 1 minute for a CLI command to finish running. After this time, the data provider closes the SSH session in which the CLI command is running, and none of the data for that command is available in agent data sets until the command runs successfully. The default path for the SSH command is `/usr/bin/ssh`. If you installed SSH in a different location, you must indicate the path by using the **KPH\_SSH\_PATH** environment variable.

### Procedure

Use one of the following methods to set up SSH connection.

- Use the `setup_hmc_key.pl` script to set up the SSH connection.
  - a) Log on to the server where the agent is installed.
  - b) Open the `install_dir/aix526/ph/bin` directory, where `install_dir` is the installation directory for the HMC Base agent.
  - c) Run the `perl setup_hmc_key.pl` command.
  - d) Respond to prompts and provide the HMC host name or IP address; the HMC user name, which must have authority equivalent to `hscviewer` authority; and the password to create the key pair.

- e) After you create the key pair, test the connectivity by running a command such as `ssh hscroot@hmchost lshmc -V`.

If SSH is connecting to this HMC for the first time, add the HMC to the `ssh known_hosts` file by responding with yes to the following message:

```
The authenticity of host 'hmchost (3.3.333.333)' can't be established.  
RSA key fingerprint is 4c:b4:26:27:38:f3:ec:58:01:92:26:f9:61:32:bb:4d.  
Are you sure you want to continue connecting (yes/no)? yes  
  
Warning: Permanently added 'hmchost,3.3.333.333' (RSA) to the list of known hosts.
```

The agent can now use SSH to collect data from the HMC.

- Use `ssh-keygen` utility to generate keys and set up the SSH connection.
  - a) Log on to the server where the agent is installed.
  - b) Use the `ssh-keygen` utility to generate public and private keys with no passphrase. For example, the following command generates a set of public and private keys:

```
ssh-keygen -t rsa -f /.ssh/id-rsa
```

Press Enter when prompted for a passphrase. The public key that is generated is stored in the `/.ssh/id-rsa.pub` file. The private key is stored in the `/.ssh/id-rsa` file.

- c) Transfer the file that contains the public key to the HMC computer by using utilities such as `scp`.
- d) On the HMC computer, append the public key file to the collection of keys that are stored on the HMC.

The stored keys are in the `/.ssh/authorized_keys2` file.

- e) Add the host name and key for the HMC in the `known_hosts` file.

This file is in the `/.ssh` directory.

- a. Run the `ssh "user"@hmc_hostname -i "private_keyfile" date` command.
  - b. Enter yes when prompted to cache the keys. This command adds the entry to the `known_hosts` file for future connections.
- f) Run the `ssh "user"@hmc_hostname date` command.

If the date is returned with no password prompt, the SSH keys were successfully set up.

## Preparing SDK for HMC

You must prepare SDK for HMC before you start the agent instance for the first time.

### About this task

Before you start your first agent instance, you must prepare the corresponding version of SDK for your HMC. After the preparation completes, you do not need to repeat this task for other HMC Base agent instance that you create for the HMC of the same version. To monitor another version of HMC, repeat this tasks to re-prepare SDK.

### Procedure

- From the `agent_dir/aix526/ph/bin` directory, run the **prepareSDK.sh** script tool to automatically prepare SDK from HMC.
  - If you see the `SDK is ready for HMC` message, the preparation is completed.
  - If you do not see the `SDK is ready for HMC` message, you can manually prepare the SDK for HMC.

**For HMC V8.5.0, complete the following steps:**

1. Use a browser to download SDK from HMC directly with the following URL:

```
https://HMC_IP:12443/rest/api/web/sdk
```

When prompted, enter the user name and password of the hscroot account. The SDK file name is in the format of pmc\_sdk\_\*.zip.

2. . Unzip the SDK zip file, and go to the IBM HMC REST Web Services SDK Runtime/lib/ibm3 directory.
3. If it doesn't already exist, create a <agent\_dir>/aix526/ph/lib/my\_hmc\_version sub-directory, where my\_hmc\_version is the version of your HMC environment, for example, 8502. To determine the version of your HMC environment, run the following command:

```
ssh hscroot@<HMC_IP> 'lshmc -v' | grep RM |  
awk -FR '{print $3}' | tr -d '.'
```

4. Copy all the .jar files in the IBM HMC REST Web Services SDK Runtime/lib/ibm3 folder of HMC SDK to the agent\_dir/aix526/ph/lib/HMC\_version directory.

**For HMC V8.6.0 or V8.7.0, complete the following steps:**

1. Use a browser to download SDK from HMC directly with the following URL:

```
https://HMC_IP:12443/rest/api/web/sdk
```

When prompted, enter the user name and password of the hscroot account. The SDK file name is in the format of pmc-rest-sdk\*.zip.

2. Unzip the SDK zip file, and go to the lib sub-directory.
3. If it doesn't already exist, create a <agent\_dir>/aix526/ph/lib/my\_hmc\_version sub-directory, where my\_hmc\_version is the version of your HMC environment, for example, 8602, or 87012. To determine the version of your HMC environment, run the following command:

```
ssh hscroot@<HMC_IP> 'lshmc -v' | grep RM |  
awk -FR '{print $3}' | tr -d '.'
```

4. Copy all the .jar files in the lib folder of the HMC SDK to the agent\_dir/aix526/ph/lib/my\_hmc\_version directory.

## Results

You successfully prepared SDK for HMC.

## What to do next

Configure the HMC Base agent according to the instructions in [“Configuring HMC Base monitoring” on page 338](#).

## Configuring the HMC Console Server for monitoring Virtual I/O

Before the HMC Base agent can monitor the status of Virtual I/O, you must configure the HMC Console Server.

### Procedure

Follow the steps to configure the HMC Console Server as the prerequisites for the HMC Base agent to monitor Virtual I/O.

- Enable the PMC function of HMC console server and virtual I/O servers.
  - a) Log on the HMC Console Server by using the browser in classic mode.

```
https://hmc_hostname
```

- b) Click **HMC Management > Change Performance Monitoring Settings**.

The **Change Performance Monitoring Settings** window is displayed.

- c) In the **Performance Monitoring Data Collection for Manage Servers** section, turn on the **Collection** function for the corresponding servers.
- d) Click each Virtual I/O Server to show the **Partition Properties** window for that server.
- e) Under the **General** tab, ensure that the check box of the **Allow performance information collection** option is selected.

Click **OK** to save the settings.

After several minutes, you can see the network and storage traffic of corresponding servers in the **Performance Monitoring** page.

- Ensure that the HMC user for the HMC Base agent has correct privilege.
  - a) When you add or edit the user, ensure that the user has the **hmcviewer** role, and that the **AllSystemResource** option for this user is enabled.
  - b) In **User Properties** window, enable the **Allow remote access via the web** option.

## Enabling the CPU and memory utilization monitoring

If the CPU and memory utilization data collection is disabled, the CPU and memory utilization data of each power server is not displayed in the UI.

### Procedure

Use one of the following methods to enable the CPU and memory utilization monitoring.

- Enable the CPU and memory utilization monitoring by running the following HMC management command `chlparutil`.

```
chlparutil-r config -m <CECname> -s <the sample rate in seconds, always 60>
```

- Enable the CPU and memory utilization monitoring on the HMC console server.
  - a) Log on the HMC console server with classic mode.
  - b) Click **Servers** node on the navigation tree.
  - c) Select the server and go to **Operations > Utilization Data > Change the Sample rate**.
  - d) Set a sampling rate.  
The sampling rate is disabled by default. You can set the rate with appropriate values, for example, 30 minutes.

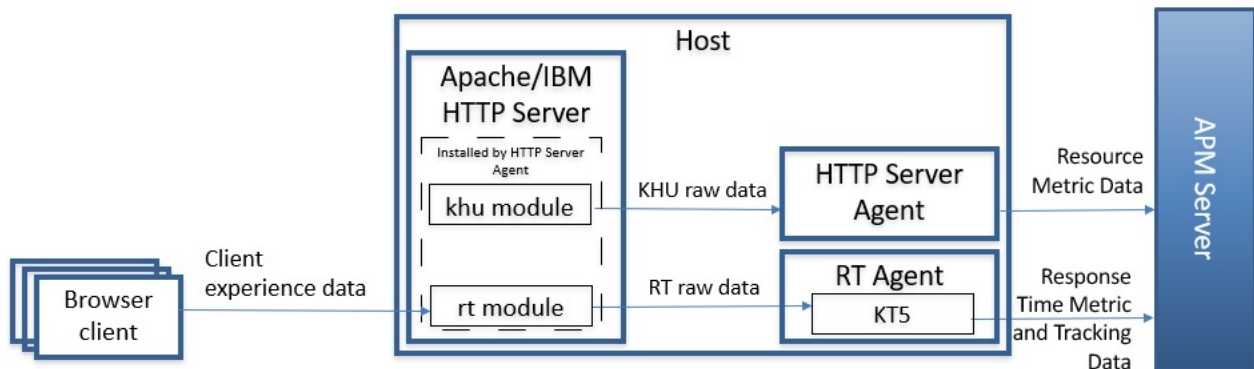

## Configuring HTTP Server monitoring

Configure the HTTP Server monitoring to enable the monitoring solution of your HTTP Server.

### Overview of HTTP Server monitoring

The HTTP Server monitoring solution provides monitoring capabilities that consist of two modules: **KHU** module and **RT (Response Time)** module.

### Architecture

### Configuring the KHU module for HTTP Server monitoring

The KHU module gets traditional resource and performance metrics. **KHU** is the agent code (unique code among all agents) for HTTP Server agent and the KHU module talks with HTTP Server agent process.

#### Before you begin

It is strongly suggested that install the HTTP Server agent when HTTP Server process is running because the agent installation can discover the running HTTP Server process and generate needed reference file.

There are two files involved in the configuration of the HTTP Server agent:

- HTTP Server configuration file: It comes with every HTTP server.
- HTTP Server agent data collector configuration file: It is also called reference file that is generated by HTTP Server agent when it discovers the running HTTP Server.

What you need to do is to include the reference file in the HTTP Server configuration file. And then restart HTTP Server. For details, see the [Procedure](#) section.

#### The HTTP Server configuration file

Each HTTP server has a configuration file by default: `http_server_install_dir/conf/httpd.conf`. In some environments, this file name might be customized. Check the exact file name with the HTTP Server administrator.

#### The HTTP Server agent data collector configuration file

When the HTTP Server agent discovers the HTTP server, it generates a data collector configuration file in the `install_dir/tmp/khu` directory.

If multiple HTTP Servers are discovered, multiple corresponding HTTP Server agent configuration files get generated.

The HTTP Server agent configuration file name has the format:

`khu.http_server_install_dir.conf.httpd.conf`

The first part of the agent configuration file name is `khu`, in which `khu` is the HTTP server agent code. The remaining part is the discovered HTTP server configuration file name with full path, in which `/` is replaced by `. .` For example, possible file names are as follows:

- **Linux** | **UNIX** `khu.usr.local.apache24.conf.httpd.conf`
- **Windows** `khu.C.Program Files.IBM.HTTPServer.conf.httpd.conf`

The following elements are inside the HTTP Server agent data collector configuration file :

- Details of the path of the `httpd.conf` file that the HTTP Server uses, for example, `KhuShmemPath "/IBM/HTTPServer/conf/httpd.conf"`.
- Location of the library to load
- Permissions that are associated with the shared memory

For more information about the configuration file, see [“Reference: HTTP Server agent configuration file samples”](#) on page 346.

**Note:** Normally, you do not need to modify this configuration file. Just locate and record the location.

## About this task

After you install the HTTP Server agent, enable the HTTP Server agent for data collection.

**Note:** You may also need to do this process on the following special occasions:

- After you upgrade to HTTP Server agent version 1.0.0.4, the new alias causes the existing HTTP Server agent nodes to become offline in the Cloud APM console.
- After you upgrade from version 1.0.0.4, the existing HTTP Server agent nodes can become offline in the Cloud APM console. This can occur if you have multiple HTTP server instances with similar agent configuration file names, for example, `httpd` and `httpd01`.

### Important:

- The `netstat` command-line network utility tool is needed for the HTTP Server agent to successfully discover the running HTTP server.
- To solve the agent node offline problem that happens after the upgrade, you must add the new HTTP server instance in the Cloud APM console after you complete this task.

## Procedure

1. To activate data collection, you must reference the data collector configuration file in the HTTP server configuration file by using the `Include` statement. Append the following statement to the end of the HTTP Server configuration file:

```
Include "agent_install_dir/tmp/khu/
khu.http_server_install_dir.conf.httpd.conf"
```

For example,

**Linux** | **UNIX** If you have an IBM HTTP Server that is installed in the `/opt/IBM/HTTPServer` directory and the data collector configuration file name with full path is like the following: `/opt/ibm/apm/agent/tmp/khu/khu.opt.IBM.HTTPServer.conf.httpd.conf`. Append the following statement to the `/opt/IBM/HTTPServer/conf/httpd.conf` HTTP server configuration file:

```
Include "/opt/ibm/apm/agent/tmp/khu/khu.opt.IBM.HTTPServer.conf.httpd.conf"
```

**Windows** If you have an IBM® HTTP Server that is installed in the `C:\ProgramFiles\IBM\HTTPServer` directory and the data collector configuration file name with full path is like the following: `C:\IBM\APM\tmp\khu\khu.C.Program Files.IBM.HTTPServer.conf.httpd.conf`. Append the following statement to the `C:\Program Files\IBM\HTTPServer\conf\httpd.conf` HTTP server configuration file:

```
Include "C:\IBM\APM\tmp\khu\khu.C.Program Files.IBM.HTTPServer.conf.httpd.conf"
```

2. Change to the following directory:

*HTTP\_server\_installation\_directory/bin*

3. Restart the HTTP Server. For example:

Linux

UNIX

```
./apachectl -k stop  
./apachectl -k start
```

Windows

```
httpd.exe -k stop  
httpd.exe -k start
```

## Results

You have successfully configured the agent.

## What to do next

Now, you can verify the HTTP Server agent data is displayed in the Cloud APM console. For instructions on how to start the Cloud APM console, see [Starting the Cloud APM console](#). For information about using the Applications editor, see [Managing applications](#).

**Note:** If there is no traffic in the HTTP server, you will not see data in the Cloud APM console.

## Configuring the RT module for HTTP Server monitoring

The RT module gets transaction response time and talks with Response Time Monitoring agent process.

The RT module is already loaded when you complete the steps of configuring KHU module. Normally, you do not need to do anything special for RT module. You only need to install the Response Time Monitoring agent to make them work together.

### Note:

- The RT module together with the KHU module are installed by HTTP Server agent and loaded by HTTP Server after a successful configuration and HTTP Server restart. This gives the convenience that customer can load modules at one time, not multiple times.
- The RT module monitors all ports for HTTP and HTTPS requests on HTTP server, and no special configuration is needed.
- When there is no Response Time Monitoring agent running, although the RT module is loaded, it will not work.
- Remember to install the Response Time Monitoring after HTTP Server agent because the Response Time Monitoring agent can detect the existence of HTTP Server agent and switch itself to work with HTTP Server RT module.
- Install Response Time Monitoring agent on the same host with HTTP Server.

For more information, see [“Configuring Response Time Monitoring” on page 778](#).

## Reference: HTTP Server agent configuration file samples

There are two files involved in the configuration of the HTTP Server agent. They are the HTTP Server agent data collector configuration file and the HTTP server configuration file. A sample for the Instance alias mapping file is also provided to help explain how alias works.

### HTTP Server agent data collector file samples

For IBM HTTP Server version 8 and later, 64-bit, the HTTP Server agent data collector configuration file contains this information:

```
#
```

```
# Settings for Monitoring Agent for HTTP Server module.
#

LoadModule khu_module "/tmp/ihslx8266/hu/lib/khuapache22dc_64.so"

<IfModule mod_khu.c>
    KhuShmemPerm 660
    KhuShmemPath "/opt/IBM/IHS/conf/httpd.conf"
    KhuCpsPath "/tmp/ihslx8266/hu/khu_cps.properties"
</IfModule>

Alias /khu "/tmp/ihslx8266/hu/etc"
<Directory "/tmp/ihslx8266/hu/etc">
    Order deny,allow
    Allow from all
    #Require all granted
</Directory>

LoadModule wrt_module /tmp/ihslx8266/hu/lib/mod_wrt_ap22_64.so
WrtOriginID HU:tivvm09_httpd:HUS
```

For IBM HTTP Server version 7, 32-bit, the configuration file contains this information:

```
#
# Settings for Monitoring Agent for HTTP Server module.
#

LoadModule khu_module "/tmp/ihslx8266/hu/lib/khuapache22dc_32.so"

<IfModule mod_khu.c>
    KhuShmemPerm 660
    KhuShmemPath "/opt/IBM/HTTPServer/conf/httpd.conf"
    KhuCpsPath "/tmp/ihslx8266/hu/khu_cps.properties"
</IfModule>

Alias /khu "/tmp/ihslx8266/hu/etc"
<Directory "/tmp/ihslx8266/hu/etc">
    Order deny,allow
    Allow from all
    #Require all granted
</Directory>

LoadModule wrt_module /tmp/ihslx8266/hu/lib/mod_wrt_ap22.so
WrtOriginID HU:linux_httpd:HUS
```

For Apache version 2.4, 64-bit, the HTTP Server agent configuration file contains this information:

```
#
# Settings for Monitoring Agent for HTTP Server module.
#

LoadModule khu_module "/tmp/ihslx8266/hu/lib/khuapache24dc_64.so"

<IfModule mod_khu.c>
    KhuShmemPerm 660

## Instance alias mapping file sample

```
# Monitoring Agent for HTTP Server instance alias mapping
# INSTANCE: auto discovered by agent. Please do NOT modify.
# ALIAS: alias name for the instance. The name will be displayed in APM UI dashboard. It
must be unique
```

```
# among all instances and it must be less than 10 characters and consist of only
alphanumeric characters.
#
INSTANCE.1=/usr/local/apache24/conf/httpd.conf
ALIAS.1=httpd

INSTANCE.1=/usr/local/apache24/conf/admin.conf
ALIAS.1=admin
```

## Configuring IBM Cloud monitoring

The Monitoring Agent for IBM Cloud collects virtual machine inventory and metrics from your IBM Cloud (SoftLayer) account. Use the IBM Cloud agent to track how many virtual devices you have configured and running in IBM Cloud. You can see what resources are allocated to each virtual device in the detailed dashboard page, which also shows information like the data center a device is located in, the operating system, and the projected public network bandwidth for the month.

### Before you begin

- Read the entire [“Configuring IBM Cloud monitoring” on page 348](#) topic to determine what is needed to complete the configuration.
- The product version and the agent version often differ. The directions here are for the most current release of this agent. To access the documentation for earlier agent releases, see the [Table 43 on page 348](#) table.

| Table 43. Agent versions |                                 |
|--------------------------|---------------------------------|
| Agent version            | Documentation                   |
| 8.14.06                  | <a href="#">Cloud APM 8.1.4</a> |

- Make sure that the system requirements for the IBM Cloud agent are met in your environment. For the up-to-date system requirement information, see the [Software Product Compatibility Reports \(SPCR\) for the IBM Cloud agent](#).
- Ensure that the following information is available:
  - A username for a user with at least Auditor permissions.
  - The API Key for IBM Cloud for that associated user.

### About this task

The IBM Cloud agent is both a multiple instance agent and also a subnode agent. After you configure agent instances, you must start each agent instance manually.

### Procedure

1. Configure the agent on Windows systems with the **IBM Performance Management** window or the silent response file.
  - [“Configuring the agent on Windows systems” on page 349](#).
  - [“Configuring the agent by using the silent response file” on page 350](#).
2. Configure the agent on Linux systems with the script that prompts for responses or the silent response file.
  - [“Configuring the agent by responding to prompts” on page 349](#).
  - [“Configuring the agent by using the silent response file” on page 350](#).

## What to do next

In the Cloud APM console, go to your Application Performance Dashboard to view the data that was collected. For more information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

If you are unable to view the data in the agent dashboards, first check the server connection logs and then the data provider logs. The default paths to these logs are listed here:

- **Linux** /opt/ibm/apm/agent/logs
- **Windows** C:\IBM\APM\TMAITM6\_x64\logs

For help with troubleshooting, see the [Cloud Application Performance Management Forum](#).

## Configuring the agent on Windows systems

You can configure the IBM Cloud agent on Windows operating systems by using the IBM Cloud Application Performance Management window. After you update the configuration values, you must start the agent to save the updated values.

### Procedure

1. Click **Start > All Programs > IBM Monitoring agents > IBM Cloud Application Performance Management**.
2. In the **IBM Performance Management** window, right-click the **Monitoring Agent for IBM Cloud** template, and then click **Configure agent**.  
**Remember:** After you configure an agent instance for the first time, the **Configure agent** option is unavailable. To configure the agent instance again, right-click on it and then click **Reconfigure...**
3. Enter a unique instance name then click **OK**. Use only Latin letters, Arabic numerals, and the hyphen-minus character in the instance name. Example, icloud-inst.
4. Click **Next** on the agent instance name window.
5. Press **New** and enter IBM Cloud SoftLayer username and API Key settings, then click **Next**.
6. Click **OK** to complete the configuration.
7. In the IBM Cloud Application Performance Management window, right-click the instance that you configured, and then click **Start**.

## Configuring the agent by responding to prompts

After installation of the IBM Cloud agent, you must configure it before you start the agent. If the IBM Cloud agent is installed on a local Linux computer, you can follow these instructions to configure it interactively through command-line prompts.

### About this task

**Remember:** If you are reconfiguring a configured agent instance, the value that is set in the last configuration is displayed for each setting. If you want to clear an existing value, press the space key when the setting is displayed.

### Procedure

Follow these steps to configure the IBM Cloud agent by running a script and responding to prompts.

1. Run the following command:

```
install_dir/bin/ibm_cloud-agent.sh config instance_name
```

where *install\_dir* is the path where the agent is installed and *instance\_name* is the name that you want to give to the agent instance.

## Example

```
/opt/ibm/apm/agent/bin/ibm_cloud-agent.sh config icloud-inst
```

2. Respond to the prompts to set configuration values for the agent.

See [“Configuration parameters for the IBM Cloud agent” on page 351](#) for an explanation of each of the configuration parameters.

3. Run the following command to start the agent:

```
install_dir/bin/ibm_cloud-agent.sh start instance_name
```

where *install\_dir* is the path where the agent is installed and *instance\_name* is the name of the agent instance.

## Example

```
/opt/ibm/apm/agent/bin/ibm_cloud-agent.sh start icloud-inst
```

## Configuring the agent by using the silent response file

The silent response file contains the agent configuration parameters. You can edit the silent response file to modify the values of these parameters, and run the configuration script to create an instance and update the agent configuration values. This mode of configuration is called the silent mode.

### About this task

The silent response file contains the agent configuration parameters with default values that are defined for some parameters. You can edit the silent response file to specify different values for the configuration parameters.

After you update the configuration values in the silent response file, you must run the configuration script to configure the agent with these updated values.

### Procedure

- Configure the IBM Cloud agent in the silent mode:
  - a) Open the `ibm_cloud_silent_config.txt` file at one of the following paths in a text editor.
    - **Linux** `install_dir/samples/ibm_cloud_silent_config.txt`  
Example, `/opt/ibm/apm/agent/samples/ibm_cloud_silent_config.txt`
    - **Windows** `install_dir\samples\ibm_cloud_silent_config.txt`  
Example, `C:\IBM\APM\samples\ibm_cloud_silent_config.txt`where *install\_dir* is the path where the agent is installed.
  - b) In the `ibm_cloud_silent_config.txt` file, specify values for all mandatory parameters and modify the default values of other parameters as needed.  
See [“Configuration parameters for the IBM Cloud agent” on page 351](#) for an explanation of each of the configuration parameters.
  - c) Save and close the `ibm_cloud_silent_config.txt` file, and run the following command:
    - **Linux** `install_dir/bin/ibm_cloud-agent.sh config instance_name install_dir/samples/ibm_cloud_silent_config.txt`  
Example, `/opt/ibm/apm/agent/bin/ibm_cloud-agent.sh config icloud-inst /opt/ibm/apm/agent/samples/ibm_cloud_silent_config.txt`
    - **Windows** `install_dir\bin\ibm_cloud-agent.bat config instance_name install_dir\samples\ibm_cloud_silent_config.txt`

Example, **C:\IBM\APM\bin\ibm\_cloud-agent.bat config icloud-inst C:\IBM\APM\samples\ibm\_cloud\_silent\_config.txt**

where *install\_dir* is the path where the agent is installed and *instance\_name* is the name that you want to give to the agent instance.

**Important:** Ensure that you include the absolute path to the silent response file. Otherwise, the agent data is not shown in the dashboards.

d) Run the following command to start the agent:

- **Linux** `install_dir/bin/ibm_cloud-agent.sh start instance_name`  
Example, `/opt/ibm/apm/agent/bin/ibm_cloud-agent.sh start icloud-inst`
- **Windows** `install_dir\bin\ibm_cloud-agent.bat start instance_name`  
Example, `C:\IBM\APM\bin\ibm_cloud-agent.bat start icloud-inst`

where *install\_dir* is the path where the agent is installed and *instance\_name* is the name of the agent instance.

## Configuration parameters for the IBM Cloud agent

The configuration parameters for the IBM Cloud agent are displayed in a table.

1. [IBM Cloud Configuration](#) - Settings to monitor IBM Cloud instances remotely. Instances are automatically discovered for the API key that you want to configure.

| Table 44. IBM Cloud Configuration |  |  |
|-----------------------------------|--|--|
| Parameter name                    | Description  | Silent configuration file parameter name |
| Username                          | The username for IBM SoftLayer account that is used to retrieve metrics from the IBM Cloud API.  | KFS_USERNAME                             |
| API Key                           | The user-specific API Key that is required to complete the authentication. API Keys are generated and can be retrieved from the IBM SoftLayer Customer Portal. | KFS_API_KEY_PASSWORD                     |

## Configuring IBM Integration Bus monitoring

The IBM Integration Bus agent is a multiple instance agent. You must create a first agent instance and start it manually.

### Before you begin

- The directions here are for the most current release of this agent. For information about how to check the version of an agent in your environment, see [Agent version command](#). For detailed information about the agent version list and what's new for each version, see [“Change history” on page 58](#).
- Make sure that the system requirements for the IBM Integration Bus agent are met in your environment. For the up-to-date system requirement information, see the [Detailed System Requirements Report for the IBM Integration Bus agent](#).

### About this task

The following procedure is a roadmap for configuring IBM Integration Bus agent, which includes both required and optional steps. Complete the necessary steps according to your needs.

## Procedure

1. Make sure the user ID that will be used to start and stop the IBM Integration Bus agent belongs to the **mqm** and **mqbrkrs** user groups.
2. **Windows**  
If IBM MQ (WebSphere MQ) is installed on the Windows system, add the IBM MQ (WebSphere MQ) library path to the **PATH** environment variable. So that the IBM Integration Bus agent can load the required IBM MQ (WebSphere MQ) libraries to start.
  - a) Add the IBM MQ (WebSphere MQ) library path to the beginning of the **PATH** environment variable.  
For example, if the installation path of IBM MQ (WebSphere MQ) is C:\IBM\WMQ75, add C:\IBM\WMQ75\bin to the beginning of the **PATH** environment variable of your Windows system.
  - b) Restart the Windows system for the changes to take effect.
3. Configure the IBM Integration Bus agent by specifying the following configuration parameters. There are also some optional configuration parameters that you can specify for the agent. For detailed instructions, see [“Configuring the IBM Integration Bus agent” on page 352](#).
  - Agent ID
  - The installation directory of integration nodes (brokers) that are to be monitored
  - The 64-bit library path of IBM MQ (WebSphere MQ)
4. Configure IBM Integration Bus to enable the data that you want to monitor. See [“Configuring IBM Integration Bus for data enablement” on page 356](#).
5. If you have enabled snapshot data collection for your integration node (broker), configure the IBM Integration Bus agent not to store any snapshot data. For instructions, see [“Disabling snapshot data collection for the agent” on page 363](#).
6. Optional: To configure the IBM Integration Bus agent to enable transaction tracking, use the **Agent Configuration** page. For instructions, see [“Configuring transaction tracking for the IBM Integration Bus agent” on page 363](#).
7. Optional: If you no longer need the transaction tracking function or you want to uninstall the IBM Integration Bus agent, disable transaction tracking for IBM Integration Bus and remove the agent provided user exit. For instructions, see [“Disabling transaction tracking” on page 362](#) and [“Removing the KQIUserExit user exit” on page 365](#).

## Configuring the IBM Integration Bus agent

You must assign an instance name to the IBM Integration Bus agent and configure the agent before it can start monitoring your IBM Integration Bus environment.

### Before you begin

- Make sure that the user ID that is used to start and stop the agent belongs to the **mqm** and **mqbrkrs** user groups.
- **Windows** If IBM MQ (WebSphere MQ) is installed on the Windows system, add the IBM MQ (WebSphere MQ) library path to the **PATH** environment variable. So that the IBM Integration Bus agent can load the required IBM MQ (WebSphere MQ) libraries to start.
  1. Add the IBM MQ (WebSphere MQ) library path to the beginning of the **PATH** environment variable.  
For example, if the installation path of IBM MQ (WebSphere MQ) is C:\IBM\WMQ75, add C:\IBM\WMQ75\bin to the beginning of the **PATH** environment variable of your Windows system.
  2. Restart the Windows system for the changes to take effect.
- You might need to provide the following information according to your environment during the agent configuration. If you do not know the appropriate configuration value to specify, gather the information from the administrator of IBM MQ (WebSphere MQ) and IBM Integration Bus.

- If IBM MQ (WebSphere MQ) is installed on the same system with the IBM Integration Bus agent, you must provide the 64-bit library path of IBM MQ (WebSphere MQ).
- If the IBM Integration Bus agent is configured to monitor the integration nodes of IBM Integration Bus V10 or IBM App Connect Enterprise V11, you must provide the installation directory for IBM Integration Bus V10 or IBM App Connect Enterprise V11.
- If you want the IBM Integration Bus agent to monitor some specific integration nodes (brokers) instead of all on the same system, you must provide the name and installation path of each integration node (broker).

## About this task

The IBM Integration Bus agent is a multiple instance agent; you must create the first instance and start the agent manually.

You can choose to configure the agent with or without interactions on UNIX or Linux systems. On Windows systems, you can configure the agent without interactions only.

- To configure the agent with interaction, run the configuration script and respond to prompts. See [“Interactive configuration” on page 353](#).
- To configure the agent without interaction, edit the silent response file and then run the configuration script. See [“Silent configuration” on page 354](#).

**Important:** If you also installed ITCAM Agent for WebSphere Message Broker, which is delivered as one of the ITCAM for Applications product, on the same system as the IBM Integration Bus agent, which is delivered in Cloud APM, do not use them to monitor the same integration node (broker) on the system.

## Interactive configuration

### Procedure

To configure the agent by running the script and responding to prompts, complete the following steps:

1. Enter the following command:

```
install_dir/bin/iib-agent.sh config instance_name
```

where *instance\_name* is the name that you want to give to the agent instance.

**Important:** Interactive configuration is not supported on Windows systems.

2. After you confirm that you want to configure IBM Integration Bus agent, specify the configuration values for general agent settings.

- a) When prompted for the **Agent Id** parameter, specify a unique alphanumeric string with a maximum length of 8 characters.

The managed system name includes the agent ID that you specify, for example, *monitoredbrokername:agentID:KQIB*, where *monitoredbrokername* is the name of the monitored integration node (broker).

- b) When prompted for the **IIB version 10 or ACE version 11 Install Directory** parameter, if you want to monitor integration nodes of IBM Integration Bus V10, or IBM App Connect Enterprise V11, specify the installation directory of IBM Integration Bus V10 or IBM App Connect Enterprise V11. For example, */opt/ibm/mqsi/ace-11.0.0.3*. If you do not want to monitor IBM Integration Bus V10 and IBM App Connect Enterprise V11, press Enter to accept the default.

**Remember:** You can specify only one installation directory for the **IIB version 10 or ACE version 11 Install Directory** parameter. If you installed IBM Integration Bus V10 or IBM App Connect Enterprise V11 in different directories and you want to monitor them all, create multiple agent instances and specify one installation directory of IBM Integration Bus V10 or IBM App Connect Enterprise V11 for each agent instance.

- Optional: Use the **Monitored Broker Settings** section to specify whether you want to use this agent to monitor only some specific integration nodes (brokers).

By default, all integration nodes (brokers) that are running on the same host system as the IBM Integration Bus agent are monitored, as determined by self-discovery. If you want the agent to monitor some specific integration nodes (brokers), specify the name of the integration node (broker) that you want to monitor and set the **Collect Node Data** setting to No, which is the default value, in the **Monitored Broker Settings** section. There can be multiple **Monitored Broker Settings** sections. Each section controls the monitoring settings for one integration node (broker).

**Tip:** You can specify more than one **Monitored Broker Settings** section. When you edit the **Monitored Broker Settings** section, the following options are available:

- Add: Create a **Monitored Broker Settings** section to configure for another integration node (broker).
  - Edit: Modify the settings of current **Monitored Broker Settings** section.
  - Del: Delete the current **Monitored Broker Settings** section.
  - Next: Move to the next **Monitored Broker Settings** section.
  - Exit: Exit the **Monitored Broker Settings** configuration.
- If you confirm that IBM MQ (WebSphere MQ) is installed on the same system, you are prompted for the **WebSphere MQ 64-bit library path** parameter. Press Enter to accept the default value, which is the 64-bit library path of IBM MQ (WebSphere MQ) automatically discovered by the agent. If no default value is displayed, you must provide the 64-bit library path of IBM MQ (WebSphere MQ) before you proceed to the next step. For example, /opt/mqm8/lib64.

**Remember:** If your integration nodes (brokers) use different versions of queue managers, specify the latest version of the IBM MQ (WebSphere MQ) 64-bit library path for this parameter.

- After the configuration completes, enter the following command to start the agent:

```
install_dir/bin/iib-agent.sh start instance_name
```

## Silent configuration

### Procedure

To configure the agent by editing the silent response file and running the script with no interaction, complete the following steps:

- Open the following agent silent response file in a text editor.

- Linux** **UNIX** `install_dir/samples/iib_silent_config.txt`
- Windows** `install_dir\tmaitm6_x64\samples\qi_silent_config.txt`

where *install\_dir* is the installation directory of the IBM Integration Bus agent. The default installation directory is as follows:

- Linux** **UNIX** `/opt/ibm/apm/agent`
- Windows** `C:\IBM\APM`

- For the **agentId** parameter, specify a unique alphanumeric string with a maximum length of 8 characters as a short identifier for the agent.

The managed system name includes the agent ID that you specify, for example, *monitoredbrokername:agentID:KQIB*, where *monitoredbrokername* is the name of the monitored integration node (broker).

- If you want to monitor the integration nodes of IBM Integration Bus V10 or IBM App Connect Enterprise V11, specify the installation directory for IBM Integration Bus V10 or IBM App Connect Enterprise V11 for the **defaultWMBInstallDirectory** parameter. For example, C:\Program Files\IBM\ACE\11.0.0.3\ for a Windows system, or /opt/ibm/mqsi/ace-11.0.0.3 for a Linux system. If you do not want to monitor IBM Integration Bus V10 and IBM App Connect Enterprise

V11, this parameter is not required because the IBM Integration Bus agent can discover the integration nodes (brokers) from earlier versions automatically.

**Remember:** You can specify only one installation directory for the **defaultWMBInstallDirectory** parameter. If you installed IBM Integration Bus V10 or IBM App Connect Enterprise V11 in different directories and you want to monitor them all, create multiple agent instances and specify one installation directory of IBM Integration Bus V10 or IBM App Connect Enterprise V11 for each agent instance.

4. Optional: Specify whether you want to use this agent to monitor only some specific integration nodes (brokers).

By default, all integration nodes (brokers) that are running on the same host system as the IBM Integration Bus agent are monitored, as determined by self-discovery. To monitor specific integration nodes (brokers), set the **collectNodeData** and **WMBInstallDirectory** parameters for each integration node (broker) that you want to monitor.

#### **collectNodeData**

Specifies whether node definition data is collected for the monitored integration node (broker). The syntax is `collectNodeData.brkr_name=NO|YES`, where *brkr\_name* is the name of the integration node (broker).

The default value is NO. It is recommended to use the default value because node definition data is not supported in the Cloud APM console.

#### **WMBInstallDirectory**

The installation directory of the integration node (broker) to be monitored. The syntax is `WMBInstallDirectory.brkr_name=broker_install_dir`, where *broker\_install\_dir* is the installation directory of the integration node (broker) to be monitored.

**Remember:** For a version 10 integration node, the **WMBInstallDirectory** parameter can override the **defaultWMBInstallDirectory** parameter that you set in the previous step.

For example, to monitor only two integration nodes (brokers) that are named BK1 and BK2, set the parameters as follows:

```
collectNodeData.BK1=NO
collectNodeData.BK2=NO
WMBInstallDirectory.BK1=BK1_install_dir
WMBInstallDirectory.BK2=BK2_install_dir
```

5. To monitor brokers that are earlier than IBM Integration Bus V10, specify the 64-bit library path of IBM MQ (WebSphere MQ) for the **WMQLIBPATH** parameter. For example, `C:\Program Files\IBM\WebSphere MQ\bin64` for a Windows system, or `/opt/mqm8/lib64` for a Linux system.

**Remember:** If your integration nodes (brokers) use different versions of queue managers, specify the latest version of the IBM MQ (WebSphere MQ) 64-bit library path for this parameter.

6. Save and close the agent silent response file, and then enter the following command:

- **Linux** | **UNIX** `install_dir/bin/iib-agent.sh config instance_name path_to_responsefile`
- **Windows** `install_dir\BIN\iib-agent.bat config "instance_name path_to_responsefile"`

where *instance\_name* is the name of the instance that you configure, and *path\_to\_responsefile* is the full path of the silent response file.

**Warning:** On Windows systems, do not include double quotation marks (") that enclose the full path to the silent response file, as this will cause a configuration error.

7. After the configuration completes, enter the following command to start the agent:

- **Linux** | **UNIX** `install_dir/bin/iib-agent.sh start instance_name`

- **Windows**

```
install_dir\bin\iib-agent.bat start instance_name
```

## Results

Now, you can log in to the Cloud APM console and use the Applications editor to add the IBM Integration Bus agent instance to the Application Performance Dashboard. For instructions on how to start the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#). For information about using the Applications editor, see [“Managing applications” on page 1269](#).

**Remember:** Whenever you update or migrate a monitored integration node (broker), you must restart the IBM Integration Bus agent after the integration node (broker) upgrade or migration.

## What to do next

The next step is to configure IBM Integration Bus for data enablement. The following data is available on the Application Performance Dashboard only after you enable them in IBM Integration Bus:

- Archive accounting and statistics
- JVM resource statistics
- Transaction tracking

For instructions, see [“Configuring IBM Integration Bus for data enablement” on page 356](#).

## Configuring IBM Integration Bus for data enablement

For some data to be available in the Cloud APM console, you must configure IBM Integration Bus to enable the required data collection.

### Before you begin

Make sure that the IBM Integration Bus agent is configured.

**Remember:** Transaction tracking enablement requires you to restart the integration node (broker).

### About this task

Archive statistics and resource statistics can be monitored by the IBM Integration Bus agent only after the data collection is enabled for the integration node (broker). Similarly, if you want to see the transaction tracking in the middleware and topology dashboards, you must enable transaction tracking within the integration node (broker) before you enable transaction tracking for the IBM Integration Bus agent.

Decide what type of data that you want to monitor with the IBM Integration Bus agent and complete the following steps according to your needs.

Integration servers that are owned by the integration node have a default `server.conf.yaml` configuration file for each integration server that is stored in a subdirectory of the integration node directory. Any properties that you set for the integration node in the `node.conf.yaml` file are inherited by the integration servers that it owns. Nonetheless, you can change an integration server's properties by modifying them in its `server.conf.yaml` file. (For more information, see [Configuring an integration node by modifying the node.conf.yaml file](#) in the IBM App Connect Enterprise documentation.)

### Procedure

- To enable archive statistics data collection for the integration node (broker), see [“Enabling archive accounting and statistics data collection” on page 357](#).
- To enable resource statistics data for an integration node (broker), see [“Enabling JVM resource statistics” on page 360](#).

- To enable transaction tracking for message flows within an integration node (broker), see [“Enabling transaction tracking”](#) on page 361.
- If you no longer want transaction tracking data, remember to disable transaction tracking for the integration node (broker) on which it was enabled. See [“Disabling transaction tracking”](#) on page 362.

## Enabling archive accounting and statistics data collection

### About this task

To enable archive accounting and statistics collection for message flows that belong to the integration node (broker), issue the **mqsichangeflowstats** command from the bin directory of the integration node (broker) installation directory.

**Remember:** Issue the **mqsichangeflowstats** command to the integration node (broker) according to your requirements for monitoring data. It is recommended that you enable only the statistics that you require, because there can be a lot of data and processing when you have many message flows. For more detailed information about the **mqsichangeflowstats** command, refer to IBM Integration Bus documentation.

**Important:** IBM Cloud Application Performance Management does not support snapshot accounting and statistics data due to the amount of data and processing required for the set 20 second snapshot interval. Archive data provides the same exact attributes as snapshot data, and is more suitable for the regular production monitoring provided by IBM Cloud Application Performance Management. If you have enabled snapshot data collection for the integration node (broker), remember to configure the IBM Integration Bus agent not to store the snapshot data. For instructions, see [“Disabling snapshot data collection for the agent”](#) on page 363.

### Procedure

- To get most data for message flows, issue the following command. This command is recommended because it does not enable the most detailed terminal statistics that provide invocation counts per terminal per node. The terminal level consumes a lot of storage.

```
mqsichangeflowstats BrokerName -a -g -j -c active -t none -n basic -o xml
```

- In ACE version 11, to get most data for message flows, modify the `node.conf.yaml` or `server.conf.yaml` file as follows. These properties are recommended because they do not enable the most detailed terminal statistics that provide invocation counts per terminal per node. The terminal level consumes a lot of storage.

```
Statistics:
# Application message flows will by default inherit Snapshot and Archive values
# set here
Snapshot:
  #publicationOn: 'inactive' # choose 1 of : active|inactive, default inactive
                           # Ensure Events.OperationalEvents.MQ|MQTT
                           # is set for outputFormat json,xml
  #accountingOrigin: 'none' # choose 1 of : none|basic
  #nodeDataLevel: 'none'   # choose 1 of : none|basic|advanced
  #outputFormat: 'usertrace' # comma separated list of :
                           #csv,bluemix,json,xml,usertrace
  #threadDataLevel: 'none' # choose 1 of : none|basic
Archive:
  archivalOn: 'active'      # choose 1 of : active|inactive,
                           # default inactive
                           # Ensure Events.OperationalEvents.MQ|MQTT
                           # is set for outputFormat xml
  #accountingOrigin: 'none' # choose 1 of : none|basic
  #majorInterval: 60        # Sets the interval in minutes at which
                           #archive statistics are published
  nodeDataLevel: 'basic'    # choose 1 of : none|basic|advanced
  outputFormat: 'xml'       # comma separated list of : csv,xml,usertrace
  #threadDataLevel: 'none'  # choose 1 of : none|basic
```

**Note:** If you want to disable this setting, comment out the lines of **archivalOn: 'active'**, **nodeDataLevel: 'basic'**, and **outputFormat: 'xml'**.

- To get all the data supported by the IBM Integration Bus agent, issue the following command:

```
mqsichangeflowstats BrokerName -a -g -j -c active -t none -n advanced -o xml
```

- In ACE version 11, to get all the data supported by the IBM Integration Bus agent, modify the `node.conf.yaml` or `server.conf.yaml` file as follows:

```
Statistics:
# Application message flows will by default inherit Snapshot and Archive values
# set here
Snapshot:
#publicationOn: 'inactive' # choose 1 of : active|inactive, default inactive
                           # Ensure Events.OperationalEvents.MQ|MQTT
                           # is set for outputFormat json,xml
#accountingOrigin: 'none'  # choose 1 of : none|basic
#nodeDataLevel: 'none'     # choose 1 of : none|basic|advanced
#outputFormat: 'usertrace' # comma separated list of :
                           # csv,bluemix,json,xml,usertrace
#threadDataLevel: 'none'   # choose 1 of : none|basic
Archive:
#archivalOn: 'active'      # choose 1 of : active|inactive, default inactive
                           # Ensure Events.OperationalEvents.MQ|MQTT
                           # is set for outputFormat xml
#accountingOrigin: 'none'  # choose 1 of : none|basic
#majorInterval: 60        # Sets the interval in minutes at which
                           # archive statistics are published
#nodeDataLevel: 'advanced' # choose 1 of : none|basic|advanced
#outputFormat: 'xml'       # comma separated list of : csv,xml,usertrace
#threadDataLevel: 'none'   # choose 1 of : none|basic
```

**Note:** If you want to disable this setting, comment out the lines of **archivalOn: 'active'**, **nodeDataLevel: 'advanced'**, and **outputFormat: 'xml'**.

- To reduce the amount of data but still reasonably monitor all message flows without further details, issue the following command:

```
mqsichangeflowstats BrokerName -a -g -j -c active -t none -n none -o xml
```

- In ACE version 11, to reduce the amount of data but still reasonably monitor all message flows without further details, modify the `node.conf.yaml` or `server.conf.yaml` file as follows:

```
Statistics:
# Application message flows will by default inherit Snapshot and Archive values
#set here
Snapshot:
#publicationOn: 'inactive' # choose 1 of : active|inactive, default inactive
                           # Ensure Events.OperationalEvents.MQ|MQTT
                           # is set for outputFormat json,xml
#accountingOrigin: 'none'  # choose 1 of : none|basic
#nodeDataLevel: 'none'     # choose 1 of : none|basic|advanced
#outputFormat: 'usertrace' # comma separated list of :
                           # csv,bluemix,json,xml,usertrace
#threadDataLevel: 'none'   # choose 1 of : none|basic
Archive:
#archivalOn: 'active'      # choose 1 of : active|inactive, default inactive
                           # Ensure Events.OperationalEvents.MQ|MQTT
                           # is set for outputFormat xml
#accountingOrigin: 'none'  # choose 1 of : none|basic
#majorInterval: 60        # Sets the interval in minutes at which
                           # archive statistics are published
#nodeDataLevel: 'none'     # choose 1 of : none|basic|advanced
#outputFormat: 'xml'       # comma separated list of : csv,xml,usertrace
#threadDataLevel: 'none'   # choose 1 of : none|basic
```

**Note:** If you want to disable this setting, comment out the lines of **archivalOn: 'active'**, **nodeDataLevel: 'none'**, and **outputFormat: 'xml'**.

- If you have a large number of message flows and want to reduce the amount of data, you can specify which message flows to monitor by replacing the `-g` or `-j` option in the previously mentioned commands.

- To specify a particular integration server (execution group) for enablement, replace -g with -e *IntegrationServerName*.
- To identify a particular message flow for enablement, replace -j with -f *MessageFlowName*.
- If you have grouped your message flows into applications, to specify a particular application for enablement, add -k *ApplicationName* to the -j option.
- The IBM Integration Bus agent collects archive accounting and statistics data at the interval of 5 minutes. To set the interval at which the integration node (broker) produces the archive accounting and statistics data to the same interval, issue the following command with the integration node (broker) stopped, and then restart the integration node (broker):

```
mqsichangebroker BrokerName -v 5
```

- In ACE version 11, the IBM Integration Bus agent collects archive accounting and statistics data at the interval of 5 minutes. To set the interval at which the integration node (broker) produces the archive accounting and statistics data to the same interval, modify the `node.conf.yaml` or `server.conf.yaml` file as follows:

```
Statistics:
# Application message flows will by default inherit Snapshot and Archive values
# set here
Snapshot:
#publicationOn: 'inactive' # choose 1 of : active|inactive, default inactive
                           # Ensure Events.OperationalEvents.MQ|MQTT
                           # is set for outputFormat json,xml
#accountingOrigin: 'none'  # choose 1 of : none|basic
#nodeDataLevel: 'none'    # choose 1 of : none|basic|advanced
#outputFormat: 'usertrace' # comma separated list of :
                           # csv,bluemix,json,xml,usertrace
#threadDataLevel: 'none'  # choose 1 of : none|basic
Archive:
archivalOn: 'active'      # choose 1 of : active|inactive, default inactive
                           # Ensure Events.OperationalEvents.MQ|MQTT
                           # is set for outputFormat xml
#accountingOrigin: 'none' # choose 1 of : none|basic
majorInterval: 5        # Sets the interval in minutes at which
                           # archive statistics are published
nodeDataLevel: 'none'    # choose 1 of : none|basic|advanced
outputFormat: 'xml'      # comma separated list of : csv,xml,usertrace
#threadDataLevel: 'none' # choose 1 of : none|basic
```

## Results

After the IBM Integration Bus agent is configured and started, the message flow accounting and statistics data is displayed in the following group widgets:

- Message Flow Dashboard
  - Commits & Backouts
  - CPU Microseconds
  - Elapsed Microseconds
  - Input Byte Rate
  - Input Message Rate
  - Input Message Size
  - Input Message Wait CPU Microseconds
  - Input Message Wait Elapsed Microseconds
  - Message Flow Errors
  - Message Processing Node Statistics
- Processing Node Dashboard
  - CPU Microseconds
  - Elapsed Microseconds

- Invocations
- Processing Node Status
- Terminal Statistics

## Enabling JVM resource statistics

### About this task

To enable JVM resource statistics for integration servers that belong to the integration node (broker), issue the **mqsichangeresourcestats** command from the bin directory of the integration node (broker) installation directory.

**Remember:** The JVM resource statistics are considered optional because only a few attributes of data are displayed for the high cost of the agent processing this data every 20 seconds. Be sure to consider whether you really need the JVM resource statistics data.

### Procedure

- To enable the statistics across all integration servers in the integration node (broker), issue the following command:

```
mqsichangeresourcestats BrokerName -c active
```

- In ACE version 11, to enable the statistics across all integration servers in the integration node (broker), modify the `node.conf.yaml` file as follows:

```
Statistics:
  # Application message flows will by default inherit Snapshot and Archive values
  # set here
  Snapshot:
    #publicationOn: 'inactive' # choose 1 of : active|inactive, default inactive
                                # Ensure Events.OperationalEvents.MQ|MQTT
                                # is set for outputFormat json,xml
    #accountingOrigin: 'none' # choose 1 of : none|basic
    #nodeDataLevel: 'none' # choose 1 of : none|basic|advanced
    #outputFormat: 'usertrace' # comma separated list of :
                                # csv,bluemix,json,xml,usertrace
    #threadDataLevel: 'none' # choose 1 of : none|basic
  Archive:
    archivalOn: 'active' # choose 1 of : active|inactive, default inactive
                        # Ensure Events.OperationalEvents.MQ|MQTT
                        # is set for outputFormat xml
    #accountingOrigin: 'none' # choose 1 of : none|basic
    majorInterval: 5 # Sets the interval in minutes at which
                     # archive statistics are published
    nodeDataLevel: 'advanced' # choose 1 of : none|basic|advanced
    outputFormat: 'xml' # comma separated list of : csv,xml,usertrace
    threadDataLevel: 'basic' # choose 1 of : none|basic
  Resource:
    reportingOn: true # choose 1 of : true|false, default false
    .....
```

**Note:** If you want to disable this setting, comment out **reportingOn: true**.

- To enable the statistics for a given integration server in the integration node (broker), issue the following command:

```
mqsichangeresourcestats BrokerName -e IntegrationServerName -c active
```

- In ACE version 11, to enable the statistics for a given integration server in the integration node (broker), modify the `server.conf.yaml` file as follows:

```
Statistics:
  # Application message flows will by default inherit Snapshot and Archive values
  # set here
  Snapshot:
    #publicationOn: 'inactive' # choose 1 of : active|inactive, default inactive
                                # Ensure Events.OperationalEvents.MQ|MQTT
                                # is set for outputFormat json,xml
```

```

#accountingOrigin: 'none' # choose 1 of : none|basic
#nodeDataLevel: 'none' # choose 1 of : none|basic|advanced
#outputFormat: 'usertrace' # comma separated list of :
# csv,bluemix,json,xml,usertrace
#threadDataLevel: 'none' # choose 1 of : none|basic
Archive:
  archivalOn: 'active' # choose 1 of : active|inactive, default inactive
# Ensure Events.OperationalEvents.MQ|MQTT
# is set for outputFormat xml
#accountingOrigin: 'none' # choose 1 of : none|basic
majorInterval: 5 # Sets the interval in minutes at which
# archive statistics are published
nodeDataLevel: 'advanced' # choose 1 of : none|basic|advanced
outputFormat: 'xml' # comma separated list of : csv,xml,usertrace
threadDataLevel: 'basic' # choose 1 of : none|basic
Resource:
  reportingOn: true # choose 1 of : true|false, default false

```

**Note:** If you want to disable this setting, comment out **reportingOn: true**.

## Results

The JVM resource statistics data is displayed in the following group widgets:

- Garbage Collection Count
- Garbage Collection Duration
- JVM Non-Heap Memory
- JVM Heap Memory

## Enabling transaction tracking

### Before you begin

1. Make sure that the IBM Integration Bus agent is installed. A user exit named `KQIUserExit` is provided to enable IBM Integration Bus for transaction tracking.
2. Make sure that the user who will start the integration node (broker) has access to the KQI User Exit module directory. That is, ensure that you add the user ID that is used to start the integration node (broker) to the group under which you installed the IBM Integration Bus agent.

### About this task

You must deploy the `KQIUserExit` user exit to the integration node (broker). Otherwise, no data is available in the middleware and topology dashboards even after you have enabled the IBM Integration Bus agent for transaction tracking.

**Tip:** The following IBM Integration Bus nodes are included in the middleware and topology dashboards by the `KQIUserExit` user exit as uninstrumented services:

- Database and compute nodes where an ODBC data source is specified
- TCP/IP nodes
- File nodes for remote FTP or FTPS servers
- MQ nodes, unless already instrumented

## Procedure

To enable transaction tracking for IBM Integration Bus, complete the following steps:

1.   Close any broker shells that have loaded the MQSI environment.
2. Open an IBM Integration Bus command console with one of the following methods. If you have multiple versions of integration nodes (brokers) installed, ensure that you start the command console for the correct version.

- **Windows** Click **Start > IBM Integration Bus > IBM Integration Console**
  - **Linux** **UNIX** From the bin directory of integration node (broker) installation directory, issue the **mqsiprofile** command.
3. Stop the integration node (broker) that you want to configure with the **mqsistop** command.
  4. Enable transaction tracking for the message flow within the integration node (broker) by adding the KQIUserExit user exit with the **mqsichangebroker** command.

- To enable transaction tracking for all message flows within the integration node (broker), run the following command:

```
mqsichangebroker broker_name -e "KQIUserExit"
```

- To enable transaction tracking for a specific message flow within the integration node (broker), run the following command:

```
mqsichangeflowuserexits broker_name -e execution_group_name -k application_name -f message_flow_name -a "KQIUserExit"
```

5. Alternatively, in Ace version 11, enable transaction tracking for the message flow within the integration node (broker) by adding the KQIUserExit to the node.conf.yaml or the server.conf.yaml file.

```
UserExits:
activeUserExitList: 'KQIUserExit' # Specify the name
#of an installed user exit to activate.
```

**Note:** If you want to disable the transaction tracking, comment out **activeUserExitList: 'KQIUserExit'**.

6. Restart the integration node (broker) with the **mqsistart** command.

## Disabling transaction tracking

### Procedure

To disable transaction tracking for IBM Integration Bus, complete the following steps:

1. Open an IBM Integration Bus command console with one of the following methods. If you have multiple versions of integration nodes (brokers) installed, ensure that you start the command console for the correct version.
  - **Windows** Click **Start > IBM Integration Bus > IBM Integration Console**
  - **Linux** **UNIX** From the bin directory of integration node (broker) installation directory, issue the **mqsiprofile** command.
2. Disable transaction tracking for the message flow within an integration node (broker) with one of the following methods:

- To disable transaction tracking for a specific message flow, use the **mqsichangeflowuserexits** command:

```
mqsichangeflowuserexits broker_name -e execution_group_name
-f message_flow_name -a ""
```

- To disable transaction tracking for all message flows within the integration node (broker), first stop the integration node (broker) with the **mqsistop** command and then issue the **mqsichangebroker** command:

```
mqsichangebroker broker_name -e ""
```

## What to do next

- For transaction tracking, after you enable transaction tracking for IBM Integration Bus, you must also enable transaction tracking for the agent. For instructions, see [“Configuring transaction tracking for the IBM Integration Bus agent”](#) on page 363.
- If you have enabled snapshot data collection for your integration node (broker), configure the IBM Integration Bus agent not to store any snapshot data. Cloud APM does not support snapshot accounting and statistics data due to the amount of data and processing required for the set 20 second snapshot interval. For instructions, see [“Disabling snapshot data collection for the agent”](#) on page 363.

## Disabling snapshot data collection for the agent

Cloud APM does not support snapshot accounting and statistics data due to the amount of data and processing required for the set 20 second snapshot interval. If you have enabled snapshot data collection for the broker, remember to configure the IBM Integration Bus agent not to store the snapshot data.

### Procedure

1. Open the agent configuration file in a text editor. The agent configuration file is in one of the following directories depending on the operating system:

- **Linux** **UNIX** `install_dir/config/<hostname>_qi_<instance_name>.cfg`
- **Windows** `install_dir\TMAITM6_x64\<hostname>_qi_<instance_name>.cfg`

where *install\_dir* is the agent installation directory; *hostname* is the host name of the operating system; *instance\_name* is the agent instance name.

2. Edit the file by adding the following parameter to the KqiAgent section:

```
defaultRetainRecentSnapshotSamples=0
```

Example:

```
INSTANCE=inst1 [
SECTION=KqiAgent [ { agentId=inst1 } { instName=inst1 }
{defaultRetainRecentSnapshotSamples=0}]
SECTION=MonitorBroker:BRK1 [ { collectNodeData=NO } ]
SECTION=MonitorBroker:BRK2 [ { collectNodeData=NO } ]
]
```

3. Save and close the file.
4. Restart the IBM Integration Bus agent for the changes to take effect.

## Configuring transaction tracking for the IBM Integration Bus agent

Transaction tracking data for IBM Integration Bus can be displayed in the middleware and topology dashboards after you enable the data collection on the **Agent Configuration** page for the IBM Integration Bus agent.

### Before you begin

- Make sure that transaction tracking is enabled for IBM Integration Bus with the agent provided user exit named KQIUserExit. If you have not done it, follow the instructions in [“Enabling transaction tracking”](#) on page 361.
- Make sure that the IBM Integration Bus agent is configured appropriately. If you have not done it, follow the instructions in [“Configuring the IBM Integration Bus agent”](#) on page 352.

### Procedure

To configure transaction tracking for the IBM Integration Bus agent, complete the following steps:

1. From the navigation bar, click  **System Configuration** > **Agent Configuration**.

- The **Agent Configuration** page is displayed.
2. Click the **IBM Integration Bus** tab.
  3. Select the check boxes for the agent instances and take one of the following actions from the **Actions** list:
    - To enable transaction tracking, click **Set Transaction Tracking > Enabled**. The status in the **Transaction Tracking** column is updated to Enabled.
    - To disable the transaction tracking data, click **Set Transaction Tracking > Disabled**. The status in the **Transaction Tracking** column is updated to Disabled.

## Results

You have configured transaction tracking for the selected agent instances. Transaction tracking data can be displayed in the middleware and topology dashboards after you enable the data collection. For further information, see [“Adding middleware applications to the Application Performance Dashboard” on page 126](#).

## Specifying unique managed system name for IBM Integration Bus agent

The IBM Integration Bus agent instance name displayed on the Cloud APM console is also known as the managed system name(MSN). You can use the agent configuration parameter to specify unique MSN for each agent instance.

### About this task

When the IBM Integration Bus agent is started, it registers the MSN in the format of *monitoredbrokername:agentID:KQIB* for each agent instance, where *monitoredbrokername* is the name of monitored broker and *agentID* is the agent ID that is set by agent configuration parameter. The maximum length of the MSN is 32 characters. If the MSN length exceeds 32 characters, it will truncated.

Unique MSN might be required in the following circumstances:

- You are running more than one IBM Integration Bus agent on the same system.
- You are running more than one monitored broker with the same name on different systems.

To specify an agent ID to get a unique MSN, use the **Agent Id** option during interactive configuration or use the **agentId** parameter in the silent response file.

**Remember:** If you have not configured the IBM Integration Bus agent for the first time after installation, follow the steps as documented in [“Configuring the IBM Integration Bus agent” on page 352](#).

### Procedure

- To use the **Agent Id** option during interactive configuration, complete the following steps:
  - a) Enter the following command:

```
install_dir/bin/iib-agent.sh config instance_name
```

where *instance\_name* is the agent instance name that you want to specify an agent ID for.

- b) Follow the options to configure the agent instance.

If no change is needed for an option, use the default value.
  - c) When the **Agent Id** option appears, specify the middle qualifier for the managed system name.

The valid format is an alphanumeric string with a maximum length of 8 characters.
- To use the **agentId** parameter in the silent response file, complete the following steps:
    - a) Open the following agent silent response file in a text editor.
      - **Linux** | **UNIX** `install_dir/samples/iib_silent_config.txt`
      - **Windows** `install_dir\tmaitm6_x64\samples\qi_silent_config.txt`

- b) Specify an agent ID for the **agentId** parameter.

The valid format is an alphanumeric string with a maximum length of 8 characters.

- c) Save and close the silent response file, and then run the following command from the command line:

- **Linux** **UNIX** `install_dir/bin/iib-agent.sh config instance_name path_to_responsefile`
- **Windows** `install_dir\BIN\iib-agent.bat config "instance_name path_to_responsefile"`

where *instance\_name* is the name of the instance that you configure, and *path\_to\_responsefile* is the full path of the silent response file.

**Warning:** On Windows systems, do not include double quotation marks (") that enclose the full path to the silent response file, as this will cause a configuration error.

- d) After the configuration completes, enter the following command to start the agent:

- **Linux** **UNIX**  
`install_dir/bin/iib-agent.sh start instance_name`

- **Windows**  
`install_dir\bin\iib-agent.bat start instance_name`

## What to do next

Log in to the Cloud APM console. If the agent instance with previous MSN is still displayed as offline, edit your application to remove it and then add the new agent instance with the assigned agent ID.

## Removing the KQIUserExit user exit

Before you uninstall the IBM Integration Bus agent, you must first remove the KQIUserExit user exit.

### Procedure

Complete the following steps to remove the KQIUserExit user exit that you deployed to IBM Integration Bus for transaction tracking:

1. Navigate to the bin directory of the IBM Integration Bus agent.

- **Windows** `agent_install_dir\arch\qi\bin`
- **Linux** **UNIX** `agent_install_dir/arch/qi/bin`

where:

- *agent\_install\_dir* is the agent installation directory. The default is C:\IBM\APM on Windows systems and /opt/ibm/apm/agent on Linux and AIX systems.
- *arch* is the architecture code of the platform. For example, lx8266 represents Linux Intel v2.6 (64-bit). For a complete list of the architecture codes, see the *agent\_install\_dir/archdsc.tbl* file.

2. Run the **configDC** script to remove the user exit library interactively:

- **Windows**  
`configDC.bat -disable iib_install_dir`

- **Linux** **UNIX**  
`./configDC.sh -disable iib_install_dir`

where *iib\_install\_dir* is the installation directory of the IBM Integration Bus.

### Example

The following example removes the agent provided user exit for version 9.0 brokers that are installed on an AIX system:

```
cd /opt/IBM/ITM/aix513/qi/bin
./configDC.sh -disable /opt/IBM/mqsi/9.0
```

## Configuring IBM i OS monitoring

Use the Monitoring Agent for IBM i OS on your IBM i OS system to gathering exactly the information you need to detect problems early and prevent them. After you install the i OS agent, complete some manual configuration steps to get it up and running.

### Before you begin

#### Confirm that your IBM i OS system fulfills the prerequisites

The IBM i OS agent requires the following environment:

- IBM i 7.2, 7.3, or 7.4
- IBM i 5770-SS1 Option 12, Host Servers
- IBM i 5770-SS1 Option 12, Host Servers
- IBM i 5770-SS1 Option 30, Qshell
- IBM i 5770-TC1 TCP/IP Communication Utilities
- IBM i 5770-SS1 Option 34, Digital Certificate Manager (DCM) if you are using secure communications
- IBM i 5770-DG1 IBM HTTP Server for i if you are using DCM for secure communications
- IBM i 5770-JV1 Java, if you are using HTTP server for DCM for secure communications

#### Delete the previous version of the monitoring agent

If IBM Tivoli Monitoring version 6.x (5724C04) is installed, follow these steps:

1. Determine whether the V6.x agent (5724C04) is installed:

```
DSPSFWRSC
```

Search for 5724C04.

2. If the V6.x agent (5724C04) is installed, stop the agent and delete the licensed product. Otherwise, continue to the deployment procedure.

```
ENDOMA
```

```
DLTLICPGM LICPGM(5724C04)
```

3. Remove the saved configuration data by completing one of the following steps:

This step is important. If you don't remove the configuration data, the V8 environment uses the V6 configuration.

- Make a backup of the IBM Tivoli Monitoring 6 configuration data by moving the /QIBM/UserData/IBM/ITM/ConfigData directory to a backup location, but not under /QIBM/UserData/IBM/ITM:

```
MOV OBJ('/QIBM/UserData/IBM/ITM/ConfigData') TODIR('<my_dir>')
```

- Remove the saved configuration data:

```
RMVDIR DIR('/QIBM/UserData/IBM/ITM/ConfigData') SUBTREE(*ALL)
```

## About this task

The IBM i OS agent is installed as a licensed program product (LPP) on your IBM i system. To configure the agent, you run a script on the APM server that gathers and copies information from the server to the agent environment file on the IBM i system.

If you want secure communications between the agent and server, you must have a keyfile database file (.kdb) containing certificates that are generated by the APM server or by a third party. For server-generated certificates, you run a preparation step on the APM server. The file that contains the certificates is transferred to the IBM i system and the certificates are exported to the IBM i \*SYSTEM certificate store by using Digital Certificate Manager (DCM).

## Procedure

Follow these steps to install and configure your IBM i OS agent:

1. Extract the files from the Base Agents or Advanced Agents package into a directory, such as a temporary directory, for installing.
2. Transfer the a4520cma.sav file to the IBM i system and restore the agent as a licensed program product.

Example of transfer on IBM i:

```
CRTSAVF ITM/APM814
CLRSAVF ITM/APM814
```

Example on the APM server with a4520cma.sav, using FTP in binary mode:

```
ftp <computer_name>
binary
put a4520cma.sav ITM/APM814
```

Example of restore on IBM i:

```
RSTLICPGM LICPGM(5725U05) DEV(*SAVF) SAVF(ITM/APM814)
```

On IBM i, if you are installing the monitoring agent on a system that is not set to language ID 2924, enter the restore commands that are shown in this example:

```
RSTLICPGM LICPGM(5725U05) DEV(*SAVF) RSTOBJ(*PGM) SAVF(ITM/APM814)
RSTLICPGM LICPGM(5724U05) DEV(*SAVF) RSTOBJ(*LNG) LNG(2924) SAVF(ITM/APM814) LNLIB(QKA4LNG)
```

3. Create the configuration package files by running the make configuration package script.  
The script creates a configuration package archive file and compressed file with information that the agent needs for communications with the server.

- a) Navigate to the default /opt/ibm/ccm directory or to the *custom\_path*/ccm directory that you specified during APM server installation, and enter the following command:

```
./make_configuration_packages.sh
```

Make a note of the output location. For example, /opt/ibm/ccm/mkcustpkg\_workdir.11013.

- b) Navigate to the directory specified when the command completes.

Example: /opt/ibm/ccm/mkcustpkg\_workdir.11013

- c) Extract the compressed file to a directory of your choosing.

```
onprem_config.tar
onprem_config.zip
```

- d) Navigate to the directory and find the following information in the onprem\_config directory:

- In the agent\_global\_env.cfg file, **BASE\_URL**

- In the `tenantid.txt` file, **tenant id**
4. Update the agent environment file on the IBM i system:
    - a) Edit the agent environment file:

```
EDTF FILE(QAUTOTMP/KMSPARM)
```

- b) Update the following environment variables, where `BASE_URL` is the value that you found in `agent_global_env.cfg`:

```
IRA_ASF_SERVER_URL=<BASE_URL>/ccm/asf/request
```

Example: `IRA_ASF_SERVER_URL=http://1.2.3.4:80/ccm/asf/request`

```
IRA_API_DATA_BROKER_URL=<BASE_URL>/1.0/monitoring/data
```

Example: `IRA_API_DATA_BROKER_URL=http://1.2.3.4:80/1.0/monitoring/data`

```
IRA_API_TENANT_ID=tenant id
```

Example: `IRA_API_TENANT_ID=A1A1-B2B2-C3C3-D4D4-E5E5-F6F6-A7A7-B8B8`

5. If you are using secure communications between the agent and server (https), follow these steps. The examples that are shown are for the Linux operating system.

- a) On the APM server, navigate to the directory where the `onprem_config.tar` or `onprem_config.zip` was extracted (step 3.c).

In the next step, the password of the certificate `keyfile.kdb` is changed to a password that you selected with the **gsk8capicmd** or **gsk8capicmd\_64**. The certificate keyfile is transferred to the IBM i system and exported into the IBM i \*SYSTEM certificate store. During this process, you specify the selected password.

- b) Configure the APM server shell session to use the GSKit command. Find the `gsk8capicmd_64` command:

```
find /opt/ibm -name gsk8capicmd_64
```

The result is `/opt/ibm/sy/lx8266/gs`.

Set environment variables in the shell that uses the result from the last command:

```
export GSK_HOME=/opt/ibm/sy/lx8266/gs
```

```
export PATH=$GSK_HOME/bin:$PATH
```

```
export LD_LIBRARY_PATH=$GSK_HOME/lib64:$LD_LIBRARY_PATH
```

- c) Run the command to change the password of the `keyfile.kdb` file.

The new password is used when you export the certificates in Digital Certificate Manager on the IBM i system. Example:

```
gsk8capicmd_64 -keydb -change pw -stashed -db onprem_config/keyfiles/keyfile.kdb -new_pw <newpw> -stash
```

**Note:** After the password is changed, use the `keyfile.kdb` file only for the IBM i OS agent. If other OS or application agents need to be configured, rerun `make_configuration_packages.sh` to use the original `keyfile.kdb` and original password.

- d) Transfer the `keyfile.kdb` file in binary mode to an IFS directory on the IBM i system. Example:

```
/apm/keyfiles/keyfile.kdb
```

- e) Configure Digital Certificate Manager (DCM) on IBM i.

- i) Authorize QAUTOMON to use certificate store files. These steps provide sufficient authority for QAUTOMON to access certificate store files.
  - a) Using WRKFCNUSG, find QIBM\_QSY\_SYSTEM\_CERT\_STORE.
  - b) Choose option 2=Change usage.
  - c) Specify QAUTOMON for User.
  - d) Specify \*ALLOWED for Usage.

QAUTOMON is now allowed access to the created certificates that are used for SSL communications between the server and agent.

- ii) Open IBM i Digital Certificate Manager (DCM) in a browser:

```
http://<hostname>:2001/ibm/console/logon.jsp/
```

- iii) Select a Certificate Store:

- a) Other System Certificate Store. Continue.
- b) Enter IFS directory and file name with the key file (/apm/keyfiles/keyfile.kdb) (Step 5.d).
- c) Enter new password that you set earlier. Continue. (Step 5.c).

- iv) Manage Certificates -> Export certificate:

- a) Certificate authority (CA). Continue.
  - i. Select apmCA. Export.
  - ii. Select Certificate store. Continue.
  - iii. Other System Certificate Store.
  - iv. Enter the IFS path and file name of \*SYSTEM certificate store, /QIBM/USERDATA/ICSS/CERT/SERVER/DEFAULT.KDB.
  - v. Enter the \*SYSTEM certificate store password. Continue.
- b) Certificate authority (CA). Continue.
  - i. Select server\_key. Export.
  - ii. Select Certificate store. Continue.
  - iii. Other System Certificate Store.
  - iv. Enter the IFS path and file name of \*SYSTEM certificate store, /QIBM/USERDATA/ICSS/CERT/SERVER/DEFAULT.KDB.
  - v. Enter the \*SYSTEM certificate store password. Continue.

- c) Server or client. Continue.

- i. Select IBM\_Tivoli\_Monitoring\_Certificate, default.agent. Export.
- ii. Select Certificate store. Continue.
- iii. Other System Certificate Store.
- iv. Enter the IFS path and file name of \*SYSTEM certificate store, /QIBM/USERDATA/ICSS/CERT/SERVER/DEFAULT.KDB.
- v. Enter the \*SYSTEM certificate store password. Continue.

- v) Select a Certificate Store.

- a) \*SYSTEM Certificate Store. Continue.
- b) Enter \*SYSTEM certificate store password. Continue.

- vi) Manage Applications -> Add Application

- a) Select Client. Continue.
- b) Application ID: QIBM\_APM\_KA4\_AGENT

- c) Application description: APM v8 IBM i OS Agent
- d) Exit program: CT\_AGENT
- e) Exit program library: QAUTOMON
- f) Threadsafe: Yes
- g) Multithread job action: Run program and send message.
- h) Application user profile: QAUTOMON
- i) Define the CA trust list: Yes
- j) Certificate revocation processing: No
- vii) Manage Certificates -> Assign certificate.
  - a) Select IBM\_Tivoli\_Monitoring\_Certificate, default.agent. Assign to applications.
  - b) Select APM v8 IBM i OS Agent, Client. Replace.
- viii) Manage Applications -> Define CA trust list.
  - a) Select Client. Continue.
  - b) Select APM v8 IBM i OS Agent, IBM\_Tivoli\_Monitoring\_Certificate. Define CA trust list.
  - c) Select all. OK.

## Results

The i OS agent is now installed on your IBM i system.

## What to do next

Start the agent on the IBM i command line with this command:

```
STROMA
```

You can stop the agent on the IBM i command line with this command:

```
ENDOMA
```

If you need to uninstall the agent from the managed system, run the following command:

```
ENDOMA
DLTLICPGM LICPGM(5725U05)
```

## Configuring IBM MQ Appliances monitoring

The MQ Appliance agent is a multi-instance agent. After installation, you must configure the agent by creating an agent instance before you can start monitoring with the agent.

### Before you begin

- The directions here are for the most current release of this agent. To access the documentation for earlier agent releases, see [Table 45 on page 370](#).

| Table 45. Agent versions |                                 |
|--------------------------|---------------------------------|
| Agent version            | Documentation                   |
| 3.0.0.5                  | <a href="#">Cloud APM 8.1.4</a> |

### Procedure

- On Linux and UNIX systems, you can configure the agent with the configuration script that prompts for responses or the silent response file.

- [“Configuring the agent by responding to prompts” on page 371](#)
- [“Configuring the agent by using the silent response file” on page 372](#)
- On Windows systems, you can configure the agent only with the silent response file.
  - [“Configuring the agent by using the silent response file” on page 372](#)

## What to do next

In the Cloud APM console, go to your Application Performance Dashboard to view the data that was collected. For more information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

If you are unable to view the data in the agent dashboards, first check the server connection logs and then the data provider logs. The default paths to these logs are listed here:

- **Linux** **UNIX** `/opt/ibm/apm/agent/logs`
- **Windows** `C:\IBM\APM\TMAITM6_x64\logs`

## Configuring the agent by responding to prompts

You must assign an instance name to the MQ Appliance agent and configure the agent before it can start monitoring your IBM® MQ Appliances.

### Procedure

To configure the agent by running the script and responding to prompts, complete the following steps:

1. Run the following command:

```
install_dir/bin/mq_appliance-agent.sh config instance_name
```

where *install\_dir* is the path where the agent is installed and *instance\_name* is the name that you want to give to the agent instance.

Example:

```
/opt/ibm/apm/agent/bin/mq_appliance-agent.sh config AQM904
```

2. Respond to the prompts to set configuration values for the agent.

See [“Configuration parameters for the MQ Appliance agent” on page 373](#) for an explanation of each of the configuration parameters.

3. Run the following command to start the agent:

```
install_dir/bin/mq_appliance-agent.sh start instance_name
```

Example:

```
/opt/ibm/apm/agent/bin/mq_appliance-agent.sh start AQM904
```

## Results

Now, you can log in to the Cloud APM console and use the Applications editor to add the MQ Appliance agent instance to the Application Performance Dashboard. For instructions on how to start the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#). For information about using the Applications editor, see [“Managing applications” on page 1269](#).

## Configuring the agent by using the silent response file

The silent response file contains the agent configuration parameters. You can edit the silent response file to modify the values of these parameters, and run the configuration script to create an instance and update the agent configuration values. This mode of configuration is called the silent mode.

### About this task

The silent response file contains the agent configuration parameters with default values that are defined for some parameters. You can edit the silent response file to specify different values for the configuration parameters.

After you update the configuration values in the silent response file, you must run the configuration script to configure the agent with these updated values.

### Procedure

To configure the agent by editing the silent response file and running the script without interaction, complete the following steps:

1. Open the `mq_appliance_silent_config.txt` file in one of the following directories in a text editor.

- **Linux** | **UNIX** `install_dir/samples/mq_appliance_silent_config.txt`
- **Windows** `install_dir\samples\mq_appliance_silent_config.txt`

where, `install_dir` is the agent installation directory. For example, `/opt/ibm/apm/agent`.

2. In the `mq_appliance_silent_config.txt` file, specify values for all mandatory parameters and modify the default values of other parameters as needed.

See [“Configuration parameters for the MQ Appliance agent” on page 373](#) for an explanation of each of the configuration parameters.

3. Save and close the `mq_appliance_silent_config.txt` file, and run the following command:

- **Linux** | **UNIX**

```
install_dir/bin/mq_appliance-agent.sh config instance_name path_to_silent_file
```

- **Windows**

```
install_dir\bin\mq_appliance-agent.bat config instance_name path_to_silent_file
```

where:

- `instance_name` is the name that you want to give to the agent instance. For example, `AQM904`.
- `path_to_silent_file` is the path to the `mq_appliance_silent_config.txt` file. For example, `/opt/ibm/apm/agent/samples/mq_appliance_silent_config.txt`.

4. After configuration completes, run the following command to start the agent:

- **Linux** | **UNIX**

```
install_dir/bin/mq_appliance-agent.sh start instance_name
```

- **Windows**

```
install_dir\bin\mq_appliance-agent.bat start instance_name
```

### Results

Now, you can log in to the Cloud APM console and use the Applications editor to add the MQ Appliance agent instance to the Application Performance Dashboard. For instructions on how to start the Cloud APM

console, see [“Starting the Cloud APM console” on page 1109](#). For information about using the Applications editor, see [“Managing applications” on page 1269](#).

## Configuration parameters for the MQ Appliance agent

The configuration parameters for the MQ Appliance agent are displayed in tables which group them according to sections.

- [Table 46 on page 373](#): Properties for receiving SNMP events and decoding V3 events.
- [Table 47 on page 374](#): Properties for Java settings.
- [Table 48 on page 374](#): Properties for the proxy server used by HTTP providers.
- [Table 49 on page 374](#): Properties for HTTP server.
- [Table 50 on page 375](#): Properties for connecting to the MQ appliance.

| Table 46. SNMP event configuration parameters |   |   |
|---|---|---|
| Parameter name                                | Description   | Parameter name in silent configuration file |
| Port Number                                   | The port number that is used to listen for SNMP events. The default is 162.   | KQZ_SNMPEVENT_PORT                          |
| Security Level                                | The security level that is used to connect to the SNMP event. It can be one of the following values: <ul style="list-style-type: none"><li>• 1=noAuthNoPriv</li><li>• 2=authNoPriv</li><li>• 3=authPriv</li></ul> The default is 2. | KQZ_SNMPEVENT_SECURITY_LEVEL                |
| User Name                                     | The user name that is used for connecting to the SNMP agent. The default is snmpuser.   | KQZ_SNMPEVENT_USER_NAME                     |
| Auth Protocol                                 | The authorization protocol that is used to connect to the SNMP agent. It can be one of the following values: <ul style="list-style-type: none"><li>• 1=MD5</li><li>• 2=SHA</li></ul> The default is 2.                              | KQZ_SNMPEVENT_AUTH_PROTOCOL                 |
| Auth Password                                 | The authorization pass phrase that is used for connecting to the SNMP agent.  | KQZ_SNMPEVENT_AUTH_PASSWORD                 |
| Priv Password                                 | The privacy pass phrase that is used for connecting to the SNMP agent.  | KQZ_SNMPEVENT_PRIV_PASSWORD                 |
| Trap configuration file                       | The location of the trap configuration file.  | KQZ_SNMPEVENT_TRAPCNFG_FILE                 |

*Table 47. Java configuration parameters*

| Parameter name   | Description  | Parameter name in silent configuration file |
|------------------|--|---|
| Java trace level | <p>The trace level that is used by the Java providers. It can be one of the following values:</p> <ul style="list-style-type: none"> <li>• 1=Off</li> <li>• 2=Error</li> <li>• 3=Warning</li> <li>• 4=Information</li> <li>• 5=Minimum Debug</li> <li>• 6=Medium Debug</li> <li>• 7=Maximum Debug</li> <li>• 8=All</li> </ul> <p>The default is 2.</p> | JAVA_TRACE_LEVEL                            |

*Table 48. Proxy server configuration parameters*

| Parameter name  | Description   | Parameter name in silent configuration file |
|-----------------|---|---|
| Proxy Hostname  | The hostname of the proxy server.                       | KQZ_HTTP_PROXY_HOSTNAME                     |
| Proxy Port      | The port number of the proxy server. The default is 80. | KQZ_HTTP_PROXY_PORT                         |
| Proxy User Name | The user name for the proxy server.                     | KQZ_HTTP_PROXY_USER                         |
| Proxy Password  | The password for the proxy server.                      | KQZ_HTTP_PROXY_PASSWORD                     |

*Table 49. HTTP server configuration parameters*

| Parameter name                 | Description  | Parameter name in silent configuration file |
|--------------------------------|--|---|
| HTTP user name                 | The user name for accessing the MQ Appliance REST Management interface.  | KQZ_HTTP_USER                               |
| HTTP password                  | The password for accessing the MQ Appliance REST Management interface.   | KQZ_HTTP_PASSWORD                           |
| Certificate Validation Enabled | <p>Whether to enable certificate validation. It can be one of the following values:</p> <ul style="list-style-type: none"> <li>• 1=true</li> <li>• 2=false</li> </ul> <p>The default is 2.</p> | KQZ_HTTP_CERTIFICATE_VALIDATION             |

Table 50. MQ appliance connection configuration parameters

| Parameter name                 | Description   | Parameter name in silent configuration file |
|--------------------------------|---|---|
| Appliance Host or IP Address   | The hostname or IP address of the MQ appliance. The default is <code>https://hostnameoripaddress:https://9.123.123.123.</code>                            | KMK_APPLIANCE_HOST_OR_IP_ADDRESS.arm1       |
| Appliance Port Number          | The port number for HTTPS connection to the MQ appliance. The default is 5554.  | KMK_APPLIANCE_PORT_NUMBER.arm1              |
| Appliance User Name            | The user name that is used for connecting to the MQ appliance.  | KMK_APPLIANCE_USER_NAME.arm1                |
| Appliance User Password        | The password for the MQ appliance user.   | KMK_APPLIANCE_USER_PASSWORD.arm1            |
| Agent Host Identification      | The hostname of the system where the MQ Appliance agent is running. The default is 9.123.123.111.   | KMK_APM_AGENT_IDENTIFICATION.arm1           |
| Certificate Validation Enabled | Whether to enable certificate validation for HTTP connection. <ul style="list-style-type: none"> <li>1=true</li> <li>2=false</li> </ul> The default is 2. | KMK_CERTIFICATE_VALIDATION_ENABLED.arm1     |

## Configuring InfoSphere DataStage monitoring

You must configure the DataStage agent so that the agent can collect data to monitor the health and performance of the DataStage server resources.

### Before you begin

Review the hardware and software prerequisites, see [Software Product Compatibility Reports for DataStage agent](#)

### About this task

The DataStage agent is a multiple instance agent. You must create the first instance and start the agent manually.

The product version and the agent version often differ. For information about how to check the version of an agent in your environment, see [Agent version command](#). For detailed information about the agent version list and what's new for each version, see the [“Change history”](#) on page 58.

## Configuring the agent on Windows systems

You can use the IBM Cloud Application Performance Management window to configure the agent on Windows systems.

### Procedure

1. Click **Start > All Programs > IBM Monitoring agents > IBM Performance Management**.

2. In the **IBM Performance Management** window, right-click **Template** in the **Task/SubSystem** column, and click **Configure Using Defaults**.

The **Monitoring Agent for DataStage** window opens.

3. In the **Enter a unique instance name** field, type an agent instance name and click **OK**.
4. In the **Monitoring Agent for DataStage** window, specify values for the configuration parameters and click **OK**.

For information about the configuration parameters, see [“Configuration parameters of the agent” on page 378](#).

5. In the **IBM Performance Management** window, right-click the agent instance that you created and click **Start** to start the agent.

## Configuring the agent on Linux systems

To configure the agent on Linux operating systems, you must run the script and respond to prompts.

### Procedure

1. On the command line, change the path to the agent installation directory.  
Example: `/opt/ibm/apm/agent/bin`
2. Run the following command where `instance_name` is the name that you want to give to the instance:  
`./datastage-agent.sh config instance_name`
3. When the command line displays the following message, type 1 and enter:  
Edit 'Monitoring Agent for DataStage' setting? [1=Yes, 2=No]
4. Specify values for the configuration parameters when you are prompted.

For information about the configuration parameters, see [“Configuration parameters of the agent” on page 378](#).

5. Run the following command to start the agent:  
`./datastage-agent.sh start instance_name`

## Configuring environment variables

You can configure environment variables to change the behavior of the DataStage agent.

### Procedure

1. Open the following file in a text editor:
  - a) **Windows** `install_dir\TMAITM6_x64\KDTENV_instance_name`
  - b) **Linux** `install_dir/config/.dt.environment`
2. Edit the following environment variables:
  - **KDT\_FIRST\_COLLECTION\_INTERVAL**: The time interval in seconds for first data collection. Set this time interval to a duration by which the agent would collect previous Job runs data in the specified time until the agent starts. The default value is 300 seconds (5 minutes). So, if the agent starts at 2:00 PM, it collects the Job runs data from 1:55 PM to 2:00 PM. This is to avoid data storm of historical job runs when the agent starts collecting data. All subsequent agent data collection for job runs fetch only the newly added job runs that took place since the last collection.
  - **KDT\_SSL\_CONTEXT**: The SSL protocol that is enabled on the Service Tier (WebSphere Application Server). The default value is TLS.
  - **KDT\_META\_SCHEMA\_NAME**: The name of database schema that is created for the metadata repository. The default value is DSODB for Db2 and xmeta for MSSQL and Oracle databases.

- **KDT\_DATABASE\_SERVICE\_NAME:** The database or service name that is used by the agent to connect to the metadata repository. The default value is XMETA for Db2, xmeta for MSSQL, and ORCL for Oracle databases.
- **KDT\_DISABLED\_ATTRIBUTEGROUP:** A comma-separated list of attribute groups whose data collection needs to be unavailable. Following values can be set as single or multiple for respective attribute group: JobRuns, JobProperties, JobRunLog, JobStages, JobParameters, EngineSystemConfiguration, EngineSystemResources, EngineServiceStatus, EngineStatusSummary, JobActivity, AgentConfiguration, and JobConfiguration.

## Configuring the agent by using the silent response file

The silent response file contains the agent configuration parameters. You can edit the silent response file to modify the values of these parameters, and run the configuration script to create an instance and update the agent configuration values. This mode of configuration is called the silent mode.

### About this task

You can use the silent response file to configure the DataStage agent on Linux and Windows system. After you update the configuration values in the silent response file, you must run the configuration script to configure the agent with these updated values.

### Procedure

1. In a text editor, open the silent config file that is available at the following location and specify values for all the parameters:

**Windows** `install_dir\samples\datastage_silent_config.txt`

**Linux** `install_dir\samples\datastage_silent_config_UNIX.txt`

**Windows** `C:\IBM\APM\samples`

**Linux** `/opt/ibm/apm/agent/samples`

For information about the configuration parameters, see [“Configuration parameters of the agent”](#) on page 378.

2. On the command line, change the path to `install_dir\bin`.
3. Run the following command:

**Windows** `datastage-agent.bat config instance_name install_dir\samples\datastage_silent_config.txt`

**Linux** `datastage-agent.sh config instance_name install_dir\samples\datastage_silent_config_UNIX.txt`

4. Start the agent.

**Windows** In the **IBM Performance Management** window, right-click the agent instance that you created, and click **Start**.

**Linux** Run the following command: `./datastage-agent.sh start instance_name`

### What to do next

Log in to the Cloud APM console to view data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console”](#) on page 1109.

For help with troubleshooting, see the [Troubleshooting](#) section.

## Configuration parameters of the agent

While configuring the DataStage agent, you can change the service tier, metadata repository, and advanced configuration parameters.

### Service tier configuration parameters

The configuration parameters that are required for the agent to connect to the service tier.

The following table contains detailed descriptions of the service tier configuration parameters of the DataStage agent.

| Table 51. Names and descriptions of the service tier configuration parameters |   |                 |
|---|---|-----------------|
| Parameter name  | Description   | Mandatory field |
| Hostname  | Hostname of the computer where service tier is installed. If the computer is part of a domain then provide fully qualified domain name (FQDN).Default Value is localhost. | Yes             |
| HTTPS Port  | HTTPS port for REST interface on the computer where service tier is installed. Default Value is 9443.   | Yes             |
| WAS Username  | The user name for connecting to WebSphere Application Server. Default Value is wasadmin.  | Yes             |
| WAS Password  | The password for connecting to WebSphere Application Server.  | Yes             |
| Confirm WAS Password  | The password that is specified in the <b>WAS Password</b> field.  | Yes             |

### Metadata repository configuration parameters

The configuration parameters that are required for the agent to connect to the metadata repository.

The following table contains detailed descriptions of the metadata repository configuration parameters of the DataStage agent.

| Table 52. Names and descriptions of the metadata repository configuration parameters |  |                 |
|--|--|-----------------|
| Parameter name   | Description  | Mandatory field |
| Database Type  | Database type of the metadata repository. Db2Default Value is 1.   | Yes             |
| Hostname   | Hostname of the computer where metadata repository is installed. If the computer is part of a domain then provide fully qualified domain name (FQDN).Default Value is localhost. | Yes             |
| Database Port  | Database port on metadata repository for JDBC Connection. Default Value is 50000.  | Yes             |
| Database Username  | The username for connecting to operations database. Default Value is dsodb.  | Yes             |
| Database Password  | The password for connecting to operations database.  | Yes             |
| Confirm Database Password  | The password that is specified in the <b>Database Password</b> field.  | Yes             |
| JDBC Driver Path   | Path to the JDBC driver including jar file. For example,/home/jars/db.jar on Linux.  | Yes             |

## Advanced configuration parameters

| Table 53. Names and descriptions of the advanced configuration parameters |   |                 |
|---|---|-----------------|
| Parameter name  | Description   | Mandatory field |
| Java trace level  | The trace levels that are used by the Java Custom providers.<br>Default Value is 2. | Yes             |

## Java API Client Configuration parameters

| Table 54. Names and descriptions of the Java API Client Configuration parameters |             |                 |
|--|-------------|-----------------|
| Parameter name   | Description | Mandatory field |
| Class path for external jars   |             | No              |

## Configuring Internet Service Monitor

The Internet Service Monitoring Agent offers the capability to determine whether a particular service performs adequately, identify problem areas and report service performance measured against Service Level agreements. Internet Service Monitoring works by emulating the actions of a real user. It regularly polls or tests Internet services to check their status and performance.

### Overview

When monitoring Internet services, you define what is to be monitored, for whom, and when. You can configure the monitors through Internet Service Monitoring configuration user interface.

The monitor test specific Internet services and forward the results of the tests to the Databridge. The monitors emulate the actions of a real user of the service.

For example, the HTTP monitor periodically attempts to access a web page by emulating requests that a web browser would usually send when a user goes to the page. The monitor records the result of the test, which is sent to the Databridge.

### Internet Service Monitoring

Each monitor is designed to test one type of protocol or service. For example, the HTTP monitor tests the availability of resources such as web pages over the Hypertext Transfer Protocol, and the FTP monitor tests the transfer of files between hosts running the File Transfer Protocol.

A monitor can test many different instances of the same service, such as a series of web pages served by a range of hosts.

### Web Service Monitoring

Using the Internet Service Monitoring range of monitors, you can tailor the type of web service monitoring you provide from basic Internet service monitoring testing the availability of a web page, to combining sequences of tests.

Internet service monitoring uses high volume, low complexity polling to test the availability of web services. For example, if you want to monitor the general availability of a website, you might use the HTTP monitor to poll many URLs at regular intervals.

Using a combination of monitors, you can build a level of service monitoring appropriate to your requirements:

- HTTP and HTTPS monitors

Monitor the availability of resources over HTTP or HTTPS by running basic, single-request tests at high volume.

- Transaction monitor (TRANSX)

Combine sequences of tests carried out by a group of monitors, simulating the actions of a real user. For example, dialing up a service, accessing a number of pages on several websites and then accessing email services.

The product version and the agent version often differ. The directions here are for the most current release of this agent. For information about how to check the version of an agent in your environment, see [Agent version command](#). For detailed information about the agent version list and what's new for each version, see the [“Change history”](#) on page 58.

## Configuring Internet Service Monitoring through user interface

To monitor Internet services, create user profiles, profile elements, and monitoring schedules. Configure user profiles, profile elements, and monitoring schedules by using the Internet Service Monitoring user interface.

### About this task

A user profile is a customer, or a department, or a group of services for which you monitor internet or web services. For each user profile, user needs to define one or more profile elements. For example, user might define a profile element to monitor a web page delivered over an HTTP service, or a profile element to monitor the availability of an FTP service. User profiles typically contain multiple profile elements, each profile element tests one of the services provided to that user. Each user profile also has an associated monitoring schedule that determines on which day and at what time the tests that are defined in the profile are to run.

To access the Internet Service Monitoring Agent's configuration window through IBM Application Performance Management dashboard use the following method:

### Procedure

1. On the Application Performance Management dashboard click  Icon. Click **Agent Configuration**, Agent configuration window opens.
2. Click **ISM** tab to configure Internet Service Monitoring Agent.

You can Create, Edit, Delete, Refresh, Schedule, and filter the user profiles. Deploy the created user profiles on selected managed system. The version displayed is the version of the managed system. Profile name indicates the user profile deployed against the selected managed systems. Follow these steps to configure any of the profiles and deploy on the managed systems.

3. To add a profile click  icon. Enter the **Profile Name** and **Description** in the dialog box.
4. Click **Next**.
5. Select a monitor from the monitors dropdown list and click **Next**.
6. Provide the values of the fields and click **Add**.  
Multiple monitors can be selected for a profile. See [“Available Internet Service Monitoring monitors”](#) on page 384 for available monitors.
7. Click **Done**.
8. Click  icon.
9. In the **Filter** field, search the user profiles by its name.
10. To deploy the profile that is created on a managed system, select the check box of the created profiles, which are to be configured and select a managed system. Click **Deploy** to deploy the profile on the selected managed system name.

## Editing profile

All the user profiles that are created are editable.

### About this task

Use the following procedure to edit the profiles.

### Procedure

1. Select **profile name** and click .
2. Select a service to edit and click **Edit**.
  - a. Add a monitor by using  icon and delete monitor by using .
  - b. To rename a profile, double-click **Profile Name** text field, modify the profile name and click **Rename Profile**.
3. Edit the values for the selected service.

#### Note:

- To enable password field for editing, double-click **username** text field. User can edit or add username, and change the password.
  - To enable **sslkeypassword** field for editing, double-click its text to change the secret key.
4. To Activate or Deactivate a monitor element for a particular profile, refer the following steps:
    - Open a profile in edit mode.
    - Select the check boxes for monitor elements that you want to activate or deactivate and click on **Activate** or **Deactivate** buttons respectively.
    - Click **Ok** from **Click on refresh icon to reflect the change** dialog box.
    - Click .
    - Verify the changes in the **Active** field. If monitor element is activated the value of **Active** field will be **True**. For Deactivated monitor elements value will be **False**.
  5. To delete multiple monitor elements, select the check-boxes next to monitor elements in the profile edit grid and click on .
  6. Click **Save** and click  icon to refresh.

## Scheduling a profile

The profiles that are created can be scheduled to deploy on a particular date and time.

### About this task

Use the following procedure to schedule profiles.

### Procedure

1. Select **profile name**.
2. Click **Schedule** button.
3. Schedule the profile by selecting day against time. User can drag the grid to select any wanted time.
4. Click **Save**.
5. Click  icon to refresh.

## Deleting a profile

The profiles that are created can be deleted permanently.

### About this task

Use the following procedure to delete the profile.

### Procedure

1. Select **profile name**.
2. Click  icon to delete the profile.

## OID Groups

Object Identifier (OID) groups are optional monitor specific parameters. They define sets of one or more OIDs of a device's Management Information Base (MIB) objects. The SNMP monitor uses the OID groups to retrieve data from those MIB objects whose OIDs appear in a specified OID group.

The details of the MIB objects from which the monitor extract data are as follows:

- **OID Value**

The numerical identifier of the MIB object instance expressed using either ASN.1 notation, for example .1.3.6.1.2.1.1.2.0, or the object's name, for example sysObjectID.0

**Note:** When using ASN.1 notation, you must include the leading . character in the OID.

**Note:** You may only use an object's instance name to specify the OID value if the MIB document that defines the name is accessible by the monitor. The default directory for MIB documents is \$ISHOME/mibs.

- **OID Name**

The name of the MIB object, for example sysObjectID. This name is used in service level classifications and in \$oidName monitor elements.

- **OID Unit**

The units of the data contained in the MIB object. For example, seconds, bytes, or bits per second (BPS). Set to BPS to enable bits per second calculation for the OID. Bits per second values are calculated as:

```
current_poll_value - prev_poll_value) / poll_interval * 8
```

- **Selector**

The index value of the MIB object. The following table shows an example that results in the selector searching all the ifDescr rows for the value FastEthernet0/1, giving a row index of 2. Then the row ifPhysAddress.2 is queried and the value 0:6:53:34:d2:a1 is returned. In this way the index 2 is not directly specified, so if the index for FastEthernet0/1 changes, the OID groups do not need to be re-configured.

| Table 55. Use of the index value |                                |
|----------------------------------|--------------------------------|
| MIB object                       | MIB object value               |
| OID value                        | ifPhysAddress                  |
| OID name                         | FastEthernet0/1PhysicalAddress |
| OID unit                         | string                         |
| Selector                         | ifDescr=FastEthernet0/1        |

## Creating OID group and MIB object

OID groups are created globally and can be used by all user profiles that monitor SNMP-enabled devices

### Procedure

Complete the following steps to create an OID group and MIB object.

1. Click the **OIDs** button to create an OID group on the Internet Service Monitoring Agent dashboard.
2. Click  icon and enter the OID group name in the **OID Group Name** field.
3. Click  icon to add the MIB object.
  - a. Enter the **value, Name, Unit** and **selector** for the MIB object.
  - b. Click **Add**.

MIB object is created successfully.

4. Click  icon to refresh.

OID group is created successfully
5. Select an **OID Group Name** and click **View** to see the list of all the MIB objects created under the selected **OID Group**.
6. Click **Close**.

## Editing OID group and MIB object

You can edit the OID groups. The MIB objects can also be edited while creating the OID group or after creating the OID group.

### Procedure

Complete the following steps to edit an OID group.

1. Click the **OIDs** button, to edit an OID group on the Internet Service Monitoring Agent dashboard..
2. Select the OID group name from the **OID Group Name** list and click  icon.
3. Select the value from the **Edit OID Group** and click  icon.
4. Modify the MIB object fields according to your requirement and click **Save** button.
5. Click **Save** on **OID Groups** pop-up page.
6. Click **Close**.

## Deleting OID group

MIB objects are contained in OID groups and used by the SNMP monitor to obtain data. You can delete individual MIB objects from an OID group or delete all MIB objects by deleting the entire OID group.

### Procedure

Complete the following steps to delete an OID group.

1. To delete the ODI group, click the **OIDs** button on the Internet Service Monitoring Agent dashboard.
2. Select the OID Group Name from the **OID Group Name** list and click  icon.

The OID group along with the MIB object is deleted.
3. Click **Close**.

*Deleting MIB object*

### Procedure

Complete the following steps to delete the MIB group.

1. To delete the MIB object, click the **OIDs** button on the Internet Service Monitoring Agent dashboard.
2. Select the OID Group Name from the **OID Group Name** list and click  icon.
3. Select the MIB object value and click  icon.  
MIB object is deleted.
4. Click **Save** on the **Edit OID Group** pop-up page.
5. Click **Close**.

## Available Internet Service Monitoring monitors

The Internet Service Monitoring a suite of monitors that cover a broad range of Internet services.

The following table lists the monitors available in Internet Service Monitoring and the types of service that it monitors.

| <i>Table 56. Available Internet service monitors</i> |  |
|--|--|
| Monitor Name   | Type of service monitored  |
| DHCP   | Dynamic Host Configuration Protocol.<br>To configure DHCP, see <a href="#">“DHCP Monitor” on page 396.</a>     |
| DNS  | Domain Name Service.<br>To configure DNS, see <a href="#">“DNS Monitor” on page 398.</a>                       |
| FTP  | File Transport Protocol.<br>To configure FTP, see <a href="#">“FTP Monitor” on page 403.</a>                   |
| HTTP   | HyperText Transport Protocol.<br>To configure HTTP, see <a href="#">“HTTP Monitor” on page 407.</a>            |
| HTTPS  | HyperText Transport Protocol (Secure).<br>To configure HTTPS, see <a href="#">“HTTPS Monitor” on page 416.</a> |
| ICMP   | Internet Control Message Protocol.<br>To configure ICMP, see <a href="#">“ICMP Monitor” on page 421.</a>       |
| LDAP   | Lightweight Directory Access Protocol.<br>To configure LDAP, see <a href="#">“LDAP Monitor” on page 426.</a>   |
| IMAP4  | Internet Message Access Protocol.<br>To configure IMAP4, see <a href="#">“IMAP4 monitor” on page 432.</a>      |
| NTP  | Network Time Protocol.<br>To configure NTP, see <a href="#">“NTP Monitor” on page 437.</a>                     |
| NNTP   | Network News Transport Protocol.<br>To configure NNTP, see <a href="#">“NNTP Monitor” on page 439.</a>         |
| POP3   | Post Office Protocol.<br>To configure POP3, see <a href="#">“POP3 Monitor” on page 444.</a>                    |

Table 56. Available Internet service monitors (continued)

| Monitor Name | Type of service monitored  |
|--------------|--|
| RADIUS       | Remote Authentication Dial-In User Service. To Configure RADIUS, see <a href="#">“RADIUS Monitor”</a> on page 449. |
| RPING        | Remote Ping (Cisco, Juniper, and RFC2925). To configure RPING, see <a href="#">“RPING Monitor”</a> on page 454.    |
| RTSP         | Real-Time Streaming Protocol. To configure RTSP, see <a href="#">“RTSP Monitor”</a> on page 459.                   |
| SAA          | Cisco Service Assurance Agent. To configure SAA, see <a href="#">“SAA monitor”</a> on page 465.                    |
| SIP          | Session Initiation Protocol. To configure SIP, see <a href="#">“SIP Monitor”</a> on page 480                       |
| SMTP         | Simple Mail Transport Protocol. To configure SMTP, see <a href="#">“SMTP Monitor”</a> on page 485.                 |
| SNMP         | Simple Network Management Protocol. To configure SNMP, see <a href="#">“SNMP Monitor”</a> on page 489.             |
| SOAP         | XML-based messaging protocol. To configure SOAP, see <a href="#">“SOAP Monitor”</a> on page 494.                   |
| TCPPort      | Transmission Control Protocol. To configure TCPPort, see <a href="#">“TCPPort Monitor”</a> on page 498             |
| TFTP         | Trivial File Transfer Protocol. To configure TFTP, see <a href="#">“TFTP Monitor”</a> on page 502.                 |
| TRANSX       | Transactions. To configure TRANSX, see <a href="#">“TRANSX Monitor”</a> on page 507.                               |

## Files

### Executable File

Each Internet service monitor consists of an executable file, properties file, rules file, and a log file.

Monitor executable files are located in the \$ISHOME/platform/arch/bin directory. The value for arch is the architecture code for the Windows - win 32 operating system.

### Properties File

The properties file is a text file and includes default settings that are preceded by the hash symbol.

To change a setting, either change the default setting and remove the hash symbol or copy and paste the line that contains the default settings, make the change and remove the hash symbol. This enables you to restore the defaults later. Monitor properties files are located in the \$ISHOME/etc/props directory.

### Rules File

Rules files are similar to IBM Application Performance Management Netcool/OMNIBus probe rules files. For information about their syntax, see the *IBM Application Performance Management Netcool/OMNIBus Probe and Gateway Guide*.

Monitor rules files are located in the \$ISHOME/etc/rules directory.

## Log file

Log files store messages about the monitor's operation.

Monitor log files are located in the \$ISHOME/log directory. The MessageLog property determines the location and name of the log file. The MessageLevel property selects the level of information that is written to the log file, for example, detailed debugging messages or unrecoverable error messages. The MaxLogFileSize property determines the size of the log file before rolling over.

The default name of the log file is name.log where *name* is the name of the monitor.

## Common features

There are a number of features that are common to all Internet service monitors. These features consist of properties, results produced by the monitors, and status messages.

This section describes the properties of all monitors. Monitor specific properties are described in the individual monitor sections.

In the following table, the default property parameters are underlined where applicable.

| Table 57. Common properties |                    |   |
|-----------------------------|--------------------|---|
| Property name               | Property parameter | Description   |
| AddRoute                    | <u>0</u>   1       | Creates a route from the IP address of the network interface used by the monitor to the IP address of the monitored host.<br><br>0 - disabled<br>1 - enabled (monitor uses the route specified in the profile element, and not over another network interface).<br><br><b>Note:</b> This property isn't supported on AIX and HP-UX platforms. |
| BridgeIPAddress             | not applicable     | Specifies the IP address of the Databridge. This property isn't configurable; the Databridge is always on the local host.   |
| BridgePort                  | integer            | Port number used by the Databridge. Set this property to the same value as the Databridge SocketPort property.<br><br>Default: 9510   |
| BridgeSSLAuthenticatePeer   | <u>0</u>   1       | If you want to configure SSL authentication between the monitor and bridge, or between the bridge and the agent, set BridgeSSLAuthenticatePeer to 1 and restart the bridge. This action authenticates the certificates from the server. Certificates are stored in the BridgeSSLTrustStore.<br><br>0 - disabled<br>1 - enabled                |
| BridgeSSLCertificateFile    | string             | Specifies the path and filename of the digital Bridge SSL certificate.<br><br>Default: \$ISHOME/certificates/monitorCert.pem  |

Table 57. Common properties (continued)

| Property name         | Property parameter | Description   |
|-----------------------|--------------------|---|
| BridgeSSLCipherSet    | string             | Specifies a CipherSet. If you update this value, use the Cipher syntax defined in the OpenSSL documentation.<br><br><b>Note:</b> Set the same value on the Internet service monitoring agent, all monitors, and the Databridge.<br><br>Default: RC4:3DES:DES:+EXP   |
| BridgeSSLDisableSSLv2 | 0 1                | Determines which types of sockets are accepted.<br><ul style="list-style-type: none"> <li>• If set to 0, both SSLv2 and SSLv3 are accepted.</li> <li>• If set to 1, sockets are opened in SSLv3 only.</li> </ul> <b>Restriction:</b> Set the same value on the Internet service monitoring agent, all monitors, and the Databridge. |
| BridgeSSLEncryption   | 0 1                | Enables Bridge SSL encryption. Set this property to the same value as the corresponding Databridge property.<br><ul style="list-style-type: none"> <li>0 - disabled</li> <li>1 - enabled</li> </ul> <b>Note:</b> Set the same value for all monitors.   |
| BridgeSSLKeyFile      | string             | The path and the filename of the Bridge SSL private key file.<br><br>Default: \$ISHOME/certificates/monitorKey.pem  |
| BridgeSSLKeyPassword  | string             | The password used to encrypt the Bridge SSL private key.<br><br>Default: tivoli   |

Table 57. Common properties (continued)

| Property name              | Property parameter | Description  |
|----------------------------|--------------------|--|
| BridgeSSLTruststore        | string             | <p>The path and file name of the Trusted certificate file for authentication. This is only required when using the BridgeSSLAuthenticatePeer setting.</p> <p>If you want to configure SSL authentication between the monitor and bridge, or between the bridge and the agent, set BridgeSSLAuthenticatePeer to 1 and restart the bridge. This action authenticates the certificates from the server. You can store certificates in both the SSLTrustStoreFile and the SSLTrustStorePath.</p> <p>Defaults:</p> <ul style="list-style-type: none"> <li>• SSLTrustStoreFile, \$ISHOME/certificates/trust.pem</li> <li>• SSLTrustStorePath, \$ISHOME/certificates/</li> </ul> <p>To add new certificates, complete one of the following steps:</p> <ul style="list-style-type: none"> <li>• Add a certificate to the end of the list in the SSLTrustStoreFile text file.</li> <li>• Add a certificate to the SSLTrustStorePath directory, and run the OpenSSL <code>c_rehash certificate_dir</code> command to hash the certificates.</li> </ul> |
| BridgeTimeout              | integer            | Time, in seconds, that the monitor waits for a response from the Databridge.   |
| ConfigFile                 | string             | Use to point to a monitor configuration file.<br>Default: blank (empty string).  |
| ConfigurationCheckInterval | integer            | The interval (in seconds) at which the monitor checks for changes to the profile.<br>Default: 1  |
| Datalog                    | 0   1              | Forces the monitor to log performance data in a datalog file. The performance data is logged in:<br><code>\$ISHOME/datalogs/userprofile</code><br>0 - disabled<br>1 - enabled  |

| Table 57. Common properties (continued) |                    |   |
|---|--------------------|---|
| Property name                           | Property parameter | Description   |
| DatalogFormat                           | string             | Defines the format of the datalog file. The parameter is a space-separated list of elements, the values of which should be stored in the datalog file. For each poll result written to the datalog file, the current time (\$time) and the time taken (\$totalTime) are logged, followed by all the elements defined in this property.                |
| DatalogNameFormat                       | string             | Format of the datalog filename.   |
| Domain                                  | string             | Specifies the domain name of the host running the monitor. If this property is not set, the monitor attempts to guess the domain name using the NIS and DNS configurations.   |
| DumpProps                               | not applicable     | Displays a list of all properties for a monitor.  |
| FullHostInfo                            | @ 1                | Specifies whether to map the \$host element to an IP address element \$hostIP (if \$host is a DNS name) or to a DNS name element (if \$host is an IP address).<br><br>0 - disabled<br>1 - enabled<br><br><b>Note:</b> This isn't available in the TRANSX monitor.   |
| GroupID                                 | string             | The group ID that the monitor should be run as.   |
| Help                                    | @ 1                | Displays the help for command-line options without running the monitor.<br><br>0 - disabled<br>1 - enabled  |
| IdentifierChecksumFields                | string             | Deprecated.   |
| IgnoreUnmatchedDVC                      | @ 1                | If a particular service level classification isn't matched, element not created by the monitor, then ignore that element in the service level calculation.<br><br><b>Tip:</b> In earlier releases of Internet Service Monitoring, service level classifications were called Discrete Value Classifications (DVCs).<br><br>0 - disabled<br>1 - enabled |

Table 57. Common properties (continued)

| Property name  | Property parameter | Description   |
|----------------|--------------------|---|
| IpAddress      | string             | Specifies the IP address of the network interface that the monitor uses during tests.<br><br>If this property isn't set, the monitor attempts to determine the host machine's IP address using a host name lookup. This attempt may fail if the host machine has more than one network interface. |
| Manager        | string             | Specifies the name of the management application, which is used in ObjectServer event de-duplication.   |
| MaxCCA         | integer            | Sets the maximum number of concurrent connections that the monitor can have at any one time. Note that if you set this value too high, you might severely affect the performance of the monitor.<br><br>This property isn't available for the ICMP monitor.<br><br>Default: 10                    |
| MaxLogFileSize | integer            | The maximum size (in bytes) of the log file.<br><br>Default: 1048576  |
| MessageLevel   | string             | The lowest level of messages to be sent to the message log. Values, in ascending order of severity are: debug, info, warn, error, and fatal.<br><br>Default: warn   |
| MessageLog     | string             | Location of the log file.<br><br>Default: \$ISHOME/log/monitor.log  |
| MinPoll        | integer            | Defines the minimum polling interval allowed. If any of the monitor configuration files have a poll interval set less than this value, the value in the configuration file is overridden.<br><br>Default: 60  |
| MsgDailyLog    | integer            | Enables generation of a daily log file.<br><br>Default: 0 - Daily log disabled  |
| MsgTimeLog     | string             | Specifies the time (in 24-hour format HHMM) after which the monitor generates a daily log, if MsgDailyLog is enabled.<br><br>Default: 0000 - 12 midnight  |

| Table 57. Common properties (continued) |                    |   |
|---|--------------------|---|
| Property name                           | Property parameter | Description   |
| Name                                    | string             | The name of the monitor. Setting this property resets the PropsFile, RulesFile and MessageLog properties to their defaults.   |
| NewProfileCheckMultiple                 | integer            | Multiple that indicates how often the monitor checks for new configuration files when checking for profile changes.<br>Default: 10  |
| NoRecover                               | integer            | Instructs the monitor not to recover the store and forward file.<br>Default: 0 - recovery isn't suppressed  |
| Pause                                   | integer            | Sets the interval (in seconds) at which a monitor spawns threads. Setting this property to higher values, such as 100 or more, forces the monitor to spawn threads at a slower rate. Increasing the value is generally only necessary on slow systems.<br>This property isn't supported on the ICMP monitor.<br>Default: 50 |
| PreviousFields                          | string             | Elements specified by this property (using the form "<element>, <element>, ...") are stored for one poll and prefixed with the string previous.   |
| Profile                                 | string             | The name of the customer profile, or profiles to use. The string can be a single profile name, a space separated list of profile names, or *, which forces the monitor to use all available profiles.<br>Default: *   |
| ProfileUpdateTimeout                    | integer            | The number of milliseconds that a profile file must remain static before it can be read by a monitor and updated. The allowable range is 1-20000 milliseconds.<br>Default: 100  |
| PropsFile                               | string             | The name of the properties file.<br>Default: \$ISHOME/etc/props/ <i>monitor</i> .props  |
| QFile                                   | string             | Sets the name of the store and forward file.<br>Default: \$ISHOME/var/ <i>monitor</i> .saf.   |

| Table 57. Common properties (continued) |                    |   |
|---|--------------------|---|
| Property name                           | Property parameter | Description   |
| QSize                                   | integer            | Sets the reserved size (in bytes) of the store and forward file.<br>Default: 10240000                         |
| UserID                                  | string             | The user ID that the monitor should be run as.<br><b>Note:</b> Don't use this property with the DHCP monitor. |
| Version                                 | not applicable     | Prints the monitor version without running the monitor.   |

#### Common monitor elements

This section describes the elements produced by all monitors. Monitor specific elements are described in the individual monitor sections. Produced elements can be viewed in the Internet Service Monitoring Agent dashboard.

If you use IBM Application Performance Management, the elements that can be viewed on the agent's dashboard as attributes are determined by a mapping file generated by the Internet service monitoring agent. This mapping file isn't configurable.

Table 58 on page 392 lists the elements produced by all monitors. Elements indicated by an asterisk (\*) are available as workspace attributes. The names of the attributes are shown within brackets. Absence of an asterisk indicates there's no equivalent workspace attribute. Attributes shown in brackets but without an element indicates that they are only available as workspace attributes, there is no equivalent element.

| Table 58. Common monitor elements |  |
|-----------------------------------|--|
| Element name                      | Element description  |
| \$consecutiveFailures             | <p>If \$failureRetests is nonzero and the test fails according to the service level classification, this element is created starting with the value of 1. The value increases until either the test no longer fails, at which point \$consecutiveFailures is set to 0, or until the following poll.</p> <p>If, at this poll, the service level is passed or starts increasing again, the element is no longer created. If the value of this element exceeds the value of \$failureRetests, the value of \$consecutiveFailures is reset to 1.</p> <p><b>Note:</b> The TRANSX monitor doesn't generate this element.</p> |
| \$datalogPath*<br>(guid)          | The path to the datalog file used by the monitor. The workspace attribute uses the last 100 characters of the path.  |
| \$description*<br>(Description)   | Contains the text description provided in the <b>Description</b> field of the monitor profile element.   |

Table 58. Common monitor elements (continued)

| Element name                              | Element description   |
|---|---|
| \$failureRetestInterval                   | The poll interval used during failure retesting. This is only valid if \$failureRetests is greater than 0. If the retest interval is greater than the normal poll interval, it's set equal to the normal poll interval.<br><b>Note:</b> The TRANSX monitor doesn't generate this element. |
| \$failureRetests                          | The number of service level failures that has to be exceeded before a failed event is recorded and sent to the ObjectServer.<br><b>Note:</b> The TRANSX monitor doesn't generate this element.  |
| \$host*<br>(Host)                         | The name of the host or server. Stored in the configuration file.   |
| \$hostName                                | Contains the host name of the \$host element (if \$host is an IP address).  |
| \$hostIP                                  | Contains the host IP of the \$host (if \$host is a DNS name).   |
| \$identchecksum*<br>(Identchecksum )      | The identifier of the profile element.  |
| \$lastServiceLevel*<br>(LastServiceLevel) | The service level number of the previous poll. This is cleared if the profile changes.  |
| \$lastServiceLevelCounter                 | The serviceLevelCounter in the previous poll. This is reset if the profile changes.   |
| \$monitorDNSdomain                        | The domain name of the machine running the monitor, as used by DNS.   |
| \$monitorHost*<br>(MonitorLocation)       | The name of the host running the monitor.   |
| \$monitorNISdomain                        | The domain name of the host running the monitor, as used by NIS (Network Information Service).  |
| \$monitorDomain                           | Overrides the \$monitorDNSdomain and \$monitorNISdomain settings.   |
| \$message*<br>(ResultMessage)             | A text string describing the result of the poll. For example, Connection failed, OK, or Success.  |
| (Node)                                    | The name of the system on which Internet Service Monitoring is running. This attribute is added by the Internet service monitoring agent.   |
| \$pollInterval                            | The poll interval specified in each monitor.  |

Table 58. Common monitor elements (continued)

| Element name  | Element description   |
|---|---|
| \$resultString*<br>(ResultString)   | A text string indicating the service level classification applied to the results of the poll. For example, TotalTime > 20.                                |
| \$service*<br>(Service)   | The name of the service being monitored. For example, FTP or HTTP.  |
| \$serviceLevel*<br>(ServiceLevel)   | The service level number of the poll, as defined in the service level classification:<br><br>0 - Unknown<br>1 - Good<br>2 - Marginal<br>3 - Failed        |
| \$serviceLevelCounter   | The number of times that the service level number has remained unchanged.   |
| (ServiceLevelString)  | The string associated with the returned service level (Unknown, Good, Marginal, or Failed).   |
| \$startTimePoll   | The time when the poll started.   |
| \$time  | The UNIX time, in seconds, when the poll occurred.  |
| \$timeStamp*<br>(Timestamp)   | The date and time when the test was performed. The timestamp format uses local settings.  |
| \$transxName  | The name of the transaction. This is produced by a monitor if the monitor is used in a transaction.   |
| Profile Details   |   |
| \$profile*<br>(IsmProfile)  | The name of the user profile.   |
| Timings - for information about how timings are measured, see <a href="#">“Time Calculations” on page 394</a> . |   |
| \$timeout   | The number of seconds in which the server must respond. Taken from the configuration file.  |
| \$totalTime*<br>(TotalTime)   | The total time taken to run an operation in seconds. This includes all lookup, connect, and download times where applicable, and interim processing time. |

## Time Calculations

Monitors attempt to divide the time taken to complete a poll into different timed stages. For example, this could include the time taken to obtain a host's IP address, or the time taken to successfully connect to a host.

The `$totalTime` is always slightly longer than the sum of the other times, because it includes the overhead incurred by the monitor's activities such as processing received data and performing system calls. `$totalTime` is measured in seconds.

#### Status messages

Monitors return the generated status messages after each service test. Status messages indicate the outcome of tests.

Messages generally originate from the monitored service or the network environment outside the monitor. [Table 59 on page 395](#) describes the common status messages returned by monitors in the `ResultMessage` attribute when using IBM Application Performance Management. Monitor specific status messages are described in the individual monitor sections.

In addition to the messages provided by the individual monitors, some monitors such as the HTTP monitor, report messages for the underlying operating system. For example, if the TCP connection fails, Internet Service Monitoring uses the string defined by the operating system, such as **connection refused**, **timeout**, **network unreachable**, and other strings.

| Table 59. Common status messages   |  |
|--|--|
| Message  | Description  |
| OK   | The request from the monitor succeeded.<br><br>Monitors may have other status messages that indicate that a process was successful. See the <i>Status Messages</i> section for each monitor. |
| Received response to request not originating from this monitor - ignored | Received a reply from the server to a message that didn't originate from the designated monitor.   |
| Connection failed<br>Connect to server failed                            | The monitor failed to connect to the server. See the log file for more information.  |
| Connection closed unexpectedly   | The connection to the server was broken.   |
| Connection timed out   | The connection succeeded, but then the server stopped responding.  |
| Connection closed by foreign host  | The remote host closed the connection before the monitor expected.   |
| Timed out waiting to read/write  | A data connection to the monitored server was established, but it has stopped responding.  |
| No Response from server  | Request timed out.   |

| Table 59. Common status messages (continued)  |   |
|---|---|
| Message   | Description                             |
| Format Error<br>Server Failure<br>No such host or domain<br>Not Implemented<br>Request refused<br>Unknown Error   | Error returned by the monitored server. |
| Network is down<br>Network is unreachable<br>Network dropped connection on reset<br>Software caused connection abort<br>Connection reset by peer<br>Connection timed out<br>Connection refused<br>Host is down<br>No route to host<br>Remote peer released connection | There's a problem with the network.     |

### DHCP Monitor

The DHCP monitor checks the availability and response time of DHCP servers.

You assign service level classifications according to the time it takes for the DHCP server to respond to a request from the DHCP monitor, by using either the total, lookup, or response time.

| Table 60. DHCP monitor files |                                |
|------------------------------|--------------------------------|
| Monitor files                | Name or Location               |
| Monitor executable           | nco_m_dhcp                     |
| Properties file              | \$ISMHOME/etc/props/dhcp.props |
| Rules file                   | \$ISMHOME/etc/rules/dhcp.rules |
| Log file                     | \$ISMHOME/log/dhcp.log         |

### Guidelines for Configuring the DHCP monitor

The DHCP monitor tests DHCP services by acting as a limited DHCP client. It sends a DHCP INFORM request to the target DHCP server on the same network by using UDP as the transport protocol over an established connection, and awaits a corresponding DHCP ACK from the server. The monitor doesn't request an IP address, or affect the expiry on existing IP addresses.

**Note:** Monitored DHCP servers must support DHCP INFORM requests and be RFC2131 compliant.

The DHCP monitor must run as `root` because it binds to a port less than 1024.

## Limitation

The DHCP monitor can't use any network interface that is configured by using a DHCP client. Instead, configure the monitor to use a network interface whose IP address isn't assigned dynamically.

## Configuring the DHCP Monitor Service Test

| Table 61. DHCP monitor configuration |  |
|--------------------------------------|--|
| Field                                | Description  |
| server                               | The host name of the DHCP server. Example is dhcp1.mycompany.com   |
| localip                              | The IP address network interface that the monitor uses to perform the test. Example is 192.168.n.n                                     |
| description                          | A text field for providing descriptive information on the element. Example is DHCP monitor   |
| port                                 | The port number of the DHCP server and the default value is 67.  |
| localport                            | The port number that the monitor uses to perform the test and the default value is 68.   |
| timeout                              | The time, in seconds, to wait for the server to respond and the default value is 30.   |
| retries                              | The number of times the monitor must retry the connection to the DHCP server before quitting and the default value is 0. Example is 2. |
| poll                                 | The time, in seconds, between each poll of the server by using the current profile element and default value is 300.                   |
| failureretests                       | The number of times to retest before indicating a failure and the default value is 0.  |
| retestinterval                       | The time, in seconds, to wait between each retest on failure and the default value is 30.  |

In addition to the test results common to all elements, the DHCP monitor generates a set of test results that contain data specific to DHCP service tests.

| Table 62. DHCP monitor elements |   |
|---------------------------------|---|
| Element                         | Description   |
| \$clientIP*ClientIp             | The IP address of the host where the monitor is running.                                    |
| \$lookupTime*(LookupTime)       | The time taken to obtain the IP address of the host server.                                 |
| \$responseTime*ResponseTime     | The time between when the connection is established and the first byte of data is received. |
| \$retries                       | The maximum number of retries, as specified during the monitor configuration.               |
| \$router                        | The IP address of the router as returned by the DHCP server.                                |

## Status messages

The DHCP monitor provides status messages in the ResultMessage attribute when using IBM Application Performance Management. These messages indicate the result of the test.

| Table 63. DHCP monitor status messages   |  |
|--|--|
| Message  | Description  |
| Received DHCPACK Received DHCPNAK  | A DHCP server responds to the DHCP inform request sent by the monitor.   |
| This monitor requires root privileges to run   | Log in as root.  |
| Did not receive valid DHCP MESSAGE   | Unrecognized response from the DHCP server.  |
| Did not receive valid DHCP MESSAGE TYPE  | Unrecognized response from the DHCP server (DHCPACK or DHCPNAK expected).  |
| Invalid transaction ID<br>Received response to request not originating from this monitor - ignored | Received a reply from a DHCP server to a message that didn't originate from this monitor.  |
| Unexpected op-code returned  | Received an unexpected message on this port.   |
| Connection failed  | The server name that is specified is invalid.  |
| Failed to send request to DHCP server  | The operating system can't identify specifically why the request might not be sent to the server so returns this status message that indicates a problem with the network. |
| No Response from server  | The DHCP server isn't responding.  |

## DNS Monitor

The DNS monitor uses the DNS (Domain Name System) service to find information about one or more hosts.

The DNS monitor uses either the IP address of the host to search for the host name, or the host name to search for the IP address. The monitor measures the performance of the service by recording the result of the search and the response times. The monitor also records details about each query sent to the server.

| Table 64. DNS monitor file summary |                               |
|------------------------------------|-------------------------------|
| Monitor files                      | Name or Location              |
| Monitor executable                 | nco_m_dns                     |
| Properties file                    | \$ISMHOME/etc/props/dns.props |
| Rules file                         | \$ISMHOME/etc/rules/dns.rules |
| Log file                           | \$ISMHOME/log/dns.log         |

## Guidelines for configuring DNS Monitor

The DNS monitor can be configured to look up the IP address or host name of the target host. Depending on the type of lookup, the monitor communicates with the DNS server in a different way.

### IP address lookup

When performing an IP address lookup test, the monitor is given a host name, which it uses to locate an IP address.

The monitor tests the DNS as follows:

1. The monitor queries the DNS server by using the fully qualified host name of HostA (hosta.dev.net) to request its IP address.

If the DNS server can locate the IP address of the host, it returns it to the monitor. If the DNS server can't locate the IP address of the host, it returns a message containing details of the failed search to the monitor.

If the request is timed out, the monitor will retry (if retries are configured). If there are no retries, the monitor will create a failed event.

If the host name specified in the configuration is a domain name, such as mycompany.com, rather than a fully qualified host name, such as hostx.mycompany.com, the monitor retrieves information about the whole domain. This information is stored in two extra elements: \$domainNameServer and \$domainNameAddr.

2. If the message returned to the monitor contains a canonical name, the monitor concludes that the name given in the configuration file must have been an alias. The monitor sends the canonical name to the DNS server to request the host's IP address.

If the DNS server locates the IP address of the host using its canonical name, it returns it to the monitor. If the DNS server can't locate the IP address of the host, it returns a message containing details of the failed search to the monitor.

3. If the first two attempts to query the DNS server fail, the monitor sends the IP address of the DNS Server (192.168.n.n) to the DNS server and requests its fully qualified host name.

If the DNS server can locate its own fully qualified host name, it returns it to the monitor. If the DNS server can't locate its own fully qualified host name, it returns a message containing details of the failed search. The request for the server's fully qualified host name (a reverse DNS lookup request), isn't supported on all types of DNS servers. If the target DNS server doesn't support reverse lookups, you can prevent the DNS monitor from sending this request by setting the LookupServerName property to 0.

### Recursive lookup

Non-recursive lookups present a more accurate picture of how the DNS server is performing, whereas recursive lookups give a better indication of the DNS performance that Internet applications (and therefore users) are getting. The DNS monitor supports both recursive and non-recursive lookups.

This is typically how Internet applications making DNS queries work. For example, a web browser always specifies recursive lookups when it's attempting to resolve the host portion of a URL.

If a DNS server can't answer a query because it doesn't contain an entry for the host in its database, it can recursively query DNS servers higher up in the hierarchy.

### DNS query types

The DNS monitor supports a range of DNS query types. Use the query code when specifying the type of DNS query.

| Table 65. DNS query types |                              |
|---------------------------|------------------------------|
| Query Code                | Query Type                   |
| A                         | Host Address                 |
| NS                        | Authoritative name server    |
| MD                        | Mail destination             |
| MF                        | Mail forwarder               |
| CNAME                     | Canonical name for an alias  |
| SOA                       | Start of a zone of authority |

| <i>Table 65. DNS query types (continued)</i> |                                  |
|--|----------------------------------|
| <b>Query Code</b>                            | <b>Query Type</b>                |
| MB   | Mailbox domain name              |
| MG   | Mail group member                |
| MR   | Mail rename domain name.         |
| NULL   | Null RR                          |
| WKS  | Well known service description   |
| PTR  | Domain name pointer              |
| HINFO  | Host information                 |
| MINFO  | Mailbox or mail list information |
| MX   | Mail exchange                    |
| TXT  | Text strings                     |
| AXFR   | Transfer of an entire zone       |
| MAILB  | Mailbox-related records          |
| MAILA  | Mail agent RR                    |
| ANY  | All records                      |

### Configuring DNS Monitor Service tests

Use the DNS monitor configuration parameters to define DNS service tests.

| <i>Table 66. Table 3. DNS monitor configuration</i> |  |
|---|--|
| <b>Field</b>  | <b>Description</b>   |
| server  | The IP address of the primary DNS server. Example is 192.168.n.n   |
| host  | The host name of the target host. Example is www.mycompany.com   |
| description   | A text field for providing descriptive information on the element. Example is DNS monitor.   |
| recursivelookups                                    | Enables or disables recursive lookups. <ul style="list-style-type: none"> <li>• recurse (use true in ismbatch).</li> <li>• norecurse (use false in ismbatch).</li> </ul> Default: recurse.                     |
| port  | Port on the DNS server to which the monitor listens and the default value is 53.   |
| localip   | Specifies the IP address of the network interface on the host machine to which the monitor binds when it performs the test. If the monitor's IPAddress property is set, it overrides the value of this field.. |
| querytype   | The DNS query type used in the test. For a list of supported query types see <a href="#">Table 65 on page 399</a> .  |
| timeout   | The time, in seconds, to wait for the server to respond.<br>Default: 10.   |

| <i>Table 66. Table 3. DNS monitor configuration (continued)</i> |   |
|---|---|
| Field   | Description   |
| retries   | The number of times the monitor should retry to contact the DNS server before quitting. |
| poll  | The time, in seconds, between each poll.<br>Default: 300.                               |
| failureretests  | The number of times to retest before indicating a failure.<br>Default: 0.               |
| retestinterval  | The time, in seconds, to wait between each failure retest.<br>Default: 10.              |

### Monitoring elements

In addition to the test results common to all elements, the DNS monitor generates a set of test results containing data specific to DNS service tests.

| <i>Table 67. Table 4. DNS monitor elements</i> |  |
|--|--|
| Element  | Description  |
| \$authoritative                                | This element is only created if the information retrieved came from an authoritative DNS server. If the DNS server wasn't authoritative, this element isn't created. |
| \$domainEmailAddress                           | The contact address of the target domain.  |
| \$domainNameServer                             | The name of the DNS server for the target domain.  |
| \$fromAliasTime                                | The time between issuing a request for a conical name, received from a previous query, and receiving an IP address.  |
| \$localIP                                      | The local IP address the monitor is configured to use. This may be blank on a machine with only one interface.   |
| \$lookup*(HostLookup)                          | The host name or IP address of the target host that the monitor is trying to locate.   |
| \$lookupCName                                  | The official host name of the target host. This element is only created if the official host name is different from the host name in \$lookupName.                   |
| \$lookupIP*(HostIp)                            | The IP address of the target host.   |
| \$lookupName*(Host)                            | The full host name of the target host.   |
| \$mxRecords                                    | The number of MX records found.  |
| \$port   | The port on which the service is monitored.  |
| \$queryType                                    | The type of DNS query used in the test. For a list of supported query types. See <a href="#">Table 65 on page 399</a> .  |
| \$responseTime*(ResponseTime)                  | The time between the monitor issuing a request to the DNS server and receiving a reply from it.  |
| \$retries                                      | The maximum number of retries, as specified in the profile element.  |
| \$serverIP                                     | The IP address of the DNS server.  |

| Table 67. Table 4.DNS monitor elements (continued) |  |
|--|--|
| Element  | Description                                  |
| \$serverName                                       | The host name of the DNS server.             |
| \$serverTime                                       | Time for the server to resolve its own name. |

### MX record handling

Two elements are created for each MX record found by the DNS monitor: \$mxHostn and \$mxPreferencen.

\$mxHostn stores the host name of an MX record. \$mxPreferencen contains the preference weighting of the host. The n increments for each record pair to differentiate them. The monitor stores the total number of MX records for a particular host in the element \$mxRecords. The record pairs are sorted in descending order of MX preference.

### Status message

The DNS monitor provides status messages in the ResultMessage attribute when using IBM Application Performance Management . These messages indicate the result of the test.

| Table 68. Table 5.DNS monitor status messages |  |
|---|--|
| Message                                       | Description                                |
| Domain information received                   | Request for a domain name succeeded.       |
| Success                                       | The request succeeded.                     |
| Invalid Response                              | Unrecognized response from the DNS server. |
| Connection failed                             | The server name specified is invalid.      |
| No Response from server                       | Request timed out.                         |
| Failed to send DNS request                    | There's a problem with the network.        |
| No such domain (no recursion)                 | The domain name is incorrect.              |

### Properties

The properties specific to the DNS monitor are described in the following table.

| Table 69. DNS monitor properties |                    |  |
|----------------------------------|--------------------|--|
| Property name                    | Property parameter | Description  |
| AcceptCNAME                      | @ 1                | If enabled, the DNS monitor accepts the canonical name in the DNS response and doesn't perform any further lookups.  |
| DNSQueryType                     | string             | The DNS query type used in tests. See Table 65 on page 399 for a list of supported query types.<br><br>Default: ANY. |

| Table 69. DNS monitor properties (continued) |                    |   |
|--|--------------------|---|
| Property name                                | Property parameter | Description   |
| LookupServerName                             | 0 1                | Enables reverse DNS lookup on the DNS server IP address.<br><br>0 - disabled<br>1 - enabled |

### FTP Monitor

The FTP monitor tests FTP services by either uploading files to, or downloading files from FTP servers. It monitors the performance of the service by recording the response time and data transfer rate, and monitors disk space and file integrity.

| Table 70. FTP monitor summary |                              |
|-------------------------------|------------------------------|
| Monitor files                 | Name or location             |
| Monitor executable            | nco_m_ftp                    |
| Properties file               | \$ISHOME/etc/props/ftp.props |
| Rules file                    | \$ISHOME/etc/rules/ftp.rules |
| Log file                      | \$ISHOME/log/ftp.log         |

### Guidelines for configuring the FTP monitor

The FTP monitor tests the availability of an FTP server by uploading a file to the server using an FTP STOR command, or downloading a file from the server using an FTP RETR command.

### Configuring FTP Monitor Service tests

The configuration parameters for the FTP monitor are described in the following table.

| Table 71. FTP monitor configuration |   |
|-------------------------------------|---|
| Field                               | Description   |
| server                              | The IP address of the target FTP server, or the machine you want to FTP from. Example is ftp.mycompany.com  |
| localfile                           | For FTP GET operations, this field specifies the name and path to which the file is downloaded.<br><br>For FTP PUT operations, this field specifies the name and path of the file that is uploaded to the FTP server.<br><br>The default value is FULL PATHNAME. Example is \$ISHOME/etc/ism/downloads/ftp-test.tar.Z |
| remotefile                          | For FTP GET operations, this field specifies the name and path of the file that is downloaded from the server.<br><br>For FTP PUT operations, this field specifies the name and path to which the file is uploaded on the FTP server.<br><br>The default value is FULL PATHNAME. Example is /sales/prodlist.tar.Z     |
| description                         | A text field for providing descriptive information about the element.   |

| Table 71. FTP monitor configuration (continued) |  |
|---|--|
| Field   | Description  |
| port  | The default port that the FTP server uses.<br>Default: 21  |
| username  | The username used to log on to the target FTP server.  |
| password  | The password used to log on to the target FTP server. Leave this blank if the FTP account doesn't require a password.  |
| command   | The FTP command for the monitor to use: <ul style="list-style-type: none"> <li>• GET or RECV - Download a file from the target FTP server</li> <li>• SEND or PUT - Upload a file to the target FTP server</li> </ul> Default: GET. |
| conntype  | Specifies the type of connection for the monitor to establish with the server when it tries to transfer the file: <ul style="list-style-type: none"> <li>• Active</li> <li>• Passive</li> </ul> Default: Active.                   |
| timeout   | The time, in seconds, to wait for the server to respond.<br>Default: 30.   |
| poll  | The time, in seconds, between each poll.<br>Default: 300   |
| failureretests                                  | The number of times to retest before indicating a failure.<br>Default: 0.  |
| retestinterval                                  | The time period in seconds to wait between each failure retest.<br>Default: 10.  |

### Regular expression matching

You can perform a regular expression search on the information being downloaded by entering up to 50 different regular expressions. The FTP monitor attempts to match the contents retrieved to each of the regular expressions.

If a match for a specified regular expression is found, the matched lines (or as much as can fit in the monitor's internal buffer) are returned in the corresponding `$regexMatchn` element. If the regular expression matches more than once in the information downloaded, only the first match is returned. The status of each regular expression test is indicated by the `$regexStatusn` elements. You can use the regular expression matches and their status information as criteria for service level classifications.

Regular expressions perform string matching on content downloaded during service tests. These expressions may contain one or more regular expression operators, which determine what content is matched by the expression.

**Note:** Regular expression syntax can be used to match strings on single lines only. Internet Service Monitoring can't match strings that include new lines or carriage returns. Use multiple regular

expressions to match strings that cover multiple lines. You can also use SLC rules to raise alarms based on the result of multiple regular expressions.

| Table 72. Regular expression operators |  |
|--|--|
| Character                              | Description  |
| .                                      | Matches any single character.<br>For example, the regular expression <code>r.t</code> matches the strings <code>rat</code> , <code>rut</code> , <code>r t</code> , but not <code>root</code> .   |
| \$                                     | Matches the end of a line.<br>For example, the regular expression <code>dog\$</code> matches the end of the string <code>it's a dog</code> but not the string <code>There are a lot of dogs</code> .   |
| ^                                      | Matches the beginning of a line.<br>For example, the regular expression <code>^When</code> matches the beginning of the string <code>When in the course of human events</code> but wouldn't match <code>What</code> and <code>When in the</code> .   |
| *                                      | Matches zero or more occurrences of the character immediately preceding.<br>For example, the regular expression <code>.*</code> matches any number of any characters.  |
| \                                      | Treats the subsequent character as an ordinary character.<br>For example, <code>\\$</code> matches the dollar sign character (\$) rather than the end of a line. Similarly, the expression <code>\.</code> matches the period character rather than any single character.  |
| [ ]                                    | Matches any one of the characters between the brackets.<br>For example, the regular expression <code>r[aou]t</code> matches <code>rat</code> , <code>rot</code> , and <code>rut</code> , but not <code>rit</code> .<br>Specify ranges of characters by using a hyphen.<br>For example, the regular expression <code>[0-9]</code> matches any digit.<br>You can also specify multiple ranges.<br>For example, the regular expression <code>[A-Za-z]</code> matches any letter case. |
|  | Matches phrases containing either of the conditions specified.<br>For example, <code>him her</code> matches the line <code>it belongs to him</code> and the line <code>it belongs to her</code> , but doesn't match the line <code>it belongs to them</code> .   |

**Note:** If you prefer the output data strings with curly braces `{}` or double quotes `"` then you need to add an escape character backslash `\` before every curly brace and double quote in the regular expression.

For example, if the data string is

```
{
  "templates":true,"mongodb":true,"ldap":true,"ucd":true,"github":true
}
```

then the regular expression should appear as `\{"templates\:true,\"mongodb\:true,\"ldap\":true,\"ucd\:true,\"github\:true\}`

## Monitor elements

In addition to the test results common to all elements, the FTP monitor generates a set of test results containing data specific to FTP service tests.

| Table 73. FTP monitor elements        |  |
|---------------------------------------|--|
| Element                               | Description  |
| \$bytesPerSec*(BytesPerSec)           | The average number of bytes transferred each second.   |
| \$bytesTransferred*(BytesTransferred) | The number of bytes uploaded or downloaded.  |
| \$checksum                            | The Checksum element doesn't normally provide meaningful values for service level classifications because checksum values aren't known when the profile element is created (the monitor calculates checksum values while tests are in progress). The \$checksum and \$previousChecksum monitor elements are intended for alert enrichment using the monitor's rules file.          |
| \$command*(FtpCommand)                | The FTP command issued by the monitor.   |
| \$connectionType*(FtpConnection)      | The type of data connection used. This can be ACTIVE or PASSIVE.   |
| \$connectTime*(ConnectTime)           | The time taken to connect to the FTP server.   |
| \$downloadTime                        | The time taken to download the file.   |
| \$localFile*(FtpLocalFile)            | Full pathname of the file stored on the local host. This element is taken from the configuration file.   |
| \$lookupTime*(LookupTime)             | The time taken to look up the FTP server IP address.   |
| \$previousChecksum                    | The PreviousChecksum element doesn't normally provide meaningful values for service level classifications because checksum values are not known when the profile element is created (the monitor calculates checksum values while tests are in progress). The \$previousChecksum and \$checksum monitor elements are intended for alert enrichment using the monitor's rules file. |
| \$regexpn                             | The regular expression.  |
| \$regexpmatchn                        | The contents of the line matching the regular expression.  |
| \$regexstatusn                        | The status of the regular expression match:<br>NONE - No regular expression checking is configured<br>MATCHED - A match was found for the regular expression<br>FAILED - A match wasn't found for the regular expression   |
| \$remoteFile*(FtpRemoteFile)          | Full pathname of the file stored on the remote host (the FTP server). This element is taken from the configuration file.   |
| \$responseTime*(ResponseTime)         | The time taken after a connection is created until the first byte of the target file is received.  |
| \$status                              | The status code returned by the FTP server.  |
| \$transferTime*(TransferTime)         | Sets the value to \$uploadTime or \$downloadTime.  |
| \$uploadTime                          | The time taken to upload the file.   |

| Table 73. FTP monitor elements (continued) |  |
|--|--|
| Element                                    | Description  |
| \$username                                 | User name (account name) used by the monitor to log in to the target host. This element is taken from the configuration file if \$message contains OK. |

### Status messages

The FTP monitor provides status messages in the ResultMessage attribute when using IBM Application Performance Management. These messages indicate the result of the test.

| Table 74. FTP monitor status messages         |   |
|---|---|
| Message                                       | Description   |
| OK  | The FTP request succeeded.  |
| Unable to open local file for reading/writing | See the FTP monitor log file for more information.  |
| Unable to read from/write to local file       |   |
| Unable to read from data connection           | A data connection to the FTP server was established, but a problem occurred.                        |
| Unable to upload to ftp server                |   |
| Timed out waiting to read/write               |   |
| Connection closed by foreign host             | The connection to the FTP server was broken.  |
| Connection closed unexpectedly                |   |
| Connection failed                             | The monitor failed to connect to the FTP server. See the FTP monitor log file for more information. |

### HTTP Monitor

The HTTP monitor checks the availability and response time of web servers.

It can monitor individual web pages, including that uses CGI, which would normally require the user to enter data into fields. It can also monitor the download time for elements such as images on a web page.

| Table 75. HTTP monitor file summary |                               |
|-------------------------------------|-------------------------------|
| Monitor files                       | Name or location              |
| Monitor executable                  | nco_m_http                    |
| Properties file                     | \$ISHOME/etc/props/http.props |
| Rules file                          | \$ISHOME/etc/rules/http.rules |
| Log file                            | \$ISHOME/log/http.log         |

### Guidelines for configuring HTTP monitor

The HTTP and HTTPS monitors check the availability and response time of web servers. Use the HTTP monitor in the following situations:

- The target website is static.  
For dynamic websites, use the TRANSX monitor.
- The target website is served over the HTTP protocol.

For websites that deliver content over the HTTPS protocol, select the HTTPS monitor.

- To perform monitoring across multiple platforms.
- Where speed is a determining factor (the HTTP monitor provides high performance).

### HTTP request types

The HTTP monitor emulates a web browser that supports the HTTP/1.0 protocol. To test the web server, the monitor sends it a request for a web page using any of the following HTTP request types:

- HEAD

The HEAD command attempts to access a web page and return the HTTP header. Issuing the HEAD command is a fast way to check that a web page is accessible.

- GET

The GET command attempts to access the web page and return the whole page, including the HTTP header. It doesn't attempt to return files associated with the page, such as images.

- GETALL

The GETALL command attempts to access the web page and return the whole page including the HTTP header, background, images, applets, frames, cascading stylesheet (CSS) files, and scripts. Like the HEAD and GET commands, this command also checks that a web page is accessible, but because the GETALL command returns the whole page and all its associated files, it may give a more realistic indication of the time taken to access the page. The monitor also uses multiple threads during a GETALL command to more accurately match the behavior of web browsers.

- POST

The POST command attempts to access a web page that contains an HTTP form and complete the fields of that form. Add body text for the POST request to the **Body** tab in the Internet Service Monitoring configuration, or use the @Body group in the Internet Service Monitoring configuration or ismbatch. Alternatively, you can use the FORM parameters. You can't use both Body text and FORM parameters in the POST request.

### Using a proxy server

You can test the availability of web pages through a proxy server. When you configure the monitor to use a proxy, it sends HTTP requests through the proxy. If required, you can bypass the proxy cache. You configure the parameters for the proxy server on the **Proxy Details** tab. The HTTP monitor supports authenticated access to proxy servers. This authentication is independent of any authentication required by the target web page.

### Proxy server elements

In earlier versions, when you configured a profile element to use a proxy server, by default the HTTP monitor inserted the name of the proxy server and port into the \$server and \$port elements, instead of the name and port of the intended destination server. To preserve the value of the intended destination server name and port in earlier versions, set the generateProxyTokens property to 1, or start the monitor with the -generateproxytokens command line parameter.

In addition to preserving the values of the \$server and \$port elements when this property or command line parameter is set, the monitor generates the \$proxyServer, \$proxyPort, \$proxyAuthType, \$proxyUsername, and \$proxyCache elements.

### Authentication

If the web page that you want to monitor, or the proxy server you want to test, requires authentication specify credentials for accessing the page in the authenticationtype, username, and passwordparameter fields on the Advanced or Proxy Details tab.

To disable authentication, set authenticationtype to NONE.

To select basic authentication:

1. Set the authenticationtype to BASIC.

2. Set username and password to those required by the web page or proxy server.

To select NTLM:

1. Set authenticationtype to NTLMv1 or NTLMv2.

2. Set username and password to those required by the web page or proxy server.

**Note:**

The monitor limits the length of HTTP requests to 4096 characters. If the length of the additional form data results in a request length that exceeds this limit, the monitor doesn't include the additional form data in the request.

**Configuring HTTP Monitor Service Test**

Use the HTTP monitor configuration parameters to define HTTP service tests.

| Table 76. HTTP monitor configuration |  |
|--------------------------------------|--|
| Field                                | Description  |
| server                               | The host name of the server to be monitored. Example is <code>www.mycompany.com</code>   |
| page                                 | The URL of the page to be monitored. Example is <code>index.html</code>  |
| description                          | A text field for providing descriptive information on the element. Example is <code>monitoring via a proxy server</code>   |
| port                                 | The port on the HTTP server to use.<br>Default: 80   |
| localip                              | Specifies the IP address of the network interface that the monitor uses for the test. If this field is empty, the monitor uses the interface specified by the <code>IpAddress</code> property. |
| version                              | The HTTP protocol version to be used: <ul style="list-style-type: none"><li>• 1.0</li><li>• 1.1</li></ul> Default: 1.0   |
| command                              | The HTTP request type: <ul style="list-style-type: none"><li>• HEAD</li><li>• GET</li><li>• GETALL</li><li>• POST</li></ul> Default: GET   |
| formname                             | When used in a transaction, the HTTP monitor scans the specified form for default values. Any values found are automatically completed the next HTTP step in the transaction.                  |

Table 76. HTTP monitor configuration (continued)

| Field              | Description  |
|--------------------|--|
| authenticationtype | Specifies the challenge -response authentication mechanism for authenticating network users: <ul style="list-style-type: none"> <li>• NONE - No authentication</li> <li>• BASIC</li> <li>• NTLMv1 - Windows NTLM version 1 challenge/response authentication</li> <li>• NTLMv2 - Windows NTLM version 2</li> </ul> Default: NONE |
| username           | The username (account name) for the monitor to use to log in to the server.  |
| password           | The password corresponding to the username for the monitor to use to log into the server.  |
| timeout            | The time, in seconds, to wait for the server to respond.<br>Default: 30  |
| poll               | The time, in seconds, between each poll.<br>Default: 300<br>.  |
| failureretests     | The number of times to retest before indicating a failure.<br>Default: 0   |
| retestinterval     | The time, in seconds, to wait between each failure retest.<br>Default: 10  |
| verifycertificate  | It's by default disabled.  |
| Proxy details      |  |
| server             | The host name of the proxy server.   |
| port               | The port on the proxy server to use.<br>Default: 8080  |
| authenticationtype | The server authentication type for the proxy server. For more information, see previous authenticationtype.<br>Default: NONE   |
| username           | Used by the monitor together with the password to log into the proxy server.   |
| password           | Used by the monitor together with the username to log into the proxy server and the label is password.   |
| useproxy           | Configures the monitor to perform the request using a proxy server. <ul style="list-style-type: none"> <li>• proxy (use true in ismbatch)</li> <li>• noproxy (use false in ismbatch)</li> </ul> Default: noproxy   |

| Table 76. HTTP monitor configuration (continued) |  |
|--|--|
| Field  | Description  |
| hostnamelookuppreference                         | <p>Determines which IP version, IPv6 or IPv4, is applied to the supplied host name. The options are:</p> <ul style="list-style-type: none"> <li>• default sets the monitor to use monitor-wide properties settings. This is the default.</li> <li>• 4Then6 selects IPv4 and then IPv6. Uses IPv4 addresses if they are available. If no IPv4 addresses are found, IPv6 addresses are used.</li> <li>• 6Then4 selects IPv6 and then IPv4. Uses IPv6 addresses if they are available. If no IPv6 addresses are found, IPv4 addresses are used.</li> <li>• 4On1y selects IPv4 only. Uses IPv4 addresses only. If there are no IPv4 addresses, the poll returns an error.</li> <li>• 6On1y selects IPv6 only. Uses IPv6 addresses only. If there are no IPv6 addresses, the poll returns an error.</li> <li>• 6Or4 selects either IPv4 or IPv6. Uses the first address returned from the host name.</li> </ul> |
| nocache  | It's by default set to cache.  |

### Regular Expression

You can perform a regular expression search on the information being downloaded by entering up to 50 different regular expressions. The HTTP monitor attempts to match the contents retrieved to each of the regular expressions. If a match for a specified regular expression is found, the matched lines (or as much as can fit in the monitor's internal buffer) are returned in the corresponding `$regexMatchn` element. If the regular expression matches more than once in the information downloaded, only the first match is returned. The status of each regular expression test is indicated by the `$regexStatusn` elements. You can use the regular expression matches and their status information as criteria for service level classifications. See [Table 72 on page 405](#) for information about regular expression syntax,

### Head and Form parameter

The HTTP monitor can send extra data in the header fields and message body of HTTP requests.

You configure the parameters for this extra data on the Parameters tab. The parameters are Name, Value and Type and they operate in the following way:

- Name-value pairs of type HEAD specify additional header fields, such as `User-Agent` and `Referer`, included in all HTTP requests sent by the monitor. Header fields may be specified for any type of HTTP method (GET, GETALL, HEAD or POST).

For ITCAM for Transactions V7.4.0.1 and later, the default user agent head parameter, `Mozilla/5.0 (ISM-MONITOR)` is added for every new HTTP or HTTPS element. The default user-agent header is so that the HTTP and HTTPS monitors can be used for websites that switch content based on the browser client.

- Name-value pairs of type FORM specify extra data included in the message body of HTTP POST requests sent by the monitor. If the target page contains a form matching the name specified in the formname field, the monitor treats any name-value pairs in the form as if they were configured in the profile element.

#### Note:

The monitor limits the length of HTTP requests to 4096 characters. If the length of the additional form data results in a request length that exceeds this limit, the monitor doesn't include the additional form data in the request.

## Monitor elements

In addition to the test results common to all elements, the HTTP monitor generates a set of test results containing data specific to HTTP service tests. Elements indicated by an asterisk (\*) are available as attribute. The names of the attributes are shown within brackets. Absence of an asterisk indicates there's no equivalent attribute. Attributes shown in bracket but without an element indicates that they are only available as attribute, there's no equivalent element.

| Table 77. HTTP monitor elements       |   |
|---------------------------------------|---|
| Element                               | Description   |
| \$bytesPerSec*(BytesPerSec)           | The average number of bytes transferred each second.  |
| \$bytesTransferred*(BytesTransferred) | The number of bytes uploaded or downloaded.   |
| \$checksum                            | The Checksum element doesn't normally provide meaningful values for service level classifications because checksum values aren't known when the profile element is created (the monitor calculates checksum values while tests are in progress). The \$checksum and \$previousChecksum monitor elements are intended for alert enrichment using the monitor's rules file. |
| \$command                             | The HTTP command issued by the monitor. For example, HEAD, GET, GETALL, or POST.  |
| \$connectTime*(ConnectTime)           | The time taken to connect to the server.  |
| \$downloadTime*(DownloadTime)         | The time taken to download the file.  |
| (Elements)                            | The number of page elements received.   |
| \$formname                            | The name of the form used in a POST action.   |
| \$lastStatus*(PageStatus)             | If a profile element retrieves multiple pages, this element contains the result string of the last page retrieved. This value is the same as that of \$urlResultn where n is equal to the value of \$pageCount.   |
| \$lastModified                        | The value of the Last-Modified HTTP header field of the first page retrieved.   |
| \$page*(Page)                         | The page accessed on the HTTP server.   |
| \$pageCount                           | The total number of resources downloaded during a GETALL test, excluding the test page itself. If the tested page doesn't refer to any other resources, this element isn't generated.   |
| \$port*(Port)                         | The port used to access the HTTP server. If the test used a proxy server, this is the value of the port on the proxy server to which the request was submitted. To preserve the port of the intended destination server, set the generateProxyTokens property to 1, or start the monitor with the -generateproxytokens command line parameter                             |

| Table 77. HTTP monitor elements (continued) |   |
|---|---|
| Element                                     | Description   |
| \$previousChecksum                          | The PreviousChecksum element doesn't normally provide meaningful values for service level classifications because checksums aren't known when the profile element is created (the monitor calculates checksum values while tests are in progress). The \$previousChecksum and \$checksum monitor elements are intended for alert enrichment using the monitor's rules file. |
| \$proxyAuthType                             | The server authentication type for the proxy server.  |
| \$proxyCache                                | The value true indicates that the proxy server retrieved the web page from the server, rather than from its own cache.  |
| \$proxyPort                                 | The port number of the proxy server to which the request was submitted.   |
| \$proxyServer                               | The host name of the proxy server.  |
| \$proxyUsername                             | Used by the monitor together with the password to log in to the proxy server.   |
| \$regexMatchn                               | The contents of the line matching the regular expression.   |
| \$regexn                                    | The regular expression.   |
| \$regexMatchn                               | The contents of the line matching the regular expression.   |
| \$regexStatusn                              | The status of the regular expression match:<br>NONE - No regular expression checking is configured<br>MATCHED - A match was found for the regular expression<br>FAILED - A match wasn't found for the regular expression  |
| \$responseTime*<br>(ResponseTime)           | The time taken after a connection is created, until the first byte of the page is received.   |
| \$timeSinceModification                     | The time that has elapsed since the page was last modified. This is the difference between the time of the test and the value of the Last-Modified HTTP header field of the first page retrieved.   |
| \$urlDownloadTimesn*<br>(UrlDownloadTime)   | URL download time of each element in a GETALL request. Each element is numbered, starting with 000 (\$urlDownloadTime000, \$urlDownloadTime001, \$urlDownloadTime002, and so on).   |
| \$urln*(Url)                                | URL of each page in a GETALL test. Each page is numbered, starting with 000 (\$url000, \$url001, \$url002, and so on).  |
| \$urlResultn*<br>(UrlResultString)          | Result string for each page downloaded in a GETALL request. Each result is numbered, starting with 000 (\$urlResult000, \$urlResult001, \$urlResult002, and so on).   |
| \$username                                  | The name used to access pages that require the user to be authenticated.  |

### Status message

The HTTP monitor provides status messages in the ResultMessage attribute when using IBM Application Performance Management. These messages indicate the result of the test.

| <i>Table 78. Table 4. HTTP monitor status messages</i> |  |
|--|--|
| Message  | Description  |
| OK   | The request from the monitor succeeded.  |
| Form not found   | The requested page cannot be found.  |
| Initialise Fetch Page Failed                           | Not enough memory to allocate space for the HTTP page fetching mechanism. The previous line message should contain further information.  |
| Connection Failed                                      | The monitor failed to connect for reasons other than the link is down, connection is reset, link is unreachable, connection timed out, connection terminated, or host is down. See the HTTP monitor log file for more information. |

### Form parameters and regular expression matching

Monitor the operation of the form `http://support.mycompany.com/cgi-bin/search.cgi` by sending HTTP POST requests with the form parameter `search=ism`, and use a regular expression to match the string `Your search was successful` in the response. If this string is returned in the response, classify the service level as Good, and Failed otherwise.

Create a new HTTP profile element and set the fields as shown in the following table.

| <i>Table 79. HTTP form profile element example</i> |   |
|--|---|
| Profile element configuration field                | Value   |
| server   | support.mycompany.com                             |
| page   | /cgi-bin/search.cgi                               |
| description  | Example - form parameters and regular expressions |
| Regular expression details                         |   |
| match 1  | Your search was successful                        |
| Service level classification details               |   |
| statement  | Regexp Status 1 = MATCHED then status GOOD        |
| Head and Form details                              |   |
| name   | search  |
| value  | ism   |
| type   | FORM  |

### Properties

The properties and command-line options specific to the HTTP monitor are described in the following table.

| Table 80. HTTP monitor properties |                    |   |
|-----------------------------------|--------------------|---|
| Property name                     | Property parameter | Description   |
| AllowDuplicateDownload            | 0 1                | Forces pages to be downloaded each time they are found.<br><br>0 - disabled (downloaded only once)<br>1 - enabled   |
| ForceHTMLParse                    | 0 1                | Forces pages that don't have content-type text/html to be parsed as HTML.<br><br>0 - disabled<br>1 - enabled  |
| GenerateProxyTokens               | 0 1                | Specifies whether the monitor generates additional elements containing information about the proxy server if a proxy server is used in a test.<br><br>0 - disabled<br>1 - enabled (additional elements \$server and \$port contain values for the proxy server)   |
| GETALLThreadNum                   | 1 2 3 4 5          | Specifies the number of separate threads to use during a GETALL request.  |
| GetLinkTags                       | 0 1                | Activates download of linked stylesheets for GETALL requests:<br><br>0 - disabled<br>1 - enabled (if the target page contains a link tag with attribute value rel=stylesheet, the monitor attempts to download the resource referred to by the link tag's href attribute)   |
| HostnameLookupPreference          | string             | Determines which IP version, IPv6 or IPv4, is applied to the supplied host name. The possible values are: <ul style="list-style-type: none"> <li>• 4Then6 selects IPv4 and then IPv6. Uses IPv4 addresses if they are available. If no IPv4 addresses are found, IPv6 addresses are used.</li> <li>• 6Then4 selects IPv6 and then IPv4. Uses IPv6 addresses if they are available. If no IPv6 addresses are found, IPv4 addresses are used.</li> <li>• 4Only selects IPv4 only. Uses IPv4 addresses only. If there are no IPv4 addresses, the poll returns an error.</li> <li>• 6Only selects IPv6 only. Uses IPv6 addresses only. If there are no IPv6 addresses, the poll returns an error.</li> <li>• 6Or4 selects either IPv4 or IPv6. Uses the first address returned from the host name.</li> </ul> Default: 4Then6 |

| <i>Table 80. HTTP monitor properties (continued)</i> |                    |   |
|--|--------------------|---|
| Property name  | Property parameter | Description   |
| Ipv6Address  | integer            | The local address to bind to as an origin for HTTP requests when using HTTP IPv6.<br>Default: no address  |
| NoParseExtensions                                    | string             | A comma-separated list of file extensions indicating file types that the monitor won't parse and instead only download.   |
| OutputDirectory                                      | string             | Specifies the output directory to use if OutputResult is true (set to 1).<br>Default: \$ISHOME/var  |
| OutputResult   | 0   1              | Specifies whether the monitor saves the data it receives from the service.<br>0 - disabled<br>1 - enabled   |
| RelativeRedirects                                    | 0   1              | Allows Location fields in HTTP 301 and HTTP 302 status codes to contain relative URLs instead of absolute URLs.<br>0 - absolute URLs<br>1 - relative URLs   |
| RFCPOST  | 0   1              | Specifies that the monitor should follow RFC1945 and RFC2616 and send a second POST after a redirect. Many web servers don't expect a POST after a redirect and most browsers don't follow the RFCs.<br>0 - disabled<br>1 - enabled |

### **HTTPS Monitor**

The HTTPS monitor checks the availability and response time of web servers. It can monitor individual web pages, including that uses HTML forms, which normally require the user to enter data into fields.

**Note:** The HTTPS monitor works in the same way as the HTTP monitor, but it communicates with the HTTP server by using version 2 or version 3 of the SSL (Secure Sockets Layer) protocol, which encrypts all communications between the server and the monitor.

| <i>Table 81. HTTPS monitor file summary</i> |                                |
|---|--------------------------------|
| Monitor files.                              | Name or location               |
| Monitor executable                          | nco_m_https                    |
| Properties file                             | \$ISHOME/etc/props/https.props |
| Rules file                                  | \$ISHOME/etc/rules/https.rules |
| Log file                                    | \$ISHOME/log/https.log         |

## Guidelines for configuring HTTPS monitor

The HTTPS monitor checks the availability and response time of web servers. Use the HTTPS monitor in the following situations:

- The target website is static.  
For dynamic websites, use the TRANSX monitor.
- The target website is served over the HTTPS protocol.  
For websites that deliver content over the HTTP protocol, select the HTTP monitor.
- To perform monitoring across multiple platforms.
- Where speed is a determining factor (the HTTPS monitor provides high performance).

## Client-side certificate

The monitor enables you to monitor servers that require client-side certificates for mutual authentication.

Specify the SSL certificate file, key file, and key password when creating a profile element.

Certificates must be in Privacy Enhanced Mail (PEM) format. If your certificate is in another format, you must convert it to PEM format. Certificates can be converted by using software such as openssl, which is available from <http://www.openssl.org>.

**Note:** If you always use the same certificate, key, and password in all profile elements, specify them using monitor properties instead of defining them in every profile element you create.

## Configuring HTTPS monitor service tests

Use the HTTPS monitor configuration parameters to define HTTPS service tests.

| Table 82. HTTPS monitor configuration |  |
|---------------------------------------|--|
| Field                                 | Description  |
| server                                | The host name of the server to be monitored. Example is <code>www.mycompany.com</code>   |
| page                                  | The URL of the page to be monitored. Example is <code>/secure/</code>  |
| description                           | A text field for providing descriptive information on the element.   |
| port                                  | The port on the server to use.<br>Default: 443   |
| localip                               | Specifies the IP address of the network interface that the monitor uses for the test. If this field is empty, the monitor uses the interface that is specified by the <code>IpAddress</code> property. |
| version                               | The HTTPS protocol version to be used: <ul style="list-style-type: none"><li>• 1.0</li><li>• 1.1</li></ul> Default: 1.0  |

Table 82. HTTPS monitor configuration (continued)

| Field              | Description  |
|--------------------|--|
| command            | The request type: <ul style="list-style-type: none"> <li>• HEAD</li> <li>• GET</li> <li>• GETALL</li> <li>• POST</li> </ul> Default: GET   |
| formname           | When used in a transaction, the HTTPS monitor scans the specified form for default values. Any values that are found are automatically completed the next HTTPS step in the transaction.   |
| authenticationtype | Specifies the challenge-response authentication mechanism for authenticating network users: <ul style="list-style-type: none"> <li>• NONE - No authentication.</li> <li>• BASIC</li> <li>• NTLMv1 - Windows NTLM version 1 challenge/response authentication.</li> <li>• NTLMv2 - Windows NTLM version 2.</li> </ul> Default: NONE                               |
| username           | The username (account name) for the monitor to use to log in to the HTTPS server.  |
| password           | The password corresponding to the username for the monitor to use to log in to the HTTPS server.   |
| sslcertificatefile | The path and filename of the digital certificate file that is used in the monitor element. If the path isn't absolute, the monitor interprets it relative to the working directory (\$ISMHOME/platform/arch/bin).<br><br>If you don't specify a certificate file, the monitor uses the certificate that is specified by the monitor property SSLCertificateFile. |
| sslkeyfile         | The path and filename of the file containing the SSL private key, which is used to identify the server and sign the SSL messages.  |
| sslkeypassword     | The password used to encrypt the SSL private key.  |
| timeout            | The time, in seconds, to wait for the server to respond.<br>Default: 30  |
| poll               | The time, in seconds, between each poll.<br>Default: 300   |
| failureretests     | The number of times to retest before indicating a failure.<br>Default: 0   |

| Table 82. HTTPS monitor configuration (continued) |  |
|---|--|
| Field   | Description  |
| retestinterval                                    | The time, in seconds, to wait between each failure retest.<br>Default: 10  |
| <i>Proxy details</i>                              |  |
| server  | The host name of the proxy server.   |
| port  | The port on the proxy server to use.   |
| authenticationtype                                | The server authentication type for the proxy HTTPS server. See <a href="#">authenticationtype</a> for further information.   |
| username  | The username for the monitor to use to log in to the proxy HTTPS server.   |
| password  | The password for the monitor to use to log in to the proxy HTTPS server.   |
| useproxy  | Configures the monitor to perform the request by using a proxy server. <ul style="list-style-type: none"> <li>• proxy (use true in ismbatch)</li> <li>• noproxy (use false in ismbatch)</li> </ul> Default is noproxy  |
| hostnamelookuppreference                          | Determines which IP version, IPv6, or IPv4, is applied to the supplied host name. The options are: <ul style="list-style-type: none"> <li>• default sets the monitor to use monitor-wide properties settings. This is the default.</li> <li>• 4Then6 selects IPv4 and then IPv6. Uses IPv4 addresses if they are available. If no IPv4 addresses are found, IPv6 addresses are used.</li> <li>• 6Then4 selects IPv6 and then IPv4. Uses IPv6 addresses if they are available. If no IPv6 addresses are found, IPv4 addresses are used.</li> <li>• 4Only selects IPv4 only. Uses IPv4 addresses only. If there are no IPv4 addresses, the poll returns an error.</li> <li>• 6Only selects IPv6 only. Uses IPv6 addresses only. If there are no IPv6 addresses, the poll returns an error.</li> <li>• 6Or4 selects either IPv4 or IPv6. Uses the first address that is returned from the host name.</li> </ul> |

### Regular expression matching

You can perform a regular expression search on the information being downloaded by entering up to 50 different regular expressions. The HTTPS monitor attempts to match the contents that are retrieved to each of the regular expressions.

If a match for a specified regular expression is found, the matched lines (or as much as can fit in the monitor's internal buffer) are returned in the corresponding `$regexMatchn` element. If the regular expression matches more than once in the information downloaded, only the first match is returned. The status of each regular expression test is indicated by the `$regexStatusn` elements. You can use the regular expression matches and their status information as criteria for service level classifications.

For more information, see [Table 72 on page 405](#).

### Head and Form parameter

Similar to the HTTP monitor, the HTTPS monitor can send extra data in the header fields and message body of HTTP requests.

For details on head and form parameters, see [HTTP Head and Form parameter](#).

### Monitor elements

| <i>Table 83. HTTPS SSL monitor elements</i> |  |
|---|--|
| Element                                     | Description  |
| \$SSLCertificateSerialNumber                | The serial number of the X509 certificate presented by the server.   |
| \$SSLCipherSuiteCount                       | The number of cipher suites available on the connection.   |
| \$SSLCipherSuiteList                        | The list of cipher suites available on the connection.   |
| \$SSLCipherSuiteName                        | The cipher suite selected for the connection.  |
| \$SSLeffectiveSessionKeyBits                | The number of bits in the session key. This is typically 128 or 168, or 40 for export versions.                              |
| \$SSLHandshakeTime*<br>(SslHandshakeTime)   | The time taken to establish the SSL connection.  |
| \$SSLIssuerName                             | The issuer name for the server's X509 format certification.  |
| \$SSLprotocolVersion                        | The version of SSL being used, either v2 or v3.  |
| \$SSLpublicKeyLengthBits                    | The size of the server's public key. This is typically 1024 bits, except where an export specification cipher suite is used. |
| \$SSLserverCertificateValidFrom             | The date that the server certificate is valid from.  |
| \$SSLserverCertificateValidTo               | The date that the server certificate is valid to.  |
| \$SSLserverName                             | SSL server name.   |
| \$SSLsubjectName                            | The subject name for the X509 format certification. This is typically the name of the organization controlling the server.   |

Elements indicated by an asterisk (\*) are available as attributes. The names of the attributes are shown within brackets. Absence of an asterisk indicates there's no equivalent attribute. Attributes that are shown in bracket but without element indicates that they are only available as attributes, there's no equivalent element.

The HTTPS monitor produces the same extra elements as the HTTP monitor, as described in [Table 77 on page 412](#). In addition, it produces the elements that are related to SSL if a client-side certificate is used in the test, as described in [Table 83 on page 420](#).

In addition to the test results common to all elements, the HTTPS monitor generates a set of test results containing data specific to HTTPS service tests.

### Status Message

The HTTPS monitor provides status messages in the `ResultMessage` attribute when using IBM Application Performance Management. These messages indicate the result of the test.

In addition to the HTTP status messages, the HTTPS monitor also generates the messages that are listed in [Table 84 on page 421](#).

| Table 84. HTTPS monitor status messages |  |
|---|--|
| Message                                 | Description  |
| OK                                      | The monitor that is successfully connected to the server.  |
| SSL handshake failed                    | The monitor failed to initialize SSL connectivity after establishing a connection to the server.   |
| Connection failed                       | The monitor failed to connect for reasons other than the link is down, connection is reset, link is unreachable, connection timed out, connection terminated, or host is down. See the HTTP monitor log file for more information. |

## Properties

The HTTPS monitor has the same properties as the HTTP monitor.

For details about the properties options that are the same as the HTTP monitor, see [Table 80 on page 415](#). Table 5 lists some more properties that are specific to HTTPS.

| Table 85. HTTPS monitor specific properties |                    |   |
|---|--------------------|---|
| Property name                               | Property parameter | Description   |
| <b>SSLCertificateFile</b>                   | string             | The path and filename of the digital certificate file that is used if no certificate is explicitly specified for an HTTPS element during its creation.<br><br>If the path isn't absolute, the monitor interprets it relative to the working directory (\$ISHOME/platform/arch/bin). |
| <b>SSLCipherSuite</b>                       | string             | The cipher suite to use for SSL operations.<br>Default: RC4:3DES:DES:+EXP   |
| <b>SSLDisableTLS</b>                        | integer            | Disables TLSv1 for heritage support.<br>Default: 0 - TLSv1 is enabled.<br>1 - TLSv1 is disabled.  |
| <b>SSLKeyFile</b>                           | string             | The file containing the SSL private key.  |
| <b>SSLKeyPassword</b>                       | string             | The password used to encrypt the SSL private key.   |

## Cipher Suits

The SSLCipherSuite property specifies the cipher suite that is used by the HTTPS monitor. For more information about SSL settings, see [“SSL setting in Internet Service Monitoring” on page 512](#).

## ICMP Monitor

The ICMP monitor tests the performance of the Internet Control Message Protocol service running on a network. To do this, the monitor uses the ICMP echo command.

The following table lists the ICMP monitor files.

| Table 86. ICMP monitor files |                               |
|------------------------------|-------------------------------|
| Monitor files                | Name or location              |
| Monitor executable           | nco_m_icmp                    |
| Properties file              | \$ISHOME/etc/props/icmp.props |

| Table 86. ICMP monitor files (continued) |                               |
|--|-------------------------------|
| Monitor files                            | Name or location              |
| Rules file                               | \$ISHOME/etc/rules/icmp.rules |
| Log file                                 | \$ISHOME/log/icmp.log         |

### Guidelines for configuring ICMP monitor

The ICMP monitor issues ICMP echo requests (commonly called pings) to target hosts and waits for an echo reply response. It records lookup times, round-trip times, and success rate metrics that provide an indication of how well the network is performing. When the monitor issues an echo request, the request may pass through one or more routers before it reaches the target host. These routers can respond to the monitor before the target host has received the echo request. If an echo request issued by the monitor passes through a router, the router may issue a reply to the monitor. This reply might indicate that the router cannot locate the target host, or that the router is too busy to process the request. It's possible that the monitor might receive replies from multiple routers before it receives an echo-reply from the target host. If the monitor successfully receives an echo-reply from the target host, it records the time taken. If the monitor doesn't receive a reply from the target server within the specified timeout period, the request is recorded as failed. You can configure the monitor to send multiple ICMP echo requests to the same target in each test. The monitor records statistics for each of the requests sent.

**Note:** Run the ICMP monitor as root because it opens a raw socket to send ICMP packets.

### Configuring ICMP monitor service tests

Use the ICMP monitor configuration parameters to define service tests. When you configure the monitor, default values are shown for the timeout and poll interval parameters. These defaults are 30 and 300 seconds respectively. Other defaults listed in the table aren't shown during configuration but are applied when the configuration details are saved if no value has been specified.

The following table lists the ICMP monitor configurations.

| Table 87. ICMP monitor configuration |  |
|--------------------------------------|--|
| Field                                | Description  |
| server                               | The host name or IP address of the server to which the echo requests are sent. Example is test.mycompany.com   |
| description                          | A text field for providing descriptive information on the element.   |
| timeout                              | The time, in seconds, to wait for the server to respond to each echo request.<br>Default: 10   |
| numberofpings                        | The number of echo requests to send.<br>Default: 5   |
| packetinterval                       | The time, in seconds, to wait between sending echo requests.<br>Default: 1   |
| packetsize                           | The size, in bytes, of each echo request sent.<br>Default: 64  |
| typeofservice                        | Sets the Type of Service field in the IP layer. Both IPv4-style Type Of Service (TOS) values and DSCP Differentiated Service Field values may be entered. Valid values are 0 -255. |

| Table 87. ICMP monitor configuration (continued) |   |
|--|---|
| Field  | Description   |
| retries  | The number of times the monitor should retry each echo request before quitting.<br>Default: 0   |
| poll   | The time, in seconds, between each poll.<br>Default: 300  |
| failureretests                                   | The number of times to retest before indicating a failure.<br>Default: 0  |
| retestinterval                                   | The time, in seconds, to wait between each failure retest.<br>Default: 10   |
| hostnamelookuppreference                         | Determines which IP version, IPv6 or IPv4, is applied to the supplied host name. Options are: <ul style="list-style-type: none"> <li>• default sets the monitor to use monitor-wide properties settings. This is the default.</li> <li>• 4Then6 selects IPv4 and then IPv6. Uses IPv4 addresses if they are available. If no IPv4 addresses are found, IPv6 addresses are used.</li> <li>• 6Then4 selects IPv6 and then IPv4. Uses IPv6 addresses if they are available. If no IPv6 addresses are found, IPv4 addresses are used.</li> <li>• 4Only selects IPv4 only. Uses IPv4 addresses only. If there are no IPv4 addresses, the poll returns an error.</li> <li>• 6Only selects IPv6 only. Uses IPv6 addresses only. If there are no IPv6 addresses, the poll returns an error.</li> <li>• 6Or4 selects either IPv4 or IPv6. Uses the first address returned from the host name.</li> </ul> |

**Note:** Monitor the availability of the host `test.mycompany.com` by checking the response times at 10-minute intervals. Attempt to connect to the server within 30 seconds and, if it times out, retry twice more. If it still fails, repeat the test three times with 5 seconds between each retry.

### Monitor elements

In addition to the test results common to all elements, the ICMP monitor generates a set of test results containing data specific to ICMP service tests.

The following table describes the additional elements for the ICMP monitor.

Elements indicated by an asterisk (\*) are available as attributes. The names of the attributes are shown within brackets below the element. Absence of an asterisk indicates there's no equivalent attribute. Attributes shown in bracket but without an element indicate that they are only available as attributes, there's no equivalent element.

| Table 88. ICMP monitor elements |  |
|---------------------------------|--|
| Element                         | Description                              |
| \$averageRTT*(Average RTT)      | The average round-trip time in seconds.  |
| \$endTime                       | The UNIX time the response was received. |

| Table 88. ICMP monitor elements (continued) |  |
|---|--|
| Element                                     | Description  |
| \$jitter                                    | The absolute value of the difference between the arrival times of two adjacent ICMP echo requests, minus their departure times. This value is calculated according to the formula specified in RFC2598. The element is created only if the number of echo requests is greater than one. If more than two echo requests are used, the value is the average jitter between all pairs of echo requests. |
| \$lookupTime*(LookupTime)                   | The time taken to obtain the IP address of the host server.  |
| \$maxRTT*(MaxRTT)                           | The maximum round-trip time in seconds.  |
| \$minRTT*(MinRTT)                           | The minimum round-trip time in seconds.  |
| \$numberPackets                             | The number of ICMP echo requests sent, as specified in the profile element.  |
| \$packetInterval                            | The time between sending each ICMP echo request, as specified in the profile element.  |
| \$packetRetries                             | The number of times the monitor tried to resend ICMP echo requests before exiting.   |
| \$packetSize                                | The size (in bytes) of each ICMP echo request, as specified in the profile element.  |
| \$pingAttempts Failed                       | The number of attempts made for the first unsuccessful ICMP echo request.  |
| \$pingAttempts Responded                    | The number of attempts made for the first successful ICMP echo request.  |
| \$pingMessageFailed                         | The message returned for the first unsuccessful ICMP echo request.   |
| \$pingMessage Responded                     | The message returned for the first successful ICMP echo request.   |
| \$pingReceivedTime Failed                   | The UNIX time the first unsuccessful echo response was received.   |
| \$pingReceivedTime Responded                | The UNIX time the first successful echo response was received.   |
| \$pingRespondIP Failed                      | The IP address that responded to the first unsuccessful ICMP echo request.   |
| \$pingRespondIP Responded                   | The IP address that responded to the first successful ICMP echo request.   |
| \$pingRTTFailed                             | The round-trip time for the first unsuccessful ICMP echo request in seconds.   |
| \$pingRTTResponded                          | The round-trip time for the first successful ICMP echo request in seconds.   |
| \$pingSentTime Failed                       | The UNIX time that the first unsuccessful ICMP echo request was sent.  |
| \$pingSentTime Responded                    | The UNIX time that the first successful ICMP echo request was sent.  |

| Table 88. ICMP monitor elements (continued) |   |
|---|---|
| Element                                     | Description   |
| \$pingsFailed                               | The number of ICMP echo requests sent to which there was no echo response.  |
| \$pingsResponded                            | The number of valid echo responses received.  |
| \$pingTime                                  | The time taken to receive the echo response after sending the ICMP echo request.  |
| \$respondPercent*<br>(RespondPercent)       | The percentage of ICMP echo requests sent for which there was a response.   |
| \$responseTime                              | The time taken for the target host to respond to an ICMP echo request.  |
| \$sentTime                                  | The UNIX time that the ICMP echo requests were sent.  |
| \$spreadRTT                                 | The difference between \$maxRTT and \$minRTT.   |
| \$startTime                                 | The UNIX time the test began.   |
| \$totalHostTime                             | The time taken to receive the echo response after beginning the test.   |
| \$typeOfService                             | The Type of Service field in the IP layer, as specified when adding a new ICMP element. For details, see <a href="#">“ICMP Monitor” on page 421</a> . |

The ICMP monitor creates a separate set of \$pingname elements to record the results for each ICMP echo request sent during the test. The number of requests sent is indicated by \$numberPackets. For example, for the \$pingRTT element, if \$numberPackets is 3, the monitor creates three elements (\$pingRTT1, \$pingRTT2, and \$pingRTT3), containing the round-trip time measurement for the three ICMP echo requests sent.

### Status message

The ICMP monitor provides status messages in the ResultMessage attribute when using IBM Application Performance Management. These messages indicate the result of the test.

The following table describes the ICMP status messages.

| Table 89. ICMP monitor status messages |   |
|--|---|
| Message                                | Description   |
| Pings Complete                         | The ICMP echo request succeeded.  |
| ICMP echo failed                       | The monitor cannot issue the ICMP echo request because there's a problem with the monitor host or its connection to the network.                                |
| Timed out                              | The ICMP echo request timed out.  |
| Unreachable                            | This message is returned from a router and isn't necessarily accurate.  |
| Source quench                          | A router is too busy to process the ICMP echo request.  |
| Time exceeded                          | This message is returned from a router. It indicates that the ICMP echo request has been forwarded around the network too many times.                           |
| Parameter problem                      | This message is returned from a router. It indicates that the router can't process the ICMP echo request. This might be because the message has been corrupted. |

## Properties

The properties specific to the ICMP monitor are described in the following.

| Table 90. ICMP properties |                    |   |
|---------------------------|--------------------|---|
| Property name             | Property parameter | Description   |
| EventsPerSec              | not applicable     | This property isn't supported.  |
| IntraPingWait             | integer            | The minimum time interval in milliseconds between all pings sent by the ICMP monitor. Use to tune your system to spread the network traffic over a longer period. For example, in an environment with thousands of targeted ICMP hosts, set IntraPingWait to 3.<br>Default: 0 |
| Ipv6Address               | integer            | The local address to bind to as an origin for ICMP echo requests when using ICMP IPv6.<br>Default: no address   |
| MaxDNSResolvingThreads    | integer            | The maximum number of threads to be used by the DNS Resolver.<br>Default: 20  |
| MaxPacketSize             | integer            | The maximum ICMP packet size in bytes.  |
| PingsPerSec               | integer            | The number of echo requests the monitor attempts to send per second. The number of actual requests sent depends on CPU and network load.<br>Default: 100  |
| SocketBufferSize          | integer            | The size of the receiving socket buffer (in kilobytes).<br>Default: 32  |

## LDAP Monitor

The LDAP monitor tests the operation of Lightweight Directory Access Protocol (LDAP) servers.

The following table lists the LDAP monitor files.

| Table 91. LDAP monitor files |                               |
|------------------------------|-------------------------------|
| Monitor files                | Name or location              |
| Monitor executable           | nco_m_ldap                    |
| Properties file              | \$ISHOME/etc/props/ldap.props |
| Rules file                   | \$ISHOME/etc/rules/ldap.rules |
| Log file                     | \$ISHOME/log/ldap.log         |

## Guidelines for configuring LDAP monitor

The LDAP monitor tests LDAP services by connecting to an LDAP server and attempting to locate a specific entry. If the server succeeds in locating the entry, it returns the contents of the entry to the monitor. The LDAP monitor can use SSL to authenticate and connect to the LDAP server.

To configure the LDAP monitor, it is necessary to understand how the LDAP protocol and the monitored directory service work. LDAP is an Internet Protocol for accessing and managing Directory Services. A directory service is a distributed database application. A directory consists of entries. For example, a directory might contain entries that relate to an organization's employees or resources. Each entry contains a set of attributes, for example the entries in a directory of employees might contain an employee's name, telephone number and address.

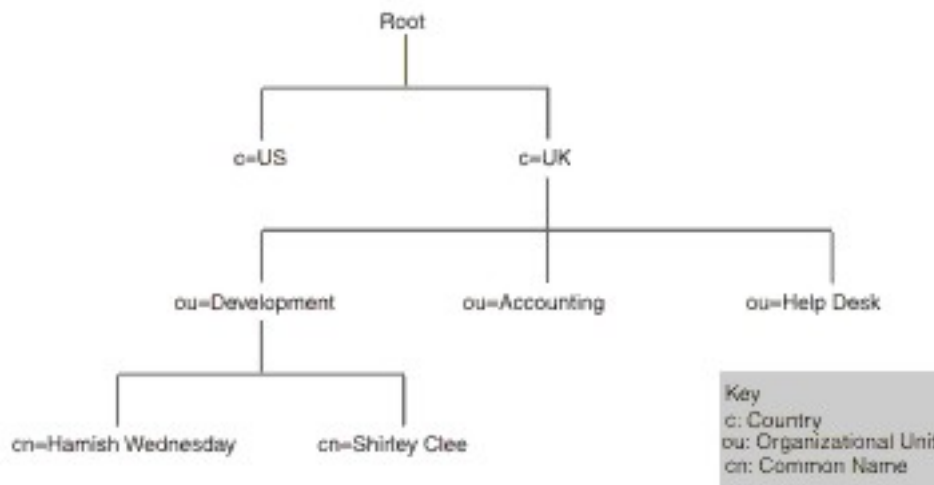

Individual Directory Services can be constructed differently, so the monitoring procedure can also differ.

### LDAP versions

The LDAP monitor supports both version 2 and 3 of LDAP. By default, the monitor attempts to connect to the target LDAP server that uses version 3, then automatically falls back to version 2 if the attempt fails. You can force the monitor to always use version 2 by setting the **NOLDAPV3** property.

### Example directory service

This example directory service stores the personal details of all employees. The directory is divided into countries and then into departments. Employees and their attributes are stored under each department.

The Directory hierarchy example image shows an extract from an example directory. This figure shows a directory structure. At the apex level is root. The two subdirectories represent countries and are labeled UK and US. The UK subdirectory is further divided into three other subdirectories representing the organization units. They are labeled as Development, Accounting, and Help Desk. Within the Development organization unit there are two subdirectories, for common names which are Shirley Clee and Hamish Wednesday.

Entities are referenced by their distinguished names. A distinguished name is the route to the entity. For example, the distinguished names of the accounting department and Hamish Wednesday would be:

```
dn="ou=accounting, c=UK"
dn="cn=Hamish Wednesday, ou=Development, c=UK"
```

The entry for each employee has multiple attributes. For example, the entry for Hamish Wednesday contains the following details.

```
cn: Hamish Wednesday
uid: ham
```

```
mail: HWednesday@development.mycompany.com
telephoneNumber: 88 88 55 44
```

Each entity in the directory hierarchy can be protected by a username (in LDAP it is a distinguished name) and password. The monitor uses this username and password to access the LDAP server.

When the monitor accesses the server, it indicates where in the directory hierarchy the search for the target entity begins. This is specified in the searchBase field as a distinguished name. For example, the search could begin at the department level:

```
ou=Accounting, c=UK
```

**Note:** The entities that make up a distinguished name are in reverse order. That is, they start at the lowest point in the hierarchy, then list each preceding entity.

The target entity is passed to the server in the filter field. This field contains an attribute of the target entity. For example, to search for Hamish Wednesday's entity, the filter field might contain:

```
(uid=ham)
```

The LDAP server uses the fields that are supplied by the monitor to search for the target entity. The result of the search is returned to the monitor.

If the search is successful, the server also returns the attributes of the target entity. The monitor converts it into elements whose names are created dynamically. For example, the monitor would convert the entry for Hamish Wednesday into:

```
$dnMatched = "cn=Hamish Wednesday, ou=Development, c=UK"
$cn = "Hamish Wednesday"
$uid = "ham"
$mail = "HWednesday@development.mycompany.com"
$telephoneNumber = "88 88 55 44"
```

## LDAP Authentication

SSL LDAP Server Authentication relies on public-private key certificates, signed by certificate authorities, such as Verisign and Thawte. For SSL authentication, the LDAP monitor uses the Netscape cert7db database of public certificates to verify LDAP server certificate signatures issued by certificate authorities.

If you are using certificates that are signed by a certificate authority that is recognized by Netscape, such as Verisign or Thawte, the LDAP monitor recognizes them automatically. If you are using certificates that are signed by your organization or by an organization not in the Netscape database, you must add them to the cert7db database.

Use the certutil utility, available from Netscape to add your certificates to the database. The cert7db database for the LDAP monitor is in the file \$ISHOME/certificates/cert7.db.

To monitor LDAP servers that are secured by SSL or TLS encryption, set the environment variables as described in the following table:

| Table 92. Environment variables required to monitor secure LDAP servers |   |   |
|---|---|---|
| Variable  | Description   | Setting   |
| <b>LDAPTLS_CACERT</b>   | Specifies the file that contains the CA certificates    | File containing server certificate.<br>For example, cacert.pem. |
| <b>LDAPTLS_REQCERT</b>  | Specifies the checks to perform on a server certificate | Select from never allow try demand.                             |

For more information, see <http://www.openldap.org>.

## Properties

Properties that are specific to the LDAP monitor are described in the following table:

| <i>Table 93. LDAP monitor properties options</i> |                    |  |
|--|--------------------|--|
| Property name                                    | Property parameter | Description  |
| NOLDAPV3   | 0 1                | Force the monitor to use LDAP v2 instead of LDAP v3.<br>0 - use LDAP v3<br>1 - use LDAP v2 |

### Cipher suites

The SSLCipherSuite property specifies the cipher suite that is used by the LDAP monitor. For more information about SSL settings, see [“SSL setting in Internet Service Monitoring” on page 512](#).

### Configuring LDAP monitor service tests

Use the LDAP monitor configuration parameters to define service tests.

When you configure the monitor, default values are shown for the timeout parameter is 30 seconds and poll interval parameter is 300 seconds. Other defaults that are listed in the table are not shown during configuration but are applied when the configuration details are saved if value is not specified.

Following table describes the LDAP monitor configurations:

| <i>Table 94. LDAP monitor configuration</i> |  |
|---|--|
| Field                                       | Description  |
| server                                      | The name or IP address of the LDAP server to be monitored. For example, ldap.mycompany.in.   |
| searchbase                                  | The distinguished name of the location from which to start the search. For example, ou=Accounting, c=UK.   |
| filter                                      | An attribute of the target entity to search for. For example, (uid=ham).   |
| description                                 | A text field for providing descriptive information on the element. For example, LDAP monitor.  |
| Active                                      | Selects whether the profile element is to be activated after it is created. For example, Selected.   |
| port  | The port on the LDAP server to connect to. You must specify the SSL port if you are using SSL authentication.<br>Default: 389  |
| username                                    | The username used to log in to the directory service. The format of the username depends on the setting of Authentication Type.<br>You can specify a Windows domain, that is, DOMAIN\username. For example, jbloggs. |
| password                                    | The password used to log in to the directory service, if necessary. For example, secret9.  |

| Table 94. LDAP monitor configuration (continued) |  |
|--|--|
| Field  | Description  |
| authenticationtype                               | <p>The LDAP authentication method to use:</p> <ul style="list-style-type: none"> <li>• SIMPLE (anonymous or plain text password)</li> <li>• SSL-SIMPLE</li> <li>• SASL-DIGEST-MD5</li> </ul> <p><b>Note:</b> SASL-DIGEST-MD5 authentication is not available on Linux operating system.</p> <p>If you set the authenticationtype to SIMPLE or SSL-SIMPLE, enter the username in distinguished name format. If you set the authenticationtype to SASL-DIGEST-MD5, enter the username as SASL bind-ids. To log in to the LDAP server as an anonymous user, set the authenticationtype to SIMPLE and leave the username and password fields blank.</p> <p>Default: SIMPLE</p> |
| sasrealm   | <p>The authentication realm for the LDAP server; usually the fully qualified domain name of the server. If you want to share passwords between multiple systems, you might use a domain name. For example, mycompany . com.</p>  |
| timeout  | <p>The time, in seconds, to wait for the server to respond.</p> <p>Default: 30</p>   |
| poll   | <p>The time, in seconds, between each poll.</p> <p>Default: 300</p>  |
| failureretests                                   | <p>The number of times to retest before failure is indicated.</p> <p>Default: 0</p>  |
| retestinterval                                   | <p>The time, in seconds, to wait between each failure retest.</p> <p>Default: 10</p>   |

### Service level classifications

Available service level classification options for the LDAP monitor are:

```
totalTime
connectTime
searchTime
initTime
dnMatched
message
```

In service level classifications:

- Specify extra service level classifications by manually entering the name of the monitor element. The name must match the name that is shown for the element in the Monitor elements section.
- message can be any message that is forwarded in the **\$message** element to IBM Application Performance Management server if used in any widget. For a list of possible values, see [Status messages](#).
- The operand is a string or a positive number.

## Monitor elements

In addition to the test results common to all elements, the LDAP monitor generates a set of test results that contains data specific to LDAP service tests.

The following table lists the additional elements for the LDAP monitor.

| Table 95. LDAP monitor elements    |  |
|------------------------------------|--|
| Element                            | Description  |
| \$authentication                   | The type of user authentication method required by the LDAP server (Standard or CRAM-MD5). |
| \$connectTime*<br>(ConnectTime)    | The time taken to connect to the LDAP server.  |
| \$distinguishedName*<br>(UserName) | The distinguished name used to log in to the directory service.                            |
| \$dnMatched                        | The entity matched in the search.  |
| \$filter*<br>(SrchFilter)          | The attribute used to locate the target entity.  |
| \$initTime*<br>(InitTime)          | The time taken to initialize the LDAP client.  |
| \$port*<br>(Port)                  | The port on the LDAP server to which the monitor is connected.                             |
| \$saslRealm                        | The SASL realm that you specified after new LDAP element is added.                         |
| \$searchBase*<br>(SearchBase)      | The distinguished name of the entity from which the search was started.                    |
| \$searchTime*<br>(SearchTime)      | The time taken to complete the search.   |

## Status messages

The LDAP monitor provides status messages in the **ResultMessage** attribute when using IBM Application Performance Management. These messages indicate the result of the test.

The following table describes the LDAP status messages.

| Table 96. LDAP monitor status messages |  |
|--|--|
| Message                                | Description  |
| Search successful                      | The request succeeded.   |
| Search failed                          | The request failed   |
| No match                               | The server might not find a matching entry in the search criteria. |

| <i>Table 96. LDAP monitor status messages (continued)</i>                                      |  |
|--|--|
| Message  | Description  |
| Connection timed out   | The connection succeeded, but then the server stopped responding.  |
| Initialisation failed - an unrecognised authentication type was specified                      | Occurs if an authentication type is used that the LDAP monitor does not support.   |
| Client initialisation failed   | Initialization of the LDAP structures failed because of inadequate memory.   |
| Bind (authentication) failed   | The server that is waiting for the bind to complete is timed out.  |
| SASL bind is not possible because server does not support LDAPv3                               | The server must support LDAPv3 to create an SASL bind.   |
| SASL bind is not possible because one of 'bind_id' (username), password or sasl_realm is blank | In order for a bind to occur, all authentication fields must have a value. Therefore, an SASL bind is not possible if the user is logged in anonymously (in plain text) by using the SIMPLE authentication type. |
| SASL bind error  | The reason for SASL bind failure cannot be identified.   |
| SASL bind authorisation error  | The SASL bind failed because the authorization credentials were incorrect.   |

### **IMAP4 monitor**

The IMAP4 monitor works with the SMTP monitor to test the availability and response time of an IMAP4 email service.

The following table lists the IMAP4 monitor files.

| <i>Table 97. IMAP4 monitor files</i> |                                |
|--------------------------------------|--------------------------------|
| Monitor files                        | Name or location               |
| Monitor executable                   | nco_m_imap4                    |
| Properties file                      | \$ISHOME/etc/props/imap4.props |
| Rules file                           | \$ISHOME/etc/rules/imap4.rules |
| Log file                             | \$ISHOME/log/imap4.log         |

### **Guidelines for configuring IMAP4 monitor**

The IMAP4 monitor works with the SMTP monitor by monitoring the mailbox to which the SMTP monitor sends test messages, and measuring that amount of time taken to deliver those messages.

**Note:** Ensure that the system clocks on the monitor host computer and the mail server are synchronized for the delivery time calculation to work correctly.

When the IMAP4 monitor has read the contents of the mailbox, it generates two different types of events:

- Message-specific events

The IMAP4 monitor creates a message-specific event for each email message that it downloads from the mailbox. In this type of event, the `$message` element is set to `Message Successfully Downloaded`. The `$timeToDeliver` element is calculated as the time taken for the message to travel between the SMTP monitor that issued it and the mailbox that received it. The `$hopCount` element indicates the number of hosts the message hopped through to arrive at the mailbox.

- Summary events

The monitor creates a summary event when it has processed all the messages in the mailbox. In this type of event, the `$message` element indicates the total number of messages successfully downloaded from the mailbox and the `$totaltime` element indicates the time taken to complete the requests. The `$totaltime` is in seconds.

## Secure mail

The IMAP4 monitor supports connections to secure mail services. It can connect using SSL/TLS, or the STARTTLS command. When defining a profile element, use the `securitytype` field to select the appropriate security. If the mail server requires a client-side certificate for SSL encryption, use the SSL properties to specify a certificate file, key file, key password and cipher suite.

## Client-side certificates

The IMAP4 monitor enables you to monitor servers that require client-side certificates for mutual authentication.

Specify the SSL certificate file, key file, and key password when creating a profile element.

Certificates must be in Privacy Enhanced Mail (PEM) format. If your certificate is in another format, you must convert it to PEM format. Certificates can be converted using software such as openssl, which is available from <http://www.openssl.org>.

**Note:** If you always use the same certificate, key, and password in all profile elements, specify them using monitor properties instead of defining them in every profile element you create.

## Mail boxes

After the IMAP4 monitor processed information contained in an email message sent by the SMTP monitor, it deletes it from the mailbox. You can use any existing mailbox to store email messages between the two monitors, even if the mailbox belongs to a real user. However, it's recommended that you create a special mailbox account for service testing.

## Configuring IMAP4 monitor service tests

Use the IMAP4 monitor configuration parameters to define service tests.

When you configure the monitor, default values are shown for the timeout and poll interval parameters. These defaults are 30 and 300 seconds respectively. Other defaults listed in the table aren't shown during configuration but are applied when the configuration details are saved if no value has been specified.

| Table 98. IMAP4 monitor configuration |   |
|---------------------------------------|---|
| Field                                 | Description   |
| server                                | The IP address of the mail server. Example is <code>test.mycompany.com</code> |
| description                           | A text field for providing descriptive information on the element.            |
| port                                  | The IP Port of the IMAP4 Server.<br>Default: 143                              |

| Table 98. IMAP4 monitor configuration (continued) |   |
|---|---|
| Field   | Description   |
| securitytype                                      | The type of secure connection opened with the mail server: <ul style="list-style-type: none"> <li>NONE - Connect without security.</li> <li>SSL - Send an SSLv2 hello, then negotiate SSLv2, SSLv3 or TLSv1.</li> <li>STARTTLS - Connect without security, issue a STARTTLS command, then establish a connection over TLSv1.</li> </ul> Default: NONE |
| username  | The name of the mailbox.  |
| password  | The password used to log in to the mailbox, if necessary.   |
| authenticationtype                                | The method of authentication to use (STANDARD or CRAM_MD5)<br>Default: STANDARD   |
| sharedsecret                                      | The shared secret for CRAM_MD5 authentication if applicable.  |
| timeout   | The time, in seconds, to wait for the server to respond.<br>Default: 30   |
| poll  | The time, in seconds, between each poll.<br>Default: 300  |
| failureretests                                    | The number of times to retest before indicating a failure.<br>Default: 0  |
| retestinterval                                    | The time, in seconds, to wait between each failure retest.<br>Default: 10   |

### Regular expression matching

You can perform a regular expression search on the information being downloaded by entering up to 50 different regular expressions. The monitor attempts to match the contents retrieved to each of the regular expressions.

If a match for a specified regular expression is found, the matched lines (or as much as can fit in the monitor's internal buffer) are returned in the corresponding `$regexMatchn` element. If the regular expression matches more than once in the information downloaded, only the first match is returned. The status of each regular expression test is indicated by the `$regexStatusn` elements. You can use the regular expression matches and their status information as criteria for service level classifications.

For information about regular expression syntax, see [Table 72 on page 405](#).

### Monitor elements

In addition to the test results common to all elements, the IMAP4 monitor generates a set of test results containing data specific to IMAP4 service tests.

The following table describes the additional elements for the IMAP4 monitor.

Elements indicated by an asterisk (\*) are available as attributes. The names of the attributes are shown within brackets. Absence of an asterisk indicates there's no equivalent attribute. Attributes shown in bracket but without an element indicate that they are only available as attributes, there's no equivalent element.

| Table 99. IMAP4 monitor elements      |  |
|---------------------------------------|--|
| Element                               | Description  |
| \$authentication                      | The type of user authentication method required by the IMAP4 server (Standard or CRAM-MD5).  |
| \$bytesPerSec                         | The average number of bytes transferred each second.   |
| \$bytesTransferred                    | The number of bytes uploaded or downloaded.  |
| \$connectTime                         | The time taken to connect to the IMAP4 server.   |
| \$downloadTime*(DownloadTime)         | The time taken to download the file.   |
| \$hopCount                            | The number of hosts the message hopped through to reach the mailbox.   |
| \$inEvent                             | Indicates that this event is part of a series of events.<br>1 indicates that it's not the final event.<br>0 indicates that it's the final event. |
| \$lookupTime*(LookupTime)             | The time taken to obtain the IP address of the host server.  |
| \$port*(Port)                         | The port on which the service is monitored.  |
| \$responseTime*(ResponseTime)         | The time between when the connection is established and the first byte of data is received.  |
| \$security                            | The type of secure connection opened with the mail server specified when adding an IMAP element (NONE, STARTTLS or SSL).                         |
| \$sentTo*(SentTo)                     | The email address used by the SMTP monitor to send the original message.   |
| \$smtpServer                          | The name of the SMTP server from which the email was sent.   |
| \$SSLHandshakeTime*(SslHandshakeTime) | The time taken to establish the SSL connection.  |
| \$timeToDeliver                       | The time taken for an email message to travel between an SMTP monitor and its destination mailbox.   |
| \$user*(ImapUser)                     | The username (account name) used by the monitor to log in to the IMAP4 server.   |

### Status message

The IMAP monitor provides status messages in the ResultMessage attribute when using IBM Application Performance Management. These messages indicate the result of the test.

The following table describes the IMAP4 status messages.

| Table 100. IMAP4 monitor status messages |  |
|--|--|
| Message                                  | Description  |
| Message successfully downloaded          | The message was successfully downloaded.                                   |
| Downloaded x messages                    | Indicates how many messages were successfully downloaded from the mailbox. |
| Server not IMAP4rev1 compliant           | The IMAP4 server doesn't comply with the IMAP4 specification (RFC2060).    |

| <i>Table 100. IMAP4 monitor status messages (continued)</i> |  |
|---|--|
| Message   | Description  |
| Server does not support STARTTLS capability                 | The server isn't configured correctly.                           |
| Unable to log into server                                   | The monitor cannot log in to the IMAP server.                    |
| Unrecognised response to STATUS command                     | The monitor doesn't recognize the value returned by the server.  |
| Unrecognised response to FETCH INTERNALDATE command         |  |
| Failed to obtain Actual-Time-Sent header                    | The monitor didn't obtain the expected response from the server. |
| Failed to obtain Actually-To header                         |  |
| Failed to obtain SMTP-Server header                         |  |

## Properties

The properties and command-line options specific to the IMAP4 monitor are described in the following table.

| <i>Table 101. IMAP4 monitor properties</i> |                    |   |
|--|--------------------|---|
| Property name                              | Property parameter | Description   |
| Originator                                 | string             | Specifies the From field to match when retrieving test email messages sent by the SMTP monitor. The monitor retrieves only messages where the From field matches the string in Originator. The IMAP4 Originator must match the Originator in the SMTP monitor.<br>Default: SMTP-Monitor |
| SSLCertificate File                        | string             | The path and filename of the digital certificate file used if no certificate is explicitly specified for an HTTPS element during its creation.<br><br>If the path isn't absolute, the monitor interprets it relative to the working directory (\$ISHOME/platform/arch/bin).             |
| SSLCipherSuite                             | string             | The cipher suite to use for SSL operations. For a description of possible values, see <a href="#">Cipher Suites</a> .<br>Default: RC4:3DES:DES:+EXP   |
| SSLDisableTLS                              | integer            | Disables TLSv1 for heritage support.<br>Default: 0 - TLSv1 is enabled.<br>1 - TLSv1 is disabled.  |
| SSLKeyFile                                 | string             | The file containing the SSL private key.  |
| SSLKeyPassword                             | string             | The password used to encrypt the SSL private key.   |

## Cipher suites

The `SSLCipherSuite` property specifies the cipher suite used by the IMAP4 monitor. For more information about SSL settings, see [“SSL setting in Internet Service Monitoring”](#) on page 512.

## NTP Monitor

The Network Time Protocol (NTP) monitor queries an NTP server by using UDP (User Datagram Protocol) to determine whether the server is supplying the correct time.

NTP uses Coordinated Universal Time to synchronize computer clocks to millisecond.

The following table lists the NTP monitor files.

| Table 102. NTP monitor files |                              |
|------------------------------|------------------------------|
| Monitor Files                | Name and Location            |
| Monitor executable           | nco_m_ntp                    |
| Properties file              | \$ISHOME/etc/props/ntp.props |
| Rules file                   | \$ISHOME/etc/ntp.rules       |
| Log file                     | \$ISHOME/log/ntp.log         |

## Guidelines for configuring NTP monitor

The NTP monitor acquires data by sending a query to an NTP server, which returns a UDP response packet with the current time (as seen by the NTP server).

The following image shows an example of the messages that are exchanged between the monitor and the NTP server.

## Configuring NTP monitor service tests

Use the NTP monitor configuration parameters to define service tests.

The following table describes the NTP configurations:

| Table 103. NTP configuration |  |
|------------------------------|--|
| Field                        | Description  |
| server                       | The host name of the NTP server. Example is <code>ntp.mycompany.com</code> .                             |
| description                  | A text field for providing descriptive information on the element. Example is <code>NTP monitor</code> . |
| port                         | The port on the NTP server to use.<br>Default: 123   |

| Table 103. NTP configuration (continued) |  |
|--|--|
| Field                                    | Description  |
| localip                                  | Specifies the IP address of the network interface on the host system to which the monitor binds when it performs the test. If the monitor's IPAddress property is set, it overrides the value of this field. Example is 102.168.n.n. |
| version                                  | The version of the NTP server to use (1, 2, 3, or 4).<br>Default: 1  |
| timeout                                  | The time, in seconds, to wait for the server to respond.<br>Default: 10  |
| retries                                  | The number of times the monitor retries to contact the NTP server.<br>Default: 0   |
| poll                                     | The time, in seconds, between each poll.<br>Default: 300   |
| failureretests                           | The number of times to retest before failure is indicated.<br>Default: 0   |
| retestinterval                           | The time, in seconds, to wait between each failure retest.<br>Default: 10  |

### Service level classification

Service level classifications define the rules for determining the level of service that is provided over NTP.

Available service level classification options for the NTP monitor are:

```
totalTime
responseTime
lookupTime
offset
adjustedOffset
message
```

In service level classifications:

- Specify more service level classifications by manually entering the name of the monitor element. The name must match the name that is shown for the element in the Monitor elements section.
- message can be any message that is forwarded in the \$message element to IBM Application Performance Management server if used in any widget. For a list of possible values, see [Status messages](#).
- The operand is a string or a positive number.

### Monitor elements

In addition to the test results common to all elements, the NTP monitor generates a set of test results that contains data specific to NTP service tests.

The following table describes the additional elements for the NTP monitor.

| <i>Table 104. NTP monitor elements</i> |   |
|--|---|
| Element                                | Description   |
| \$adjustedOffset                       | The time offset from the server in seconds.   |
| \$localIP                              | The local IP address the monitor is configured to use. It might be blank on a system with only one interface. |
| \$lookupTime*<br>(LookupTime)          | The time taken to obtain the IP address of the host server.   |
| \$ntpVersionIn                         | Protocol version used in the response from the server.  |
| \$ntpVersionOut                        | Protocol version that is used for sending.  |
| \$offset                               | The difference in time between the NTP server and the system that runs the monitor in seconds.                |
| \$port*<br>(Port)                      | The port on the NTP server to use.  |
| \$responseTime*<br>(ResponseTime)      | The time between the monitor to connect to the NTP server and receive a response.                             |
| \$retries                              | The number of times to resend a request if no response IDs are received.                                      |

### Status messages

The NTP monitor provides status messages in the `ResultMessage` attribute when you use IBM Application Performance Management. These messages indicate the result of the test.

The following table describes the NTP status messages.

| <i>Table 105. NTP monitor status messages</i> |  |
|---|--|
| Message                                       | Description                                |
| Successful query                              | The NTP server gave the expected response. |
| Connection failed                             | Unable to initialize a UDP socket.         |
| Failed to send request to NTP server          | Unable to write to UDP socket.             |
| No response from server                       | The NTP server did not respond.            |

### NNTP Monitor

The NNTP monitor tests the availability of an NNTP service by reading from and posting to a newsgroup.

The following table lists the NNTP monitor files.

Table 106. NNTP monitor files

| Monitor files      | Name or location              |
|--------------------|-------------------------------|
| Monitor executable | nco_m_nnnp                    |
| Properties file    | \$ISHOME/etc/props/nnnp.props |
| Rules file         | \$ISHOME/etc/rules/nnnp.rules |
| Log file           | \$ISHOME/log/nnnp.log         |

### Guidelines for configuring the NNTP monitor

The NNTP monitor tests NNTP services by posting to and reading from an NNTP server. Each profile element that you create for the monitor performs either a read operation or a post operation.

In a read operation, the monitor connects to the NNTP service to check whether a particular Internet newsgroup exists. If the newsgroup exists, the monitor records the number of news items in it. It also attempts to record the last news item that is added to the newsgroup. The following image shows the read operation.

In a post operation, the monitor checks that the newsgroup exists and then attempts to write a test message to it. The subject of the test message is NNTP Monitor Test Message. The following image shows the post operation.

Each profile element specifies a username and password that is supplied by the monitor when it is accessing an NNTP server. The monitor uses the plain text authentication system.

```

AUTHINFO USER username
AUTHINFO PASS password
  
```

Where the username and password are specified in the monitor profile element.

### Properties

Properties options specific to the NNTP monitor are described in the following table.

Table 107. NNTP monitor properties options

| Property name   | Property parameter | Description   |
|-----------------|--------------------|---|
| OutputDirectory | string             | Specifies the output directory to use if <b>OutputResult</b> is true (set to 1).<br>Default: \$ISHOME/var |

| Table 107. NNTP monitor properties options (continued) |                    |  |
|--|--------------------|--|
| Property name  | Property parameter | Description  |
| OutputResult   | 0 1                | Specifies that the monitor can save the data that it receives from the service.<br><br>0 - disabled<br>1 - enabled |

### Configuring NNTP monitor service tests

Use the NNTP monitor configuration parameters to define service tests.

The following table lists the NNTP monitor configurations.

| Table 108. NNTP monitor configuration |  |
|---------------------------------------|--|
| Field                                 | Description  |
| server                                | The IP address of the NNTP server. For example, news.mycompany.com.  |
| newsgroup                             | The name of the newsgroup the monitor uses for posting and reading test messages. For example, mycompany.test. |
| description                           | A text field for providing descriptive information on the element. For example, READ.                          |
| port                                  | The port number of the NNTP server.<br>Default: 119  |
| username                              | The username used to authenticate with the NNTP server.  |
| password                              | The password of the username used to authenticate with the NNTP server.  |
| action                                | Indicates whether to post or retrieve an article. It can be READ or POST.<br>Default: POST                     |
| timeout                               | The time, in seconds, to wait for the server to respond.<br>Default: 30  |
| poll                                  | The time, in seconds, between each poll.<br>Default: 300   |
| failureretests                        | The number of times to retest before failure is indicated.<br>Default: 0                                       |
| retestinterval                        | The time, in seconds, to wait between each failure retest.<br>Default: 10                                      |

### Matching regular expression

You can perform a regular expression search on the information that is being downloaded by entering up to 50 different regular expressions. The NNTP monitor attempts to match the contents that are retrieved to each of the regular expressions.

If a match for a specified regular expression is found, the matched lines (or as much as can fit in the monitor's internal buffer) are returned in the corresponding `$regexMatchn` element. If the regular expression matches more than once in the information downloaded, only the first match is returned. The status of each regular expression test is indicated by the `$regexStatusn` elements. You can use the regular expression matches and their status information as criteria for service level classifications.

For more information, see [Table 72 on page 405](#).

### Service level classifications

Service level classifications define the rules for determining the level of service that is provided over NNTP.

Available service level classification options for the NNTP monitor are:

```
totalTime
lookupTime
connectTime
transferTime
responseTime
status
bytesTransferred
bytesPerSec
newsItems
expected
lastLineReceived
checksum
previousChecksum
regexMatch1 to 3
regexStatus1 to 3
message
```

In service level classifications:

- Specify more service level classifications by manually entering the name of the monitor element. The name must match the name that is shown for the element in the Monitor elements section.
- `message` can be any message that is forwarded in the `$message` element to IBM Application Performance Management server if used in a widget. For a list of possible values, see [Status messages](#).
- The operand is a string or a positive number.
- status codes 220 and 240 indicate success. See the NNTP protocol for other status codes returned by the operation.
- `egexpStatusn` might have the following values:
  - NONE: No regular expression checking is configured
  - MATCHED: A match was found for the regular expression
  - FAILED: A match was not found for the regular expression
- Evaluate regular expression matches that uses test expressions of the format:

```
regexMatchn [contains|!contains] expression
```

Use `contains` and `!contains` operators in place of `=` and `!=` because `regexMatchn` normally contains the entire line that matches the regular expression instead of just the matching portion, so the `=` and `!=` operators often do not match the expression.

- The Checksum and PreviousChecksum elements do not normally provide meaningful values for service level classifications because checksum values are not known when the profile element is created (the monitor calculates checksum values while tests are in progress). The `$checksum` and `$previousChecksum` monitor elements are intended for alert enrichment by using the monitor's rules file.

### Monitor elements

In addition to the test results common to all elements, the NNTP monitor generates a set of test results that contains data specific to NNTP service tests.

The following table describes the additional elements for the NNTP monitor.

| <i>Table 109. NNTP monitor elements</i> |  |
|---|--|
| <b>Element</b>                          | <b>Description</b>   |
| \$action*<br>(NntpAction)               | The action taken by the monitor. It can be READ or POST.   |
| \$bytesPerSec                           | The average number of bytes transferred each second.   |
| \$bytesTransferred                      | The number of bytes uploaded or downloaded.  |
| \$checksum                              | The Checksum element does not normally provide meaningful values for service level classifications because checksum values are not known when the profile element is created (the monitor calculates checksum values while tests are in progress). The \$checksum and \$previousChecksum monitor elements are intended for alert enrichment by using the monitor's rules file.         |
| \$connectTime*<br>(ConnectTime)         | The time taken to establish a connection to the NNTP server.   |
| \$downloadTime                          | The time taken to download the file.   |
| \$group*<br>(NntpGroup)                 | The name of the monitored newsgroup.   |
| \$lastLineReceived                      | This element is only set if the \$message element contains the message Expect Failed. If it is set, it contains the NNTP server's response.  |
| \$lookupTime*<br>(LookupTime)           | The time taken to look up the server IP address.   |
| \$newsItems                             | The number of news items in the news group.  |
| \$password                              | The password used to authenticate the monitor.   |
| \$previousChecksum                      | The PreviousChecksum element does not normally provide meaningful values for service level classifications because checksum values are not known when the profile element is created (the monitor calculates checksum values while tests are in progress). The \$previousChecksum and \$checksum monitor elements are intended for alert enrichment by using the monitor's rules file. |
| \$responseTime*<br>(ResponseTime)       | The time taken, after a connection is created, until the first byte of the target article is received.   |

| Table 109. NNTP monitor elements (continued) |   |
|--|---|
| Element                                      | Description   |
| \$status                                     | The status code returned by the NNTP server.  |
| \$transferTime*<br>(TransferTime)            | Sets the value to \$uploadTime or \$downloadTime.                                       |
| \$uploadTime                                 | The time taken to upload the file.  |
| \$username                                   | The username used to authenticate the monitor.  |
| If \$message contains \$ExpectFailed         |   |
| \$expected                                   | The text in the connection that the monitor was waiting for when the connection failed. |
| \$lastLineReceived                           | The last line of text in the connection that the monitor received from the NNTP server. |

### Status messages

The NNTP monitor provides status messages in the ResultMessage attribute when using IBM Application Performance Management. These messages indicate the result of the test.

The following table describes the NNTP status messages.

| Table 110. NNTP monitor status messages |  |
|---|--|
| Message                                 | Description  |
| Article Posted                          | The NNTP POST action succeeded.  |
| Article Retrieved                       | The NNTP READ action succeeded.  |
| Not Found                               | The article might not be located.  |
| Expect failed                           | The NNTP request failed.   |
| Timed out waiting to read               | A data connection to the server was established, but it stopped responding.          |
| Connection failed                       | The monitor failed to connect to the server. For more information, see the log file. |
| Connection closed by foreign host       | The remote host closed the connection before the monitor expected it to.             |

### POP3 Monitor

The POP3 monitor works along with the SMTP monitor to test the availability and response time of a POP3 email service.

The following table lists the POP3 monitor files.

Table 111. POP3 monitor files

| Monitor files      | Name or location              |
|--------------------|-------------------------------|
| Monitor executable | nco_m_pop3                    |
| Properties file    | \$ISHOME/etc/props/pop3.props |
| Rules file         | \$ISHOME/etc/rules/pop3.rules |
| Log file           | \$ISHOME/log/pop3.log         |

### Guidelines for configuring POP3 monitor

The POP3 monitor operates along with the SMTP monitor by monitoring the mailbox to which the SMTP monitor sends test messages, and measuring that amount of time taken to deliver those messages.

**Note:** Ensure that the system clocks on the monitor host computer and the mail server are synchronized for the delivery time calculation to work correctly.

When the POP3 monitor has read the contents of the mailbox, it generates two different types of events:

- Message-specific events

The POP3 monitor creates a message-specific event for each email message that it downloads from the mailbox. In this type of event, the monitor sets the \$message element to Message Successfully Downloaded. The \$timeToDeliver element is calculated as the time taken for the message to travel between the SMTP monitor that issued it and the mailbox that received it. The \$hopCount element indicates the number of hosts the message hopped through to arrive at the mailbox.

- Summary events

The monitor creates a summary event when it has processed all the messages in the mailbox. In this type of event, the \$message element indicates the total number of messages successfully downloaded from the mailbox and the \$totaltime element indicates the time taken to complete the requests. The \$totaltime is in seconds.

### Secure mail

The POP3 monitor supports connections to secure mail services. It can connect using SSL/TLS, or the STARTTLS command. When defining a POP3 monitor element, use the Security Type field to select the appropriate security. If the mail server requires a client-side certificate for SSL encryption, use the SSLname properties or command line options to specify a certificate file, key file, key password and cipher suite.

### Client-side certificate

The POP3 monitor enables you to monitor servers that require client-side certificates for mutual authentication. Specify the SSL certificate file, key file, and key password while creating a profile element. Certificates must be in Privacy Enhanced Mail (PEM) format. If your certificate is in another format, you must convert it to PEM format. Certificates can be converted using software such as openssl, which is available from <http://www.openssl.org>.

**Note:** If you always use the same certificate, key, and password in all profile elements, specify them using monitor properties instead of defining them in every profile element you create.

### Configuring POP3 monitor tests

**Note:** Monitor the operation of the mail server mail.mycompany.com by configuring the SMTP monitor to send messages to a test mailbox, and configuring the POP3 monitor to retrieve the messages. The test mailbox has the address ismtest@mycompany.com and credentials ismtest/secret1. Use a connection timeout of 20 seconds, 2 retests on failure, and a retest interval of 5

seconds at each end, and test the services every ten minutes. Use the default service level classifications provided by the profile elements.

| <i>Table 112. POP3 monitor configuration</i> |   |
|--|---|
| Field  | Description   |
| server                                       | The IP address of the mail server. Example is mail.mycompany.com  |
| description                                  | A text field for providing descriptive information on the element.  |
| port   | The port number of the mail server.<br>Default: 110   |
| securitytype                                 | The type of secure connection opened with the mail server: <ul style="list-style-type: none"> <li>• NONE - Connect without security</li> <li>• SSL - Send an SSLv2 hello, then negotiate SSLv2, SSLv3 or TLSv1</li> <li>• STARTTLS - Connect without security, issue a STLS command, then establish a connection over TLSv1. This is the most secure security type.</li> <li>• NONE - Connect without security</li> </ul> Default: NONE   |
| username                                     | The name of the mailbox.  |
| password                                     | The password used to log in to the mailbox, if necessary.   |
| authenticationtype                           | The method of authentication to use and the label is Authentication Type: <ul style="list-style-type: none"> <li>• STANDARD - Uses a user/pass exchange where the password isn't encrypted. This is appropriate for intermittent use of POP3.</li> <li>• APOP - Use where the POP3 client connects to the server regularly. This offers a higher level of security than standard. Ensure that you specify an APOP Shared Secret if you select APOP. Note that not all servers support APOP.</li> </ul> Default: STANDARD. |
| sharedsecret                                 | The shared secret for APOP authentication, applicable only if you're using the APOP authentication type. The string should be at least eight characters long and is obscured in the user interface.   |
| timeout                                      | The time, in seconds, to wait for the server to respond.<br>Default: 30   |
| poll   | The time, in seconds, between each poll.<br>Default: 300  |
| failureretests                               | The number of times to retest before indicating a failure.<br>Default: 0  |
| retestinterval                               | The time, in seconds, to wait between each failure retest.<br>Default: 10   |

| Table 112. POP3 monitor configuration (continued) |  |
|---|--|
| Field   | Description  |
| verifycertificate                                 | The verification certificate of the server.<br>Default: Disabled |

Use the POP3 monitor configuration parameters to define service tests.

### Regular expression matching

You can perform a regular expression search on the information being downloaded by entering up to 50 different regular expressions. The monitor attempts to match the contents retrieved to each of the regular expressions.

If a match for a specified regular expression is found, the matched lines (or as much as can fit in the monitor's internal buffer) are returned in the corresponding `$regexpMatchn` element. If the regular expression matches more than once in the information downloaded, only the first match is returned. The status of each regular expression test is indicated by the `$regexpStatusn` elements. You can use the regular expression matches and their status information as criteria for service level classifications.

For information about regular expression syntax, see [Table 72 on page 405](#).

### Monitor elements

In addition to the test results common to all elements, the POP3 monitor generates a set of test results containing data specific to POP3 service tests.

[Table 1](#) describes the additional elements for the POP3 monitor.

Elements indicated by an asterisk (\*) are available as attributes. The names of the attributes are shown within brackets. Absence of an asterisk indicates there's no equivalent attribute. Attributes shown in bracket but without an element indicate that they are only available as attributes, there's no equivalent element.

| Table 113. IMAP4 monitor elements              |  |
|--|--|
| Element  | Description  |
| <code>\$authentication</code>                  | The type of user authentication method required by the IMAP4 server (Standard or CRAM-MD5).  |
| <code>\$bytesPerSec</code>                     | The average number of bytes transferred each second.   |
| <code>\$bytesTransferred</code>                | The number of bytes uploaded or downloaded.  |
| <code>\$connectTime</code>                     | The time taken to connect to the IMAP4 server.   |
| <code>\$downloadTime*</code><br>(DownloadTime) | The time taken to download the file.   |
| <code>\$hopCount</code>                        | The number of hosts the message hopped through to reach the mailbox.   |
| <code>\$inEvent</code>                         | Indicates that this event is part of a series of events. 1 indicates that it isn't the final event, 0 indicates that it's the final event. |
| <code>\$lookupTime*(Looku<br/>pTime)</code>    | The time taken to obtain the IP address of the host server.  |
| <code>\$port*(Port)</code>                     | The port on which the service is monitored.  |
| <code>\$responseTime*</code><br>(ResponseTime) | The time between when the connection is established and the first byte of data is received.  |

| Table 113. IMAP4 monitor elements (continued) |  |
|---|--|
| Element                                       | Description  |
| \$security                                    | The type of secure connection opened with the mail server specified when adding an IMAP element (NONE, STARTTLS or SSL). |
| \$sentTo*(SentTo)                             | The email address used by the SMTP monitor to send the original message.   |
| \$smtpServer                                  | The name of the SMTP server from which the email was sent.   |
| \$SSLHandshakeTime*(SslHandshakeTime)         | The time taken to establish the SSL connection.  |
| \$timeToDeliver                               | The time taken for an email message to travel between an SMTP monitor and its destination mailbox.                       |
| \$user*(ImapUser)                             | The username (account name) used by the monitor to log in to the IMAP4 server.   |

### Status message

The POP3 monitor provides status messages in the ResultMessage attribute when using IBM Application Performance Management. These messages indicate the result of the test.

The following table describes the POP3 status messages.

| Table 114. POP3 monitor status messages |  |
|---|--|
| Message                                 | Description  |
| Message successfully downloaded         | The POP3 request was successful.   |
| Downloaded x messages                   | Indicates how many messages were downloaded from the mailbox.  |
| Timed out waiting to read/write         | A data connection to the server was established, but it has stopped responding.                              |
| Connection closed by foreign host       | The remote host closed the connection before the monitor expected.   |
| Connection failed                       | The monitor failed to connect to the server. See the log file for more information.                          |
| APOP not supported by the server        | The APOP authentication method isn't supported by the server. Use the Standard authentication type instead.  |
| APOP service not available              | The APOP server implementation isn't supported by the monitor. Use the Standard authentication type instead. |
| Server does not support STLS capability | The server doesn't support STARTTLS. Use a different security type.  |

### Properties

Properties specific to the POP3 monitor are described in the following table.

Table 115. POP3 monitor properties and command-line options

| Property name       | Property parameter | Description   |
|---------------------|--------------------|---|
| SSLCertificate File | string             | The path and filename of the digital certificate file used if no certificate is explicitly specified for a POP3 element during its creation.<br><br>If the path isn't absolute, the monitor interprets it relative to the working directory (\$ISHOME/platform/arch/bin). |
| SSLCipherSuite      | string             | The cipher suite to use for SSL operations. Default: RC4:3DES:DES:+EXP. See <a href="#">Cipher suites</a> for a description of the possible values.   |
| SSLDisableTLS       | integer            | Disables TLSv1 for legacy support.<br><br>Default: 0 - TLSv1 is enabled. Set to 1 to disable TLSv1.   |
| SSLKeyFile          | string             | The file containing the SSL private key.  |
| SSLKeyPassword      | string             | The password used to encrypt the SSL private key.   |

### Cipher suites

The SSLCipherSuite property specifies the cipher suite used by the POP3 monitor. For more information about SSL settings, see [“SSL setting in Internet Service Monitoring”](#) on page 512.

### RADIUS Monitor

Remote Authentication Dial-In User Service (RADIUS) provides authentication for remote access to services. The RADIUS monitor simulates a client system that access a RADIUS service and returns data about the performance of the service.

The following table lists the RADIUS monitor files.

| Table 116. RADIUS monitor files |                                 |
|---------------------------------|---------------------------------|
| Monitor Files                   | Name and Location               |
| Monitor executable              | nco_m_radius                    |
| Properties file                 | \$ISHOME/etc/props/radius.props |
| Rules file                      | \$ISHOME/etc/rules/radius.rules |
| Log file                        | \$ISHOME/log/http.log           |

### Guidelines for configuring Radius monitor

The RADIUS monitor simulates the operation of a Network Access Server (NAS), sending requests to a RADIUS server.

The RADIUS monitor uses UDP to send requests to the RADIUS server and then generates events that contain the results of those requests and data about the server performance. The following image shows the operation of the monitor.

The monitor can test both the authentication and accounting operations of RADIUS servers:

- Access-Requests by using Password Authentication Procedure (PAP)
- Access-Requests by using Challenge-Handshake Authentication Protocol (CHAP)
- Accounting-Requests: Start, Stop, Accounting On, and Accounting Off

### Properties

The properties options specific to the RADIUS monitor are described in the following table.

| Table 117. RADIUS monitor properties options |                    |  |
|--|--------------------|--|
| Property name                                | Property parameter | Description  |
| FramedServiceRequest                         | 0   1              | When this property is set to 1, the monitor selects the Framed service type set in Access-Requests.<br>0 - disabled<br>1 - enabled |

### Configuring Radius monitor service tests

Use the RADIUS monitor configuration parameters to define service tests.

The following table describes the Radius monitor configurations:

| Table 118. RADIUS monitor configuration |   |
|---|---|
| Field                                   | Description   |
| server                                  | The IP address of the RADIUS server.                                    |
| sharedsecret                            | The shared secret used to authenticate the monitor.                     |
| username                                | The username supplied by the monitor to authenticate the RADIUS server. |
| password                                | The password supplied by the monitor to authenticate the RADIUS server. |
| description                             | A text field for providing descriptive information on the element.      |

| Table 118. RADIUS monitor configuration (continued) |   |
|---|---|
| Field   | Description   |
| requesttype   | Specifies the type of request sent to the RADIUS server: <ul style="list-style-type: none"> <li>• Authenticate (CHAP)</li> <li>• Authenticate (PAP)</li> <li>• Accounting</li> </ul> Default: Authenticate(CHAP)  |
| port  | The port to use to connect to the RADIUS server.<br>Default: 1812   |
| localip   | Specifies the IP address of the network interface on the host system to which the monitor binds when it performs the test. If the monitor's IPAddress property is set, it overrides the value of this field.  |
| loginhost   | Sets the value of the Login-IP-Host attribute in the Access-Request.  |
| calledstation                                       | Sets the value of the Called-Station-Id attribute in the Access-Request.  |
| callingstation                                      | Sets the value of the Calling-Station-Id attribute in the Access-Request.   |
| accountsessionid                                    | Sets the value of the Acct-Session-Id attribute in Accounting-Request packets sent to the accounting server.<br><b>Note:</b> This field applies to the Accounting request type only.  |
| accountstatustype                                   | Sets the value of the Acct-Status-Type attribute in Accounting-Request packets sent to the accounting server: <ul style="list-style-type: none"> <li>• Start</li> <li>• Stop</li> <li>• Accounting On</li> <li>• Accounting Off</li> </ul> <b>Note:</b> This field applies to the Accounting request type only.<br>Default: Start |
| accountsessiontime                                  | Sets the value of the Acct-Session-Time attribute (in seconds) in accounting-request packets sent to the accounting server.<br><b>Note:</b> This field applies to the Accounting request type only.   |
| nasip   | The NAS-IP-Address attribute that is sent by the RADIUS monitor as part of an Access-Request packet.  |
| nasport   | The NAS-Port attribute that is sent by the RADIUS monitor as part of an access request packet.  |

| Table 118. RADIUS monitor configuration (continued) |   |
|---|---|
| Field   | Description   |
| timeout   | The time, in seconds, to wait for the server to respond.<br>Default: 10                           |
| retries   | The number of times to retry to connect to the RADIUS server if there is a problem.<br>Default: 0 |
| poll  | The time, in seconds, between each poll.<br>Default: 300  |
| failureretests                                      | The number of times to retest before failure is indicated.<br>Default: 0                          |
| retestinterval                                      | The time, in seconds, to wait between each failure retest.<br>Default: 10                         |

### Service level classification

Service level classifications define the rules for determining the level of service that is provided by RADIUS service.

Available service level classification options for the RADIUS monitor are:

```
totalTime
lookupTime
responseTime
message
```

In service level classifications:

- Specify more service level classifications by manually entering the name of the monitor element. The name must match the name that is shown for the element in the Monitor elements section.
- message can be any message that is forwarded in the \$message element to IBM Application Performance Management server if used in any widget. For a list of possible values, see [Status messages](#).
- The operand is a string or a positive number.

### Monitor elements

In addition to the test results common to all elements, the RADIUS monitor generates a set of test results that contain data specific to RADIUS service tests.

The following table describes the additional elements for the RADIUS monitor.

| Table 119. RADIUS monitor elements |  |
|------------------------------------|--|
| Element                            | Description  |
| \$accountSessionId                 | Unique identifier used to match start and stop records.  |
| \$accountSessionTime               | When accountStatusType is set to Stop, this field shows the amount of time that the user receives the service, in seconds. |

*Table 119. RADIUS monitor elements (continued)*

| <b>Element</b>                  | <b>Description</b>  |
|---------------------------------|---|
| \$accountStatusType             | Indicates whether it is the start of the user's service (start) or the end (stop).  |
| \$calledStationId               | The RADIUS monitor sends the calledStationId as part of an Access-Request packet. It is used if the RADIUS server requires it and not used if callingStationId is used. |
| \$callingStationId              | The RADIUS monitor sends callingStationId as part of an Access-Request packet. It is used if the RADIUS server requires it and not used if calledStationId is used.     |
| \$localIP                       | The local IP address the monitor is configured to use. It might be blank on a system with only one interface.   |
| \$loginIPHost*<br>(LoginIpHost) | The RADIUS monitor sends loginIPHost as part of an Access-Request Packet. It might be required by servers that are being monitored.                                     |
| \$lookupTime*<br>(LookupTime)   | The time taken to obtain the IP address of the host server.   |
| \$nasPort*<br>(NasPort)         | NAS Port parameter that is sent by the RADIUS monitor as part of an Access-Request packet. Default: 0.  |
| \$password                      | The password used to authenticate the monitor.  |
| \$port*<br>(Port)               | The port on which the service is monitored.   |
| \$requestType                   | Indicates the request type that is selected for the element, either PAP, CHAP, or Accounting.   |
| \$responseTime                  | The time that is taken between sending a request to the RADIUS server and receiving a reply from it.  |
| \$retries                       | The maximum number of retries.  |
| \$secret                        | The shared secret password taken from the configuration file.   |
| \$username*<br>(RadiusUser)     | The user name used to authenticate the monitor.   |

### **Status messages**

The RADIUS monitor provides status messages in the ResultMessage attribute when using IBM Application Performance Management. These messages indicate the result of the test.

The following table describes the RADIUS monitor status messages

| <i>Table 120. RADIUS monitor status messages</i> |  |
|--|--|
| <b>Message</b>                                   | <b>Description</b>   |
| CHAP authentication - Access granted             | The monitor was authenticated (using CHAP). It is only returned if the CHAP request type was used.                           |
| PAP authentication - Access granted              | The monitor was authenticated (using PAP). It is only returned if the PAP request type was used.                             |
| Accounting response received                     | An accounting response was received from the server. The transaction is continued.   |
| Connection failed                                | The server name that is specified is invalid.  |
| Failed to send request to RADIUS server          | Might not write UDP packet to the network. No further error information is available.  |
| No response from server                          | The RADIUS server is not responding.   |
| Incorrect identifier returned                    | There was a response from the server to a request that was not sent from the monitor.  |
| Invalid response authenticator                   | The response contained an authorization that was not expected. It might be caused by an incorrect shared secret or password. |
| Unrecognized response                            | The server did not recognize the packet that is sent.  |
| PAP authentication - Access denied               | The monitor was not authenticated (using PAP).   |
| CHAP authentication - Access denied              | The monitor was not authenticated (using CHAP).  |

### **RPING Monitor**

The RPING monitor tests the availability of network devices by pinging them remotely from a router. It provides maximum, minimum, and average round-trip time performance data.

The monitor supports Cisco, Juniper routers, and RFC2925-compliant routers.

The following table lists the RPING Monitor files.

| <i>Table 121. RPING monitor files</i> |                                    |
|---------------------------------------|------------------------------------|
| <b>Monitor files</b>                  | <b>Name or location</b>            |
| Monitor executable                    | nco_m_rping                        |
| Properties file                       | \$ISHOME/etc/ims/props/rping.props |
| Rules file                            | \$ISHOME/etc/ims/rules/rping.rules |
| Log file                              | \$ISHOME/log/rping.log             |

Table 121. RPING monitor files (continued)

| Monitor files | Name or location  |
|---------------|---|
| Script files  | <p>\$ISHOME/scripts/rping/cisco.s (SNMP script for Cisco routers)</p> <p>\$ISHOME/scripts/rping/juniper.s (SNMP script for Juniper routers)</p> <p>\$ISHOME/scripts/rping/rfc2925.s (SNMP script for RFC2925-compliant routers)</p> |

### Guidelines for configuring RPING monitor

The RPING monitor acquires data by configuring the router to ping a network device, then periodically polling the router to obtain the results of the pings.

The monitor configures the ping tests by using an SNMP SET command to create a control row in the router's ping MIB, then it retrieves the ping data from the MIB by using SNMP GET commands. All communication with the router is over SNMP.

The following image shows an example of the messages that are exchanged between the monitor and the network device.

### Enabling remote Ping request on Cisco routers

By default, remote ping SNMP requests on Cisco routers are disabled. However, for the RPING monitor to do an SNMP SET request and to start pinging, this request must be enabled.

To enable the request, log in to the Cisco router and enter the following commands:

```

enable
config terminal
snmp-server community communitystring rw
write mem
logout
  
```

The communitystring configured in the router must match the string that you enter in the R/W Community String field of any RPING profile elements that are created for that router. The write mem line ensures that the settings are saved when the router is rebooted.

### Enabling remote Ping request on Juniper routers

By default, remote ping SNMP requests that on Juniper routers are disabled. For the RPING monitor to operate by using a Juniper router, you must enable SNMP requests.

To enable SNMP request on the router, ensure that the SNMP section of the JUNOS configuration match:

```

[edit snmp]
view ping-mib-view {
  oid .1.3.6.1.2.1.80 include; # pingMIB
  oid jnxPingMIB include; # jnxPingMIB
}
community communitystring {
  authorization read-write;
  view ping-mib-view;
}
  
```

The communitystring configured in the router must match the string that you enter in the communitystring field of any RPING profile elements that are configured for that router.

## Properties

Properties options specific to the RPING monitor are described in the following table.

| Table 122. RPING properties options |                    |   |
|-------------------------------------|--------------------|---|
| Property name                       | Property parameter | Description   |
| MibDir                              | string             | The directory that contains MIB files used by the monitor.<br>Default: \$ISHOME/mibs. |

## Configuring the RPING monitor service tests

Use the RPING monitor configuration parameters to define service tests.

| Table 123. RPING monitor configuration |  |
|--|--|
| Field                                  | Description  |
| server                                 | The name or IP address of the router. For example, <code>rt1.mycompany.com</code> .  |
| routrertype                            | The type of router: <ul style="list-style-type: none"><li>• CISCO</li><li>• Juniper</li><li>• RFC2925</li></ul>                    |
| host                                   | The name or IP address of the server you want the router to ping.  |
| communitystring                        | Specifies the SNMP community string that is used to communicate with the router. For example, <code>server1.mycompany.com</code> . |
| description                            | A text field for providing descriptive information about the element. For example is, <code>RPING monitor</code> .                 |
| vpn                                    | The optional name of a VPN to use for sending pings. The router uses the VPN specified instead of the default route configured.    |
| version                                | The SNMP version to use:<br>1 - SNMPv1<br>2 - SNMPv2c<br>3 - SNMPv3<br>Default: 2  |
| numberofpings                          | The number of pings to send.<br>Default: 5   |
| packetsize                             | The size of the packets to send, in bytes.<br>Default: 64  |
| packettimeout                          | The time to wait between pings in seconds.<br>Default: 500   |

| Table 123. RPING monitor configuration (continued) |  |
|--|--|
| Field  | Description  |
| securityname†                                      | The username for the SNMP session.   |
| authenticationphrase†                              | The authentication password for the user.  |
| privacyphrase†                                     | The privacy password for the user.   |
| authenticationprotocol†                            | The protocol to use to authenticate the user: <ul style="list-style-type: none"> <li>• MD5</li> <li>• SHA1</li> </ul> Default: MD5 |
| privacyprotocol†                                   | The protocol to use for encrypting the session.<br>Default: DES  |
| timeout  | The time, in seconds, between each poll.<br>Default: 10  |
| retries  | The number of times the monitor retries to contact the server.<br>Default: 3   |
| poll   | The time to wait between pings in seconds.<br>Default: 300   |
| failureretests                                     | The number of times to retest before failure is indicated.<br>Default: 0   |
| retestinterval                                     | The time, in seconds, to wait between each failure retest.<br>Default: 10  |
| † Applicable only to SNMPv3.                       |  |

### Service level classification

Service level classifications define the rules for determining the level of service that is provided over RPING.

Available service level classification options for the RPING monitor are:

```
totalTime
lookupTime
numPacketSent
numPacketsRecv
maxRTT
minRTT
averageRTT
respondPercent
message
```

In service level classifications:

- Specify more service level classifications by manually entering the name of the monitor element. The name must match the name that is shown for the element in the Monitor elements section.

- message can be any message that is forwarded in the **\$message** element to IBM Application Performance Management server if used in any widget. For a list of possible values, see [Status messages](#).
- The operand is a string or a positive number.

### Monitor elements

In addition to the test results common to all elements, the RPING monitor generates a set of test results that contain data specific to RPING service tests.

The following table lists the additional elements for the RPING monitor.

| <i>Table 124. RPING monitor elements</i> |  |
|--|--|
| Element                                  | Description  |
| \$authProto                              | The authentication protocol as specified when the element was created.   |
| (AverageRTT)                             | The average round-trip time in seconds.  |
| \$community                              | The SNMP community string for the router.  |
| \$communityString                        | The SNMP community string used to communicate with the router.   |
| (MaxRTT)                                 | The maximum round-trip time in seconds.  |
| (MinRTT)                                 | The minimum round-trip time in seconds.  |
| \$numPacketSent                          | The number of packets sent by the monitor.   |
| \$numPings                               | The number of pings sent, as specified when the RPING element was added.   |
| \$packetSize                             | The size of packets to send.   |
| \$packetTimeout                          | The time to wait between sending packets.  |
| \$privProto                              | The privacy protocol as specified when the element was created.  |
| \$remoteHost*<br>(RemoteHost)            | The name or IP address of the server you want the router to ping.  |
| (RespondPercent)                         | The percentage of pings sent for which there was a response.   |
| \$routerMan*<br>(RouterName)             | The router type selected when the RPING element was added: <ul style="list-style-type: none"> <li>• CISCO</li> <li>• Juniper</li> <li>• RFC2925</li> </ul> |
| \$securityName                           | The security user name as specified when the element was created.  |
| (SnmpVersion)                            | The version of SNMP used to send SNMP packets (version 1, 2c, or 3).   |
| (SourceRouter)                           | The name or IP address of the router.  |
| \$timeout                                | The number of seconds in which the server must respond. Taken from the configuration file.   |

| Table 124. RPING monitor elements (continued) |   |
|---|---|
| Element                                       | Description   |
| \$vpn*<br>(Vpn)                               | The name of the VPN specified in the <b>vpn</b> field of the RPING profile element. |

### Status messages

The RPING monitor provides status messages in the **ResultMessage** attribute when using IBM Application Performance Management. These messages indicate the result of the test.

The following table describes the RPING status messages.

| Table 125. RPING monitor status messages |  |
|--|--|
| Message                                  | Description  |
| Got Response                             | The monitor received a response from the Cisco device.                           |
| Error in packet - exiting thread         | There was an error in one of the packets.  |
| Timed out while trying initial sets      | There was no response from the router when you try to create the rowEntry field. |
| Internal Error                           | Error in the router.   |
| Host poll did not finish                 | The network device did not finish the pings.                                     |
| Response Failed<br>Operation Failed      | The router was unable to ping the network device.                                |
| Timed out on Get requests                | The monitor timed out when you try to get the results from the router.           |

### RTSP Monitor

The Real Time Streaming Protocol (RTSP) monitor tests audio and video stream playback on streaming servers. It gathers information about media files, and initiates stream playback, pause, and the end of a streaming session.

The following table lists the RTSP monitor files.

| Table 126. RTSP monitor files |                               |
|-------------------------------|-------------------------------|
| Monitor files                 | Name or location              |
| Monitor executable            | nco_m_rtsp                    |
| Properties file               | \$ISHOME/etc/props/rtsp.props |
| Rules file                    | \$ISHOME/etc/rules/rtsp.rules |
| Log file                      | \$ISHOME/log/rtsp.log         |

## Guidelines for configuring the RTSP monitor

The RTSP monitor connects to the streaming server in either DESCRIBE or PLAY mode. The monitor downloads information or statistics that are delivered by genuine RTSP servers such as Darwin.

### DESCRIBE Mode

In the DESCRIBE mode, the RTSP monitor connects to the streaming server and requests information about the audio and video files and streams.

The server returns a status code where a value of 200 indicates a file that can be downloaded, and where other values indicate that why the requested file cannot be played.

However, the statistics that relate to playback are not reported in this mode, the basic function of the servers that support RTSP can be tested.

### PLAY Mode

In PLAY mode, the RTSP monitor connects to the streaming server in the same way as in DESCRIBE mode, and then streams the file to provide statistics on requested downloads.

### Properties

Properties options specific to the RTSP monitor are described in the following table.

| Table 127. RTSP monitor properties options |                    |  |
|--|--------------------|--|
| Property name                              | Property parameter | Description  |
| StreamingSocket BufferSize                 | integer            | The size of the streaming socket buffer, with a range of 8 to 64 KB.<br>Default: 8 |

### Configuring the RTSP monitor service tests

Use the RTSP monitor configuration parameters to define service tests.

The following table lists the RTSP monitor configurations:

| Table 128. RTSP monitor configuration |   |
|---------------------------------------|---|
| Field                                 | Description   |
| server                                | The target system that runs the streaming server. For example, <code>rtsp.mymusic.com</code> .              |
| remotefile                            | The file that gets downloaded. For example, <code>singalong.mp3</code> .                                    |
| description                           | A text field for providing descriptive information on the element. For example, <code>RTSP monitor</code> . |
| port                                  | The port that the monitor connects to on the target system.<br>Default: 554                                 |

Table 128. RTSP monitor configuration (continued)

| Field          | Description   |
|----------------|---|
| action         | The action that the server performs on the stream: <ul style="list-style-type: none"> <li>• DESCRIBE</li> <li>• PLAY</li> </ul> Default: DESCRIBE |
| duration       | The portion of the stream, in seconds, that the server plays back.<br>Default: 5  |
| maxbandwidth   | The maximum bandwidth, n bits per second, that is used for streaming.<br>Default: 1500000   |
| timeout        | The time, in seconds, to wait for the RTSP server to respond.<br>Default: 10  |
| poll           | The time, in seconds, between each poll.<br>Default: 300  |
| failureretests | The number of times to retest before failure is indicated.<br>Default: 0  |
| retestinterval | The time, in seconds, to wait between each failure retest.<br>Default: 10   |

### Service level classifications

Service level classifications define the rules for determining the level of service that is provided over RTSP.

Available service level classification options for the RTSP monitor are:

```
totalTime
lookupTime
connectTime
responseTime
sdpDownloadTime
playbackTime
status
percentPacketsLost
message
```

In service level classifications:

- Specify more service level classifications by manually entering the name of the monitor element. The name must match the name that is shown for the element in the monitor elements section.
- message can be any message that is forwarded in the **\$message** element to IBM Application Performance Management server if used in any widget. For a list of possible values, see [Status messages](#).
- The operand is a string or a positive number.
- A status code of 200 indicates success. See the RTSP protocol for other status codes returned by the operation.

## Monitor elements

In addition to the test results common to all elements, the RTSP monitor generates a set of test results that contain data specific to RTSP service tests.

The following table describes the additional elements for the RTSP monitor.

| Table 129. RTSP monitor elements        |   |
|---|---|
| Element                                 | Description   |
| \$action                                | The action taken by the monitor.  |
| \$averageBandwidth                      | The average total bandwidth, in bits.   |
| \$bytesReceived                         | The total number of bytes received.   |
| \$connectTime*<br>(ConnectTime)         | The time taken to establish a connection with the target server.  |
| \$describeStageStatus                   | Status code for a stage of the RTSP conversation.   |
| \$filename                              | The name of the media file.   |
| \$lookupTime*<br>(LookupTime)           | The time taken to obtain the IP address of the host server.   |
| \$maxBandwidth                          | The maximum bandwidth by using the configuration interface.   |
| \$mediaResponseTime                     | The time taken by the server to start streaming the requested file.   |
| \$numberOfStreams                       | The number of streams embedded in the media.  |
| \$percentPacketsLost                    | The percentage of packets lost.   |
| \$playbackTime*<br>(PlaybackTime)       | The time that represents the sum of the <code>setupResponseTime</code> and the <code>mediaResponseTime</code> .   |
| \$playStageStatus                       | Status code for a stage of the RTSP conversation.   |
| \$port                                  | The port used to access the monitor's server.   |
| \$responseTime*<br>(ResponseTime)       | The time from when the connection is established to when the first byte of data is received.  |
| \$sdpDownloadTime*<br>(SdpDownloadTime) | The time taken to download data about the media file.   |
| \$setupResponseTime                     | The time that represents part of the <code>playbackTime</code> .<br><b>Note:</b> The element is only generated when the RTSP monitor is operating in PLAY mode. |
| \$setupStageStatus                      | Status code for a stage of the RTSP conversation.   |

| Table 129. RTSP monitor elements (continued) |  |
|--|--|
| Element                                      | Description  |
| \$status                                     | The status code returned by the RTSP server.                           |
| \$streamingTime                              | The time taken by the server to complete streaming the requested file. |
| \$streamLength                               | The length of the longest stream in the media file.                    |
| \$teardownStageStatus                        | Status code for a stage of the RTSP conversation.                      |
| \$totalBandwidthRequired                     | The total bandwidth, in kilobits per second.                           |
| \$totalPacketsLost                           | The total number of packets lost.                                      |
| \$totalPacketsReceived                       | The number of packets received.  |

### Status messages

The RTSP monitor provides status messages in the **ResultMessage** attribute when using IBM Application Performance Management. These messages indicate the result of the test.

| Table 130. RTSP monitor status messages                 |   |
|---|---|
| Message   | Description   |
| OK  | The request succeeded.  |
| Connection failed                                       | The monitor failed to connect to the server. For more information, see the log file.  |
| Connection closed by foreign host                       | The connection to the RTSP server was broken.   |
| Timed out waiting to read/write                         | A data connection to the RTSP server was established, but a problem occurred.         |
| Play failed - no streams                                | The monitor received a response, but no audio or video was available for playback.    |
| select() failed on RTSP socket (PLAY stage)             | The socket was closed from the remote server, or it timed out waiting for a response. |
| RTSP Server response not in expected format             | The response from the server was in a format that the monitor does not support.       |
| Redirection requested by server not supported by client | The response from the server is not supported by the client.                          |
| Server cannot fulfill client request                    | The request is failed and no further information is available.                        |

| Table 130. RTSP monitor status messages (continued)                 |  |
|---|--|
| Message   | Description  |
| Server Error  | There was a problem with the server and the request failed.<br><br>A code of 500 or greater was returned by the server.<br><br>For more information, see the RTSP protocol (RFC 2326). |
| RTSP response header CSeq doesn't match request CSeq                | The RTSP server is misconfigured and is not functioning correctly.   |
| Corrupted RTSP server response                                      |  |
| Corrupted session description                                       |  |
| RTSP SETUP response CSeq doesn't match request CSeq                 |  |
| RTSP SETUP response, incomplete Session string                      |  |
| RTSP SETUP response, Session ID has changed within the same session |  |
| RTSP SETUP response does not contain server ports to connect to     |  |
| RTSP SETUP response does not contain server port pair to connect to |  |
| RTSP PLAY response CSeq doesn't match request CSeq                  |  |
| RTSP PLAY response, incomplete Session string                       |  |
| RTSP PLAY response, Session ID has changed within the same session  |  |
| RTSP PLAY response, incomplete RTP-Info string                      |  |
| RTSP PLAY response does not valid RTP seqnum in RTP-Info response   |  |
| RTSP PLAY response does not valid RTP time in RTP-Info response     |  |

## SAA monitor

The Cisco Service Assurance Agent (SAA) is a performance monitoring agent for Cisco products for IOS version 12.2(2) and above.

The SAA monitor uses the Cisco Service Assurance Agent facility to test various timings between Cisco routers.

Table 131. SAA monitor summary

| Monitor files     | Name or location             |
|-------------------|------------------------------|
| Executable name   | nco_m_saa                    |
| Properties file   | \$ISHOME/etc/props/saa.props |
| Rules file        | \$ISHOME/etc/rules/saa.rules |
| Log file          | \$ISHOME/log/saa.log         |
| Scripts directory | \$ISHOME/scripts/saa/        |

### Guidelines for configuring the SAA monitor

The SAA monitor configures a router's SAA to test the availability of another network device or service by using timed echo request or responses that are defined in the Cisco Response Time Monitor's Management Information Base (MIB). The monitor uses Simple Network Management Protocol to communicate with the Service Assurance Agent.

The following image demonstrates the operation of the SAA monitor.

### Operation

The SAA monitor configures the Service Assurance Agent to run echo tests, called probes, on other network devices. You can configure a range of different probes, each of which uses a different protocol.

All probes can operate against any IP enabled target, except Jitter, which requires another SAA capable Cisco responder router.

Each monitor profile element initiates an Service Assurance Agent probe on a router at startup and with each successive poll, it collects result information and reschedules the probe. If a probe stops unexpectedly, the monitor restarts it immediately. When the probe tests are complete, it goes into inactive state until the next monitor poll. In next monitor poll, the result data is collected and another test cycle begins. During each poll, the monitor checks the probe's state. If the probe is still running, the monitor stops it and then polls the Management Information Base (MIB) for result data and error information from the last cycle. It then reschedules the probe, resets the statistical data, and reactivates the probe, which runs unattended until the next monitor poll.

To prevent the possibility of leaving uncontrolled processes on the router, the monitor starts probes with a predefined life span that is extended at each monitor poll. If the monitor is terminated, it continues to run until its life span expires. Thereafter, it moves into inactive state until an age-out time is reached and router ends the process.

It is not necessary to preconfigured IOS and Service Assurance Agent because the monitor automatically configures, controls, and cleans up after the probes at run time. This includes configuring responder routers that are needed by some probe types.

### Probe persistence

The ProbePersist monitor property controls probe persistence across monitor polls. If probe persistence is not enabled, probes start at each poll and ends immediately after producing the test results.

## Router load

At times, probe operations can be affected by router load. The StatusWait property provides probes with the time to change from one state to another before an operation is considered to be failed.

## Probe types

The types of probes available with the SAA monitor are listed as follows:

- DHCP
- DLSW
- DNS
- FTP
- HTTP Get Requests
- ICMP Echo
- ICMP Path Echo
- Jitter
- UDP Echo
- SNA-Echo
- VOIP

Echo probes perform tests based on a timeframe, whereas Jitter, VOIP, and HTTP probes perform tests by single operation.

## SAA properties

You must set the properties of the SAA monitor.

The following table describes the properties of SAA monitor.

| Table 132. SAA monitor properties |                    |   |
|-----------------------------------|--------------------|---|
| Property name                     | Property parameter | Description   |
| AgeOut                            | integer            | The maximum number of seconds that a probe remains inactive before it stops.<br>Default is 600.   |
| MibDir                            | string             | The directory that is used for MIB files.<br>Default path is \$ISHOME/mibs  |
| ProbeLife                         | integer            | The maximum number of seconds that a probe remains active when it's unattended.<br>Default is 600.  |
| ProbePersist                      | 0 1                | The probes can run in two modes. They perform a single test cycle per monitor poll or they are started once and are rescheduled at each poll. <ul style="list-style-type: none"><li>• 0 indicates single test cycle</li><li>• 1 indicates reschedule at each poll</li></ul> |
| StatusWait                        | integer            | The number of seconds a monitor waits for a probe to complete any action before it fails.   |

## Configuring SAA monitor service tests

You must configure SAA monitor parameters to define service tests.

The following table described the SAA monitor configuration fields.

Table 133. SAA monitor configuration

| Field                   | Description  |
|-------------------------|--|
| server                  | The name or IP address of the Cisco router.  |
| communitystring         | The SNMP community string for the router.  |
| probetype               | The SAA probe type applicable to the profile element.  |
| description             | A text field for providing descriptive information for the element.  |
| Active                  | Indicates whether the profile element is active.   |
| port                    | The port used to access the router.<br>Default port is 161.  |
| version                 | The SNMP version to use: <ul style="list-style-type: none"> <li>• 1 is used for SNMPv1</li> <li>• 2 is used for SNMPv2c</li> <li>• 3 is used for SNMPv3</li> </ul> Default is 1. |
| probeid                 | Specifies a value that is used to generate the probe control row index.  |
| securityname†           | The username for the SNMP session.   |
| authenticationphrase†   | The authentication password for the user.  |
| privacyphrase†          | The privacy password for the user.   |
| authenticationprotocol† | The protocols that are used for authenticating the users are as follows: <ul style="list-style-type: none"> <li>• MD5</li> <li>• SHA1</li> </ul> Default is MD5.                 |
| privacyprotocol†        | The protocol to use for encrypting the session. This is DES.   |
| timeout                 | The time, in seconds, to wait for the router to respond.<br>Default is 5.  |
| retries                 | The number of times the monitor retry to contact the router before it quits.<br>Default is 0.  |
| poll                    | The time, in seconds, between each poll.<br>Default is 300   |
| failureretests          | The number of times to retest before it indicates a failure.<br>Default is 0.  |
| retestinterval          | The time, in seconds, to wait between each retest on failure.<br>Default is 10.  |

**Note:** † Applicable only to SNMPv3.

## Probe type configuration

Probe configuration is different for each type of probe, and Internet Service Monitoring agent provides a set of configuration fields specific to each type. To create a profile element, select a probe type, then provide the configuration appropriate for that type. For information about individual configuration items, see the Cisco Response Time Monitor MIB document.

## Service level classification

Service level classification defines the rules for determining the level of service that is provided by a network device.

Available service level classification options for the SAA monitor are as follows:

```
totalTime
errTotal
numRTT
minRTT
maxRTT
avgRTT
minPosJitterSD
maxPosJitterSD
minNegJitterSD
maxNegJitterSD
minPosJitterDS
maxPosJitterDS
minNegJitterDS
maxNegJitterDS
packetLossSD
packetLossDS
packetOutOfSequence
packetMIA
packetLateArrival
minDelaySD
maxDelaySD
minDelayDS
maxDelayDS
avgPosJitterSD
avgPosJitterDS
avgNegJitterSD
avgNegJitterDS
avgDelaySD
avgDelayDS
devPosJitterSD
devPosJitterDS
devNegJitterSD
devNegJitterDS
devDelaySD
devDelayDS
MOS
ICPIF
mMinRTT
httpRTT
dnsRTT
tcpConnectRTT
transactionRTT
message
```

In service level classifications:

- Specify more service level classifications by manually entering the name of the monitor element. The name must match the name that is shown for the element in the Monitor elements section.
- `message` can be any message that is forwarded in the **\$message** element to IBM Application Performance Management server if used in any widget. For a list of possible values, see [“Status messages” on page 480](#).
- The operand is a string or a positive number.

### Monitor elements

In addition to the test results common to all elements, the SAA monitor generates a set of test results that contains data specific to the type of probe in use.

### DHCP probes

DHCP probes generate multiple elements.

The following table describes the DHCP probe elements.

| Table 134. DHCP probe elements |   |
|--------------------------------|---|
| Element                        | Description   |
| \$authProto                    | The authentication protocol as specified when the element was created.        |
| \$community                    | The community used to send SNMP requests to the SAA.                          |
| \$port                         | The port used to connect to the SAA.  |
| \$privProto                    | The privacy protocol as specified when the element was created.               |
| \$probeType                    | dhcp  |
| \$securityName                 | The security user name as specified when the element was created.             |
| \$snmpVersion<br>(SnmpVersion) | The version of SNMP used to send SNMP packets (version 1, 2c, or 3).          |
| (SourceRouter)                 | The name of the router used to send DHCP requests.                            |
| \$totalRTT † (TotalRTT)        | The total round-trip time taken to get an IP from the DHCP server in seconds. |

**Note:** † indicates that the element is available for service level classifications.

### DLSW probes

DLSW probes generate multiple elements.

The following table describes DLSW probe elements.

| Table 135. DLSW probe elements |  |
|--------------------------------|--|
| Element                        | Description  |
| \$authProto                    | The authentication protocol as specified when the element was created. |
| \$avgRTT* †<br>(AverageRTT)    | The average round-trip time in seconds.                                |
| \$community                    | The community used to send SNMP requests to the SAA.                   |
| \$errTotal* †<br>(ErrorTotal)  | The total number of packets in error.                                  |
| \$maxRTT* †<br>(MaximumRTT)    | The highest round-trip time in seconds.                                |
| \$minRTT* †<br>(MinimumRTT)    | The lowest round-trip time in seconds.                                 |

| Table 135. DLSW probe elements (continued) |  |
|--|--|
| Element                                    | Description  |
| \$numRTT†                                  | The number of successful round trips.                                  |
| \$port                                     | The port used to connect to the SAA.                                   |
| \$privProto                                | The privacy protocol as specified when the element was created.        |
| \$probeType †                              | dlsw   |
| \$securityName                             | The security user name as specified when the element was created.      |
| \$snmpVersion<br>(SnmpVersion)             | The version of SNMP used to send SNMP packets (version 1, 2c, or 3).   |
| (SourceRouter)                             | The router used to perform the SAA test.                               |
| \$sumOfRTT<br>(TotalRTT)                   | The sum of all round-trip times in seconds.                            |
| (TargetHost)                               | The name or IP address of the host on which the target SAA is running. |

**Note:** † indicates that the element is available for service level classifications.

#### DNS probes

DNS probes generate multiple elements.

The following table describes DNS probe elements.

| Table 136. DNS probe elements  |  |
|--------------------------------|--|
| Element                        | Description  |
| \$authProto                    | The authentication protocol as specified when the element was created. |
| \$community                    | The community used to send SNMP requests to the SAA.                   |
| \$dnsHost<br>(Host)            | The host to resolve from server.                                       |
| \$dnsServer                    | The IP of the DNS server.  |
| (HostLookup)                   | The IP address of the host.  |
| \$port                         | The port used to connect to the SAA.                                   |
| \$privProto                    | The privacy protocol as specified when the element was created.        |
| \$probeType                    | dns  |
| \$securityName                 | The security user name as specified when the element was created.      |
| \$snmpVersion<br>(SnmpVersion) | The version of SNMP used to send SNMP packets (version 1, 2c, or 3).   |
| (SourceRouter)                 | The name of the router used to send DNS requests.                      |
| \$totalRTT †<br>(TotalRTT)     | The total round-trip time for the DNS lookup in seconds.               |

**Note:** † indicates that the element is available for service level classifications.

#### *FTP probes*

FTP probes generate multiple elements.

The following table describes FTP probe elements.

| <i>Table 137. FTP probe elements</i> |  |
|--------------------------------------|--|
| <b>Element</b>                       | <b>Description</b>   |
| \$activePassive                      | The connection type used in the test, either Active or Passive.<br>Default: Passive                              |
| \$authProto                          | The authentication protocol as specified when the element was created.   |
| \$community                          | The community used to send SNMP requests to the SAA.   |
| \$errorStatus                        | The result string indicating the status of the test (from the <code>rttMonLatestRttOperSense</code> MIB object). |
| \$ftpFile                            | The name of the test file retrieved during the test.   |
| \$ftpUrl<br>(FtpUrl)                 | The URL used in the FTP test.  |
| \$port                               | The port used to connect to the SAA.   |
| \$privProto                          | The privacy protocol as specified when the element was created.  |
| \$securityName                       | The security user name as specified when the element was created.  |
| \$snmpVersion<br>(SnmpVersion)       | The version of SNMP used to send SNMP packets (version 1, 2c, or 3).   |
| (SourceRouter)                       | The name of the router used to send FTP requests.  |
| \$totalRTT<br>(TotalRTT)             | The completion time of the test (from the <code>rttMonLatestRttOperCompletionTime</code> MIB object) in seconds. |

#### *HTTP-Get probes*

HTTP-Get probes generate multiple elements.

The following table describes the HTTP-Get probe elements.

| <i>Table 138. HTTP-Get probe elements</i> |  |
|---|--|
| <b>Element</b>                            | <b>Description</b>   |
| \$authProto                               | The authentication protocol as specified when the element was created. |
| \$community                               | The community used to send SNMP requests to the SAA.                   |
| \$dnsRTT †<br>(DnsRTT)                    | The round-trip time to perform the DNS query in seconds.               |
| \$httpRTT †<br>(HttpRTT)                  | The round-trip time to perform the HTTP operation in seconds.          |

| Table 138. HTTP-Get probe elements (continued) |   |
|--|---|
| Element  | Description   |
| (HttpUrl)                                      | The URL that is monitored.  |
| \$messageBodyBytes                             | The size of the message body received.                                      |
| \$numRTT†                                      | The number of successful round trips.                                       |
| \$port   | The port used to connect to the SAA.  |
| \$privProto                                    | The privacy protocol as specified when the element was created.             |
| \$probeType                                    | http-get  |
| \$securityName                                 | The security user name as specified when the element was created.           |
| (SourceRouter)                                 | The name of the router used to send HTTP requests.                          |
| \$snmpVersion<br>(SnmpVersion)                 | The version of SNMP used to send SNMP packets (version 1, 2c, or 3).        |
| \$targetHost                                   | The name of the host for the service that is being tested.                  |
| \$tcpConnectRTT †<br>(TcpConnectRTT)           | The round-trip time to connect to the HTTP server in seconds.               |
| \$transactionRTT †<br>(TransactionRTT)         | The round-trip time to download the object specified by the URL in seconds. |

**Note:** † indicates that the element is available for service level classifications.

#### ICMP-Echo probes

ICMP-Echo probes generate multiple elements.

The following table describes the ICMP-Echo probe elements.

| Table 139. ICMP-Echo probe elements |  |
|-------------------------------------|--|
| Element                             | Description  |
| \$authProto                         | The authentication protocol as specified when the element was created.                           |
| \$avgRTT †<br>(AverageRTT)          | The average round-trip time in seconds.  |
| \$community                         | The community used to send SNMP requests to the SAA.   |
| \$errBusies                         | The number of pings that are failed because a previous incomplete ping.                          |
| \$errDisconnects                    | The number of pings that are failed through disconnects.   |
| \$errDrops                          | The number of pings failed because an internal resource was not available.                       |
| \$errNoConnects                     | The number of pings that are failed because a connection to the target might not be established. |
| \$errSequences                      | The number of pings failed because an unexpected sequence ID was received.                       |

| Table 139. ICMP-Echo probe elements (continued) |  |
|---|--|
| Element   | Description  |
| \$errTimeouts                                   | The number of pings failed through timeouts.   |
| \$errTotal †<br>(ErrorTotal)                    | The total number of packets in error.  |
| \$errVerifies                                   | The number of pings failed because the data received was not the same as the data expected.  |
| \$maxRTT †<br>(MaximumRTT)                      | The highest round-trip time in seconds.  |
| \$minRTT †<br>(MinimumRTT)                      | The lowest round-trip time in seconds.   |
| \$numRTT †                                      | The number of successful round trips.  |
| \$port  | The port used to connect to the SAA.   |
| \$privProto                                     | The privacy protocol as specified when the element was created.  |
| \$probeType                                     | The probe type must be as follows: <ul style="list-style-type: none"> <li>• icmp-echo</li> <li>• icmp-echo-path</li> <li>• udp-echo</li> </ul> |
| \$securityName                                  | The security user name as specified when the element was created.  |
| \$snmpVersion<br>(SnmpVersion)                  | The version of SNMP used to send SNMP packets (version 1, 2c, or 3).   |
| (SourceRouter)                                  | The name of the router used to send ICMP requests.   |
| \$sumOfRTT                                      | The sum of all round-trip times in seconds.  |
| \$targetHost<br>(Host)                          | The host name of the service that is being monitored.  |
| \$tos<br>(Tos)                                  | The type of service value.   |
| \$vpn<br>(Vpn)                                  | The name of the VPN.   |

**Note:** † indicates that the element is available for service level classifications.

#### ICMP-Path-Echo probes

ICMP-Patch-Echo probes generate multiple elements.

The following table describes the ICMP-Patch-Echo probe elements.

Table 140. ICMP-Path-Echo probe elements

| Element                        | Description   |
|--------------------------------|---|
| \$authProto                    | The authentication protocol as specified when the element was created.  |
| \$avgRTT †<br>(AverageRTT)     | The average round-trip time in seconds.   |
| \$community                    | The community used to send SNMP requests to the SAA.  |
| (HopHostOne to Eight)          | The first to eighth host that visit using ICMP Echo Path.   |
| \$maxRTT †<br>(MaximumRTT)     | The highest round-trip time in seconds.   |
| \$minRTT †<br>(MinimumRTT)     | The lowest round-trip time in seconds.  |
| \$numRTT †                     | The number of successful round trips.   |
| \$port                         | The port used to connect to the SAA.  |
| \$privProto                    | The privacy protocol as specified when the element was created.   |
| \$probeType                    | The probe type is as follows: <ul style="list-style-type: none"> <li>icmp-echo</li> <li>icmp-echo-path</li> </ul> |
| \$securityName                 | The security user name as specified when the element was created.   |
| \$snmpVersion<br>(SnmpVersion) | The version of SNMP used to send SNMP packets (version 1, 2c, or 3).  |
| (SourceRouter)                 | The name of the router used to send ICMP requests.  |
| \$sumOfRTT                     | The sum of all round-trip times in seconds.   |
| \$targetHost                   | The name of the host for the service that is being tested.  |
| \$tos<br>(Tos)                 | The type of service value.  |
| \$vpn<br>(Vpn)                 | The name of the VPN.  |

**Note:** † indicates that the element is available for service level classifications.

#### Jitter probes

Jitter probes generate multiple elements.

The following table describes the Jitter probe elements.

Table 141. Jitter probe elements

| Element                    | Description  |
|----------------------------|--|
| \$authProto                | The authentication protocol as specified when the element was created.   |
| \$avgDelayDS†              | The average delay from destination to source in seconds.                 |
| \$avgDelaySD†              | The average delay from source to destination in seconds.                 |
| \$avgNegJitterDS†          | The average negative Jitter from destination to source in seconds.       |
| \$avgNegJitterSD†          | The average negative Jitter from source to destination in seconds.       |
| \$avgPosJitterDS†          | The average positive Jitter from destination to source in seconds.       |
| \$avgPosJitterSD†          | The average positive Jitter from source to destination in seconds.       |
| \$avgRTT †<br>(AverageRTT) | The average round-trip time in seconds.                                  |
| \$community                | The community used to send SNMP requests to the SAA.                     |
| \$devDelayDS†              | The standard deviation of delay from destination to source.              |
| \$devDelaySD†              | The standard deviation of delay from source to destination.              |
| \$devNegJitterDS†          | The standard deviation of negative Jitter from destination to source.    |
| \$devNegJitterSD†          | The standard deviation of negative Jitter from source to destination.    |
| \$devPosJitterDS†          | The standard deviation of positive Jitter from destination to source.    |
| \$devPosJitterSD†          | The standard deviation of positive Jitter from source to destination.    |
| \$errDescription           | A description of the error.  |
| \$errTotal<br>(ErrorTotal) | The total number of packets in error.                                    |
| \$maxDelayDS †             | The maximum delay from destination to source in seconds.                 |
| \$maxDelaySD †             | The maximum delay from source to destination in seconds.                 |
| \$maxNegJitterDS †         | The maximum negative Jitter value from destination to source in seconds. |
| \$maxNegJitterSD †         | The maximum negative Jitter value from source to destination in seconds. |
| \$maxPosJitterDS †         | The maximum positive Jitter value from destination to source in seconds. |
| \$maxPosJitterSD †         | The maximum positive Jitter value from source to destination in seconds. |
| \$maxRTT †<br>(MaximumRTT) | The highest round-trip time in seconds.                                  |
| \$minDelayDS †             | The minimum delay from destination to source in seconds.                 |
| \$minDelaySD †             | The minimum delay from source to destination in seconds.                 |

Table 141. Jitter probe elements (continued)

| Element                        | Description  |
|--------------------------------|--|
| \$minNegJitterDS †             | The minimum negative Jitter value from destination to source in seconds. |
| \$minNegJitterSD †             | The minimum negative Jitter value from source to destination in seconds. |
| \$minPosJitterDS †             | The minimum positive Jitter value from destination to source in seconds. |
| \$minPosJitterSD †             | The minimum positive Jitter value from source to destination in seconds. |
| \$minRTT †<br>(MinimumRTT)     | The lowest round-trip time in seconds.                                   |
| \$numNegJitterDS               | The number of negative Jitter values from destination to source.         |
| \$numNegJitterSD               | The number of negative Jitter values from source to destination.         |
| \$numOW                        | The number of one-way operations for delay.                              |
| \$numPosJitterDS               | The number of positive Jitter values from destination to source.         |
| \$numPosJitterSD               | The number of positive Jitter values from source to destination.         |
| \$numRTT †                     | The number of successful round trips.                                    |
| \$packetLateArrival †          | The number of packets that arrived after timeout.                        |
| \$packetLossDS †               | The number of packets that are lost from destination to source.          |
| \$packetLossSD †               | The number of packets that are lost from source to destination.          |
| \$packetMIA†                   | The number of packets that are lost where the direction is unknown.      |
| \$packetOutOfSequence†         | The number of packets returned out of order.                             |
| \$port                         | The port used to connect to the SAA.                                     |
| \$privProto                    | The privacy protocol as specified when the element was created.          |
| \$probeType†                   | Jitter   |
| (ResponderRouter)              | The name of the router that is used to respond to the Jitter requests.   |
| \$securityName                 | The security user name as specified when the element was created.        |
| (SourceRouter)                 | The name of the router that is used to send Jitter requests.             |
| \$snmpVersion<br>(SnmpVersion) | The version of SNMP used to send SNMP packets (version 1, 2c, or 3).     |
| \$sum2DelayDS                  | The sum of squares of delays from destination to source.                 |
| \$sum2DelaySD                  | The sum of squares of delays from source to destination.                 |
| \$sum2NegJitterDS              | The sum of squares of all negative Jitter values.                        |
| \$sum2NegJitterSD              | The sum of squares of all negative Jitter values.                        |
| \$sum2PosJitterDS              | The sum of squares of all positive Jitter values.                        |

| <i>Table 141. Jitter probe elements (continued)</i> |  |
|---|--|
| <b>Element</b>                                      | <b>Description</b>   |
| \$sum2PosJitterSD                                   | The sum of squares of all positive Jitter values.          |
| \$sum2Rtt†  | The sum of squares of the round-trip values in seconds.    |
| \$sumDelayDS  | The sum of delays from destination to source in seconds.   |
| \$sumDelaySD  | The sum of delays from source to destination in seconds.   |
| \$sumNegJitterDS                                    | The sum of all negative Jitter values in seconds.          |
| \$sumNegJitterSD                                    | The sum of negative Jitter values in seconds.              |
| \$sumPosJitterDS                                    | The sum of all positive Jitter values in seconds.          |
| \$sumPosJitterSD                                    | The sum of all positive Jitter values in seconds.          |
| \$sumRTT  | The sum of all round trips in seconds.                     |
| \$targetHost  | The name of the host for the service that is being tested. |
| \$tos<br>(Tos)                                      | The type of service value.                                 |
| \$vpn<br>(\Vpn)                                     | The name of the VPN.                                       |

**Note:** † indicates that the element is available for service level classifications.

#### *SNA-Echo probes*

SNA-Echo probes (SNA-RU-Echo, SNA-LU0-Echo, SNA-LU2-Echo, SNA-LU62-Echo, and SNA-LU62Native-Echo) generate the elements that are listed in the following table.

The following table describes the JSNA-Echo probe elements.

| <i>Table 142. SNA-Echo probe elements</i> |  |
|---|--|
| <b>Element</b>                            | <b>Description</b>   |
| \$authProto                               | The authentication protocol as specified when the element was created. |
| \$avgRTT †<br>(AverageRTT)                | The average round-trip time in seconds.                                |
| \$community                               | The community used to send SNMP requests to the SAA.                   |
| \$errTotal †                              | The total number of packets in error.                                  |
| \$maxRTT †<br>(MaximumRTT)                | The highest round-trip time in seconds.                                |
| \$minRTT †<br>(MinimumRTT)                | The lowest round-trip time in seconds.                                 |
| \$numRTT†                                 | The number of successful round trips.                                  |
| \$port                                    | The port used to connect to the SAA.                                   |

| Table 142. SNA-Echo probe elements (continued) |  |
|--|--|
| Element  | Description  |
| \$privProto                                    | The privacy protocol as specified when the element was created.      |
| \$probeType<br>(ProbeType)                     | sna - name - echo  |
| \$securityName                                 | The security user name as specified when the element was created.    |
| (SourceRouter)                                 | The name of the router that is used to send SNA requests.            |
| \$snmpVersion<br>(SnmpVersion)                 | The version of SNMP used to send SNMP packets (version 1, 2c, or 3). |
| \$sumOfRTT<br>(TotalRTT)                       | The sum of all round-trip times in seconds.                          |
| (TargetHost)                                   | The host target for the SNA echo request.                            |

**Note:** † indicates that the element is available for service level classifications.

#### UDP-Echo probes

UDP-Echo probes generate the elements listed in the following table.

The following table describes the UDP-Echo probe elements.

| Table 143. UDP-Echo probe elements |   |
|------------------------------------|---|
| Element                            | Description   |
| \$authProto                        | The authentication protocol as specified when the element was created.                      |
| \$avgRTT †<br>(AverageRTT)         | The average round-trip time in seconds.   |
| \$community                        | The community used to send SNMP requests to the SAA.  |
| \$errBusies                        | The number of pings failed because a previous incomplete ping.                              |
| \$errDrops                         | The number of pings failed because internal resource was not available.                     |
| \$errTimeouts                      | The number of pings failed through timeouts.  |
| \$errTotal †<br>(ErrorTotal)       | The total number of packets in error.   |
| \$errVerifies                      | The number of pings failed because the data received was not the same as the data expected. |
| \$maxRTT †<br>(MaximumRTT)         | The highest round-trip time in seconds.   |
| \$minRTT †<br>(MinimumRTT)         | The lowest round-trip time in seconds.  |

| Table 143. UDP-Echo probe elements (continued) |  |
|--|--|
| Element  | Description  |
| \$numRTT †                                     | The number of successful round trips.                                |
| \$port   | The port used to connect to the SAA.                                 |
| \$privProto                                    | The privacy protocol as specified when the element was created.      |
| \$probeType                                    | udp - echo   |
| \$securityName                                 | The security user name as specified when the element was created.    |
| \$snmpVersion*<br>(SnmpVersion)                | The version of SNMP used to send SNMP packets (version 1, 2c, or 3). |
| \$sumOfRTT                                     | The sum of all round-trip times (in seconds).                        |
| \$targetHost<br>(Host)                         | The host name of the service that is monitored.                      |
| \$tos<br>(Tos)                                 | The type of service value.   |
| \$vpn<br>(Vpn)                                 | The name of the VPN.   |

**Note:** † indicates that the element is available for service level classifications.

#### VOIP probes

VOIP probes generate the same elements as Jitter probes. In addition, they generate the elements that are listed in the following table.

The following table describes VOIP probe elements.

| Table 144. VOIP probe elements |  |
|--------------------------------|--|
| Element                        | Description  |
| \$authProto                    | The authentication protocol as specified when the element was created. |
| \$avgRTT †<br>(AverageRTT)     | The average round-trip time in seconds.                                |
| \$community                    | The community used to send SNMP requests to the SAA.                   |
| \$errTotal †<br>(ErrorTotal)   | The total number of packets in error.                                  |
| \$ICPIF †                      | The ICPIF value.   |
| \$maxRTT †<br>(MaximumRTT)     | The highest round-trip time in seconds.                                |
| \$minRTT †<br>(MinimumRTT)     | The lowest round-trip time in seconds.                                 |

| Table 144. VOIP probe elements (continued) |  |
|--|--|
| Element                                    | Description  |
| \$MOS †                                    | The value of the Mean Opinion Score (MOS) from the test.             |
| \$port                                     | The port used to connect to the SAA.                                 |
| \$privProto                                | The privacy protocol as specified when the element was created.      |
| \$probeType †                              | voip   |
| (ResponderRouter)                          | The name of the router that is used to respond to the VOIP requests. |
| \$securityName                             | The security user name as specified when the element was created.    |
| \$snmpVersion<br>(SnmpVersion)             | The version of SNMP used to send SNMP packets (version 1, 2c, or 3). |
| (SourceRouter)                             | The name of the router that is used to send the VOIP requests.       |
| (Tos)                                      | The type of service value.   |
| (Vpn)                                      | The name of the VPN.   |

**Note:** † indicates that the element is available for service level classifications.

#### Status messages

The SAA monitor provides status messages in the **ResultMessage** attribute when using IBM Application Performance Management. These messages indicate the result of the test.

The following table describes the status messages for SAA monitors.

| Table 145. SAA monitor status messages |  |
|--|--|
| Message                                | Description  |
| Success                                | The probe operation succeeded.                     |
| Operation failed                       | The probe operation failed.                        |
| Invalid status                         | The probe operation failed with an invalid status. |

#### SIP Monitor

The SIP monitor checks the availability of Session Initiation Protocol (SIP) servers, including the time that is taken to register and authenticate end points. The monitor initiates a SIP session so that SIP requests and SIP responses can be monitored.

The following table lists the SIP monitor files.

| Table 146. SIP monitor file summary |                              |
|-------------------------------------|------------------------------|
| Monitor files                       | Name or location             |
| Monitor executable                  | nco_m_sip                    |
| Properties file                     | \$ISHOME/etc/props/sip.props |
| Rules file                          | \$ISHOME/etc/rules/sip.rules |
| Log file                            | \$ISHOME/log/sip.log         |

#### Guidelines for configuring the SIP monitor

The SIP monitor tests the availability of a SIP server by sending a request to the URI of a SIP enabled device, over the SIP server, and receiving, also over the SIP server, responses from the SIP device.

The SIP monitor acts as a User Agent Client (UAC); it initiates the connections that are used to test SIP services. The User Agent Server (UAS), the receiver or target of the call can be any SIP-enabled device such as a computer that runs a soft phone, or a message bank.

When testing a SIP server, the monitor undertakes the following sequence of actions:

1. Register with the SIP server by using the credentials supplied in the profile element.
2. Send an OPTIONS request to the UAS.
3. Send an INVITE request to the UAS.

Register a successful test result if the UAS accepts the request.

4. Send a BYE request to the UAS and end the connection with the UAS.
5. Unregister from the SIP server, with immediate expiry.

The monitor records the duration of each action that is performed in the test.

## Properties

The properties options specific to the SIP monitor are described in the following table.

| Table 147. SIP monitor properties options |                    |   |
|---|--------------------|---|
| Property name                             | Property parameter | Description   |
| ShowZeroes                                | 0 1                | Specifies the display of SIP statistics with zero values.<br>0 - disabled<br>1 - enabled  |
| Transports                                | string             | Lists local protocol port transports separated by a space that is TCP or UDP for the protocol. Wildcard port numbers are allowed.<br>Default: UDP:* |

## Cipher suites

The **SSLCipherSuite** property specifies the cipher suite that is used by the SIP monitor. For more information, see [“SSL setting in Internet Service Monitoring” on page 512](#).

## Configuring the SIP monitor service tests

Use the SIP monitor configuration parameters to define service tests.

| Table 148. SIP monitor configuration |   |
|--------------------------------------|---|
| Field                                | Description   |
| server                               | Specifies the name of the server to be tested. For example, sip1.mycompany.com.                           |
| serverport                           | The port through which the SIP monitor can reach the server to be tested.                                 |
| username                             | Specifies the extension number or account identity of the SIP monitor that calls. For example, jblogg.    |
| target                               | Specifies the extension number of a SIP enabled device that is used to make a call. For example, 5551234. |
| password                             | Specifies the password for the username.  |

| Table 148. SIP monitor configuration (continued) |  |
|--|--|
| Field  | Description  |
| description                                      | A text field for providing descriptive information on the element. For example, SIP_monitor. |
| proxy  | The host name of the proxy server. Example is, proxy.mycompany.com.                          |
| proxyport  | The port through which the SIP monitor can reach the proxy server.                           |
| timeout  | The time, in seconds, to wait for the server to respond.<br>Default: 30                      |
| poll   | The time, in seconds, between each poll.<br>Default: 300                                     |
| failureretests                                   | The number of times to retest before failure is indicated.<br>Default: 0                     |
| retestinterval                                   | The time, in seconds, to wait between each retest on failure.<br>Default: 10                 |

### Service level classification

Service level classifications define the rules for determining the level of service that is provided over SIP.

Available service level classification options for the SIP monitor are:

```
totalTime
message
```

In service level classifications:

- Specify more service level classifications by manually entering the name of the monitor element. The name must match the name that is shown for the element in the Monitor elements section.
- message can be any message that is forwarded in the **\$message** element to IBM Application Performance Management server if used in any widget. For a list of possible values, see [Status messages](#).
- The operand is a string or a positive number.

### Monitor elements

In addition to the test results common to all elements, the SIP monitor generates a set of test results that contain data specific to SIP service tests.

The following table describes the additional elements for the SIP monitor.

| Table 149. SIP monitor elements     |  |
|-------------------------------------|--|
| Element                             | Description  |
| \$AcceptReg                         | The number of accepted SIP registration requests.                            |
| \$AuthTime*<br>(AuthenticationTime) | The time taken to authorize both the SIP monitor and the SIP enabled device. |

| Table 149. SIP monitor elements (continued)  |   |
|--|---|
| Element  | Description   |
| \$authAttempts   | The number of times the monitor needed to resend a request to include its credentials.  |
| (CallSetupTime)  | The time taken to set up a call.  |
| \$Invalid  | The number of invalid sent and received requests.   |
| \$InvalidReg   | The number of invalid SIP registration requests.  |
| \$lastMethod   | The last method the monitor saw other than BYE or ACK.  |
| \$lastSequence [METHOD]  | The last sequence that is received for a method.  |
| \$lastStatus [METHOD]  | The last status that is received for a method or overall.   |
| \$method METHOD  | Tally of messages that are seen for a method.   |
| \$optionsTime*<br>(OptionsTime)  | The time taken to negotiate an options change (OPTIONS to 200 OK).  |
| \$postDialTime*<br>(PostDialTime)  | The time taken to receive a ringing signal after the dialing (INVITE to 180 Ringing).   |
| \$RegTime*<br>(RegistrationTime)   | The time taken to register both the SIP monitor and the SIP enabled device.   |
| \$registrationTime   | The time taken to register with the server (REGISTER to 200 OK).  |
| \$Requests   | The number of SIP Request messages that are received and sent.  |
| (\$RequestsSent)   | The number of SIP Request messages sent.  |
| <code>\${request response}[Sent Received Transmitted Total]<br/>[METHOD] [STATUS]</code> | Tally of messages seen for various categories, for example, requestSentINVITE = 1, responseReceived = 10, and responseReceivedBYE200 = 1. |
| \$Responses  | The number of SIP Response messages that are received and sent.   |
| (\$ResponseReceived)   | The number of SIP Response messages received.   |

| Table 149. SIP monitor elements (continued) |  |
|---|--|
| Element                                     | Description  |
| \$sessionAnswered                           | <ul style="list-style-type: none"> <li>• 1 - if the call is answered</li> <li>• 0 - if the call is unanswered</li> </ul>           |
| \$sessionCreated                            | <ul style="list-style-type: none"> <li>• 1 - if a session is established</li> <li>• 0 - if a session is not established</li> </ul> |
| \$sessionTerminated                         | <ul style="list-style-type: none"> <li>• 1 - if the session ends</li> <li>• 0 - if the session does not end.</li> </ul>            |
| \$shutdownTime*<br>(ShutdownTime)           | The time taken to end the connection (BYE to 200 OK).  |
| \$terminatedReason*<br>(TerminatedReason)   | The reason for the connection closure.   |
| (Username)                                  | The user name used to log in to the SIP server.  |
| (Target)                                    | The target to open the session to.   |

### Status messages

The SIP monitor provides status messages in the **ResultMessage** attribute when using IBM Application Performance Management. These messages indicate the result of the test.

The following table describes the SIP monitor status messages.

| Table 150. SIP monitor status messages |  |
|--|--|
| Message                                | Description  |
| Register timed out                     | The monitor failed to register to the server.  |
| Invite timed out                       | The INVITE message timed out.  |
| OK                                     | The request and response succeeded.  |
| n operation status<br>description      | <ul style="list-style-type: none"> <li>• <i>n</i> is the message number sequence.</li> <li>• operation is type of message.</li> <li>• status is the status code.</li> <li>• description is a plain text description of the status.</li> </ul> <p>For example, 1 INVITE 200 OK.</p> |

### SIP responses

The SIP monitor supports the following types of responses. Each response has a 3-digit code:

- Informational Responses (100 - 199)
- Successful Responses (200 - 299)
- Redirection Responses (300 - 399)
- Client Failure Responses (400 - 499)
- Server Failure Responses (500 - 599)

- Global Failure Responses (600 - 699)

The following table lists the common SIP responses.

| <i>Table 151. Common SIP responses</i> |  |
|--|--|
| <b>Response</b>                        | <b>Description</b>   |
| 100 Trying                             | The message is received by the SIP enabled device but yet to be processed.   |
| 180 Ringing                            | The message is received and processed by the SIP enabled device. The device is ringing to alert the user.  |
| 200 OK                                 | This code is returned upon successful completion of a method. For example, the call is registered with the server or the user answered the call. |
| 401 Unauthorized                       | The user is not authorized.  |
| 407 Proxy Authentication Required      | This code is similar to 401, but indicates that the user must first authenticate.  |
| 408 Request Timeout                    | The user did not answer the call.  |

For a full list of SIP responses, see RFC3261.

### **SMTP Monitor**

The SMTP monitor works in along with the IMAP4 or POP3 monitors to test the performance of an email service.

The following table lists the SMTP monitor files.

| <i>Table 152. SMTP monitor files</i> |                               |
|--------------------------------------|-------------------------------|
| <b>Monitor files</b>                 | <b>Name or location</b>       |
| Monitor executable                   | nco_m_smtp                    |
| Properties file                      | \$ISHOME/etc/props/smtp.props |
| Rules file                           | \$ISHOME/etc/rules/smtp.rules |
| Log file                             | \$ISHOME/log/smtp.log         |

### **Guidelines for monitoring SMTP monitor**

The SMTP monitor operates along with the POP3 or IMAP4 monitors. It periodically sends an email message to a mailbox on the target server and records the time taken to issue the send email request. The POP3 or IMAP4 monitor then reads the messages from the mailbox and uses them to calculate the response time and availability of the email service.

**Note:** The SMTP monitor operates along with the POP3 or IMAP4 monitors. It periodically sends an email message to a mailbox on the target server and records the time taken to issue the send email request. The POP3 or IMAP4 monitor then reads the messages from the mailbox and uses them to calculate the response time and availability of the email service.

### **Mailboxes**

You may configure the monitor to send email messages to any existing mailbox, even if the mailbox belongs to a real user. However, it's recommended that you create a special mailbox account for service testing. The email parameter specifies the recipient mailbox. By default, the monitor sends test messages with the subject line SMTP Monitor Test Message. If required, you can configure SMTP profile elements without a mailbox name. In this configuration, the monitor simply checks that the SMTP service is accepting connections.

## Secure mails

The SMTP monitor supports connections to secure mail services. It can connect using SSL/TLS, or the STARTTLS command. When defining an SMTP monitor element, use the Security Type field to select the appropriate security. If the mail server requires a client-side certificate for SSL encryption, use the SSLname properties or command line options to specify a certificate file, key file, key password and cipher suite.

### Client-side certificate

The SMTP monitor enables you to monitor servers that require client-side certificates for mutual authentication. You specify the SSL certificate file, key file, and key password when creating a profile element. Certificates must be in Privacy Enhanced Mail (PEM) format. If the certificate is in another format, you must convert it to PEM format. Certificates can be converted using software such as openssl, which is available from <http://www.openssl.org>.

**Note:** If you always use the same certificate, key, and password in all profile elements, specify them using monitor properties instead of defining them in every profile element you create.

### Configure the SMTP monitor service tests

Use the SMTP monitor configuration parameters to define service tests. When you configure the monitor, default values are shown for the timeout and poll interval parameters. These defaults are 30 and 300 seconds respectively. If no value is specified other defaults listed in the table aren't shown during configuration but are applied when the configuration details are saved.

| Table 153. SMTP monitor configuration |  |
|---------------------------------------|--|
| Field                                 | Description  |
| server                                | The IP address of the mail server. Example is mail.mycompany.com   |
| description                           | A text field for providing descriptive information on the element.   |
| port                                  | The port number of the mail server.<br>Default: 25<br><br>If you use a server other than an SMTP server, update the port on which to connect to the server. For example, if you use an IMAP4 server over SSL for Microsoft Exchange, specify port 465.   |
| securitytype                          | The type of secure connection opened with the mail server: <ul style="list-style-type: none"><li>• NONE - Connect without security</li><li>• SSL - Send an SSLv2 hello, then negotiate SSLv2, SSLv3 or TLSv1</li><li>• STARTTLS - Connect without security, issue a STARTTLS command, then establish a connection over TLSv1</li></ul> Default: NONE |
| username                              | The username used to log in to the SMTP server. Used with PLAIN or CRAM-MD5 authentication.  |
| password                              | The password used to log in to the SMTP server. Used with PLAIN or CRAM-MD5 authentication.  |

| <i>Table 153. SMTP monitor configuration (continued)</i> |   |
|--|---|
| Field  | Description   |
| authenticationtype                                       | The method to authenticate the monitor to the SMTP server. The available options are: <ul style="list-style-type: none"> <li>• NONE - No authentication is attempted</li> <li>• PLAIN - Plain text username and password authentication</li> <li>• CRAM-MD5 - CRAM-MD5 authentication is used</li> </ul> Default value is NONE. |
| sharedsecret   | The shared secret key for CRAM-MD5 authentication.  |
| email  | The email address of the mailbox used by the SMTP and POP3 monitors.  |
| timeout  | The time, in seconds, to wait for the SMTP server to respond.<br>Default: 30  |
| poll   | The time, in seconds, between each poll.<br>Default: 300  |
| failureretests   | The number of times to retest before indicating a failure.<br>Default: 0  |
| retestinterval   | The time, in seconds, to wait between each failure retest.<br>Default: 10   |

**Note:** Monitor the availability of the mail server `mail.mycompany.com` by attempting to connect to it at 10-minute intervals. Use a connection timeout of 30 seconds and, if the connection fails, retry three times with 5 seconds between each retry.

### Monitor element

In addition to the test results common to all elements, the SMTP monitor generates a set of test results containing data specific to SMTP service tests.

The following table describes the additional elements for the SMTP monitor.

| <i>Table 154. SMTP monitor elements</i> |  |
|---|--|
| Element                                 | Description  |
| \$authentication                        | The type of user authentication method required by the SMTP server (Standard or APOP). |
| \$bytesPerSec                           | The average number of bytes transferred each second.                                   |
| \$bytesTransferred                      | The number of bytes uploaded or downloaded.  |
| \$connectTime*<br>(ConnectTime)         | The time taken to connect to the SMTP server.  |
| \$email*<br>(EmailAddress)              | The email address of the mailbox to which the monitor to sends test email.             |

| Table 154. SMTP monitor elements (continued) |  |
|--|--|
| Element                                      | Description  |
| \$lookupTime*<br>(LookupTime)                | The time taken to obtain the IP address of the host server.  |
| \$port*<br>(Port)                            | The port on which the service is monitored.  |
| \$responseTime*<br>(ResponseTime)            | The time taken, after a connection is created, until the first byte of the test email can be sent to the SMTP server.                      |
| \$security                                   | The type of secure connection opened with the mail server (NONE, STARTTLS or SSL) as set in the profile element <b>securitytype</b> field. |
| \$SSLHandshakeTime*<br>(SslHandshakeTime)    | The time taken to establish the SSL connection.  |
| \$status*<br>(ResultStatus)                  | The status code returned by the SMTP server.   |
| \$uploadTime*<br>(UploadTime)                | The time taken to upload the file.   |
| \$user*<br>(SmtplibUser)                     | The username (account name) used by the monitor to log in to the SMTP server.  |

### Status message

The SMTP monitor provides status messages in the \$message element when using IBM Application Performance Management. These messages indicate the result of the test.

### Properties

Properties specific to the SMTP monitor are described in the following table.

| Table 155. SMTP monitor properties and command-line options |                    |  |
|---|--------------------|--|
| Property name   | Property parameter | Description  |
| MailMessage Path  | string             | Path to a file containing text to send in the test email. A default message is sent if this isn't set.   |
| Originator  | string             | Specifies the From field to set when sending the test email. Ensure that this matches the corresponding string in the IMAP4 monitor.<br>Default: SMTP-Monitor.   |
| SSLCertificate File   | string             | The path and filename of the digital certificate file used if no certificate is explicitly specified for an SMTP element during its creation.<br><br>If the path isn't absolute, the monitor interprets it relative to the working directory (\$ISHOME/platform/arch/bin). |

| Table 155. SMTP monitor properties and command-line options (continued) |                    |   |
|---|--------------------|---|
| Property name   | Property parameter | Description   |
| SSLCipherSuite  | string             | The cipher suite to use for SSL operations. For a description of possible values, see <a href="#">Cipher suites</a> .<br>Default: RC4 : 3DES : DES : +EXP   |
| SSLDisableTLS   | integer            | Disables TLSv1 for legacy support.<br>Default: 0 - TLSv1 is enabled.<br>1 TLSv1 is disabled.  |
| SSLKeyFile  | string             | The file containing the SSL private key.  |
| SSLKeyPassword  | string             | The password used to encrypt the SSL private key.   |
| UseBody   | integer            | Specifies where the monitor writes tracking information in the mail message, either in the mail header or mail body.<br>Default: 0 - information is included in the mail header.<br>1 - write information to the mail body. |

### Cipher suites

The SSLCipherSuite property specifies the cipher suite used by the SMTP monitor. For more information about SSL settings, see “[SSL setting in Internet Service Monitoring](#)” on page 512.

### SNMP Monitor

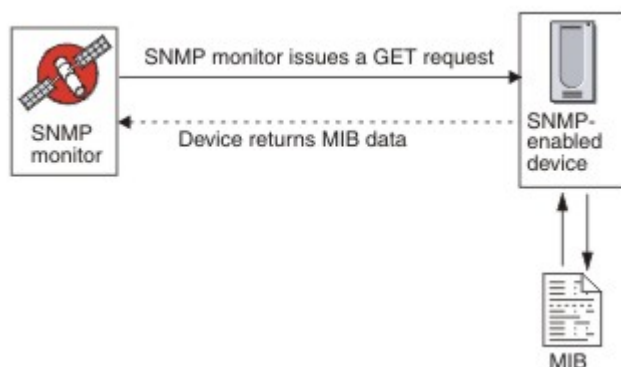

The SNMP monitor tests the SNMP enabled devices for performance and fault data.

The following table lists the SNMP monitor files.

| Table 156. SNMP monitor summary |                               |
|---------------------------------|-------------------------------|
| Monitor files                   | Name or location              |
| Monitor executable              | nco_m_snmp                    |
| Properties file                 | \$ISHOME/etc/props/snmp.props |
| Rules file                      | \$ISHOME/etc/rules/snmp.rules |
| Log file                        | \$ISHOME/log/snmp.log         |

### Guidelines for configuration SNMP monitor

The SNMP monitor acquires data from SNMP enabled devices by sending SNMP GET requests for one or more objects that are contained in a device's MIB. The device then returns the MIB data to the SNMP monitor. The SNMP monitor supports SNMP versions 1, 2c, and 3.

## Properties

Properties options specific to the SNMP monitor are described in the following table.

| Table 157. SNMP monitor properties options |                    |  |
|--|--------------------|--|
| Property name                              | Property parameter | Description  |
| InvalidBps Value                           | integer            | Specifies an integer value that is substituted for bits per second (Bps) value calculations when only one data point is available. |
| MibDir                                     | string             | Specifies the directory that contains MIB documents that are used by the monitor.<br>Default: \$ISHOME/mibs.                       |
| StripQuotes                                | 0 1                | Strips quote characters from integer data.<br>0 - disabled<br>1 - enabled  |
| Rollover Threshold                         | integer            | The value that a delta must meet or exceed if a rollover happens before a router reset occurs.<br>Default: 0 (never rollover)      |

## Configuring the SNMP monitor service tests

Use the SNMP monitor configuration parameters to define service tests.

| Table 158. SNMP monitor configuration |  |
|---------------------------------------|--|
| Field                                 | Description  |
| server                                | The server to send SNMP GET requests to.   |
| objectgroupname                       | The text name for the group of OIDs to include in the GET request.   |
| communitystring                       | The SNMP read/write community string for the SNMP server on the client.<br><b>Note:</b> Use a caret character (^) in community names advisedly, see <a href="#">Community names</a> for further information. |
| description                           | A text field for providing descriptive information on the element.   |

Table 158. SNMP monitor configuration (continued)

| Field                   | Description  |
|-------------------------|--|
| port                    | The port on the server to use.<br>Default: 161   |
| version                 | The SNMP version to use:<br>1 - SNMPv1<br>2 - SNMPv2c<br>3 - SNMPv3<br>Default: 1            |
| securityname†           | The username for the SNMP session.   |
| authenticationphrase†   | The authentication password for the user.  |
| privacyphrase†          | The privacy password for the user.   |
| authenticationprotocol† | The protocol to use to authenticate the user:<br>• MD5<br>• SHA1<br>Default: MD5             |
| privacyprotocol†        | The protocol to use for encrypting the session.<br>Default: DES                              |
| timeout                 | The time, in seconds, to wait for the server to respond.<br>Default: 20                      |
| poll                    | The time, in seconds, between each poll.<br>Default: 300                                     |
| retries                 | The number of times the monitor retries to contact the server before it quits.<br>Default: 0 |
| failureretests          | The number of times to retest before failure is indicated.<br>Default: 0                     |
| retestinterval          | The time, in seconds, to wait between each failure retest.<br>Default: 10                    |

| Table 158. SNMP monitor configuration (continued) |   |
|---|---|
| Field   | Description   |
| hostnamelookuppreference                          | <p>Determines which IP version, IPv6, or IPv4, is applied to the supplied host name. Options are:</p> <ul style="list-style-type: none"> <li>• default sets the monitor to use monitor-wide properties settings. This is the default.</li> <li>• 4Then6 selects IPv4 and then IPv6. Uses IPv4 addresses if they are available. If no IPv4 addresses are found, IPv6 addresses are used.</li> <li>• 6Then4 selects IPv6 and then IPv4. Uses IPv6 addresses if they are available. If no IPv6 addresses are found, IPv4 addresses are used.</li> <li>• 4Only selects IPv4 only. Uses IPv4 addresses only. If there are no IPv4 addresses, the poll returns an error.</li> <li>• 6Only selects IPv6 only. Uses IPv6 addresses only. If there are no IPv6 addresses, the poll returns an error.</li> <li>• 6Or4 selects either IPv4 or IPv6. Uses the first address that is returned from the host name.</li> </ul> |
| † Applicable only to SNMPv3.                      |   |

### Community names

Internet Service Monitoring uses the caret character (^) as an escape character as it sends information to the target device. If a community name contains a caret, you must enter two carets in a row (^) for the name to be correct at the router. For example, for the community name a\$^&b to be correct when sent to the device use a\$^^&b.

### Service level classifications

Service level classifications define the rules for determining the level of service.

Available service level classification options for the SNMP monitor are:

```
totalTime
message
```

In service level classifications.

- Specify more service level classifications by manually entering the name of the monitor element. The name must match the name that is shown for the element in the Monitor elements section.
- message can be any message that is forwarded in the **\$message** element to IBM Application Performance Management server if used in any widget. For a list of possible values, see [Status messages](#).
- The operand is a string or a positive number.
- oidName is the name that is assigned to a MIB object in the OID Name field defined in the OID group.

### Monitor elements

In addition to the test results common to all elements, the SNMP monitor generates a set of test results that contain data specific to SNMP service tests.

The following table describes the additional elements for the SNMP monitor.

| Table 159. SNMP monitor elements |  |
|----------------------------------|--|
| Element                          | Description  |
| \$community                      | The SNMP community string for the SNMP server on the client. |

| <i>Table 159. SNMP monitor elements (continued)</i>  |  |
|--|--|
| Element  | Description  |
| \$numOids  | The number of OIDs used in the query.  |
| \$oidGroupName*<br>(OidGroup)                        | The name of the OID group. The OID group contains the OIDs that the monitor is polling.  |
| \$oidName0 to n*<br>(OIDNameZero to Nine)            | The name of the first to the last MIB object in the OID group. It is indicated by a number when using Netcool/OMNIBus and by alphabetic text (zero to nine) when using IBM Application Performance Management.   |
| \$oidNames   | The names of each OID separated by a vertical bar (   ).   |
| \$oidReturnValues0 to n*<br>(snmpResultZero to Nine) | The data that is returned by the SNMP GET command for the first to the last MIB object in the OID group. This is indicated by a number when using Netcool/OMNIBus and by alphabetic text (zero to nine) when using IBM Application Performance Management. |
| \$oidUnit0 to n                                      | The units for the first to the last MIB object in the OID group indicated by a number.   |
| \$oidUnits   | The units for each OID, separated by a vertical bar character (   ).   |
| \$port   | The port on which the service is monitored.  |
| \$snmpVersion*<br>(SnmpVersion)                      | Version of SNMP used to send SNMP packets configured in the profile (Version 1, 2c or 3).  |

### Status message

The SNMP monitor provides status messages in the `ResultMessage` attribute when using IBM Application Performance Management. These messages indicate the result of the test.

The following table describes the SNMP monitor status messages.

| <i>Table 160. SNMP monitor status messages</i>              |   |
|---|---|
| Message   | Description   |
| Successful Get  | The query of the SNMP agent was successful.   |
| Failed to open snmp sessions<br>SNMP session - start failed | Unable to initialize an SNMP session.   |
| Error in packet   | Unable to create a valid SNMP packet.   |
| Timed out while waiting for response                        | No response received from the SNMP agent.   |
| Internal Error  | This was an internal error in the monitor. For more information, contact IBM Technical Support. |
| Error Processing OID  | There was an error processing one of the OIDs.  |

| Table 160. SNMP monitor status messages (continued) |  |
|---|--|
| Message   | Description  |
| ERROR: Too Many OIDs                                | The monitor is set to request too many OIDs at one time. The maximum is 100.                   |
| ERROR: PDU received mismatch with PDU sent          | The protocol data unit (PDU) received by the monitor did not match the PDU sent to the server. |

### SOAP Monitor

The SOAP monitor checks the availability and response time of the SOAP interface (SOAP 1.0 and 1.1). It can also monitor the validity of SOAP inputs (requests) and SOAP outputs (responses).

The SOAP monitor supports the following message encoding styles:

- RPC - Encoded
- Document - Literal Unwrapped
- Document - Literal Wrapped

The following table lists the SOAP monitor files.

| Table 161. SOAP monitor file summary |                               |
|--------------------------------------|-------------------------------|
| Monitor files                        | Name or location              |
| Monitor executable                   | nco_m_soap                    |
| Properties file                      | \$ISHOME/etc/props/soap.props |
| Rules file                           | \$ISHOME/etc/rules/soap.rules |
| Log file                             | \$ISHOME/log/soap.log         |

### Guidelines for configuring the SOAP monitor

The SOAP monitor tests the operation of a SOAP service by sending the target SOAP interface a request that contains a set of inputs, and then receiving and analyzing the outputs that are contained in the response that is received from the interface. When a request is sent to the SOAP interface, the request can either succeed or fail. A request succeeds if a response is received and the values in the response message match the specified output values. A request fails if no response is received or a response is received but the values in its message do not match the output values.

The SOAP inputs and outputs that are contained in requests and responses depend on the functions of the SOAP service under test, when you design a test for a SOAP service, must specify inputs and outputs appropriate to that service. The inputs consist of the names of the data to be sent and their assigned input values. The outputs consist of the names of the data to be received and their expected output values. These data names are sourced from a local Web Service Description Language (WSDL) file, which you specify when you configure the SOAP monitor. The input and output data names must match the names and data types in the WSDL file. The data names must also be in the same order as in the WSDL file. If the names do not match, or the order is incorrect, an error message is generated when the monitor tries to poll the SOAP interface.

The format of inputs is:

```
dataname:datatype=assigned_value, dataname:datatype=assigned_value, ...
```

The format of outputs is:

*dataname:datatype=expected\_value, dataname:datatype=expected\_value, ...*

### SOAP data types

The SOAP monitor supports simple, array, and user-defined data types. Simple data types include Integer, String, and Boolean. Arrays might contain simple data types and other array and user-defined data types.

| Table 162. Simple data types |            |                    |               |
|------------------------------|------------|--------------------|---------------|
| Simple data types            |            |                    |               |
| anyURI                       | float      | language           | Qname         |
| boolean                      | gDay       | long               | short         |
| byte                         | gMonth     | Name               | string        |
| date                         | gMonthDay  | NCName             | time          |
| dateTime                     | gYear      | negativeInteger    | token         |
| decimal                      | gYearMonth | NMTOKEN            | unsignedByte  |
| double                       | ID         | NMTOKENS           | unsignedInt   |
| duration                     | IDREFS     | nonNegativeInteger | unsignedLong  |
| ENTITIES                     | int        | nonPositiveInteger | unsignedShort |
| ENTITY                       | integer    | normalizedString   |               |

### SOAP authentication

If the SOAP interface that you want to monitor requires basic HTTP authentication, specify credentials for accessing the interface in the SOAP profile element when using Internet Service Monitoring Configuration tool.

To set the required SOAP authentication parameters:

1. In the Internet Service Monitoring Configuration tool, select the profile element for which you want to add authentication information.
2. On the **Advanced** tab, click in the **Value** field for the username parameter and enter the required value.
3. Click in the **Value** field for the password parameter and enter the required value. The password is encrypted.
4. Click **OK**.

If authentication is no longer required, delete the values for the **username** and **password** parameters.

### Properties

The properties options specific to the SOAP monitor are described in the following table.

Table 163. SOAP monitor properties options

| Property name     | Property parameter | Description                                 | Default  |
|-------------------|--------------------|---|--|
| SoapParser        | string             | XML parsing library.                        | \$ISHOME/platform/\$ARCH/bin/AxisXMLParserXerces.dll |
| SoapTransport     | string             | SOAP transport library.                     | \$ISHOME/platform/\$ARCH/bin/HTTPTransport.dll       |
| SoapChannel       | string             | SOAP channel library                        | \$ISHOME/platform/\$ARCH/bin/HTTPChannel.dll         |
| SoapSecureChannel | string             | SOAP secure channel library.                | \$ISHOME/platform/\$ARCH/bin/HTTPSSLChannel.dll      |
| SoapClientLog     | string             | The name of the extra SOAP client log file. | \$ISHOME/log/SoapClient.log                          |

### Cipher suites

The SSLCipherSuite property specifies the cipher suite that is used by the SOAP monitor.

For more information, see [“SSL setting in Internet Service Monitoring” on page 512.](#)

### Configuring the SOAP monitor services tests

Use the SOAP monitor configuration parameters to define service tests.

Table 164. SOAP monitor configuration

| Element            | Description   |
|--------------------|---|
| wsdl               | The path to a local copy of the WSDL file.                                    |
| operation          | The name of the SOAP operation.   |
| operationnamespace | The namespace of the SOAP operation.  |
| location           | The URL of the SOAP service to be monitored.                                  |
| description        | A text field for providing descriptive information on the element.            |
| timeout            | The time, in seconds, to wait for the SOAP service to respond.<br>Default: 10 |
| poll               | The time, in seconds, between each poll.<br>Default: 300                      |
| failureretests     | The number of times to retest before failure is indicated.<br>Default: 0      |
| retestinterval     | The time, in seconds, to wait between each failure retest.<br>Default: 10     |
| Soap parameters    |   |

Table 164. SOAP monitor configuration (continued)

| Element | Description  |
|---------|--|
| inputs  | <p>Provides access to the name, type, and value fields, including attributes, for SOAP inputs. Use simple, complex, or array soap parameters. For example:</p> <ul style="list-style-type: none"> <li>Simple: <code>symbol:string="IBM"</code></li> <li>Complex: <pre>outer:{item1:string,item2:string}(aaa:string='bbb') ={item1(attr:string='ccc')='', item2(attr:string='ddd',attr2:string='eee')='fff'}</pre> <p>In this example the attributes in parentheses, marked in bold, are optional.</p> </li> <li>Array: <code>input:int[]=[1,2,3,4]</code></li> </ul> |
| outputs | <p>Provides access to the name, type, and value fields, including attributes, for SOAP outputs. Use simple, complex, or array soap parameters.</p> <p>For more information about syntax, see the examples for SOAP parameter inputs.</p>   |

### Service level classification

Service level classifications define the rules for determining the level of service that is provided by the SOAP interface.

Available service level classification options for the SOAP monitor are:

```
totalTime
message
```

In service level classifications:

- Specify more service level classifications by manually entering the name of the monitor element. The name must match the name that is shown for the element in the Monitor elements section.
- `message` can be any message in the **\$message** element to IBM Application Performance Management server if used in any widget. For a list of possible values, see [Status messages](#).

### Monitor elements

In addition to the test results common to all elements, the SOAP monitor generates a set of test results that contain data specific to SOAP service tests.

The following table lists the additional elements for the SOAP monitor.

| Table 165. SOAP monitor elements |  |
|----------------------------------|--|
| Element                          | Description  |
| (Location)                       | The URL of the SOAP service that is monitored.   |
| (Operation)                      | The name of the SOAP service that is monitored.  |
| \$outputMatch                    | Success if returned value matches the output value, else Failure.                                      |
| \$responseValueName              | The value name received in the SOAP response.  |
| \$soapname                       | The container name in the SOAP response. Only applicable to array and user-defined complex data types. |
| \$soaptype                       | The container type in the SOAP response. Only applicable to array and user-defined complex data types. |

| Table 165. SOAP monitor elements (continued) |  |
|--|--|
| Element                                      | Description                                |
| (WSDL)                                       | The path to a local copy of the WSDL file. |

### Status messages

The SOAP monitor provides status messages in the **ResultMessage** attribute when using IBM Application Performance Management. These messages indicate the result of the test.

The messages are either Success if the returned values match the output values or an error message. The error message contains a description of the error.

### Example

Monitor the availability of the SOAP interface at 5-minute intervals. If the SOAP interface is unavailable, repeat the test at most two times, with 5 seconds between each repeated test. Send a request that adds 1 + 2 and check that the response contains the value of 3.

Create a SOAP profile element and set the fields that are shown in the following table.

| Table 166. SOAP profile element example |                                  |
|---|----------------------------------|
| Configuration field                     | Value                            |
| wSDL                                    | c:\%ISMHOME%\etc\SOAP.wSDL       |
| operation                               | add                              |
| operationnamespace                      | http://localhost/SOAP/Calculator |
| location                                | http://serverA/SOAP/Calculator   |
| description                             | basic Calculator SOAP monitor    |
| Active                                  | Selected                         |
| timeout                                 | 30                               |
| poll                                    | 300                              |
| failureretests                          | 2                                |
| retestinterval                          | 5                                |
| inputs                                  | [in0=1,in1=2]                    |
| outputs                                 | [addReturn=3]                    |

### TCPPort Monitor

The TCPPort monitor provides coverage for services that are not tested by the other monitors. It detects and responds to commands or strings on a TCP port. This monitor is particularly useful for monitoring bespoke services.

The following table lists the TCPPort monitor files.

| Table 167. TCPPort monitor files |                  |
|----------------------------------|------------------|
| Monitor files                    | Name or location |
| Monitor executable               | nco_m_tcpport    |

| Table 167. TCPPort monitor files (continued) |                                  |
|--|----------------------------------|
| Monitor files                                | Name or location                 |
| Properties file                              | \$ISHOME/etc/props/tcpport.props |
| Rules file                                   | \$ISHOME/etc/rules/tcpport.rules |
| Log file                                     | \$ISHOME/log/tcpport.log         |

### Guidelines for configuring the TCPPort monitor

The TCPPort monitor tests TCP-based services by connecting to the service, monitoring messages, received from the service and sending responses to it.

To configure a test, you define a sequence of expected messages and responses that comprise a normal interaction on that service.

For example, a standard interaction for a telnet service involves the following sequence:

- The telnet service sends a login message, prompting for a username.
- The client sends a response that contains a username.
- The telnet service sends a message that prompts a password.
- The client sends a response that contains a password.
- If the login attempt is successful, the telnet service sends some form of greeting message.

The monitor's **WaitForn** and **Sendn** properties, which are specified define the expected messages and the responses to those messages. These properties in the monitor properties file, define how the monitor interacts with the TCP service:

- **WaitForn** properties are regular expressions. The monitor uses them to match messages that are received on the monitored port.
- **Sendn** properties are literal strings that the monitor writes to the port.

**Note:** If required, you can insert control characters into these properties by using a text editor that supports control character insertion.

The format for defining WaitForn and Sendn properties is:

```
WaitFor1: 1st received message
Send1: 1st response
WaitFor2: 2nd received message
Send2: 2nd response
...
WaitFor5: 5th received message
Send5: 5th response
```

When the monitor reaches the first unset **WaitFor** property, it stops sending and receiving. If the **MonitorDisconnect** property is set to 0, the monitored service must close the connection that is opened by the monitor otherwise the monitor reports the message Timed out waiting to read in its **\$message** element. With many services, connection can be closed by sending a quit command. If **MonitorDisconnect** is set to 1, the monitor disconnects after the last Send or WaitFor command completes, or the timeout is reached, whichever occurs first.

### Configuring the TCPPort monitor service test

Use the TCPPort monitor configuration parameters to define service tests.

| Table 168. TCPPort configuration |   |
|----------------------------------|---|
| Field                            | Description   |
| server                           | The IP address of the system on which the target service is running.<br>Example is server.mycompany.com |

| Table 168. TCPPort configuration (continued) |   |
|--|---|
| Field  | Description   |
| port   | The port on which to connect to the target service.                       |
| description                                  | A text field for providing descriptive information on the element.        |
| timeout                                      | The time, in seconds, to wait for the server to respond.<br>Default: 30   |
| poll   | The time, in seconds, between each poll.<br>Default: 300                  |
| failureretests                               | The number of times to retest before failure is indicated.<br>Default: 0  |
| retestinterval                               | The time, in seconds, to wait between each failure retest.<br>Default: 10 |

**Note:** Monitor the availability of the telnet service that runs on the host server.mycompany.com on port 23. Use the credentials user or guest to log in to the server and close the connection immediately after login. Run the test at 5-minute intervals, and set a 10-second timeout on connection attempts.

1.Add the following entries to the TCPPort properties file:

```
WaitFor1: ".*[Ll]ogin:"
Send1: "user"
WaitFor2: ".*[Pp]assword:"
Send2: "guest"
WaitFor3: ".*%"
Send3: "exit"
```

2.Start or Restart the TCPPort monitor.

### Regular expression matches

Perform a regular expression search on the information that is downloaded by entering up to 50 different regular expressions. The TCPPort monitor attempts to match the contents that are retrieved to each of the regular expressions. If a match for a specified regular expression is found, the matched lines (or as much as can fit in the monitor's internal buffer) are returned in the corresponding \$regexpMatchn element. If the regular expression matches more than once in the information downloaded, only the first match is returned. The status of each regular expression test is indicated by the \$regexpStatusn elements. You can use the regular expression matches and their status information as criteria for service level classifications.

For more information, see [Table 72 on page 405](#).

### Monitor elements

The following table describes the additional elements for the TCPPort monitor.

Elements indicated by an asterisk (\*) are available as attributes. The names of the attributes are shown within brackets. Absence of an asterisk indicates there's no equivalent attribute. Attributes that are shown in bracket but without an element indicates that they are only available as attributes, there's no equivalent element.

In addition to the test results common to all elements, the TCPPort monitor generates a set of test results that contain data specific to TCPPort service tests.

| Table 169. TCPPort monitor elements |   |
|-------------------------------------|---|
| Element                             | Description   |
| \$bytesPerSec                       | The average number of bytes transferred each second.  |
| \$bytesTransferred                  | The number of bytes uploaded or downloaded.   |
| \$connectTime*(Connect Time)        | The time taken to establish a connection with the target server.  |
| \$downloadTime*(DownloadTime)       | The time taken to download data.  |
| \$lastlineThere's                   | The contents of the last line received from the target server.  |
| \$lookupTime*(LookupTime)           | The time taken to obtain the IP address of the host server.   |
| \$networkError                      | Contains any network errors during the connection.  |
| \$port*(Port)                       | The port on the target server the monitor tried to connect to.  |
| \$waitingFor                        | If the connection terminates before the monitor completes its sequence of waits and sends, this element contains the contents of the last WaitFor property. |

### Status message

The TCPPort monitor provides status messages in the ResultMessage attribute when using IBM Application Performance Management. These messages indicate the result of the test.

The following table describes the TCPPort status messages.

| Table 170. TCPPort monitor status messages |  |
|--|--|
| Message                                    | Description  |
| OK   | The request succeeded.   |
| Timed out waiting to read/write            | A data connection to the server was established, but it does not respond.            |
| Connection closed unexpectedly             | The connection to the server was broken.   |
| Connection failed                          | The monitor failed to connect to the server. For more information, see the log file. |
| Network connect error                      | There's a problem with the network.  |
| Network error whilst reading               |  |

### Properties

Properties options specific to the TCPPort monitor are described in the following table.

| Table 171. TCPPort properties |                    |   |
|-------------------------------|--------------------|---|
| Property name                 | Property parameter | Description   |
| Monitor Disconnect            | 0 1                | Specifies that the monitor must disconnect itself after the last Send or WaitFor command. If the last command is a Send, the monitor disconnects immediately after the string is sent. If the last command is a WaitFor, the monitor disconnects as soon as the monitor receives a match or when the poll timeout is exceeded.<br><br>0 - disabled (monitor doesn't connect)<br>1 - enabled |
| OutputDirectory               | string             | Specifies the output directory to use if the OutputResult is saved.<br><br>Default: \$ISHOME/var.   |
| OutputResult                  | 0 1                | Specifies that the monitor must save the data that it receives from the service.<br><br>0 - disabled<br>1 - enabled   |
| Send                          | n                  | Literal string that the monitor writes to the port. See <a href="#">Guidelines for configuring TCPPort monitor</a> .<br><br>n is a number in the range 1 - 30 inclusive.  |
| singleLineMatch               | 0 1                | Specifies that the monitor should return a single line match when a regular expression is matched.<br><br>0 - disabled (multiple lines are matched)<br>1 - enabled (single line is matched)   |
| WaitFor                       | n                  | Regular expression used to match commands or strings on the monitored port. For more information, see <a href="#">Guidelines for configuring TCPPort monitor</a> .<br><br>n is a number 1 - 30 inclusive.   |

### Cipher suites

The SSLCipherSuite property specifies the cipher suite that is used by the TCPPORT monitor. For more information about SSL settings, see [“SSL setting in Internet Service Monitoring” on page 512](#).

### TFTP Monitor

The TFTP monitor measures the performance of the Trivial File Transfer Protocol (TFTP) service between two systems.

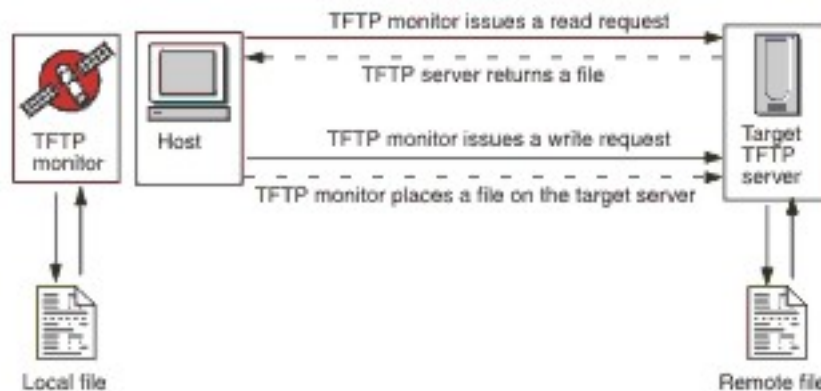

The following table lists the TFTP monitor files.

| Table 172. FTP monitor summary |                  |
|--------------------------------|------------------|
| Monitor files                  | Name or location |
| Executable name                | nco_m_tftp       |

| Table 172. FTP monitor summary (continued) |                               |
|--|-------------------------------|
| Monitor files                              | Name or location              |
| Properties file                            | \$ISHOME/etc/props/tftp.props |
| Rules file                                 | \$ISHOME/etc/rules/tftp.rules |
| Log file                                   | \$ISHOME/log/tftp.log         |

### Guidelines for configuring TFTP monitor

The TFTP monitor transfers files between the host system and the target server by using TFTP READ or WRITE requests, then records the response time and data transfer rate. Use it to ensure that your TFTP server is up and running and transferring files at an acceptable rate.

To upload a file, the monitor sends the TFTP WRITE request (WRQ), and to download a file it sends the TFTP READ request (RRQ). In the TFTP clients, the upload operation is PUT and download operation is GET.

The TFTP monitor supports the octet (binary) and netascii file transfer modes.

### Configuring TFTP monitor services tests

Use the TFTP monitor configuration parameters to define service tests.

| Table 173. TFTP monitor configuration |   |
|---------------------------------------|---|
| Field                                 | Description   |
| server                                | The IP address of the target TFTP server, or the system you want to transfer files to or from.  |
| localfile                             | For GET operations, this field specifies the name and path to which the file is downloaded.<br>For PUT operations, this field specifies the name and path of the file that is uploaded to the server.                 |
| remotefile                            | For GET operations, this field specifies the name and path of the file that is downloaded from the server.<br>For PUT operations, this field specifies the name and path to which the file is uploaded on the server. |
| description                           | A text field for providing descriptive information about the TFTP monitor.  |

| Table 173. TFTP monitor configuration (continued) |  |
|---|--|
| Field   | Description  |
| port  | The port that the TFTP server uses.<br>Default: 69   |
| localip   | The IP address of the host's network interface on which the monitor opens the TFTP connection. If this field is empty, the monitor uses the interface that is specified by the <code>IpAddress</code> property   |
| localport   | The port that the monitor uses to establish the TFTP connection. If the value of this field is 0, the monitor selects a suitable port.   |
| command   | The TFTP command for the monitor to use: <ul style="list-style-type: none"> <li>• GET - Download a file from the target server to the monitor host.</li> <li>• PUT - Upload a file from the monitor host to the target server.</li> </ul> Default: GET |
| transfermode                                      | Specifies the format in which the monitor transfers the file: <ul style="list-style-type: none"> <li>• OCTET (8-bit)</li> <li>• NETASCII</li> </ul> Default: OCTET   |
| timeout   | The time, in seconds, to wait for the TFTP server to respond.<br>Default: 10   |
| retries   | The number of times that the monitor attempts to transfer a file before it quits.<br>Default: 3  |
| poll  | The time, in seconds, between each poll. Do not set this value too low as constant polling might overwhelm the service.<br>Default: 300  |
| failureretests                                    | The number of times that the monitor retests the TFTP server after an initial failure before failure is indicated.<br>Default: 0   |
| retestinterval                                    | The time, in seconds, to wait between each failure retest.<br>Default: 10  |

### Service level classifications

Service level classifications define the rules for determining the level of service that is provided by a TFTP server.

Available service level classification options for the TFTP monitor are:

```
totalTime
lookupTime
responseTime
```

```

transferTime
bytesTransferred
bytesPerSec
checksum
message

```

In service level classifications:

- Specify more service level classifications by manually entering the name of the monitor element. The name must match the name that is shown for the element in the Monitor elements section.
- `message` can be any message that is forwarded in the `$message` element to IBM Application Performance Management server if used in any widget. For a list of possible values, see [Status messages](#).
- The operand is a string or a positive number.
- The checksum element does not normally provide meaningful results for service level classifications. Its value is not known when the profile element is created. The monitor calculates checksum values while tests are in progress. This element is intended for alert enrichment by using rules files.

### Monitor elements

In addition to the test results common to all elements, the TFTP monitor generates a set of test results that contain data specific to TFTP service tests.

The following table describes the additional elements for the TFTP monitor.

| <i>Table 174. TFTP monitor elements</i>                |  |
|--|--|
| Element  | Description  |
| <code>\$bytesPerSec*</code><br>(BytesPerSec)           | The average number of bytes transferred each second.   |
| <code>\$bytesTransferred*</code><br>(BytesTransferred) | The number of bytes uploaded or downloaded.  |
| <code>\$checksum</code>                                | The checksum value of the downloaded data. It is generated by the monitor and is provided for further processing by using rules files. |
| <code>\$command*</code><br>(TftpCommand)               | The TFTP command that is issued by the monitor (GET or PUT).   |
| <code>\$localFile*</code><br>(TftpLocalFile)           | Full path name of the file stored on the local host. This element is taken from the configuration file.                                |
| <code>\$localIP</code>                                 | The local IP address the monitor is configured to use. It might be blank on a system with only one interface.                          |
| <code>\$lookupTime*</code><br>(LookupTime)             | The time taken to obtain the IP address of the host server.  |
| <code>\$remoteFile*</code><br>(TftpRemoteFile)         | Full path name of the file stored on the remote host (the FTP server). This element is taken from the configuration file.              |
| (TransferTime)   | The time taken to transfer the file.   |

| Table 174. TFTP monitor elements (continued) |   |
|--|---|
| Element                                      | Description   |
| (TftpConnection)                             | The format in which the monitor transferred the file. It is either OCTET (8 bit) or NETASCII. |

### Status messages

The TFTP monitor provides status messages in the ResultMessage attribute when using IBM Application Performance Management. These messages indicate the result of the test.

| Table 175. TFTP monitor status messages                               |  |
|---|--|
| Message   | Description  |
| OK  | The TFTP request succeeded.  |
| FAILED: connect failed  | The monitor failed to connect to the server. Check that the server is running. |
| FAILED: internal tftp monitor error                                   | There is a problem with the monitor, possibly caused by insufficient memory.   |
| FAILED: A send/wait timed out   | The TFTP request failed. There might be a problem with the network.            |
| FAILED: An unspecific error condition. The transfer should be aborted |  |
| FAILED: Received a short or malformed packet                          |  |
| FAILED: local file open/read/write failed                             |  |
| FAILED: unrecognized status from transfer attempt                     |  |

### Example

Test the availability of the TFTP server `tftp.mycompany.com` by uploading the file `$ISHOME/etc/testfiles/upload.txt` to `/ism/test/upload_result.txt`. Use `netascii` mode to upload the file at 20-minute intervals

Classify the service level by using the following criteria:

- If the upload is not successful, the service level is Failed
- If the total time of the transfer is greater than 10 seconds, the service level is Marginal
- Otherwise, the service level is Good

Create a TFTP monitor profile element and set the configuration as shown in the following table.

| Table 176. TFTP profile element example |  |
|---|--|
| Configuration field                     | Values   |
| server                                  | <code>tftp.mycompany.com</code>                    |
| localfile                               | <code>\$ISHOME/etc/ism/testfiles/upload.txt</code> |

| Table 176. TFTP profile element example (continued) |  |
|---|--|
| Configuration field                                 | Values   |
| remotefile  | /ism/test/upload_result.txt  |
| description   | TFTP test  |
| Active  | Selected   |
| command   | PUT  |
| transfermode  | NETASCII   |
| poll  | 1200   |
| statement   | <pre>If (Message != OK) then status Failed else if (TotalTime &gt; 10) then status Marginal else status Good</pre> |

### TRANSX Monitor

The TRANSX monitor simulates the actions of a real internet user by running a series of activities, which it performs by using other Internet Service Monitors.

For example, configure TRANSX to access pages of a website by using the HTTP monitor, download some files, send or receive by using the POP3 and SMTP monitors.

The following table lists the TRANSX monitor files.

| Table 177. TRANSX monitor files |                                 |
|---------------------------------|---------------------------------|
| Monitor files                   | Name or location                |
| Monitor executable              | nco_m_transaction               |
| Properties file                 | \$ISHOME/etc/props/transx.props |
| Rules file                      | \$ISHOME/etc/rules/transx.rules |
| Log file                        | \$ISHOME/log/transx.log         |

### Properties

| Table 178. TRANSX monitor properties |                    |   |
|--------------------------------------|--------------------|---|
| Property name                        | Property parameter | Description   |
| CompleteTransax                      | 0 1                | <p>Specifies that the transaction continues even if a step fails.</p> <ul style="list-style-type: none"> <li>• 0 - disabled (doesn't continue)</li> <li>• 1 - enabled (continues)</li> </ul>  |
| DetailedTimings                      | 0 1                | <p>Specifies that the TRANSX monitor produces data logs that contains fine-grained timings for each step. Fine grained timings that are produced in the data logs are pre-set, and can't be modified.</p> <ul style="list-style-type: none"> <li>• 0 - disabled</li> <li>• 1 - enabled</li> </ul> |

| Table 178. TRANSX monitor properties (continued) |                    |   |
|--|--------------------|---|
| Property name                                    | Property parameter | Description   |
| MultipleEvents                                   | 0   1              | Specifies whether the monitor generates multiple events for transaction results: <ul style="list-style-type: none"> <li>• 0 - disabled (monitor generates only one event containing the results of all steps and summary results)</li> <li>• 1 - enabled (monitor generates one event for every step in the transaction and a final summary event)</li> </ul> |
| StepPause  | integer            | Specifies the length of the pause, in seconds, between execution of each transaction step.<br><br>The length of the pause doesn't affect the value of a transaction's \$totalTime element. \$totalTime represents the sum of a transaction's \$stepXTime elements.<br><br>Default: 0  |

The following table describes the properties specific to the SMTP monitor.

#### Guidelines for configuring the TRANSX monitor

The TRANSX monitor tests services by simulating a set of activities that comprise a typical user experience. The set of activities is called a transaction, and each activity in the transaction is called a transaction step.

TRANSX profile elements define the transactions. Each transaction step configures an Internet service monitor, such as HTTP, to perform the operation for that step. You configure transaction steps through the Edit button on the Steps tab of the TRANSX profile element.

The steps are configured in the same way as you configure any other profile elements. For example, the configuration details for a step that involves the HTTP monitor can include Head/Form parameters, Proxy server parameters, regular expressions, and service level classifications.

When the TRANSX monitor tests a step in the transaction, it records the time that is taken and the level of service for the step.

**Note:** The TRANSX monitor requires root privileges if any transaction steps use another monitor, such as ICMP, that requires root privileges.

#### Handling dynamic content with HTTP and HTTPS monitors

Many websites use the dynamic content to provide functions such as session- or region-based interactions. When used together with the TRANSX monitor, the HTTP and HTTPS monitors can test web pages that contain dynamic content, such as session IDs, region codes, or dates and times that are embedded in links, whose values may be different each time the transaction is tested.

The dynamic content features provided by the HTTP and HTTPS monitors when running in transaction mode enables to identify dynamic content in the form of name-value pairs, called dynamic page elements, embedded in URLs, or defined in HTML form elements, which the monitor then extracts from a page during each test, ensuring that the appropriate dynamic value is used every time that a transaction is tested.

For example, consider a website's Login page, <http://www.mycompany.com/login>, that contains a link for logging on to the website. The link URL for the login action <http://www.mycompany.com/doLogin?sessionId=id> include a session ID for the Login transaction. In this example, the name-value pair `sessionId=id` is a dynamic page element; the value of `id` changes each time the Login page is accessed. To test the Login page as part of a transaction, you would configure the transaction

to obtain and use the value of `sessionID` each time the transaction is tested and insert it into the login action URL.

The TRANSX monitor passes dynamic page elements from one transaction step to the next. In the website Login example, the transaction's first step would access the Login page to obtain the session ID then pass it to a second step, which submits the login request containing that ID. The operations that are performed in these steps are:

1. Access the page containing the dynamic page elements, for example `http://www.mycompany.com/login`
2. Submit the action by using the dynamic page elements, for example `http://www.mycompany.com/doLogin?sessionID=@030671`

When you identify a dynamic page element in a transaction step, it's passed on to the next transaction step, which inserts the name-value pair into its request. The element is passed on to each subsequent HTTP or HTTPS transaction until you explicitly remove it.

### **Adding and removing dynamic pages**

Each HTTP or HTTPS transaction step consists of a request, which returns an HTML page. When running a transaction step that contains dynamic page elements, the monitor parses the HTML page to locate each element's name-value pair and passes it to the next transaction step, which inserts them into its HTTP or HTTPS request.

To specify that a step uses dynamic page elements, set the parameter type for the element to DYNAMIC. Then, specify each dynamic element that is to be extracted and passed on to later steps. Identify each dynamic element by entering its name, for example, `sessionID` and select Add To as the value. Add To indicates that the element is to be passed on to later steps.

**Note:** To obtain the name of a dynamic page element, view the HTML source of the page on which it's located.

Dynamic page elements are passed from one transaction step to the next. If a page element is no longer required to be passed on to a next step, set the Value of the element to Remove From. Manually update the subsequent transaction steps to ensure that the correct page elements are processed.

Use the following guidelines for adding and removing dynamic page elements:

- If a step doesn't use any dynamic page elements, don't select DYNAMIC as the parameter type.
- If a step requires a dynamic page element, the step that retrieves the page on which the dynamic element appears must specify the name of the element and the value Add To.
- If a step doesn't require a dynamic element that is passed on from prior steps, set the value of the previous step to Remove From.

### **GET and POST**

In GET methods, all dynamic page elements are inserted into the request URL automatically. In POST methods, you must specify each dynamic element as a FORM parameter on the Parameters tab.

The monitor automatically inserts the dynamic value for each form when it runs the transaction step.

### **Creating transaction**

You define transactions by creating TRANSX profile elements and transaction steps by using the Internet Service Monitoring user interface. For more information, see [“Creating transactions” on page 511](#).

## Configuring the TANSX monitor service test

| Table 179. TRANSX monitor configuration |  |
|---|--|
| Field                                   | Description  |
| transxname                              | A name for the transaction.  |
| description                             | A text field for providing descriptive information on the element. |
| poll                                    | The time, in seconds, between each poll.<br>Default: 300           |

**Note:** Monitor the availability of a website by using a sequence of web browsing, file downloads, and sent email messages.

1. Create a TRANSX profile element.
2. Create an HTTP transaction step to monitor the availability of a website.
3. Create an FTP transaction step to monitor a file download.
4. Create a POP3 or SMTP transaction step to monitor email.

See to the documentation for each monitor for further information.

### Monitor elements

The TRANSX monitor generates events containing the results of each transaction. These events contain the results of the entire transaction as well as those of the individual transaction steps.

However, by default, the monitor places all transaction and step results in a single event, by using the `MultipleEvents` property that you can configure the monitor to create individual events for each transaction step and a summary event for the entire transaction. [Table 1](#) lists the TRANSX summary elements.

Elements indicated by an asterisk (\*) are available as attributes. The names of the attributes are shown within brackets. Absence of an asterisk indicates there's no equivalent attribute. Attributes that are shown in bracket but without an element indicates that they are only available as attributes, there's no equivalent element.

| Table 180. TRANSX summary monitor elements      |   |
|---|---|
| Element   | Description   |
| <code>\$numberOfSteps*(NumberOfSteps)</code>    | The number of steps in the transaction.   |
| <code>\$stepDescriptions</code>                 | A list of the descriptions for each step, which is separated by a vertical bar character ( ).       |
| <code>\$stepTimes*(Step1 to 10TotalTime)</code> | The timing data returned by each step (1 - 10).   |
| <code>\$stepUnits</code>                        | A list of the units for each step, usually seconds, each separated by a vertical bar character ( ). |
| <code>(TransName)</code>                        | The name of the transaction as specified when configuring the transaction.                          |
| <code>(TransStepDescription)</code>             | The description of the transaction step as specified when configuring the step.                     |

## Status message

The TRANSX monitor provides status messages in the ResultMessage attribute when using IBM Application Performance Management. These messages indicate the result of the test.

The following table describes the status messages.

| Table 181. TRANSX monitor status messages                    |   |
|--|---|
| Message  | Description   |
| Successfully completed transaction                           | The transaction was completed successfully.   |
| Error in transaction   | There was a failure in one of the steps of the transaction.   |
| Service Level Failed, ending transactionService Level Failed | The service level of one of the steps returned a failed response, which caused the transaction to stop. |

### Creating transactions

Transactions can be defined by creating TRANSX profile elements and transaction steps using the Internet Service Monitoring user interface.

## Procedure

To create a transaction using the interface:

1. Click **System Configuration icon**. Under which click **Agent Configuration**.  
The agent configuration window opens.
2. Click **ISM** tab to configure Internet Service Monitoring agent.
3. Click **(+)** plus icon to create a new profile. Enter the **Profile Name** and **Description**.
4. Click **Next**.
5. Click **TRANSX** Monitor from monitor drop-down list to select TRANSX Monitor.
6. Click **Next**.
7. Enter the mandatory parameters.
8. In the **advance** tab specify the **poll interval**.
9. Click **(+)** plus icon on the Steps tab.
10. Click the monitor that needs to be selected from the monitor drop-down list.
11. Click **Select** to configure the transaction step.
  - a) Specify the mandatory and optional parameters the same way as previously entered to configure the profile elements.
  - b) If creating dynamic steps for the HTTP or HTTPS monitor, set the Name and Value pairs on the Parameters tab and select DYNAMIC as the parameter type.
12. Click **Add**.
13. Click refresh icon on the steps grid.
14. Repeat steps 1 - 13 for each additional transaction help.
15. Click **Add** to finish.
16. Click **Done** to save.

## Results

**Note:** To specify a pause between each transaction step, use the StepPause property.

## SSL setting in Internet Service Monitoring

Internet Service Monitoring uses OpenSSL to communicate securely with typically remote internet services using various monitors, for example, the HTTPS monitor communicates with a secured HTTPD. Internet Service Monitoring also uses OpenSSL between the monitors and the Databridge and between the Internet Service Monitoring (KIS) and the Databridge. Specify the cipher suite that your application uses in the `SSLCipherSuite` property.

The Databridge should be configured to securely communicate with the monitors and the Internet Service Monitoring so that every monitor shares a common set of Databridge related properties to manage secure communication with the Databridge. Some monitors also share a similar, but different set of related properties to manage secure communication with their respective internet services under test.

The following monitors support monitoring of secured internet services:

- HTTPS
- IMAP4
- POP3
- SMTP

These monitors use certificates. All certificates are stored in X509 format in Privacy Enhanced Mail .Pemfiles in `$ISMHOME/certificates`. The certificate for the Databridge is also stored in the same location. For this reason, the following properties are shared by all monitors, the Databridge, and the Internet Service Monitoring:

- `SSLTrustStore` (Default: `$ISMHOME/certificates/trust.pem`)
- `SSLTrustStorePath` (Default: `$ISMHOME/certificates/`)

As all communication between monitors and the Databridge, and between selected monitors and their secured internet services are built on the same version of OpenSSL, they share characteristics. For example, the highest level of security Internet Service Monitoring can provide is a function of the highest level provided by the underlying OpenSSL. The lowest level of security provided is similarly dependent on the underlying OpenSSL.

If the Internet Service Monitoring is updated, and that update includes an update to the underlying OpenSSL, the internet services being monitored might be impacted. For example:

1. HTTPS monitor in Internet Service Monitoring V7.x.1 is monitoring a secured HTTPD server.
2. Apply a new version of Internet Service Monitoring that contains an updated version of OpenSSL, which means the HTTPS monitor is now V7.x.2.
3. You notice that the HTTPS monitor is now failing to monitor the secured HTTPD.

The security level of the HTTPD server is less than the minimum supported by the newly updated Internet Service Monitoring V7.x.2. Even though the configuration of the HTTPS monitor hasn't changed, its behavior has, because it depends on the underlying OpenSSL layer. The newer Internet Service Monitoring/HTTPS Monitor/OpenSSL combination is more secure than the old combination, and you now need to raise the security level of the remote HTTPD server.

Monitoring secured internet services presents you with a dilemma. Should the security level of Internet Service Monitoring be so low that it can monitor weakly protected Internet services; or should it be as high as the minimum currently recommended settings? If the former is selected, then a weakened Internet Service Monitoring might compromise security, possibly at both ends.

The same version of OpenSSL is used by all monitors. All of these monitors share a common set of monitor properties for configuring the underlying OpenSSL, which are described in the following table.

Table 182. OpenSSL related monitor properties

| Property name   | Property parameter | Description  |
|-----------------|--------------------|--|
| SSLCipherSuite  | string             | Specifies the cipher suites to use for SSL operations between the monitor and the internet service being monitored. Values for this property should be in the form recommended by OpenSSL.<br>Default: AES:3DES:DES:!EXP:!DHE:!EDH |
| SSLDisableSSLv2 | 0 1                | Determines which type of secure connection to make when monitoring a secured internet service.<br>0 – SSLv2 is allowed<br>1 – SSLv2 is NOT allowed<br>Default: 1 (SSLv2 NOT allowed).  |
| SSLDisableSSLv3 | 0 1                | Determines which type of secure connection to make when monitoring a secured internet service.<br>0 – SSLv3 is allowed<br>1 – SSLv3 is NOT allowed<br>Default: 1 (SSLv3 NOT allowed).  |
| SSLDisableTLS   | 0 1                | Determines which type of secure connection to make when monitoring a secured internet service.<br>0 – TLSv1.0 is allowed<br>1 – TLSv1.0 is NOT allowed<br>Default: 0 (TLSv1.0 is allowed).   |
| SSLDisableTLS11 | 0 1                | Determines which type of secure connection to make when monitoring a secured internet service.<br>0 – TLSv1.1 is allowed<br>1 – TLSv1.1 is NOT allowed<br>Default: 0 (TLSv1.1 is allowed).   |
| SSLDisableTLS12 | 0 1                | Determines which type of secure connection to make when monitoring a secured internet service.<br>0 – TLSv1.2 is allowed<br>1 – TLSv1.2 is NOT allowed<br>Default: 0 (TLSv1.2 is allowed).   |

Table 182. OpenSSL related monitor properties (continued)

| Property name      | Property parameter | Description  |
|--------------------|--------------------|--|
| SSLCertificateFile | string             | <p>The path and filename of the public digital certificate file used by the monitor. When a monitor attempts to set up a secured connection to an internet service, the latter may optionally request that the monitor provide its client side certificate, allowing the internet service to verify the monitor or client (client-side certificate verification).</p> <p>The certificate must be in Privacy Enhanced Mail (PEM) format.</p> <p>For the HTTPS monitor, this value can be specified for each HTTPS element at creation time. However, if the HTTPS monitor is going to use the same certificate for all elements, the value in the <code>HTTPS.props</code> file is used.</p> <p>For IMAP, LDAP, POP3, SIP, SMTP and SOAP monitors, the value is set monitor wide.</p> <p>If the path isn't absolute, the monitor interprets it relative to the working directory, <code>\$ISMHOME/certificates</code>.</p> <p>Default: ""</p> |
| SSLKeyFile         | string             | <p>The path and filename of the file containing the private key used by the monitor. The monitor uses this file to encrypt messages it sends to others. The receivers use the monitor's public digital certificate to decrypt the message.</p> <p>Default: <code>monitoryKey.pem</code></p>  |
| SSLKeyPassword     | string             | <p>The password used to encrypt the SSL private key.</p> <p>Default: ""</p>  |
| SSLTrustStoreFile  | string             | <p>The fully qualified name of the file that stores all the X509 public certificates of the internet services that are being monitored, as a concatenated list.</p> <p>Revoked certificates (CRLs) are also stored here as a concatenated list.</p> <p>The Databridge can also store its public certificate here. This property appears in the <code>bridge.props</code> file.</p> <p>Certificates are stored in Privacy Enhanced Mail (PEM) format. Convert certificates obtained in other formats to PEM format using OpenSSL software available from <a href="http://www.openssl.org">http://www.openssl.org</a>.</p> <p>Default: <code>"\$ISMHOME/certificates/trust.pem"</code></p>   |

Table 182. OpenSSL related monitor properties (continued)

| Property name                | Property parameter | Description   |
|------------------------------|--------------------|---|
| SSLTrustStorePath            | string             | <p>The location of the .pem files containing the X509 certificates of the secure internet service being monitored.</p> <p>Revoked certificates (CRLs) are also stored here.</p> <p>The Databridge can also store its public certificate here. This property appears in thebridge.props file.</p> <p>If new certificates are added to this directory, run the openssl rehash command to scan the directory and calculate a hash for each certificate.</p> <p>If both SSLTrustStoreFile and SSLTrustStorePath properties are used, OpenSSL uses both properties to locate trusted certificates.</p> <p>Default: "\$ISMHOME/certificates/"</p> |
| VerifyCertificate Preference | 0 1                | <p>Enables or Disables the verification of the certificate provided by the internet service being monitored against the certificate revocation list (CRL).</p> <p>Default: 0 - disabled</p>   |

### Cipher suites

The cipher suites available to the Internet Service Monitoring are a subset of those allowed by OpenSSL. The set of cipher suites allowed by OpenSSL changes over time. As new vulnerabilities are discovered and best practices evolve, access to specific or general types of cipher suites may be restricted or removed entirely by OpenSSL. As these later versions of OpenSSL are included in later versions of the ISM, there's a flow on effect, which may impact the configuration and operation of the monitors.

Use the SSLCipherSuite monitor-wide property to specify the cipher suites allowed by a monitor from all the ciphers suites available using keywords. To specify multiple suites, use a colon separated list of keywords. For example, the default SSLCipherSuite property is AES:3DES:DES:!EXP:!DHE:!EDH. This selection means that cipher suites that include AES, 3DES, and DES are allowed, but excludes any cipher suites that use EXP (Export (short key lengths)), DHE (Diffie Hellman Exchange), or EDH (Ephemeral Diffie Hellman) key exchanges. Additionally, when the secure connection is made between the monitor and the internet service, AES is used first, followed by 3DES, then DES if necessary. The syntax for the cipher suite lists for Internet Service Monitoring is the same as for OpenSSL.

To pick the correct set of cipher suites for a monitor, consider what the underlying OpenSSL supports, the range of ciphers that the internet service being monitored supports, and the security standards of your organization. You may not be able to monitor a secure external site that has a level of security less than that which Internet Service Monitoring or OpenSSL will tolerate. In some cases, a monitor that was once able to monitor an internet service, may fail after upgrading Internet Service Monitoring because the security levels are incompatible.

The following table lists a subset of cipher suites equivalent to the default value for SSLCipherSuite of AES:3DES:DES:!EXP:!DHE:!EDH with their properties. In the table, you'll see the following terms:

- Cipher Suite Name: Describes the cipher suite using a name constructed from keywords.
- Protocol: Describes the version of the protocol supported.
- Key Exchange: Describes the key exchange system used for encryption and decryption.

- Encryption & Key Length: Describes the type of encryption algorithm used and the length of the key (in bits) used.
- MAC: Describes the Message Authentication Code used to ensure that the data hasn't been tampered with.

| <i>Table 183. Cipher suite name and property values AES:3DES:DES:!EXP:!DHE:!EDH</i> |                 |                     |                       |                                    |                                    |
|---|-----------------|---------------------|-----------------------|------------------------------------|------------------------------------|
| <b>Cipher Suite Name</b>  | <b>Protocol</b> | <b>Key Exchange</b> | <b>Authentication</b> | <b>Encryption &amp; Key Length</b> | <b>Message Authentication Code</b> |
| ECDHE-RSA-AES256-GCM-SHA384   | TLSv1.2         | ECDH                | RSA                   | AESGCM(256)                        | AEAD                               |
| ECDHE-ECDSA-AES256-GCM-SHA384   | TLSv1.2         | ECDH                | ECDSA                 | AESGCM(256)                        | AEAD                               |
| ECDHE-RSA-AES256-SHA384   | TLSv1.2         | ECDH                | RSA                   | AES(256)                           | SHA384                             |
| ECDHE-ECDSA-AES256-SHA384   | TLSv1.2         | ECDH                | ECDSA                 | AES(256)                           | SHA384                             |
| ECDHE-RSA-AES256-SHA  | SSLv3           | ECDH                | RSA                   | AES(256)                           | SHA1                               |
| ECDHE-ECDSA-AES256-SHA  | SSLv3           | ECDH                | ECDSA                 | AES(256)                           | SHA1                               |
| SRP-DSS-AES-256-CBC-SHA   | SSLv3           | SRP                 | DSS                   | AES(256)                           | SHA1                               |
| SRP-RSA-AES-256-CBC-SHA   | SSLv3           | SRP                 | RSA                   | AES(256)                           | SHA1                               |
| SRP-AES-256-CBC-SHA   | SSLv3           | SRP                 | SRP                   | AES(256)                           | SHA1                               |
| DH-DSS-AES256-GCM-SHA384  | TLSv1.2         | DH/DSS              | DH                    | AESGCM(256)                        | AEAD                               |
| ...followed by 61 more rows   |                 |                     |                       |                                    |                                    |

The following table lists a subset of cipher suites equivalent to the value for SSLCipherSuite of AES:3DES:DES:!EXP:!DHE:!EDH:!SSLv2:!SSLv3 with their properties. Some protocols are now eliminated and the overall set of cipher suites has been reduced 71 - 31.

| <i>Table 184. Cipher suite name and property values AES:3DES:DES:!EXP:!DHE:!EDH:!SSLv2:!SSLv3</i> |                 |                     |                       |                                    |                                    |
|---|-----------------|---------------------|-----------------------|------------------------------------|------------------------------------|
| <b>Cipher Suite Name</b>  | <b>Protocol</b> | <b>Key Exchange</b> | <b>Authentication</b> | <b>Encryption &amp; Key Length</b> | <b>Message Authentication Code</b> |
| ECDHE-ECDSA-AES256-GCM-SHA384   | TLSv1.2         | ECDH                | ECDSA                 | AESGCM(256)                        | AEAD                               |
| ECDHE-RSA-AES256-SHA384   | TLSv1.2         | ECDH                | RSA                   | AES(256)                           | SHA384                             |
| ECDHE-ECDSA-AES256-SHA384   | TLSv1.2         | ECDH                | ECDSA                 | AES(256)                           | SHA384                             |
| DH-DSS-AES256-GCM-SHA384  | TLSv1.2         | DH/DSS              | DH                    | AESGCM(256)                        | AEAD                               |

Table 184. Cipher suite name and property values **AES:3DES:DES:!EXP:!DHE:!EDH:!SSLv2:!SSLv3**  
(continued)

| Cipher Suite Name           | Protocol | Key Exchange | Authentication | Encryption & Key Length | Message Authentication Code |
|-----------------------------|----------|--------------|----------------|-------------------------|-----------------------------|
| DH-RSA-AES256-GCM-SHA384    | TLSv1.2  | DH/RSA       | DH             | AESGCM(256)             | AEAD                        |
| DH-RSA-AES256-SHA256        | TLSv1.2  | DH/RSA       | DH             | AES(256)                | SHA256                      |
| DH-DSS-AES256-SHA256        | TLSv1.2  | DH/DSS       | DH             | AES(256)                | SHA256                      |
| ADH-AES256-GCM-SHA384       | TLSv1.2  | DH           | None           | AESGCM(256)             | AEAD                        |
| ADH-AES256-SHA256           | TLSv1.2  | DH           | None           | AES(256)                | SHA256                      |
| ECDH-RSA-AES256-GCM-SHA384  | TLSv1.2  | ECDH/RSA     | ECDH           | AESGCM(256)             | AEAD                        |
| ...followed by 21 more rows |          |              |                |                         |                             |

### Reducing vulnerability

In future releases, the DHE and EDH ciphers will be disabled by default because of vulnerabilities. For previous versions of Internet Service Monitoring, you may need to disable the DHE and EDH ciphers in all monitors. To disable the DHE and EDH ciphers, update the `SSLCipherSuite` and `BridgeSSLCipherSet` monitor properties.

For example, to disable DHE and EDH ciphers in the HTTPS monitor, update the `https.props` file to include the following properties:

```
SSLCipherSuite: AES:3DES:DES:!DES-CBC-SHA:!EXP:!DHE:!EDH
BridgeSSLCipherSet: AES:3DES:DES:!DES-CBC-SHA:!EXP:!DHE:!ED
```

Ensure that you verify that this configuration change doesn't cause any compatibility issues. If you change the default setting after applying this fix, you may expose yourself to a security vulnerability. You should review your entire environment to identify other areas where you have enabled the Diffie-Hellman key-exchange protocol used in TLS and take appropriate mitigation and remediation actions.

### Protocol selection

You can select from a range of historic and current secure communication protocols. They can be individually selected using a set of boolean monitor properties:

- `SSLDisableSSLv2`
- `SSLDisableSSLv3`
- `SSLDisableTLS`
- `SSLDisableTLS11`
- `SSLDisableTLS12`
- `BridgeSSLDisableSSLv2`
- `BridgeSSLDisableSSLv3`

You should disable SSLv2 and SSLv3. These protocols have been compromised and have several known vulnerabilities. They are disabled by default and are only provided for legacy purposes.

Internet Service Monitoring enables TLS by default. If you know that the internet services you're monitoring aren't using TLS 1.0 and have already uplifted to TLS 1.1 or TLS 1.2, you should disable the unused protocols in Internet Service Monitoring.

The Databridge component communicates with the Internet Service Monitoring agent and with each of the monitors. By default, this communication is encrypted and TLS is the preferred protocol.

## Key trust stores and certificates

Internet Service Monitoring stores its certificates in a user-defined file in a user-defined location. All certificates must be stored in Privacy Enhanced Mail (PEM) format. Ensure that public certificates obtained from other organizations are converted to PEM format. Conversion software is available at <http://www.openssl.org>.

Trusted certificates specified using the SSLTrustStoreFile property are stored in the file as a concatenated list.

It is good practice to store Certificate Revocation Lists (CRLs) in the trust store, against which certificates can be validated. Certificate Authorities have systems in place to generate lists of revoked certificates and have distribution systems in place to make them publicly available. Then, if a certificate is compromised, it will be revoked.

## Databridge security settings

All monitors communicate with the Databridge, so all monitors have a common set of properties that should be set to manage communication between the monitors and the Databridge. By default, communication is encrypted. The default encryption protocol is TLS. Unlike monitor properties, there is no mechanism to control if a particular version of TLS is enabled or disabled. All the monitors should have the same values for the Databridge properties, otherwise there will be communication issues. Similarly, the properties set in the Databridge .props file should be consistent with those in the monitors. The Databridge also communicates with the Internet Service Monitoring agent, which has its own .props file. Some of the values in the agent .props are Databridge-related and like monitors, must have values that are consistent with those in the Databridge .props file.

| Table 185. OpenSSL related Databridge properties |                    |   |
|--|--------------------|---|
| Property name                                    | Property parameter | Description   |
| BridgeSSLEncryption                              | 0 1                | Determines whether communication with the Databridge is encrypted or not. This covers all communication from Databridge to Monitors and Internet Service Monitoring agent.<br><br>0 – not encrypted<br>1 – encrypted<br><br><b>Restriction:</b> Set the same value on the Internet Service Monitoring agent, all monitors, and the Databridge.  |
| BridgeSSLCipherSet                               | string             | Specifies the cipher suites to use for SSL operations to and from the Databridge. Values for this property should be in the form recommended by OpenSSL.<br><br><b>Restriction:</b> Set the same value on the Internet Service Monitoring agent, agent, all monitors, and the Databridge.<br><br>Default: AES : 3DES : DES : !EXP : !DHE : !EDH |

Table 185. OpenSSL related Databridge properties (continued)

| Property name                   | Property parameter | Description  |
|---------------------------------|--------------------|--|
| <b>BridgeSSLDisableSSLv2</b>    | 0 1                | <p>Determines which type of secure connection to make to and from the Databridge.</p> <p>0 – SSLv2 and SSLv3 are allowed<br/>1 – SSLv2 is NOT allowed</p> <p><b>Restriction:</b> Set the same value on the Internet Service Monitoring agent, all monitors, and the Databridge.</p> <p>Default: 1 (SSLv2 NOT allowed).</p> |
| <b>BridgeSSLDisableSSLv3</b>    | 0 1                | <p>Determines which type of secure connection to make to and from the Databridge.</p> <p>0 – SSLv3 is allowed<br/>1 – SSLv3 is NOT allowed</p> <p><b>Restriction:</b> Set the same value on the Internet Service Monitoring agent, all monitors, and the Databridge.</p> <p>Default: 1 (SSLv3 NOT allowed).</p>            |
| <b>BridgeSSLCertificateFile</b> | string             | <p>The path and filename of the digital Databridge SSL certificate.</p> <p>Default: \$ISMHOME/certificates/bridgeCert.pem</p>  |
| <b>BridgeSSLKeyFile</b>         | string             | <p>The path and filename of the Databridge SSL private key file.</p> <p>Default: \$ISMHOME/certificates/bridgeKey.pem</p>  |
| <b>BridgeSSLKeyPassword</b>     | string             | <p>The password used to encrypt the Databridge SSL private key.</p> <p>Default: <b>Tivoli</b></p>  |

Table 185. OpenSSL related Databridge properties (continued)

| Property name                    | Property parameter | Description   |
|----------------------------------|--------------------|---|
| <b>BridgeSSLTrustStore</b>       | string             | <p>The path and file name of the Trusted certificate file for authentication. This is only required when using the <b>BridgeSSLAuthenticatePeer</b> property.</p> <p>Default: \$ISMHOME/certificates/trust.pem</p> <p>If you want to configure SSL authentication between a monitor and Databridge, or between the Databridge and the agent, set BridgeSSLAuthenticatePeer to 1 and restart the Databridge. This action authenticates the certificates from the server. You can store certificates in both the SSLTrustStoreFile and the SSLTrustStorePath.</p> <p>Defaults:</p> <ul style="list-style-type: none"> <li>• SSLTrustStoreFile, \$ISMHOME/certificates/trust.pem</li> <li>• SSLTrustStorePath, \$ISMHOME/certificates/</li> </ul> <p>To add new certificates, complete one of the following steps:</p> <ul style="list-style-type: none"> <li>• Add a certificate to the end of the list in the SSLTrustStoreFile text file</li> <li>• Add a new certificate to the SSLTrustStorePath directory, and run the OpenSSL <b>c_rehash certificate_dir</b> command to hash the certificates</li> </ul> |
| <b>SSLTrustStoreFile</b>         | string             | This property is used by secure monitors and the Databridge. See <a href="#">Table 182 on page 513</a> for more information.  |
| <b>SSLTrustStorePath</b>         | string             | This property is used by secure monitors and the Databridge. See <a href="#">Table 182 on page 513</a> for more information.  |
| <b>BridgeSSLAuthenticatePeer</b> | 0 1                | <p>Specifies whether the Databridge should cross-authenticate with other Internet Service Monitoring components.</p> <p>0 – disabled<br/>1 – enabled</p> <p>If a monitor contacts the Databridge, it must authenticate with the Databridge, and the Databridge must authenticate with the monitor.</p> <p>If the Internet Service monitoring agent contacts the Databridge, it must authenticate with the Databridge, and the Databridge must authenticate with the agent.</p> <p>Certificates for the Databridge are stored in the BridgeSSLTrustStore.</p> <p>Default: 0 - disabled</p>   |

## Internet Service Monitoring agent properties

The Internet Service Monitoring has its own properties file ,which contains a set of security properties and settings. The agent properties file doesn't communicate with the monitors, but it does communicate with the Databridge, so the security settings in the agent's . props file manage communication between the agent and the Databridge.

## Configuring the agent on Windows systems

You can configure the agent on Windows systems by using the **IBM Performance Management** window.

### Procedure

Configure Internet Service Monitoring Agent on the user system as follows.

To manually configure the Internet Service Monitoring agent on user systems:

1. On the **IBM Performance Management dashboard**, click **System configuration > Agent configuration** that is listed under **System Configuration**.
2. Click **ISM** tab to open the Internet Service Monitoring Agent dashboard.

## Configuring Databridge

Configuring the Databridge involves setting properties for the Databridge that control its operation such as the connection of the component modules and the internet service monitors.

### Operation and configuration

The Databridge and its component modules are configured through properties files.

The properties determine the operation of the Databridge and its component modules that sends test results to IBM Cloud Application Performance Management for reporting on Internet Service Monitoring Agent dashboard.

### Configuring the Databridge

The Databridge must be configured to receive data from the Internet Service Monitors and to forward that data to its component modules for further processing.

The following table lists the files associated with the Databridge. The **Properties file**, **Store And Forward file**, and **Log file** are described in more detail in the appropriate sections.

| Table 186. Databridge files and their location |   |
|--|---|
| Databridge file                                | Location or name  |
| Executable file                                | \$ISHOME/platform/arch/bin/nco_m_bridge   |
| Properties file                                | \$ISHOME/etc/props/bridge.props   |
| Store and Forward file                         | Name and location are specified by properties in the bridge.props file. The default name and location is \$ISHOME/var/sm_bridge.saf |
| Log file                                       | \$ISHOME/log/bridge.log   |
| Error log file                                 | \$ISHOME/log/bridge.err   |

### Store And Forward file

If the Databridge is unable to forward data to Netcool/OMNIbus , it stores all of the data it would normally send in a Store And Forward (SAF) file. When Netcool/OMNIbus becomes available again, it processes all of the events stored in the SAF file.

The QFile and QSize properties in the Databridge properties file determine the name, location and operation of the store and forward processing.

### Log file

The Databridge sends daily messages about its operations to a message log file. By default, the name of this file is `$ISHOME/log/bridge.log`. It is updated at 12 midnight. The Databridge properties `MsgDailyLog` and `MsgTimeLog` control the operation of message logging.

### Starting the Databridge

Starting the Databridge using the Windows Services console.

### Procedure

**Note:** If the ObjectServer module is connected to the Databridge, ensure that its target system is running before starting the Databridge. If any of the Databridge modules fails to initialize correctly, the Databridge won't start.

1. From the Windows desktop, click **Start > Administrative Tools > Services**.
2. From the list of services, select the service named NCO BRIDGE Internet Service Monitor and click **Start** from the menu.

### Connecting modules

The Databridge properties file defines the modules to connect to the Databridge.

### About this task

Each Module *n* `SharedLib` and Module *n* `PropFile` property pair defines the connection for one module. Modules are loaded in order of definition, starting from Module0.

### Procedure

1. To connect individual modules to the Databridge:
  - a) In the Databridge properties file, identify the next available Module *n* `SharedLib` and Module *n* `PropFile` property pair.
  - b) Set Module *n* `SharedLib` to the name of the module's shared library (its binary implementation).
  - c) Set Module *n* `PropFile` to the full path of the module's properties file.

In this example, lines 1 and 2 connect the ObjectServer module, lines 3 and 4 connect the Datalog module, lines 5 and 6 connect the IBM Application Performance Management (pipe) module. The Datalog module doesn't have a properties file, so the entry for the properties file has the value `" "`.
2. To disable a module:
  - a) Set the corresponding Module *n* `SharedLib` property to `"NONE"` and the Module *n* `PropFile` property to `" "`. All other modules that have a value higher than *n* are also ignored.

### Connecting monitors

Internet service monitors get connected to the Databridge over TCP. Each monitor has a set of properties that configures the connection to the Databridge.

### About this task

To connect a monitor to the Databridge, set the value of the `BridgePort` property defined in the monitor's properties file to the value of the `SocketPort` property defined in the Databridge properties file. The default value of each monitor's `BridgePort` property and the Databridge's `SocketPort` property is 9510.

The databridge supports SSL encryption of the test results that it receives from the monitors. To encrypt a monitor's test results, set the values of the `BridgeSSL` properties defined in the monitor's properties file to the values of the `BridgeSSL` properties defined in the Databridge properties file. To encrypt all monitors' test results, all monitors must have the same `BridgeSSL` properties.

## Configuring Databridge module

The Databridge directs test results to the Internet Service Monitoring Agent. The monitoring agent converts this data to the required format and distributes it to the IBM Application Performance Management Server. Configure the Databridge module and the Internet service monitoring agent through their respective properties files.

Configure the operation of the Databridge by modifying the property values defined in the module properties file.

The module properties file is named `pipe_module.props`. This file is located in the `$ISHOME/etc/props/` directory.

Following table lists the properties available for the module. If changes are made to the properties, restart the Databridge for those changes to take effect.

| Table 187. Databridge module properties |         |  |
|---|---------|--|
| Property name                           | Type    | Description  |
| TEMAHOST                                | string  | The name of the host running the monitoring agent.<br>Default: localhost |
| TEMAPORT                                | integer | The port number used by the host.<br>Default: 9520                       |

You configure the operation of the Internet service monitoring agent by modifying the property values defined in the monitoring agent properties file.

The monitoring agent properties file is named `kisagent.props`. This file is located in the `$ISMHOME/etc/props/` directory.

The following table lists the properties available for the monitoring agent.

| Table 188. Monitoring agent properties |         |   |
|--|---------|---|
| Property name                          | Type    | Description   |
| TEMAPORT                               | integer | The port number used by the host. This must be the same as the port number for the TEMAPORT property listed in the module properties file.<br>Default: 9520   |
| ObsoleteDuration                       | integer | The time, in seconds, after which any data that hasn't been updated is deleted from the monitoring agent's memory. Data might not be updated when, for example, a profile element has been stopped or a network failure has occurred.<br><b>Note:</b> Don't set the ObsoleteDuration time to a value less than the poll interval because this results in loss of data between poll intervals.<br>Default: 900 |

Table 188. Monitoring agent properties (continued)

| Property name  | Type    | Description   |
|----------------|---------|---|
| AggDuration    | integer | <p>The time, in seconds, after which the monitoring agent stops data from being aggregated and reported on the agent dashboard. Any data that is older than the specified time is deleted from the monitoring agent's memory.</p> <p>Old data is calculated by comparing the interval between the start and the current time to the aggregate duration time. If the interval is greater than the aggregate duration time, 10 percent of the old data is removed and the start time is increased by 1/10th of the interval. The monitoring agent calculates this every 5 minutes.</p> <p>Default: 3600</p> |
| ManageServices | 0 1     | <p>Starts and stops all monitors and the Databridge when the Internet Service Monitoring agent is started or stopped. 1 is enabled, and 0 is disabled.</p> <p>Default: 1</p>  |

The connection between the Internet service monitoring agent and the Databridge module is created when you install Internet Service Monitoring.

## Enabling Netcool/OMNIBus

Follow these steps to enable the Tivoli Netcool/OMNIBus to send the events from Internet Service Monitoring to Netcool/OMNIBus.

### Before you begin

Ensure that you installed IBM Tivoli Netcool/OMNIBus.

### Procedure

Complete the following steps to enable the Netcool/OMNIBus:

1. Stop the Internet Service Monitoring by using the following command:

```
$CANDLEHOME/bin/ism-agent.sh stop
```

2. Open the `bridge.props` file that is placed at `$ISMHOME/etc/props` path and update the file with following code snippet:

```
Module0SharedLib : "libSModulePipe"
Module0PropFile : "$ISMHOME/etc/props/pipe_module.props"
Module1SharedLib : "libSModuleObjectServer"
Module1PropFile : "$ISMHOME/etc/props/objectserver.props"
```

3. Modify the permission of `8.1.0` directory placed at `$ISMHOME/objectserver` path as follows:

```
cd $ISMHOME/objectserver/
chmod -R 777 8.1.0
```

**Note:** Modify the permission of all the files inside `8.1.0` directory by using `chmod -R 777 <file-name>` command. Where `<file-name>` is the name of file inside `8.1.0` directory.

4. Modify the `omni.dat` file placed at `$ISMHOME/objectserver/8.1.0/etc` path to configure Netcool/OMNIBus server address.

5. Run `nco_igen` from the following location:

```
cd $ISMHOME/objectserver/8.1.0/bin
./nco_igen
```

6. Start the Internet Service Monitoring by using the following command:

```
$CANDLEHOME/bin/ism-agent.sh start
```

7. Verify that Internet Service Monitoring, Databridge and all the monitors are in running state.

To check the status of Databridge and monitors, run the following command:

```
ps -aef|grep -i nco_*
```

To check the status of Internet Service Monitoring, run the following command:

```
ps -aef|grep -i kis
```

8. Use the IBM Tivoli Netcool/OMNIBus user interface to verify that Databridge sends the data to Netcool/OMNIBus server.

Data must be displayed for Internet Service Monitoring on the IBM Application Performance Management user interface.

## Migration support

Support of two standalone utilities Properties Migration and Profile Migration are available for Internet Service Monitoring agent version 8.1.4.0.12 and onward. These utilities are developed for migration of agent properties and Internet Services configurations from legacy versions of Internet Service Monitoring agent such as 2.4 and ITM to APM version of the agent.

For more information about the utilities, refer [Properties Migration and Profiles Migration utilities of Internet Service Monitoring](#).

## Configuring J2SE monitoring

To collect resource monitoring and diagnostic data from the on-premises Java applications that are being monitored, you must configure the J2SE data collector.

### Before you begin

Install one of the supported Java runtimes:

- Oracle Java Platform Standard Edition 7 (Java SE Development Kit 7)

**Remember:** This Java Runtime does not support the J2SE data collector image that is configured with HTTPS protocol.

- Oracle Java Platform Standard Edition 7 (Java SE Runtime Environment 7)

**Remember:** This Java Runtime does not support the J2SE data collector image that is configured with HTTPS protocol.

- Oracle Java Platform Standard Edition 8 (Java SE Development Kit 8)
- Oracle Java Platform Standard Edition 8 (Java SE Runtime Environment 8)
- IBM SDK, Java Technology Edition, Version 7
- IBM SDK, Java Technology Edition, Version 8

**Important:** For Windows server 2016, install JDK 8, update 131 (Java SE Development Kit 8u131), or Java SE Development Kit 7, and update 80 (JDK 7u80).

For more information about system requirements, see [Software Product Compatibility Reports for J2SE data collector](#).

## About this task

You can configure the J2SE data collector on Windows, Linux, and AIX systems.

The directions here are for the most current release of this agent. For information about how to check the version of an agent in your environment, see [Agent version command](#). For detailed information about the agent and data collector version list and what's new for each version, see the ["Change history" on page 58](#).

## Procedure

1. Copy the following files from the APM installer to a directory:

**Important:** The directory path must not have any spaces.

- **Windows** Copy the `gdc.zip` file from the APM installer to a directory, and extract it.
- **Linux** **UNIX** Copy the `gdc-apd.tar.gz` file from the APM installer to a directory, and extract it.
- **Linux** **UNIX** Provide read/write and execute permissions to the user for the `j2se_dc` folder. Execute permission is provided to run scripts and JAR files in the folder. Read/write permission is provided because the deep-dive diagnostics files are generated in this folder.

2. On the command line, go to `DCHOME\.gdc<toolkit_version>\bin`

Where *toolkit\_version* is,

- For V8.1.4.0 and earlier, *toolkit\_version* is 7.3.0.5.0.
- For V8.1.4.0.1 and later, *toolkit\_version* is 7.3.0.14.0.

3. Run the following command:

**Windows** `config.bat`

**Linux** **UNIX** `config.sh`

4. When you are prompted, specify the path to Java Home, and press **Enter**.

For example,

**Windows** `C:\Program Files\jre7`

**Linux** **UNIX** `/opt/ibm/java`

5. Complete the following steps for the agent version that you use:

- For V8.1.4.0.2 and earlier, complete the following steps:
  - a. When you are prompted, enter the full name (qualified name) of the main class of application, and press **Enter**. The main class is the entry point of the application that needs to be monitored. Example: `testapp.TemperatureConveter`
  - b. When you are prompted, enter a distinct application alias name, and press **Enter**. The name that you enter here is used to create the instance name on the APM dashboard.

**Windows** The `dcstartup.bat` file is generated at the following location: `DCHOME\.gdc<toolkit_version>\runtime\j2seapplication_alias.hostname.application_alias`. This file is the script to run your application along with the data collector.

**Linux** **UNIX** The `dcstartup.sh` file is generated at the following location: `DCHOME/.gdc/toolkit_version/runtime/j2seapplication_alias.hostname.application_alias`. This file is the script to run your application along with the data collector.

- For V8.1.4.0.3 to V8.1.4.0.5, complete the following steps
  - a. When prompted, enter the home directory of Java application. For example, `/root/J2seApp/`
  - b. Select a Java application from the list that is provided to you and then Exit.

- com.ibm.SampleApplication
- com.ibm.DBApplication
- com.ibm.SpringBootApplication

Select any application that is provided in the list or provide 0 to select any other application that is not in the list.

- i) If you provide 0, enter full name of Main class of any other application. For example, com.ibm.testApp.Main
- ii) If you select any option from the provided list, alias name is created based on the class name. If the alias name exceeds the character limit, then provide the alias name within the character limit.

**Important:** The maximum character limit for alias name is calculated in such a way that alias\_name + host\_name does not exceed 24 characters.

- c. Select the option to enable or disable Transaction Tracking. The default value is Yes.
  - d. Select the option to enable or disable Diagnostics data collection. The default value is Yes.
    - i) If you select Yes, then select the option to Method Trace mode. The default value is No.
  - e. If you select an option from the list that is provided in Step b, copy the startup script <DCHOME>/j2se\_dc/.gdc/toolkit\_version/runtime/j2se<application\_alias>.<hostname>.<application\_alias> to the location of your choice.
- For V8.1.4.0.6 and later, complete the following steps:
    - a. When prompted, enter the home directory of Java application. For example, /root/J2seApp/
    - b. Select the application type that you want to monitor.
      - Java Application
      - Jetty Server
    - c. If you select the application type as *Java Application*, then follow the steps that are mentioned in section V8.1.4.0.3 to V8.1.4.0.5 of Step 5.
    - d. If you select the application type as *Jetty Server*, then follow these steps:
      - i) Enter the Jetty Home directory. For example, /home/jetty/jetty-distribution-9.4.12.v20180830
      - ii) Enter the Alias name. If the alias name exceeds the character limit, then provide the alias name within the character limit.

**Important:** If you select the application type as *Java Application* and any option from the list in Step b of section V8.1.4.0.3 to V8.1.4.0.5, then copy the startup script <DCHOME>/j2se\_dc/.gdc/toolkit\_version/runtime/j2se<application\_alias>.<hostname>.<application\_alias> to the location of your choice.
    - e. If the selected type is *Jetty Server*, then dcstartup.bat/dcstartup.sh is copied into the given Jetty Home directory.
  - For V8.1.4.0.7, complete the following steps:
    - If you configure J2SE data collector by using the Open JDK version 9 or later and when you enter the path to Java Home, a warning displays with the content as follows:

**Warning:**

```
WARNING: An illegal reflective access operation has occurred
WARNING: Illegal reflective access by jnr.posix.JavalibCHelper
(file:/root/testopen/preconf-13march/j2se_dc/.gdc/7.3.0.14.0/
bin/lib/jython.jar)to method sun.nio.ch.SelChImpl.getFD()
WARNING: Please consider reporting this to the maintainers of
```

```
jnr.posix.JavaLibCHelper
WARNING: Use --illegal-access=warn to enable warnings of next
illegal reflective access operations
WARNING: All illegal access operations will be denied in next
release Mar 15, 2019 11:35:06 AM
org.python.netty.util.internal.PlatformDependent <clinit>
INFO: Your platform does not provide complete lowlevel API for
accessing direct buffers reliably.
Unless explicitly requested, heap buffer is always preferred
to avoid potential system instability.
```

However, the J2SE data collector works correctly and you can ignore the warning.

For V8.1.4.0.2 and earlier versions, follow step 6 to modify **Windows** `dcstartup.bat` or **Linux** **UNIX** `dcstartup.sh` file.

6. To modify the **Windows** `dcstartup.bat` or **Linux** **UNIX** `dcstartup.sh` file, complete the following steps:
  - If the application classes and JAR files are bundled in a single JAR file, complete the following steps:
    - a. Open the following file:
      - **Windows** `dcstartup.bat`
      - **Linux** **UNIX** `dcstartup.sh`
    - b. Replace `-cp .:$classpath:$Classpath $ITCAM_JVM_OPTS full name of the main class` with `$ITCAM_JVM_OPTS -jar Application jar file` and save the file.
  - If the application is using multiple JAR files, complete the following steps:
    - a. Open the following file:
      - **Windows** `dcstartup.bat`
      - **Linux** **UNIX** `dcstartup.sh`
    - b. Set the `CLASSPATH` variable to the JAR files.
    - c. Replace `-cp .:$classpath:$Classpath $ITCAM_JVM_OPTS full name of the main class` with `-cp .:$classpath:$Classpath $ITCAM_JVM_OPTS -jar Application jar file` and save the file.

The application JAR file must contain the main application class.

**Note:** To modify **Windows** `dcstartup.bat` or **Linux** **UNIX** `dcstartup.sh` file for V8.1.4.0.3 to V8.1.4.0.5 and V8.1.4.0.6 to later (If the Application type is selected as *Java Application*) versions, follow step 7.

7. Complete following steps when your application is using multiple JAR files.
  - a) Open the following file:
    - **Windows** `dcstartup.bat`
    - **Linux** **UNIX** `dcstartup.sh`
  - b) Set the `CLASSPATH` variable to the JAR files.
  - c) For V8.1.4.0.7, if you configure the J2SE data collector with Java 9 or 10 and if you use the SSL connection for APM connectivity, then the Transaction Tracking data is not displayed. To resolve the issue, you can add the flag **--add-modules java.xml.bind** to the last line of `dcstartup.bat` or `dcstartup.sh` file.

For example,

- If the Application is a jar file, then update the last line as follows:

```
PathToJava --add-modules java.xml.bind --add-opens=
jdk.management/com.sun.management.internal=
```

```
ALL-UNNAMED -jar $Classpath $ITCAM_JVM_OPTS AppJarName.jar
```

- If the Application is not bundled in a jar file, then update the last line as follows:

```
PathToJava --add-modules java.xml.bind --add-opens=  
jdk.management/com.sun.management.internal=ALL-UNNAMED -cp  
.:$classpath:$Classpath $ITCAM_JVM_OPTS FullyQualifiedClassName
```

8. To enable deep-dive diagnostics monitoring, edit the `custom_request.xml` with the J2SE specific classes and methods that you want to monitor. You can do so by two ways: manual and automated process.

To automatically populate the `custom_request.xml` with the J2SE application-specific classes and methods:

- a) Go to the `<DCHOME>/j2se_dc/.gdc/7.3.0.14.0/runtime/j2se<application_alias>.<hostname>.<application_alias>/` directory and open the `dc.properties` file.
- b) Enable the `is.auto.update.custom_requests.xml` property by setting its value to `true` and save the file.
- c) Run commands from step 9.
- d) Stop the data collector after 10 to 15 minutes.
- e) Check whether the `<DCHOME>/j2se_dc/.gdc/7.3.0.14.0/runtime/j2se<application_alias>.<hostname>.<application_alias>/custom/custom_requests.xml` is populated with the custom methods and classes.
- f) Remove the unwanted entries and open the `dc.properties` file again.
- g) Disable the `is.auto.update.custom_requests.xml` property by setting its value to `false` and save the file.
- h) Run commands from step 9.

**Note:** If some of the custom methods from the application are not auto-discovered, then you need to add the custom methods manually.

To manually populate the `custom_request.xml`:

- a) Go to `<DCHOME>/j2se_dc/.gdc/7.3.0.14.0/runtime/j2se<application_alias>.<hostname>.<application_alias>/custom/custom_requests.xml` and edit the `custom_request.xml`.

For example,

```
<edgeRequest>  
<requestName>truncateDb</requestName>  
<Matches>testApp.JDBC.DBManager</Matches>  
<type>application</type>  
<methodName>truncateDb</methodName>  
</edgeRequest>
```

- b) Add the application-specific classes and methods.
9. Run the following command:

**Windows** `dcstartup.bat`

**Linux** | **UNIX** `dcstartup.sh`

**Note:** If the selected application type is *Jetty Server*, then run the `dcstartup.bat/dcstartup.sh` present in the Jetty Home directory.

The J2SE application is started along with the configured data collector.

## What to do next

Log in to the Cloud APM console to view the data that is collected by the data collector in the dashboards. For information about using the console, see [“Starting the Cloud APM console” on page 1109](#).

For help with troubleshooting, see the [Troubleshooting](#) section.

## Checking the Status of Transaction Tracking and Diagnostics data collection

For V8.1.0.3 and later, on the agent configuration page, you can check the status of the transaction tracking and diagnostics data.

### About this task

You can check the status of transaction tracing and diagnostic data collection with the help of two commands. Refer the procedure to know about these commands.

### Procedure

1. Use **config status** command.

- a) Open the bin directory. Issue the command

```
Linux | UNIX cd <DCHOME>/j2se_dc/.gdc/toolkit_version/bin/
Windows cd <DCHOME>\j2se_dc\.gdc\toolkit_version\bin\
```

Where *toolkit\_version* is,

- For V8.1.4.0 and earlier, *toolkit\_version* is 7.3.0.5.0.
- For V8.1.4.0.1 and later, *toolkit\_version* is 7.3.0.14.0.

- b) Enter the following command to check status

```
Linux | UNIX config.sh status
Windows config.bat status
```

- c) Select the Java Applications with alias name that are identified, from the list to check their status, or select exit.

- i) ddperf
- ii) Main
- iii) Exit

2. Use **config status <application\_alias\_name>** command.

- a) Enter the following command to open a directory

```
Linux | UNIX cd <DCHOME>/j2se_dc/.gdc/7.3.0.14.0/bin/
Windows cd <DCHOME>\j2se_dc\.gdc\7.3.0.14.0\bin\
```

- b) Enter the following command to check status

```
Linux | UNIX config.sh status <application_alias_name>
Windows config.bat status <application_alias_name>
```

## Changing the Status of Transaction Tracking and Diagnostics data collection

For V8.1.0.3 and later, on the agent configuration page, you can change the status of the transaction tracking and diagnostics data.

### About this task

You can change the status of transaction tracing and diagnostic data collection with the help of command prompt. Refer the following procedure to know about these commands.

## Procedure

1. Open the bin directory and run the following command:

```
Linux | UNIX cd <DCHOME>/j2se_dc/.gdc/toolkit_version/bin/
Windows cd <DCHOME>\j2se_dc\.gdc\toolkit_version\bin\
```

Where *toolkit\_version* is,

- For V8.1.4.0 and earlier, *toolkit\_version* is 7.3.0.5.0.
- For V8.1.4.0.1 and later, *toolkit\_version* is 7.3.0.14.0.

2. To check the status, enter the following command:

```
Linux | UNIX config.sh <application_alias_name>
Windows config.bat <application_alias_name>
```

3. When prompted select the option to enable or disable Transaction Tracking. Default is Yes.
4. When prompted select the option to enable or disable Diagnostics data collection. Default is Yes.
  - a) If Yes, then select the option to enable/disable Method Trace. Default is NO.

## Configuring JBoss monitoring

The Monitoring Agent for JBoss monitors the resources of JBoss application servers and the JBoss Enterprise Application platform. Use the dashboards that are provided with the JBoss agent to identify the slowest applications, slowest requests, thread pool bottlenecks, JVM heap memory and garbage collection issues, busiest sessions, and other bottlenecks on the JBoss application server.

### Before you begin

- The product version and the agent version often differ. The directions here are for the most current release of this agent. To access the documentation for earlier agent releases, see the [Table 189 on page 531](#) table.

| Table 189. Agent versions |   |
|---------------------------|---|
| Agent version             | Documentation   |
| 1.0.3.3                   | <a href="#">Cloud APM 8.1.4</a>                               |
| 1.0.3.1                   | <a href="#">IBM Performance Management 8.1.3</a> <sup>1</sup> |
| 1.0.2.11                  | <a href="#">IBM Performance Management 8.1.2</a> <sup>1</sup> |

<sup>1</sup> The link opens an on-premises IBM Knowledge Center topic.

- Make sure that the system requirements for the JBoss agent are met in your environment. For the up-to-date system requirement information, see the [Software Product Compatibility Reports \(SPCR\) for the JBoss agent](#).
- Before you configure the JBoss agent, the JBoss server first must be configured by completing the following tasks.
  1. “Enable JMX MBean server connections” on page 533.
  2. “Add a JBoss server management user” on page 534.
  3. “Enabling Web/HTTP Statistic Collection” on page 535. This procedure is for JBoss EAP version 7.x and WildFly versions 8.x, 9.x and 10.x.

### About this task

The Managed System Name includes the instance name that you specify, for example, *instance\_name: host\_name: pc*, where *pc* is your two character product code. The Managed System Name is limited to 32 characters.

The instance name that you specify is limited to 28 characters minus the length of your host name. For example, if you specify JBoss as your instance name, your managed system name is JBoss:hostname:JE.

**Note:** If you specify a long instance name, the Managed System name is truncated and the agent code does not display correctly.

The JBoss agent is a multiple-instance agent. You must create an agent instance for each JBoss server you monitor, and start each agent instance manually.

Transaction tracking capability is available for the JBoss agent in the Cloud APM, Advanced offering.

- To enable transaction tracking for a new agent instance, complete [step 1](#) or [step 2](#) of this procedure, then follow the procedure to [“Setup the JBoss agent transaction tracking or diagnostics data collector”](#) on [page 543](#).
- To enable transaction tracking for an agent instance that is already configured for basic monitoring, follow the procedure to [“Setup the JBoss agent transaction tracking or diagnostics data collector”](#) on [page 543](#).
- To disable transaction tracking for an agent instance, follow the procedure to [“Disable the JBoss agent transaction tracking data collector”](#) on [page 546](#).
- To uninstall transaction tracking for all agent instances and remove the transaction tracking toolkit, follow the procedure to [“Uninstall all JBoss agent transaction tracking”](#) on [page 547](#).

## Procedure

1. Configure the agent on Windows systems by using the **IBM Performance Management** window or by using the silent response file.
  - [“Configuring the agent on Windows systems”](#) on [page 537](#).
  - [“Configuring the agent by using the silent response file”](#) on [page 540](#).
2. Configure the agent on Linux systems by running command line script and responding to prompts, or by using the silent response file.
  - [“Configuring the agent by responding to prompts”](#) on [page 539](#).
  - [“Configuring the agent by using the silent response file”](#) on [page 540](#).
3. Optional: Configure transaction tracking by configuring individual agent instances to provide transaction tracking data and configuring your Application Performance Dashboard to display transaction tracking data.
  - a) Follow the procedure to [“Setup the JBoss agent transaction tracking or diagnostics data collector”](#) on [page 543](#).
  - b) Enable the transaction tracking data in the Application Performance Dashboard for the JBoss agent.
    - i) From the navigation bar, click  **System Configuration > Agent Configuration**. The **Agent Configuration** page is displayed.
    - ii) Select the **JBoss** tab.
    - iii) Select the check boxes for the JBoss server agent instances that you want to monitor and take one of the following actions from the **Actions** list:
      - To enable transaction tracking, click **Set Transaction Tracking > Enabled**. The status in the **Transaction Tracking** column is updated to *Enabled*.
      - To disable transaction tracking, click **Set Transaction Tracking > Disabled**. The status in the **Transaction Tracking** column is updated to *Disabled*.
    - c) View the JBoss agent transaction tracking data dashboards by adding the JBoss agent instance to an application in your Application Performance Dashboard.  
For more information about using the Applications editor, see [Managing applications](#).
    - d) Ensure that user accounts are assigned to a role that includes the Diagnostic Dashboard permission to have access to the following JBoss agent transaction tracking Application Dashboard buttons.

Otherwise, these buttons are disabled for that user in the Application Dashboard.

- i) The **Diagnose** drill-down button on the **Slowest 5 Response Time** widget.
- ii) The **Inflight Requests** button on the **Applications** widget.

**Note:** Transaction tracking capability is available for the JBoss agent in the Cloud APM, Advanced offering. For the JBoss agent with basic resource monitoring capability, which is in the Cloud APM, Base offering, skip this step.

## What to do next

In the Cloud APM console, go to your Application Performance Dashboard to view the data that was collected. For more information about using the Cloud APM console, see [“Starting the Cloud APM console”](#) on page 1109.

If you are unable to view the data in the agent dashboards, first check the server connection logs and then the data provider logs. The default paths to these logs are as follows.

- **Linux** /opt/ibm/apm/agent/logs
- **Windows** C:\IBM\APM\TMAITM6\_x64\logs

For help with troubleshooting, see the [Cloud Application Performance Management Forum](#).

## Enable JMX MBean server connections

Before the JBoss agent can gather data from the JBoss server, Java Management Extensions (JMX) MBean server connections must be enabled.

### Procedure

Follow the steps for your JBoss server release and version.

- Configure EAP 5.2.

Make a backup copy of the `run.conf` file, then add the following lines to it:

```
JAVA_OPTS="$JAVA_OPTS -Djboss.platform.mbeanserver"
JAVA_OPTS="$JAVA_OPTS -Dcom.sun.management.jmxremote"
JAVA_OPTS="$JAVA_OPTS -Dcom.sun.management.jmxremote.ssl=false"
JAVA_OPTS="$JAVA_OPTS -Dcom.sun.management.jmxremote.authenticate=false"
JAVA_OPTS="$JAVA_OPTS -Dcom.sun.management.jmxremote.port=1090"
JAVA_OPTS="$JAVA_OPTS -Djavax.management.builder.initial=
org.jboss.system.server.jmx.MBeanServerBuilderImpl"
```

- Configure AS 6.x.

Specify the bind address as a parameter when you start the JBoss server.

- **Linux** `jboss_server_home/bin/run.sh -b Ip_address`
- **Windows** `jboss_server_home\bin\run.bat -b <Ip_address>`

where `jboss_server_home` is the JBoss server installation directory.

For example, if the bind address is 10.77.9.250:

```
/apps/wildfly-9.0.2.Final/bin/run.sh -b 10.77.9.250
```

- Configure all other supported versions.

JBoss and WildFly servers are installed with their JMX ports disabled for remote management by default. You must change the configuration of the JBoss server to allow remote management. You must edit the `jboss_server_home/standalone/configuration/standalone.xml` to allow remote management.

- a) Make a backup copy of `jboss_server_home/standalone/configuration/standalone.xml` file.

Where *jboss\_server\_home* is the JBoss server installation directory.

b) Allow remote configuration.

Search for `urn:jboss:domain:jmx` and within its subsystem section, make sure that the `remoting-connector` entry has `use-management-endpoint="true"`.

Example result.

```
<subsystem xmlns="urn:jboss:domain:jmx:1.3">
    <expose-resolved-model/>
    <expose-expression-model/>
    <remoting-connector use-management-endpoint="true"/>
</subsystem>
```

c) Allow remote connections.

Find where the interfaces are defined and replace 127.0.0.1 (loopback) with the external IP on the server to bind to. Do not bind to 0.0.0.0.

Example before replacement.

```
<interfaces>
    <interface name="management">
        <inet-address value="${jboss.bind.address.management:127.0.0.1}"/>
    </interface>
    <interface name="public">
        <inet-address value="${jboss.bind.address:127.0.0.1}"/>
    </interface>
    ...
```

Example after the replacement if the external IP address is 192.168.101.1.

```
<interfaces>
    <interface name="management">
        <inet-address value="${jboss.bind.address.management:192.168.101.1}"/>
    </interface>
    <interface name="public">
        <inet-address value="${jboss.bind.address:192.168.101.1}"/>
    </interface>
    ...
```

## Add a JBoss server management user

Before the JBoss agent can gather data from the JBoss server, a management user must be added if one does not exist.

### Procedure

Use the JBoss **add-user** script to add a management user.

1. Go to the binary or `bin` directory under the JBoss server installation directory.
2. Run the **add-user** script.

- **Linux** `./add-user.sh`
- **Windows** `add-user.bat`

3. Follow the prompts to generate a management user.

### Example

```
root@jboss-wf10-rh7:/apps/wildfly-10.0.0.Final/bin
] ./add-user.sh

What type of user do you wish to add?
a) Management User (mgmt-users.properties)
b) Application User (application-users.properties)
(a): a

Enter the details of the new user to add.
```

```

Using realm 'ManagementRealm' as discovered from the existing property files.
Username : MyAdmin
Password recommendations are listed below. To modify these restrictions edit the add-
user.properties
configuration file.
- The password should be different from the username
- The password should not be one of the following restricted values {root, admin,
administrator}
- The password should contain at least 8 characters, 1 alphabetic character(s), 1 digit(s),
1 non-alphanumeric symbol(s)
Password :
Re-enter Password :
What groups do you want this user to belong to? (Please enter a comma separated list, or leave
blank
for none)[ ]:
About to add user 'MyAdmin' for realm 'ManagementRealm'
Is this correct yes/no? yes
Added user 'MyAdmin' to file '/apps/wildfly-10.0.0.Final/standalone/configuration/mgmt-
users.properties'
Added user 'MyAdmin' to file '/apps/wildfly-10.0.0.Final/domain/configuration/mgmt-
users.properties'
Added user 'MyAdmin' with groups to file
'/apps/wildfly-10.0.0.Final/standalone/configuration/mgmt-groups.properties'
Added user 'MyAdmin' with groups to file
'/apps/wildfly-10.0.0.Final/domain/configuration/mgmt-groups.properties'
Is this new user going to be used for one AS process to connect to another AS process?
e.g. for a slave host controller connecting to the master or for a Remoting connection for
server to
server EJB calls.
yes/no? no

```

## Enabling Web/HTTP Statistic Collection

Before the JBoss agent can gather JBoss server web metrics and other subsystem metrics, statistics collection must be enabled for each subsystem. This procedure is for JBoss EAP version 7.x and WildFly versions 8.x, 9.x and 10.x.

### Procedure

The **statistics-enabled** attribute of various JBoss subsystems controls statistic collection. This setting can be viewed and updated by using the JBoss command line interface.

**Note:** This procedure is for JBoss EAP version 7.x and WildFly versions 8.x, 9.x and 10.x.

1. Go to the binary or bin directory under the JBoss server installation directory.
2. Start the JBoss command line interface.

- **Linux** `./jboss-cli.sh --connect [--controller=IP:port]`
- **Windows** `jboss-cli.bat --connect [--controller=IP:port]`

where *IP* is the JBoss server's IP address and *port* is the JBoss server's port. For example, 192.168.10.20:9990.

**Tip:** If the connection attempt results in the error, "Failed to connect to the controller: The controller is not available at localhost:9990: java.net.ConnectException: WFLYPRT0053: Could not connect to http-remoting://localhost:9990. The connection failed: WFLYPRT0053: Could not connect to http-remoting://localhost:9990. The connection failed: Connection refused", use the **--controller** parameter.

This error indicates that the management server is not listening on the localhost IP address (127.0.0.1) and is configured to listen on the computer's IP address.

3. Run the following commands to view the current state of each subsystem's statistics-enabled attribute:

**Note:** If JBoss is running in Domain Mode, each command must be prefixed with the associated profile and these commands must be run for each monitored profile. For example: `/profile=full/subsystem=ejb3:read-attribute(name=statistics-enabled)`

```

/subsystem=ejb3:read-attribute(name=enable-statistics)
/subsystem=transactions:read-attribute(name=statistics-enabled)
/subsystem=undertow:read-attribute(name=statistics-enabled)
/subsystem=webservices:read-attribute(name=statistics-enabled)
/subsystem=datasources/data-source=Data_Source_Name:read-
attribute(name=statistics-enabled)
/subsystem=datasources/data-source=Data_Source_Name/statistics=pool:read-
attribute(name=statistics-enabled)
/subsystem=datasources/data-source=Data_Source_Name/statistics=jdbc:read-
attribute(name=statistics-enabled)

```

where *Data\_Source\_Name* is the name of a data source that is configured for use with JBoss.

**Note:** Data sources can be listed by using the command `/subsystem=datasources:read-resource`.

Example result when statistics are not enabled:

```

{
  "outcome" => "success",
  "result" => false
}

```

4. Run the following command to change the value of each subsystem's statistics-enabled attribute to *true*:

```

/subsystem=ejb3:write-attribute(name=enable-statistics, value=true)
/subsystem=transactions:write-attribute(name=statistics-enabled,value=true)
/subsystem=undertow:write-attribute(name=statistics-enabled,value=true)
/subsystem=webservices:write-attribute(name=statistics-enabled,value=true)
/subsystem=datasources/data-source=Data_Source_Name:write-
attribute(name=statistics-enabled,value=true)
/subsystem=datasources/data-source=Data_Source_Name/statistics=pool:write-
attribute(name=statistics-enabled,value=true)
/subsystem=datasources/data-source=Data_Source_Name/statistics=jdbc:write-
attribute(name=statistics-enabled,value=true)

```

Example result when you enable statistics for a subsystem:

```

{
  "outcome" => "success",
  "response-headers" => {
    "operation-requires-reload" => true,
    "process-state" => "reload-required"
  }
}

```

5. Exit the JBoss command line interface.
6. Restart the JBoss server.

**Note:** Any currently running JBoss agents with transaction tracking enabled must be restarted.

## Configuring the agent on Windows systems

You can configure the JBoss agent on Windows operating systems by using the IBM Cloud Application Performance Management window. After you update the configuration values, you must start the agent to save the updated values.

### Procedure

1. Click **Start > All Programs > IBM Monitoring agents > IBM Cloud Application Performance Management**.
2. In the **IBM Performance Management** window, right-click the **Monitoring Agent for JBoss** template, and then click **Configure agent**.

**Remember:** After you configure an agent instance for the first time, the **Configure agent** option is disabled. To configure the agent instance again, right-click on it and then click **Reconfigure**.

3. Enter a unique instance name then click **OK**. Use only letters, Arabic numerals, the underline character, and the minus character in the instance name.  
For example, jboss01.

Figure 17. The window to enter a unique instance name.

4. Enter the JBoss Server settings, then click **Next**.

See [Table 190 on page 541](#) for an explanation of each of the configuration parameters.

Figure 18. The window for configuration parameters for the JBoss server

5. Enter the Java settings, then click **Next**.

See [Table 190 on page 541](#) for an explanation of each of the configuration parameters.

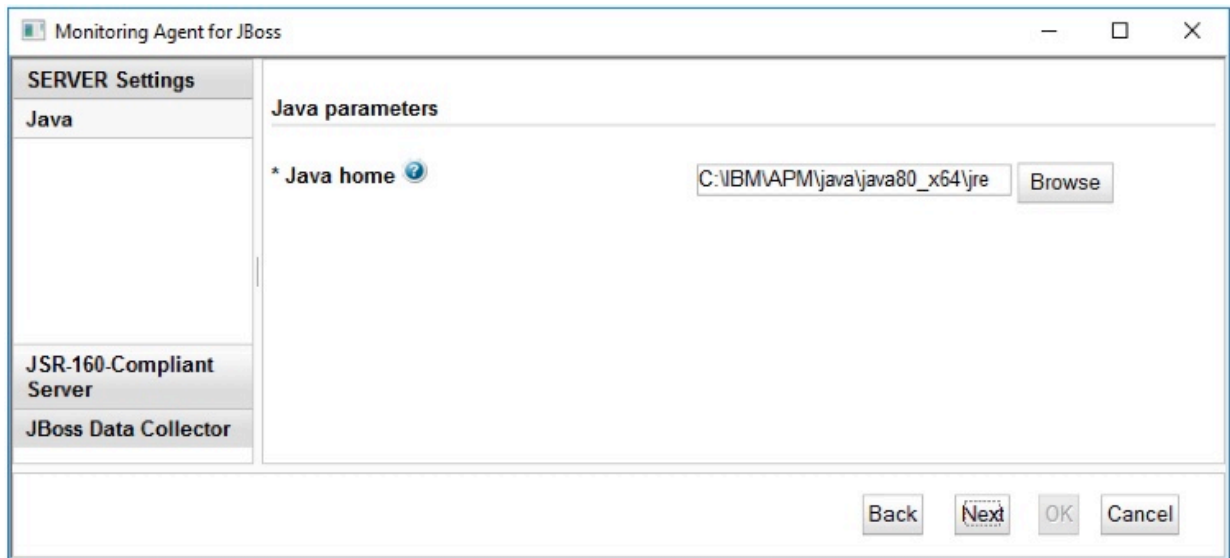

Figure 19. The window to specify Java settings.

6. Enter the JMX settings, then click **Next**.

See [Table 190 on page 541](#) for an explanation of each of the configuration parameters.

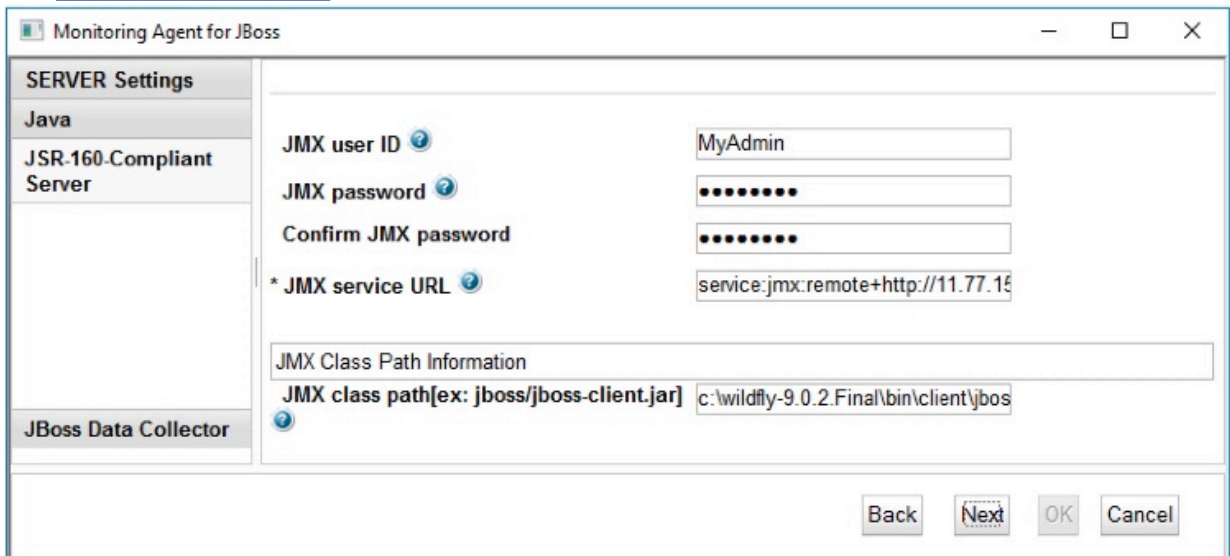

Figure 20. The window to specify JMX settings.

7. View the JBoss agent data collector settings.

Leave the **DC Runtime Directory** blank during initial configuration of the agent. See [Table 190 on page 541](#) for an explanation of each of the configuration parameters.

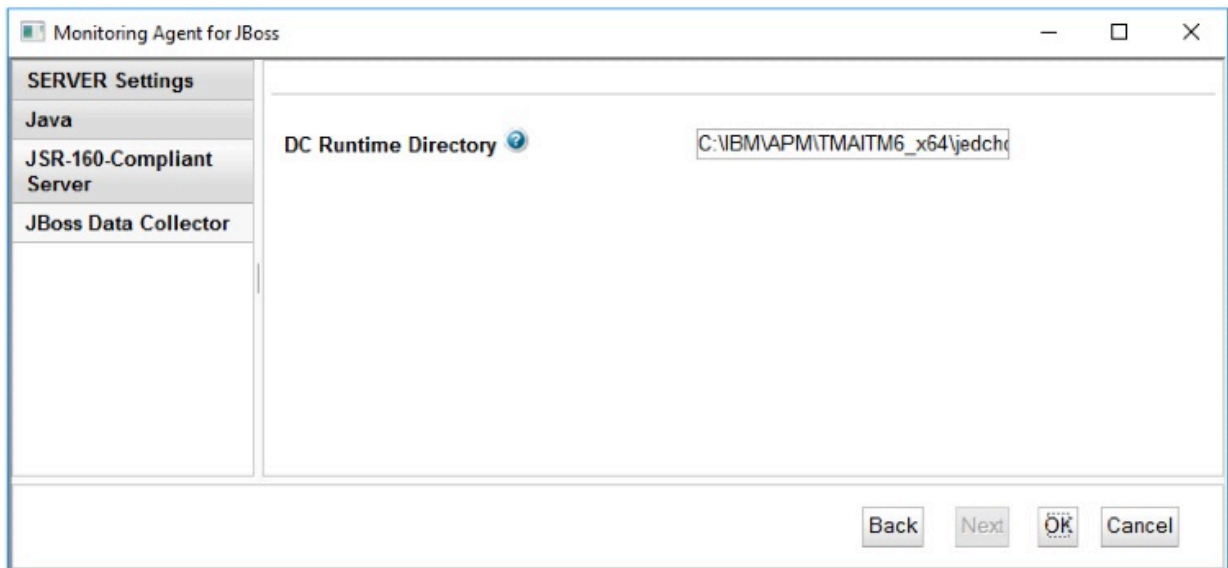

Figure 21. The window to specify JBoss agent data collector settings

8. Click **OK** to complete the agent configuration.
9. In the IBM Cloud Application Performance Management window, right-click the instance that you configured, and then click **Start**.

## Configuring the agent by responding to prompts

After installation of the JBoss agent, you must configure it before you start the agent. If the JBoss agent is installed on a local Linux or UNIX computer, you can follow these instructions to configure it interactively through command line prompts.

### About this task

**Remember:** If you are reconfiguring a configured agent instance, the value that is set in the last configuration is displayed for each setting. If you want to clear an existing value, press the space key when the setting is displayed.

### Procedure

1. On the command line, run the following command:

```
install_dir/bin/jboss-agent.sh config instance_name
```

where *install\_dir* is the path where the agent is installed and *instance\_name* is the name that you want to give to the agent instance.

Example

```
/opt/ibm/apm/agent/bin/jboss-agent.sh config example-inst01
```

2. Respond to the prompts to set configuration values for the agent.  
See [“Configuration parameters for the JBoss agent” on page 541](#) for an explanation of each of the configuration parameters.
3. Run the following command to start the agent:

```
install_dir/bin/jboss-agent.sh start instance_name
```

where *install\_dir* is the path where the agent is installed and *instance\_name* is the name of the agent instance.

## Example

```
/opt/ibm/apm/agent/bin/jboss-agent.sh start example-inst01
```

## Configuring the agent by using the silent response file

The silent response file contains the agent configuration parameters. You can edit the silent response file to modify the values of these parameters, and run the configuration script to create an instance and update the agent configuration values. This mode of configuration is called the silent mode.

### About this task

The silent response file contains the agent configuration parameters with default values that are defined for some parameters. You can edit the silent response file to specify different values for the configuration parameters.

After you update the configuration values in the silent response file, you must run the configuration script to configure the agent with these updated values.

### Procedure

- To configure the JBoss agent in the silent mode, complete the following steps:
  - In a text editor, open the `jboss_silent_config.txt` file that is available at the following path:

- **Linux** **UNIX** `install_dir/samples/jboss_silent_config.txt`  
Example, `/opt/ibm/apm/agent/samples/jboss_silent_config.txt`
- **Windows** `install_dir\samples\jboss_silent_config.txt`

where `install_dir` is the path where the agent is installed.

The default `install_dir` paths are listed here:

- **Linux** `/opt/ibm/apm/agent`
- **Windows** `C:\IBM\APM\TMAITM6_x64`

#### Example

**Linux** **UNIX** `/opt/ibm/apm/agent/samples/jboss_silent_config.txt`

**Windows** `C:\IBM\APM\samples\jboss_silent_config.txt`

- In the `jboss_silent_config.txt` file, specify values for all mandatory parameters. You can also modify the default values of other parameters.

See “Configuration parameters for the JBoss agent” on page 541 for an explanation of each of the configuration parameters.

- Save and close the `jboss_silent_config.txt` file, and run the following command:

- **Linux** **UNIX** `install_dir/bin/jboss-agent.sh config instance_name install_dir/samples/jboss_silent_config.txt`
- **Windows** `install_dir\bin\jboss-agent.bat config instance_name install_dir\samples\jboss_silent_config.txt`

where `install_dir` is the path where the agent is installed and `instance_name` is the name of the agent instance.

The default `install_dir` paths are listed here:

- **Linux** `/opt/ibm/apm/agent`

– **Windows** C:\IBM\APM\TMAITM6\_x64

**Important:** Ensure that you include the absolute path to the silent response file. Otherwise, the agent data is not shown in the dashboards.

Example

**Linux** **UNIX** /opt/ibm/apm/agent/bin/jboss-agent.sh config example-inst01  
/opt/ibm/apm/agent/samples/jboss\_silent\_config.txt

**Windows** C:\IBM\APM\bin\jboss-agent.bat config example-inst01 C:\IBM\APM\samples  
\jboss\_silent\_config.txt

d) Run the following command to start the agent:

– **Linux** **UNIX** *install\_dir*/bin/jboss-agent.sh start **instance\_name**

– **Windows** *install\_dir*\bin\jboss-agent.bat start **instance\_name**

where *install\_dir* is the path where the agent is installed and *instance\_name* is the name of the agent instance.

The default *install\_dir* paths are listed here:

– **Linux** /opt/ibm/apm/agent

– **Windows** C:\IBM\APM\TMAITM6\_x64

Example

**Linux** **UNIX** /opt/ibm/apm/agent/bin/jboss-agent.sh start example-inst01

**Windows** C:\IBM\APM\bin\jboss-agent.bat start example-inst01

## Configuration parameters for the JBoss agent

The configuration parameters for the JBoss agent are displayed in a table.

1. [JBoss Agent Settings](#) - JBoss agent environment settings.
2. [Table 191 on page 542](#) - Example JMX service URLs.

| Table 190. JBoss Agent Settings |  |  |
|---------------------------------|--|--|
| Parameter name                  | Description  | Silent configuration file parameter name |
| Server Name                     | Provide a name to identify the JBoss/WildFly Server.   | <b>KJE_SERVER</b>                        |
| Java home                       | The path to where Java is installed.   | <b>JAVA_HOME</b>                         |
| JMX user ID                     | The user ID for connecting to the MBean server.  | <b>KQZ_JMX_JSR160_JSR160_USER_ID</b>     |
| JMX password                    | Password   | <b>KQZ_JMX_JSR160_JSR160_PASSWORD</b>    |
| JMX service URL                 | The service URL for connecting to the MBean server.<br>See <a href="#">Table 191 on page 542</a> for examples. | <b>KQZ_JMX_JSR160_JSR160_SERVICE_URL</b> |

Table 190. JBoss Agent Settings (continued)

| Parameter name       | Description   | Silent configuration file parameter name |
|----------------------|---|--|
| JMX class path       | The JAR files that are searched to locate a class or resource. Locate and enter the path to the <code>jboss-client.jar</code> file for your JBoss server. Example for a JBoss EAP 6 server, <code>/opt/EAP-6.3.0/jboss-eap-6.3/bin/client/jboss-client.jar</code> .   | <b>KQZ_JMX_JSR160_JSR160_JAR_FILES</b>   |
| DC Runtime Directory | <p><b>Note:</b> This parameter is only for the JBoss agent with transaction tracking capability, which is in the Cloud APM, Advanced offering. For the JBoss agent with basic resource monitoring capability, which is in the Cloud APM, Base offering, skip this parameter.</p> <p>The full path to the JBoss data collector runtime directory is set by the <b>simpleConfig</b> script. Leave this parameter blank during the initial configuration of the agent.</p> | <b>KQZ_DC_RUNTIME_DIR</b>                |

Table 191. JMX service URLs

| JBoss server version               | JMX service URL with default port <sup>1</sup>  |
|------------------------------------|---|
| WildFly 8, 9 and 10<br>JBoss EAP 7 | <code>service:jmx:remote+http://ip:9990</code><br><code>service:jmx:remote+https://ip:9994</code> |
| JBoss EAP 6<br>JBoss AS 7          | <code>service:jmx:remoting-jmx://ip:9999</code>   |
| JBoss EAP 5.2<br>JBoss AS 6.1      | <code>service:jmx:rmi:///jndi/rmi://ip:1090/jmxrmi</code>   |

<sup>1</sup> The port is based on the port in the JBoss configuration file entry `<socket-binding name="management-native" interface="management" port="$ {jboss.management.native.port:NNNN}"/>`. If the port was changed from the default value, adjust it according to the port number in your configuration file.

## Configuring JBoss agent in domain mode

To monitor JBoss servers in domain mode with JBoss agent, follow the steps:

### About this task

#### Procedure

1. Install JBoss agent on each computer that contains JBoss servers you want to monitor.
2. Add the following line to the `domain.xml` file under all socket profiles used by the JBoss servers that you want to monitor.

```
<subsystem xmlns="urn:jboss:domain:jmx:1.3">
  <expose-resolved-model/>
  <expose-expression-model/>
  <remoting-connector use-management-endpoint="false"/>
</subsystem>
```

**Note:** The following lines might occur multiple times (once per socket profile).

```
<subsystem xmlns="urn:jboss:domain:jmx:1.3">
  <expose-resolved-model/>
  <expose-expression-model/>
</subsystem>
```

**Note:** Server socket profiles are set in the host XML files. The default host XML file is `host.xml` in the configuration directory, but can be overridden with the `--host-config` option when you run the JBoss domain executable file. Make sure to edit the correct files for your system.

3. Update the host XML file for each JBoss host to set its IP address. Do not use loopback address, such as 127.0.0.1 and local host.

```
<interfaces>
  <interface name="management">
    <inet-address value="{jboss.bind.address.management:<ServerIP accessible by agent>}" />
  </interface>
  <interface name="public">
    <inet-address value="{jboss.bind.address:<ServerIP accessible by agent>}" />
  </interface>
</interfaces>
```

**Note:** If you edit the IP address of your domain controller, ensure that the host configurations are modified to use the updated domain controller IP address.

4. Configure the JBoss agent on each computer containing JBoss servers you wish to monitor. For more information, see [“Configuring the agent by responding to prompts” on page 539](#) and [“Configuring the agent on Windows systems” on page 537](#).
5. Start the JBoss agent by running the command:

```
install_dir/bin/jboss-agent.sh start instance_name
```

6. Verify the monitored JBoss servers are displayed on Cloud APM console correctly.

## Setup the JBoss agent transaction tracking or diagnostics data collector

If you want to use the transaction tracking or diagnostics capability of the JBoss agent, you need to make some changes to the agent instance environment settings file, the JBoss server startup file, and the DC Runtime Directory agent configuration parameter. A script is provided to help you make the changes.

### Before you begin

**Linux** Ensure that the resource limit for open files is greater than 5,000 for the transaction tracking or diagnostics toolkit to work properly.

- Display the current open file limit setting. **`ulimit -n`**
- Example setting the open file limit to 5,056. **`ulimit -n 5056`**

Perform [Configuring the JBoss agent Step “1” on page 532](#) or [“2” on page 532](#) before you follow this procedure.

The JBoss agent must be installed locally to the JBoss server that is monitored with the transaction tracking or diagnostics capability.

The user account that runs this script must have write permission to the following directories and files:

1. The *JBOSS\_HOME* directory.
2. The *JBOSS\_HOME/bin* directory and files.
3. The *JBOSS\_HOME/modules/system/layers/base/org/jboss/as/server/main/module.xml* file.
4. The *install\_dir/config* directory.
5. The *install\_dir/config/hostname\_je\_instance\_name.cfg* file.

where

### **JBOSS\_HOME**

JBoss server installation directory.

### **install\_dir**

Path where the agent is installed. The default path is:

- **Linux** /opt/ibm/apm/agent
- **Windows** C:\IBM\APM\TMAITM6\_x64

### **hostname**

The name of the host computer where the agent is installed.

### **instance\_name**

Name of the agent instance that is assigned in the agent configuration method topic:

- [Configuring the agent on Windows systems, step “3” on page 537](#)
- [Configuring the agent by responding to prompts, step “1” on page 539](#)
- [Configuring the agent by using the silent response file, step “3” on page 540](#)

## **Procedure**

Run the **simpleConfig** script.

1. Log in to the JBoss server with the JBoss agent installed.
2. Change directory to the agent installation directory.

- **Linux** *install\_dir*
- **Windows** *install\_dir\TMAITM6\_x64*

where *install\_dir* is the path where the agent is installed.

The default *install\_dir* paths are listed here:

- **Linux** /opt/ibm/apm/agent
- **Windows** C:\IBM\APM\TMAITM6\_x64

3. Change directory to *jedchome/7.3.0.13.0/bin*.
4. Run the setup script.

- **Linux** ./simpleConfig.sh
- **Windows** simpleConfig.bat

**Note:** The setup script is not working for JBoss servers in domain mode. To enable the transaction tracking or diagnostics capability for JBoss servers in domain mode, you must configure JBoss agents as in the [“Configuring JBoss agent in domain mode” on page 542](#) topic and then enable the transaction

tracking or diagnostics capability by following the steps in the [JBoss TT and DD configuration in domain mode document](#). To get this document, contact with [IBM support team](#).

5. Follow the prompts to enter parameters for your environment:

- a) Enter the JBoss agent *instance\_name* chosen for the agent instance.
- b) Enter the JBoss server installation directory.

If the *JBOSS\_HOME* environment variable is set, its value will be offered as the default value.

where

### **JBOSS\_HOME**

The JBoss server installation directory.

### **instance\_name**

The name of the agent instance that is assigned in the agent configuration method topic:

- Configuring the agent on Windows systems, step [“3” on page 537](#)
- Configuring the agent by responding to prompts, step [“1” on page 539](#)
- Configuring the agent by using the silent response file, step [“3” on page 540](#)

### **install\_dir**

The path where the agent is installed. The default path is:

- **Linux** /opt/ibm/apm/agent
- **Windows** C:\IBM\APM\TMAITM6\_x64

6. Restart the JBoss server and the agent if they are running.

## **Results**

JBoss server files that are changed during transaction tracking or diagnostics configuration:

- *JBOSS\_HOME*/bin/standalone.conf

This file is updated with configuration settings required for the transaction tracking or diagnostics capability. Configuration markers are inserted into the file for use when you disable the transaction tracking or diagnostics capability. A backup file is saved in the *JBOSS\_HOME*/bak directory prior to adding or removing the transaction tracking or diagnostics capability changes.

- *JBOSS\_HOME*/modules/system/layers/base/org/jboss/as/server/main/module.xml

This file is updated with a JAVA EE API module dependency. Configuration markers are inserted into the file for use when you disable the transaction tracking or diagnostics capability. A backup file is saved in the *JBOSS\_HOME*/bak directory prior to adding or removing the transaction tracking or diagnostics capability changes.

Agent files that are changed during transaction tracking or diagnostics configuration:

- Agent instance configuration file

- **Linux** *install\_dir*/config/hostname\_je\_instance\_name.cfg
- **Windows** *install\_dir*\TMAITM6\_x64\hostname\_JE\_instance\_name.cfg

- Agent environment settings file

- **Linux** *install\_dir*/config/je\_instance\_name.environment
- **Windows** *install\_dir*\TMAITM6\_x64\KJENV\_instance\_name

where

### **JBOSS\_HOME**

JBoss server installation directory.

### **install\_dir**

Path where the agent is installed. The default path is:

- **Linux** /opt/ibm/apm/agent
- **Windows** C:\IBM\APM\TMAITM6\_x64

#### hostname

The name of the host computer where the agent is installed.

#### instance\_name

Name of the agent instance that is assigned in the agent configuration method topic:

- Configuring the agent on Windows systems, step “3” on page 537
- Configuring the agent by responding to prompts, step “1” on page 539
- Configuring the agent by using the silent response file, step “3” on page 540

**Note:** If the JBoss agent is re-configured after JBoss agent transaction tracking or diagnostics was configured, the agent environment settings file will be overwritten by the JBoss agent reconfiguration. You need to run the steps in the Procedure section again to configure the JBoss agent transaction tracking or diagnostics data collector. Or else, you might see no transaction tracking data in the Application Performance Dashboard, and the default 5457 port is not listening.

## Disable the JBoss agent transaction tracking data collector

The transaction tracking capability of the JBoss agent requires changes to the agent instance environment settings file, the JBoss server startup file, and the DC Runtime Directory agent configuration parameter. A script is provided to remove these changes for an agent instance with transaction tracking enabled.

### Before you begin

Ensure that the JBoss server and the JBoss agent are shut down.

The user account that runs this script must have write permission to the following directories and files:

1. The *JBOSS\_HOME* directory
2. The *JBOSS\_HOME/bin* directory and files
3. The *JBOSS\_HOME/modules/system/layers/base/org/jboss/as/server/main/module.xml* file
4. The *install\_dir/config* directory
5. The *install\_dir/config/hostname\_je\_instance\_name.cfg* file

### Procedure

Run the **simpleConfig** script with the **remove** option.

1. Log in to the JBoss server with the JBoss agent installed.
2. Change directory to the agent installation directory.
  - **Linux** *install\_dir*
  - **Windows** *install\_dir\TMAITM6\_x64*
3. Change directory to *jedchome/7.3.0.13.0/bin*.
4. Run the **simpleConfig** with the **remove** option.
  - **Linux** *./simpleConfig.sh remove instance\_name*
  - **Windows** *simpleConfig.bat remove instance\_name*
5. Start the JBoss server and the agent.

Where:

#### **JBOSS\_HOME**

The JBoss server installation directory

**hostname**

The name of the host computer where the agent is installed

**instance\_name**

The name of the agent instance that is assigned in the agent configuration method topic:

- Configuring the agent on Windows systems, step “3” on page 537
- Configuring the agent by responding to prompts, step “1” on page 539
- Configuring the agent by using the silent response file, step “3” on page 540

**install\_dir**

The path where the agent is installed. The default path is:

- **Linux** /opt/ibm/apm/agent
- **Windows** C:\IBM\APM\TMAITM6\_x64

**architecture**

The IBM Application Performance Management or Cloud APM system architecture identifier. For example, lx8266 represents Linux Intel v2.6 (64-bit). For a complete list of the architecture codes, see the *install\_dir/registry/archdsc.tbl* file.

## Uninstall all JBoss agent transaction tracking

The transaction tracking capability of the JBoss agent can be uninstalled. A script is provided to remove all agent instance with transaction tracking enabled and also remove the transaction tracking toolkit.

### Before you begin

Ensure that the JBoss server and all JBoss agent instances are shut down.

The user account that runs this script must have write permission to the following directories and files:

1. The *JBOSS\_HOME* directory.
2. The *JBOSS\_HOME/bin* directory and files.
3. The *JBOSS\_HOME/modules/system/layers/base/org/jboss/as/server/main/module.xml* file.
4. The *install\_dir/config* directory.
5. The *install\_dir/config/hostname\_je\_instance\_name.cfg* file.

### Procedure

Run the **simpleConfig** script with the **uninstall** option.

1. Log in to the JBoss server with the JBoss agent installed.
2. Change directory to the agent installation directory.
  - **Linux** *install\_dir/architecture/je/bin*. For example: /opt/ibm/apm/agent/lx8266/je/bin or /opt/ibm/apm/agent/lx8266/je/bin
  - **Windows** *install\_dir\TMAITM6\_x64*
3. Change directory to jedchome/7.3.0.13.0/bin.
4. Run the **simpleConfig** with the **uninstall** option.
  - **Linux** ./simpleConfig.sh **uninstall**
  - **Windows** simpleConfig.bat **uninstall**
5. Start the JBoss server and all agent instances.

Where:

**JBOSS\_HOME**

The JBoss server installation directory.

**hostname**

The name of the host computer where the agent is installed.

**instance\_name**

The name of the agent instance that is assigned in the agent configuration method topic:

- Configuring the agent on Windows systems, step “3” on page 537
- Configuring the agent by responding to prompts, step “1” on page 539
- Configuring the agent by using the silent response file, step “3” on page 540

**install\_dir**

The path where the agent is installed. The default path is:

- **Linux** /opt/ibm/apm/agent
- **Windows** C:\IBM\APM\TMAITM6\_x64

**architecture**

The IBM Application Performance Management or Cloud APM system architecture identifier. For example, lx8266 represents Linux Intel v2.6 (64-bit). For a complete list of the architecture codes, see the *install\_dir/registry/archdsc.tbl* file.

## Configuring Liberty monitoring

---

You can use the Liberty data collector to monitor your Liberty. The Liberty data collector helps you to manage the performance and availability of Java-based microservices or Liberty applications in both Kubernetes and on-premises environments.

- For Liberty V19, V20 and future versions, follow the procedure to configure the Liberty data collector.
  - For on-premises environments:
    1. Make sure that you configure the data collector package with the `make_configuration_packages.sh` and `configure_agent_images.sh` scripts on the system where the Cloud APM server is installed. For detailed instructions, see “Configuring the downloaded images” on page 182.
    2. Download the `.esa` file. For instructions, see [Downloading the Liberty data collector](#).
    3. Configure the Liberty data collector. For instructions, see [Configuring the Liberty data collector in on-premises environments](#)
  - For Kubernetes environments:
    1. You must authorize the data collector to access Kubernetes resources. For instructions, see [Authorizing the data collector to access Kubernetes resources](#).
    2. Download the `.esa` file. For instructions, see [Downloading the Liberty data collector](#).
    3. Configure the Liberty data collector in your environment. For instructions, see [Configuring the Liberty data collector in Kubernetes environments](#).
- For Liberty V18.\* and older versions, you can use both the new method and previous method to configure the Liberty data collector. For previous instructions, see “Configuring the Liberty data collector for Liberty V18.\* and older versions” on page 558.

## Downloading the Liberty data collector

The Liberty data collector is available in the [WebSphere Liberty Repository](#) and it can be automatically downloaded if your local system can access this online public repository. If your firewall rules do not allow

connection to the WebSphere Liberty Repository, you can download it from another system that has access.

## About this task

To download the Liberty data collector, complete the download from WebSphere Liberty Repository:

## Procedure

- If your environment doesn't have access to the WebSphere Liberty repository where the Liberty application container is built, complete the following steps:
  - a) Download the extension pack from another system that can access [Liberty data collector](#) in the WebSphere Liberty Repository.
  - b) Copy the downloaded file to a temporary directory on your local system where the Liberty application is running.
- If your environment has access to the [WebSphere Liberty repository](#) where the Liberty application container is built, complete the following step:
  - a) Add the following to the Docker file, so that the .esa file is downloaded automatically:

```
RUN /opt/ibm/wlp/bin/installUtility install ibmAppMetricsForJava-1.2.1 --acceptLicense
```

## Monitoring on-premises Liberty applications

You can configure the Liberty data collector to monitor the on-premises Liberty applications running on stand-alone Docker containers, VMs or physical nodes and then send monitoring data to the Cloud APM server.

## Before you begin

- Check that you configure the data collector package on the system where the Cloud APM server is installed. For detailed instructions, see [“Configuring the downloaded images” on page 182](#).
- Check whether you downloaded the Liberty data collector package. For more information, see [“Downloading the Liberty data collector” on page 548](#).

## About this task

Configure the Liberty data collector by using the `config_unified_dc.sh` file under the Liberty data collector directory, for example, `liberty_home/usr/extension/liberty_dc/bin`, and the `onprem_config.tar` file that you get in [“Configuring the downloaded images” on page 182](#).

## Procedure

- To configure the Liberty data collector for VMs or physical nodes, do the following steps:
  - a) Go to the `liberty_home/bin` directory and run the following command to install the data collector:

```
./installUtility install --acceptLicense path_to_dc_package
```

where `path_to_dc_package` is the full path to the .esa file that you downloaded. For example, `/opt/javametrics.liberty.icam-1.2.1.esa`.

**Note:** The `installUtility` command is not applicable to Open Liberty. If you use Open Liberty, copy the `javametrics.liberty.icam-1.2.1.esa` file to the `/opt` directory and run the following commands:

```
mkdir -p /opt/ol/wlp/usr/extension/lib/features/  
cd /tmp  
unzip /opt/javametrics.liberty.icam-1.2.1.esa  
mv /tmp/wlp/liberty_dc /opt/ol/wlp/usr/extension/
```

```
mv /tmp/OSGI-INF/SUBSYSTEM.MF /opt/ol/wlp/usr/extension/lib/features/
javametrics.liberty.icam-1.2.1.mf
```

- b) Run the following command to apply server configuration to the monitored application:

```
./config_unified_dc.sh [-silent <silent_file>]
```

**Note:**

- If *<silent\_file>* is not provided, the `silent_config_liberty_dc.txt` file under the same directory of `config_unified_dc.sh` will be used.
- The path of `onprem_config.tar` is provided in *silent\_file*, for example,  
`CONFIGPACK_PATH=/opt/ibm/ccm/mkcustpkg_workdir.7378/onprem_config.tar`.

- c) Restart your Liberty application.

- To configure the Liberty data collector for standalone Docker environment, do the following steps:

- a) Create a `silent_config_liberty_dc.txt` silent configuration file in the same directory as your Dockerfile and add the following lines:

```
JAVA_HOME=/opt/ibm/java/jre
LIBERTY_HOME=/opt/ibm/wlp
SERVER_NAME=*
ADD_XMX_SIZE=True
SERVER_TYPE=apm
CONFIGPACK_PATH=/opt/ibm/ccm/mkcustpkg_workdir.7378/onprem_config.tar
APM_KEYFILE_PASSWORD=xxx
```

Where:

- *JAVA\_HOME* is the Java home that is used by liberty applications. The default value is `/opt/ibm/java/jre`.
- *LIBERTY\_HOME* is the directory where the liberty application is installed. The default value is `/opt/ibm/wlp`.
- *SERVER\_NAME* is the name of the liberty servers that are monitored by the data collector. You can separate the server names with a space character. The `*` character shows all the servers installed are monitored. The default value is `*`.
- *ADD\_XMX\_SIZE* allows you to allocate an extra 512 M memory for all the monitored servers. The value is **True** or **False**. The default value is **True**.
- *SERVER\_TYPE* is the type of monitoring server to which the data collector is connected. The value is **APM**.
- *CONFIGPACK\_PATH* is the absolute path of the configuration package.
- You need to input the password in *APM\_KEYFILE\_PASSWORD* if the password in config pack is not the default one.

- b) Update the specific variable values according to the Liberty server settings.

- c) If you use Open Liberty, add the following lines to the Dockerfile of your Liberty application:

```
COPY path_to_esa_file /opt/
RUN mkdir -p /opt/ol/wlp/usr/extension/lib/features/
RUN cd /tmp && unzip /opt/javametrics.liberty.icam-1.2.1.esa
&& mv /tmp/wlp/liberty_dc /opt/ol/wlp/usr/extension/
&& mv /tmp/OSGI-INF/SUBSYSTEM.MF /opt/ol/wlp/usr/extension/lib/features/
javametrics.liberty.icam-1.2.1.mf
COPY path_to_silent_file /opt/ol/wlp/usr/extension/liberty_dc/bin/
RUN /opt/ol/wlp/usr/extension/liberty_dc/bin/config_unified_dc.sh -silent
```

Where:

- *path\_to\_esa\_file* is the relative path for the downloaded `javametrics.liberty.icam-1.2.1.esa` file to the current directory. For example, `/tmp/javametrics.liberty.icam-1.2.1.esa`.
- *path\_to\_silent\_file* is the relative path for the `silent_config_liberty_dc.txt` file to the current directory. For example, `/tmp/silent_config_liberty_dc.txt`.

- d) If you use WebSphere Liberty, add the following lines to the Dockerfile of your Liberty application:

```
COPY path_to_esa_file /opt/  
RUN /opt/ibm/wlp/bin/installUtility install --acceptLicense /opt/  
javametrics.liberty.icam-1.2.1.esa  
COPY path_to_silent_file /opt/ibm/wlp/usr/extension/liberty_dc/bin/  
RUN /opt/ibm/wlp/usr/extension/liberty_dc/bin/config_unified_dc.sh -silent
```

- e) Build the new docker image.

```
docker build -t <application image name>:<image tag> .
```

- f) Start your Liberty application with the new docker image.

- If a proxy is set for the JVM, add the *JVM\_ARGS* variable to the container specification in the application deployment yaml file to define the proxy properties.
  - If authentication is not required, specify the *JVM\_ARGS* variable value as follows:

```
- name: JVM_ARGS  
  value: "-Dhttp.proxyHost=http_proxy_host -Dhttp.proxyPort=http_proxy_port  
-Dhttps.proxyHost=https_proxy_host -Dhttps.proxyPort=https_proxy_port -  
Djava.net.useSystemProxies=true  
-Dhttp.nonProxyHosts=non_proxy_host"
```

- If a user ID and password is required to access the proxy, specify the *JVM\_ARGS* variable value as follows:

```
- name: JVM_ARGS  
  value: "-Dhttp.proxyHost=http_proxy_host -Dhttp.proxyPort=http_proxy_port -  
Dhttp.proxyUser=http_proxy_user  
-Dhttp.proxyPassword=http_proxy_pwd -Dhttps.proxyHost=https_proxy_host  
-Dhttps.proxyPort=https_proxy_port -Dhttps.proxyUser=https_proxy_user  
-Dhttps.proxyPassword=https_proxy_pwd -Djava.net.useSystemProxies=true -  
Dhttp.nonProxyHosts=non_proxy_host"
```

**Note:**

- All proxy properties that are embraced by double quotation marks ("" ) must be set on the same line as value: and separated by a space.
- The *-Djava.net.useSystemProxies* value must be set to true.
- Use the *-Dhttp.nonProxyHosts* variable to specify the IPs that are used for internal communication and the asterisk (\*) can be used. If you want to designate multiple settings for the *-Dhttp.nonProxyHosts* variable, use the double quotation mark to surround the settings. But don't use the double quotation mark for other variables, or it will bring proxy not set error.

If there is one setting for the *-Dhttp.nonProxyHosts* variable, see the following example.

```
- name: JVM_ARGS  
  value: "-Dhttp.proxyHost=9.42.23.52 -Dhttp.proxyPort=82 -Dhttp.proxyUser=myproxy  
-Dhttp.proxyPassword=mypwd -Dhttps.proxyHost=9.42.23.52 -Dhttps.proxyPort=82  
-Dhttps.proxyUser=myproxy -Dhttps.proxyPassword=mypsw -Djava.net.useSystemProxies=true -  
Dhttp.nonProxyHosts=10.*"
```

If there are multiple settings for the *-Dhttp.nonProxyHosts* variable, see the following example, where 10.\*|localhost are surrounded by the double quotation.

```
- name: JVM_ARGS  
  value: "-Dhttp.proxyHost=9.42.23.52 -Dhttp.proxyPort=82 -Dhttp.proxyUser=myproxy -  
Dhttp.proxyPassword=mypwd  
-Dhttps.proxyHost=9.42.23.52 -Dhttps.proxyPort=82 -Dhttps.proxyUser=myproxy -  
Dhttps.proxyPassword=mypsw  
-Djava.net.useSystemProxies=true -Dhttp.nonProxyHosts=\"10.*|localhost\""
```

## Monitoring Liberty applications in Kubernetes environment

Before you monitor Liberty applications, you must connect the data collector to the server by creating a secret. Then, you update your application deployment to monitor the Liberty applications.

### Before you begin

If your service account doesn't have access to Kubernetes resources, see [“Authorizing the data collector to access Kubernetes resources”](#) on page 556.

The Liberty data collector is available to be automatically downloaded from [WebSphere Liberty Repository](#) during configuration. If your firewall rules do not allow connection to this open repository, download the Liberty data collector from another system that has access. However, if you don't want to download the data collector from the public repository due to company policy and you would prefer to download from Passport Advantage, for more information, see [“Downloading the Liberty data collector”](#) on page 548.

The following Cloud APM server information is required during Liberty data collector configuration.

- The URL of the target Cloud APM server.
- The location of the key file, either a URL to download the key file or a local file directory (required only by a secure HTTPS connection).
- The key file password that is paired with the key file (required only by a secure HTTPS connection).

### About this task

Configure the data collector to the server by creating the secret. Then, update the application deployment to use the Docker file that you build.

### Procedure

1. Create the server secret yaml file named `apm-server-config-secret.yaml` by running either the `create -f` or the `apply -f` command.
2. Add the following information to the `apm-server-config-secret.yaml` file:

```
apiVersion: v1
kind: Secret
metadata:
  name: apm-server-config
data:
  ibm_apm_ingress_url: apm_for_devops_server_url
  ibm_apm_keyfile: key_file_location
  ibm_apm_keyfile_password: key_file_pswd
```

**Note:** Use base64 encoding to encrypt the actual values for the following variables. For example, on a Linux system run the `echo -n 'original_value' | base64` command to get the encoded value.

Where:

- *apm\_server\_url* is the base64 encoded URL of the target Cloud APM server.
- *key\_file\_location* is the base64 encoded location of the key file. This variable is required by a secure HTTPS connection only.

**Tip:** If the key file is outside the docker image, it can be set as URL like `http://127.0.0.1:8080/keyfile.jks`. If the key file is inside the docker image, it can be set as an absolute path like `file:///etc/apm-keyfile/keyfile.jks` or a relative path like `keyfile.jks`. But note that if you set it as a relative path, its parent directory is `${liberty.dir}/itcamdc/etc`.

- *key\_file\_pswd* is the base64 encoded key file password that should be based64 encoded no matter with default certificate or the self-signed certificate of Cloud APM server. This variable is required by a secure HTTPS connection only.
3. On the master node, create the server secrets by running the following command:

```
kubectl create -f apm-server-config-secret.yaml
```

4. Update the Dockerfile of your Liberty application. You must have the write access to the server folder.

- If you use Open Liberty, add the following lines to your Dockerfile:

```
COPY path_to_esf_file /opt/  
RUN mkdir -p /opt/ol/wlp/usr/extension/lib/features/  
RUN cd /tmp && unzip /opt/javametrics.liberty.icam-1.2.1.esf  
    && mv /tmp/wlp/liberty_dc /opt/ol/wlp/usr/extension/ && mv /tmp/OSGI-INF/SUBSYSTEM.MF  
    /opt/ol/wlp/usr/extension/lib/features/javametrics.liberty.icam-1.2.1.mf  
COPY path_to_silent_file /opt/ol/wlp/usr/extension/liberty_dc/bin/  
RUN /opt/ol/wlp/usr/extension/liberty_dc/bin/config_unified_dc.sh -silent
```

- If you use WebSphere Liberty and your environment has access to the WebSphere Liberty repository where the Liberty application container is built, add the following commands to your Dockerfile:

```
RUN chmod 777 liberty_server_dir  
RUN /opt/ibm/wlp/bin/installUtility install  
    ibmAppMetricsForJava-1.2.1  
    --acceptLicense  
RUN /opt/ibm/wlp/usr/extension/liberty_dc/bin/config_unified_dc.sh -silent
```

The **chmod 777** command grants you the write access to the Liberty server directory, for example, `/opt/ibm/wlp/usr/server/defaultServer`. The **installUtility** command enables you to download the data collector automatically from the WebSphere Liberty repository.

- If you use WebSphere Liberty and your environment doesn't have access to the WebSphere Liberty repository where the Liberty application container is built, add the following commands to your Dockerfile:

```
RUN chmod 777 liberty_server_dir  
COPY path_to_esf_file /opt/  
RUN /opt/ibm/wlp/bin/installUtility install --acceptLicense /opt/javametrics.liberty.icam-  
    1.2.1.esf  
RUN /opt/ibm/wlp/usr/extension/liberty_dc/bin/config_unified_dc.sh -silent
```

You must download the `esf` file because it is not downloaded automatically by using the **installUtility** command.

Where:

- `path_to_esf_file` is the relative path of the downloaded `javametrics.liberty.icam-1.2.1.esf` file to the current directory. The `javametrics.liberty.icam-1.2.1.esf` file must be in same directory as your Docker file or in a sub-directory of your Docker file location. This is required because Docker needs all files in the context of the Docker build. For more information about writing the Docker file, see: [Dockerfile reference](#).
  - **installUtility** is the liberty tool in the `bin` directory of the Liberty home directory. It is used to install the Liberty extension pack.
  - `/opt/ibm/wlp/` is the path to the liberty home directory. It can be changed accordingly.
  - `config_unified_dc.sh` is the configuration script that is used to configure the data collector. It runs in silent mode with the **-silent** parameter, and it reads the `liberty_dc_home/bin/silent_config_liberty_dc.txt` default config file.
5. Build and tag the new Docker image of the application and push this new image to the private registry.

Ensure that you include the docker registry and the docker group when you build and push the image, as shown here:

```
docker build -t <docker_registry>/<docker_group>  
/<application_image_name>:<image_tag> .  
docker push <docker_registry>/<docker_group>/<application_image_name>:<image_tag>
```

Example:

```
docker build -t mycluster.icp:8500/default/my_app_image:latest .
docker push mycluster.icp:8500/default/my_app_image:latest
```

6. If a proxy is set for the JVM, add the *JVM\_ARGS* variable to the container specification in the application deployment yaml file to define the proxy properties.

- If authentication is not required, specify the *JVM\_ARGS* variable value as follows:

```
- name: JVM_ARGS
  value: "-Dhttp.proxyHost=http_proxy_host -Dhttp.proxyPort=http_proxy_port
-Dhttps.proxyHost=https_proxy_host -Dhttps.proxyPort=https_proxy_port -
Djava.net.useSystemProxies=true
-Dhttp.nonProxyHosts=non_proxy_host"
```

- If a user ID and password is required to access the proxy, specify the *JVM\_ARGS* variable value as follows:

```
- name: JVM_ARGS
  value: "-Dhttp.proxyHost=http_proxy_host -Dhttp.proxyPort=http_proxy_port -
Dhttp.proxyUser=http_proxy_user
-Dhttp.proxyPassword=http_proxy_pwd -Dhttps.proxyHost=https_proxy_host
-Dhttps.proxyPort=https_proxy_port -Dhttps.proxyUser=https_proxy_user
-Dhttps.proxyPassword=https_proxy_pwd -Djava.net.useSystemProxies=true -
Dhttp.nonProxyHosts=non_proxy_host"
```

**Note:**

- All proxy properties that are embraced by double quotation marks (") must be set on the same line as `value:` and separated by a space.
- The `-Djava.net.useSystemProxies` value must be set to `true`.
- Use the `-Dhttp.nonProxyHosts` variable to specify the IPs that are used for internal communication and the asterisk (\*) can be used. If you want to designate multiple settings for the `-Dhttp.nonProxyHosts` variable, use the double quotation mark to surround the settings. But don't use the double quotation mark for other variables, or it will bring `proxy not set` error.

If there is one setting for the `-Dhttp.nonProxyHosts` variable, see the following example.

```
- name: JVM_ARGS
  value: "-Dhttp.proxyHost=9.42.23.52 -Dhttp.proxyPort=82 -Dhttp.proxyUser=myproxy
-Dhttp.proxyPassword=mypwd -Dhttps.proxyHost=9.42.23.52 -Dhttps.proxyPort=82
-Dhttps.proxyUser=myproxy -Dhttps.proxyPassword=mypsw -Djava.net.useSystemProxies=true -
Dhttp.nonProxyHosts=10.*"
```

If there are multiple settings for the `-Dhttp.nonProxyHosts` variable, see the following example, where `10.*|localhost` are surrounded by the double quotation.

```
- name: JVM_ARGS
  value: "-Dhttp.proxyHost=9.42.23.52 -Dhttp.proxyPort=82 -Dhttp.proxyUser=myproxy -
Dhttp.proxyPassword=mypwd
-Dhttps.proxyHost=9.42.23.52 -Dhttps.proxyPort=82 -Dhttps.proxyUser=myproxy -
Dhttps.proxyPassword=mypsw
-Djava.net.useSystemProxies=true -Dhttp.nonProxyHosts=\"10.*|localhost\""
```

7. Open your application deployment yaml file to use the new Docker image and update the `volumeMounts` and `Volumes` section by adding the following lines:

```
volumeMounts:
- name: global-environment
  mountPath: /opt/ibm/apm/serverconfig
volumes:
- name: global-environment
  secret:
    secretName: apm-server-config-secret
    optional: true
```

Where:

- /opt/ibm/apm/serverconfig is the fixed value to store the files in the docker container.
- apm-server-config-secret is the name of the secret that is created in step 1.

If you are working with a local application deployment yaml, you must run the following command for your changes to take effect:

```
kubectl create -f application_deployment_yaml_file
-n my_namespace
```

## Special Scenario - Using the customized script to start the Liberty server

### About this task

To configure the Liberty data collector successfully, after the data collector package is extracted to your local system, you must update the customized script.

### Procedure

1. Set the WLP\_USER\_DIR environment variable by adding the following line to the script:

```
export WLP_USER_DIR=liberty_home/usr
```

2. Set the JVM arguments by adding the following lines to the script:

```
-Xbootclasspath/p:dc_home/toolkit/lib/bcm-bootstrap.jar
-Djava.security.policy=dc_home/itcamdc/etc/datacollector.policy
-Xverbosegclog:/opt/ibm/wlp/usr/servers/defaultServer/logs/gc.log,1,10000
-verbosegc
-Dliberty.home=liberty_home
-DAppServerName=liberty_server_name
-javaagent:dc_home/toolkit/lib/tk_dyninst.jar
-Xmx768m
```

Where:

- *liberty\_home* is the Liberty home directory. For example, /opt/ibm/wlp.
- *dc\_home* is the home directory of the Liberty data collector. It is the liberty\_dc folder within the directory where you extract the data collector package. For example, /opt/liberty\_dc/.
- *liberty\_server\_name* is the Liberty server name. For example, defaultServer.
- Use the -Xmx option to allocate an extra 512 M memory for the data collector.

Here is an example of a customized script to start the Liberty server:

```
#!/bin/sh
export WLP_USER_DIR=/opt/ibm/wlp/usr

exec ${JAVA_HOME}/jre/bin/java -javaagent:/opt/ibm/wlp/bin/tools/
ws-javaagent.jar
-Djava.awt.headless=true -XX:MaxPermSize=256m
-Ddefault.client.encoding=UTF-8
-Ddefault.override.encoding=UTF-8 -Dfile.encoding=UTF-8 -Duser.language=en
-Duser.region=EN
-Xbootclasspath/p:/opt/ibm/wlp/usr/extension/liberty_dc/toolkit/lib/
bcm-bootstrap.jar
-Djava.security.policy=/opt/ibm/wlp/usr/extension/liberty_dc/itcamdc/etc/
datacollector.policy
-Xverbosegclog:/opt/ibm/wlp/usr/servers/defaultServer/logs/gc.log,1,10000
-verbosegc
-Dliberty.home=/opt/ibm/wlp
-DAppServerName=defaultServer
-javaagent:/opt/ibm/wlp/usr/extension/liberty_dc/toolkit/lib/tk_dyninst.jar
-Xms1024M -Xmx2048M -jar /opt/ibm/wlp/bin/tools/ws-server.jar defaultServer
```

## Authorizing the data collector to access Kubernetes resources

To monitor applications that are running in Kubernetes, the service account that you use to configure the runtime data collector must have access to Kubernetes resources through Kubernetes API. Otherwise, you must authorize the service account with appropriate access before you configure the data collector.

### About this task

The service account that you use to install and configure the data collector must have access to Kubernetes resources. To determine whether the data collector has access to resources, you can use this service account to run the following commands on the Kubernetes master node:

```
kubectl auth can-i list nodes --all-namespaces --as system:serviceaccount:
namespace:service_account_name
kubectl auth can-i get nodes --all-namespaces --as system:serviceaccount:
namespace:service_account_name
kubectl auth can-i get pods --all-namespaces --as system:serviceaccount:
namespace:service_account_name
kubectl auth can-i list services --all-namespaces --as system:serviceaccount:
namespace:service_account_name
kubectl auth can-i get services --all-namespaces --as system:serviceaccount:
namespace:service_account_name
kubectl auth can-i get configmaps --all-namespaces --as system:serviceaccount:
namespace:service_account_name
kubectl auth can-i get deployments --all-namespaces --as system:serviceaccount:
namespace:service_account_name
kubectl auth can-i list endpoints --all-namespaces --as system:serviceaccount:
namespace:service_account_name
kubectl auth can-i get endpoints --all-namespaces --as system:serviceaccount:
namespace:service_account_name
```

Where *namespace* is the namespace of your environment and *service\_account\_name* is the name of the service account that you use to configure the data collector. By default, the *service\_account\_name* is default. You must change the *namespace* and *service\_account\_name* with the values that you use.

**Tip:** To determine the existing *service\_account\_name* of a pod, you can run the command **kubectl get po my\_pod\_name -o yaml | grep serviceAccount**, where *my\_pod\_name* is the name of the running pod.

See the following example:

```
kubectl auth can-i list nodes --all-namespaces --as system:serviceaccount:ops-am:default
kubectl auth can-i get nodes --all-namespaces --as system:serviceaccount:ops-am:default
kubectl auth can-i get pods --all-namespaces --as system:serviceaccount:ops-am:default
kubectl auth can-i list services --all-namespaces --as system:serviceaccount:ops-am:default
kubectl auth can-i get services --all-namespaces --as system:serviceaccount:ops-am:default
kubectl auth can-i get configmaps --all-namespaces --as system:serviceaccount:ops-am:default
kubectl auth can-i get deployments --all-namespaces --as system:serviceaccount:ops-am:default
kubectl auth can-i list endpoints --all-namespaces --as system:serviceaccount:ops-am:default
kubectl auth can-i get endpoints --all-namespaces --as system:serviceaccount:ops-am:default
```

If you get at least one response of the commands to be no, it means that you do not have required permissions. Do the following steps to grant required service account that is used to set up your application.

### Procedure

1. Create a ClusterRole yaml file (for example, name it as `lwdc-clusterrole.yaml`) to allow read permission to required Kubernetes resources.

Here is an example:

```
apiVersion: rbac.authorization.k8s.io/v1
kind: ClusterRole
metadata:
  name: lwdc-query
rules:
- apiGroups:
  - ""
  - "apps"
```

```
resources:
- nodes
- services
- configmaps
- pods
- deployments
- endpoints
verbs:
- list
- get
```

2. Run the following command to create the ClusterRole:

```
# kubectl create -f lwdc-clusterrole.yaml
```

3. Create a ClusterRoleBinding yaml file (for example, name it as `lwdc-rolebinding.yaml`) to bind the service account to the ClusterRole that is created in step 1 and 2. This ClusterRole has access permission to query Kubernetes resources in the RBAC mode.

The following example binds the `system:serviceaccount:ops-am:default` account to the specific ClusterRole.

```
kind: ClusterRoleBinding
apiVersion: rbac.authorization.k8s.io/v1
metadata:
  name: lwdc-rolebinding
  namespace: ops-am
subjects:
- kind: User
  name: system:serviceaccount:ops-am:default
  apiGroup: rbac.authorization.k8s.io
roleRef:
  kind: ClusterRole
  name: lwdc-query
  apiGroup: rbac.authorization.k8s.io
```

If you need to grant the access to multiple service accounts in cluster scope, you can also create the ClusterRoleBinding against service account group, for example:

```
kind: ClusterRoleBinding
apiVersion: rbac.authorization.k8s.io/v1
metadata:
  name: lwdc-rolebinding
  namespace: ops-am
subjects:
- kind: Group
  name: system:serviceaccounts
  apiGroup: rbac.authorization.k8s.io
roleRef:
  kind: ClusterRole
  name: lwdc-query
  apiGroup: rbac.authorization.k8s.io
```

4. Run the following command:

```
# kubectl create -f clusterrolebinding.yaml
```

## Configuring the Liberty data collector for Liberty V18.\* and older versions

For Liberty V18.\* and older versions, you can use both the new configuration process and old configuration process. See the following topics to learn how to use previous method to configure the Liberty data collector.

### Configuring the Liberty data collector in on-premises environments (Liberty V18.\* and older versions)

To monitor the Liberty profile on Linux for System x, you can directly deploy a stand-alone data collector to your local Liberty directory without installing WebSphere Applications agent.

#### Before you begin

1. Download the `_datacollectors_linux_8.1.4.0.12.tgz` data collector package from the IBM Passport Advantage website. For detailed instructions, see [“Download instructions” on page 131](#).
2. Configure the data collector package with the `make_configuration_packages.sh` and `configure_agent_images.sh` scripts on the system where the Cloud APM server is installed. For detailed instructions, see [“Configuring the downloaded images” on page 182](#).
3. If your firewall rules do not allow transparent outbound HTTPS connections to external hosts, you can configure data collectors to send traffic to a forward proxy. For instructions, see [“Configuring data collectors to communicate through a forward proxy” on page 224](#).
4. The monitor-1.0 feature is required by the data collector. You can download this feature from the Liberty feature repository with the **installUtility** command. For instructions, see the section about downloading assets in the WebSphere Application Server Network Deployment Knowledge Center.
5. For the Memory Analysis dashboard to contain data, you must enable memory allocation collection for the data collector during configuration. This diagnostic feature requires IBM Health Center 3.0.8 or later. If the IBM Health Center version is not eligible, upgrade the JRE that is used by the application server to a version that contains IBM Health Center 3.0.8 or later.

**Tip:** To check the IBM Health Center version that is included in the JRE used by the application server, change to the bin directory within the JRE home directory and then issue `java -Xhealthcenter -version`.

#### About this task

You can choose to manually configure the data collector or to use the provided configuration script to configure the data collector.

#### Procedure

- To manually configure the data collector, get the data collector files from the data collector package and then modify some local files for the Liberty server.
  - a) Run the following command to extract files from the data collector package.

```
tar -xzf _datacollectors_linux_8.1.4.0.12.tgz
```

The `liberty_datacollector_8.1.4.0.tgz` package is included in the extracted directory.

- b) Extract files from the `liberty_datacollector_8.1.4.0.tgz` package to a local directory with the following command. The extracted directory will become the home directory of the data collector.

```
tar -xzf liberty_datacollector_8.1.4.0.tgz
```

For example, to extract the files to the `/opt/ibm/apm/` directory, issue the following commands:

```
cd /opt/ibm/apm
tar -xzf liberty_datacollector_8.1.4.0.tgz
```

You can find the extracted files in the `/opt/ibm/apm/liberty_dc/.gdc/7.3.0.14.08` directory. This directory is referred to as the data collector home directory (*dc\_home*) in the following steps.

- c) Navigate to the Liberty server home directory. For example, `/opt/ibm/wlp/usr/servers/defaultServer`.
- d) Edit the `jvm.options` file by adding the following parameters. If the `jvm.options` file does not exist, create it with a text editor.

```
-agentlib:am_ibm_16=server_name
-Xbootclasspath/p:dc_home/toolkit/lib/bcm-bootstrap.jar
-Djava.security.policy=dc_home/itcamdc/etc/datacollector.policy
-Dliberty.home=liberty_home
-Xhealthcenter:level=inprocess
-Xgc:allocationSamplingGranularity=10000
-verbosegc
-Xverbosegclog:absolute_path_to_log_file,1,10000
```

When you add the entries, take note of the following things:

- Each entry must be on a single line.
  - Replace *server\_name* with the name of the Liberty server.
  - Replace *dc\_home* with the home directory of the data collector. For example, `/opt/ibm/apm/liberty_dc/.gdc/7.3.0.14.08`.
  - Replace *liberty\_home* with the root of Liberty installation directory. For example, `/opt/ibm/wlp`.
  - If the Liberty server is working with heavy workload, add the `-Xmx` parameter to allocate extra 512M heap size for the data collector. For example, `-Xmx1024M`.
  - The `-Xhealthcenter:level=inprocess` and `-Xgc:allocationSamplingGranularity=10000` lines are optional. Add the two lines only if you want to enable memory allocation collection, which is disabled by default. Enabling memory allocation collection is required for the Memory Analysis dashboard to contain data.
  - The `-Xverbosegclog:absolute_path_to_log_file,1,10000` line is optional, which specifies the path to the redirected garbage collection log file. If not specified, logs are written into one file and rotates every 10000 allocation failures. The original `stdout` or `stderr` file (`console.log`) might be very large as the server runs. Add this line if you want to save the garbage collection output log files to another directory and limit the log file number and size. If the specified path is invalid, this line takes no effect and the garbage collection log file remains the `stdout` or `stderr` file.
- e) Open the `server.env` file in the same directory and add the following path to the environment entry. If the `server.env` file does not exist, create it with a text editor.

```
LD_LIBRARY_PATH=$LD_LIBRARY_PATH:/lib:dc_home/toolkit/lib/1x8266:dc_home/
toolkit/lib/1x8266/ttapi
```

When you add the entries, take note of the following things:

- Each entry must be on a single line.
  - Replace *dc\_home* with the home directory of the data collector. For example, `/opt/ibm/apm/liberty_dc/.gdc/7.3.0.14.08`.
- f) Modify the `server.xml` in the same directory to enable the monitoring feature by adding the following line to the `<featureManager>` section:

```
<feature>monitor-1.0</feature>
```

- g) Restart the Liberty server.

- To configure the data collector by responding to prompts, use the configuration script that is provided in the data collector packages.

a) Run the following command to extract files from the data collector package.

```
tar -xzf _datacollectors_linux_8.1.4.0.12.tgz
```

The `liberty_datacollector_8.1.4.0.tgz` package is included in the extracted directory.

b) Extract files from the `liberty_datacollector_8.1.4.0.tgz` package with the following command.

```
tar -xzf liberty_datacollector_8.1.4.0.tgz
```

For example,

```
cd /opt/ibm
tar -xzf liberty_datacollector_8.1.4.0.tgz
```

The extracted data collector files are in the `liberty_dc` directory.

c) Change to the `liberty_dc/.gdc/7.3.0.14.08/bin` directory and start the configuration script by running the following command:

```
./config_liberty_dc.sh
```

- d) When prompted, enter the root of your Liberty installation directory or accept the default. For example, `/opt/ibm/wlp`.
- e) When prompted, enter the home of JVM that is used by the application server or accept the default. For example, `/opt/ibm/java`.
- f) The configuration program can automatically discover and list the application servers that are not configured within the specified directory. Enter the number that corresponds to the Liberty server that you want to configure. To select more than one server, separate the numbers by space or enter `*` to select all.
- g) After the configuration program finishes updating files for all Liberty servers, manually update the JVM heap size to allocate extra 512M heap for the data collector.
- h) Restart the servers for configuration to take effect.

## Results

The data collector is configured and is connected to the Cloud APM server. Resource monitoring, transaction tracking, and diagnostic data is enabled. However, heap collection and memory allocation collection are disabled. You can enable them with the data collector properties files if you need the data in the Heap Dump and Memory Analysis dashboards.

## What to do next

- To view the monitoring data for your Liberty servers, start the Cloud APM console. For instructions, see [Starting the Cloud APM console](#). For information about using the Applications editor, see [Managing applications](#).

**Remember:** When you add the Liberty data collector instance on the Application Dashboard, select **Liberty Runtime** instead of **WebSphere Application Server** from the component list.

- For the Heap Dump dashboard and/or Memory Analysis dashboard to contain data, you also need to enable the data collector for heap snapshot collector and/or memory allocation collection, which can be done in the data collector `.properties` files. See [“Enabling or disabling transaction tracking and diagnostic data collection”](#) on page 981.
- If the key file or the Cloud APM server changes, reconnect the data collector to the Cloud APM server. For instructions, see [“Reconnecting the data collector to the Cloud APM server”](#) on page 259.

## Unconfiguring the data collector for on-premises applications

If you do not need to monitor your Liberty servers or if you want to upgrade the data collector to a new version, you must unconfigure the data collector that you deployed to the Liberty server.

### About this task

To unconfigure the data collector that is deployed to the Liberty server, roll back the changes that are made when you configure the data collector. You can choose to configure the data collector manually or with the provided `unconfig_liberty_dc` script.

### Procedure

- To manually unconfigure the data collector, complete the following steps:
  - Navigate to the Liberty server home directory. For example, `/opt/ibm/wlp/usr/servers/defaultServer`.
  - Edit the `jvm.options` file to remove the following parameters if any.

```
-agentlib:am_ibm_16=server_name
-Xbootclasspath/p:dc_home/toolkit/lib/bcm-bootstrap.jar
-Djava.security.policy=dc_home/itcamdc/etc/datacollector.policy
-Dliberty.home=liberty_home
-Xhealthcenter:level=inprocess
-Xgc:allocationSamplingGranularity=10000
-verbosegc
-Xverbosegclog:absolute_path_to_log_file,1,10000
```

- Edit the `server.env` file in the same directory to remove the following value for the **LD\_LIBRARY\_PATH**

```
/lib:dc_home/toolkit/lib/1x8266:dc_home/toolkit/lib/1x8266/ttapi
```

where `dc_home` is the home directory of the data collector. For example, `/opt/ibm/apm/liberty_dc/.gdc/7.3.0.14.08`.

- Edit the `server.xml` file in the same directory to remove `<feature>monitor-1.0</feature>` from the `<featureManager>` section.
  - Restart the Liberty server.
- To unconfigure the data collector with the `unconfig_liberty_dc.sh` script, complete the following steps:
    - Change to the `dc_home/bin` directory. For example, `/opt/ibm/apm/liberty_dc/.gdc/7.3.0.14.08/bin`.
    - Start the unconfiguration script by running the following command:

```
./unconfig_liberty_dc.sh
```

- When prompted, enter the root of your Liberty installation directory or accept the default. For example, `/opt/ibm/wlp`.
- The unconfiguration program can automatically discover and list the application servers that are configured within the specified directory. Enter the number that corresponds to the Liberty server that you want to unconfigure. To select more than one server, separate the numbers by space or enter `*` to select all.
- After the unconfiguration program finishes updating files for all Liberty servers, restart the servers for changes to take effect.

### What to do next

After you unconfigure the data collector, the Cloud APM console continues to display the data collector in any applications that you added the data collector to. The Cloud APM console will show that no data is available for the application and will not indicate that the data collector is offline. For information about

how to remove the data collector from applications and from resource groups, see [“Removing data collectors from Cloud APM console”](#) on page 262.

You can also delete the home directory of the data collector if you do not need it anymore.

## Configuring the Liberty data collector in IBM Cloud environment (Liberty V18.\* and older versions)

To monitor a Liberty profile running in the IBM Cloud environment, you must download the data collector package from IBM Passport Advantage, deploy the data collector to your local application files, and then push the updates to IBM Cloud.

### Before you begin

It is assumed that the Liberty application is pushed to the IBM Cloud environment by using the Cloud Foundry commands. The `manifest.yml` file and the Liberty server home directory (which contains the `server.xml` file) already exist.

If your Liberty application is deployed as a WAR file, you must modify some local files to update your application by pushing a local directory that contains both the WAR file and the data collector files. An example is provided here to explain how to get a local Liberty server home directory if you only have a WAR file.

1. Issue the following command to run the Liberty application locally:

```
mvn install liberty:run-server
```

In the directory that contains the Liberty WAR file, a sub-directory, `/liberty/wlp/usr/servers/defaultServer`, is created. This directory can serve as the Liberty server home directory in the following procedure.

2. From the root directory that contains the Liberty WAR file, copy the entire `application_name-SNAPSHOT` folder to the `/liberty/wlp/usr/servers/defaultServer` directory.
3. In the `/liberty/wlp/usr/servers/defaultServer` directory, edit the `bootstrap.properties` file to modify the **appLocation** path. The **appLocation** path must be set to the relative path to the application directory in IBM Cloud.
4. Remove the `logs` and `workarea` folders. They do not need to be pushed to IBM Cloud.
5. Modify the **path** value in the `manifest.yml` file to point to the `defaultServer` directory.

For example, `path: target/liberty/wlp/usr/servers/defaultServer`.

### Procedure

Complete the following steps to configure the Liberty data collector:

1. Download the data collector package named `_datacollectors_linux_8.1.4.0.12.tgz` from IBM Passport Advantage website. For detailed instructions, see [“Download instructions”](#) on page 131.
2. Configure the data collector package with the `make_configuration_packages.sh` and `configure_agent_images.sh` scripts on the system where the Cloud APM server is installed. For detailed instructions, see [“Configuring the downloaded images”](#) on page 182.
3. Run the following command to extract files from the data collector package.

```
tar -xzf _datacollectors_linux_8.1.4.0.12.tgz
```

The `liberty_datacollector_8.1.4.0.tgz` package is included in the extracted directory.

4. Extract files from the `liberty_datacollector_8.1.4.0.tgz` package to a temporary directory.

```
tar -xzf liberty_datacollector_8.1.4.0.tgz
```

For example,

```
cd /root/tmp
tar -xzf liberty_datacollector_8.1.4.0.tgz
```

You can find the extracted files in the `liberty_dc` directory within the temporary directory.

5. Copy the `.gdc` directory from the `liberty_dc` directory to the home directory of your Liberty server where the `server.xml` file is stored. The Liberty server home directory is referred to as `liberty_server_home` in the following steps.

```
cp -rf temp_dir/liberty_dc/.gdc liberty_server_home
```

For example,

```
cp -rf /root/tmp/liberty_dc/.gdc /opt/liberty855/wlp/usr/servers/defaultServer/
```

6. Copy or merge the contents of the `jvm.options` and `server.env` files from the `liberty_dc/etc` directory to `liberty_server_home` directory.

- If the `jvm.options` and `server.env` files do not exist in `liberty_server_home` directory, copy the two files from `temp_dir/liberty_dc/etc` to `liberty_server_home`.

```
cp temp_dir/liberty_dc/etc/jvm.option liberty_server_home
cp temp_dir/liberty_dc/etc/server.env liberty_server_home
```

- If the `jvm.options` or `server.env` file exists in `liberty_server_home` directory, merge the contents with the ones from `temp_dir/liberty_dc/etc` directory.
7. If your IBM Cloud applications cannot directly connect to the Cloud APM server due to the network or firewall settings, configure the data collector to send traffic through a forward proxy. To do it, edit the `jvm.options` file in one of the following ways:

- If authentication is not required, add the following lines to the file:

```
-Dhttp.proxyHost=http_proxy_host
-Dhttp.proxyPort=http_proxy_port
-Dhttps.proxyHost=http_proxy_host
-Dhttps.proxyPort=http_proxy_port
-Djava.net.useSystemProxies=true
```

- If a user name and password are required to access the forward proxy server, add the following lines to the file:

```
-Dhttp.proxyHost=http_proxy_host
-Dhttp.proxyPort=http_proxy_port
-Dhttp.proxyUser=http_proxy_user
-Dhttp.proxyPassword=http_proxy_password
-Dhttps.proxyHost=http_proxy_host
-Dhttps.proxyPort=http_proxy_port
-Dhttps.proxyUser=http_proxy_user
-Dhttps.proxyPassword=http_proxy_password
-Djava.net.useSystemProxies=true
```

8. Modify the `server.xml` file within the Liberty server home directory to enable the monitoring feature by adding the following line to the `<featureManager>` section:

```
<featureManager>
  <feature>monitor-1.0</feature>
</featureManager>
```

9. Modify the `manifest.yml` file of your Liberty application to allocate additional 512M memory.
10. Open a command prompt, change to the local directory that contains the `manifest.yml` file for the Liberty server. For example, `/opt/liberty855/`.
11. Log in to IBM Cloud and update the Liberty profile with the **cf push** command.

## Results

The data collector is configured and is connected to the Cloud APM server. Resource monitoring, transaction tracking, and diagnostic data is enabled. However, heap collection and memory allocation

collection are disabled. You can enable them with the data collector properties files if you need the data in the Heap Dump and Memory Analysis dashboards.

## What to do next

- If you are an IBM Cloud Public user, configure the IBM Cloud Secure Gateway to enable it to connect to the Cloud APM server. For instructions, see [“Configuring the IBM Cloud Secure Gateway”](#) on page 258.
- To view the monitoring data for your IBM Cloud application, start the Cloud APM console. For instructions, see [Starting the Cloud APM console](#). For information about using the Applications editor, see [Managing applications](#).

**Remember:** When you want to add the Liberty data collector instance on the Application Dashboard, select **Liberty Runtime** instead of **WebSphere Application Server** from the component list.

- For the Heap Dump dashboard and/or Memory Analysis dashboard to contain data, you also need to enable the data collector for heap snapshot collector and/or memory allocation collection, which can be done in the data collector .properties files. See [“Customizing data collector with properties files”](#) on page 566.
- If the key file or the Cloud APM server changes, reconnect the data collector to the Cloud APM server. For instructions, see [“Reconnecting the data collector to the Cloud APM server”](#) on page 259.

### Environment variables for customizing the Liberty data collector

To customize the Liberty data collector for the IBM Cloud applications, use the IBM Cloud UI to add the environment variables that are supported by the data collector.

**Tip:** To add environment variables on the IBM Cloud UI, first log in to the IBM Cloud UI and click your application, and then click **Runtime > Environment variable**. In the **user-defined** section, add the environment variables.

- Use the variables that are listed in [Table 192 on page 564](#) to configure connection between the Liberty data collector and the Cloud APM server.
- Use the variable that is listed in [Table 193 on page 565](#) to enable or disable method trace for your IBM Cloud applications.
- After method tracing is enabled, use the variables that are listed in [Table 194 on page 565](#) to specify thresholds for different types of requests, so that different levels of monitoring data can be collected.

**Remember:** After you add or modify the environment variable, restart your application for the changes to take effect.

| Table 192. Environment variables for server connections |   |  |
|---|---|--|
| Variable name   | Possible values   | Description  |
| APM_BM_GATEWAY_URL                                      | <ul style="list-style-type: none"><li>• <code>https://server_ip_or_hostname:443</code></li><li>• <code>http://server_ip_or_hostname:80</code></li></ul> | The URL of the target Cloud APM server gateway.  |
| APM_KEYFILE_PSWD  | Encrypted password of the key file  | <p>The encrypted key file password that is paired with the key file. If you are a Linux user, you can use the <code>echo -n &lt;keyfile password&gt;   base64</code> command to encrypt your password.</p> <p><b>Remember:</b> Set this variable only when you configured the <code>APM_BM_GATEWAY_URL</code> variable to use HTTPS.</p> |

| Table 192. Environment variables for server connections (continued) |  |   |
|---|--|---|
| Variable name   | Possible values                                    | Description   |
| APM_KEYFILE_URL   | http://<br>hosted_http_server:port/<br>keyfile.jks | The URL to download the key file.<br><br><b>Remember:</b> Set this variable only when you configured the <code>APM_BM_GATEWAY_URL</code> variable to use HTTPS. |

| Table 193. Environment variable for method trace |   |   |
|--|---|---|
| Variable name                                    | Possible values   | Description   |
| METHOD_TRACE_ENABLE                              | <ul style="list-style-type: none"> <li>true</li> <li>false</li> </ul> | Use this variable to enable or disable method tracing. The value of true enables method tracing.<br><br>The default value is false. |

After method trace is enabled, you can configure thresholds for different types of requests to customize method trace. The following thresholds, which trigger the collection of different levels of monitoring data, can be configured for each request type:

#### Primary thresholds

If you configure the primary threshold for a request type, the timing information of this type of requests is captured, such as CPU time and response time for that request type. As a result, when a request takes more time to complete than the time that is specified for the primary threshold, the timing of the request is captured.

#### Secondary thresholds

If you configure the secondary threshold for a request type, deep context data is captured, such as stack traces and SQL for database requests. The context data that is captured differs based on the request type. When a request takes more time to complete than the time that is specified for the secondary threshold, its context data is captured.

The environment variable for different request thresholds is named as `<request_type>_<threshold level>`. For example, to configure a primary threshold for the JMS request, add the `JMS_PRIMARY` variable and set its value.

Table 194 on page 565 lists the corresponding environment variables that you can add for different request types. The values are in milliseconds.

| Table 194. Environment variables for different request thresholds |                                 |
|---|---------------------------------|
| Variable name   | Default value (in milliseconds) |
| SERVLET_PRIMARY   | 20                              |
| SERVLET_SECONDARY   | 50                              |
| JDBC_PRIMARY  | 20                              |
| JDBC_SECONDARY  | 50                              |
| JNDI_PRIMARY  | 20                              |
| JNDI_SECONDARY  | 50                              |
| EJB_PRIMARY   | 20                              |
| EJB_SECONDARY   | 50                              |
| WEBSERVICES_PRIMARY   | 20                              |

Table 194. Environment variables for different request thresholds (continued)

| Variable name   | Default value (in milliseconds) |
|---|---------------------------------|
| WEBSERVICES_SECONDARY                                   | 50                              |
| APP_METHODS_PRIMARY<br>(application methods – non J2EE) | 50                              |
| APP_METHODS_SECONDARY                                   | 1000                            |
| JCA_PRIMARY   | 50                              |
| JCA_SECONDARY   | 80                              |
| JMS_PRIMARY   | 40                              |
| JMS_SECONDARY   | 70                              |

### Customizing data collector with properties files

By default, transaction tracking and method tracing are enabled for the data collector. Heap snapshot collection and memory allocation collection are disabled. You can customize the data collection or the intervals at which the diagnostic data is collected by editing the `.properties` files of the data collector.

### About this task

The properties files of the data collector are in the `dc_home` directory, for example, `/opt/liberty855/wlp/usr/servers/defaultServer/.gdc/7.3.0.14.08`. Use different properties to customize the data collector for the following purposes:

- Enable or disable transaction tracking.
- Enable or disable heap snapshot collection.
- Specify the interval at which the data collector takes snapshot of heap dump.
- Enable or disable memory allocation monitoring.
- Specify the interval at which the data collector collects memory allocation information.
- Enable or disable method tracing.

**Remember:** After you modify the `.properties` files, use the **cf push** command to push the updates to the IBM Cloud environment.

### Procedure

- To enable or disable transaction tracking, set the **com.ibm.tivoli.itcam.dc.bluemix.transaction.enabled** property in the following file to true or false:

`dc_home/ldc/etc/ldc.properties`

If transaction tracking is enabled, you can monitor IBM Java application stack in the topologies.

- To enable or disable heap snapshot collection, set the **com.ibm.tivoli.itcam.hc.send.heap.enable** and **com.ibm.tivoli.itcam.hc.snapshot.automatic.enable** properties in the following file to true or false.

`dc_home/healthcenter/etc/hc.properties`

If heap snapshot collection is enabled, the data collector can take heap snapshot at specified intervals. Heap dump information can be displayed in the Heap Dump dashboard.

- To change the interval at which heap snapshot is taken by the data collector, set the **com.ibm.tivoli.itcam.hc.snapshot.automatic.interval** property in the same file to a positive integer. The unit of the interval is minute and the default is 360.

`dc_home/healthcenter/etc/hc.properties`

- To enable or disable memory allocation collection, set the **com.ibm.tivoli.itcam.hc.events.collection.automatic.enable** property in the following file to true or false.

`dc_home/healthcenter/etc/hc.properties`

**Remember:** To enable memory allocation collection, you also need to ensure the following two lines are added to the `jvm.options` file of the Liberty server.

```
-Xhealthcenter:level=inprocess
-Xgc:allocationSamplingGranularity=10000
```

After memory allocation collection is enabled, data is available in the Memory Analysis dashboard.

- To specify the interval at which memory allocation information is collected, set the **com.ibm.tivoli.itcam.hc.events.collection.automatic.interval** property in the same file to a positive integer. The unit of the interval is minute and the default is 15.

`dc_home/healthcenter/etc/hc.properties`

- To enable or disable method tracing, set the **dfe.enable.methoddata** property in the following file to true or false:

`dc_home/gdc/etc/gdc_dfe.properties`

## What to do next

- After method tracing is enabled, you can set thresholds for different types of requests by using the environment variables, so that different levels of monitoring data can be collected for different requests. For applicable environment variables, see [Table 194 on page 565](#).
- If you disabled memory allocation collection, remember to remove the following lines from the `jvm.options` file of the Liberty server:

```
-Xhealthcenter:level=inprocess
-Xgc:allocationSamplingGranularity=10000
```

## Unconfiguring the data collector for IBM Cloud applications

If you do not need to monitor your Liberty profiles in IBM Cloud environment or if you want to upgrade the data collector to a new version, you must unconfigure the data collector that you previously deployed.

## About this task

To unconfigure the data collector for your Liberty profile in IBM Cloud environment, roll back the changes that are made in `jvm.options`, `server.env` and `server.xml` files, and then update the Liberty profile in IBM Cloud with the **cf push** command.

## Procedure

1. In your local directory of the Liberty profile, modify the `jvm.options` file to remove the following parameters. You can delete the file if it is empty after the change.

```
-agentlib:am_ibm_16=defaultServer
-Xbootclasspath/p:../../../../.gdc/7.3.0.14.08/toolkit/lib/bcm-bootstrap.jar
-Djava.security.policy=../../../../.gdc/7.3.0.14.08/itcamdc/etc/datacollector
.policy
-Dliberty.home=/home/vcap/app/.liberty
-Xhealthcenter:level=inprocess
-Xgc:allocationSamplingGranularity=10000
```

```
-verbosegc
-Xverbosegclog:/home/vcap/app/wlp/usr/servers/defaultServer/logs/gc.log,1,10000
```

2. In the `server.env` file, remove the following value for the **LD\_LIBRARY\_PATH** environment variable. You can delete the file if it is empty after the change.

```
LD_LIBRARY_PATH=:/lib:../../../../.gdc/7.3.0.14.08/toolkit/lib/lx8266
:../../../../.gdc/7.3.0.14.08/toolkit/lib/lx8266/ttapi
```

3. Modify the `server.xml` file to remove the monitor-1.0 feature by removing the following line to the `<featureManager>` section

```
<feature>monitor-1.0</feature>
```

4. Delete the `.gdc` directory within the Liberty home directory.
5. Open a command prompt, change to the directory that contains the `manifest.yml` file of the Liberty server.
6. Log in to IBM Cloud and update the Liberty profile with the **cf push** command.

## What to do next

After you unconfigure the data collector, the Cloud APM console continues to display the data collector in any applications that you added the data collector to. The Cloud APM console will show that no data is available for the application and will not indicate that the data collector is offline. For information about how to remove the data collector from applications and from resource groups, see [“Removing data collectors from Cloud APM console” on page 262](#).

## Configuring Linux KVM monitoring

You must configure the Monitoring Agent for Linux KVM to collect data of the Red Hat Enterprise Virtualization Hypervisor (RHEVH) and Red Hat Enterprise Virtualization Manager (RHEVM) servers. After you install the agent on a server or a virtual machine, you must create the first instance, and start the agent manually.

### Before you begin

Review hardware and software prerequisites. For the up-to-date system requirement information, see the [Software Product Compatibility Reports \(SPCR\) for the Linux KVM agent](#).

### About this task

The Linux KVM agent is a multi-instance and multi-connection agent. Multi-instance means that you can create multiple instances and each instance can make multiple connections to one or more RHEVM or RHEVH servers.

**Remember:** Use different instances to monitor RHEVM or the RHEVH servers.

The product version and the agent version often differ. The directions here are for the most current release of this agent. For information about how to check the version of an agent in your environment, see [Agent version command](#). For detailed information about the agent version list and what's new for each version, see the [“Change history” on page 58](#).

You can use the same configuration script to configure instances for the RHEVH and the RHEVM servers:

- To configure a connection to the RHEVM server, complete the steps that are mentioned in the [“Configuring a connection to the RHEVM server”](#) topic.
- To configure a connection to the RHEVH server, complete the steps that are mentioned in the [“Configuring a connection to the RHEVH server”](#) topic.

## Creating a user and granting required permissions

Before you configure the Linux KVM agent, you must create a user and grant required permissions to the user to monitor the RHEVM and RHEVH servers.

### Procedure

1. Open the **Red Hat Enterprise Virtualization Manager Web Administration** portal.
2. Click **Configure**.
3. In the **Configuration** window, select **Roles**.
  - a) To create a role, click **New**.
  - b) In the **New Role** window, add the name of the role and select **Admin** as the account type.
  - c) Ensure that the check boxes in the **Check boxes to Allow Action** pane are not selected, and click **OK**.
4. In the **Configuration** window, select **System Permission**.
  - a) To grant a user permission, click **Add**.
  - b) In the **Add System Permission to User** window, select the user to whom you want to grant the permission.
  - c) From the **Assign role to user** list, select the role that you created and click **OK**.

### What to do next

Complete the agent configuration:

- [“Configuring a connection to the RHEVH server” on page 575](#)
- [“Configuring a connection to the RHEVM server” on page 573](#)

## Configuring protocols

The agent uses different protocols to connect to the RHEVH server. You can configure any of these protocols: SSH, TLS, or TCP.

### About this task

The Linux KVM agent remotely connects to each hypervisor by using the **virsh** tool that manages your QEMU-KVM virtual machines, and collects metrics. The **libvirt** API in the agent environment uses several different remote transport protocols. For the list of supported protocols, see the [Remote support page](#).

### Configuring the SSH protocol

You can configure the SSH protocol to remotely monitor a host.

### About this task

**Assumption:** The Linux KVM agent is installed on host A. You want to remotely monitor the hypervisor on host B.

### Procedure

1. Log in to host A with the same user ID that runs the Linux KVM agent process, for example, the root user ID.

**Tip:** Ensure that you know the ID on host B that accepts the SSH connection and the root user ID on host A.
2. Generate the **id\_rsa** and **id\_rsa.pub** keys on host A by using the **ssh-keygen** utility.

The keys are saved at the following location: `~/ .ssh`: `$ ssh-keygen -t rsa`.

3. Copy the authorized keys from host B:

```
$ scp Id on host B@name or IP address of host B:~/.ssh/authorized_keys  
~/.ssh/authorized_keys_from_B
```

4. Append the public key for host A to the end of the authorized keys for host B:

```
cat ~/.ssh/id_rsa.pub >> ~/.ssh/authorized_keys_from_B
```

5. Copy the authorized keys back to host B:

```
$ scp ~/.ssh/authorized_keys_from_B Id on host B@name or IP address of host  
B:~/.ssh/authorized_keys
```

**Remember:** If you are monitoring multiple hosts, repeat steps “3” on page 570, “4” on page 570, and “5” on page 570 for each host.

6. Remove the authorized keys that you copied on host B:

```
~/.ssh/authorized_keys_from_B
```

7. Add the following command to the ~/.bash\_ profile of the current ID on host A:

```
$ eval `ssh-agent`
```

**Remember:** Ensure that you use the single back quotation mark ( ` ) that is located under the tilde ( ~ ) on US keyboards, rather than the single quotation mark ( ' ).

8. Add the identity to host A and enter the password that you used when you created the ID:

```
$ ssh-add ~/.ssh/id_rsa
```

9. Run the following command if you receive the Could not open a connection to your authentication agent message:

```
exec ssh-agent bash
```

**Tip:** You can replace the bash with the shell that you are using and then run the following command again:

```
$ ssh-add ~/.ssh/id_rsa
```

10. Test the SSH protocol to ensure that it connects from host A to host B without entering the SSH password:

**Tip:** If you are monitoring multiple hosts, use the following command to test the connection for each host:

```
$ ssh Id on host B@name or IP address of host B
```

11. To verify the connection, run the following command:

```
virsh -c qemu+ssh://Id on host B@name or IP address of host B:port/system
```

If you did not change the default SSH port, omit the **:port** section of the command.

**Important:** If the **virsh** command succeeds, the Linux KVM agent connects to the hypervisor.

12. You must restart host A before you restart the Linux KVM agent on host A. To restart, run the **ssh-add** command again and specify the password each time.

**Tip:** You can use SSH keychains to avoid reentering the password.

## Configuring the TLS protocol

You can configure the TLS protocol to remotely monitor a host.

### About this task

**Assumption:** The Linux KVM agent is installed on host A. You want to remotely monitor the hypervisor on host B.

## Procedure

1. To create a certificate authority (CA) key and a certificate in your hypervisor, complete the following steps:

- a) Log in to host B.
- b) Create a temporary directory and change the path to this temporary directory:

```
mkdir cert_files  
cd cert_files
```

- c) Create a 2048-bit RSA key:

```
openssl genrsa -out cakey.pem 2048
```

- d) Create a self-signed certificate to your local CA:

```
openssl req -new -x509 -days 1095 -key cakey.pem -out \  
cacert.pem -sha256 -subj "/C=US/L=Austin/O=IBM/CN=my CA"
```

- e) Check your CA certificate:

```
openssl x509 -noout -text -in cacert.pem
```

2. To create the client and server keys and certificates in your hypervisor, complete the following steps:

- a) Create the keys:

```
openssl genrsa -out serverkey.pem 2048  
openssl genrsa -out clientkey.pem 2048
```

- b) Create a certificate signing request for the server:

**Remember:** Change the kvmhost.company.org address, which is used in the server certificate request, to the fully qualified domain name of your hypervisor host.

```
openssl req -new -key serverkey.pem -out serverkey.csr \  
-subj "/C=US/O=IBM/CN=kvmhost.company.org"
```

- c) Create a certificate signing request for the client:

```
openssl req -new -key clientkey.pem -out clientkey.csr \  
-subj "/C=US/O=IBM/OU=virtualization/CN=root"
```

- d) Create client and server certificates:

```
openssl x509 -req -days 365 -in clientkey.csr -CA cacert.pem \  
-CAkey cakey.pem -set_serial 1 -out clientcert.pem  
openssl x509 -req -days 365 -in serverkey.csr -CA cacert.pem \  
-CAkey cakey.pem -set_serial 94345 -out servercert.pem
```

- e) Check the keys:

```
openssl rsa -noout -text -in clientkey.pem  
openssl rsa -noout -text -in serverkey.pem
```

- f) Check the certificates:

```
openssl x509 -noout -text -in clientcert.pem  
openssl x509 -noout -text -in servercert.pem
```

3. To distribute the keys and certificates to the host server, complete the following steps:

- a) Copy the CA certificate cacert.pem file to this directory: /etc/pki/CA

```
cp cacert.pem /etc/pki/CA/cacert.pem
```

- b) Create the /etc/pki/libvirt directory, and copy the servercert.pem server certificate file to the /etc/pki/libvirt directory. Ensure that only the root user can access the private key.

```
mkdir /etc/pki/libvirt
```

```
cp servercert.pem /etc/pki/libvirt/.
```

```
chmod -R o-rwx /etc/pki/libvirt
```

**Remember:** If the keys or certificates are named incorrectly or copied to the wrong directories, the authorization fails.

- c) Create the /etc/pki/libvirt/private directory and copy the serverkey.pem server key file to the /etc/pki/libvirt/private directory. Ensure that only the root user can access the private key.

```
mkdir /etc/pki/libvirt/private
```

```
cp serverkey.pem /etc/pki/libvirt/private/.
```

```
chmod -R o-rwx /etc/pki/libvirt/private
```

**Remember:** If the keys or certificates are named incorrectly or copied to the wrong directories, the authorization fails.

- d) Verify that the files are correctly placed:

```
find /etc/pki/CA/*|xargs ls -l
```

```
ls -lR /etc/pki/libvirt
```

```
ls -lR /etc/pki/libvirt/private
```

**Remember:** If the keys or certificates are named incorrectly or copied to the wrong directories, the authorization fails.

- 4. To distribute keys and certificates to clients or management stations, complete the following steps:

- a) Log in to host A.

- b) Copy the CA certificate cacert.pem from the host to the /etc/pki/CA directory in host A without changing the file name.

```
scp kvmhost.company.org:/tmp/cacert.pem /etc/pki/CA/
```

- c) Copy the client certificate clientcert.pem file to the /etc/pki/libvirt directory from host B. Use the default file names and make sure that only the root user is able to access the private key.

```
mkdir /etc/pki/libvirt/
```

```
scp kvmhost.company.org:/tmp/clientcert.pem /etc/pki/libvirt/.
```

```
chmod -R o-rwx /etc/pki/libvirt
```

**Remember:** If the keys or certificates are named incorrectly or copied to the wrong directories, the authorization fails.

- d) Copy the client key clientkey.pem to the /etc/pki/libvirt/private directory from the host. Use the default file names and ensure that only the root user can access the private key.

```
mkdir /etc/pki/libvirt/private
```

```
scp kvmhost.company.org:/tmp/clientkey.pem /etc/pki/libvirt/private/.
```

```
chmod -R o-rwx /etc/pki/libvirt/private
```

**Remember:** If the keys or certificates are named incorrectly or copied to the wrong directories, the authorization fails.

- e) Verify that the files are correctly placed:

```
ls -lR /etc/pki/libvirt
```

```
ls -lR /etc/pki/libvirt/private
```

- 5. To edit the libvirtd daemon configuration, complete the following steps:

- a) Log in to host B.

- b) Make a copy of the /etc/sysconfig/libvirtd file and the /etc/libvirt/libvirtd.conf file.

- c) Edit the `/etc/sysconfig/libvirtd` file and ensure that the **--listen** parameter is passed to the `libvirtd` daemon. This step ensures that the `libvirtd` daemon is listening to network connections.
- d) Edit the `/etc/libvirt/libvirtd.conf` file and configure a set of allowed subjects with the **tls\_allowed\_dn\_list** directive in the `libvirtd.conf` file.  
**Important:** The fields in the subject must be in the same order that you used to create the certificate.
- e) Restart the `libvirtd` daemon service for changes to take effect:  
**`/etc/init.d/libvirtd restart`**
6. To change the firewall configuration, access the security level configuration and add TCP port 16514 as a trusted port.
7. To verify that the remote management is working, run the following command on host A:  
**`virsh -c qemu+tls://kvmhost.company.org/system list --all`**

## Configuring the TCP protocol

Use the TCP protocol only for testing.

### About this task

**Assumption:** The Linux KVM agent is installed on host A. You want to remotely monitor the hypervisor on host B.

### Procedure

1. Log in to host B.
2. Edit the `/etc/libvirt/libvirtd.conf` file and ensure that the **listen\_tcp** parameter is enabled, and the value of the **tcp\_port** parameter is set to the default value of 16509.
3. Edit the `/etc/libvirt/libvirtd.conf` file to set the **auth\_tcp** parameter to "none". This step instructs TCP not to authenticate the connection.
4. Restart the **libvirt** daemon on host B in listening mode by running it with the **--listen** flag or by editing the `/etc/sysconfig/libvirtd` file and uncommenting the `LIBVIRT_ARGS="--listen"` line.
5. To verify the connection, run the following command:

**`virsh -c qemu+tcp://kvmhost.company.org:port/system`**

If you did not change the default TCP port, omit the **:port** section of the command.

**Important:** If the **virsh** command succeeds, the Linux KVM agent connects to the hypervisor.

### What to do next

Configure the agent by completing the steps that are described in [“Configuring a connection to the RHEVH server”](#) on page 575.

## Configuring a connection to the RHEVM server

To configure a connection to the RHEVM server, you must run the script and respond to prompts.

### Before you begin

1. Download the security certificate that is available at the following path: `http://[RHEVM-IP]/ovirt-engine/services/pki-resource?resource=cacertificate&format=X509-PEM-CA`  
Depending on the browser, the certificate is either downloaded or imported into the browser's Keystore.

- If the browser downloads the certificate: Save the file as `rhvm.cer`
  - If the browser imports the certificate: Export it from the browser's certification options and save it as `rhvm.cer`
2. Use the `keytool` utility to import the security certificate file to generate a local keystore file:

```
keytool -import -alias ALIAS -file CERTIFICATE_FILE -keystore  
KEYSTORE_FILE
```

Example **keytool -import -alias RHEVM36vmwt9 -file hjs495-vmw-t-9.cer  
-keystore RHEVM36KeyStore**

Where

#### **ALIAS**

A unique reference for each certificate that is added to the certificate truststore of the agent, for example, an appropriate alias for the certificate from *datasource.example.com* is *datasource*.

#### **CERTIFICATE\_FILE**

The complete path and file name to the data source certificate that is being added to the truststore.

#### **KEYSTORE\_FILE**

The name of the keystore file that you want to specify.

**Tip:** The `keytool` utility is available with Java Runtime Environment (JRE). The keystore file is stored at the same location from where you run the command.

3. Ensure that the user, who connects to the RHEVM, is an administrator with the SuperUser role. Use can use an existing user ID with this role, or you can create a new user ID by completing the steps that are mentioned in [“Creating a user and granting required permissions” on page 569](#).

## **Procedure**

1. On the command line, run the following command:

```
install_dir/bin/linux_kvm-agent.sh config instance_name
```

Example **/opt/ibm/apm/agent/bin/linux\_kvm-agent.sh config instance\_name**

Where

#### **instance\_name**

The name that you want to give to the instance.

#### **install\_dir**

The path where the agent is installed.

2. Respond to the prompts and specify values for the configuration parameters.

For information about the configuration parameters, see [“Configuration parameters to connect to the RHEVM server” on page 575](#).

3. Run the following command to start the agent:

```
install_dir/bin/linux_kvm-agent.sh start instance_name
```

Example **/opt/ibm/apm/agent/bin/linux\_kvm-agent.sh start instance\_name**

## **What to do next**

Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

If you need help with troubleshooting, see the [Troubleshooting](#) section.

## Configuring a connection to the RHEVH server

To configure a connection to the RHEVH server, you must run the script and respond to prompts.

### Before you begin

- Ensure that the user, who connects to the RHEVM, is a root user. You can use an existing user ID or create a new user ID by completing the steps that are mentioned in [“Creating a user and granting required permissions”](#) on page 569.
- Configure the protocol that you want to use to connect to the RHEVH server by completing the steps that are described in [“Configuring protocols”](#) on page 569.

### Procedure

1. On the command line, run the following command:

```
install_dir/bin/linux_kvm-agent.sh config instance_name
```

Example **/opt/ibm/apm/agent/bin/linux\_kvm-agent.sh config instance\_name**

Where

**instance\_name**

The name that you want to give to the instance.

**install\_dir**

The path where the agent is installed.

2. Respond to the prompts and specify values for the configuration parameters.

For information about the configuration parameters, see [“Configuration parameters to connect to the RHEVH server”](#) on page 577.

3. Run the following command to start the agent:

```
install_dir/bin/linux_kvm-agent.sh start instance_name
```

Example **/opt/ibm/apm/agent/bin/linux\_kvm-agent.sh start instance\_name**

### What to do next

Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console”](#) on page 1109.

If you need help with troubleshooting, see the [Troubleshooting](#) section.

## Configuration parameters to connect to the RHEVM server

You can modify the default values of configuration parameters that are used for connecting the agent with the RHEVM server.

The following table contains detailed descriptions of the configuration parameters.

| Table 195. Names and descriptions of the configuration parameters for connecting to the RHEVM server |   |                 |
|--|---|-----------------|
| Parameter name   | Description   | Mandatory field |
| Edit Monitoring Agent for Linux KVM settings   | Indicates that you can begin editing the default values of the configuration parameters. Enter 1 (Yes), which is also the default value, to continue. | Yes             |
| Maximum number of Data Provider Log Files  | The maximum number of log files that the data provider creates before it overwrites the previous log files. The default value is 10.                  | Yes             |

Table 195. Names and descriptions of the configuration parameters for connecting to the RHEVM server (continued)

| Parameter name                               | Description  | Mandatory field |
|--|--|-----------------|
| Maximum Size in KB of Each Data Provider Log | The maximum size in KB that a data provider log file must reach before the data provider creates a new log file. The default value is 5190 KB.   | Yes             |
| Level of Detail in Data Provider Log         | <p>The level of detail that can be included in the log file that the data provider creates. The default value is 4 (Info). The following values are valid:</p> <ul style="list-style-type: none"> <li>• 1 = Off: No messages are logged.</li> <li>• 2 = Severe: Only errors are logged.</li> <li>• 3 = Warning: All errors and messages that are logged at the Severe level and potential errors that might result in undesirable behavior.</li> <li>• 4 = Info: All errors and messages that are logged at the Warning level and high-level informational messages that describe the state of the data provider when it is processed.</li> <li>• 5 = Fine: All errors and messages that are logged at the Info level and low-level informational messages that describe the state of the data provider when it is processed.</li> <li>• 6 = Finer: All errors and messages that are logged at the Fine level plus highly-detailed informational messages, such as performance profiling information and debug data. Selecting this option can adversely affect the performance of the monitoring agent. This setting is intended only as a tool for problem determination along with IBM support staff.</li> <li>• 7 = Finest: All errors and messages that are logged at the Fine level and the most detailed informational messages that include low-level programming messages and data. Choosing this option might adversely affect the performance of the monitoring agent. This setting is intended only as a tool for problem determination along with IBM support staff.</li> <li>• 8 = All: All errors and messages are logged.</li> </ul> | Yes             |
| Edit Hypervisor settings                     | Indicates whether you want to edit the parameters for a connection to the RHEVH server. Enter 5 (Next) because you are configuring a connection to the RHEVM server. The default value is 5 (Next).  | Yes             |
| Edit RHEVM Connection Details settings       | <p>Indicates whether you want to edit the parameters for a connection to the RHEVM server. Enter 1 (Add) to continue. The default value is 5 (Next).</p> <p><b>Important:</b> After you specify values for all the configuration parameters, you are again prompted to indicate whether you want to continue to edit the parameters. Enter 5 (Exit).</p>   | Yes             |
| RHEVM ID                                     | The unique user name, which you specify for the RHEVM that you connect to.   | Yes             |
| Host   | The host name or IP address of the data source that is used to connect to the RHEVM server.  | Yes             |

*Table 195. Names and descriptions of the configuration parameters for connecting to the RHEVM server (continued)*

| Parameter name   | Description   | Mandatory field |
|------------------|---|-----------------|
| User             | The user name of the data source with sufficient privileges to connect to the RHEVM server.             | Yes             |
| Password         | The password of the user name that you use to connect to the RHEVM server.                              | Yes             |
| Re-type password | The same password that you specified in the <b>Password</b> field.                                      | Yes             |
| Port             | The port number that is used to connect to the RHEVM server.  | Yes             |
| Domain           | The domain to which the user belongs.   | Yes             |
| KeyStorePath     | The file path and name of the local keystore file that you created by using the <b>keytool</b> command. | Yes             |

## Configuration parameters to connect to the RHEVH server

You can modify the default values of configuration parameters that are used for connecting the agent with the RHEVH server.

The following table contains detailed descriptions of the configuration parameters.

*Table 196. Names and descriptions of the configuration parameters for connecting to the hypervisor*

| Parameter name                               | Description   | Mandatory field |
|--|---|-----------------|
| Edit Monitoring Agent for Linux KVM settings | Indicates that you can begin editing the default values of the configuration parameters. Enter 1 (Yes), which is also the default value, to continue. | Yes             |
| Maximum number of Data Provider Log Files    | The maximum number of log files that the data provider creates before it overwrites the previous log files. The default value is 10.                  | Yes             |
| Maximum Size in KB of Each Data Provider Log | The maximum size in KB that a data provider log file must reach before the data provider creates a new log file. The default value is 5190 KB.        | Yes             |

Table 196. Names and descriptions of the configuration parameters for connecting to the hypervisor (continued)

| Parameter name                       | Description   | Mandatory field |
|--------------------------------------|---|-----------------|
| Level of Detail in Data Provider Log | <p>The level of detail that can be included in the log file that the data provider creates. The default value is 4 (Info). The following values are valid:</p> <ul style="list-style-type: none"> <li>• 1 = Off: No messages are logged.</li> <li>• 2 = Severe: Only errors are logged.</li> <li>• 3 = Warning: All errors and messages that are logged at the Severe level and potential errors that might result in undesirable behavior.</li> <li>• 4 = Info: All errors and messages that are logged at the Warning level and high-level informational messages that describe the state of the data provider when it is processed.</li> <li>• 5 = Fine: All errors and messages that are logged at the Info level and low-level informational messages that describe the state of the data provider when it is processed.</li> <li>• 6 = Finer: All errors and messages that are logged at the Fine level plus highly-detailed informational messages, such as performance profiling information and debug data. Selecting this option can adversely affect the performance of the monitoring agent. This setting is intended only as a tool for problem determination along with IBM support staff.</li> <li>• 7 = Finest: All errors and messages that are logged at the Fine level and the most detailed informational messages that include low-level programming messages and data. Selecting this option might adversely affect the performance of the monitoring agent. This setting is intended only as a tool for problem determination along with IBM support staff.</li> <li>• 8 = All: All errors and messages are logged.</li> </ul> | Yes             |
| Edit Hypervisor settings             | Indicates whether you want to edit the parameters for a Hypervisor connection. Enter 1 (Add). The default value is 5 (Next).  | Yes             |
| Hypervisor ID                        | The unique user name, which you specify for the RHEVH that you connect to.  | Yes             |
| Host                                 | The host name or IP address of the data source that is used to connect to the RHEVH server.   | Yes             |
| User                                 | A user name of the data source with sufficient privileges to connect to the RHEVM server.   | Yes             |
| Remote Transport                     | <p>The protocol that is used by the local libvirt API to connect to remote libvirt APIs. The default value is 1. The following values are valid:</p> <ul style="list-style-type: none"> <li>• 1 = SSH</li> <li>• 2 = TLS</li> <li>• 3 = TCP (Unencrypted - not recommended for production use)</li> </ul>   | Yes             |

| Table 196. Names and descriptions of the configuration parameters for connecting to the hypervisor (continued) |   |                 |
|--|---|-----------------|
| Parameter name   | Description   | Mandatory field |
| Port   | The port that is used by the transport protocol to connect to the libvirt API. The default value is 22.<br><br><b>Important:</b> This port is only needed if the standard ports were changed (22 for SSH, 16514 for TLS, 16509 for TCP).  | Yes             |
| Domain   | The domain to which the user belongs.   | Yes             |
| Connection Instance Type   | Indicates whether the local libvirt API connects to the privileged system driver or the per-user unprivileged session driver. The default value is 1. The following values are valid:<br><br><ul style="list-style-type: none"> <li>• 1 = system</li> <li>• 2 = session</li> </ul>  | Yes             |
| Edit RHEVM Connection Details settings   | Indicates whether you want to edit the parameters for a connection to the RHEVM server. Enter 1 (Add) to continue. The default value is 5 (Next).<br><br><b>Important:</b> After you specify values for all the configuration parameters, you are again prompted to indicate whether you want to continue to edit the parameters. Enter 5 (Next). | Yes             |

## Configuring Environment Variables

You can configure environment variables to change the behavior of the agent.

### About this task

**Note:** Environment variable setting will impact all the running agent instances in Linux platform.

### Procedure

1. Stop all the agent instances.
2. Locate the environment variable file.
  - Linux platform:  
Locate the `.vm.environment` file by navigating to the agent folder.
    - Agent of 32-bit system: `$CANDLEHOME/config`
    - Agent of 64-bit system: `$CANDLEHOME/config`
3. Edit environment variable according to the requirement and save the file.

Example:

```
KV1_DATA_PROVIDER_CONNECTION_RETRY_COUNT=0
```

#### Note:

In the event of connection failure, if the environment variable

**KV1\_DATA\_PROVIDER\_CONNECTION\_RETRY\_COUNT** is not configured or set to 0, the agent will continuously attempt connection to data source every 30 seconds.

In the event of connection failure, user can limit the number of connection attempts by setting the environment variable **KV1\_DATA\_PROVIDER\_CONNECTION\_RETRY\_COUNT** to a valid non-zero value.

4. Start the agent instance.

## Configuring MariaDB monitoring

---

You must configure the MariaDB agent so that the agent can collect data to monitor the availability and performance of MariaDB server resources. Refer the following prerequisites to configure the MariaDB agent for both remote and local monitoring.

### Before you begin

Ensure that the system requirements for the MariaDB agent are met in your environment. For the up-to-date system requirement information, see the [Software Product Compatibility Reports \(SPCR\)](#) for the MariaDB agent.

### About this task

The MariaDB agent is a single instance agent. You must configure the agent manually after it is installed. You can configure the agent on Windows and Linux operating systems. The agent requires an instance name and the MariaDB server user credentials to configure it. The managed system name includes the instance name that you specify, for example, *instance\_name: host\_name: pc*, where *pc* is your two character product code. The managed system name can contain up to 32 characters. The instance name that you specify can contain up to 28 characters, excluding the length of your hostname. For example, if you specify MariaDB as your instance name, your managed system name is MariaDB:hostname:MJ.

**Important:** If you specify a long instance name, the managed system name is truncated and the agent code is not displayed.

## Configuring the agent on Windows systems

You can configure the agent on Windows operating systems by using the IBM Cloud Application Performance Management window. After you update the configuration values, start the agent to apply the updated values.

### Procedure

To configure the agent on Windows operating systems, complete the following steps:

1. Click **Start > All Programs > IBM Monitoring agents > IBM Performance Management**.
2. In the **IBM Performance Management** window, complete these steps:
  - a) Double-click the **Monitoring Agent for MariaDB** template.
  - b) In the **Monitoring Agent for MariaDB** window, specify an instance name and click **OK**.
3. In the **Monitoring Agent for MariaDB** window, complete these steps:
  - a) In the **IP Address** field, enter the IP address of MariaDB server that you want to monitor remotely. If the agent is installed on a server to be monitored, retain the default value.
  - b) In the **JDBC user name** field, enter the name of a MariaDB server user. The default value is root.
  - c) In the **JDBC password** field, type the password of a JDBC user.
  - d) In the **Confirm JDBC password** field, type the password again.
  - e) In the **JDBC Jar File** field, click **Browse** and locate the directory that contains the MariaDB connector Java file and select it.
  - f) Click **Next**.
  - g) In the **JDBC port number** field, specify the port number of the JDBC server. The default port number is 3306.
  - h) From the **Java trace level** list, select a trace level for Java. The default value is Error.
  - i) Click **OK**. The instance is displayed in the **IBM Performance Management** window.

4. Right-click the **Monitoring Agent for MariaDB** instance, and click **Start**.

**Remember:** To configure the agent again, complete these steps in the **IBM Performance Management** window:

- a. Stop the agent instance that you want to configure.
- b. Right-click the **Monitoring Agent for MariaDB** instance, and click **Reconfigure**.
- c. Repeat steps 3 and 4.

## What to do next

Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For more information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

## Configuring the agent on Linux systems

You can run the configuration script and respond to prompts to configure the agent on Linux operating systems.

### Procedure

To configure the agent on Linux operating systems, complete the following steps:

1. On command line, run the following command:

```
install_dir/bin/mariadb-agent.sh config instance_name
```

Where *instance\_name* is the name you want to give to the instance, and *install\_dir* is the installation directory for the MariaDB agent.

2. When you are prompted to enter a value for the following parameters, press **Enter** to accept the default value, or specify a different value and press **Enter**.

- IP address
- JDBC username
- JDBC password
- Retype JDBC password
- JDBC JAR file
- JDBC port number (Default port number is 3306.)
- Java trace level (Default value is `Error`.)

For more information about the configuration parameters, see [“Configuring the agent by using the silent response file” on page 676](#).

3. Run the following command to start the agent:

```
install_dir/bin/mariadb-agent.sh start instance_name
```

## What to do next

Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For more information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

## Configuring the agent by using the silent response file

The silent response file contains the agent configuration parameters. You can edit the silent response file to modify the values of these parameters, and run the configuration script to create an instance and update the agent configuration values. This mode of configuration is called the silent mode.

### About this task

You can use the silent response file to configure the MariaDB agent on Linux and Windows system. After you update the configuration values in the silent response file, you must run the configuration script to configure the agent with these updated values.

### Procedure

To configure the agent by using the silent response file, complete the following steps:

**Remember:** This procedure assumes the following default path where the agent is installed:

**Windows** C:\IBM\APM

**Linux** opt/ibm/apm/agent

If the agent is installed at a different path, substitute the path in the instructions. Also, edit the **AGENT\_HOME** parameter in the silent response file to specify the path where the agent is installed.

1. In a text editor, open the response file that is available at the following path:

**Linux** `install_dir/samples/mariadb_silent_config.txt`

**Windows** `install_dir\samples\mariadb_silent_config.txt`

Where *install\_dir* is the installation directory of the MariaDB agent

2. In the response file, specify a value for the following parameters:

- For the **Server Name** parameter, specify the IP address of a MariaDB server that you want to monitor remotely. Otherwise, retain the default value as localhost.
- For the **JDBC user name** parameter, retain the default username value of root or specify the name of a user with privileges to view the INFORMATION\_SCHEMA tables.
- For the **JDBC password** parameter, enter the JDBC user password.
- For the **JDBC Jar File** parameter, retain the default path if this path to the MariaDB connector for the Java JAR file is correct. Otherwise, enter the correct path. The connector is available at the following default path:

**Linux** `/usr/share/java/mariadb-connector-java.jar`

**Windows** `C:\Program Files (x86)\MariaDB\mariadb-connector-java.jar`

- For the **JDBC port number** parameter, retain the default port number of 3306 or specify a different port number.
  - For the **Java trace level** parameter, retain the default value of Error or specify a different level according to the IBM support instructions.
3. Save and close the response file, and run the following command to update the agent configuration settings:

**Linux** `install_dir/bin/mariadb-agent.sh config instance_name install_dir/samples/mariadb_silent_config.txt`

**Windows** `install_dir\BIN\mariadb-agent.bat config instance_name install_dir\samples\mariadb_silent_config.txt`

Where *instance\_name* is the name that you want to give to the instance, and *install\_dir* is the installation directory of MariaDB agent.

**Important:** Ensure to include the absolute path to the silent response file. Otherwise, dashboards do not display agent data.

## What to do next

Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For more information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

## Configuring Microsoft Active Directory monitoring

---

The Monitoring Agent for Microsoft Active Directory is automatically configured and started after installation.

### Before you begin

Review the hardware and software prerequisites, see [Software Product Compatibility Reports for Microsoft Active Directory agent](#)

To view data for all attributes in the dashboard, complete the following tasks:

- [“Running the Microsoft Active Directory agent as an administrator user” on page 583](#)
- [“Configuring local environment variables” on page 584](#)

### About this task

The directions here are for the most current release of this agent. For information about how to check the version of an agent in your environment, see [Agent version command](#). For detailed information about the agent version list and what's new for each version, see [“Change history” on page 58](#).

## Running the Microsoft Active Directory agent as an administrator user

You must have administrative rights to run the Microsoft Active Directory agent.

### About this task

All data sets are available to the users who are members of the Administrators group. In this task, you create a user, assign administrator rights to the user, and change the user account for the agent to this user.

### Procedure

1. Click **Start > All Programs > Administrative Tools > Active Directory Users and Computers**.
2. To expand the domain where you want to create the user, click the plus sign (+) next to the name of a domain.
3. Right-click **Users**, and then click **New > User**.
4. To create a new user, open the **New Object - User** wizard.  
By default, a new user is a member of the Domain Users group.
5. Right-click the new user that is created in the Domain Users group, and click **Properties**. The **Username Properties** window is displayed. The username is the name of the new user.
6. In the **Username Properties** window, complete the following steps:
  - a) Click the **Member of** tab. In the **Member of** area, add the Administrators group.
  - b) Click **Apply**, and then click **OK**.
7. Click **Start > Run**, and then type `services.msc`.
8. In the **Services** window, complete the following steps:
  - a) Right-click the **Monitoring Agent for Active Directory service**, and click **Properties**.
  - b) In the **Monitoring Agent for Active Directory Properties** window, on the **Log On** tab, click **This Account**. Enter the user credentials.
  - c) Click **Apply**, and then click **OK**.

9. Restart the agent service.

## Configuring local environment variables

You must specify values for the environment variables to view the Sysvol replication data in the dashboard. Optionally, you can also update the cache interval value to enable or disable caching.

### Procedure

1. In the **IBM Performance Management** window, from the **Actions** menu, click **Advanced > Edit ENV File**.
2. In the K3ZENV file, change the values of the following environment variables.

#### **ADO\_CACHE\_INTERVAL**

Determines whether to start or stop the caching and is used to set a value for the cache interval. Cache interval is the duration in seconds between two consecutive data collections. You can specify any positive integer value for the cache interval to start the caching. You can specify the zero value for the cache interval to stop the caching. By default, the caching is started, and the cache interval value is set to 1200.

#### **ADO\_SYSVOL\_FORCE\_REPLICATION\_FLAG**

Determines whether the force replication that is initiated by the agent is enabled or disabled. The default value of this variable is TRUE. To disable force replication, change the value of this variable to FALSE.

#### **ADO\_SYSVOL\_REPLICATION\_TEST\_INTERVAL**

Determines the time interval in minutes between two Sysvol replication tests. The default value of this variable is 0 minutes. To complete the Sysvol replication test, ensure that the value of this variable is greater than zero.

#### **ADO\_SYSVOL\_REPLICATION\_TEST\_VERIFICATION\_INTERVAL**

Determines the amount of time in minutes that the agent waits to verify the results of Sysvol replication after it completes the Sysvol replication test.

The value of the **ADO\_SYSVOL\_REPLICATION\_TEST\_INTERVAL** variable must be greater than the value of the **ADO\_SYSVOL\_REPLICATION\_TEST\_VERIFICATION\_INTERVAL** variable. You can use the following values for these variables:

**ADO\_SYSVOL\_REPLICATION\_TEST\_INTERVAL: 1440**

**ADO\_SYSVOL\_REPLICATION\_TEST\_VERIFICATION\_INTERVAL: 30**

After you assign valid values to the two environment variables, the Active Directory agent creates one file in the Sysvol shared folder of the managed system and initializes forced Sysvol replication. This forced replication is initialized from the managed system to the Sysvol shared folders of the Sysvol replication partners. After you verify the results of the replication test, the agent removes the files that are created and replicated from the managed system and Sysvol replication partners.

3. Optional: In the K3ZENV file, add the **APM\_ATTRIBUTES\_ENABLE\_COLLECTION** environmental variable and set its value to Yes to view data for the following data sets in the **Attribute details** tab.
  - Services
  - Replication
  - File Replication Service
  - Moved or Deleted Org Unit
  - LDAP
  - Security Accounts Manager
  - DFS
  - Address Book
  - Event Log

- Password Setting Objects

**Remember:** If you want to disable data collection for these data sets, set the value for the **APM\_ATTRIBUTES\_ENABLE\_COLLECTION** environment variable to No.

4. Restart the Microsoft Active Directory agent.

## What to do next

Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

## Running Microsoft Active Directory agent as a non-administrator user

You can run the Log File agent as a non-administrator user.

### About this task

You can run the monitoring agent for Active Directory as a non-administrator user; however, Trust Topology attributes and Sysvol Replication attributes might not be available. These attributes are available only to domain users.

To view the Trust Topology attributes, a non-administrator user must have the following registry permissions:

- Grant full access to the HKEY\_LOCAL\_MACHINE\SOFTWARE\Candle directory.
- Grant read access to the HKEY\_LOCAL\_MACHINE\SOFTWARE\Microsoft\WindowsNT\CurrentVersion\Perflib directory.

To view the Sysvol Replication attributes, a non-administrator user must have full access to the Sysvol folder on all domain controllers in a domain.

**Important:** When Microsoft Active Directory agent is running as a non-administrator user, some services from the Services attribute group show values for Current State and Start Type attributes as Unknown on the APM User Interface.

The following table contains the attribute groups for the Active Directory agent that display data for domain users and performance monitoring users.

Table 197. Attribute groups for domain users and performance monitoring users

| User right                                    | Attribute group   |
|---|---|
| Domain users                                  | <ul style="list-style-type: none"> <li>• RID Pool Information</li> <li>• Services</li> <li>• Event Logs</li> <li>• DNS</li> <li>• DNS ADIntegrated Details</li> <li>• DNS ADIntegrated</li> <li>• DHCP</li> <li>• Trust</li> <li>• Group Policy Objects</li> <li>• Lost and Found Objects</li> <li>• Exchange Directory Service</li> <li>• Replication Conflict Objects</li> <li>• LDAP Attribute</li> <li>• Root Directory Server</li> <li>• Containers</li> <li>• Replication Partner</li> <li>• Domain Controller Availability</li> <li>• Replication Partner Latency</li> <li>• Forest Topology</li> </ul>  |
| Domain users and performance monitoring users | <p>All attribute groups that are mentioned for the domain users and the following extra attribute groups:</p> <ul style="list-style-type: none"> <li>• Address Book</li> <li>• Replication</li> <li>• Directory Services</li> <li>• Knowledge Consistency Checker</li> <li>• Kerberos Key Distribution Center</li> <li>• Lightweight Directory Access Protocol</li> <li>• Local Security Authority</li> <li>• Name Service Provider</li> <li>• Security Accounts Manager</li> <li>• File Replication Service</li> <li>• Distributed File System Replication</li> <li>• DFS Replication Connections</li> <li>• DFS Replicated Folders</li> <li>• DFS Service Volume</li> <li>• Domain Controller Performance</li> <li>• Remote Access Server</li> <li>• Direct-Access Server</li> <li>• Netlogon Attributes</li> </ul> |

**Note:** Additionally, the following attribute groups display data for users who are members of the *Administrators* group:

- Active Directory Database Information
- Moved or Deleted Organizational Unit
- Password Setting Objects

For information, refer [“Configuring Microsoft Active Directory monitoring” on page 583](#)

## Procedure

1. Click **Start > Programs > Administrative Tools > Active Directory Users and Computers**.
2. Expand the domain in which you want to create the user by clicking the plus sign (+) next to the name of a domain.
3. Right-click **Users**, and then click **New > User**.
4. Create a new user by using the **New Object - User** wizard. By default, a new user is a member of the **Domain Users** group.
5. Right-click the new user that is created in the *Domain Users* group, and click **Properties**. The **Username Properties** window opens, where *username* is the name of the new user. Complete the following steps in the **Username Properties** window:
  - a) Click **Member of** tab. In the **Member of** area, add the **Performance Monitor Users** group.
  - b) Click **Apply**, and then click **OK**.
6. Go to the *Candle\_Home* directory. The default path is `C:\IBM\APM`.
7. Right-click the *APM* folder and click **Properties**. The **APM Properties** window opens. Complete the following steps in the **APM Properties** window:
  - a) On the **Security** tab, click **Edit**.
  - b) Click **Add** to add the new user and grant full access to this user.
  - c) Click **Apply**, and then click **OK**.
8. Click **Start > Run**, and then type `services.msc`. The **Services** window opens. Complete the following steps in the **Services** window:
  - a) Right-click the **Monitoring Agent** for Active Directory service, and click **Properties**.
  - b) In the **Active Directory Properties** window, on the **Log On** tab, click **This Account**. Enter the user credentials.
  - c) Click **Apply**, and then click **OK**.
9. Restart the agent service.

## Configuring domain services for attribute group **AD\_Services\_Status**

You can configure the MS Active Directory Domain Services in `Services.properties` to be used or to be excluded when determining `Server Status`. The attribute group `AD_Services_Status` and its situation are applicable for Windows Server 2012 and later.

### About this task

The `Services.properties` file contains the following default MS Active Directory Domain Services and its configuration.

True indicates that the service will be considered when determining `Server Status` value.

False indicates that the service will not be considered when determining `Server Status` value.

Table 198. MS Active Directory Domain Services and the configuration setting.

| MS Active Directory Domain Services  | Default Setting |
|--------------------------------------|-----------------|
| DFS Replication                      | true            |
| Remote Procedure Call (RPC)          | false           |
| DNS Client                           | true            |
| DNS Server                           | true            |
| Group Policy Client                  | false           |
| Intersite Messaging                  | true            |
| Kerberos Key Distribution Center     | true            |
| NetLogon                             | true            |
| Windows Time                         | true            |
| DHCP Client                          | false           |
| Active Directory Web Services        | false           |
| Active Directory Federation Services | false           |

**Note:** Agent restart is required to enable data collection for the attribute group AD\_Services\_Status on Windows Server 2012 and later.

## Procedure

1. Stop the agent.
2. Locate the `Services.properties` file for modification, if any.  
For 32-bit agent, the `Services.properties` file is located at `CANDLE_HOME\TMAITM6\`.  
For 64-bit agent, the `Services.properties` file is located at `CANDLE_HOME\TMAITM6_x64\`.  
The `CANDLE_HOME` is the agent installation directory.
3. If you want the Domain Services to be considered when determining the Server Status, set its value to true.  
If you want the Domain Services to be excluded when determining the Server Status, set its value to false.  
Save and close the file.
4. Start the agent.

## Upgrading Microsoft Active Directory agent

You can upgrade the MS Active Directory agent to the latest version.

### Before you begin

Ensure the `installAPMAgents.bat` file provided in the installer of the latest release is available in the machine that the agent is installed.

### About this task

To upgrade the agent to the latest version, complete the following procedure.

### Procedure

1. Logon to the machine that the agent is installed.

2. Launch a command prompt, run the `installAPMAgents.bat` file that is sourced from the installer of the latest release.
3. Enter the installation directory that the existing agent resides, and press enter.
4. The command prompt shows the base agent version and the target agent version to be upgraded. Press enter to proceed.
5. When agent upgrade is successful, the upgraded agent version is showed on the **IBM Performance Management** window.
6. On the **IBM Performance Management** window, right-click the agent and select **Reconfigure** from the drop-down menu.
7. To reflect the upgraded agent version on the **Application Performance Dashboard**, logon to the APM server and restart the APM server components by using the following commands.
  - a. `apm stop_all`
  - b. `apm start_all`
8. On the **IBM Performance Management** window, right-click the agent and select **Recycle** from the drop-down menu.

## Results

The upgraded agent is reflected on the **Application Performance Dashboard**.

**Note:** It could take up to 30 minutes or more to show the upgraded agent on the **Application Performance Dashboard**.

## Configuring Microsoft Cluster Server monitoring

---

You must configure the Monitoring Agent for Microsoft Cluster Server so that the agent can collect the cluster server data. Use the silent response file to configure the agent.

### Before you begin

Ensure that you complete the following tasks:

- Create an empty resource group for the agent.
- Create a generic service cluster resource in the resource group of the agent on Windows Server 2008, 2012, 2016, and 2019 systems.
- Ensure that the user, who connects to the Microsoft Cluster Server environment or application, has administrator privileges. Use an existing user with administrator privileges, or create a new user. Assign administrator privileges to the new user by adding the new user to the Administrators group.

**Remember:** To configure the Microsoft Cluster Server agent, you can use a local or a domain user provided that the user has administrator privileges.

Review hardware and software prerequisites. For the up-to-date system requirement information, see the [Software Product Compatibility Reports \(SPCR\)](#) for the Microsoft Cluster Server agent.

The product version and the agent version often differ. The directions here are for the most current release of this agent. For information about how to check the version of an agent in your environment, see [Agent version command](#). For detailed information about the agent version list and what's new for each version, see the [“Change history”](#) on page 58.

### About this task

The Microsoft Cluster Server agent is a single instance agent. You must install and configure the agent manually in the same way on each node in the cluster. To configure the agent, see [“Configuring the agent by using the silent response file”](#) on page 590.

## Creating a generic service cluster resource on Windows Server 2008, 2012, 2016, and 2019 systems

You must add the cluster agent service as a resource so that the agent can monitor the cluster server.

### Before you begin

Ensure that the agent is stopped on each node in the cluster.

### Procedure

To create a generic service cluster resource, complete the following steps:

1. Open the **Failover Cluster Manager** on any one of the cluster nodes.
2. Complete one of the following steps:
  - For Windows Server 2008:  
In the navigation pane, right-click **Services And Applications**, and then click **More Actions > Create Empty Service or Application**. The new service displays in the services and applications list. Rename the newly created service.
  - For Windows Server 2012:  
In the navigation pane, right-click **Roles**, and then click **More Actions > Create Roles**. The new service displays in the roles list.
  - For Windows Server 2016 and 2019:  
In the navigation pane, right-click **Roles**, and then click **Configure Roles**. The new service displays.
3. Right-click the new service and click **Add resource > Generic Service**.
4. In the **New Resource Wizard** window, select **Monitoring Agent for Microsoft Cluster Server** and click **Next**.
5. Click **Next** in the subsequent windows until you see the **Finish** button.
6. Click **Finish**.  
The agent service is added as a resource.
7. Right-click **Monitoring Agent for Microsoft Cluster Server** resource and click **Bring Resource Online**.

### Results

The agent is started on the preferred node.

## Configuring the agent by using the silent response file

The silent response file contains the Microsoft Cluster Server agent configuration parameters with default values defined for some parameters. You can edit the silent response file to configure the agent with different values for the configuration parameters.

### Before you begin

If you want to modify the default configuration parameters, edit the response file.

### About this task

You can configure the agent using the silent response file.

### Procedure

1. Open the silent response file that is available at this path: `install_dir\samples\microsoft_cluster_server_silent_config.txt`
2. For the **CTIRA\_HOSTNAME** environment variable, specify the cluster name as a value.

3. On each cluster node, run the following command: `install_dir\BIN  
\microsoft_cluster_server-agent.bat config install_dir\samples  
\microsoft_cluster_server_silent_config.txt`

### What to do next

Change the user account from the local user to the domain user.

## Changing the user account

After you configure the Microsoft Cluster Server agent, you can change the user account from the local user to the domain user.

### About this task

By default, the agent runs under the local user account. The agent must be run under the domain user so that the agent can monitor all nodes in the cluster from a single node.

### Procedure

To change the user account, complete the following steps:

1. Open the **IBM Performance Management** window.
2. Right-click the agent and click **Change Startup**.
3. Enter the domain login credentials.
4. Open the **Failover Cluster Manager** on one of the nodes, and start the cluster service.

### Results

The agent is started on the node.

### What to do next

Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the Performance Management console, see [“Starting the Cloud APM console” on page 1109](#).

## Configuring Microsoft Exchange monitoring

---

You must configure the Monitoring Agent for Microsoft Exchange Server to monitor the availability and performance of Exchange Servers.

### Before you begin

Before you configure the agent, ensure that you complete the following tasks:

- [“Creating users” on page 592](#)
- [“Assigning administrator rights to the Exchange Server user” on page 595](#)
- [“Making the Exchange Server user a local administrator” on page 596](#)
- [“Configuring the Exchange Server for reachability” on page 598](#)
- [“Configuring the agent to run under the domain user” on page 599](#)
- Review the hardware and software prerequisites. For the up-to-date system requirement information, see the [Software Product Compatibility Reports \(SPCR\)](#) for the Microsoft Exchange Server agent.

### About this task

The directions here are for the most current release of this agent. For information about how to check the version of an agent in your environment, see [Agent version command](#). For detailed information about the agent version list and what's new for each version, see [“Change history” on page 58](#).

You can start the Microsoft Exchange Server agent after the agent is installed. However, manual configuration is required to view data for all the agent attributes.

- To configure the agent locally, see [“Configuring the agent locally” on page 599](#).
- To configure the agent by using the silent response file, see [“Configuring the agent by using the silent response file” on page 604](#).

## Creating users

You can create a user for the agent on the Exchange Server manually or by running the *New User* utility. You must create the user on each Exchange Server that you want to monitor.

### Before you begin

Install the Microsoft Exchange Server agent. To create a user, you must be a domain administrator with full administrator rights on the Microsoft Exchange Server.

### About this task

Use one of the following procedures to create users:

- [“Creating users on Exchange Server 2007 and 2010” on page 592](#)
- [“Creating users on Exchange Server 2013” on page 593](#)
- [“Creating users by running the New User utility” on page 594](#)

## Creating users on Exchange Server 2007 and 2010

You must create a user for the agent on Exchange Server 2007 and 2010 so that the agent can communicate and authenticate with the Exchange Server that you want to monitor.

### Procedure

To create a user, complete the following steps:

1. Click **Start > Programs > Microsoft Exchange Server 2007 > Exchange Management Console**. The **Exchange Management Console** window opens.
2. In the Console tree, click **Mailbox in Recipient Configuration**.
3. In the Action pane, click **New Mailbox**. The New Mailbox wizard opens.
4. On the **Introduction** page, click **User Mailbox**.
5. On the **User Type** page, click **New User**.
6. On the **User Information** page, specify the following information:

#### Organizational unit

By default, the users container in the Active Directory is displayed. Click **Browse** to change the default organizational unit.

#### First name

Type the first name of the user.

#### Initials

Type the initials of the user.

#### Last name

Type the last name of the user.

#### Name

By default, the user's first name, initials, and last name are displayed in this field. You can modify the name.

#### User log on name (User Principal Name)

Type the name that the user must use to log on to the mailbox.

**User log on name (pre-Windows 2000, or earlier)**

Type the user name that is compatible with Microsoft Windows 2000 Server, or earlier.

**Password**

Type the password that the user must use to log on to the mailbox.

**Confirm password**

Retype the password that you entered in the **Password** field.

**User must change password at next logon**

Select this check box if you want the user to reset the password.

7. On the **Mailbox Settings** page, specify the following information:

**Alias**

By default, the value for this field is identical to the value that you specified in the **User logon name (User Principal Name)** field.

**Mailbox database**

Click **Browse** to open the **Select Mailbox Database** window. Select the mailbox database that you want to use and click **OK**.

**Managed folder mailbox policy**

Select this check box to specify a messaging records management (MRM) policy. Click **Browse** to select the MRM mailbox policy that you want to associate with this mailbox.

**Exchange ActiveSync mailbox policy**

Select this check box to specify an Exchange ActiveSync mailbox policy. Click **Browse** to select the Exchange ActiveSync mailbox policy that you want to associate with this mailbox.

8. On the **New Mailbox** page, review the configuration summary. Click **New** to create a mailbox. On the **Completion** page, the Summary section shows whether the mailbox was created.
9. Click **Finish**.

**What to do next**

Assign administrator rights to the Exchange user that you created.

**Creating users on Exchange Server 2013**

You must create a user for the agent on Exchange Server 2013 so that the agent can communicate and authenticate with the Exchange Server that you want to monitor.

**Procedure**

To create a user on Exchange Server 2013, complete the following steps:

1. Log in to the Exchange Admin Center with administrator credentials.
2. On the **Exchange admin center** page, click on the **recipients**, and then click **mailboxes**.
3. Click the down arrow next to the plus sign (+) that is located under the **mailboxes** option, and then click **User mailbox**.
4. On the "new user mailbox" page, click **New user**, and specify values for the other fields.
5. Click **Save**.

**What to do next**

Assign administrator rights to the Exchange user that you created.

## Creating users by running the New User utility

You can run the New User utility to create users on Exchange Server 2007, or later. The user that is created by running this utility has all the required permissions to run the agent. This utility is installed when you install the agent.

### Before you begin

Ensure that the agent is installed. To run the New User utility, you must be a domain administrator with full administrator rights on the Exchange Server.

### About this task

When you run this utility, the user is created in the Users group of the Active Directory, and has the following permissions:

- On Exchange Server 2007:
  - Local administrator
  - Remote desktop user
  - Exchange recipient administrator
- On Exchange Server 2010, or later:
  - Local administrator
  - Remote desktop user
  - Exchange Servers or Public Folder Management.

### Procedure

To run the New User utility, complete the following steps:

1. Double-click the `kexnewuser.exe` file that is available at the following location:  
`install_dir\TMAITM6_x64` Where *install\_dir* is the path where the agent is installed.
2. In the **New User** window, complete the following steps:
  - a) Enter the **first name** and the **last name** of the user.  
**Restriction:** The length of the first and the last name must not exceed 28 characters.
  - b) In the **User Logon Name** field, enter the name that the user must type whenever the user logs in.  
**Restriction:** The length of the user logon name must not exceed 256 characters.
  - c) In the **Password** field, enter your password.
  - d) In the **Confirm Password** field, enter the password again.
  - e) Select **User Must Change Password at Next Logon** if you want the specified password to be reset the next time when the user logs on.
  - f) Click **Next**.  
The configuration values that you specify are validated, and error messages are displayed for incorrect values.
3. From the list of mailbox databases, select the required mailbox database, and click **Next**.  
A summary of configuration values is displayed.
4. Click **Finish**.

### Results

The settings are saved, and the user is created.

## Assigning administrator rights to the Exchange Server user

The user that you created for the Microsoft Exchange Server agent must be a domain administrator with full administrator rights on Microsoft Exchange Server. The administrator rights are necessary to access the Microsoft Exchange Server agent components.

### Before you begin

Create an Exchange Server user who has the mailbox on the Exchange Server that is being monitored.

### About this task

Use one of the following procedures to assign administrator rights to the user:

- [“Assigning administrator rights on Exchange Server 2007” on page 595](#)
- [“Assigning administrator rights on Exchange Server 2010” on page 595](#)
- [“Assigning administrator rights on Exchange Server 2013” on page 596](#)
- [“Assigning administrator rights on Exchange Server 2016” on page 596](#)

### Assigning administrator rights on Exchange Server 2007

You must assign Exchange Recipient Administrator rights to the user on Exchange Server 2007.

#### Procedure

1. Click **Start > Programs > Microsoft Exchange Server 2007 > Exchange Management Console**. The **Exchange Management Console** window opens.
2. In the Console tree, click **Organization Configuration**.
3. In the Action pane, click **Add Exchange Administrator**.
4. On the **Add Exchange Administrator** page, click **Browse**. Select the new user that you created, and then select **Exchange Recipient Administrator** role.
5. Click **Add**.
6. On the **Completion** page, click **Finish**.

### Assigning administrator rights on Exchange Server 2010

You must assign Exchange Servers or Public Folder Management rights to the user on Exchange Server 2010.

#### Procedure

1. Log on to Exchange server with Administrator privileges.
2. Click **Start > Administrative Tools > Server Manager**.
3. Expand the **Tools**.
4. Click **Active Directory Users and Computers**.
5. Expand **Domain**, click **Microsoft Exchange Security Groups**.
6. Right-click **Exchange Servers or Public Folder Management**, then click **Properties**.
7. In **Exchange Servers Properties or Public Folder Management Properties** window, go to **Members** and click **Add**.
8. From the list of users, select the user that you want to add to the group, and click **OK**.
9. Click **OK**.

## Assigning administrator rights on Exchange Server 2013

You must assign Exchange Servers or Public Folder Management rights to the user on Exchange Server 2013.

### Procedure

1. Log on to Exchange server with Administrator privileges.
2. Click **Start > Administrative Tools > Server Manager**.
3. Expand the **Tools**.
4. Click **Active Directory Users and Computers**.
5. Expand **Domain**, click **Microsoft Exchange Security Groups**.
6. Right-click **Exchange Servers or Public Folder Management**, then click **Properties**.
7. In **Exchange Servers Properties or Public Folder Management Properties** window, go to **Members** and click **Add**.
8. From the list of users, select the user that you want to add to the group, and click **OK**.
9. Click **OK**.

## Assigning administrator rights on Exchange Server 2016

You must assign Exchange Servers or Public Folder Management rights to the user on Exchange Server 2016.

### Procedure

1. Log on to Exchange server with Administrator privileges.
2. Click **Start > Administrative Tools > Server Manager**.
3. Expand the **Tools**.
4. Click **Active Directory Users and Computers**.
5. Expand **Domain**, click **Microsoft Exchange Security Groups**.
6. Right-click **Exchange Servers or Public Folder Management**, then click **Properties**.
7. In **Exchange Servers Properties or Public Folder Management Properties** window, go to **Members** and click **Add**.
8. From the list of users, select the user that you want to add to the group, and click **OK**.
9. Click **OK**.

### What to do next

Make the user a local administrator of the computer where the Exchange Server is installed.

## Making the Exchange Server user a local administrator

To access the Exchange Server data, the user that you created for the Microsoft Exchange Server agent must be a local administrator of the computer where the Exchange Server is installed.

### Before you begin

Create an Exchange Server user.

### About this task

Use one of the following procedures to make the user a local administrator:

- [“Making the user a local administrator on Windows 2003 computer” on page 597](#)
- [“Making the user a local administrator on Windows 2008 computer” on page 597](#)
- [“Making the user a local administrator on Windows 2012 computer” on page 597](#)

- [“Making the user a local administrator on Windows 2016 computer” on page 598](#)

## Making the user a local administrator on Windows 2003 computer

You must make the user that you created for the Exchange Server a local administrator of the computer that runs on the Windows 2003 operating system, and where the Exchange Server is installed.

### Procedure

1. Right-click **My Computer** on the computer desktop and click **Manage**.
2. Expand **Local Users and Groups**.
3. Click **Groups**.
4. Double-click **Administrators** to display the **Administrators Properties** window.
5. Click **Add**.
6. Select **Entire Directory** from the **Look in** list.
7. Select the name of the user that you created and click **Add**.
8. Click **OK**.
9. Click **OK**.

## Making the user a local administrator on Windows 2008 computer

You must make the user that you created for the Exchange Server a local administrator of the computer that runs on the Windows Server 2008 operating system, and where the Exchange Server is installed.

### Procedure

1. Click **Start > Administrative Tools > Server Manager**.
2. In the navigation pane, expand **Configuration**.
3. Double-click **Local Users and Groups**.
4. Click **Groups**.
5. Right-click the group to which you want to add the user account, and then click **Add to Group**.
6. Click **Add** and type the name of the user account.
7. Click **Check Names** and then click **OK**.

## Making the user a local administrator on Windows 2012 computer

You must make the user that you created for the Exchange Server a local administrator of the computer that runs on the Windows Server 2012 operating system and where the Exchange Server is installed.

### Procedure

1. Click **Start > Server Manager**.
2. On the **Server Manager dashboard** page, click **Tools > Computer Management**.
3. In the navigation pane of the **Computer Management** page, expand **Local Users and Groups**, and then click **Users**.
4. From the users list, right-click the user to which you want to assign administrator rights, and click **Properties**.
5. Click the **Member Of** tab, and click **Add**.
6. On the **Select Group** page, type **Administrators**, and then click **OK**.
7. Click **Apply** and **OK**.

## Making the user a local administrator on Windows 2016 computer

You must make the user that you created for the Exchange Server a local administrator of the computer that runs on the Windows Server 2016 operating system and where the Exchange Server is installed.

### Procedure

1. Click **Start > Server Manager**.
2. On the **Server Manager dashboard** page, click **Tools > Computer Management**.
3. In the navigation pane of the **Computer Management** page, expand **Local Users and Groups**, and then click **Users**.
4. From the users list, right-click the user to which you want to assign administrator rights, and click **Properties**.
5. Click the **Member Of** tab, and click **Add**.
6. On the **Select Group** page, type Administrators, and then click **OK**.
7. Click **Apply** and **OK**.

## Configuring the Exchange Server for reachability

To verify reachability, the Microsoft Exchange Server agent sends an email message to the server, and measures the amount of time to receive an automated response. Before you start the agent, you must configure the Exchange Server to automatically respond to email messages.

### Before you begin

Before you configure the Exchange Server, ensure that the following tasks are completed:

- A mailbox is created for the user on the Exchange Server that you want to monitor.
- The user that you created for the agent is a domain user.
- The servers in your Microsoft Exchange organization are configured for mail flow between servers.

### Procedure

Complete the following steps for each Exchange Server for which you want to verify reachability:

1. Log in to Microsoft Outlook by specifying credentials of the user that you created.
2. Click **Next** on the **Startup** window.
3. Select **Yes** and click **Next**.
4. In the **Microsoft Exchange Server** field, type the name of the Exchange Server.
5. In the **Mailbox** field, type the name of the user that you created.
6. Click **Finish**.
7. Click **OK**.
8. Click **Tools > Rules and Alerts > New Rule**.
9. Select **Start from a blank rule**.
10. Select **Check messages when they arrive** and click **Next**.
11. Select the following options:
  - **Where my name is in the To: box**
  - **With specific words in the subject or body**
12. Under **Step 2** in the window, click **Specific words**.
13. In the **Specify words or phrases to search for in the subject or body** field, type AVAILABILITY CHECK.
14. Click **Add**.
15. Click **OK** and then click **Next**.

16. Select **Have the server reply using a specific message** and click **a specific message**.
17. In the email message editor, type the following text in the subject field of the message:  
CHECK RECEIVED: MAILBOX AVAILABLE.
18. Close the email message editor and click **Yes** to save these changes.
19. Click **Next**.
20. When you are asked about exceptions, do not specify any restrictions.
21. Click **Next**.
22. Click **Finish** and then click **OK**.

## What to do next

Configure the Microsoft Exchange Server agent.

## Configuring the agent to run under the domain user

By default, the Microsoft Exchange Server agent is configured to run under the local user. The agent must be run under the domain user that you created.

### Before you begin

Ensure that:

- The user that you created is a domain user with local administrator rights.
- The user has administrator rights on the server where the agent is installed.

### About this task

When the agent is run under the domain user, the agent can monitor all the components of the Exchange Server.

### Procedure

To change the user under which the agent runs, complete the following steps:

1. Run the following command to verify which user ID is being used for starting the agent.  
**install\_dir\InstallITM\KinCinfo.exe -r**
2. If the monitoring agent was started with a user ID that does not belong to the Administrator group, stop the agent.
3. Open the **Manage Monitoring Services** window.
4. Right-click the agent instance, and click **Change Startup**.
5. Specify the fully qualified user ID as <Domain\Userid>, and then specify the password.
6. Start the monitoring agent.

## Configuring the agent locally

You can configure the agent locally by using the IBM Cloud Application Performance Management window.

### Procedure

1. Click **Start > All Programs > IBM Monitoring agents > IBM Performance Management**.
2. In the **IBM Performance Management** window, right-click **Monitoring Agent for Microsoft Exchange Server**, and then click **Configure agent**.

**Attention:** Click **Reconfigure** if **Configure agent** is disabled.

3. In the **Monitoring Agent for Microsoft Exchange Server: Agent Advanced Configuration** window, click **OK**.
4. In the **Agent Configuration** window, complete the following steps:
  - a) Click the **Exchange Server Properties** tab, and specify values for the configuration parameters. When you click **OK**, the specified values are validated.
  - b) Click the **Exchange Services Monitoring** tab, and specify values for the configuration parameters. When you click **OK**, the specified values are validated.
  - c) Click the **Advanced Configuration Properties** tab, and specify values for the configuration parameters. When you click **OK**, the specified values are validated.

For information about the configuration parameters in each tab of the **Agent Configuration** window, see the following topics:

- [“Configuration parameters for the Exchange Server properties” on page 600](#)
- [“Configuration parameters for Exchange services” on page 601](#)
- [“Configuration parameters for reachability” on page 602](#)

For information about the validation of configuration values, see [“Validation of configuration values” on page 603](#).

5. Recycle the agent.

## What to do next

Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

**Restriction:** On the Cloud APM dashboard, instances of only one of the Exchange component types (Microsoft Exchange Server or Microsoft Exchange Server 2013) are displayed under My Components.

## Configuration parameters for the Exchange Server properties

In the **Exchange Server Properties** tab of the **Agent Configuration** window, you can configure the Exchange Server properties, such as server name, domain name, and user name.

The following table contains detailed descriptions of the configuration settings in the **Exchange Server Properties** tab.

| <i>Table 199. Names and descriptions of configuration settings in the Exchange Server Properties tab</i> |  |   |  |
|--|--|---|--|
| Parameter name   | Description  | Mandatory field   | Examples   |
| Exchange Server Name   | <p>The name of the Exchange Server. During installation of the Exchange Server, the default Exchange Server name is the Windows Server host name. If you change the default Exchange Server name, you must use the changed name when you configure the Exchange Server agent.</p> <p><b>Remember:</b> In clustered and distributed environments, specify the Mailbox Server name for Exchange Server 2007.</p> | <p>Yes</p> <p><b>Important:</b> Do not specify a value if the agent is installed on a server that has a single copy cluster with more than two nodes.</p> | <p>If the Exchange Server name is popcorn, enter popcorn in the <b>Exchange Server Name</b> field.</p> |

| Table 199. Names and descriptions of configuration settings in the Exchange Server Properties tab (continued) |   |                               |  |
|---|---|-------------------------------|--|
| Parameter name  | Description   | Mandatory field               | Examples   |
| Exchange Domain Name  | The name of the domain where the Exchange Server is installed.  | Yes                           | If the Exchange Server is in the LAB.XYZ.com domain, enter the name that precedes the first dot, for example, LAB. |
| Exchange User Name  | The name of the user who is configured to access the Exchange Server.<br><b>Remember:</b> The user must have a mailbox on the same Exchange Server.   | Yes                           |  |
| Exchange User Password  | The password of the user who is configured to access the Exchange Server.   | Yes                           |  |
| Confirm Password  | The same password that you specified for the Exchange Server user.  | Yes                           |  |
| Exchange MAPI Profile Name  | MAPI profiles are the primary configuration settings that are required for accessing the Exchange Server. This field is disabled if you are using a 64-bit Microsoft Exchange Server agent to monitor Exchange Server 2007, or later. | No                            |  |
| Configuration in cluster  | Select this check box if you want to configure the Microsoft Exchange Server agent in a cluster environment.  | Not applicable                |  |
| Cluster Server Name   | The name of the Cluster Server.<br>This field is enabled when you select the <b>Configuration in cluster</b> check box.   | Yes, if the field is enabled. | SCCCLuster   |
| Exchange Subsystem ID   | The name of the Cluster Server node.<br>This field is enabled when you select the <b>Configuration in cluster</b> check box.  | Yes, if the field is enabled. | node1  |
| Exchange Agent Historical Data Directory  | The location on the disk where the historical data is stored.<br>This field is enabled when you select the <b>Configuration in cluster</b> check box.   | Yes, if the field is enabled. | c:\history   |

## Configuration parameters for Exchange services

In the **Exchange Services Monitoring** tab of the **Agent Configuration** window, you can select the Exchange services to know the Exchange Server status.

The following table contains detailed descriptions of the configuration settings in the **Exchange Services Monitoring** tab.

| Table 200. Names and descriptions of configuration settings in the Exchange Services Monitoring tab |   |                 |
|---|---|-----------------|
| Parameter name  | Description   | Mandatory field |
| Exchange Services   | Select the Exchange services from the available list of services, and click the arrow to move the selected services to the <b>Services Configured for Server Status</b> list so that the Microsoft Exchange Server agent can monitor them.<br><br><b>Remember:</b> The list of available services changes according to the Exchange Server version and the roles that are installed.  | Not applicable  |
| Services Configured for Server Status   | The services that are already available in this list determine the status of the Exchange Server. These services are mandatory and cannot be moved from the <b>Services Configured for Server Status</b> list to the <b>Exchange Services</b> list. You can add more services to the <b>Services Configured for Server Status</b> list by moving the services from the <b>Exchange Services</b> list. You can move these additional services back to the <b>Exchange Services</b> list. | Not applicable  |

## Configuration parameters for reachability

In the **Advanced Configuration Properties** tab of the **Agent Configuration** window, you can configure the parameters that are related to reachability, such as target email address and reachability interval.

The following table contains detailed descriptions of the configuration settings in the **Advanced Configuration Properties** tab.

| Table 201. Names and descriptions of configuration settings in the Advanced Configuration Properties tab |  |                                |
|--|--|--------------------------------|
| Parameter name   | Description  | Mandatory field                |
| Enable Mailbox Reachability Monitoring   | Select this check box if you want the agent to capture the reachability metrics data.  | Not applicable                 |
| Target Email Address   | An email address to verify reachability. Separate multiple email addresses with a semicolon (;).<br><br><b>Restriction:</b> The total number of characters in this field must not exceed 1023. | Yes, if this field is enabled. |
| Email Transmission Interval (seconds)  | The waiting time (in seconds) of the Exchange Server agent between sending emails.   | Yes, if this field is enabled. |
| Email Transmission Timeout (seconds)   | The interval (in seconds) for which the agent waits for a response to the email that was sent to test whether the Mailbox Server is reachable.   | No                             |
| Enable Mailbox Detail Monitoring   | Select this check box to collect data for the mailbox detail metrics.  | Not applicable                 |
| Mailbox Detail Collection Start time   | The time (in hh:mm:ss format) when mailbox detail metrics are collected.   | No                             |
| Mailbox Detail Collection Interval (seconds)   | The interval (in seconds) between collections of mailbox detail metrics.   | No                             |
| Event Logs Collection Time (minutes)   | The duration (in minutes) for which the agent collects event records.  | No                             |

*Table 201. Names and descriptions of configuration settings in the Advanced Configuration Properties tab (continued)*

| Parameter name                               | Description  | Mandatory field |
|--|--|-----------------|
| Maximum Number of Events                     | The maximum count up to which event records are collected. The collection of event records stops when the number of collected event records exceeds the maximum count.   | No              |
| Collection Interval (seconds)                | The interval (in seconds) between the agent cycles.  | No              |
| Exchange Topology Interval (seconds)         | The interval (in seconds) between collections of topology detail information.  | No              |
| Message Tracking Collection Interval (hours) | <p>The interval (in hours) for which the message tracking logs are collected.</p> <p><b>Restriction:</b> The interval value must be in the range 1 - 12. If you specify the interval value that is greater than 12, the value is saved as 12. If you enter an invalid value that contains alphabets or special characters, the value is saved as 0, which indicates that the message tracking collection is disabled.</p> <p>This field is disabled if any of the following conditions is true:</p> <ul style="list-style-type: none"> <li>• The Mailbox Server role or the Hub Transport role is not installed on the Exchange Server.</li> <li>• The message tracking feature is disabled on the Exchange Server.</li> </ul> | No              |

## Validation of configuration values

The values that you specify while configuring the agent are validated. The validation ensures that the values are specified for all mandatory parameters and certain conditions are met, such as local administrator rights for the user.

The following table shows the validation tests that are performed on the specified configuration values.

*Table 202. Validation tests*

| Validation test        | Verifies whether   |
|------------------------|--|
| Exchange Server Name   | The Mailbox Server name of the user matches the specified Exchange Server name.  |
| Exchange Server Rights | The user has the required Exchange Server rights. On Exchange Server 2007, the user must have recipient administrator rights, and on Exchange Server 2010, or later, the user must have recipient management rights. |
| Local Admin            | The user has local administrator rights.   |
| Agent Service Logon    | The agent service is configured to run with the specified user account.  |

If one or more validation tests fail, an error message is generated. You must specify values for all mandatory parameters. Otherwise, you cannot save the configured values.

## Configuring the agent by using the silent response file

The silent response file contains the agent configuration parameters with default values defined for some parameters. You can edit the silent response file to configure the agent with different values for the configuration parameters.

### About this task

After you update the configuration values in the silent response file, you must run the configuration script to configure the agent with these updated values.

### Procedure

1. Open the `msex_silent_config.txt` file that is located at `install_dir\samples`, and specify values for all mandatory parameters.

You can also modify the default values of other parameters.

2. Run the following command:

```
install_dir\BIN\msexch-agent.bat config install_dir\samples  
\msex_silent_config.txt
```

### What to do next

Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

**Restriction:** On the Cloud APM dashboard, instances of only one of the Exchange component types (Microsoft Exchange Server or Microsoft Exchange Server 2013) are displayed under My Components.

## Configuring local environment variables for the agent

You can configure the local environment variables for the Microsoft Exchange Server agent to enable or disable event throttling for duplicate events.

### Procedure

1. Click **Start > All Programs > IBM Monitoring agents > IBM Cloud Application Performance Management**.
2. In the **IBM Performance Management** window, from the **Actions** menu, click **Advanced > Edit ENV File**.
3. In the KEXENV file, change the values of the following environment variables:

#### **EX\_EVENT\_THROTTLE\_ENABLE**

This variable enables you to throttle duplicate events. The default value is `False`. To enable event throttling to prevent triggering of situations for duplicate events, set the value of this variable to `True`.

#### **EX\_EVENT\_THROTTLE\_DURATION**

This variable provides the duration (in minutes) for throttling of events. The default value is 0 minutes.

## Configuring Microsoft Hyper-V monitoring

---

When you install the Monitoring Agent for Microsoft Hyper-V Server, the agent is automatically configured and started with the default configuration settings. Use the silent response file to modify the default configuration settings.

### Before you begin

- Review hardware and software prerequisites. For the up-to-date system requirement information, see the [Software Product Compatibility Reports \(SPCR\)](#) for the Microsoft Hyper-V Server agent.
- If you want to modify the default configuration parameters, edit the response file.
- To view the virtual machine data in the Virtual Machine page, ensure that you install the integration component and the OS agent on each virtual machine. For virtual machines that run on the Linux system, ensure that you complete the following tasks:
  - Upgrade the Linux system.
  - Install the updated `hyperivkvpd` or `hyperiv-daemons` rpm package on the virtual machine.

### About this task

You can configure the agent when the agent is running or stopped. The agent remains in the same state after configuration. For example, if the agent is running, it remains in the running state after configuration.

**Important:** For the 8.1.3 release of Performance Management, the agent configuration window is removed because it is not required. The agent configuration window is available for 8.1.2, or earlier versions of Performance Management.

The product version and the agent version often differ. The directions here are for the most current release of this agent. For information about how to check the version of an agent in your environment, see [Agent version command](#). For detailed information about the agent version list and what's new for each version, see the [“Change history”](#) on page 58.

### Procedure

To configure the agent, complete the following steps:

1. Open the `microsoft_hyper-v_server_silent_config.txt` file that is at `install_dir\samples`, and specify values for all mandatory parameters.

You can also modify the default values of other parameters.

2. Open the command prompt, and enter the following command:

```
install_dir\BIN\microsoft_hyper-v_server-agent.bat config install_dir\samples\microsoft_hyper-v_server_silent_config.txt
```

The response file contains the following parameters:

- KHV\_DIRECTOR\_PORT
- KHV\_DIRECTOR\_SERVER

**Remember:** The agent configuration is organized into the following groups:

#### **IBM Systems Director configuration (IBM\_DIRECTOR\_CONFIGURATION)**

The configuration elements that are defined in this group are always present in the agent's configuration. This group defines information that applies to the entire agent.

#### **IBM Systems Director Server Port Number (KHV\_DIRECTOR\_PORT)**

The port number for the IBM Systems Director Server. The default value is none.

#### **IBM Systems Director Server Host Name (KHV\_DIRECTOR\_SERVER)**

The host name or IP address of the IBM Systems Director Server that is managing the environment. The default value is none.

3. Start the agent if it is in the stopped state.

## What to do next

Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

## Providing Local Security Policy for running Monitoring Agent for Microsoft Hyper-V Server on Windows by a Non-Administrator user

Local security policies are available to run the Monitoring Agent for Microsoft Hyper-V Server on Windows by a non-administrator user.

### About this task

A combination of following two local security policies works to run the Microsoft Hyper-V Server agent on Windows by a non-administrator user. For the Microsoft Hyper-V Server agent to start or stop, configure, and verify data, use these two policies.

- Debug Programs
- Log on as Service

Also, following attribute groups need administrator rights to get data on the APM portal:

- Availability
- Migration
- VM Mig WO Cluster
- VM Storage Migration

Follow the procedure that is given to avail the Local Security permissions for a non-administrator user.

### Procedure

1. Install the Microsoft Hyper-V Server agent as a local administrator.
2. Add the non-administrator user under the `install_dir` directory and provide the following permissions to it:
  - a) Provide full access to the `HKEY_LOCAL_MACHINE\SOFTWARE\IBMMonitoring` registry.
  - b) Provide read access to the non-administrator user in the `HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Perflib` registry.
  - c) Provide full access to the non-administrator user in the `install_dir` directory.
3. Go to the **Start** menu and run the **secpol.msc** command to open the Local Security policies.
4. To add a non-administrator user in the policies, refer [“Granting Local Security Policy permissions” on page 607](#).
5. To add a non-administrator user in the Hyper-V Administrator Users group, refer [“Adding a non-administrator user in the Hyper-V administrator users group” on page 608](#).
6. To add a non-administrator user in the Performance Monitor Users group, refer [“Adding a non-administrator user in the Performance Business Monitor users group” on page 608](#).
7. To modify the DCOM security permission for a non-administrator user, refer [“Modifying DCOM permissions” on page 607](#).
8. Restart the Microsoft Hyper-V Server agent and verify data on the APM portal.

## Granting Local Security Policy permissions

To start or stop, configure, and verify data for the Microsoft Hyper-V Server agent, you need to grant permissions to these two local security policies: Debug Programs and Log on as Service.

### Granting Debug Programs permission

#### About this task

To grant the Debug Programs permission, complete the following procedure.

#### Procedure

1. Click **Start > Control Panel > Administrative Tools > Local Security Policy**. The **Local Security Settings** window opens.
2. Expand **Local Policies** and click **User Rights Assignment**. The list of policies opens.
3. Double-click the **Debug Programs** policy. The **Debug Programs Properties** window opens.
4. Click **Add User or Group**. The **Select Users or Groups** window opens.
5. In the **Enter the object names to select** field, enter the user account name to whom you want to assign permissions, and then click **OK**.
6. Click **Apply**, and then click **OK**.

### Granting Log on as Service permission

#### About this task

To grant the Log-on as Service permission, complete the following procedure.

#### Procedure

1. Click **Start > Administrative Tools > Local Security Policy**. The **Local Security Settings** window opens.
2. Expand **Local Policies** and click **User Rights Assignment**. The list of policies opens.
3. Double-click the **Log-on as service** policy. The **Log-on as service Properties** window opens.
4. Click **Add User or Group**. The **Select Users or Groups** window opens.
5. In the **Enter the object names to select** field, enter the user account name to whom you want to assign permissions, and then click **OK**.
6. Click **Apply**, and then click **OK**.

## Modifying DCOM permissions

You need to modify DCOM permissions to run the Microsoft Hyper-V Server agent with the non-administrator user access.

#### About this task

To modify DCOM permissions, verify that the user has appropriate permissions to start the DCOM server. To modify permissions, complete the following procedure.

#### Procedure

1. Using the **Regedit** command, go to the **HKCR\Clsid\\*clsid** value registry value.  
**Note:** When you configure the agent with a non-administrator user, the CLSID value is displayed in the event viewer with the event ID 10016.
2. In the Registry Editor pane, double-click **Default**.

3. In the **Edit string** dialog box, copy the value data string.
4. Click **Start > Control Panel > Administration Tools > Component Services**.
5. In the **Component Services** window, expand **Component Services > Computers > My Computer**, and double-click **DCOM**.
6. In the DCOM config pane, locate the copied string (program name), right-click the program name, and then click **Properties**.
7. In the **Properties** window, select the **Security** tab.
8. Under the **Launch and Activation Permissions** group box, select **Customize**, and then click **Edit**. The **Launch and Activation Permissions** window opens.
9. Click **Add**, enter a non-administrator user to the permission list, and click **OK**.
10. Select the **Allow** check box for Local Launch and Local Activation, and then click **OK**.

## Adding a non-administrator user in the Hyper-V administrator users group

You need to add a non-administrator user in the Hyper-V administrator users group to get data on the APM portal.

### About this task

To add a non-administrator user in the Hyper-V administrator users group, complete the following procedure.

### Procedure

1. Click **Start > Control Panel > Administration Tools > Computer Management**. The **Computer Management** window opens.
2. Click **System Tools > Local Users and Groups > Groups**. The list of groups opens.
3. Double-click the **Hyper-V Administrators** group. The **Hyper-V Administrators Properties** window opens.
4. Click **Add**. The **Select Users or Groups** window opens.
5. In the **Enter the object names to select** field, enter the user account name to whom you want to assign permissions, and then click **OK**.
6. Click **Apply**, and then click **OK**.

## Adding a non-administrator user in the Performance Business Monitor users group

You need to add a non-administrator user in the Performance Monitor users group to get data on the APM portal.

### About this task

To add a non-administrator user in the Performance Business Monitor users group, complete the following procedure.

### Procedure

1. Click **Start > Control Panel > Administration Tools > Computer Management**. The **Computer Management** window opens.
2. Click **System Tools > Local Users and Groups > Groups**. The list of groups opens.
3. Double-click the **Performance Monitor Users** group. The **Performance Business Monitor Users Properties** window opens.
4. Click **Add**. The **Select Users or Groups** window opens.

5. In the **Enter the object names to select** field, enter the user account name to whom you want to assign permissions, and then click **OK**.
6. Click **Apply**, and then click **OK**.

## Configuring Microsoft IIS monitoring

---

When you install the Monitoring Agent for Microsoft Internet Information Services, the agent is automatically configured and starts with the default configuration settings.

### Before you begin

- Review hardware and software prerequisites. For the up-to-date system requirement information, see the [Software Product Compatibility Reports \(SPCR\) for the Microsoft IIS agent](#).
- Ensure that the user, who connects to the Microsoft Internet Information Server environment or application, has administrator privileges. Use an existing user with administrator privileges, or create a new user. Assign administrator privileges to the new user by adding the new user to the Administrators group.

**Remember:** To configure the Microsoft IIS agent, you can use a local or a domain user provided that the user has administrator privileges.

### About this task

You can configure the agent when the agent is running or stopped. The agent remains in the same state after configuration. For example, if the agent is running, it remains in the running state after configuration.

To configure the agent, you can either use the **IBM Performance Management** window or the silent response file.

The product version and the agent version often differ. The directions here are for the most current release of this agent. For information about how to check the version of an agent in your environment, see [Agent version command](#). For detailed information about the agent version list and what's new for each version, see the [“Change history”](#) on page 58.

### What to do next

After you configure the agent, you can change the user account from the local user to the domain user. For steps to change the user account, see [“Changing the user account”](#) on page 611.

## Configuring the agent on Windows systems

You can configure the Microsoft IIS agent on Windows operating systems by using the **IBM Performance Management** window. After you update the configuration values, you must start the agent to save the updated values.

### About this task

You can configure the agent when the agent is running or stopped. The agent remains in the same state after configuration. For example, if the agent is running, it remains in the running state after configuration.

The Microsoft IIS agent provides default values for some parameters. You can specify different values for these parameters.

### Procedure

1. Click **Start > All Programs > IBM Monitoring agents > IBM Performance Management**.
2. In the **IBM Performance Management** window, right-click **Monitoring Agent for Microsoft Internet Information Services**, and click **Reconfigure**.
3. In the Monitoring Agent for Microsoft Internet Information Services window, complete the following steps:

- a) On the **HTTP Error Log Configuration** tab, specify a location to save the log file, and click **Next**.

**Note:** By default, this log file is saved at the following location: C:\WINDOWS\system32\LogFiles\HTTPERR. The administrator can change the location of the log file.

- b) On the **Site Log Configuration** tab, specify a location to save the log file, and click **OK**.

**Note:** By default, this log file is saved at the following location: C:\inetpub\logs\LogFiles. The administrator can change the location of the log file.

4. In the **Restart of Monitoring Agent for Microsoft IIS** window, click **Yes**.

## What to do next

Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

If you need help with troubleshooting, see the [Troubleshooting](#) section.

## Configuring the agent by using the silent response file

When you install the Microsoft IIS agent, the agent is automatically configured and starts with the default configuration settings. Use the silent response file to modify the default configuration settings.

### Before you begin

If you want to modify the default configuration parameters, edit the response file.

### About this task

You can configure the agent when the agent is running or stopped. The agent remains in the same state after configuration. For example, if the agent is running, it remains in the running state after configuration.

### Procedure

To configure the Microsoft IIS agent, complete the following steps:

1. On the command line, change the path to the directory that contains the `msiis-agent.bat` file.
2. Enter the following command: **msiis-agent.bat config *absolute path to the response file***.

The response file contains the following parameters:

#### **KQ7\_SITE\_LOG\_FILE**

C:\inetpub\logs\LogFiles

#### **KQ7\_HTTP\_ERROR\_LOG\_FILE**

C:\WINDOWS\system32\LogFiles\HTTPERR

**Remember:** The agent configuration is organized into the following groups:

#### **Site Log Configuration (SITE\_LOG)**

This group contains the configuration parameters that are related to the site log file (KQ7\_SITE\_LOG\_FILE). An administrator can specify a location to save the log file. By default, this log file is saved at the following location: C:\inetpub\logs\LogFiles

#### **HTTP Error Log Configuration (HTTP\_ERROR\_LOG)**

This group contains the configuration parameters that are related to the HTTP error log file (KQ7\_HTTP\_ERROR\_LOG\_FILE). An administrator can specify a location to save the log file. By default, this log file is saved at the following location: C:\WINDOWS\system32\LogFiles\HTTPERR

3. If the agent is in the stopped state, start the agent.

## What to do next

Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

If you need help with troubleshooting, see the [Troubleshooting](#) section.

## Changing the user account

After you configure the Microsoft IIS agent, you can change the user account from the local user to the domain user.

### About this task

By default, the Microsoft IIS agent runs under the local user account.

### Procedure

1. Run the following command to verify which user ID is being used for starting the agent:  
**install\_dir\InstallITM\KinCinfo.exe -r**
2. If the monitoring agent was started with a user ID that does not belong to the Administrator group, stop the agent.
3. Open the **Manage Monitoring Services** window.
4. Right-click the agent instance, and click **Change Startup**.
5. Specify the fully qualified user ID as <Domain\User ID>, and then specify the password.
6. Start the Microsoft IIS agent.

## Prerequisite to install Web Application Attribute Group

You need to check the following set of prerequisites before you install the Web Application attribute group:

- Run the host command in Windows Power Shell to check the version of PowerShell. If the version is not 5.1, then download the required version from <https://www.microsoft.com/en-us/download/details.aspx?id=54616>.
- Check the version of the .NET framework. To check the version, in the registry, go to location HKEY\_LOCAL\_MACHINE\SOFTWARE\Microsoft\NET Framework Setup\NDP\v4\Full. If the .NET framework is 4.6 or less, get the required version of installation for the .NET framework from <https://www.microsoft.com/en-in/download/details.aspx?id=49982>.
- Then install the PowerShell module.
  - If the operating system is Windows Server 2008 R2, install the Carbon module using the command, `Install-Module -Name Carbon`.
  - If the operating system is Windows Server 2012 or Windows Server 2012 R2, install the IISAdministration module using the command `Install-Module -Name IISAdministration`.
  - The Windows Server 2016 or Windows Server 2019 has all the required features. Installing IIS server from the server manager installs the IISAdministration module.

## Configuring Skype for Business Server monitoring

---

When you install the Monitoring Agent for Skype for Business Server (formerly known as MS Lync Server), the agent will be in the unconfigured state. To start the agent, you need to configure it.

### Before you begin

- Review the hardware and software prerequisites. For the up-to-date system requirement information, see the [Software Product Compatibility Reports \(SPCR\)](#) for the Skype for Business Server agent.
- Ensure that the user that you use to run the Skype for Business Server agent, is a domain user with administrator privileges and has access to all the remote servers that are listed in the Lync or Skype for Business Server topology. Use an existing domain user with administrator privileges, or create a new domain user and assign administrator privileges to the new domain user.

## About this task

You can configure the agent when the agent is running or stopped. The agent remains in the same state after configuration. For example, if the agent is running, it remains in the running state after configuration.

The product version and the agent version often differ. The directions here are for the most current release of this agent. For information about how to check the version of an agent in your environment, see [Agent version command](#). For detailed information about the agent version list and what's new for each version, see the [“Change history”](#) on page 58.

To configure the agent, you can either use the **IBM Performance Management** window or the silent response file.

## What to do next

After you configure the agent, you can change the user account from the local user to the domain user. For steps to change the user account, see [“Changing the user account”](#) on page 614.

## Permissions and access rights for a non-administrator user

You can run the monitoring agent for Skype for Business Server agent as a non-administrator user; however, some functions are inaccessible.

### Registry Permissions

To create a non-administrator user, create a new user (non-administrator) and set up registry permissions for the new user as follows.

- Full access to the KEY\_LOCAL\_MACHINE\SOFTWARE\IBMMonitoring
- Full access to the CANDLE\_HOME directory

The non-administrator user must be a member of the Performance Monitor Users and Performance Log Users. If you define these permissions for a non-administrator user, data is displayed for all the Perfmon-based attribute groups.

### To view attribute groups' data collected from Database

If you want to view data for attribute groups that is collected from database, you must set up the following permissions for the non-administrator user.

- The non-administrator user account that you use to run the Skype for Business Server agent must have the Debug Program permission to add a debugger to any process.

By default, the Debug Program permission is assigned only to the administrator and Local System accounts. To grant the Debug Program permission, you must complete the following steps on the Lync or Skype for Business Server:

1. Click **Start > Administrative Tools > Local Security Policy**. The **Local Security Settings** window opens.
  2. Expand **Local Policies** and then click **User Rights Assignment**. The list of user rights opens.
  3. Double-click the **Debug Programs policy**. The **Debug programs Properties** window opens.
  4. Click **Add User or Group**. The **Select Users or Groups** window opens.
  5. In the Enter the object names to select field, enter the user account name to whom you want to assign permissions, and then click **OK**.
  6. Click **OK**.
- Grant Log on as Service permission

To grant the Log-on as service permission, you must complete the following steps on the Lync or Skype for Business Server:

1. Click **Start > Administrative Tools > Local Security Policy**. The **Local Security Settings** window opens.
2. Expand **Local Policies** and then click **User Rights Assignment**. The list of user rights opens.
3. Double-click the **Log-on as service** policy. The **Log-on as service Properties** window opens.
4. Click **Add User or Group**. The **Select Users or Groups** window opens.
5. In the Enter the object names to select field, enter the user account name to whom you want to assign permissions, and then click **OK**.
6. Click **OK**.

The Availability attribute group show data for users who are members of the Administrators group.

## Configuring the agent on Windows systems

You can configure the Skype for Business Server agent (formerly known as MS Lync Server agent) on Windows operating systems by using the **IBM Performance Management** window. After you update the configuration values, you must start the agent to save the updated values.

### About this task

You can configure the agent when the agent is running or stopped. The agent remains in the same state after configuration. For example, if the agent is running, it remains in the running state after configuration.

The Skype for Business Server agent provides default values for some parameters. You can specify different values for these parameters.

### Procedure

1. Click **Start > All Programs > IBM Monitoring agents > IBM Performance Management**.
2. In the **IBM Performance Management** window, right-click **Monitoring Agent for Skype for Business Server**, and then click **Configure agent**.
3. In the Monitoring Agent for Skype for Business Server window, complete the following steps:
  - a) On the **SQL Configuration for Skype for Business Topology** tab, to connect to the Microsoft Lync Server or Skype for Business Server Central Management Store, specify values for the configuration parameters, and then click **Next**.
 

**Note:** You can skip this tab, as SQL Configuration for Skype for Business Topology is not applicable for IBM Cloud Application Performance Management.

**Important:** Synthetic transaction configuration is optional. If you require the synthetic transaction data, specify the configuration parameters on the **Setup Information** and **Scheduler Configuration** tabs.
  - b) On the **Administrator Login Credentials** tab, specify the administrator credentials, and then click **Next**.
  - c) On the **Setup Information** tab, to run commands for the synthetic transactions, specify values for the configuration parameters, and then click **Next**.
  - d) On the **Scheduler Configuration** tab, to schedule the synthetic transactions, specify values for the configuration parameters, and then click **Next**.
  - e) On the **SQL Server Configuration for Skype for Business Monitoring Role** tab, to connect to the Microsoft Lync Server or Skype for Business Server monitoring role, specify values for the configuration parameters, and then click **Next**.

For information about the configuration parameters, see [“Configuration parameters for the agent”](#) on page 615.

4. In the **IBM Performance Management** window, right-click **Monitoring Agent for Skype for Business Server**, and then click **Start**.

## What to do next

Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

If you need help with troubleshooting, see the [Troubleshooting](#) section.

## Configuring the agent by using the silent response file

When you install the Skype for Business Server agent (formerly known as MS Lync Server agent), the agent will be in the unconfigured state. To start the agent, you need to configure it. The silent response file contains the agent configuration parameters with default values defined for some parameters. You can edit the silent response file to specify different values for the configuration parameters.

### Before you begin

If you want to modify the default configuration parameters, edit the response file.

### About this task

You can configure the agent when the agent is running or stopped. The agent remains in the same state after configuration. For example, if the agent is running, it remains in the running state after configuration.

### Procedure

To configure the Skype for Business Server agent, complete the following steps:

1. Open the command prompt.
2. Change the path to the directory that contains the `skype_for_business_server-agent.bat` file.
3. Enter the **skype\_for\_business\_server-agent.bat config** *absolute path to the response file* command.

For information about the configuration parameters, see [“Configuration parameters for the agent” on page 615](#).

4. Start the agent if it is in the stopped state.

## What to do next

Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

If you need help with troubleshooting, see the [Troubleshooting](#) section.

## Changing the user account

After you configure the Skype for Business Server agent, you can change the user account from the local user to the domain user.

### About this task

By default, the Skype for Business Server agent runs under the local user account. When the agent runs under the domain user, the agent can collect data from the remote servers.

### Procedure

1. Run the following command to verify which user ID is being used for starting the agent:  
**install\_dir\InstallITM\KinCinfo.exe -r**
2. If the monitoring agent was started with a user ID that does not belong to the Administrator group, stop the agent.
3. Open the **Manage Monitoring Services** window.

4. Right-click the agent instance, and click **Change Startup**.
5. Specify the fully qualified user ID as <Domain\User ID>, and then specify the password.
6. Start the Skype for Business Server agent.

## Configuration parameters for the agent

When you configure the Skype for Business Server agent (formerly known as MS Lync Server agent), you can change the default values of the configuration parameters, such as the database server name, database instance name, database name, and other parameters.

The following table contains descriptions of the configuration parameters for the Skype for Business Server agent.

**Note:** Out of all the fields, the Pool FQDN field is mandatory in following table.

| Table 203. Names and descriptions of the configuration parameters for the agent |  |
|---|--|
| Parameter name  | Description  |
| Database Server Name (for example, PS6877)                                      | <ul style="list-style-type: none"> <li>• <b>SQL Configuration for Skype for Business Topology</b> tab: The name of the database server where the Lync or Skype for Business Server Central Management Store is installed.</li> <li>• <b>SQL Server Configuration for Skype for Business Monitoring Role</b> tab: The name of the database server where the monitoring role is installed.</li> </ul>              |
| Database Instance Name  | <ul style="list-style-type: none"> <li>• <b>SQL Configuration for Skype for Business Topology</b> tab: The default instance.</li> <li>• <b>SQL Server Configuration for Skype for Business Monitoring Role</b> tab: The name of the database instance where the monitoring role is installed.</li> </ul>   |
| Database Name   | The name of the database.  |
| Database User ID  | The user ID of the database. This user must have access to the required Microsoft SQL Server instance. This user need not be an Active Directory user.   |
| Database Password   | The password of the database where the monitoring role is installed.   |
| Username (Example: skype\administrator)   | The user ID of the administrator. This user must be a domain user with administrator privileges and access to all the remote servers that are listed in the Lync or Skype for Business Server topology. The credentials of this user are also used in Synthetic Transaction feature. So, this user should be authorized to create Windows Schedule in Task Scheduler and execute Synthetic Transaction Commands. |
| Password  | The login password of administrator.   |
| Confirm Domain Password   | Enter the same password that you specified in the Domain Password field.   |
| Pool FQDN   | The fully qualified domain name (FQDN) of Skype Pool for which synthetic commands are executed.  |
| Geographic Location   | The geographic location of the production system.  |

| Table 203. Names and descriptions of the configuration parameters for the agent (continued) |   |
|---|---|
| Parameter name  | Description   |
| Test Users1 (for example, user1@skype.com)  | First Username which can be used while executing Synthetic Transaction cmdlets. Format for username is SAMAccountName@domain.com. Do not provide Sip Address.   |
| Test User1 PWD  | The password of Test User1.   |
| Confirm Test User1 PWD  | Enter the same password that you specified in the <b>Test User1 PWD</b> field.  |
| Test User2 (for example, user2@skype.com)   | Second Username which can be used while executing Synthetic Transaction cmdlets. Format for username is SAMAccountName@domain.com. Do not provide Sip Address.  |
| Test User2 PWD  | The password of Test User2.   |
| Confirm Test User2 PWD  | Enter the same password that you specified in the <b>Test User2 PWD</b> field.  |
| Use Agent Configuration Values  | Keep this field enabled if you want to run synthetic commands using all fields provided in configuration panel. Disable to use values set by New-CsHealthMonitoringConfiguration. If disabled, the value of <b>Pool FQDN</b> will be used as identity for Get-CsHealthMonitoringConfiguration. Make sure to provide valid test user credentials to execute <b>Test-CsMcp2PIM</b> command. |
| Frequency   | The frequency of the scheduled utility that fetches the data of synthetic transactions. The frequency can have the following values: <ul style="list-style-type: none"> <li>• Daily (DAY_FREQUENCY)</li> <li>• Weekly (WEEK_FREQUENCY)</li> <li>• Monthly (MONTHLY_FREQUENCY)</li> </ul>  |
| Collection Hour   | The hour part of the time-stamp, in the 24-hour clock format that you select to schedule the utility.   |
| Collection Minute   | The minutes part of the time-stamp that you select to schedule the utility.   |
| Start Date (YYYY-MM-DD)   | The time when the scheduler is activated.   |
| End Date (YYYY-MM-DD)   | The time when the scheduler is deactivated.   |

## Configuring Microsoft .NET monitoring

The Monitoring Agent for Microsoft .NET monitors .NET applications. The agent starts automatically after installation to collect resource monitoring data. However, to collect transaction tracking and diagnostics data, you must complete some configuration tasks.

### Before you begin

Review the hardware and software prerequisites. For the up-to-date system requirement information, see the [Software Product Compatibility Reports \(SPCR\)](#) for the Microsoft .NET agent. The .NET framework

4.7.2 should be installed on the agent machine. Scripts are added for Prereqchecker that requires .NET framework 4.7.2 or later.

## About this task

After the agent is installed, complete the following configuration tasks so that the agent can collect the transaction tracking and diagnostics data:

1. Registering the data collector  
The data collector is a component of the Microsoft .NET agent. It collects the transaction tracking and diagnostics data and passes the data to the Microsoft .NET agent. You must register the data collector for collecting this data. For details, see [“Registering the data collector” on page 618](#).
2. Configuring the collection of transaction tracking and diagnostics data  
After you register the data collector, enable the collection of transaction tracking and diagnostics data on the Cloud APM console. You can also enable the diagnostics data collection by using the **configdc** command. For details, see [“Enabling collection of transaction tracking and diagnostics data” on page 621](#) and [“Enabling the collection of diagnostics data by using the configdc command” on page 622](#).
3. Activating the configuration updates  
If you enable the diagnostics data collection by using the **configdc** command, you must activate the configuration so that the updates are saved to the configuration file. For more information about activating the configuration changes, see [“Activating the configuration updates” on page 623](#).
4. Tuning the performance of data collector  
You might need to complete some tasks to fine tune the performance of data collector. For details, see [“Performance tuning of data collector” on page 624](#).

## Agent coexistence

In an agent coexistence environment, you can view the transaction tracking data from either the Cloud APM console or Tivoli® Enterprise Portal. For information about enabling data collection for transaction tracking in the agent coexistence environment, see [“Enabling transaction tracking in agent coexistence environment” on page 623](#).

The product version and the agent version often differ. The directions here are for the most current release of this agent. For information about how to check the version of an agent in your environment, see [Agent version](#). To access the documentation for earlier agent releases, see the following table:

| Table 204. Agent versions and documentation |  |
|---|--|
| Microsoft .NET agent version                | Documentation  |
| 8.1.3.2                                     | <a href="#">IBM Cloud Application Performance Management</a> |
| 8.1.3 and 8.1.2                             | <a href="#">IBM Performance Management 8.1.3</a>             |

The link opens an on-premises Knowledge Center topic.

## Permissions to run an agent by using a local or domain account

Only a local or domain user who is a member of Administrators group has permissions to run the Microsoft .NET agent. This topic provides conditions that must be met if the local or domain user is not a member of Administrators group.

### User must have the following permissions to the system drive and agent installation drive

1. Read
2. Write
3. Execute
4. Modify

## User must have the following permission to the HKEY\_LOCAL\_MACHINE registry key

- Read

## User must be a member of following groups on monitored server

1. Users
2. IIS\_IUSRS
3. Performance Monitor Users
4. Performance Log Users

**Note:** However, it is advisable to run Microsoft .NET agent with a local or domain user that is a member of local Administrators group.

## Registering the data collector

You must register the data collector to collect the transaction tracking and diagnostics data. To collect the resource monitoring data, no specific configuration is required.

### About this task

Register the following components of data collector depending on the transaction, diagnostics, or both types of data that you want the data collector to collect:

| Table 205. Data collector components and their functions |   |
|--|---|
| Component name   | Monitors  |
| httpmodule   | ASP.NET transactions and collects request response time and CPU time                            |
| profiler   | ADO.NET transactions and collects method, stack trace, and request context data for diagnostics |
| isapi  | ASP.NET transactions and collects request response time and CPU time                            |
| soap   | ASMX or WCF service transactions and WCF services response time                                 |

### Remember:

- Use `isapi32` to filter the 32-bit applications on a 64-bit Microsoft IIS Server.
- Register all the components to track all transactions and view the complete transaction topology.

## Procedure

1. On the server where the agent is installed, run the following command as an administrator:

```
cd install_dir\qe\bin
configdc.exe registerdc [all|isapi|isapi32|profiler|httpmodule|soap]
```

### Remember:

- When you run the **configdc.exe registerdc** command without specifying any components to register, only `httpmodule` is registered.
- To register all the components, run the **configdc.exe registerdc all** command.
- To register any of the components together, run this command: **configdc.exe registerdc component\_name component\_name**. For example, **configdc.exe registerdc httpmodule profiler**

2. Restart the .NET applications.

### What to do next

After you register the data collector, you must enable the data collection for transaction tracking and diagnostics. For information about enabling data collection, see [“Enabling collection of transaction tracking and diagnostics data”](#) on page 621.

If you want to stop monitoring .NET applications, unregister the data collector. Repeat the specified steps by using the **configdc.exe unregisterdc** command to unregister all the components of data collector.

## Using the IIS Response Time module of the .NET agent

From 8.1.4.0.2 release onwards, the .NET agent includes the "IIS Response Time module", which works with the Response Time agent to show end user transactions data for the IIS server.

### Enabling Response Time module

You need to enable Response Time module before using it.

#### Procedure

Complete the following steps to enable Response Time module:

1. Open the command prompt in administrator mode.
2. To stop IIS, run the following command:  

```
iisreset /stop
```
3. Go to `install_dir\qe\bin` directory on the command prompt.
4. To register the Response Time module for IIS, run the following command:  

```
configdc registerdc rtmodule
```
5. To start IIS, run the following command:  

```
iisreset /start
```

#### Results

The Response Time module is enabled.

### Configuring the Response Time agent to work with the .NET agent's IIS Response Time module

You need to configure the Response Time agent to work with the .NET agent's IIS Response Time module.

#### Before you begin

Install the Response Time agent (8.1.4 version), for more information see [Chapter 7, “Installing your agents,”](#) on page 181.

#### Procedure

Complete the following steps, to configuring the Response Time agent to work with the .NET Agent's IIS Response Time module:

1. Open a text editor in administrator mode.
2. Open the following file in the text editor:  

```
config_dir\TMAITM6_x64\host_name_T5.config
```

  
where `config_dir` is the APM home and `host_name` is the name of the server.
3. Update the following property:

- ```
{ KT5DISABLEANALYZER=YES } { KT5ENABLEWEBPLUGIN=YES }
```
4. Add the following property in the SECTION=analyzerconfig [ ] section:  

```
{KT5WEBPLUGINIPCNAME=KFC1}
```
  5. Restart the Response Time agent.
  6. Log in to the Performance Management console to verify the data that is collected by the agent in the dashboards. For information about using the Performance Management console, see [“Starting the Cloud APM console”](#) on page 1109.

## Configuring JavaScript Injection for IIS Response Time Module

You must configure JavaScript (JS) Injection to work with the .NET agent's Internet Information Services (IIS) Response Time module.

### Procedure

To configure JS Injection to work with the .NET agent's IIS Response Time module, follow these steps:

1. Open a text editor in administrator mode.
2. Open the following file in the text editor:  

```
<APM_HOME>\qe\config\dotNetDcConfig.properties.inactive
```
3. To enable JS Injection for the Response Time module, set the **RTModule.JSInjection.Enabled** property to **true**.
4. To disable JS Injection for the Response Time module, set the **RTModule.JSInjection.Enabled** property to **false**.
5. Open the command prompt in administrator mode and go to the <APM\_HOME>\qe\bin directory.
6. Run the following commands:
  - `configdc activateconfig`
  - `iisreset`

## Disabling the IIS Response Time Module

You can disable the IIS Response Time module when you don't want to see end user transactions data for the IIS server.

### Procedure

Complete the following steps to disable the IIS response time module:

1. Open the command prompt in administrator mode.
2. To stop IIS, run the following command:  

```
iisreset /stop
```
3. Go to `install_dir\qe\bin` directory on the command prompt.
4. To unregister Response Time module for IIS, complete the following steps:
  - To unregister response time module for IIS, run the following command:  

```
configdc unregisterdc rtmodule
```
  - To unregister all the components of data collector including the Response Time module, run the following command:  

```
configdc unregisterdc all
```
5. To start IIS, run the following command:  

```
iisreset /start
```

## Results

The IIS response time module is disabled.

## Limitations of IIS Response Time module

Limitations of IIS Response Time module are listed here.

- The user information is not tracked by the IIS Response Time module and user name currently appears as "Unknown".

## Enabling collection of transaction tracking and diagnostics data

On the **Agent Configuration** page, you can enable or disable the collection of transaction tracking and diagnostics data.

### Before you begin

Ensure that you have registered the data collector. For details, see [“Registering the data collector” on page 618](#).

### Procedure

Complete the following steps to configure the data collection for each managed system.

1. Log in to the Cloud APM console.
2. From the navigation bar, click  **System Configuration** > **Agent Configuration**.  
The **Agent Configuration** page is displayed.
3. Click the **MS .NET** tab.
4. Select the check boxes of the managed systems for which you want to configure the data collection and complete any of the following actions from the **Actions** list.
  - To enable transaction tracking, click **Set Transaction Tracking** > **Enabled**. The status in the **Transaction Tracking** column is updated to Enabled for each selected managed system.
  - To enable the diagnostic data collection, select **Set Diagnostic Mode** and click the level that you want to set. The status in the **Diagnostic Mode** column is updated to display the specified level for each selected managed system.
    - Level 1: The HTTP module collects the request summary and request instance data.
    - Level 2: The HTTP module collects the request summary and request instance data. The profiler collects the method data and stack trace data.
  - To disable transaction tracking, click **Set Transaction Tracking** > **Disabled**. The status in the **Transaction Tracking** column is updated to Disabled for each selected managed system.
  - To disable diagnostic data collection, click **Set Diagnostic Mode** > **Disabled**. The status in the **Diagnostic Mode** column is updated to Disabled for each selected managed system.

## Results

The data collection is configured for each managed system.

### What to do next

Log in to the Cloud APM console to view the transaction tracking and diagnostics data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

## Enabling the collection of diagnostics data by using the configdc command

You can also enable or disable the collection of diagnostics data by using the **configdc** command. This process is optional.

### Before you begin

- Ensure that you have registered the data collector. For details, see [“Registering the data collector”](#) on page 618.
- Ensure that you have completed the process at [“Enabling collection of transaction tracking and diagnostics data”](#) on page 621.
- Ensure that the `qe_custom.properties` file is processed by the APM server at `<APM_Home>\localconfig\qe` and has following properties:
  - `transaction_tracking=ENABLED`
  - `diagnostic_mode=LEVEL2`

### Procedure

1. Run the following command:

```
cd install_dir\qe\bin configdc deepdivedc -tracelevel trace_level
```

Where,

#### ***install\_dir***

The installation directory of the Microsoft .NET agent.

#### ***trace\_level***

The trace level that indicates the amount of diagnostics data that the .NET Data Collector collects. Specify one of the following values:

**0**

The collection of the diagnostics data is disabled.

**1**

The collection of the diagnostics data is enabled. The HTTP module collects the request summary and request instance data.

**2**

The collection of the diagnostics data is enabled. The HTTP module collects the request summary and request instance data. The profiler collects method data and stack trace data.

**Tip:** When you set the trace level by using the **configdc.exe deepdivedc -tracelevel** command, the value of the `bci_dc.diagnose.level` parameter is set in the `dotNetDcConfig.properties` file.

2. Activate the configuration changes.

For information about activation of changes, see [“Activating the configuration updates”](#) on page 623.

### What to do next

Log in to the Cloud APM console to view the diagnostics data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console”](#) on page 1109.

## Enabling transaction tracking in agent coexistence environment

In an agent coexistence environment, you can configure the data collector to collect and pass the transaction tracking data to the Tivoli Enterprise Portal, which is a component of IBM Tivoli Monitoring.

### Before you begin

You must install the Microsoft .NET agent, which is delivered as part of Cloud APM and you must remove or unregister the .NET Data Collector component, which is delivered with ITCAM for Microsoft Applications. Use the **configdc.exe unregisterdc** command to unregister all modules of the data collector.

### Procedure

To configure the data collector to collect and pass the transaction tracking data to the Tivoli Enterprise Portal, complete the following steps:

1. Go to the *install\_dir*\localconfig\qe directory, where *install\_dir* is the installation directory of the Microsoft .NET agent. The default path is C:\IBM\APM.
2. Open the qe\_default.properties file and set the value of the **transaction\_tracking** parameter to ENABLED.
3. Save and close the qe\_default.properties file.
4. Go to the *install\_dir*\qe\config directory.
5. Open the dotNetDcConfig.properties.inactive file in a text editor.
6. Set the **TTDC.enabled** and **TTAS.enabled** parameters as follows:

```
TTDC.enabled=true
TTAS.enabled=true
```

7. To configure the connection to the Transaction Collector, set the values of the **TTAS.Host** and **TTAS.Port** parameters to the IP address and port number of the Transaction Collector.
8. Run the following command to activate the changes:

```
install_dir\qe\bin\configdc.exe activateconfig
```

9. Restart the .NET application for the changes to take effect.

### Results

Now, the transaction tracking data can be collected and displayed on the Tivoli Enterprise Portal.

### What to do next

To disable the transaction tracking for a .NET Data Collector, repeat the procedure and use the following configuration values:

- In the qe\_default.properties file, set transaction\_tracking=DISABLED.
- In the dotNetDcConfig.properties.inactive file, set TTDC.enabled=false and TTAS.enabled=false.

## Activating the configuration updates

You must activate the updates that you make in the configuration settings by using the configdc command. The activation ensures that your updates are saved to the dotNetConfig.properties file.

### About this task

When you update the configuration settings by using the **configdc** command, the parameter values are updated in the dotNetConfig.properties file. However, if this file is being used and cannot be modified, your configuration setting updates are saved in the

`dotNetDcConfig.properties.inactive` file. You must activate the configuration so that the updates are saved in the `dotNetConfig.properties` file.

## Procedure

1. Go to the following path:  
`install_dir\qe\bin`  
Where *install\_dir* is the installation directory of the Microsoft .NET agent.
2. Run the following command:  
`configdc activateConfig`

## What to do next

If the Internet Information Service (IIS) transactions are monitored and the data collector configuration is updated, restart the IIS to activate the configuration.

If ASMX or WCF web services are monitored and the data collector configuration is updated, restart the process that hosts the web service.

## Performance tuning of data collector

When you configure the data collector to collect the transaction tracking and diagnostics data, the performance of data collector is affected. To improve the performance, you can complete some performance-tuning tasks.

You might need to complete the following tasks to improve the performance of data collector:

- Filter the ADO.NET interfaces that you want to monitor.
- Sample the transaction tracking and diagnostics data.
- Configure trace logging.

## Specifying ADO.NET interfaces for monitoring

You can specify the ADO.NET client interfaces that you want to enable for transaction tracking.

### Before you begin

If you want to view the ADO.NET interfaces that are supported by the .NET Data Collector, see [Functions of namespaces supported by the data collector](#).

To view the configuration values of the .NET Data Collector, see the `dotNetDcConfig.properties` file in the `install_dir\qe\config` directory, where *install\_dir* is the installation directory of the Microsoft .NET agent.

### About this task

By default, all the supported ADO.NET interfaces are enabled for transaction tracking during the installation of the agent. To specify the interfaces that the data collector must monitor, enable or disable monitoring for specific interfaces.

If you disable the monitoring of an interface, the settings of any associated application domain filter remain in the data collector configuration file. The filter is retained when the interface is enabled again.

## Procedure

- To enable the monitoring of an ADO.NET interface, complete these steps:
  - a) From the `install_dir\qe\bin` directory, run the following command:

```
configdc enableMonitor all | adsi | db2 | ldap | odbc | oledb | oracle | sql
```

```
| http | web  
[-appdomain appdomain filter list]
```

b) Activate the configuration changes.

For information about activation of changes, see [“Activating the configuration updates” on page 623](#).

- To disable the monitoring of an ADO.NET interface, complete these steps:

a) From the *install\_dir\qe\bin* directory, run the following command:

```
configdc disableMonitor all | adsi | db2 | ldap | odbc | oledb | oracle | sql  
| http | web
```

b) Activate the configuration changes.

For information about activation of changes, see [“Activating the configuration updates” on page 623](#).

## Sampling transaction tracking and diagnostic data

If the system performance is affected due to transaction tracking or diagnostic data collection, you can enable sampling of the collected data to improve the performance.

### About this task

When the system performance suffers due to the transaction tracking and diagnostic data collection, you can configure the data collector to periodically collect data through sampling. When the sampling is enabled, the data collector does not collect data for every request, but at intervals of several requests. You can change the sampling rate dynamically according to the CPU usage of the DotNetProfilerService process.

**CAUTION:** However, sampling can save system resources sampled data might not be efficient for diagnosing problems. After data sampling is enabled, the transaction tracking topology might be broken or lost. Therefore, enable data sampling only when the performance is seriously affected.

### Procedure

To enable sampling on the transaction tracking and diagnostic data collection, complete the following steps:

1. Go to the following directory:  
*install\_dir\qe\config*  
Where *install\_dir* is the installation directory of the Microsoft .NET agent.
2. In a text editor, open the *dotNetDcConfig.properties.inactive* file.
3. Set the following parameters in the file:

#### **bci\_dc.sampling.Enabled**

Specifies whether the data collector periodically collects the transaction tracking and diagnostic data. Valid values are *true* and *false*.

#### **bci\_dc.sampling.base**

Specifies the base for data sampling. A valid value is a positive number. For example, if you set the value of the **bci\_dc.sampling.base** parameter to 10, the data collector collects the transaction tracking and diagnostic data every 10 requests. The sampling rate is 1 out of 10 requests. The data collector collects data for 1st, 11th, 21st, 31st, and other requests.

#### **bci\_dc.dynamic.sampling**

Specifies whether the sampling rate is constant or dynamic. Valid values are *on* and *off*. When you set the value of the **bci\_dc.dynamic.sampling** parameter to *on*, the sampling rate is dynamically adjusted according to the value of the **bci\_dc.dynamic.max\_cpu\_usage** parameter.

**bci\_dc.dynamic.max\_cpu\_usage**

Specifies the CPU usage threshold for the DotNetProfilerService process. If the CPU usage of the DotNetProfilerService process is greater than 110% of the specified value, the sampling rate is decreased. If the CPU usage is less than 90% of the specified value, the sampling rate is increased. A valid value is in the range 1 - 100.

4. Save and close the `dotNetDcConfig.properties.inactive` file.
5. Run the following command to activate the changes:

```
install_dir\qe\bin\configdc.exe activateconfig
```

6. Restart the .NET application for the change to take effect.

## Enabling trace logging for the data collector

You can enable the generation of trace logs for the data collector. You can use these trace logs to troubleshoot problems that might occur with the collection of transaction tracking and diagnostics data.

### About this task

To collect logs for ASP.NET transactions, ADO.NET transactions, and diagnostics data, enable trace logs for the `httpmodule`, `profiler`, and `isapi` components of data collector. To collect logs for ASMX and WCF transactions, enable trace logs for the `soap` component of data collector.

**Important:** The performance of data collector might be affected when the trace logging is enabled. Therefore, disable the trace logging after the required trace logs are collected.

### Procedure

1. On the server where the agent is installed, navigate to the following path:  
`install_dir\qe\bin`  
Where, `install_dir` is the installation directory of the Microsoft .NET agent.
2. Complete both or any of the following procedures depending on the trace logs that you want to enable:
  - To enable trace logs for the `httpmodule`, `profiler`, `soap` components, and response time module, complete the following steps:
    - a. Run the following command:  
**`configdc logging -tracing on`**
    - b. Restart IIS and .NET applications.
  - To enable trace logs for the BCI engine, complete the following steps:
    - a. Navigate to the following path:  
`<APM_HOME>\qe\config`
    - b. In a text editor, open the `dotNetDcConfig.properties.inactive` file.
    - c. For the property **`bci_dc.trace.logging`**, specify the value as `on`.
    - d. Run the following command:  
**`configdc activateconfig`**
    - e. Restart IIS.

### What to do next

To disable trace logs, do the following:

- To disable trace logs for the `httpmodule`, `profiler`, `soap` components, and response time module:
  - Run the following command:  
`configdc logging -tracing off`
  - Restart IIS and .NET applications.

- To disable trace logs for the BCI engine:
  - Go to the following path:  
`<APM_HOME>\qe\config`
  - In a text editor, open the `dotNetDcConfig.properties.inactive` file.
  - For the **bci\_dc.trace.logging** property, specify the value as `off`.
  - Run the following command:  
**configdc activateconfig**
  - Restart IIS and .NET applications.

## Supporting .NET Core Applications Monitoring

The agent now supports .NET Core Applications monitoring.

### .NET Core Applications monitoring

The Microsoft .NET agent supports monitoring that meets the following criteria:

- .NET Core applications that are hosted in IIS only.
 

**Note:** The Microsoft .NET agent does not monitor .NET Core applications that are hosted outside of IIS and Desktop Core applications.
- .NET framework WCF service and database calls when the WCF service that contains the database calls is invoked from .NET Core applications.
- .NET Core applications that are developed on .NET framework platform.

### Limitations

- The following database attribute groups are not supported:
  - `KQE_DATABASE_CALL_DETAILS`
  - `KQE_DATABASE_CALL_SUMMARY`
- Since .NET Core does not support WCF applications, the Microsoft .NET agent does not support the two related attribute groups `KQE_WCF_OPERATION_LEVEL_DATA` and `KQE_SERVICE_MODEL_SERVICE_FILTER`.

## Enabling Support for .NET Core Applications Monitoring

You must enable the .NET Core applications for monitoring.

### Before you begin

- Ensure Microsoft .NET Core 3.1.2 Windows Server Hosting Bundle is installed on agent machine.
- Ensure the .NET Core applications that are going to be hosted in IIS are published in self-contained mode. If you are publishing the application in framework dependent mode, ensure the required supported version of .NET Core Runtime is installed on the agent machine.

**Tip:** If the version of .NET Core application is 3.1 and it is published in framework dependent mode, the .NET Core Runtime 3.1 should be installed on agent machine.

#### Note:

- Supported .NET Core applications versions: 2.1, 2.2, 3.1.
- Configuration is not required to retrieve resource monitoring data for .NET Core applications.

**Important:** Ensure the following configuration for .NET monitoring are completed:

- [“Permissions to run an agent by using a local or domain account” on page 617](#)
- [“Registering the data collector” on page 618](#)

- [“Using the IIS Response Time module of the .NET agent” on page 619](#)
- [“Enabling collection of transaction tracking and diagnostics data” on page 621](#)
- [“Enabling the collection of diagnostics data by using the configdc command” on page 622](#)
- [“Activating the configuration updates” on page 623](#)

### About this task

After installation and registering the required modules, perform the following steps for agent to retrieve the transaction tracking and diagnostic data for .NET Core applications.

### Procedure

1. Select your application in **IIS**.
2. Navigate to the **Modules** section.
3. Double click the **NetdcHttpModule**.
4. Uncheck the box **Invoke only for requests to ASP.NET applications or managed handlers**.
5. Double click the **NetdcRTModule**.
6. Uncheck the box **Invoke only for requests to ASP.NET applications or managed handlers** to get response time data.
7. Restart application and browse your application again.

### Disabling Modules for .NET Core Applications

You need to revert the modules to its original state for each .NET Core application. You can unregister the modules, if necessary.

### About this task

To revert the modules to its original state for each .NET Core application and then unregister them, perform the following steps.

### Procedure

1. Select your application in **IIS**.
2. Navigate to the **Modules** section.
3. Right-click **NetdcHttpModule** of the .NET core application and click **Revert to Parent**.
4. Right-click **NetdcRTModule** of the .NET core application and click **Revert to Parent**.
5. Unregister all modules by using the following command:

```
configdc unregisterdc all
```

6. Unregister the module by using the following command:

```
configdc unregisterdc rtmodule
```

## Configuring Microsoft Office 365 monitoring

You must configure the Microsoft Office 365 agent to monitor the availability and performance of Microsoft Office 365 subscriptions of the organization.

### Before you begin

- Review the hardware and software prerequisites.
- To collect data for Office 365 users, the following modules must be installed on the Windows client where the agent is installed:

- PowerShell 3.0 or later
- Microsoft Online Services Sign-In Assistant PowerShell
- SharePoint Online Management Shell
- DotNetFrameworkVersion 4.5.2 or later

A user, who configures the agent, must have administrative privileges along with privileges to enable the remote execution policy of PowerShell.

- Ensure that the user, who starts the Microsoft Office 365, has administrator privileges. Use an existing user with administrator privileges, or create a new user. Assign administrator privileges to the new user by adding the new user to the Administrators group.

Review hardware and software prerequisites. For the up-to-date system requirement information, see the [Software Product Compatibility Reports \(SPCR\) for the Microsoft Office 365 agent](#).

## About this task

The product version and the agent version often differ. The directions here are for the most current release of this agent. For more information about how to check the version of an agent in your environment, see [Microsoft Office 365 agent](#). To access the documentation for V1.0.0, see the [IBM Cloud Application Performance Management Knowledge Center](#).

You can start the Microsoft Office 365 agent after the agent is installed. However, manual configuration is required to view data for all the agent attributes.

To configure the agent, you can either use the IBM Cloud Application Performance Management window or the silent response file.

## Verifying reachability of configured users

To verify reachability, the Microsoft Office 365 agent sends an email message to the configured users, and measures the amount of time to receive an automated response. Before you start the agent, you must configure all the users, which are configured in the Office 365 agent mailbox reachability setting, to automatically respond to email messages.

### Before you begin

Before you configure the Exchange Online users for reachability, ensure that the following tasks are completed:

- A mailbox is created for each user on the Exchange Online that you want to monitor.
- The user that you created for the agent is a global Office 365 user.

### Procedure

Complete the following steps for each Exchange Online user account for which you want to verify reachability:

1. Log in to Microsoft Outlook by specifying credentials of the user that you created.
2. Click **Tools > Rules and Alerts > New Rule**.
3. In the **Rules wizard** window, under **Start from a blank rule**, click **Apply rule on messages I receive** and click **Next**.
4. Select the following options:
  - **From people or public group**
  - **With specific words in the subject**
5. Under **Step 2** in the window, click **people or public group**.
6. In the **Rule address** window, select the user (global administrator) from which the messages are to be received and click **Next**.
7. Under **Step 2** in the window, click **Specific words**.

8. In the **Specify words or phrases to search for in the subject or body** field, type Test Reachability.
9. Click **Add**.
10. Click **OK** and then click **Next**.
11. Select **Have the server reply using a specific message** and click **a specific message**.
12. In the email message editor, type the following text in the subject field of the message:  
Test Reachability.
13. In the **To** list, add the global administrator.
14. Close the email message editor and click **Yes** to save these changes.
15. Click **Finish**.
16. Click **Apply** and then click **OK**.

### What to do next

Configure the Microsoft Office 365 agent.

For help with troubleshooting, see the [Troubleshooting](#) section.

## Configuring the agent on Windows systems

You can configure the Microsoft Office 365 agent on Windows operating systems by using the IBM Cloud Application Performance Management window. After you update the configuration values, you must start the agent to save the updated values.

### About this task

You can configure the agent when the agent is running or stopped. The agent remains in the same state after configuration. For example, if the agent is running, it remains in the running state after configuration.

The Microsoft Office 365 agent provides default values for some parameters. You can specify different values for these parameters.

### Procedure

1. Click **Start > All Programs > IBM Monitoring agents > IBM Performance Management**.
2. In the **IBM Performance Management** window, right-click **Monitoring Agent for Microsoft Office 365**, and click **Configure Agent**.
3. In the **Monitoring Agent for Microsoft Office 365** window, complete the following steps:
  - a) On the **Office365 Subscription Details** tab, enter the user name and password of the Office 365 global administrator, and click **Next**.
  - b) On the **Mailbox Reachability Monitoring** tab, enter the list of email addresses that are delimited by semicolons in the **Reachability Email Addresses** field.
  - c) On the **Mailbox and OneDrive Usage Monitoring** tab, select the duration for the collection interval in hours from the **Collection Interval** list,, and click **Next**.
4. In the **Monitoring Agent for Microsoft Office 365** window, click **Yes**.

### What to do next

- Change the user account from the local user to the domain user. For details, see [“Changing the user account”](#) on page 631.
- Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console”](#) on page 1109.
- For help with troubleshooting, see the [Troubleshooting](#) section.

## Configuring the agent by using the silent response file

When you install the Microsoft Office 365 agent, the agent must be configured and started manually after providing the configuration settings. Use the silent response file to configure the custom settings.

### Before you begin

Edit the response file to modify the following default configuration settings:

#### **KMO\_USER\_NAME**

The user name of the Office 365 global administrator.

#### **KMO\_PASSWORD**

The password of the Office 365 global administrator.

#### **KMO\_MAIL\_ADDRESSES1**

A list of email addresses to be targeted for verifying mailbox reachability. The list of email addresses must be delimited using semicolons.

#### **KMO\_DATA\_COLLECTION\_DURATION**

The duration (in hours) for which the agent waits before fetching the mailbox and OneDrive usage data.

The response file is available at the following location:

<CANDLEHOME>\samples

### About this task

You can configure the agent when the agent is running or stopped. The agent remains in the same state after configuration. For example, if the agent is running, it remains in the running state after configuration.

### Procedure

To configure the Microsoft Office 365 agent, complete the following steps:

1. On the command prompt, change the path to the directory that contains the `microsoft_office365-agent.bat` file.
2. Enter the following command: `microsoft_office365-agent.bat absolute path to the response file`.

The response file contains the following parameters:

3. If the agent is in the stopped state, start the agent.

### What to do next

- Change the user account from the local user to the domain user. For details, see [“Changing the user account”](#) on page 631.
- Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console”](#) on page 1109.
- For help with troubleshooting, see the [Troubleshooting](#) section.

## Changing the user account

After you configure the Microsoft Office 365 agent, change the user account from the local user to the domain user.

### About this task

By default, the Microsoft Office 365 agent runs under the local user account.

## Procedure

1. Run the following command to verify which user ID is being used for starting the agent:  
**install\_dir\InstallITM\KinCinfo.exe -r**
2. If the monitoring agent was started with a user ID that does not belong to the Administrator group, stop the agent.
3. Open the **Manage Monitoring Services** window.
4. In the **Manage Monitoring Services** window, right-click the agent instance, and click **Change Startup**.
5. Specify the fully qualified user ID as <Domain\User ID>, and then specify the password.
6. Start the Microsoft Office 365 agent.

## Validating and granting access to the user

To safeguard against unauthorized access to the MS Office 365 application that the agent monitors, you need to validate the user and grant access to the MS Office 365 application.

### Before you begin

Ensure that the user, who starts Microsoft Office 365, has the subscription ID and administrator rights.

### About this task

You can validate the user and grant application access by adding the following user details to the agent configuration file:

- Tenant ID
- Client ID
- Secret ID

## Procedure

To validate and grant access to the user, follow these steps:

1. Log in to Microsoft Office 365 by specifying your subscription credentials.
2. Click Microsoft 365 admin center. The Microsoft 365 admin center page opens.
3. In the left pane, click **Azure Active Directory**. The Azure Active Directory admin center page opens.
4. Click **App registration**.
5. Click **New registration** and enter any name of the application, for example, Office365API, and select the **Supported account type** and click **Register**.  
After registration, you will get the Application (client) ID and Directory (tenant) ID.
6. To generate the secret key, click **Certificates & Secrets > New Client Secret**. The Add a client secret window opens.
7. Enter the **Description** name, select **Expires** option as **Never**, and click **Add**. You get a Secret key. Copy the secret key for user configuration as it is stored in the encrypted format later.
8. To give permissions to access the API, click **API permissions > Add a permission > Office 365 Management APIs**, and select **Application permissions**.  
**Note:** Applications are authorized to call APIs when they are granted permissions by users or administrators as part of the consent process.
9. Select the required permission and click **Add permissions**.
10. To provide grant admin for APIs, click **Grant admin consent**.
11. Click **Yes** when you see the status as Granted for domain.
12. To add user details, such as Client ID, Tenant ID, and Secret ID to the configuration file, follow these steps:
  - a) Go to the agent installer folder, for example, <APM Home\TMAITM6\_x64.

- b) In the installer folder, open the kmoOffice365CDP.exe.config file and add the Client ID, Tenant ID, and Secret ID values that are generated from the Azure portal as mentioned in steps 1 - 8.

For example,

```
<add key="Office365ServiceAPIConnectionServiceUrl" value="https://manage.office.com/api/v1.0/#TenantID#/ServiceComms" />
<add key="AuthURL" value="https://login.microsoftonline.com/#TenantID#/oauth2/v2.0/token"/>
<add key="Client_id" value="702ce315-f8dd-4775-91d9-c7c7ec376835"/>
<add key="Client_secret" value="42_mW-xp-2xLkv~2dH8sDj6.wURkaok0re"/>
```

13. Save the kmoOffice365CDP.exe.config file.
14. If the user has multi-factor authentication (MFA), then skip the authentication by disabling the second-level (Mobile/ App) authentication from the Azure portal. To disable the second-level authentication, follow these steps:
  - a) Go to Microsoft 365 admin center.
  - b) Click **Azure Active Directory > Properties > Manage Security default > Enable Security defaults**.
  - c) Select **No**, and click **Save**.
15. Reconfigure the agent.

## Configuring local environment variables

You can configure local environment variables to change the behavior of the Microsoft Office 365 agent.

### Procedure

1. Click **Start > All Programs > IBM Monitoring agents > IBM Performance Management**.
2. In the **IBM Performance Management** window, from the **Actions** menu, click **Advanced > Edit ENV File**.
3. In the environment variable file, enter the values for the environment variables.

For more information about the environment variables that you can configure, see [“Local environment variables” on page 633](#).

### Local environment variables

You can change the behavior of the Microsoft Office 365 agent by configuring the local environment variables.

### Variables for defining the data collection method for the agent

To set the method for data collection of the agent, use the following environment variables:

- **CDP\_DP\_INITIAL\_COLLECTION\_DELAY**: Use this variable to set the time interval (in seconds) after which the thread pool begins its data collection.
- **KMO\_MAILBOX\_REACHABILITY\_INTERVAL**: Use this variable to set the data collection interval (in minutes) for mailbox reachability attribute group.
- **KMO\_SKYPE\_REPORT\_INTERVAL**: Use this variable to set the data collection interval (in hours) for Skype for Business usage statistics feature.
- **KMO\_SERVICE\_API\_INTERVAL**: Use this variable to set the data collection interval (in minutes) for Office 365 service health feature.
- **KMO\_NETWORK\_CONNECTION\_INTERVAL**: Use this variable to set the data collection interval (in minutes) for internet connectivity feature.
- **KMO\_NETWORK\_PERFORMANCE\_INTERVAL**: Use this variable to set the data collection interval (in minutes) for Office 365 services network performance feature.

- **KMO\_SITE\_CONNECTION\_INTERVAL**: Use this variable to set the data collection interval (in minutes) for Office 365 connectivity feature.
- **KMO\_SPSITE\_COLLECTION\_INTERVAL**: Use this variable to set the data collection interval (in minutes) for SharePoint Sites details feature.
- **KMO\_UASGE\_STATS\_INTERVAL**: Use this variable to set the data collection interval (in hours) for Office 365 Services usage and user statistics feature.
- **KMO\_TENANT\_INTERVAL**: Use this variable to set the data collection interval (in minutes) for Office 365 tenant details feature.
- **KMO\_ONEDRIVE\_CONNECTIVITY\_INTERVAL**: Use this variable to set the data collection interval (in minutes) for Office 365 OneDrive connectivity feature.
- **KMO\_TENANT\_DOMAIN**: Use this variable to set the domain name of the tenant.

## Configuring Microsoft SharePoint Server monitoring

When you install the Monitoring Agent for Microsoft SharePoint Server, the agent is automatically configured and started with the default configuration settings. Use the silent response file to modify the default configuration settings.

### Before you begin

Ensure that you complete the following tasks:

- Ensure that the user, who connects to the Microsoft SharePoint Server environment or application, has administrator privileges. Use an existing user with administrator privileges, or create a new user. Assign administrator privileges to the new user by adding the new user to the Administrators group.

**Remember:** To configure the Microsoft SharePoint Server agent, you can use a local or a domain user provided that the user has administrator privileges.

- Edit the response file and modify the default configuration parameters.

The response file contains the following parameters:

#### **KQP\_DB\_User**

The user ID of the database.

#### **KQP\_DB\_Password**

The password of the database.

Review hardware and software prerequisites. For the up-to-date system requirement information, see the [Software Product Compatibility Reports \(SPCR\) for the Microsoft SharePoint Server agent](#).

The product version and the agent version often differ. The directions here are for the most current release of this agent. For information about how to check the version of an agent in your environment, see [Agent version](#). To access the documentation for earlier agent releases, see the following table:

| Table 206. Agent versions and documentation |                                                                                                                        |
|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------|
| Microsoft SharePoint Server agent version   | Documentation                                                                                                          |
| 06.31.09.00, 06.31.10.00                    | <a href="#">IBM Cloud Application Performance Management</a>                                                           |
| 06.31.09.00                                 | <a href="#">IBM Performance Management 8.1.3</a><br><b>Note:</b> The link opens an on-premises Knowledge Center topic. |
| 06.31.07.00                                 | <a href="#">IBM Performance Management 8.1.2</a><br><b>Note:</b> The link opens an on-premises Knowledge Center topic. |

## Procedure

To configure the Microsoft SharePoint Server agent, complete the following steps:

1. Open the command prompt.
2. Change the path to the directory that contains the `ms_sharepoint_server-agent.bat` file.
3. Enter the following command: **ms\_sharepoint\_server-agent.bat config** *absolute path to the response file*
4. If the agent is in the stopped state, start the agent.

## What to do next

After you configure the agent, you can change the user account from the local user to the domain user. For steps to change the user account, see [“Changing the user account” on page 635](#).

## Changing the user account

After you configure the Microsoft SharePoint Server agent, you can change the user account from the local user to the domain user.

### About this task

With the domain user, the agent can monitor all the components of the Microsoft SharePoint Server agent.

## Procedure

To change the user account, complete the following steps:

1. Run the following command to verify which user ID is being used for starting the agent.  
**install\_dir\InstallITM\KinCinfo.exe -r**
2. If the monitoring agent was started with a user ID that does not belong to the Administrator group, stop the agent.
3. Open the **Manage Monitoring Services** window.
4. Right-click the agent instance, and click **Change Startup**.
5. Specify the fully qualified user ID as <Domain\Userid>, and then specify the password.
6. Start the monitoring agent.

## What to do next

Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

## Running Monitoring Agent for Microsoft SharePoint Server by a non-admin user

Local security policies are available to run a Monitoring Agent for Microsoft SharePoint Server by a non-admin user.

### About this task

A combination of following two local security policies works to run the Microsoft SharePoint Server agent by a non-admin-user.

1. Debug Programs.
2. Log on as Service.

Follow the procedure that is given to avail the Local Security permissions for a non-administrator user.

## Procedure

1. Go to TEMA and change the Microsoft SharePoint Server agent startup with non-admin user.
2. Add non-admin user under Registry key HKEY\_LOCAL\_MACHINE\SOFTWARE\Microsoft\Office Server directory and give read access to it.
3. Add non-admin user under Registry key HKEY\_LOCAL\_MACHINE\SOFTWARE\Microsoft\Shared Tools\Web Server Extensions and give read access to it.
4. Add non-admin user manually under Registry key HKEY\_LOCAL\_MACHINE\SOFTWARE\Microsoft\Shared Tools\Web Server Extensions\16.0\Secure\ and give read access to it.
5. Add non-admin user under Registry key HKEY\_LOCAL\_MACHINE\SOFTWARE\IBMMonitoring directory and give full permissions to it.
6. Add non-admin user under Registry key HKEY\_LOCAL\_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Perflib directory and give read access to it.
7. Add non-admin user in SharePoint Agent installation folder (Candle folder for example, C:\IBM\APM) and give full permissions to it.
8. Run the **secpol.msc** command in **startmenu** to open the **Local Security Policy**.
9. Add non-admin user in Local Security Policy refer [“Local Security Policy permissions” on page 636](#)
10. Add non-admin user in the SQL Server Login user group. The user must have sysadmin SQL Server role permissions on the SQL Server.
11. Restart the Microsoft SharePoint Server agent.
12. Check Microsoft SharePoint Server agent status and Verify the data on APM portal.
13. The following attribute groups show data for users who are members of the Administrators group.
  - a) Availability
  - b) Web Service

## Local Security Policy permissions

Local security policies are available to run a Microsoft SharePoint Server agent by a non-admin user. These policies help to start or stop, configure, and do data verification of the agent. Following two local security policies work to run the Microsoft SharePoint Server agent by a non-admin-user.

### Granting Log on as Service permission

You can grant the Log-on as service permission.

### About this task

To grant the Log-on as service permission, follow the procedure on Microsoft SharePoint Server agent as described here.

## Procedure

1. Click **Start > Administrative Tools > Local Security Policy**. The **Local Security Settings** window opens.
2. In the navigation pane, expand **Local Policy** and click **User Rights Assignment**. The list of user rights opens.
3. Double-click **Log-on as service** policy. The **Log-on as service Properties** window opens.
4. Click **Add User or Group**. The **Select Users or Groups** window opens.
5. In the **Enter the object names to select** field, enter the user account name to whom you want to assign permissions, and then click **OK**.
6. Click **OK**.

## Granting Debug Programs permission

You can grant the Debug Programs permission.

### About this task

To grant the Debug Programs permission, follow the procedure on Microsoft SharePoint Server agent as described here:

### Procedure

1. Click **Start > Administrative Tools > Local Security Policy**. The **Local Security Settings** window opens.
2. Expand **Local Policy** and click **User Rights Assignment**. The list of user rights opens.
3. Double-click **Debug Programs** policy. The **Debug Programs Properties** window opens.
4. Click **Add User or Group**. The **Select Users or Groups** window opens.
5. In the Enter the object names to select field, enter the user account name to whom you want to assign permissions, and then click **OK**.
6. Click **OK**.

## Configuring Microsoft SQL Server monitoring

---

You must configure the Monitoring Agent for Microsoft SQL Server so that the agent can collect data from the application that is being monitored.

### Before you begin

Review the hardware and software prerequisites. For the up-to-date system requirement information, see the [Software Product Compatibility Reports \(SPCR\)](#) for the Microsoft SQL Server agent.

You can install and configure the Microsoft SQL Server agent locally by using the command prompt interface. Ensure that the agent is installed on the server that is being monitored.

### About this task

The directions here are for the most current release of this agent. For information about how to check the version of an agent in your environment, see [Agent version command](#). For detailed information about the agent version list and what's new for each version, see ["Change history" on page 58](#).

The Microsoft SQL Server agent is a multiple instance agent; you must configure and start each agent instance manually.

- To configure the agent, complete the following tasks:
  - Create a user and grant the required permissions
  - Select the databases for monitoring
  - Configure the local environment variables
- To run the agent in a cluster environment, complete the steps that are described in the "Running the agent in a cluster environment" topic.

## Creating a user and granting permissions

On the Microsoft SQL Server, you must create a user under which the agent runs, and grant permissions to the user for monitoring Microsoft SQL Server. The process of granting permissions is the same for Microsoft SQL Server 2005, or later.

### Before you begin

Install the Microsoft SQL Server agent. To create a user and grant permissions to the user, you must be a database administrator with the sysdamin authorization role.

### About this task

Use the following procedure to determine if an existing SQL Server user has sufficient permissions to monitor Microsoft SQL Server:

- **Windows** [“Checking the permissions of an existing SQL Server user” on page 638](#)

Use one of the following procedures to create a user:

- **Windows** [“Creating a SQL Server user ID with Windows authentication” on page 639](#)
- **Windows** **Linux** [“Creating a SQL Server user ID with SQL Server authentication” on page 640](#)

Use the following procedure to grant permissions:

- **Windows** [“Granting minimum permissions for data collection” on page 640](#)
- **Windows** [“Granting permission to the Perflib registry key for collecting data for few data sets” on page 642](#)

### Checking the permissions of an existing SQL Server user

**Windows** You can run the utility tool **koqVerifyPerminssions.exe** to check if an existing SQL Server user has sufficient permissions related to SQL Server databases.

### About this task

The utility tool **koqVerifyPerminssions.exe** returns the message PASS if the user has **sysadmin** role or the minimum required permissions. The detailed checking result is logged in **koqVerifyPermissions\_log**.

The following lists the minimum permissions:

- Permissions for server must include **View server state**, **Control server** and **View any definition**.  
These server level permissions are mandatory.
- For all system databases and the user-defined databases for monitoring, the database role membership must include **public** and **db\_owner**.

The **db\_owner** permission is required to collect data for the following data sets:

- Server Details data set
- Database Summary data set
- Database Details data set
- Database Mirroring data set
- Server Summary data set
- Job Summary data set
- Job Detail data set
- Availability Replicas Details In Cluster data set

- For **msdb** database, the database role membership must include **public**, **db\_owner**, **db\_datareader**, **SQLAgentReaderRole** and **SQLAgentUserRole**. These permissions are required for Job Details data set.

## Procedure

1. Launch the command prompt and change to the following utility directory.
  - For 64-bits agents, *Agent\_home*\TMAITM6\_x64
  - For 32-bits agents, *Agent\_home* \TMAITM6
 where *Agent\_home* is the agent installation directory.
2. Run the **koqVerifyPerminssions.exe** by providing the parameters:

```
koqVerifyPermissions.exe -S Instance_name -U Username -P Password
```

Where:

- *Instance\_name* is the SQL Server instance name.
- *Username* is the user name that is verified by the utility tool.
- *Password* is the password of the user. This parameter is required if *username* is provided.

**Note:** If the *username* and the *password* are not provided, the default user that is logon to the system is used. Example: NT AUTHORITY\SYSTEM.

## Results

The detailed checking result is available in *koqVerifyPermissions\_log* at the following directory:

- For 64-bits agents, *Agent\_home*\TMAITM6\_x64\logs
- For 32-bits agents, *Agent\_home* \TMAITM6\logs

Where *Agent\_home* is the agent installation directory.

## Creating a SQL Server user ID with Windows authentication

**Windows** Create a new user with the Windows authentication and assign the required roles and permissions to the user.

## Procedure

To create a user, complete the following steps:

1. In the **SQL Server Management Studio**, open **Object Explorer**.
  2. Click **Server\_instance\_name > Security > Logins**.
  3. Right-click **Logins** and select **New Login**.
  4. On the **General** page, in the **Login name** field, type the name of a Windows user.
  5. Select **Windows authentication**.
  6. Depending on the role and permissions that you want to assign to this user, complete one of the following tasks:
    - On the Server Roles page, assign the *sysadmin* role to the new login ID.
    - If you do not want to assign the *sysadmin* role to the user, grant minimum permissions to the user by completing the steps that are mentioned in [“Granting minimum permissions for data collection”](#) on page 640.
- Important:** By default, the *public* role is assigned to the new login ID.
7. Click **OK**.

## Results

A user is created with the default *public* role and the permissions that you assigned, and is displayed in the **Logins** list.

## Creating a SQL Server user ID with SQL Server authentication

**Windows** **Linux** Create a new user with the SQL Server authentication and assign the required roles and permissions to the user.

### Procedure

To create a user, complete the following steps:

1. In the **SQL Server Management Studio**, open **Object Explorer**.
2. Click **Server\_instance\_name > Security > Logins**.
3. Right-click **Logins** and select **New Login**.
4. On the **General** page, in the **Login name** field, type the name for a new user.
5. Select **SQL Server authentication**.
6. In the **Password** field, type a password for the user.
7. In the **Confirm Password** field, retype the password that you entered in the **Password** field.
8. Depending on the role and permissions that you want to assign to this user, complete one of the following tasks:
  - On the **Server Roles** page, assign the *sysadmin* role to the new login ID.
  - If you do not want to assign the *sysadmin* role to the user, grant minimum permissions to the user by completing the steps that are mentioned in [“Granting minimum permissions for data collection”](#) on page 640.

**Important:** By default, the *public* role is assigned to the new login ID.

9. Click **OK**.

## Results

A user is created with the default *public* role and the permissions that you assigned, and is displayed in the **Logins** list.

## Granting minimum permissions for data collection

**Windows** Apart from the default **public** role, you can assign the **sysadmin** role to a user or grant the minimum permissions to a user so that the agent can collect data for data sets.

### About this task

You can grant the permissions via user interface or the utility tool **permissions.cmd**.

### Procedure

- To grant the minimum permissions to the user via the user interface, complete these steps:
  - a) Open the **Server Roles** page and verify that the **public** check box is selected.
  - b) Open the **User Mapping** page and then select following checkbox for master database.
    - **public**
    - **db\_owner**
  - c) Additionally, on the **User Mapping** page, select the following check boxes for all the system databases and the user-defined databases which you want to monitor:
    - **public**

- **db\_owner**

For the **msdb** database, select the following additional check boxes:

- **public**
- **db\_owner**
- **db\_datareader**
- **SQLAgentReaderRole**
- **SQLAgentUserRole**

- d) Open the **Securables** page, and then select the following check boxes for the server instance that you are monitoring:
  - view any definition
  - view server state
  - control server
- To grant the minimum permissions to the user by using the utility tool **permissions.cmd**, complete the following:
  - a) Launch the Windows Explorer and browse to the utility tool directory *Agent\_grant\_perm\_dir*:
    - For 64-bits agent, *Agent\_grant\_perm\_dir* is *Agent\_home\TMAITM6\_x64\scripts\KOQ\GrantPermission*.
    - For 32-bits agent, *Agent\_grant\_perm\_dir* is *Agent\_home\TMAITM6\scripts\KOQ\GrantPermission*.
    - *Agent\_home* is the agent installation directory.

**Attention:** The utility tool **permissions.cmd** grants **db\_owner** on all databases by default. To exclude certain databases, you must add the database names in the *Agent\_grant\_perm\_dir\exclude\_database.txt* file. The database names must be separated by the symbol alias @.

**Tip:** For example, you want to exclude the databases **MyDatabase1** and **MyDatabase2**, add the following entry in the *exclude\_database.txt* file:

```
MyDatabase1@MyDatabase2
```

- b) Double click **permissions.cmd** to launch the utility tool.
- c) Enter the intended parameter values when prompted:

| Table 207. Parameters                                                                                                                                                                                                   |                                                                                                                         |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| Parameters                                                                                                                                                                                                              | Description                                                                                                             |
| SQL Server name or SQL Server instance name                                                                                                                                                                             | Enter the target SQL Server name or the target SQL Server instance name that you want to grant permissions to the user. |
| The existing SQL Server user's logon name                                                                                                                                                                               | Enter the user name whose permissions will be altered.                                                                  |
| Permissions options:<br><b>1</b> Grant <b>db_owner</b> permission<br><b>2</b> Grant <b>db_datareader</b> , <b>SQLAgentReaderRole</b> and <b>SQLAgentUserRole</b> permissions<br><b>3</b> Grant all required permissions | Enter <b>1</b> or <b>2</b> or <b>3</b> according to your requirement.                                                   |

| Table 207. Parameters (continued)                                                                                 |                                                                                                                                                                                      |
|-------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Parameters                                                                                                        | Description                                                                                                                                                                          |
| The user to grant permissions:<br><b>1</b> The user who is currently logon to the system<br><b>2</b> Another user | Enter <b>1</b> or <b>2</b> .<br>If <b>2</b> is select, enter the target user name when prompted.<br><br><b>Note:</b> The users must have access to grant permissions to other users. |

## What to do next

Configure the agent.

## Granting permission to the Perflib registry key for collecting data for few data sets

**Windows** To collect data for few date sets, you need to grant users read access to the Perflib registry key.

### About this task

You need to grant this permission to the Windows user with which agent services are configured. There are many data sets that are affected in absence of Perflib permissions like MS SQL Database Detail, MS SQL Memory Manager, MS SQL Lock Resource Type Summary, MS SQL Job Summary, MS SQL Server Transactions Summary, MS SQL Server Summary, and so on.

### Procedure

To grant permission to the Perflib registry key, complete these steps:

1. To open Registry Editor, click **Start > Run > Regedit.exe**, and press **Enter**.
2. Go to the HKEY\_LOCAL\_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Perflib registry key.
3. Right-click the **Perflib** key, and click **Permissions**.
4. Click **Add**, enter the windows user name with which the agent is installed and configured, and then click **OK**.
5. Click the user that you added.
6. Allow read access to the user by selecting the check box.
7. Click **Apply**, and then click **OK**.

## Local environment variables

You can change the behavior of the Microsoft SQL Server agent by configuring the local environment variables.

### Variables for checking availability of the SQL Server service

To check the availability of the SQL Server service, use the following environment variables:

- **COLL\_MSSQL\_RETRY\_INTERVAL**: This variable provides the retry interval (in minutes) to check the SQL Server service status. If the value is less than or equal to zero, then the variable takes the default value of 1 minute.
- **COLL\_MSSQL\_RETRY\_CNT**: This variable provides the number of retries that the SQL Server agent makes to check whether the SQL Server service is started or not. If the SQL Server service is not started after the number of retries that are specified in this variable, then collector stops working. If the value of the variable is less than or equal to zero, then the variable takes the default value of 3.

## Variables for monitoring the SQL Server error log file

To monitor the MS SQL Error Event Details data set, use the following environment variables:

- **COLL\_ERRORLOG\_STARTUP\_MAX\_TIME**: This variable provides the time interval (T) for error collection before the agent starts. The default value is 0 minutes. This variable can take the following values:

### **T = 0**

The agent starts monitoring the error log file from the time the agent starts or is restarted. The agent does not read the errors that were logged in the error log file before the agent was started.

### **T = 1**

The agent monitors the error log file according to the following values that are set for the **COLL\_ERRORLOG\_STARTUP\_MAX\_EVENT\_ROW** variable, which is represented by R:

- If  $R < 0$ , the agent starts monitoring the error log file from the time the agent starts or is restarted.
- If  $R = 1$ , the agent monitors all the errors that are logged in the error log file.
- If  $R > 1$  and the agent is installed for the first time, the agent monitors the error log file until R errors are monitored. If  $R > 1$  and the agent is restarted, the agent monitors all the previously missed R errors.

### **T > 1**

The agent monitors all previous errors that were logged up to T minutes from the time that the agent starts or restarts. The agent monitoring also depends on the following values that you set for the **COLL\_ERRORLOG\_STARTUP\_MAX\_EVENT\_ROW** variable:

- If  $R \leq 0$ , the agent starts monitoring the error log file from the time the agent is started or the agent is restarted.
- If  $R = 1$ , the agent monitors the error log file for all the errors that are logged up to T minutes.
- If  $R > 1$ , the agent does not monitor more than R errors that are logged in last T minutes.

- **COLL\_ERRORLOG\_STARTUP\_MAX\_EVENT\_ROW**: This variable provides the maximum number of errors that must be processed when the agent starts. The default value is 0. You can assign following values to this variable:

### **R = 0**

The agent starts monitoring the error log file from the time that the agent starts or restarts. The agent does not read errors that were created in the error log file before the agent was started.

### **R = 1**

The agent monitors the errors that were logged in the last T minutes from the time that the agent starts or restarts.

### **R > 1**

The agent monitors R errors that are logged in the last T minutes.

- **COLL\_ERRORLOG\_MAX\_EVENT\_ROW**: This variable provides the number of error rows. The default value is 50. You can assign following values to this variable:

### **X = 0**

The agent does not display the error logs.

### **X > 0**

The agent displays the X error rows.

- **COLL\_ERRORLOG\_RECYCLE\_WAIT**: This variable provides the time interval (in seconds) for which the Microsoft SQL Server agent waits before collecting data of the MS SQL Error Event Detail attribute group when the situation on this attribute group is triggered. You can assign a value to this variable in the range of 1 to 30. If the value of this variable is less than zero, then the variable takes the default value of zero (seconds). If the value of this variable is greater than 30, then the variable takes the default value of 30 (seconds).

## Variable for setting the query timeout interval

To set the query timeout interval for the SQL Server agent, use the following environment variables:

- **QUERY\_TIMEOUT:** This environment variable defines the maximum amount of time (in seconds) that the SQL Server agent waits to receive a response for a query that is sent to the SQL Server. The value for this variable must be less than 45 seconds. However, if you set the value for this variable as 0 seconds, the SQL Server agent waits indefinitely to receive a response from the SQL Server. If the SQL Server agent accesses many locked databases, you must assign the value to this variable in the range of 10 - 20 seconds. If the query is not processed within the set timeout interval, the SQL Server agent skips the timed out query and moves to the next query in the queue. The agent does not display data for the query that timed out.
- **QUERY\_THREAD\_TIMEOUT:** This environment variable defines the maximum amount of time (in seconds) that the SQL Server agent waits to receive a response for a query that is sent to the SQL Server. This environment variable is applicable for few attribute groups that uses threaded collection. For example, KOQDBD, KOQTBLD, KOQDEVD, and so on. The value for this variable does not have any limit unlike QUERY\_TIMEOUT variable. Otherwise, it works similar to QUERY\_TIMEOUT variable.

## Variable for viewing information about the enabled jobs

To view the information about enabled jobs in the MS SQL Job Detail data set, use the **COLL\_JOB\_DISABLED** environment variable. If you set the value of this variable as 1, the Microsoft SQL Server agent does not display information about disabled jobs. If you do not specify this variable, you can view information that is about enabled and disabled jobs.

## Variable for limiting the rows in the MS SQL Filegroup Detail data set

To limit the number of rows that the collector service fetches for the MS SQL Filegroup Detail data set, use the **COLL\_KOQFGRPD\_MAX\_ROW** environment variable. This environment variable defines the maximum number of rows that the collector service fetches for the Filegroup Detail data set. If you do not specify a value for this variable, the collector service fetches 10,000 rows for the Filegroup Detail data set. Use this environment variable to modify the default limit of maximum rows in the `koqcoll.ctl` file. Complete the following steps to modify the default limit:

1. Specify the maximum number of rows for KOQFGRPD in the `koqcoll.ctl` file.
2. Add the **COLL\_KOQFGRPD\_MAX\_ROW** environment variable, and ensure that the value of this variable is the same as the value that you have specified in the `koqcoll.ctl` file.

If the value in the `koqcoll.ctl` file is less than the value that is specified in the **COLL\_KOQFGRPD\_MAX\_ROW** environment variable, the value in the `koqcoll.ctl` file is treated as the value for the maximum number of rows.

If the value in the `koqcoll.ctl` file is greater than the value that is specified in the **COLL\_KOQFGRPD\_MAX\_ROW** environment variable, the value in the **COLL\_KOQFGRPD\_MAX\_ROW** environment variable is treated as the value for the maximum number of rows.

## Variables for enhancing the collection for the MS SQL Filegroup Detail data set

Use the **COLL\_DBD\_FRENAME\_RETRY\_CNT** variable to specify the number of attempts that can be made to move the `%COLL_HOME%\tmp_%COLL_VERSION%_%COLL_SERVERID%_%COLL_SERVERID%__FGRP_TEMP` file to the `%COLL_HOME%\tmp_%COLL_VERSION%_%COLL_SERVERID%_%COLL_SERVERID%__FGRP_PREV` file.

If you do not specify a value for this variable, the Microsoft SQL Server agent makes 3 attempts to move the file.

## Variable for limiting the rows in the MS SQL Device Detail data set

To limit the number of rows that the collector service fetches for the MS SQL Device Detail data set, use the **COLL\_KOQDEVD\_MAX\_ROW** environment variable. This environment variable defines the maximum number of rows that the collector service fetches for the Device Detail data set. If you do not specify a value for this variable, the collector service fetches 10,000 rows for the Device Detail data set. Use this

environment variable to modify the default limit of maximum rows in the `koqcoll.ctl` file. Complete the following steps to modify the default limit:

1. Specify the maximum number of rows for `KOQDEV`D in the `koqcoll.ctl` file.
2. Add the **`COLL_KOQDEV`D\_MAX\_ROW** environment variable, and ensure that the value of this variable is the same as the value that you have specified in the `koqcoll.ctl` file.

If the value in the `koqcoll.ctl` file is less than the value that is specified in the **`COLL_KOQDEV`D\_MAX\_ROW** environment variable, the value in the `koqcoll.ctl` file is treated as the value for the maximum number of rows.

If the value in the `koqcoll.ctl` file is greater than the value that is specified in the **`COLL_KOQDEV`D\_MAX\_ROW** environment variable, the value in the **`COLL_KOQDEV`D\_MAX\_ROW** environment variable is treated as the value for the maximum number of rows.

## Variables for enhancing the collection for the MS SQL Device Detail data set

To enhance the MS SQL Device Detail data set collection, use the following environment variables:

- **`COLL_KOQDEV`D\_INTERVAL**: This environment variable enables you to specify a time interval (in minutes) between two consecutive collections of the MS SQL Device Detail data set.

**Note:** By default, the data collection for the Device Detail data set is demand based. Use the **`COLL_KOQDEV`D\_INTERVAL** variable to start a thread based collection for the Device Detail data set and to set the time interval between two threaded collections.

- **`COLL_DBD_FRENAME_RETRY_CNT`**: Use this environment variable to specify the number of attempts that can be made to move the `%COLL_HOME%\tmp_%COLL_VERSION%_%COLL_SERVERID%_%COLL_SERVERID%__DEV`D\_TEMP file to the `%COLL_HOME%\tmp_%COLL_VERSION%_%COLL_SERVERID%_%COLL_SERVERID%__DEV`D\_PREV file.

If you do not specify a value for this variable, the Microsoft SQL Server agent makes 1 attempt to move the file.

## Variables for enhancing the collection for the MS SQL Database Detail data set

To enhance the MS SQL Database Detail data set collection, use the following environment variables:

- **`COLL_KOQD`BD\_INTERVAL**: Use this environment variable to specify a time interval (in minutes) between two consecutive thread-based collections of the MS SQL Database Detail data set. If you do not specify a value for this variable or the specified time interval is less than 3 minutes, then the Microsoft SQL Server agent defaults to 3 minutes interval. In case, the collection is taking more time or the data is frequently seen as NOT\_COLLECTED, then you can check the collection time by referring to the Database Detail Collection completed in %d seconds log and set the variable value to a value that is greater than the collection time specified in the log.
- **`COLL_DBD_FRENAME_RETRY_CNT`**: Use this environment variable to specify the number of attempts that can be made to move the `%COLL_HOME%\tmp_%COLL_VERSION%_%COLL_SERVERID%_%COLL_SERVERID%__D`BD\_TEMP file to the `%COLL_HOME%\tmp_%COLL_VERSION%_%COLL_SERVERID%_%COLL_SERVERID%__D`BD\_PREV file.

If you do not specify a value for this variable, the Microsoft SQL Server agent makes 1 attempt to move the file.

## Variables for enhancing the collection for the MS SQL Audit Details data set

To enhance the MS SQL Audit Details data set collection, use the following environment variables:

- **`COLL_AUDIT_TYPE`**: Use this variable to enable or disable the monitoring of specific logs. The default value of the variable is `[AL][FL][SL]`. By default, the agent monitors all three types of logs that include the application logs, audit files, and the security logs. The value of the variable includes two character code for each log type:
  - `[AL]` for application logs

- [FL] for audit files
- [SL] for security logs

You can change the value of the variable to disable the monitoring of specific log type. For example, if you specify the value of the variable as [AL][SL] the audit files are not monitored. If no value is specified for the variable, audit details not monitored.

- **COLL\_AUDIT\_DURATION:** Use this variable to report the audit events that occurred during the time interval that you specify in this variable. For example, if you set this variable to 7, the audit events that occurred only in last 7 hours are reported by the Audit Details data set. The default value of the **COLL\_AUDIT\_DURATION** variable is 24 hours.
- **COLL\_AUDIT\_COLLECTION\_INTERVAL:** The threaded collection in the Audit Details data set provides specifications of all the database that are present on the SQL server instance. Use this variable to set the interval for this threaded collection. For example, if you set this variable to 7, a fresh set of database specifications is extracted from the SQL server instance after every 7 hours. The default value of the **COLL\_AUDIT\_COLLECTION\_INTERVAL** variable is 24.

### Variable for enhancing the collection for the MS SQL Process Detail data set

To enhance the MS SQL Process Detail data set collection, use the **COLL\_PROC\_BLOCK\_INTERVAL** variable with the following values:

- If **COLL\_PROC\_BLOCK\_INTERVAL** = 0, the collection for the Blocking Process Duration attribute, and the Blocking Resource Duration attribute is disabled.
- If **COLL\_PROC\_BLOCK\_INTERVAL** = x, the interval between the two consecutive data collections for the Blocking Process Duration and the Blocking Resource Duration attributes is x minutes.

If the **COLL\_PROC\_BLOCK\_INTERVAL** variable is not set in the CANDLE\_HOME directory, the interval between the two consecutive data collections is three minutes.

### Variable for excluding the locked objects from the data collection

If the queries that are sent for the Database Detail, Filegroup Details, Database Mirroring, and Device Detail workspaces take long to execute, use the **COLL\_DBCC\_NO\_LOCK** variable to run a query with the value WITH (NOLOCK). This variable causes the query not to wait in the queue when an object on which the query is run is locked.

### Variable for setting the sorting criteria for the rows returned by the Table Details data set

The rows that are returned by the Table Details data set are sorted in a descending order depending on the value that is set for the **COLL\_TBLD\_SORTBY** variable. The default value for the **COLL\_TBLD\_SORTBY** variable is FRAG (fragmentation percent). The valid values are: ROWS (number of rows in a tables), SPACE (space used by the table), and OPTSAGE (the optimizer statistics age of the table).

### Variable for enhancing the collection for the MS SQL Problem Detail and Problem Summary data sets

- **COLL\_ALERT\_SEV:** Use this variable to set the severity level of the error messages that are displayed in the Problem Detail and Problem Summary data sets. Error messages, which have a severity level that is equal to or greater than the value mentioned in this variable, are displayed in the Problem Detail and Problem Summary data sets. For example, if you set the value of this variable to 10, the error messages with severity level 10 or greater are displayed in the Problem Detail and Problem Summary data sets. If you do not specify a value for this variable, the error messages, which have a severity level that is equal to or greater than 17, are displayed in the Problem Detail and Problem Summary data sets.
- **COLL\_SINCE\_ERRORLOG\_RECY:** Use this variable to monitor only the high severity errors in the current ERRORLOG file. If you do not specify a value for this variable, the value of the variable is 0, which means that for collecting the data, the Problem Summary data set also considers the high severity errors that

are read from the previous ERRORLOG file. To monitor only the high severity errors in the current ERRORLOG file, set the value of this variable to 1.

## Variables for setting the timeout interval

To set the timeout interval for the Microsoft SQL Server agent, you can use the following environment variables:

- **WAIT\_TIMEOUT:** Use this variable to set the wait timeout interval for the Microsoft SQL Server agent. If any data set takes more than 45 seconds to collect data, then the agent might hang or situations might be incorrectly triggered. Check the log for the data sets that take more than 45 seconds to collect the data, and use the **WAIT\_TIMEOUT** variable to increase the wait time between the agent process and the collector process.
- **COLL\_DB\_TIMEOUT:** Use this variable to define the wait interval (in seconds) for any request such as running a query on the existing SQL server connection to complete before returning to the application. If you set this value to 0, then there is no timeout. If you do not specify a value for this variable, the agent waits 15 seconds before returning to the application.

## Variables for setting the properties of the collector log files

To set the properties of the collector log files, you can use the following environment variables:

- **COLL\_WRAPLINES:** Use this variable to specify the maximum number of lines in a `col1.out` file. The default value of this variable is 90,000 lines (about 2 MB).
- **COLL\_NUMOUTBAK:** Use this variable to specify the number of backup copies of the collector log files that you want to create. By default, five backup copies of the collector log file are created. The backup file is named `*.out`. When this backup file is full, the file is renamed to `*.ou1` and the latest logs are written in the `*.out` file. In this manner, for five backup files, the oldest logs are available in the `*.ou5` file and the latest logs are available in the `*.out` file.

You can create more than five backup copies of the collector log files by specifying one of the following values in the **COLL\_NUMOUTBAK** variable:

- For less than 10 backup files, specify the number of backup files that you want to create in the **COLL\_NUMOUTBAK** variable. For example, if you specify 9 in the **COLL\_NUMOUTBAK** variable, nine backup files will be created.
- For more than 9 and less than 1000 backup files, in the **COLL\_NUMOUTBAK** variable, specify the number of backup files preceded by a hyphen. For example, if you specify -352 in the **COLL\_NUMOUTBAK** variable, three hundred and fifty-two backup files will be created.
- **COLL\_DEBUG:** Use this variable to enable full tracing of the collector by setting the value of this variable to `dddddddddd` (10 times "d").

## Variable for deleting the temporary files

**COLL\_TMPFILE\_DEL\_INTERVAL:** Use this variable to specify the interval (in minutes) after which the `KOQ_<timestamp>` temporary files should be deleted. If you do not specify a value for this variable, the value of the variable is 0, which means that the temporary files must be deleted immediately.

## Variable for changing driver used by the MS SQL Server agent

To change the driver that is used by the Microsoft SQL Server agent, use the **KOQ\_ODBC\_DRIVER** environment variable. This variable specifies the driver that the Microsoft SQL Server agent uses to connect to the SQL Server. If you do not specify a value for this variable, then agent uses the ODBC SQL Server Driver as a default driver.

**Note:** When you specify the Microsoft SQL Server driver, ensure that the driver name is correct and the driver is listed under the drivers' option in data source (ODBC).

## Variable for connecting to an AlwaysOn enabled SQL Server database

**KOQ\_APPLICATION\_INTENT**: Use this variable to specify the connection option while connecting to SQL Server.

**KOQ\_APPLICATION\_INTENT** option details:

- **Readonly**: Connection is opened with **ApplicationIntent** as *readonly*.
- **Readwrite**: Connection is opened with **ApplicationIntent** as *readwrite*.  
When it is set to Readwrite, Microsoft SQL Server agent would not perform any write operations with the connection.

If this variable is not set, the connection is established without **ApplicationIntent** property.

**Note**: The driver is specified by the environment variable **KOQ\_ODBC\_DRIVER**. If this variable is not set, then the default SQL Server driver is used.

If the driver doesn't support **ApplicationIntent**, the connection is opened without **ApplicationIntent** property.

## Configuration parameters of agent

You must provide the mandatory configuration parameters of the agent.

### About this task

The following table contains the details of configuration parameters. Review the parameters and determine the value for each parameter.

| Parameter Name                 | Description                                                                  | Default Value | Mandatory Field |
|--------------------------------|------------------------------------------------------------------------------|---------------|-----------------|
| User Name                      | User name or login used to establish connection between agent and SQL Server | NA            | Yes             |

## Configuring the agent on Windows systems

You can use the IBM® Cloud Application Performance Management window to configure the agent on Windows systems.

### Before you begin

Before you configure the agent, ensure that you complete the following tasks:

- Create a user and grant the required permissions

- Review the local environment variables

## About this task

The Microsoft SQL Server agent is a multiple instance agent; you must configure and start each agent instance manually.

- To configure the agent, complete the following tasks:
  - Select the databases for monitoring
  - Configure the local environment variables

## Selecting the databases for monitoring

You can select the database that you want to monitor by using the **Configure Database Agents** window.

### Procedure

1. Open the **IBM Performance Management** window.
2. In the **IBM Performance Management** window, click the **Task/SubSystem** column, right-click **Template**, and then **Configure Using Defaults**.
3. In the **Configure Database Agents** window, select the database server that you want to monitor from the **Database Servers Available**, and move it to the **Server to Monitor** list.
4. In the **Database Server Properties** window, values for the following fields are automatically populated:
  - Server Name
  - Database Version
  - Home Directory
  - Error Log File

The following fields in the **Database Server Properties** window are optional:

- Windows Authentication
- Extended Parms
- Monitor all Databases
- Day(s) Frequency
- Weekly Frequency
- Monthly Frequency
- Collection Start Time
- Table Detail Continuous Collection

For more information about the configuration parameters in the **Database Server Properties** window, see “Configuration parameters for the Database Server properties” on page 650.

5. If you do not select the **Windows Authentication** field, enter your user ID and password in the **Login** and **Password** fields by using only ASCII characters.
6. In the **Extended Parms** field, enter the name of the data set to disable the data collection, and then click **OK**.

For example:

- Enter koqtblld to disable data collection for Table Detail data set.
  - Enter koqdbd to disable data collection for Database Detail data set.
  - Enter koqtblld, koqdbd to disable data collection for Table Detail and Database Detail data sets.
7. If you do not select the **Monitor All Databases** check box, specify the list of databases for which you want to enable or disable monitoring in the field of **Databases** group area.

**Remember:** If you select the **Monitor All Databases** check box and specify the databases in **Databases** group area, the setting of **Monitor All Databases** check box takes precedence.

8. Specify the frequency for the collection of the MS SQL Table Detail data set. The possible values are daily, weekly, or monthly.
9. Select the **Table Detail Continuous Collection** check box to enable continuous collection of the MS SQL Table Detail data set. If you select the **Table Detail Continuous Collection** check box, enter a value in the **Interval Between Two Continuous Collection (in minutes)** field.
10. In the **Configure Database Agents** window, click **OK**, and then start the agent.

**Note:** From agent version 8.1.4.0.15, the option for Long Live Database connection will be enabled by default.

## What to do next

Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

If you need help with troubleshooting, see the [Troubleshooting](#) section.

## Configuration parameters for the Database Server properties

In the **Database Server Properties** window, you can configure the Database Server properties, such as server name, database version, and home directory.

The following table contains detailed descriptions of the configuration settings in the **Database Server Properties** window.

| Table 208. Names and descriptions of configuration settings in the <b>Database Server Properties</b> window |                                                                                                                                                                                                                                                                                  |                 |                                                                                                                                                                                                                                                                                                                                                                             |

| Database (continued)  | <p><b>Remember:</b></p> <ul style="list-style-type: none"> <li>If you do not select the <b>Monitor All Databases</b> check box, you must specify the list of databases for which you want to enable or disable monitoring, in the text field that is present in the <b>Databases</b> group area. If you click <b>OK</b> in the <b>Database Server Properties</b> window without selecting the <b>Monitor All Databases</b> check box and specifying the list of databases, an error message is displayed in a pop-up window and the agent configuration does not finish.</li> <li>If you select the <b>Monitor All Databases</b> check box and also specify the databases to monitor in the text field that is present in the <b>Databases</b> group area, then priority is given to the value of the <b>Monitor All Databases</b> check box. The list of databases that you specify in the text field is ignored.</li> </ul> |                 | <p>Case 5: Wrong input</p> <p>Example:</p> <pre>@%m%</pre> <p>Output: None of the databases are filtered.</p> <p>Case 6: Default</p> <p>Example: Field is blank (No query is typed)</p> <p>Output: All the databases are filtered.</p> <p>Case 7: Mixed patterns</p> <p>Example:</p> <pre>@[m-t]_d%</pre> <p>Output: All the databases (of any length) whose names start with the characters m, n, o, p, q, r, s, t, followed by any character, with the character d in the third place are filtered.</p> |
| Day(s) Frequency      | Use this feature to define the frequency of collecting data of Table Detail attributes. The values can be from zero to 31.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | No              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Weekly Frequency      | Use this feature to specify a particular day for collecting data for Table Detail attributes. The values can be from zero to 7.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | No              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Monthly Frequency     | Use this feature to define the data collection of Table Detail attributes on a particular day of the month. The possible values are 1, 2, 3, and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | No              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Collection Start Time | <p>The collection start time can be entered in HH:MM format.</p> <p>The possible values for hours are zero to 23. The default value is zero.</p> <p>The possible values for minutes are from zero to 59. Table 208. Names and descriptions of configuration settings in the **Database Server Properties** window (continued)

| Parameter name                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Mandatory field | Examples |
|------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|----------|
| Table Detail Continuous Collection                   | Use this feature for the continuous background collection of Table Detail data.<br><br>The <b>Table Detail Continuous Collection</b> check box is selected by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | No              |          |
| Interval Between Two Continuous Collection (in min.) | Specify the time for the interval between two collections in minutes. The minimum interval time is 3 minutes.<br><br>You can select the <b>Interval Between Two Continuous Collection (in min.)</b> check box or you can use Scheduling to specify continuous collection of the Table Detail data set. If you select the <b>Interval Between Two Continuous Collection (in min.)</b> check box, you must specify the time interval for collection. If you use Scheduling to specify the collection of the Table Detail data set, the minimum time interval is 1 day.<br><br>The default interval between two continuous collections is 3 minutes. | No              |          |

The agent collects the data at the time interval for which data collection occurs frequently. For example, if you specify all frequencies (daily, weekly, and monthly) for collecting data, the agent starts the data collection according to the following conditions:

- If day(s) frequency  $\leq 7$ , the day(s) frequency settings are selected, and the weekly and monthly frequency settings are ignored.
- If day(s) frequency  $> 7$ , the weekly frequency settings are selected, and the day(s) and monthly frequency settings are ignored.

**Remember:** If the **Table Detail Continuous Collection** check box is selected, the agent collects the data at the interval that is mentioned in the **Interval Between Two Continuous Collection (in min.)** field and not according to the daily, weekly, or monthly frequencies.

## Configuring local environment variables on Windows systems

You can configure local environment variables to change the behavior of the Microsoft SQL Server agent.

### Procedure

1. Click **Start > All Programs > IBM Monitoring agents > IBM Performance Management**.
2. In the **IBM Performance Management** window, from the **Actions** menu, click **Advanced > Edit Variables**.
3. In the Monitoring Agent for Microsoft SQL Server: **Override Local Variable Settings** window, click **Add**.
4. In the **Add Environment Setting Override** window, enter the variable and the corresponding value.

**Note:** Refer to [“Local environment variables” on page 642](#) for the complete list of configurable environment variables.

## Running as a non-administrator user

You can run the monitoring agent for Microsoft SQL Server as a non-administrator user.

### About this task

The Microsoft SQL Server agent can be run as a non-administrator user from Domain Users group.

### Procedure

1. Start Windows application Active Directory Users and Computers and create a domain user.
  - Make sure that the new user is a member of the *Domain Users* group.
  - Make sure that the SQL Server is a member of *Domain Computers*.
2. Add the newly created domain user in the *SQL Server Login* user group. The domain user should have **sysadmin** SQL Server role permission on the SQL Server or the permissions that are mentioned in [https://www.ibm.com/support/knowledgecenter/SSMKFH/com.ibm.apmaas.doc/install/sql\\_config\\_agent\\_grant\\_permission\\_sqlserver.htm](https://www.ibm.com/support/knowledgecenter/SSMKFH/com.ibm.apmaas.doc/install/sql_config_agent_grant_permission_sqlserver.htm).
3. Log on to the SQL Server as the domain administrator.
4. Grant **Modify** permission to every drive that the Microsoft SQL Server agent accesses. Complete the following procedures to propagate the permission to all sub directories:
  - a) Go to **My Computer**.
  - b) Right-click the **drive**.
  - c) Click the **Security** tab.
  - d) Add the newly created user.
  - e) Give **Modify** permission to the newly created user.
  - f) Click **OK**. This procedure takes a few minutes to apply permission to all sub directories.
5. By using the Windows Registry, grant read access to HKEY\_LOCAL\_MACHINE, and propagate the settings. Complete the following steps to propagate the settings:
  - a) Right-click the HKEY\_LOCAL\_MACHINE directory and select **Permissions**.
  - b) Add the newly created user.
  - c) Select the newly created user.
  - d) Select the **Allow Read** check box.
  - e) Click **OK**. This procedure takes a few minutes to propagate the settings to the entire HKEY\_LOCAL\_MACHINE tree.
6. By using the Windows Registry, grant the agent-specific registry permissions according to the following list.
  - If you installed a 32-bit agent on a 32-bit operating system, grant full access to the KEY\_LOCAL\_MACHINE\SOFTWARE\IBMMonitoring directory, and then propagate the settings.
  - If you installed a 32-bit agent on a 64-bit operating system, grant full access to the HKEY\_LOCAL\_MACHINE\SOFTWARE\Wow6432Node\Candle directory, and then propagate the settings.
  - If you installed a 64-bit agent on a 64-bit operating system, grant full access to the KEY\_LOCAL\_MACHINE\SOFTWARE\IBMMonitoring directory, and then propagate the settings.

Complete the following steps to propagate settings:

- a) Right-click the directory for which you have full access and select **Permissions**.
- b) Add the newly created user.
- c) Select the newly created user.
- d) Select the **Allow Full Control** check box.

- e) Click **OK**. This procedure takes a few minutes to propagate the settings to the entire KEY\_LOCAL\_MACHINE\SOFTWARE\IBMMonitoring tree.
7. Add a new Domain User to the **Performance Monitor Users** group.
  8. Verify that Domain Users are members of the *Users* group.
  9. Grant the following permissions to the Windows directory to run as a non-administrator user:
    - If a 32-bit agent is installed on a 32-bit operating system, grant read and write access to the OS\_installation\_drive:\Windows\system32 directory
    - If a 32-bit agent is installed on a 64-bit operating system, grant read and write access to the OS\_installation\_drive:\Windows\SysWOW64 directory
- Note:** Permissions for Windows directory are not necessary for Windows Server 2008, Windows Server 2008 R2, and Windows Server 2012, Windows Server 2012 R2, Windows Server 2016.
10. Grant **Modify** permission to the SQL Server data file and log file:
    - The default path of the SQL Server data file is *SQLServer\_root\_dir*\DATA, where *SQLServer\_root\_dir* is the root directory of the SQL Server instance. For example, if the root directory of the SQL Server instance is C:\Program Files\Microsoft SQL Server\MSSQL.1\MSSQL, the data file path is C:\Program Files\Microsoft SQL Server\MSSQL.1\MSSQL\DATA.
    - The default path of the SQL Server log file is *SQLServer\_root\_dir*\LOG, where *SQLServer\_root\_dir* is the root directory of the SQL Server instance. For example, if the root directory of the SQL Server instance is C:\Program Files\Microsoft SQL Server\MSSQL.1\MSSQL, the log file path is C:\Program Files\Microsoft SQL Server\MSSQL.1\MSSQL\LOG.
  11. Grant full permissions to the Candle\_Home directory. The default path is C:\IBM\ITM.
  12. Apply local security permissions, refer [“Local Security Policy permissions”](#) on page 659.
  13. Restart the SQL Server to ensure that local security permissions are applied effectively.
  14. Change the logon settings for the SQL Server agent services to the non-administrator user by completing the following steps:
    - a) Click **Start > Administrative Tools > Services**.
    - b) Right-click the **Monitoring Agent For SQL Server *instance\_name***, and click **Properties**. The **SQL Service Properties** window opens.
    - c) Click **Log On** tab.
    - d) Click **This account** and type the user name.
    - e) In the **Password** and **Confirm Password** fields, enter the password, and click **OK**.
    - f) Repeat steps b to e for the **Monitoring Agent For SQL Server Collector *instance\_name***, where *instance\_name* is the Microsoft SQL Server instance name.

### **Local Security Policy permissions**

Local security policy administers the system and its security policy. It plays an important part in keeping the agent and the system in which the agent is installed secure. This policy works by giving access rights, permissions to users. For, Microsoft SQL Server agent, make sure that the user has following permissions to adhere to local security permission policy.

*Log on as Service permission*

### **About this task**

To grant the Log-on as service permission, complete the following steps.

## Procedure

1. Click **Start > Administrative Tools > Local Security Policy**. The **Local Security Settings** window opens.
2. Click **Local Policies** to expand the list.
3. Click **User Rights Assignment**. The list of user rights opens.
4. Double-click **Log-on as service** policy. The **Log-on as service Properties** window opens.
5. Click **Add User or Group**. The **Select Users or Groups** window opens.
6. In the **Enter the object names to select** field, enter the user account name to whom you want to assign the permissions, and click **OK**.
7. Click **OK**.

*Debug Programs Permission*

## About this task

To grant the debug program permission, complete the following procedure on Microsoft SQL Server agent .

## Procedure

1. Click **Start > Administrative Tools > Local Security Policy**. The **Local Security Settings** window opens.
2. Click **Local Policies** to expand the list.
3. Click **User Rights Assignment**.The list of user rights opens.
4. Double-click **Debug Programs** policy. The **Debug programs Properties** window opens.
5. Click **Add User or Group**. The **Select Users or Groups** window opens.
6. In the **Enter the object names to select** field, enter the user account name to whom you want to assign permissions, and click **OK**.
7. Click **OK**.

*Impersonate a client after authentication*

## About this task

To grant the Impersonate a client after authentication permission, complete the following procedure on Microsoft SQL Server agent .

## Procedure

1. Click **Start > Administrative Tools > Local Security Policy**. The **Local Security Settings** window opens.
2. Click **Local Policies** to expand the list.
3. Click **User Rights Assignment**.The list of user rights opens.
4. Double-click **Impersonate a client after authentication** policy. The **Impersonate a client after authentication Properties** window opens.
5. Click **Add User or Group**. The **Select Users or Groups** window opens.
6. In the **Enter the object names to select** field, enter the user account name to whom you want to assign permissions, and then click **OK**.
7. Click **OK**.

## Configuring the agent on Linux systems

To configure the agent on Linux operating systems, you must run the script and respond to prompts.

### Before you begin

Before you configure the agent, ensure that you complete the following tasks:

- Review the local environment variables

### About this task

The Microsoft SQL Server agent is a multiple instance agent; you must configure and start each agent instance manually.

### Procedure

1. On the command line, change the path to the agent installation directory.

Example:

```
cd /opt/ibm/apm/agent/bin
```

2. Run the following command where *instance\_name* is the name that you want to give to the instance:

```
./mssql-agent.sh config instance_name
```

3. When the command prompt displays the following message, type 1 and enter:

Edit 'Monitoring Agent for MSSQL setting? [1=Yes, 2=No]

4. Specify values for the configuration parameters when you are prompted.

For information about the configuration parameters, see Configuration parameters of agent.

5. Run the following command to start the agent:

```
./mssql-agent.sh start instance_name
```

6. Run the following command to stop the agent:

```
./mssql-agent.sh stop instance_name
```

## Configuring local environment variables on Linux systems

You can configure local environment variables to change the behavior of the Microsoft SQL Server agent on Linux systems.

### Procedure

1. Launch a terminal or the system file manager, change directory to agent installation directory:

Example:

```
/opt/ibm/apm/agent
```

2. Run the following command to stop the agent:

```
./mssql-agent.sh stop instance_name
```

Where *instance\_name* is the agent instance name.

3. Open the file `oq.environment` that exists in the following config directory:

Example:

```
install_dir/config
```

Where *install\_dir* is the agent installation directory.

4. Add the required environment variables at end of the file `oq.environment` by following the name-value pair format.

```
export VARIABLE_NAME=VARIABLE_VALUE
```

Example:

```
export KOQ_ODBC_DRIVER=ODBC Driver 17 for SQL Server
```

**Note:**

- Refer to [“Local environment variables” on page 642](#) for the complete list of configurable environment variables.
- The custom variables added are not preserved after agent upgrade.
- From agent version 8.1.4.0.15, the option for Long Live Database connection will be enabled by default.

5. Save the file.
6. Start the agent from the agent installation directory:

```
cd /opt/ibm/apm/agent/bin
```

```
./mssql-agent.sh start instance_name
```

## Configuring the agent by using the silent response file

You can use the silent response file to configure the agent or multiple instances of the agent.

### Before you begin

To configure multiple instances of the agent, ensure that the configuration details of all the agent instances are specified in the silent response file.

### About this task

Run the configuration script to change the configuration settings. You can edit the silent response file before you run the configuration script.

### Procedure

To configure the agent, complete the following steps:

1. Launch a text editor, open the silent response file that is available at the following location:

- **Windows** `install_dir\samples\mssql_silent_config.txt`
- **Linux** `install_dir/samples/mssql_silent_config.txt`

Where *install\_dir* is the agent installation directory.

Example:

- **Windows** `C:\IBM\APM\samples\mssql_silent_config.txt`
- **Linux** `/opt/ibm/apm/agent/samples/mssql_silent_config.txt`

**Note:** For information about the agent configuration parameters, see [“Configuration parameters of agent” on page 648](#).

2. Launch a command prompt, change the directory to the following:

- **Windows**

```
cd install_dir\bin
```

- **Linux**

```
cd install_dir/bin
```

3. Run the following command:

- **Windows**

```
mssql-agent.bat config install_dir\samples\mssql_silent_config.txt
```

- **Linux**

```
mssql-agent.sh config instance_name install_dir/samples/mssql_silent_config.txt
```

4. Start the agent.

- **Windows** In the **IBM Performance Management** window, right-click the agent instance that you created, and click Start.
- **Linux** Run the following command:

```
cd /opt/ibm/apm/agent/bin
```

```
./mssql-agent.sh start instance_name
```

## What to do next

Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

If you need help with troubleshooting, see the [Troubleshooting](#) section.

## Running the agent in a cluster environment

**Windows** You can configure the Microsoft SQL Server agent in a cluster environment. Multiple instances of the Microsoft SQL Server and the Microsoft SQL Server agent can run on a single node.

After you install and configure the Microsoft SQL Server agent, complete the following tasks to run the agent in a cluster environment:

- Add environment variables
- Change the startup type of the agent service and the collector service
- Add the agent and the collector to the cluster environment

You can set up a cluster environment for the following versions of the Microsoft SQL Server:

- Microsoft SQL Server 2005
- Microsoft SQL Server 2008
- Microsoft SQL Server 2008 R2
- Microsoft SQL Server 2012
- Microsoft SQL Server 2014
- Microsoft SQL Server 2016

**Important:** On Windows systems, the agent must be installed in the same directory where the OS agent is installed. Install the agent on the nodes system disk of each cluster node.

## Adding environment variables

You must configure the environment variables that are used by the agents that are installed on each cluster node.

### About this task

You must specify values for the following environment variables:

- **CTIRA\_HOSTNAME**: This variable is used to configure each instance of the Microsoft SQL Server agent. The value of this variable is limited to 31 characters and is common for all monitoring agents. Set the value of this variable to the cluster name to navigate to all the monitoring agents for that cluster in the Application Performance Dashboard.
- **CTIRA\_NODETYPE**: This variable is used to identify the agent. By default, the value of this variable is set to **MSS** for the Microsoft SQL Server agent.
- **CTIRA\_SUBSYSTEMID**: This variable is used to distinguish the multiple instances of the Microsoft SQL Server agent. By default, the value of this variable is set to **Microsoft SQL Virtual Server** for the Microsoft SQL Server agent.
- **COLL\_HOME**: This variable is used to collect data and store log files for attribute groups that use configuration files at a shared location. Set the value of the variable to *X:\shared-location*, where *X* is a shared drive that is accessible to the cluster nodes. For example, set the value for the **COLL\_HOME** variable when you define the configuration settings for the MS SQL Table Detail attribute group or MS SQL Error Event Details attribute group.
- **CTIRA\_HIST\_DIR**: This variable is used to specify the path to the shared disk directory. If history for the Microsoft SQL Server agent is configured to be stored at the monitoring agent, each instance of the agent must be configured with a common **CTIRA\_HIST\_DIR** variable that refers to the shared disk directory.

**Remember:** If history is stored at the Cloud APM server, you need not specify a value for the **CTIRA\_HIST\_DIR** variable. Storing history at the Cloud APM server increases the load on that server.

To add these variables, see the steps that are described in [“Configuring local environment variables on Windows systems”](#) on page 657.

### What to do next

Change the startup type of the agent service and the collector service to **Manual** by completing the steps that are described in [“Changing the startup type of the agent service and the collector service”](#) on page 664.

## Changing the startup type of the agent service and the collector service

By default the startup type of the agent service and the collector service is **Automatic**. Change the startup type of the agent service and the collector service to **Manual** so that the cluster resource can control the starting and stopping of the monitoring agent

### Procedure

To change the startup type of the agent service, complete the following steps:

1. Click **Start > Run**, type the command `services.msc`, and then click **OK**.
2. Right-click the agent and click **Properties**.
3. In the **Monitoring Agent for Microsoft SQL Server Properties** window, from the **Startup type** list, select **Manual**, click **Apply**, and then **OK**.

### What to do next

- Use the same procedure to change the startup type of the collector service to **Manual**.

- Add the agent and the collector to the cluster environment by completing the steps that are described in [“Adding the agent and collector to the cluster environment ” on page 665.](#)

## Adding the agent and collector to the cluster environment

You must add the agent and the collector to the cluster environment.

### Procedure

1. Click **Start > Control Panel > Administrative Tools > Failover Cluster Management**.
2. Expand **Failover Cluster Management**.
3. Expand **Services and Applications** and right-click the SQL instance that you want to configure.
4. Click **Add a resource > Generic Service**. The New Resource Wizard opens.
5. On the Select Service page, select the service name, and then click **Next**.

Examples of Windows Services names:

- Monitoring Agent for Microsoft SQL Server: SQLTEST#INSTANCE1
  - Monitoring Agent for Microsoft SQL Server: Collector SQLTEST#INSTANCE1
  - Monitoring Agent for Microsoft SQL Server: SQLTEST2#INSTANCE2
  - Monitoring Agent for Microsoft SQL Server: Collector SQLTEST2#INSTANCE2
6. On the Confirmation page, check the details, and then click **Next**.
  7. On the Summary page, click **Finish**. The Microsoft SQL Server agent is now added.

**Remember:** Use the same steps to add the collector to the cluster environment.

8. To bring the agent online, right-click the agent, and click **Bring this resource online**.
9. To bring the collector online, right-click the collector, and click **Bring this resource online**.

### Results

The Microsoft SQL Server agent is now running in a cluster environment.

**Remember:** If you want to configure the agent again, you must first take the agent and the collector offline, or edit the agent variables on the node where the agent and collector run. When you complete the agent configuration, bring the agent and the collector back online.

## Configuring the agent by using the cluster utility

**Windows** You can use the cluster utility to add multiple Microsoft SQL Server agent instances to a cluster group in a cluster environment.

The cluster utility automatically adds the agent service and the collector service of each Microsoft SQL Server agent instance as a generic service resource to the cluster group. You can use the cluster utility to complete the following tasks:

- [Adding an SQL Server agent instance to the cluster](#)
- [Updating an existing SQL Server agent instance in a cluster](#)
- [Removing an SQL Server agent instance from a cluster](#)

### Prerequisites for using the cluster utility

You must ensure that your system environment meets the prerequisites for running the cluster utility.

Ensure that the following prerequisites are met:

- Run the cluster utility on a computer that has at least one group in the cluster environment.
- Start the remote registry service for all nodes in the cluster.
- You must have the cluster manager authorization to access the cluster utility.

- The service name of agent and collector must be same on all cluster node.

For example, if the agent service name is Monitoring Agent for Microsoft SQL Server: SQLTEST#INSTANCE1 and the collector name is Monitoring Agent for Microsoft SQL Server: Collector SQLTEST#INSTANCE1 then the same service name must be present on all nodes of cluster.

## Adding an Microsoft SQL Server agent instance to the cluster

You can use the cluster utility to add an Microsoft SQL Server agent instance to a cluster group in a cluster environment.

### Procedure

1. To run the utility, complete one of the following steps:
  - For a 64-bit agent, go to the *candle\_home*\TMAITM6\_x64 directory.
  - For a 32-bit agent, go to the *candle\_home*\TMAITM6 directory.
2. To run the Cluster Utility, double-click the KoqClusterUtility.exe.
3. In the **SQL Server Agent Instances Available** area, select a Microsoft SQL Server agent instance, and click **Add**.
4. In the **Select cluster group name** window, select a cluster group.  
The cluster group that you select must be the SQL Server instance that is monitored by the Microsoft SQL Server agent.
5. In the **Select Path for Shared Location** window, navigate to the path where the agent and collector logs are stored.  
If you do not select the path, by default, the CANDLEHOME/TMAITM6(\_x64)/logs location is selected for storing the agent and collector logs.
6. To add the Microsoft SQL Server agent instance to the cluster environment, click **OK**.  
The activity logs of the cluster utility are displayed in the **History** pane.

## Updating an existing Microsoft SQL Server agent instance in a cluster

You can use the cluster utility to update the location where the agent and collector logs are stored for an SQL Server instance in a cluster.

### Procedure

1. To update an existing Microsoft SQL Server agent instance, open the **Cluster Utility** window.
2. In the **SQL Server Agent Instances Configured** area, select a Microsoft SQL Server agent instance, and click **Update**.
3. In the **Set Path for Shared Location** window, navigate to the path where the agent and collector logs are stored.  
If you do not select the path, the agent and collector logs are stored at the location that was set while adding the Microsoft SQL Server agent instance in a cluster.
4. Click **OK**.  
The activity logs of the cluster utility are displayed in the **History** pane.

## Removing a Microsoft SQL Server agent instance from a cluster

You can use the cluster utility to remove a Microsoft SQL Server agent instance from a cluster group.

### Procedure

1. Open the **Cluster Utility** window.
2. In the **SQL Server Agent Instances Configured** area, select a Microsoft SQL Server agent Instance, and click **Remove**.

3. In the **Please Confirm Action** dialog box, click **Yes** to delete the Microsoft SQL Server agent instance from the cluster.

The activity logs of the cluster utility are displayed in the **History** pane.

## Configuring multiple collations for ERRORLOG file

The Microsoft SQL Server agent version 06.31.17.00 or later for Application Performance Management version 8.1.4.0.4 supports multiple collations in ERRORLOG file. You can now configure the agent to parse more than one collations in the ERRORLOG file for **Problem Detail** attribute group. Note that the multiple collations in ERRORLOG file is not applicable for **Error Event Detail** attribute group.

### Before you begin

To configure multiple collations of the agent, ensure that the agent is installed.

### About this task

The default collation is English. For other languages of SQL Server, the agent will parse the ERRORLOG file based on the collations in the configuration file `koqErrConfig.ini`. So you must add the collations that are in used in `koqErrConfig.ini` file.

### Procedure

To configure multiple collations for the agent, complete the following steps:

1. Go to the agent directory *agent\_directory*.

#### Windows

- For 64-bits agent, *agent\_directory* is *Agent\_home*\TMAITM6\_x64.
- For 32-bits agent, *agent\_directory* is *Agent\_home*\TMAITM6.

#### Linux

- For 64-bits agent, *agent\_directory* is *Agent\_home*/TMAITM6\_x64.

Where *Agent\_home* is the agent installation directory.

2. Open the configuration `koqErrConfig.ini` file:
3. Move to the end of the file to add the new collations.

For example, to enable collation for French, add the following collation settings in **name-value** pair format at the end of `koqErrConfig.ini` file.

```
[French]
Error = Erreur :
Severity = Gravité :
State = État :
```

**Note:** The sample list of collations is available in *agent\_directory*\`koqErrConfigSample.ini`.

Where

#### Windows

- For 64-bits agent, *agent\_directory* is *Agent\_home*\TMAITM6\_x64.
- For 32-bits agent, *agent\_directory* is *Agent\_home*\TMAITM6.

#### Linux

- For 64-bits agent, *agent\_directory* is *Agent\_home*/TMAITM6\_x64.

Where *Agent\_home* is the agent installation directory.

If the target collation is not available in `koqErrConfigSample.ini`, you can determine the collation keyword values from the ERRORLOG file.

Adhere to the following collation format when configure the collation settings in `koqErrConfig.ini`.

```
[Section_name]
Error = Error_value
Severity = Severity_value
State = State_value
```

Where

- *Section\_name* is the SQL Server collation name. Ensure the collation name is enclosed with an open bracket "[" and a closed bracket "]"
- *Error\_value* is the corresponding error keyword found in the ERRORLOG file of your target collation.
- *Severity\_value* is the corresponding severity keyword found in the ERRORLOG file of your target collation.
- *State\_value* is the corresponding state keyword found in the ERRORLOG file of your target collation.

**Important:** The keyword values must be the same as the keyword values found in the ERRORLOG file, including the special characters.

4. Save the configuration koqErrConfig.ini file.

Agent restart is not required.

If the configuration file koqErrConfig.ini is not available or the configuration file koqErrConfig.ini is empty, the ERRORLOG file will show the default collation as English error message with severity level more than the default severity level, if any.

If the configuration file koqErrConfig.ini is configured correctly, the ERRORLOG file will show the corresponding error messages with severity level more than the default severity level, if any.

The default severity level is 17.

**Attention:** The changes made in the koqErrConfig.ini file is not preserved during agent upgrade, you must make a backup before performing agent upgrade.

## What to do next

Check the **Errorlog Alert** widget or the **Problem Detail** attribute group on Application Performance Management dashboard as the result of the collation settings..

## Configuring MongoDB monitoring

The Monitoring Agent for MongoDB requires an instance name. You must manually configure and start the agent instance. The MongoDB agent supports local as well as remote monitoring. Refer the following prerequisites for configuring MongoDB agent for both remote and local monitoring.

### Before you begin

- Review the hardware and software prerequisites. For the up-to-date system requirement information, see the [the Software Product Compatibility Reports \(SPCR\) for the MongoDB agent](#).
- Ensure that the user, who configures the MongoDB agent, has the required roles to collect data for all attributes.
  - To configure the agent on the MongoDB database version 2.4 and version 2.6, the clusterAdmin, readAnyDatabase, and dbAdminAnyDatabase roles must be assigned to the user
  - To configure the agent on the MongoDB database version 3.x and 4.x, the clusterMonitor, readAnyDatabase, and dbAdminAnyDatabase roles must be assigned to the user

To know about the attribute groups for which these user roles are required, see [Table 209 on page 669](#).

- Use an existing user or create a user in the admin database.

**Important:** Before you create a user and grant the required roles to the user, you must connect to the MongoDB database and change the database to admin database. If the mongod or mongos process is running in the authentication mode, enter the required credentials to connect to MongoDB database.

1. Run the following command to connect to the MongoDB database:

```
mongo IP:port
```

Where

- *IP* is the IP address of the mongod or mongos process
- *port* is the port number of the mongod or mongos process

2. Change the database to the admin database:

**use admin**

3. Run one of the following commands to add a user in the MongoDB admin database and assign the required roles to the user:

- For the MongoDB database version 2.4, run the following command:

```
db.addUser({ user: "username", pwd: "password", roles: [ 'clusterAdmin', 'readAnyDatabase', 'dbAdminAnyDatabase' ] })
```

- For the MongoDB database version 2.6, run the following command:

```
db.createUser({user: "username", pwd: "password", roles: [ 'clusterAdmin', 'readAnyDatabase', 'dbAdminAnyDatabase' ] })
```

- For the MongoDB database version 3.x and 4.x, run the following command:

```
db.createUser({user: "username", pwd: "password", roles: [ 'clusterMonitor', 'readAnyDatabase', 'dbAdminAnyDatabase' ] })
```

4. Run the following command to verify that the user is added to the admin database:

```
db.auth("username", "password")
```

Return code **1** indicates that the user is added, whereas the return code **0** indicates that the user addition failed.

The following table contains information about the user roles and the attributes for which these user roles are required:

| Table 209. Attributes groups and their required user roles |                          |                                                                                                                                                                                                                                |
|------------------------------------------------------------|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Roles                                                      | MongoDB database version | Attribute groups                                                                                                                                                                                                               |
| dbAdminAnyDatabase                                         | 2.x, 3.x and 4.x         | Response Times                                                                                                                                                                                                                 |
| readAnyDatabase                                            | 2.x, 3.x and 4.x         | <ul style="list-style-type: none"> <li>• Mongod Listing</li> <li>• General Shard Information</li> <li>• Collection Storage</li> <li>• Database Names</li> <li>• Shard Details</li> <li>• Collection Storage Details</li> </ul> |

Table 209. Attributes groups and their required user roles (continued)

| Roles          | MongoDB database version | Attribute groups                                                                                                                                                                                                                                                                                                 |
|----------------|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- For remote monitoring of the MongoDB server, see the two prerequisites
  1. Since MongoDB agent requires mongo shell to collect information remotely from the MongoDB server, the system on which MongoDB agent is installed and configured must have an instance of MongoDB server. The mongo shell of the MongoDB server on the agent machine is used to connect to the remote MongoDB server for monitoring.
  2. In /etc/hosts file of the system that hosts the agent, there is an entry of the remote machine.

## About this task

The managed system name includes the instance name that you specify. For example, you can specify the instance name as *instance\_name: host\_name: pc*, where *pc* is the two character product code of your agent. The managed system name can contain up to 32 characters. The instance name can contain up to 28 characters, excluding the length of your host name. For example, if you specify Mongo2 as your instance name, your managed system name is Mongo2: hostname: KJ.

**Important:** If you specify a long instance name, the managed system name is truncated and the agent code is not completely displayed.

The product version and the agent version often differ. The directions here are for the most current release of this agent. For information about how to check the version of an agent in your environment, see [Agent version command](#). For detailed information about the agent version list and what's new for each version, see the [“Change history”](#) on page 58.

### Remember:

- For the agent to successfully collect data, start the agent with the super (root) user, or use the same user ID to start the agent and the mongod process.

- In an environment where MongoDB runs as a cluster, ensure that you install the agent on the same computer where the router process is running. Configure the agent on the same computer with the IP address and port number of that computer and the setup **TYPE** as 1.
- In an environment where MongoDB runs as a cluster in authentication mode, ensure that you add the same user ID with the required rights on all the shards in the cluster.

You can configure the agent by using the default settings, by editing the silent response file, or by responding to prompts.

## Configuring the agent with default settings

For a typical environment, use default settings to configure the agent. When default settings are used for the agent configuration, the agent does not run in the authentication mode.

### Procedure

1. Run the following command:  
`install_dir/bin/mongodb-agent.sh config instance_name install_dir/samples/mongodb_silent_config.txt`

Where

- *instance\_name* is the name that you specify for the unique application instance.
- *install\_dir* is the installation directory of the MongoDB agent.

The default installation directory is `/opt/ibm/apm/agent`.

2. Run the following command to start the agent:  
`install_dir/bin/mongodb-agent.sh start instance_name`

### What to do next

Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

If you need help with troubleshooting, see the [Troubleshooting](#) section.

## Configuring the agent by using the silent response file

The silent response file contains the agent configuration parameters with default values defined for some parameters. You can edit the silent response file to specify different values for the configuration parameters, and configure the agent.

### Before you begin

To run the MongoDB database in the authentication mode, ensure that you configure the agent with a user who has the `clusterAdmin`, `readAnyDatabase`, and `dbAdminAnyDatabase` roles on the MongoDB database.

### Procedure

1. In a text editor, open the silent response file that is available at the following path:  
`install_dir/samples/mongodb_silent_config.txt`.
2. For the **TYPE** parameter, enter one of the following values:
  - 1 for a cluster
  - 2 for a replication set
  - 3 for a stand-alone instance

By default, the agent monitors a cluster.

3. For the **PORT** parameter, specify the port number of the router for a MongoDB cluster or a mongod instance of the MongoDB replication set that is being monitored.

**Remember:** If you do not specify any port number, the agent automatically discovers the port number of the appropriate MongoDB process that is active on the default interface. If no MongoDB process is active on the default interface, then the agent selects the port number of the appropriate MongoDB process that is active on the secondary interface.

4. For the **HOST** parameter, specify the IP address of the MongoDB host system.

**Remember:** If you do not specify any IP address, the agent automatically detects the IP address of the appropriate MongoDB process that is active on the default interface. If no MongoDB process is active on the default interface, then the agent detects the IP address of the appropriate MongoDB process that is active on the secondary interface.

5. For the **AUTHENTICATION** parameter, specify YES to indicate that mongoDB is running in the authentication mode. The default value is NO, which indicates that the agent is not running in the authentication mode.

**Remember:** When the MongoDB database is running in the authentication mode, the MongoDB agent or any MongoDB client cannot connect to the MongoDB database without credentials. To connect to the database that runs in the authentication mode, specify YES for the **AUTHENTICATION** parameter.

If you specify YES, complete the following steps:

- a) For the **User Name** parameter, specify a user name for the router or the mongod instance. Ensure that minimum roles are assigned to the user. For information about user roles, see [Table 209 on page 669](#).
  - b) For the **Password** parameter, specify the password.
6. Save and close the `mongodb_silent_config.txt` file, and run the following command:  
`install_dir/bin/mongodb-agent.sh config instance_name install_dir/samples/mongodb_silent_config.txt`

Where

- `instance_name` is the name that you specify for the instance.
- `install_dir` is the installation directory of the MongoDB agent.

7. Run the following command to start the agent:  
`install_dir/bin/mongodb-agent.sh start instance_name`

**Important:** If you upgrade the agent to V1.0.0.9 or later and want to run the agent in the authentication mode, then you must configure the agent again to provide a user name and a password. For collecting data, you must stop and restart the agent after configuration.

## What to do next

Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

If you need help with troubleshooting, see the [Troubleshooting](#) section.

## Configuring the agent by responding to prompts

To configure the agent with custom settings, you can specify values for the configuration parameters when prompted while the script is being run.

### Procedure

1. Run the following command:  
`install_dir/bin/mongodb-agent.sh config instance_name`

Where

- `instance_name` is the name that you specify for the instance.
- `install_dir` is the installation directory of the MongoDB agent.

2. When you are prompted to provide a value for the **TYPE** parameter, press Enter to accept the default value, or specify one of the following values, and then press Enter:
  - 1 for a cluster
  - 2 for a replication set
  - 3 for a stand-alone instance

By default, the agent monitors a cluster.

3. When you are prompted to provide a value for the **PORT** parameter, press Enter to accept the default value, or specify the port number of the router for a MongoDB cluster or a mongod instance of the MongoDB replication set that is being monitored, and then press Enter.

**Remember:** If you do not specify any port number, the agent automatically discovers the port number of the appropriate MongoDB process that is active on the default interface. If no MongoDB process is active on the default interface, then the agent selects the port number of the appropriate MongoDB process that is active on the secondary interface.

4. When you are prompted to provide a value for the **HOST** parameter, press Enter to accept the default value, or specify the IP address of the MongoDB host system, and then press Enter.

**Remember:** If you do not specify any IP address, the agent automatically detects the IP address of the appropriate MongoDB process that is active on the default interface. If no MongoDB process is active on the default interface, then the agent detects the IP address of the appropriate MongoDB process that is active on the secondary interface.

5. When you are prompted to provide a value for the **AUTHENTICATION** parameter, press Enter to accept the default value, or specify whether the agent is running in the authentication mode.

The default value is NO, which indicates that the agent is not running in the authentication mode. Specify YES to indicate that mongoDB is running in the authentication mode.

**Remember:** When the MongoDB database is running in the authentication mode, the MongoDB agent or any MongoDB client cannot connect to the MongoDB database without credentials. To connect to the database that runs in the authentication mode, specify YES for the **AUTHENTICATION** parameter.

If you specify YES, complete the following steps:

- a) For the **User Name** parameter, specify a user name for the router or the mongod instance. Ensure that minimum roles are assigned to the user. For information about user roles, see [Table 209 on page 669](#).
  - b) For the **Password** parameter, specify the password.
6. Run the following command to start the agent:  
`install_dir/bin/mongodb-agent.sh start instance_name`

## What to do next

Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

If you need help with troubleshooting, see the [Troubleshooting](#) section.

## Configuring MySQL monitoring

---

The Monitoring Agent for MySQL requires an instance name and the MySQL server user credentials. You can change the configuration settings after you create the first agent instance.

### Before you begin

- Ensure that a user is created in the MySQL database for running the agent. The user does not require any specific privileges on the MySQL database that is being monitored locally.
- Ensure following tasks are completed if MySQL server is monitored remotely:
  - Configure the MySQL server to listen on all or a specific interface(s).

- Grant access to the remote user.
- Enable the MySQL port in your firewall.
- Ensure that MySQL JDBC driver is installed before installing this agent. The path to this driver is required for agent configuration.
  - MySQL JDBC connector should be compatible with MySQL server which is being monitored.  
For example, if MySQL sever 8.0.18 is monitored, the mysql-connector-java-8.0.18.jar should be installed on agent machine.
  - MySQL JDBC connector mysql-connector-java-8.0.11 is the stable version for non-windows platform.
- Review the hardware and software prerequisites. For the up-to-date system requirement information, see the [Software Product Compatibility Reports \(SPCR\)](#) for the MySQL agent.

## About this task

The directions here are for the most current release of this agent. For information about how to check the version of an agent in your environment, see [Agent version command](#). For detailed information about the agent version list and what's new for each version, see “[Change history](#)” on page 58.

The managed system name includes the instance name that you specify, for example, *instance\_name: host\_name: pc*, where *pc* is your two character product code. The managed system name can contain up to 32 characters. The instance name that you specify can contain up to 28 characters, excluding the length of your host name. For example, if you specify MySQL2 as your instance name, your managed system name is MySQL2: hostname: SE.

**Important:** If you specify a long instance name, the managed system name is truncated and the agent code is not completely displayed.

## Configuring the agent on Windows systems

You can use the IBM Cloud Application Performance Management window to configure the agent on Windows systems.

### Procedure

1. Click **Start > All Programs > IBM Monitoring agents > IBM Performance Management**.
2. In the **IBM Performance Management** window, complete these steps:
  - a) Double-click the **Monitoring Agent for MySQL** template.
  - b) In the **Monitoring Agent for MySQL** window, specify an instance name and click **OK**.
3. In the **Monitoring Agent for MySQL** window, complete these steps:
  - a) In the **IP Address** field, enter the IP address of a MySQL server that you want to monitor remotely.  
If the agent is installed on the server to be monitored, retain the default value.
  - b) In the **JDBC user name** field, enter the name of a MySQL server user. The default value is root.
  - c) In the **JDBC password** field, type the password of a JDBC user.
  - d) In the **Confirm JDBC password** field, type the password again.
  - e) In the **JDBC Jar File** field, click **Browse** and locate the directory that contains the MySQL connector Java file and select it.
  - f) Click **Next**.
  - g) In the **JDBC port number** field, specify the port number of the JDBC server.  
The default port number is 3306.
  - h) From the **Java trace level** list, select a trace level for Java.  
The default value is Error.
  - i) Click **OK**.  
The instance is displayed in the **IBM Performance Management** window.

4. Right-click the **Monitoring Agent for MySQL** instance, and click **Start**.

**Remember:** To configure the agent again, complete these steps in the **IBM Performance Management** window:

- a. Stop the agent instance that you want to configure.
- b. Right-click the **Monitoring Agent for MySQL** instance, and click **Reconfigure**.
- c. Repeat steps [3](#) and [4](#).

### What to do next

Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

## Configuring the agent on Linux systems

You run the configuration script to configure the agent on Linux systems.

### Procedure

1. Run the following command:

```
install_dir/bin/mysql-agent.sh config instance_name
```

Where *instance\_name* is the name you want to give to the instance, and *install\_dir* is the installation directory for the MySQL agent.

2. When you are prompted to enter a value for the following parameters, press Enter to accept the default value, or specify a different value and press enter.

- IP Address
- JDBC user name
- JDBC password
- Re-type:JDBC password
- JDBC Jar File
- JDBC port number (Default port number is 3306.)
- Java trace level (Default value is `ERROR`.)

For information about the configuration parameters, see [“Configuring the agent by using the silent response file” on page 676](#).

3. Run the following command to start the agent.

```
install_dir/bin/mysql-agent.sh start instance_name
```

### What to do next

Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

## Configuring the agent by using the silent response file

Use the silent response file to configure the agent without responding to prompts when you run the configuration script. You can use the silent response file for configuring the agent on both Windows and Linux systems.

### About this task

The silent response file contains the configuration parameters. You edit the parameter values in the response file, and run the configuration script to create an agent instance and update the configuration values.

### Procedure

**Windows** This procedure assumes the following default path where the agent is installed:

**Windows** C:\IBM\APM

**Linux** opt/ibm/apm/agent

If the agent is installed at a different path, substitute the path in the instructions, and edit the **AGENT\_HOME** parameter in the silent response file to specify the path where the agent is installed.

1. In a text editor, open the response file that is available at the following path:

**Linux** `install_dir/samples/mysql_silent_config.txt`

**Windows** `install_dir\samples\mysql_silent_config.txt`

Where `install_dir` is the installation directory of the MySQL agent.

2. In the response file, specify a value for the following parameters:

- For the **Server Name** parameter, specify the IP address of a MySQL server that you want to monitor remotely. Otherwise, retain the default value as `localhost`.
- For the **JDBC user name** parameter, retain the default user name value of `root` or specify the name of a user with privileges to view the `INFORMATION_SCHEMA` tables.
- For the **JDBC password** parameter, enter a JDBC user password.
- For the **JDBC Jar File** parameter, retain the default path if this path to the MySQL connector for the Java jar file is correct. Otherwise, enter the correct path. The connector is available at the following default path:

**Linux** `/usr/share/java/mysql-connector-java.jar`

**Windows** `C:\Program Files (x86)\MySQL\Connector J 5.1.26\mysql-connector-java-5.1.26-bin.jar`

- For the **JDBC port number** parameter, retain the default port number of 3306 or specify a different port number.
  - For the **Java trace level** parameter, retain the default value of `Error` or specify a different level according to the IBM support instructions.
3. Save and close the response file, and run the following command to update the agent configuration settings:

**Linux** `install_dir/bin/mysql-agent.sh config instance_name install_dir/samples/mysql_silent_config.txt`

**Windows** `install_dir\BIN\mysql-agent.bat config instance_name install_dir\samples\mysql_silent_config.txt`

Where `instance_name` is the name that you want to give to the instance, and `install_dir` is the installation directory of the MySQL agent.

**Important:** Be sure to include the absolute path to the silent response file. Otherwise, no agent data is displayed in the dashboards.

## What to do next

Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

## Configuring NetApp Storage monitoring

---

The Monitoring Agent for NetApp Storage monitors the NetApp storage systems by using the NetApp OnCommand Unified Manager, the OnCommand API Services, and the OnCommand Performance Manager.

### Before you begin

- Review the hardware and software prerequisites. For the up-to-date system requirement information, see the [Software Product Compatibility Reports \(SPCR\) for the NetApp Storage agent](#).
- Ensure that the following components are installed on your machine:
  - OnCommand Unified Manager
  - OnCommand Performance Manager
  - OnCommand API Services

For information about installing these components, see the NetApp documentation.

- Ensure that the versions of the OnCommand API Services, the OnCommand Unified Manager, and the OnCommand Performance Manager are compatible. For example, to configure the OnCommand API Services V1.0, pair the OnCommand Unified Manager V6.2, V6.1, or V6.0 with the OnCommand Performance Manager V1.1. For compatible product versions, see the [Interoperability Matrix Tool](#).
- Ensure that the user, who connects to the OnCommand Unified Manager, has the GlobalRead privilege for the NetApp storage system that is being monitored. Use an existing user ID with this privilege, or create a new user ID. For information about creating the user ID in your NetApp storage system, see the NetApp documentation.
- Ensure that the user, who you use to configure the OnCommand API Services, is an administrator or a monitor. These user types have default permissions to run the rest API.
- Download the NetApp Manageability SDK JAR file (`manageontap.jar`) from the NetApp website and install the file in the monitoring agent `lib` directory by completing the steps that are mentioned in [“Downloading and installing the NetApp Manageability SDK JAR file” on page 678](#).

### About this task

The NetApp Storage agent is a multiple instance agent. You must create the first instance, and start the agent manually.

The product version and the agent version often differ. The directions here are for the most current release of this agent. For information about how to check the version of an agent in your environment, see [Agent version command](#). For detailed information about the agent version list and what's new for each version, see the [“Change history” on page 58](#).

- To configure the agent on Windows systems, you can use the **IBM Performance Management** window or the silent response file.
- To configure the agent on Linux systems, you can run the script and respond to prompts, or use the silent response file.

## Downloading and installing the NetApp Manageability SDK JAR file

The NetApp Storage agent requires the NetApp Manageability SDK JAR file to communicate with a NetApp OCUM server.

### About this task

After you install the NetApp Storage agent, download the NetApp Manageability SDK JAR file (`manageontap.jar`) from the NetApp website and install the file in the monitoring agent `lib` directory.

### Procedure

1. Download the compressed file that contains the JAR file from the following website: <http://communities.netapp.com/docs/DOC-1152>.
2. Extract this compressed file and copy the `manageontap.jar` file to the following locations:
  - For 32-bit Windows systems, copy the file to `install_dir\tmaitm6`
  - For 64-bit Windows systems, copy the file to `install_dir\tmaitm6_x64`
  - For 32-bit Linux systems, copy the file to `install_dir/li6263/nu/lib`
  - For 64-bit x86-64 Linux systems, copy the file to `install_dir/lx8266/nu/lib`
  - For 64-bit zLinux systems, copy the file to `install_dir/ls3266/nu/lib`

### What to do next

Complete the agent configuration.

## Configuring the agent on Windows systems

You can configure the agent on Windows operating systems by using the **IBM Performance Management** window. After you update the configuration values, you must start the agent to save the updated values.

### About this task

The NetApp Storage agent provides default values for some parameters. You can specify different values for these parameters.

### Procedure

1. Click **Start > All Programs > IBM Monitoring agents > IBM Performance Management**.
2. In the **IBM Performance Management** window, right-click **Monitoring Agent for NetApp Storage**, and then click **Configure agent**.

**Remember:** After you configure the agent for the first time, the **Configure agent** option is disabled. To configure the agent again, click **Reconfigure**.

3. In the Monitoring Agent for NetApp Storage window, complete the following steps:
  - a) Enter a unique name for the NetApp Storage agent instance, and click **OK**.
  - b) On the **Data Provider** tab, specify values for the configuration parameters, and then click **Next**.
  - c) On the **OnCommand Unified Manager** tab, specify values for the configuration parameters, and then click **Next**.
  - d) On the **OnCommand API Service** tab, specify values for the configuration parameters, and then click **OK**.

For information about the configuration parameters in each tab of the Monitoring Agent for NetApp Storage window, see the following topics:

- [“Configuration parameters for the data provider” on page 681](#)
- [“Configuration parameters for the OnCommand Unified Manager” on page 682](#)

- “Configuration parameters for the OnCommand API Service” on page 682
4. In the **IBM Performance Management** window, right-click **Monitoring Agent for NetApp Storage**, and then click **Start**.

## What to do next

Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

If you need help with troubleshooting, see the [Troubleshooting](#) section.

## Configuring the agent by using the silent response file

The silent response file contains the agent configuration parameters. You can edit the silent response file to modify the values of these parameters, and run the configuration script to create an instance and update the agent configuration values. This mode of configuration is called the silent mode.

### About this task

The silent response file contains the agent configuration parameters with default values that are defined for some parameters. You can edit the silent response file to specify different values for the configuration parameters.

After you update the configuration values in the silent response file, you must run the configuration script to configure the agent with these updated values.

### Procedure

- To configure the NetApp Storage agent in the silent mode, complete the following steps:
  - a) In a text editor, open the `netapp_storage_silent_config.txt` file that is available at the following path:
    - **Linux** `install_dir/samples/netapp_storage_silent_config.txt`  
Example `/opt/ibm/apm/agent/samples/netapp_storage_silent_config.txt`
    - **Windows** `install_dir\samples\netapp_storage_silent_config.txt`  
Example `C:\IBM\APM\samples\netapp_storage_silent_config.txt`
  - b) In the `netapp_storage_silent_config.txt` file, specify values for all mandatory parameters. You can also modify the default values of other parameters.  
  
For information about the configuration parameters, see the following topics:
    - [“Configuration parameters for the data provider” on page 681](#)
    - [“Configuration parameters for the OnCommand Unified Manager” on page 682](#)
    - [“Configuration parameters for the OnCommand API Service” on page 682](#)
  - c) Save and close the `netapp_storage_silent_config.txt` file, and run the following command:
    - **Linux** `install_dir/bin/netapp_storage-agent.sh config instance_name install_dir/samples/netapp_storage_silent_config.txt`  
Example `/opt/ibm/apm/agent/bin/netapp_storage-agent.sh config instance_name /opt/ibm/apm/agent/samples/netapp_storage_silent_config.txt`
    - **Windows** `install_dir\bin\netapp_storage-agent.bat config instance_name install_dir\samples\netapp_storage_silent_config.txt`  
Example `C:\IBM\APM\bin\netapp_storage-agent.bat config instance_name C:\IBM\APM\samples\netapp_storage_silent_config.txt`

Where

**instance\_name**

Name that you want to give to the instance.

**install\_dir**

Path where the agent is installed.

**Important:** Ensure that you include the absolute path to the silent response file. Otherwise, the agent data is not shown in the dashboards.

d) Run the following command to start the agent:

– **Linux** `install_dir/bin/netapp_storage-agent.sh start instance_name`

Example **/opt/ibm/apm/agent/bin/netapp\_storage-agent.sh start instance\_name**

– **Windows** `install_dir\bin\netapp_storage-agent.bat start instance_name`

Example **C:\IBM\APM\bin\netapp\_storage-agent.bat start instance\_name**

**What to do next**

Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

If you need help with troubleshooting, see the [Troubleshooting](#) section.

**Configuring the agent by responding to prompts**

To configure the agent on Linux systems, you must run the script and respond to prompts.

**Procedure**

1. On the command line, enter the following command:

`install_dir/bin/netapp_storage-agent.sh config instance_name`

Example **/opt/ibm/apm/agent/bin/netapp\_storage-agent.sh config instance\_name**

Where

**instance\_name**

Name that you want to give to the instance.

**install\_dir**

Path where the agent is installed.

2. Respond to the prompts by referring to the following topics:

- [“Configuration parameters for the data provider” on page 681](#)
- [“Configuration parameters for the OnCommand Unified Manager” on page 682](#)
- [“Configuration parameters for the OnCommand API Service” on page 682](#)

3. Run the following command to start the agent:

`install_dir/bin/netapp_storage-agent.sh start instance_name`

Example **/opt/ibm/apm/agent/bin/netapp\_storage-agent.sh start instance\_name**

**What to do next**

Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

If you need help with troubleshooting, see the [Troubleshooting](#) section.

## Configuration parameters for the data provider

When you configure the NetApp Storage agent, you can change the default values of the parameters for the data provider, such as the maximum number of data provider log files, the maximum size of the log file, and the level of detail that is included in the log file.

The following table contains detailed descriptions of the configuration parameters for the data provider.

| Table 210. Names and descriptions of the configuration parameters for the data provider |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                 |

| Instance Name<br>( <b>KNU_INSTANCE_NAME</b> )                                           | The name of the instance.<br><br><b>Restriction:</b> The Instance Name field displays the name of the instance that you specify when you configure the agent for the first time. When you configure the agent again, you cannot change the instance name of the agent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Yes             |
| Maximum number of Data Provider Log Files<br>( <b>KNU_LOG_FILE_MAX_COUNT</b> )          | The maximum number of log files that the data provider creates before it overwrites the previous log files. The default value is 10.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Yes             |
| Maximum Size in KB of Each Data Provider Log<br>( <b>KNU_LOG_FILE_MAX_SIZE</b> )        | The maximum size in KB that a data provider log file must reach before the data provider creates a new log file. The default value is 5190 KB.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Yes             |
| Level of Detail in Data Provider Log<br>( <b>KNU_LOG_LEVEL</b> )                        | The level of detail that can be included in the log file that the data provider creates. The default value is 4 (Info). The following values are valid: <ul style="list-style-type: none"><li>• 1 (Off): No messages are logged.</li><li>• 2 (Severe): Only errors are logged.</li><li>• 3 (Warning): All errors and messages that are logged at the Severe level and potential errors that might result in undesirable behavior.</li><li>• 4 (Info): All errors and messages that are logged at the Warning level and high-level informational messages that describe the state of the data provider when it is processed.</li><li>• 5 (Fine): All errors and messages that are logged at the Info level and low-level informational messages that describe the state of the data provider when it is processed.</li><li>• 6 (Finer): All errors and messages that are logged at the Fine level plus highly-detailed informational messages, such as performance profiling information and debug data. Selecting this option can adversely affect the performance of the monitoring agent. This setting is intended only as a tool for problem determination in conjunction with IBM support staff.</li><li>• 7 (Finest): All errors and messages that are logged at the Fine level and the most detailed informational messages that include low-level programming messages and data. Choosing this option might adversely affect the performance of the monitoring agent. This setting is intended only as a tool for problem determination in conjunction with IBM support staff.</li><li>• 8 (All): All errors and messages are logged.</li></ul> | Yes             |

## Configuration parameters for the OnCommand Unified Manager

When you configure the NetApp Storage agent, you can change the default values of the parameters for the OnCommand Unified Manager (OCUM), such as the IP address of the OCUM server, user name, and password.

The following table contains detailed descriptions of the configuration parameters for the data source.

| Table 211. Names and descriptions of the configuration parameters for the OnCommand Unified Manager |                                                                                                               |                 |
|-----------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|-----------------|
| Parameter name                                                                                      | Description                                                                                                   | Mandatory field |
| Server<br>( <b>KNU_DATASOURCE_HOST_ADDRESS</b> )                                                    | The host name or IP address of the NetApp OCUM server to be monitored.                                        | Yes             |
| User ( <b>KNU_DATASOURCE_USERNAME</b> )                                                             | A user name on the NetApp OCUM server with sufficient privileges to collect data. The default value is admin. | Yes             |
| Password<br>( <b>KNU_DATASOURCE_PASSWORD</b> )                                                      | The password of the user that you specify in the <b>User</b> parameter.                                       | Yes             |
| Confirm Password                                                                                    | The same password that you specified in the <b>Enter Password</b> parameter.                                  | Yes             |
| Protocol<br>( <b>KNU_DATASOURCE_PROTOCOL</b> )                                                      | The protocol to be used for communicating with the NetApp OCUM server. The default value is HTTPS.            | Yes             |

## Configuration parameters for the OnCommand API Service

When you configure the NetApp Storage agent, you can change the default values of the parameters for the OnCommand API Service, such as the host address, user name, and password.

The following table contains detailed descriptions of the configuration parameters for the data source.

| Table 212. Names and descriptions of the configuration parameters for the OnCommand API Service |                                                                                                             |                 |
|-------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|-----------------|
| Parameter name                                                                                  | Description                                                                                                 | Mandatory field |
| Host Address<br>( <b>KNU_API_SERVICES_HOST_ADDRESS</b> )                                        | The host name or IP address of the OnCommand API service.                                                   | Yes             |
| User<br>( <b>KNU_API_SERVICES_USERNAME</b> )                                                    | A user name with sufficient privileges to connect to the OnCommand API service. The default value is admin. | Yes             |
| Password<br>( <b>KNU_API_SERVICES_PASSWORD</b> )                                                | The password of the user that you specify in the <b>User</b> parameter.                                     |                 |
| Confirm Password                                                                                | The same password that you specified in the <b>Enter Password</b> parameter.                                | Yes             |
| KNU_API_SERVICES_PORT                                                                           | The port indicates the communication protocol of API Services. The default value is 443.                    | Yes             |

## Configuring Environment Variables

You can configure environment variables to change the behavior of the agent.

### About this task

**Note:** For Windows platform, user can edit the environment variable that will change the behavior of the specific agent instance.

For non-Windows platform, environment variable setting will impact all the running agent instances.

### Procedure

1. Stop all the agent instances.
2. Locate the environment variable file.

- Windows:

Locate the `KNUENV_instance_name` file by navigating to the agent folder, where *instance\_name* is the agent instance name.

- Agent of 32-bit system: `%CANDLEHOME%\TMAITM6`
- Agent of 64-bit system: `%CANDLEHOME%\TMAITM6_x64`

- Non-Windows:

Locate the `.vm.environment` file by navigating to the agent folder.

- Agent of 32-bit system: `$CANDLEHOME/config`
- Agent of 64-bit system: `$CANDLEHOME/config`

3. Edit environment variable according to the requirement and save the file.

Example:

```
KNU_DATA_PROVIDER_CONNECTION_RETRY_COUNT=0
```

**Note:**

In the event of connection failure, if the environment variable

**KNU\_DATA\_PROVIDER\_CONNECTION\_RETRY\_COUNT** is not configured or set to 0, the agent will continuously attempt connection to data source every 30 seconds.

In the event of connection failure, user can limit the number of connection attempts by setting the environment variable **KNU\_DATA\_PROVIDER\_CONNECTION\_RETRY\_COUNT** to a valid non-zero value.

4. Start the agent instance.

## Configuring Node.js monitoring

You can use either the Node.js agent or the stand-alone Node.js data collector to monitor your Node.js applications. If you want a simpler installation process and transaction tracking function, use the Node.js data collector.

### Before you begin

- The directions here are for the most current release of this agent and data collector. For information about how to check the version of an agent in your environment, see [Agent version command](#). For detailed information about the agent version list and what's new for each version, see [“Change history” on page 58](#).
- Make sure that the system requirements for the Node.js agent or Node.js data collector are met in your environment.
  - For the up-to-date system requirement information of Node.js agent, see the [Software Product Compatibility Reports \(SPCR\) for the Node.js agent](#).

- For the up-to-date system requirement information of Node.js data collector, see the [Software Product Compatibility Reports \(SPCR\) for the Node.js data collector](#).

## About this task

The following procedure is a roadmap for configuring the Monitoring Agent for Node.js and the stand-alone Node.js data collector, which includes both required and optional steps.

- To monitor on-premises applications, you can configure the stand-alone Node.js data collector or the Node.js agent. If you want to enable transaction tracking for your Node.js applications, configure the stand-alone data collector.
- To monitor IBM Cloud(formerly Bluemix) or Kubernetes applications, configure the stand-alone Node.js data collector.

Complete the following steps according to your needs.

## Procedure

- Configure the Node.js agent to monitor your on-premises applications.
  - a) Add one agent data collector to your Node.js applications for the agent to work properly. See [“Configuring the Node.js agent” on page 684](#).
  - b) Optional: To change the monitoring behavior of your agent, see [Configuring the Node.js agent data collector](#).
  - c) Optional: To configure diagnostic data collection and display, see [Configuring the diagnostics data collector](#).
- Configure the stand-alone Node.js data collector to monitor IBM Cloud applications.
  - a) To configure the stand-alone Node.js data collector, see [“Configuring the stand-alone Node.js data collector for IBM Cloud\(formerly Bluemix\) applications” on page 690](#).
  - b) To change the behavior of the stand-alone Node.js data collector, see [“Customizing the stand-alone Node.js data collector for IBM Cloud applications” on page 691](#).
- Configure the stand-alone Node.js data collector to monitor on-premises applications.
  - a) To configure the stand-alone Node.js data collector, see [“Configuring the stand-alone Node.js data collector for on-premises applications” on page 695](#).
  - b) To change the behavior of the stand-alone Node.js data collector, see [“Customizing the Node.js data collector for on-premises applications” on page 697](#).
- Configure the stand-alone Node.js data collector to monitor applications on Kubernetes.
  - a) To configure the stand-alone Node.js data collector, see [“Configuring the stand-alone Node.js data collector for Kubernetes applications” on page 701](#).
  - b) To change the behavior of the stand-alone Node.js data collector, see [“Customizing the stand-alone Node.js data collector for Kubernetes applications” on page 702](#).

## Configuring the Node.js agent

You must add an agent data collector to your Node.js application and restart it before the agent can start monitoring your application.

### Before you begin

Before you reconfigure the agent settings within the same version, use the following steps to clean the data collector files that were created by the previous configuration:

1. Go to the `install_dir/1x8266/nj/bin` directory.
2. Run the `./uninstall.sh` command to remove existing data collector files.

## About this task

The Node.js agent is a single instance agent. It registers subnodes for each monitored Node.js application. The subnode is in the following structure:

`NJ:hostname_port:NJA`

**Tip:** If one Node.js application listens on multiple port numbers, then the lowest port number is used.

You must add an agent data collector to your Node.js application, and restart your application before the agent can begin monitoring your application. The agent data collectors collect data that is forwarded to the Node.js agent. Currently, the following agent data collectors are provided:

- The resource data collector collects resource monitoring data from your Node.js applications.
- The diagnostics data collector collects diagnostic data and resource monitoring data from your Node.js applications.
- The method trace data collector collects method traces, diagnostics data, and resource monitoring data from your Node.js applications.

## Procedure

1. Make sure that the user ID that is used to run the application server has full permission to the `install_dir` directory of the agent.
2. Go to the directory `install_dir/bin` and run the following command:

```
./nodejs-agent.sh config
```

3. Follow the prompts to specify values for the following configuration options:

### **KNJ\_NODEJS\_RUNTIME\_BIN\_LOCATION**

The directory to the `bin` folder of your Node.js runtime. The default directory is `/usr/local/bin`.

### **KNJ\_NPM\_RUNTIME\_BIN\_LOCATION**

The directory to the `bin` folder of your `npm` command. The default directory is `/usr/local/bin`.

### **KNJ\_NPM\_LIB\_LOCATION**

The directory to the `lib` folder of your npm package global installation directory. The default directory is `/usr/local/lib`. For example, if you install npm package by running `npm install -g` command, the package is installed to `/nodejs_home/lib/node_modules` and the **KNJ\_NPM\_LIB\_LOCATION** is `/nodejs_home/lib`.

### **CP\_PORT**

The port that the agent listens on for data from socket clients. A value of 0 indicates that an ephemeral port will be used. The default value is 63336.

**Note:** Don't use the port number that is already used in your system. To check whether the port is already in use, run the `netstat -apn | grep port_number` command.

4. Start the agent by running the following command:

```
./nodejs-agent.sh start
```

5. Verify that the Node.js agent is started successfully. The `KNJ_NPM_LIB_LOCATION/node_modules/ibmapm` folder is generated if the agent starts successfully.
6. Based on the offering that you have and your requirements, insert one of the following entries to the `.js` file of your Node.js application to configure the agent data collectors:

**Note:** Only one entry can be added to your Node.js application to enable agent data collector capabilities. Also, if you enable capabilities that are not included in the offering, unnecessary overhead can happen, which decreases application execution efficiency.

- If you have only resource monitoring capabilities, you can add the resource data collector. To add it, insert the following line in the beginning of the Node.js application file:

```
require('KNJ_NPM_LIB_LOCATION/node_modules/ibmapm');
```

If the value of **KNJ\_NPM\_LIB\_LOCATION** on your environment is `/usr/local/lib`, the line is

```
require('/usr/local/lib/node_modules/ibmapm');
```

- If you have diagnostics in addition to resource-level monitoring capabilities, you can choose to add one of the following agent data collectors:

- To add the method trace data collector, insert the following line in the beginning of the Node.js application file:

```
require('KNJ_NPM_LIB_LOCATION/node_modules/ibmapm/methodtrace.js');
```

- To add the diagnostics data collector, insert the following line in the beginning of the Node.js application file:

```
require('KNJ_NPM_LIB_LOCATION/node_modules/ibmapm/deepdive.js');
```

- To add the resource monitoring data collector, insert the following line in the beginning of the Node.js application file:

```
require('KNJ_NPM_LIB_LOCATION/node_modules/ibmapm');
```

To guarantee best performance, add the method trace data collector only for debugging purposes.

**Note:** The code of the plug-ins changes from Cloud APM, Private V8.1.4. If you upgrade your agent from earlier versions, you must update the code of the existing data collectors in your applications for the monitoring ability to work properly.

7. Restart your Node.js application to enable the agent data collector.

## Results

You have successfully configured the Node.js agent.

## What to do next

- Now, you can verify that the Node.js agent data is displayed in the Cloud APM console. For instructions on how to start the Cloud APM console, see [Starting the Cloud APM console](#). For information about using the Applications editor, see [Managing applications](#).

**Important:** To add your application to the Cloud APM console, choose **Node.js** in the application editor.

- You can change the runtime behavior of Node.js agent data collectors. For more information, see [Configuring the Node.js agent data collector](#).
- You can enable diagnostics data collection and display by configuring the diagnostics data collector. For more information, see [Configuring the diagnostics data collector](#).

## Configuring the Node.js agent data collector

You can change the behavior of each Node.js agent data collector by changing its runtime configuration in its configuration file.

### Runtime configuration file

The Node.js data collector code is in the following directory:

`KNJ_NPM_LIB_LOCATION/node_modules/ibmapm`

where `KNJ_NPM_LIB_LOCATION` is the directory to the lib folder of your npm package global installation directory. The default directory is `/usr/local/lib`.

There is also a runtime configuration file for each agent data collector in the same folder. The agent data collector reads the configuration file every minute.

**Tip:** The runtime configuration file is named in the following format:

`plugin_application port number_conf.json`

When you change the content of the configuration file, the behavior of the associated agent data collector changes. There are two types of information in the configuration file that you can change:

- [URL filtering rules](#)
- [agent data collector logging parameters](#)

## URL filtering rules

You can change URL filtering rules in the runtime configuration file. Regular expressions are used to map the URL path name to a user customized path name. You can map the URL to a customized path name to satisfy the following requirements:

- Aggregating URLs with similar paths. For example, you have the following URL paths:

```
/demo/poll/1
/demo/poll/2
/demo/poll/3
...
```

On the web server, requests for these paths are likely served by a common routine, so you can aggregate the paths to a single URL type by using the filter in the following example.

```
"filters":
[
  {
    "pattern": "/demo/poll/.+",
    "to": "/demo/poll/"
  }
]
```

This filter results in all requests to URL paths like `/demo/poll/xxx` being mapped to a URL path type of `/demo/poll`. The response time for all requests to URL paths of this type are then averaged to a single value. Aggregating in this way can help you make more efficient use of available resources.

- Ignoring URL paths to static files or filtering out certain types of requests. For example, if a web page includes images that generate separate server download requests, you might not be interested in seeing response times for these types of requests.

To filter out a type of request, set the `"to"` value to empty as in the format of the following example:

```
"filters":
[
  {
    "pattern": "GET /css/.+\\.css$",
    "to": ""
  }
]
```

This filter causes the requests to get a `.css` file to be ignored. As a result, you can use the available resources more efficiently on the requests that you need to monitor.

In the configuration file, URL filter rules are provided in a JSON array named `filters`:

```
"filters":
[
  {
    "pattern": ".+\\.png$",
    "to": ""
  },
  {
    "pattern": ".+\\.jpg$",
    "to": ""
  },
  {
    "pattern": "GET /js/.+\\.js$",
    "to": ""
  },
  {
    "pattern": "GET /css/.+\\.css$",
    "to": ""
  }
]
```

```
] }
```

Each member in the array is a filtering rule. When an HTTP request is received by the agent data collector, the agent data collector extracts the URL path name from the request and compares it with each "pattern". If the path name does not match a "pattern", the original URL path name is kept and used for measurements.

## Agent data collector logging parameter

You can change logging behaviors by modifying the parameter in the `config.properties` configuration file in the `KNJ_NPM_LIB_LOCATION/node_modules/ibmapm/etc` directory. The following logging parameter is provided for you to change:

### The log level

The entry in the configuration file for log level is `KNJ_LOG_LEVEL=info`, which means the summary information about the actions is printed in the log. You can set the log level by changing the value of `KNJ_LOG_LEVEL`. The default value is `info` and the log is printed to standard output.

The following five log level values are supported:

#### **off**

Logs are not printed.

#### **error**

Information is only logged on an error condition.

#### **info**

Information is logged when the Node.js agent data collector is running normally. The raw monitoring data that is sent to the agent is also logged.

#### **debug**

Debug, info, and error information are printed in the log, for example, collected data, data that is sent to server, and server response.

#### **all**

All information is printed in the log.

## Configuring the Node.js agent diagnostics data collector

Support for diagnostics data collection is disabled by default. If you have diagnostic capabilities, you must set and adjust the data collection for specific Node.js applications.

### Procedure

- To modify the data collector settings of a specific application that is running:
  1. Navigate to the `KNJ_NPM_LIB_LOCATION/node_modules/ibmapm` directory, and open the file `plugin_port_conf.json` in a text editor.

**Tip:** For information about `KNJ_NPM_LIB_LOCATION`, see the parameter description of "`KNJ_NPM_LIB_LOCATION`" on page 685
  2. Use the following table for information on modifying the data collector settings:

Table 213. Data collector settings

| Diagnostic data category                                           | Description                                                                                                                                                                                                           | Property       | Action                                                                                                                            |
|--------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------|
| Minimum time delta for stack trace reporting                       | Specifies the response time threshold for collecting the stack trace of a request or a method call. If the response time of a request or method call exceeds this value, the data collector collects its stack trace. | minClockStack  | Set to a value in milliseconds                                                                                                    |
| Minimum time delta to report requests                              | Specifies the response time threshold for collecting the method trace of a request instance. If the response time of a request instance exceeds this threshold, the data collector collects its method trace.         | minClockTrace  | Set to a value in milliseconds                                                                                                    |
| Maximum number of events per file                                  | Specifies the maximum number of events to be recorded in a .jso file. The .jso file records the diagnostic data for these events.                                                                                     | eventsPerFile  | Set to a maximum number of events value                                                                                           |
| Maximum amount of time to report to one file                       | Specifies the maximum amount of time for the .jso file to record diagnostic data                                                                                                                                      | fileCommitTime | Set to the maximum time in seconds                                                                                                |
| Maximum number of files to keep before the oldest ones are deleted | Specifies the maximum number of .jso files to be kept before the oldest ones are deleted.                                                                                                                             | maxFiles       | Set to the maximum number of files                                                                                                |
| Request sampling period                                            | Specifies the sampling period for requests.                                                                                                                                                                           | sampling       | Set to the wanted sampling period. The default value is 10. A value of 10 means that the agent collects one of every 10 requests. |

- Optional: Set the `SECURITY_OFF` environment variable if you want the diagnostics data collector to collect user sensitive information such as cookies, HTTP request contexts, and database requests context. This information is not collected by default.

Use caution when you are setting this variable because it might cause information to be leaked.

**Linux**

For example, to set this environment variable, issue the following command:

```
export SECURITY_OFF=true
```

## Results

The configuration of the diagnostics data collector is changed for the running application that you specified or for all applications.

## Configuring the stand-alone Node.js data collector for IBM Cloud(formerly Bluemix) applications

To collect information about Node.js applications on IBM Cloud, you must configure the stand-alone Node.js data collector.

### Before you begin

1. Make sure that your Node.js application can run successfully locally. The stand-alone Node.js data collector can monitor Node.js V8.0.0 and future fix packs, V10.0.0 and future fix packs, and V12.0.0 and future fix packs.
2. Download the data collector package from IBM Passport Advantage website. For detailed instructions, see [“Download instructions” on page 131](#).
3. Configure the data collector package with the `make_configuration_packages.sh` and `configure_agent_images.sh` scripts on the system where the Cloud APM server is installed. For detailed instructions, see [“Configuring the downloaded images” on page 182](#).

### Procedure

1. Extract files from the data collector package. The `nodejs_datacollector_8.1.4.0.6.tgz` package is included in the extracted directory.
2. Extract the `nodejs_datacollector_8.1.4.0.6.tgz` file, for example, by running the following command:

```
tar -zxvf nodejs_datacollector_8.1.4.0.6.tgz
```

3. Extract the `ibmapm.tgz` file in the `nodejs_dc` folder by running the following command:

```
tar -zxvf nodejs_dc/ibmapm.tgz
```

You will get an `ibmapm` folder.

4. Copy the `ibmapm` folder that is extracted from the data collector package to the home directory of your application, for example, by running the following command:

```
cp -r directory_to_the_ibmapm_folder home_directory_of_your_Node.js_application
```

**Tip:** The home directory of your Node.js application is determined by the command that you use to start the Node.js application and the directory that contains your main file. If you use the **node app.js** command to start your Node.js application and the `app.js` main file is in the `/root/nodejs_app` directory, `/root/nodejs_app` is the home directory of your application.

5. In the `package.json` file of your Node.js application, add the following line to the dependencies section:

```
"ibmapm": "./ibmapm"
```

**Remember:** Do not miss the comma at the end of each line in the file except the last one, and keep the `package.json` file in good form.

Example:

```
"dependencies": {
  "ibmapm": "./ibmapm",
  "cors": "^2.5.2",
  "helmet": "^1.3.0",
  "loopback": "^2.22.0",
  "loopback-boot": "^2.6.5",
  "loopback-datasource-juggler": "^2.39.0",
  "serve-favicon": "^2.0.1",
  "strong-error-handler": "^1.0.1"
}
```

6. Add the following line to the beginning of the main file of your Node.js application:

```
require('ibmapm');
```

If you start your application by running the **node app.js** command, `app.js` is the main file of your application.

7. From the directory that contains the `manifest.yml` file of your Node.js application, log in to IBM Cloud and then run the following command:

```
cf push
```

**Tip:** For a sample `manifest.yml` file, see [“Sample manifest.yml file” on page 262](#).

## Results

The data collector is configured and is connected to the Cloud APM server.

## What to do next

You can verify that the monitoring data for your IBM Cloud application is displayed in the Cloud APM console. For instructions on how to start the Cloud APM console, see [Starting the Cloud APM console](#). For information about using the Applications editor, see [Managing applications](#).

**Remember:** To add your application to the Cloud APM console, choose **Node.js Runtime** in the application editor.

## Customizing the stand-alone Node.js data collector for IBM Cloud applications

You can add environment variables on the IBM Clouduser interface to customize the monitoring for your IBM Cloud application.

### User-defined environment variables for the Node.js data collector

You can use the information in the following table to customize Node.js monitoring on IBM Cloud.

| Table 214. Supported user-defined environment variables for Node.js monitoring on IBM Cloud |            |                            |                                                                                                                                                                                                                            |
|---------------------------------------------------------------------------------------------|------------|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Variable name                                                                               | Importance | Value                      | Description                                                                                                                                                                                                                |
| KNJ_SAMPLING                                                                                | Optional   | Sampling count of requests | The number of requests based on which a sample is taken.<br><br>The default value is 10, which means that one out of every 10 requests is monitored.<br><br>If you do not set this variable, the default value 10 is used. |

Table 214. Supported user-defined environment variables for Node.js monitoring on IBM Cloud (continued)

| Variable name          | Importance | Value                                                                     | Description                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------|------------|---------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| KNJ_MIN_CLOCK_TRACE    | Optional   | Response time threshold for collecting method trace, in milliseconds      | <p>If the response time of a request instance exceeds the value of this variable, the data collector collects its method trace.</p> <p>The default value is 0.</p> <p>If you do not set this variable, the default value 0 is used.</p>                                                                                                                                                             |
| KNJ_MIN_CLOCK_STACK    | Optional   | Response time threshold for collecting stack trace, in milliseconds       | <p>If the response time of a request instance exceeds the value of this variable, the data collector collects its stack trace.</p> <p>The default value is 0.</p> <p>If you do not set this variable, the default value 0 is used.</p>                                                                                                                                                              |
| KNJ_ENABLE_METHODTRACE | Optional   | <ul style="list-style-type: none"> <li>• True</li> <li>• False</li> </ul> | <p>Enables or disables method trace.</p> <ul style="list-style-type: none"> <li>• If you set this variable to true, method trace for requests is disabled.</li> <li>• If you set this value to false, method trace for requests is enabled. This is the default value.</li> </ul> <p>If you do not set this variable, the default value False is used and method trace for requests is enabled.</p> |
| KNJ_ENABLE_DEEPDIVE    | Optional   | <ul style="list-style-type: none"> <li>• True</li> <li>• False</li> </ul> | <p>If you set this variable to true, then the diagnostic data is sent to the server. By default, this value is set to false, which means that diagnostic data is not sent to the server.</p>                                                                                                                                                                                                        |
| KNJ_ENABLE_TT          | Optional   | <ul style="list-style-type: none"> <li>• true</li> <li>• false</li> </ul> | <p>Enables or disables the transaction tracking of AAR.</p> <ul style="list-style-type: none"> <li>• If you set this variable to true, transaction tracking of AAR is enabled.</li> <li>• If you set this variable to false, transaction tracking of AAR is disabled.</li> </ul> <p>By default, this value is not set, which means transaction tracking is disabled.</p>                            |

Table 214. Supported user-defined environment variables for Node.js monitoring on IBM Cloud (continued)

| Variable name       | Importance | Value                                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------|------------|--------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| KNJ_AAR_BATCH_FREQ  | Optional   | Interval at which AAR data is sent, in seconds               | <p>Specifies the interval at which the AAR data is batched and sent to the server, in seconds.</p> <p>The default value is 60, which means the AAR data is batched and sent to the server every minute.</p> <p><b>Note:</b> This variable works with <u>KNJ_AAR_BATCH_COUNT</u> to determine when AAR data is batched and sent to the server. When the condition that is set by either of the two variables is met, AAR data is batched and sent. When the requests that the AAR data contains reaches the maximum number, for example 100, at a shorter interval than what is set, the data is still batched and sent immediately.</p> |
| KNJ_AAR_BATCH_COUNT | Optional   | Maximum number of requests that a batch of AAR data contains | <p>Specifies the maximum number of requests that a batch of AAR data can contain before it is sent to the server.</p> <p>The default value is 100, which means when the number of requests that a batch of AAR data contains reaches 100, this batch of AAR data is sent to the server.</p>                                                                                                                                                                                                                                                                                                                                             |

Table 214. Supported user-defined environment variables for Node.js monitoring on IBM Cloud (continued)

| Variable name | Importance | Value                                                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|------------|---------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| KNJ_LOG_LEVEL | Optional   | Level of information that is printed in the log                           | <p>Controls the level of information that is printed in the log. The following levels are provided:</p> <p><b>off</b><br/>Logs are not printed.</p> <p><b>error</b><br/>Information is only logged on an error condition.</p> <p><b>info</b><br/>Information is logged when the Node.js agent data collector is running normally. The raw monitoring data that is sent to the agent is also logged.</p> <p><b>debug</b><br/>The debug, info, and error information are printed in the log, for example, collected data, data that is sent to server, and server response.</p> <p><b>all</b><br/>All information is printed in the log.</p> <p>By default, the log level is info, which means the summary information about the data collector actions is printed in the log. Logs are printed to standard output.</p> |
| SECURITY_OFF  | Optional   | <ul style="list-style-type: none"> <li>• true</li> <li>• false</li> </ul> | <p>Enables or disables collection of user sensitive information, such as cookies, HTTP request context, and database request context.</p> <ul style="list-style-type: none"> <li>• If you set this variable to true, user sensitive information is collected.</li> <li>• If you set this variable to false, user sensitive information is not collected. This is the default value.</li> </ul> <p>If you do not specify this variable, the default value of false is used and user sensitive information is not collected.</p>                                                                                                                                                                                                                                                                                        |

## Unconfiguring the stand-alone Node.js data collector for IBM Cloud applications

If you do not need to monitor your Node.js environment or if you want to upgrade the stand-alone Node.js data collector, you must first unconfigure previous settings for the stand-alone Node.js data collector.

### Procedure

1. Remove the `require('ibmapm');` line from the application main file.

**Tip:** If you start your application by running the **node app.js** command, `app.js` is the main file of your application.

2. Remove the following dependencies from the `package.json` file.

```
"ibmapm": "./ibmapm"
```

**Remember:** Do not remove the dependencies that your application needs.

3. Delete the `ibmapm` folder from the home directory of your application.

### Results

You have successfully unconfigured the stand-alone Node.js data collector.

### What to do next

After you unconfigure the data collector, the Cloud APM console continues to display the data collector in any applications that you added the data collector to. The Cloud APM console will show that no data is available for the application and will not indicate that the data collector is offline. For information about how to remove the data collector from applications and from resource groups, see [“Removing data collectors from Cloud APM console” on page 262](#).

## Configuring the stand-alone Node.js data collector for on-premises applications

If you installed the Node.js application in on-premise environment, you must configure the Node.js data collector to collect information about the Node.js application.

### Before you begin

1. Make sure that your Node.js application can run successfully locally. The stand-alone Node.js data collector can monitor Node.js V8.0.0 and future fix packs, V10.0.0 and future fix packs, and V12.0.0 and future fix packs.
2. Download the data collector package from IBM Passport Advantage website. For detailed instructions, see [“Download instructions” on page 131](#).
3. Configure the data collector package with the `make_configuration_packages.sh` and `configure_agent_images.sh` scripts on the system where the Cloud APM server is installed. For detailed instructions, see [“Configuring the downloaded images” on page 182](#).

### Procedure

1. Extract files from the data collector package. The `nodejs_datacollector_8.1.4.0.6.tgz` package is included in the extracted directory.
2. Determine the home directory of your application.
  - For typical Node.js applications, if you use the **node app.js** command to start your Node.js application and the `app.js` main file is in the `/root/nodejs_app` directory, `/root/nodejs_app` is the home directory of your application.

- For collective members in the IBM API Connect environment, run the **wlpn-server list** command to display the list of all your collective member on the same machine. The home directory of your collective member is in the following format:

```
user_directory/collective-member_name/package
```

For example, if you get `/root/wlpn/rock-8345a96-148538-1/package` as a command output, `/root/wlpn` is the user directory and `rock-8345a96-148538-1` is the collective member name.

- For Developer Portal applications in the IBM API Connect environment, you can run the **ps -ef | grep node** command to find the home directory. If you get the following command output, for example, the home directory is `/home/admin/bgsync` and the main file of your application is `rest_server.js`:

```
admin 19085 1 0 Jun25 ? 00:06:53 /usr/local/bin/node /home/admin/bgsync/  
rest_server.js
```

- From the home directory of your application, run the following command to extract files from the data collector package:

```
tar -zxvf nodejs_datacollector_8.1.4.0.6.tgz
```

- Extract the `ibmapm.tgz` file in the `nodejs_dc` folder by running the following command:

```
tar -zxvf nodejs_dc/ibmapm.tgz
```

You will get an `ibmapm` folder.

- Run the following command to install the data collector to your application:

```
npm install ./ibmapm
```

- Add the following line to the beginning of the main file of your Node.js application:

```
require('ibmapm');
```

- If you start your application by running the **node app.js** command, `app.js` is the main file of your application.
- For collective members in the IBM API Connect environment, the main file is defined in the `package.json` file in the home directory or its sub-folders. By default, the main file is `home_directory/server/server.js`, where *home\_directory* is the home directory to your collective member.
- For Developer Portal applications in the IBM API Connect environment, you can run the **ps -ef | grep node** command to find the main file. If you get the following command output, for example, the main file of your application is `rest_server.js`.

```
admin 19085 1 0 Jun25 ? 00:06:53 /usr/local/bin/node /home/admin/bgsync/  
rest_server.js
```

- Restart your application.

#### Tip:

- To restart your collective member, run the `wlpn-server stop collective_member_name` command. The collective member automatically restarts after you run this command. If it does not start, run the `wlpn-server start collective_member_name` command to restart it manually.
- To restart your Developer Portal applications, first run the `/etc/init.d/restservice stop` command to stop the application, and then run the `/etc/init.d/restservice start` command to start it.

## Results

The data collector is configured and is connected to the Cloud APM server.

## What to do next

- You can verify that the monitoring data for your application is displayed in the Cloud APM console. For instructions on how to start the Cloud APM console, see [Starting the Cloud APM console](#). For information about using the Applications editor, see [Managing applications](#).
- To view topology information for your API Connect environment, enable transaction tracking. For more instructions, see description of the `KNJ_ENABLE_TT` variable in “[Customizing the Node.js data collector for on-premises applications](#)” on page 697.

**Remember:** To add your application to the Cloud APM console, choose **Node.js Runtime** in the application editor.

## Customizing the Node.js data collector for on-premises applications

By modifying files in the data collector package, you can set the environment variables to customize the monitoring for your Node.js application.

You can set the variables by customizing the environment variables or editing the `config.properties` file. You can find the `config.properties` file in the `ibmapm/etc` folder where your Node.js data collector is installed.

| Table 215. Supported variables |            |                                                                      |                                                                                                                                                                                                                                  |
|--------------------------------|------------|----------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Variable name                  | Importance | Value                                                                | Description                                                                                                                                                                                                                      |
| KNJ_SAMPLING                   | Optional   | Sampling count of requests                                           | The number of requests based on which a sample is taken.<br><br>The default value is 10, which means that one out of every 10 requests is monitored.<br><br>If you do not set this variable, the default value 10 is used.       |
| KNJ_MIN_CLOCK_TRACE            | Optional   | Response time threshold for collecting method trace, in milliseconds | If the response time of a request instance exceeds the value of this variable, the data collector collects its method trace.<br><br>The default value is 0.<br><br>If you do not set this variable, the default value 0 is used. |
| KNJ_MIN_CLOCK_STACK            | Optional   | Response time threshold for collecting stack trace, in milliseconds  | If the response time of a request instance exceeds the value of this variable, the data collector collects its stack trace.<br><br>The default value is 0.<br><br>If you do not set this variable, the default value 0 is used.  |

Table 215. Supported variables (continued)

| Variable name          | Importance | Value                                                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------|------------|---------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| KNJ_ENABLE_METHODTRACE | Optional   | <ul style="list-style-type: none"> <li>• True</li> <li>• False</li> </ul> | <p>Enables or disables method trace.</p> <ul style="list-style-type: none"> <li>• If you set this variable to true, method trace for requests is disabled.</li> <li>• If you set this value to false, method trace for requests is enabled. This is the default value.</li> </ul> <p>If you do not set this variable, the default value <code>False</code> is used and method trace for requests is enabled.</p>                                                                                                                                                                                                                                 |
| KNJ_ENABLE_DEEPDIVE    | Optional   | <ul style="list-style-type: none"> <li>• True</li> <li>• False</li> </ul> | <p>If you set this variable to true, then the diagnostic data is sent to the server. By default, this value is set to false, which means that diagnostic data is not sent to the server.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| KNJ_ENABLE_TT          | Optional   | <ul style="list-style-type: none"> <li>• true</li> <li>• false</li> </ul> | <p>Enables or disables the transaction tracking of AAR.</p> <ul style="list-style-type: none"> <li>• If you set this variable to true, transaction tracking of AAR is enabled.</li> <li>• If you set this variable to false, transaction tracking of AAR is disabled.</li> </ul> <p>By default, this value is not set, which means transaction tracking is disabled.</p>                                                                                                                                                                                                                                                                         |
| KNJ_AAR_BATCH_FREQ     | Optional   | Interval at which AAR data is sent, in seconds                            | <p>Specifies the interval at which the AAR data is batched and sent to the server, in seconds.</p> <p>The default value is 60, which means the AAR data is batched and sent to the server every minute.</p> <p><b>Note:</b> This variable works with <a href="#">KNJ_AAR_BATCH_COUNT</a> to determine when AAR data is batched and sent to the server. When the condition that is set by either of the two variables is met, AAR data is batched and sent. When the requests that the AAR data contains reaches the maximum number, for example 100, at a shorter interval than what is set, the data is still batched and sent immediately.</p> |

Table 215. Supported variables (continued)

| Variable name       | Importance | Value                                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------|------------|--------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| KNJ_AAR_BATCH_COUNT | Optional   | Maximum number of requests that a batch of AAR data contains | <p>Specifies the maximum number of requests that a batch of AAR data can contain before it is sent to the server.</p> <p>The default value is 100, which means when the number of requests that a batch of AAR data contains reaches 100, this batch of AAR data is sent to the server.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| KNJ_LOG_LEVEL       | Optional   | Level of information that is printed in the log              | <p>Controls the level of information that is printed in the log. The following levels are provided:</p> <p><b>off</b><br/>Logs are not printed.</p> <p><b>error</b><br/>Information is only logged on an error condition.</p> <p><b>info</b><br/>Information is logged when the Node.js agent data collector is running normally. The raw monitoring data that is sent to the agent is also logged.</p> <p><b>debug</b><br/>The debug, info, and error information are printed in the log, for example, collected data, data that is sent to server, and server response.</p> <p><b>all</b><br/>All information is printed in the log.</p> <p>By default, the log level is <b>info</b>, which means the summary information about the data collector actions is printed in the log. Logs are printed to standard output.</p> |

Table 215. Supported variables (continued)

| Variable name | Importance | Value                                                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|------------|---------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SECURITY_OFF  | Optional   | <ul style="list-style-type: none"> <li>• true</li> <li>• false</li> </ul> | <p>Enables or disables collection of user sensitive information, such as cookies, HTTP request context, and database request context.</p> <ul style="list-style-type: none"> <li>• If you set this variable to true, user sensitive information is collected.</li> <li>• If you set this variable to false, user sensitive information is not collected. This is the default value.</li> </ul> <p>If you do not specify this variable, the default value of false is used and user sensitive information is not collected.</p> |

## Unconfiguring the stand-alone Node.js data collector for on-premises applications

If you do not need to monitor your Node.js environment or if you want to upgrade the stand-alone Node.js data collector, you must first unconfigure previous settings for the stand-alone Node.js data collector.

### Procedure

1. Remove the `require('ibmapm');` line from the application main file.

**Tip:** If you start your application by running the **node app.js** command, `app.js` is the main file of your application.

2. Remove `"ibmapm": "./ibmapm"` from the dependencies section in the `package.json` file of your Node.js application.
3. Delete the `node_modules` folder from the home directory of your application.
4. Run the `npm install` command to install application dependencies.

### Results

You have successfully unconfigured the stand-alone Node.js data collector.

### What to do next

After you unconfigure the data collector, the Cloud APM console continues to display the data collector in any applications that you added the data collector to. The Cloud APM console will show that no data is available for the application and will not indicate that the data collector is offline. For information about how to remove the data collector from applications and from resource groups, see [“Removing data collectors from Cloud APM console”](#) on page 262.

## Configuring the stand-alone Node.js data collector for Kubernetes applications

If you installed the Node.js application on Kubernetes, you can configure the Node.js data collector to collect information about the Node.js application.

### Before you begin

1. Make sure that your Node.js application can run successfully. The stand-alone Node.js data collector can monitor Node.js V8.0.0 and future fix packs, V10.0.0 and future fix packs, and V12.0.0 and future fix packs.
2. Download the data collector package from IBM Passport Advantage website. For detailed instructions, see [“Download instructions”](#) on page 131.
3. Configure the data collector package with the `make_configuration_packages.sh` and `configure_agent_images.sh` scripts on the system where the Cloud APM server is installed. For detailed instructions, see [“Configuring the downloaded images”](#) on page 182.

### Procedure

1. Extract files from the data collector package. The `nodejs_datacollector_8.1.4.0.6.tgz` package is included in the extracted directory.
2. Extract the `nodejs_datacollector_8.1.4.0.6.tgz` file, for example, by running the following command:

```
tar -zxvf nodejs_datacollector_8.1.4.0.6.tgz
```

3. Extract the `ibmapm.tgz` file in the `nodejs_dc` folder by running the following command:

```
tar -zxvf nodejs_dc/ibmapm.tgz
```

You will get an `ibmapm` folder.

4. In the `package.json` file of your Node.js application, add the following line to the dependencies section:

```
"ibmapm": "./ibmapm"
```

**Remember:** Do not miss the comma at the end of each line in the file except the last one, and keep the `package.json` file in good form.

5. Add the following line to the beginning of the main file of your Node.js application:

```
require('./ibmapm');
```

If you start your application by running the `node app.js` command, `app.js` is the main file of your application.

6. Rebuild your docker image.

**Note:** If you run your Node.js app on other Docker environments, for example, Docker Swarm or AWS Docker services, you need to dockerize the steps.

### What to do next

If you want to customize the monitoring, you can add environment variables in your deployment yaml file. For details, see [“Customizing the stand-alone Node.js data collector for Kubernetes applications”](#) on page 702.

## Customizing the stand-alone Node.js data collector for Kubernetes applications

You can add environment variables to the deployment yaml file to customize the monitoring for your Kubernetes application.

### User-defined environment variables for the Node.js data collector

You can use the information in the following table to customize Node.js monitoring on Kubernetes.

| Table 216. Supported user-defined environment variables for Node.js monitoring on Kubernetes |            |                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------------------------------------------------------------------|------------|------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Variable name                                                                                | Importance | Value                                                                  | Description                                                                                                                                                                                                                                                                                                                                                                                      |
| KNJ_SAMPLING                                                                                 | Optional   | Sampling count of requests                                             | <p>The number of requests based on which a sample is taken.</p> <p>The default value is 10, which means that one out of every 10 requests is monitored.</p> <p>If you do not set this variable, the default value 10 is used.</p>                                                                                                                                                                |
| KNJ_MIN_CLOCK_TRACE                                                                          | Optional   | Response time threshold for collecting method trace, in milliseconds   | <p>If the response time of a request instance exceeds the value of this variable, the data collector collects its method trace.</p> <p>The default value is 0.</p> <p>If you do not set this variable, the default value 0 is used.</p>                                                                                                                                                          |
| KNJ_MIN_CLOCK_STACK                                                                          | Optional   | Response time threshold for collecting stack trace, in milliseconds    | <p>If the response time of a request instance exceeds the value of this variable, the data collector collects its stack trace.</p> <p>The default value is 0.</p> <p>If you do not set this variable, the default value 0 is used.</p>                                                                                                                                                           |
| KNJ_ENABLE_METHODTRACE                                                                       | Optional   | <ul style="list-style-type: none"><li>• True</li><li>• False</li></ul> | <p>Enables or disables method trace.</p> <ul style="list-style-type: none"><li>• If you set this variable to true, method trace for requests is disabled.</li><li>• If you set this value to false, method trace for requests is enabled. This is the default value.</li></ul> <p>If you do not set this variable, the default value False is used and method trace for requests is enabled.</p> |
| KNJ_ENABLE_DEEPDIVE                                                                          | Optional   | <ul style="list-style-type: none"><li>• True</li><li>• False</li></ul> | <p>If you set this variable to true, then the diagnostic data is sent to the server. By default, this value is set to false, which means that diagnostic data is not sent to the server.</p>                                                                                                                                                                                                     |

Table 216. Supported user-defined environment variables for Node.js monitoring on Kubernetes (continued)

| Variable name       | Importance | Value                                                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------|------------|---------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| KNJ_ENABLE_TT       | Optional   | <ul style="list-style-type: none"> <li>• true</li> <li>• false</li> </ul> | <p>Enables or disables the transaction tracking of AAR.</p> <ul style="list-style-type: none"> <li>• If you set this variable to true, transaction tracking of AAR is enabled.</li> <li>• If you set this variable to false, transaction tracking of AAR is disabled.</li> </ul> <p>By default, this value is not set, which means transaction tracking is disabled.</p>                                                                                                                                                                                                                                                                         |
| KNJ_AAR_BATCH_FREQ  | Optional   | Interval at which AAR data is sent, in seconds                            | <p>Specifies the interval at which the AAR data is batched and sent to the server, in seconds.</p> <p>The default value is 60, which means the AAR data is batched and sent to the server every minute.</p> <p><b>Note:</b> This variable works with <a href="#">KNJ_AAR_BATCH_COUNT</a> to determine when AAR data is batched and sent to the server. When the condition that is set by either of the two variables is met, AAR data is batched and sent. When the requests that the AAR data contains reaches the maximum number, for example 100, at a shorter interval than what is set, the data is still batched and sent immediately.</p> |
| KNJ_AAR_BATCH_COUNT | Optional   | Maximum number of requests that a batch of AAR data contains              | <p>Specifies the maximum number of requests that a batch of AAR data can contain before it is sent to the server.</p> <p>The default value is 100, which means when the number of requests that a batch of AAR data contains reaches 100, this batch of AAR data is sent to the server.</p>                                                                                                                                                                                                                                                                                                                                                      |

Table 216. Supported user-defined environment variables for Node.js monitoring on Kubernetes (continued)

| Variable name | Importance | Value                                                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|------------|---------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| KNJ_LOG_LEVEL | Optional   | Level of information that is printed in the log                           | <p>Controls the level of information that is printed in the log. The following levels are provided:</p> <p><b>off</b><br/>Logs are not printed.</p> <p><b>error</b><br/>Information is only logged on an error condition.</p> <p><b>info</b><br/>Information is logged when the Node.js agent data collector is running normally. The raw monitoring data that is sent to the agent is also logged.</p> <p><b>debug</b><br/>The debug, info, and error information are printed in the log, for example, collected data, data that is sent to server, and server response.</p> <p><b>all</b><br/>All information is printed in the log.</p> <p>By default, the log level is info, which means the summary information about the data collector actions is printed in the log. Logs are printed to standard output.</p> |
| SECURITY_OFF  | Optional   | <ul style="list-style-type: none"> <li>• true</li> <li>• false</li> </ul> | <p>Enables or disables collection of user sensitive information, such as cookies, HTTP request context, and database request context.</p> <ul style="list-style-type: none"> <li>• If you set this variable to true, user sensitive information is collected.</li> <li>• If you set this variable to false, user sensitive information is not collected. This is the default value.</li> </ul> <p>If you do not specify this variable, the default value of false is used and user sensitive information is not collected.</p>                                                                                                                                                                                                                                                                                        |

### Example of yaml file

```
spec:
  containers:
  - name: testapp
    image: mycluster.icp:8500/default/testapp:v1
    imagePullPolicy: Always
    ports:
    - containerPort: 3000
```

```
protocol: TCP
env:
- name: KNJ_LOG_LEVEL
  value: "debug"
- name: KNJ_ENABLE_TT
  value: "true"
- name: KNJ_ENABLE_DEEPDIVE
  value: "true"
```

## Unconfiguring the stand-alone Node.js data collector for Kubernetes applications

If you do not need to monitor your Node.js environment or if you want to upgrade the stand-alone Node.js data collector, you must first unconfigure previous settings for the stand-alone Node.js data collector.

### Procedure

1. Remove the `require('ibmapm');` line from the application main file.

**Tip:** If you start your application by running the `node app.js` command, `app.js` is the main file of your application.

2. Remove the following dependencies from the `package.json` file.

```
"ibmapm": "./ibmapm"
```

**Remember:** Do not remove the dependencies that your application needs.

### Results

You have successfully unconfigured the stand-alone Node.js data collector.

### What to do next

After you unconfigure the data collector, the Cloud APM console continues to display the data collector in any applications that you added the data collector to. The Cloud APM console will show that no data is available for the application and will not indicate that the data collector is offline. For information about how to remove the data collector from applications and from resource groups, see [“Removing data collectors from Cloud APM console”](#) on page 262.

## Configuring OpenStack monitoring

---

You must configure the Monitoring Agent for OpenStack before the agent can automatically monitor the OpenStack agent environment.

### Procedure

1. Configure the agent by responding to prompts. For instructions, see [“Configuring the OpenStack agent”](#) on page 706.
2. If you want to collect process-related information, configure the data collector for the OpenStack agent. For instructions, see [“Enabling process-related information collection and SSH connections”](#) on page 707.
3. Enter configuration values for the agent to operate. For instructions, see [“Adding the configuration values”](#) on page 709.

## Configuring the OpenStack agent

For a typical environment, if you want the OpenStack agent to automatically monitor the OpenStack environment, you must configure the agent first.

### Before you begin

Make sure that you have installed all required software as described in [Preinstallation on Linux systems](#).

### Procedure

You have two options to configure the OpenStack agent on a Linux system:

- To configure the agent by running the script and responding to prompts, see [“Interactive configuration” on page 706](#).
- To configure the agent by editing the silent response file and running the script with no interaction, see [“Silent configuration” on page 707](#).

### Interactive configuration

#### Procedure

1. To configure the agent, run the following command:

```
install_dir/bin/openstack-agent.sh config instance_name
```

where *install\_dir* is the installation directory of your OpenStack agent. The default installation directory is `/opt/ibm/apm/agent`.

2. When prompted to Enter `instance_name`, specify an instance name.

**Important:** The OpenStack agent is a multiple instance agent and requires an instance name for each agent instance. The instance name that you specify is included in the managed system name `instance_name: host_name: sg`. The length of the instance name you specify is limited to 28 characters minus the length of your host name. For example, if you specify `OS1` as your instance name, your managed system name is `OS1: hostname: SG`.

3. When prompted to Edit `Monitoring Agent for OpenStack`, press `Enter` to continue.
4. When prompted to Edit `OpenStack environment authentication information`, provide the following information:

```
OpenStack authentication url (default is: http://localhost:identity/v3):
OpenStack username (default is: admin):
Enter OpenStack password (default is: ):
Re-type: OpenStack password (default is: ):
OpenStack tenant name (default is: admin):
```

5. When prompted for `Python Executable Location`, specify the Python executable location, for example, `/usr/bin/python`.

You can find the fully qualified path by running the following command in your environment:

```
which python
```

6. When prompted for `Port Number`, accept the default value or specify a port number.

This port is used for monitoring internal communication between the OpenStack agent data collector and the OpenStack agent, both of which are installed on a local server only. The agent listens on this port for data from the data collector. The default value of 0 indicates that an ephemeral port is used when the agent starts. On a server with strict security rules on ports, you can configure one specific port for the agent to use. This port is for internal use by the agent and is not related to the OpenStack environment.

7. Edit the `/etc/hosts` file on your system to add host mapping for each monitored node.

## Silent configuration

### Procedure

1. Open the `sg_silent_config.txt` file in a text editor. The file is in the `install_dir/samples` directory, where `install_dir` is the installation directory of the OpenStack agent.
2. Edit the `sg_silent_config.txt` configuration file for the OpenStack agent.
3. Specify values for the parameters that are identified in the file. The response file contains comments that define the available parameters and the values to specify.
4. Save the file and exit.
5. Edit the `/etc/hosts` file on your system to add host mapping for each monitored node.
6. From the `install_dir/samples` directory, run the following command to configure the agent:

```
install_dir/bin/openstack-agent.sh config instance_name path_to_response_file
```

where `install_dir` is the name of the instance to be configured, and `path_to_responsefile` is the full path of the silent response file. Specify an absolute path to this file.

For example, if the response file is in the default directory, run the following command.

```
/opt/ibm/apm/agent/bin/openstack-agent.sh config instance_name  
/opt/ibm/apm/agent/samples/sg_silent_config.txt
```

### Results

The agent is configured.

### What to do next

- After you finish configuring the agent, you can start the agent instance by running the command:

```
install_dir/bin/openstack-agent.sh start instance_name
```

where `instance_name` is the name of the agent instance to be configured.

- To connect the OpenStack agent to an SSL-enabled OpenStack environment, specify the directory of your OpenStack server SSL certificate by setting the following variable:

```
OS_cert_path=directory of the certificate.crt file
```

The `OS_cert_path` variable is in the `OS_authentication_info` section in the `ksg_dc_instance_name.cfg` file.

- If you want to collect process-related information, configure the data collector for the OpenStack agent by completing the steps in [“Enabling process-related information collection and SSH connections” on page 707](#).
- If you want to change the trace level of the agent for troubleshooting purpose, edit the value of the variable `KBB_RAS1` in the `install_dir/config/sg.environment` file according to the instructions in the file.

## Enabling process-related information collection and SSH connections

If you want to collect process-related information, configure the agent data collector for the OpenStack agent and set up SSH connections with the target OpenStack component server.

### About this task

You must set up an SSH connection to collect process information before you start the OpenStack agent. To set up the connection, use the `ksg_setup_key.sh` or `ksg_ssh_setup.py` assistance tool provided by the product and described in the following procedure.

If you are familiar with setting up SSH connections, you can also use the **ssh-keygen** and **ssh-copy-id** Linux commands to set up the connection

## Procedure

1. Go to the *install\_dir*/config directory, where *install\_dir* is the agent installation directory.
2. Edit the *ksg\_dc\_instance\_name*.cfg file, where *instance\_name* is the name you specified for this agent instance.

The file is created after the agent instance starts. If the file does not exist, copy *install\_dir*/1x8266/sg/bin/ksg\_dc.cfg to the *install\_dir*/config directory and change the file name to *ksg\_dc\_instance\_name*.cfg.

For example, if the instance name is OS1, change the name to *ksg\_dc\_OS1*.cfg.

3. In the *ksg\_dc\_instance\_name*.cfg file, set the value of the parameter **collect\_process\_information** to YES.
4. In the **OS\_process\_collection** section, specify the value for the **ssh\_user\_host** parameter with the users and host names or IP addresses of the OpenStack component servers according to the format of the following example:

```
ssh_user_host=root@9.112.250.248,user1@hostname
```

5. Save the settings.
6. For the settings to take effect, restart the agent instance by running the following commands:

```
install_dir/bin/openstack-agent.sh stop instance_name
install_dir/bin/openstack-agent.sh start instance_name
```

7. Set up the SSH connections with the target component server by using one of the following ways:

- Set up the connections one by one by using the *ksg\_setup\_key*.sh script: go to *install\_dir*/1x8266/sg/bin directory and run the *ksg\_setup\_key*.sh script with host name or IP and user to build the SSH connections with component servers that are specified in Step 4. If you follow the example that is given in Step 4, you must run the script twice to set up the connection one by one:

```
./ksg_setup_key.sh 9.112.250.248 root
./ksg_setup_key.sh hostname user1
```

**Note:** You must provide the passwords when you run the scripts for the first time. You don't need to provide the passwords again.

- Set up the connections one by one or in a batch job by using the *ksg\_ssh\_setup*.py tool that is provided by the OpenStack agent in *install\_dir*/1x8266/sg/bin. You must install Python pexpect library before you can use this tool.

- To set up SSH connections one by one, run the command:

```
python ksg_ssh_setup.py -single
```

This command helps you to set up the SSH connection to the remote target server. You must provide the following information:

```
Enter the remote target machine host name or IP address: (Type 'END' to end input.)
Enter the account to access the remote machine(e.g. root):
Enter the above user's password:
```

- To set up SSH connections in a batch job, run the command:

```
python ksg_ssh_setup.py -ssh SSH_file
```

where *SSH\_file* is the file that contains the target server, user, and password information. You must create the file according to the *ksg\_dc\_ssh\_list.txt* file in the same directory as the

Python tool, and specify the host and user information in the file according to the format of the examples:

```
hostname root passw0rd
9.112.250.248 user1 passw0rd
```

**Note:** You must set up the connections again only when the user name or password for the target server changes. You do not need to set up the connections again after you restart the agent or change the agent configuration.

## Results

The data collector is configured and the SSH connections are set up properly. Now, you can log in to the Cloud APM console and use the Applications editor to add the OpenStack agent instance to the Application Performance Dashboard. When you add the agent instance, choose **OpenStack Environment** from the component list when adding the agent instance.

## What to do next

- When you click **API End Point Summary By Service Type > API Endpoint Details**, you see a No data available message in the **API Detecting Failure Times History** and **API Detecting Failure Percent History** group widgets. Click an API endpoint shown in **API Endpoint Details** and you can view monitoring data in the two group widgets.
- When you click **Process Summary By Component > Process Details** or **SSH Server Connection Status > Process Details**, you see a No data available message in the **Process CPU Usage History** and **Process Memory Usage History** group widgets. Click a process shown in **Process Details** and you can view monitoring data in the two group widgets.

## Adding the configuration values

For both local and remote configuration, you provide the configuration values for the agent to operate.

When you use the interactive mode to configure the agent, a panel is displayed so you can enter each value. When a default value exists, this value is pre-entered into the field. If a field represents a password, two entry fields are displayed. You must enter the same value in each field. The values that you type are not displayed to help maintain the security of these values.

When you use the silent mode to configure the agent, you can edit the *response\_file* in the *install\_dir/samples* directory to add the configuration values. After you save the changes, follow the instructions in Step [“6” on page 707](#) and run the following command for the changes to take effect:

```
install_dir/bin/openstack-agent.sh start instance_name
```

where *instance\_name* is the name of the agent instance to be configured.

After the configuration completes, you can find the configured values in the *.cfg* file of the agent instance, for example, *hostname\_sg\_instance\_name.cfg*.

The configuration for this agent is organized into the following groups:

### OpenStack environment authentication information (OPENSTACK\_CONNECTION)

The OpenStack environment authentication information

The configuration elements defined in this group are always present in the agent's configuration.

This group defines information that applies to the entire agent.

### OpenStack authentication url (KSG\_OPENSTACK\_AUTH\_URL)

The auth\_url of OpenStack environment

The type is string.

This value is required.

Default value: `http://localhost:identity/v3`

**OpenStack password (KSG\_OPENSTACK\_PASSWORD)**

The administrator user's password

The type is password.

This value is required.

Default value: None

**OpenStack tenant name (KSG\_OPENSTACK\_TENANT\_NAME)**

The OpenStack tenant name, also known as the project name

The type is string.

This value is required.

Default value: admin

**OpenStack username (KSG\_OPENSTACK\_USERNAME)**

The administrator user to log in to the OpenStack environment

The type is string.

This value is required.

Default value: admin

**Python (KSG\_PYTHON)**

Python executable location

The configuration elements defined in this group are always present in the agent's configuration.

This group defines information that applies to the entire agent.

**Python Executable Location (KSG\_PYTHON\_LOCATION)**

The python executable that will be used to run the OpenStack agent data collector. You can find the fully qualified path by running the following command in your terminal: "which python".

The type is string.

This value is required.

Default value: None

**Socket (KSG\_SOCKET)**

Socket Data Source

The configuration elements defined in this group are always present in the configuration of the agent.

This group defines information that applies to the entire agent.

**Port Number (CP\_PORT)**

The port that the agent will use to listen on for data from socket clients. A value of 0 indicates an ephemeral port will be used. This port does NOT correspond to any ports used by your application. This port is for internal use by the agent.

The type is numeric.

This value is optional.

Default value: 0

## Configuring Oracle Database monitoring

---

The Monitoring Agent for Oracle Database provides monitoring capabilities for the availability, performance, and resource usage of the Oracle database. You can configure more than one Oracle

Database agent instance to monitor different Oracle databases. Remote monitoring capability is also provided by this agent.

## Before you begin

- Before you configure the Oracle Database agent, you must grant privileges to the Oracle user account that is used by the Oracle Database agent. For more information about privileges, see [Granting privileges to the Oracle Database agent user](#).
- If you are monitoring an Oracle database remotely, the agent must be installed on a computer with either the Oracle database software or the Oracle Instant Client installed.

## About this task

The directions here are for the most current release of the agent, except as indicated. For information about how to check the version of an agent in your environment, see [Agent version](#).

For general Oracle database performance monitoring, the Oracle Database agent provides monitoring for the availability, performance, resource usage, and activities of the Oracle database, for example:

- Availability of instances in the monitored Oracle database.
- Resource information such as memory, caches, segments, resource limitation, tablespace, undo (rollback), system metric, and system statistics.
- Activity information, such as OS statistics, sessions, contention, and alert log.

The Oracle Database agent is a multiple-instance agent. You must create the first instance and start the agent manually. Additionally, each agent instance can monitor multiple databases.

The Managed System Name for the Oracle Database agent includes a database connection name that you specify, an agent instance name that you specify, and the host name of the computer where the agent is installed. For example, `pc:connection_name-instance_name-host_name:SUB`, where *pc* is your two character product code and *SUB* is the database type (Possible values are RDB, ASM, or DG). The Managed System Name is limited to 32 characters. The instance name that you specify is limited to 23 characters, minus the length of your host name and database connection. For example, if you specify **dbconn** as your database connection name, **Oracle02** as your agent instance name, and your host name is *Prod204a*, your managed system name is `RZ:dbconn-oracle02-Prod204a:RDB`. This example uses 22 of the 23 characters available for the database connection name, agent instance name, and host name.

- If you specify a long instance name, the Managed System name is truncated and the agent code does not display correctly.
- The length of the *connection\_name*, *instance\_name*, and *hostname\_name* variables are truncated when they exceed 23 characters.
- To avoid a subnode name that is truncated, change the subnode naming convention by setting the following environment variables: **KRZ\_SUBNODE\_INCLUDING\_AGENTNAME**, **KRZ\_SUBNODE\_INCLUDING\_HOSTNAME**, and **KRZ\_MAX\_SUBNODE\_ID\_LENGTH**.
- If you set **KRZ\_SUBNODE\_INCLUDING\_AGENTNAME** to N0, the subnode ID part of the subnode name does not include the agent instance name. For example,
  - Default subnode name: *DBConnection-Instance-Hostname*
  - Subnode name with environment variable set to N0: *DBConnection-Hostname*
- If you set **KRZ\_SUBNODE\_INCLUDING\_HOSTNAME** to N0, the subnode ID part of the subnode name does not include the host name. For example,
  - Default subnode name: *DBConnection-Instance-Hostname*
  - Subnode name with environment variable set to N0: *DBConnection-Instance*

## Procedure

1. To configure the agent on Windows systems, you can use the **IBM Performance Management** window or the silent response file.
  - “[Configuring the agent on Windows systems](#)” on page 712.
  - “[Configuring the agent by using the silent response file](#)” on page 720.
2. To configure the agent on Linux and UNIX systems, you can run the script and respond to prompts, or use the silent response file.
  - “[Configuring the agent by responding to prompts](#)” on page 716.
  - “[Configuring the agent by using the silent response file](#)” on page 720.

## What to do next

For advanced configuration only, the Oracle database administrator must enable the Oracle user to run the `krzgrant.sql` script to access the database, see [Running the krzgrant.sql script](#).

In the Cloud APM console, go to your Application Performance Dashboard to view the data that was collected. For information about using the Cloud APM console, see “[Starting the Cloud APM console](#)” on page 1109.

If you are unable to view the data in the agent dashboards, first check the server connection logs and then the data provider logs. The default paths to these logs are as follows:

- **Linux**    **UNIX**    `/opt/ibm/apm/agent/logs`
- **Windows**    `C:\IBM\APM\TMAITM6_x64\logs`

For help with troubleshooting, see the [Cloud Application Performance Management Forum](#).

## Configuring the agent on Windows systems

You can configure the agent on Windows operating systems by using the **IBM Performance Management** window. After you update the configuration values, start the agent to save the updated values.

## Procedure

1. Click **Start > All Programs > IBM Monitoring agents > IBM Cloud Application Performance Management**.
2. In the **IBM Performance Management** window, right-click the **Monitoring Agent for Oracle Database** template, and then click **Configure agent**.

**Remember:** After you configure an agent instance for the first time, the **Configure agent** option is disabled. To configure the agent instance again, right-click on it and then click **Reconfigure**.
3. In the Monitoring Agent for Oracle Database window, complete the following steps:
  - a) Enter a unique instance name for the Monitoring Agent for Oracle Database instance, and click **OK**.
4. On the Default Database Configuration pane of the **Configure ITCAM Extended Agent for Oracle Database** window, perform the following steps:
  - a) Enter the **Default Username**. This is the default database user ID for database connections.

This user ID is the ID that the agent uses to access the monitored database instance. This user ID must have select privileges on the dynamic performance views and tables that are required by the agent.
  - b) Enter the **Default Password**. This is the password that is associated with the specified default database user ID.
  - c) If the Oracle agent version is 8.0, perform this step.
    - i) Enter the **Oracle JDBC Jar File**. This is the full path to the Oracle JDBC driver jar file used to communicate with the Oracle database. The Oracle Java Database Connectivity (JDBC) driver

that supports the Oracle database versions monitored by the Oracle agent must be available on the agent computer.

- d) If the Oracle agent version is 6.3.1.10, perform these steps.
    - i) If the Oracle Database agent is installed on the Oracle database server that is monitored, select **Use libraries in Oracle home** and enter the **Oracle Home Directory**. Optionally for local monitoring, the Oracle Home Directory setting can be left blank and the *ORACLE\_HOME* system environment variable is used.
    - ii) If the Oracle Database agent is remote from the Oracle database server that is monitored, select **Use libraries in Oracle instant client** and enter the **Oracle Instant Client Installation Directory**.
  - e) If you need to set advanced configuration options, check **Show advanced options** otherwise, proceed to [step 5](#).
  - f) Net Configuration Files Directories can be left blank and the default directory is used. If the Oracle agent version is 6.3.1.10, you can enter multiple net configuration file directories by using a semi-colon (;) to separate the directories. For Oracle agent version 8.0, only one directory is supported.

This setting contains the Oracle database net configuration file or files. The directory is defined by the *TNS\_ADMIN* environment variable for each Oracle database instance. The default directory is %ORACLE\_HOME%\NETWORK\ADMIN. If this item is not configured, the default directory is used. To disable the use of the default directory, set the following agent environment variable to false: KRZ\_LOAD\_ORACLE\_NET=false.
  - g) Leave the Customized SQL definition file name blank. It is not used.
  - h) Choose whether the default dynamic listener is configured at this workstation.

The default dynamic listener is (PROTOCOL=TCP) (HOST=localhost) (PORT=1521). If the default dynamic listener is configured at this workstation, set this value to Yes.
  - i) Click **Next**.
5. On the **Instance configuration** pane of the **Configure ITCAM Extended Agent for Oracle Database** window, perform the following steps:
- This is where the actual database connection instances are defined. You need to add at least one. This is also where you edit and delete database connection instances. If multiple database connection instance configurations exist, use the **Database connections** option to choose the instance to edit or delete.
- a) Press **New** in the **Database connections** section.
  - b) Enter a **Database Connection Name** as an alias for the connection to the database.

This alias can be anything that you choose to represent the database connection with the following restrictions. Only letters, Arabic numerals, the underline character, and the minus character can be used in the connection name. The maximum length of a connection name is 25 characters.
  - c) Choose a **Connection Type**
    - i) (Optional) Basic

The default and most common connection type is **Basic**. If you are unsure which connection type you need, it is suggested that you choose this connection type.

      - a) Select the **Basic** connection type when the target monitored database is a single instance, such as a standard file system instance or an ASM single instance.
      - b) Enter the Hostname as the host name or IP address for the database.
      - c) Enter the Port number that is used by the database.
      - d) Select either **Service Name** or **SID**.
        - i. When **Service Name** is selected, enter the name of the service that is a logical representation of a database, a string that is the global database service name.

A service name is a logical representation of a database, which is the way that a database is presented to clients. A database can be presented as multiple services and a service can be implemented as multiple database instances. The service name is a string that is the global database name, that is, a name composed of the database name and domain name, entered during installation or database creation. If you are not sure what the global database name is, then you can obtain it from the value of the `SERVICE_NAMES` parameter in the initialization parameter file.

- ii. When **SID** is selected, enter the Oracle System Identifier that identifies a specific instance of a running database.

This is the Oracle System Identifier that identifies a specific instance of a database.

Proceed to [step 5d](#).

ii) (Optional) TNS

- a) Select the **TNS** connection type if the `ORACLE_HOME` system environment variable is set and the TNS alias for the target monitored database is defined in the `$ORACLE_HOME/network/admin/tnsnames.ora` file.
- b) Enter the **TNS alias** name.

Proceed to [step 5d](#).

iii) (Optional) Advanced

- a) Select the **Advanced** connection type when there is more than one Oracle Instance across multiple physical nodes for the target monitored database. For example, an ASM with Real Applications Cluster (RAC) database.
- b) Enter the **Oracle Connection String**.

This attribute supports all Oracle Net naming methods as follows:

- SQL Connect URL string of the form://host:port/service name. For example, //dlsun242:1521/bjava21.
- Oracle Net keyword-value pair. For example,

```
(DESCRIPTION=(ADDRESS=(PROTOCOL=tcp) (HOST=dlsun242) (PORT=1521))
(CONNECT_DATA=(SERVICE_NAME=bjava21)))
```

- **TNSNAMES** entries, such as **inst1**, with the `TNS_ADMIN` or `ORACLE_HOME` environment variable set and the configuration files configured.

Proceed to [step 5d](#).

- d) Check **Use a different user name and password** for this connection to use different credentials than the default credentials that you set in [step 4a](#) and [step 4b](#). Otherwise, proceed to [step 5g](#).
- e) Enter the **Database Username** for this connection.

This user ID is the ID that the agent uses to access the monitored database instance. This user ID must have select privileges on the dynamic performance views and tables that are required by the agent.
- f) Enter the **Database Password**. The password that is associated with the specified database user ID.
- g) Select a **Role** that matches the permissions that are granted to the database connection's credentials.

The role is the set of privileges to be associated with the connection. For a user that was granted the SYSDBA system privilege, specify a role that includes that privilege. For ASM instances, use the **SYSDBA** or **SYSASM** role.
- h) Check **Show remote log monitoring options** if you monitor remote Oracle alert logs from this agent instance, otherwise proceed to [step 5k](#).
- i) Enter a path or use **Browse** to select the **Oracle Alert log file paths**.

The absolute file paths of mapped alert log files for remote database instances in this database connection. The agent monitors alert logs by reading these files. Usually found at \$ORACLE\_BASE/diag/rdbms/DB\_NAME/SID/trace/alert\_SID.log. For example, if the DB\_NAME and SID are both db11g and ORACLE\_BASE is /home/dbowner/app/oracle, then the alert log would be found at /home/dbowner/app/oracle/diag/rdbms/db11g/db11g/trace/alert\_db11g.log.

**Windows** If the Oracle Database agent runs and reads the alert log files through the network, the remote file path must follow the universal naming convention for Windows systems. For example, \\tivx015\path\alert\_orcl.log.

**Windows**

**Important:** Enter the path and alert log file name together. A mapped network driver is not supported for the alert log path.

**Linux** **UNIX** If the Oracle Database agent is on a remote server, a locally mounted file system is required for to monitor its remote alert logs.

**Windows** Multiple files are separated by a semicolon (;).

**Linux** **UNIX** Multiple files are separated by a colon (:).

Each file is matched to a database instance by using the alert\_instance.log file name pattern or if it is unmatched, it is ignored.

Local database instance alert log files are discovered automatically.

- j) Select or enter the **Oracle Alert Log File Charset**. This is the code page of the mapped alert log files.

If this parameter is blank, the system's current locale setting is used, for example:

- ISO8859\_1, ISO 8859-1 Western European encoding
- UTF-8, UTF-8 encoding of Unicode
- GB18030, Simplified Chinese GB18030 encoding
- CP950, Traditional Chinese encoding
- EUC\_JP, Japanese encoding
- EUC\_KR, Korean encoding

For the full list of all the supported code pages, see the [ICU supported code pages](#).

- k) Click **Apply** to save this database connection instance's settings in the **Database connections** section.

- l) (Optional) Test the new database connection.

i) Select the new database connection in the **Database connections** section.

ii) Click **Test connection**.

iii) Observe the results in the **Test connection** result window.

- Example successful **Test Result**:

```
Testing connection config1 ...
Success
```

- Example unsuccessful **Test Result**:

```
Testing connection config1 ...
KBB_RAS1_LOG; Set MAXFILES to 1
ORA-12514: TNS:listener does not currently know of service requested in connect
descriptor
Failed
```

- m) Click **Next**.

6. Read the information on the **Summary** pane of the **Configure ITCAM Extended Agent for Oracle Database** window, then click **OK** to finish configuration of the agent instance.

7. In the **IBM Performance Management** window, right-click **Monitoring Agent for Oracle Database**, and then click **Start**.

## What to do next

- Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

## Configuring the agent by responding to prompts

To configure the agent on Linux and UNIX operating systems, run the command line configuration script and respond to its prompts.

### Procedure

1. Open the *install\_dir/bin* directory, where *install\_dir* is the installation directory for the Oracle Database agent.
2. (Optional) To list the names of any existing configured agent instances, run the following command: **./cinfo -o rz**.
3. To configure the Oracle Database agent, run the following command: **./oracle\_database-agent.sh config instance\_name**.
4. When prompted to Edit 'Monitoring Agent for Oracle Database' settings, press **Enter**. The default value is Yes.
5. To enter the Default Database Configuration information, perform the following steps:

**Note:** The Default Database Configuration section is not the database connection instance configuration. It is a template section for setting what is used as the default values when you add the actual database connection instance configurations, which begin in [step 6](#).

- a) When prompted for the Default Username, type the default database user ID for database connections and press **Enter**.  
This user ID is the ID that the agent uses to access the monitored database instance. This user ID must have select privileges on the dynamic performance views and tables that are required by the agent.
- b) When prompted to Enter Default Password, type the password that is associated with the specified default database user ID, and press **Enter**. Then, if prompted, confirm the password.
- c) If the Oracle agent version is 8.0, perform this step.
  - i) Enter the **Oracle JDBC Jar File**. This is the full path to the Oracle JDBC driver jar file used to communicate with the Oracle database. The Oracle Java Database Connectivity (JDBC) driver that supports the Oracle database versions monitored by the Oracle agent must be available on the agent computer.
- d) If the Oracle agent version is 6.3.1.10, perform these steps.
  - i) When prompted for the Oracle Home Directory, if the Oracle Database agent is installed on the Oracle database server that is monitored, type the Oracle home directory, and press **Enter**. If the Oracle Database agent is not installed on the Oracle database server that will be monitored, leave this setting blank, press **Enter**, and perform the next step. If you want to clear the value for the Oracle Home Directory directory, press the space bar, and then press **Enter**.  
**Note:** Optionally for local monitoring, [Oracle Home Directory](#) and [Oracle Instant Client Installation Directory](#) can be left blank and the `ORACLE_HOME` system environment variable is used.
  - ii) If the Oracle Database agent is remote from the Oracle database server that is monitored, type the Oracle Instant Client Installation Directory directory, and press **Enter**. If you set [Oracle Home Directory](#) in step [“5.d.i” on page 716](#), this value is ignored.

- e) Net Configuration Files Directories can be left blank and the default directory is used. If the Oracle agent version is 6.3.1.10, you can enter multiple net configuration file directories by using **Windows** ";" or **Linux** **UNIX** ":" to separate the directories. For Oracle agent version 8.0, only one directory is supported. Press **Enter**.
- This setting contains the Oracle database net configuration file or files. The directory is defined by the *TNS\_ADMIN* environment variable for each Oracle database instance. The default directory is **Linux** **UNIX** \$ORACLE\_HOME/network/admin or **Windows** %ORACLE\_HOME%\NETWORK\ADMIN. If this item is not configured, the default directory is used. To disable the use of the default directory, set the following agent environment variable to false:  
KRZ\_LOAD\_ORACLE\_NET=false.
- f) Choose whether the default dynamic listener is configured at this workstation, and press **Enter**.  
The default dynamic listener is (PROTOCOL=TCP) (HOST=localhost) (PORT=1521). If the default dynamic listener is configured at this workstation, set this value to True.
- g) Leave the Customized SQL definition file name blank. It is not used.
6. You are prompted to Edit 'Database Connection' settings after seeing the following output on the screen:
- ```
Instance Configuration :
Summary :
Database Connection :
```
- Note:** This step is where the actual database connection instances are defined. You need to add at least one. This is also where you edit and delete database connection instances. If multiple database connection instance configurations exist, use the Next option to skip the instances that do not need to be edited or deleted until you arrive at the instance you need to edit or delete.
7. To add a new database connection, type 1, and press **Enter**.
8. To enter the database connection information, perform the following steps:
- When prompted for the Database Connection Name, type an alias for the connection to the database and press **Enter**.  
This alias can be anything that you choose to represent the database connection with the following restrictions. Only letters, Arabic numerals, the underline character, and the minus character can be used in the connection name. The maximum length of a connection name is 25 characters.
  - When prompted for the Connection Type, select one of the following types of connection:
    - (Optional) Basic  
The default and most common connection type is **Basic**. If you are unsure which connection type you need, it is suggested that you choose this connection type.
      - Select the **Basic** connection type if the target monitored database is a single instance, such as a standard file system instance or an ASM single instance.
      - When prompted for the Hostname, type the host name or IP address for the Oracle database, and press **Enter**.
      - When prompted for the Port, type the port number, and press **Enter**.
      - Enter one of the next two settings. Either Service Name or SID.
        - (Optional) When prompted for the Service Name, type the name of the service that is a logical representation of a database, a string that is the global database service name, press **Enter** and proceed to [step 8c](#).  
A service name is a logical representation of a database, which is the way that a database is presented to clients. A database can be presented as multiple services and a service can be implemented as multiple database instances. The service name is a string that is the global database name, that is, a name composed of the database name and domain name, entered during installation or database creation. If you are not sure what the global database name is, then you can obtain it from the value of the

SERVICE\_NAMES parameter in the initialization parameter file. This parameter can be left blank if you set the SID in step “8.b.i.4.b” on page 718.

- ii. (Optional) When prompted for the SID, type the Oracle System Identifier that identifies a specific instance of a running database, press **Enter** and proceed to [step 8c](#).

This parameter is the Oracle System Identifier that identifies a specific instance of a database. If Service Name was defined in step “8.b.i.4.a” on page 717, you can leave this item blank.

ii) (Optional) TNS

- a) Select the **TNS** connection type when the *ORACLE\_HOME* system environment variable is set and the TNS alias for the target monitored database is defined in the \$ORACLE\_HOME/network/admin/tnsnames.ora file.
- b) Type the TNS alias name, and press **Enter** and proceed to [step 8c](#).

iii) (Optional) Advanced

- a) Select the **Advanced** connection type when there is more than one Oracle Instance across multiple physical nodes for the target monitored database. For example, an ASM with Real Applications Cluster (RAC) database.
- b) Type the Oracle connection string, press **Enter** and proceed to [step 8c](#).

This attribute supports all Oracle Net naming methods as follows:

- SQL Connect URL string of the form://host:port/service name. For example, //dlsun242:1521/bjava21.
- Oracle Net keyword-value pair. For example,

```
(DESCRIPTION=(ADDRESS=(PROTOCOL=tcp) (HOST=dlsun242) (PORT=1521))
(CONNECT_DATA=(SERVICE_NAME=bjava21)))
```

- **TNSNAMES** entries, such as **inst1**, with the *TNS\_ADMIN* or *ORACLE\_HOME* environment variable set and the configuration files configured.

**Note:** The description that is shown during command-line configuration might have a backslash before colons (\:) and before equal sign symbols (\=). Do not type backslashes in the connection string. They are displayed in the description to escape the normal behavior of interpreting the equals sign as part of a command, and instead interpret it merely as text.

- c) Proceed to [step 8c](#).

- c) When prompted for the Database Username, type the database user ID for the connection, and press **Enter**.

For standard file system instances, this user ID must have select privileges on the dynamic performance views and tables that are required by the agent.

For ASM instances, use an account with the **SYSDBA** or **SYSASM** role. For example, the sys account.

- d) When prompted to Enter Database Password, type the password that is associated with the specified database user ID.
- e) When prompted for Role, choose the role that matches the permissions that are granted to the specified user ID, and press **Enter**.

The role is the set of privileges to be associated with the connection. For a user that was granted the SYSDBA system privilege, specify a role that includes that privilege.

For ASM instances, use the **SYSDBA** or **SYSASM** role.

- f) When prompted for Oracle Alert Log File Paths (including alert log file name), type the alert log paths, and press **Enter**.

This parameter is for any absolute file paths of mapped alert log files for remote database instances in this database connection. The agent monitors alert logs by reading these files. Usually

found at \$ORACLE\_BASE/diag/rdbms/DB\_NAME/SID/trace/alert\_SID.log. For example, if the DB\_NAME and SID are both db11g and ORACLE\_BASE is /home/dbowner/app/oracle, then the alert log would be found at /home/dbowner/app/oracle/diag/rdbms/db11g/db11g/trace/alert\_db11g.log.

**Windows** If the Oracle Database agent runs and reads the alert log files across the network, the remote file path must follow the universal naming convention for Windows systems. For example, \\tivx015\path\alert\_orcl.log.

**Important:** Enter the path and alert log file name together. A mapped network driver is not supported for the alert log path.

**Linux** **UNIX** If the Oracle Database agent runs, a locally mounted file system is required for remote alert logs.

**Windows** Multiple files are separated by a semicolon (;).

**Linux** **UNIX** Multiple files are separated by a colon (:).

Each file is matched to a database instance by using the alert\_instance.log file name pattern or if it is unmatched, it is ignored.

Local database instance alert log files can be discovered automatically.

- g) When prompted for the **Oracle Alert Log File Charset**, type the code page of the mapped alert log files, and press **Enter**.

If this parameter is blank, the system's current locale setting is used, for example:

- ISO8859\_1, ISO 8859-1 Western European encoding
- UTF-8, UTF-8 encoding of Unicode
- GB18030, Simplified Chinese GB18030 encoding
- CP950, Traditional Chinese encoding
- EUC\_JP, Japanese encoding
- EUC\_KR, Korean encoding

For the full list of all the supported code pages, see the [ICU supported code pages](#).

9. When prompted again to Edit 'Database Connection' settings, you see the name of the database connection that you set in [step 8a](#). You can edit it again or delete it. If you have more than one database connection instance that is already configured, use **Next** to step through them.
10. (Optional) To add another database connection to monitor multiple database instances with this agent instance, type 1, press **Enter**, and return to [Step 8](#).
11. When you are finished modifying database connections, type 5, and press **Enter** to exit the configuration process.
12. To start the agent, enter:  
`install_dir/bin/oracle_database-agent.sh start instance_name.`

## What to do next

- Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

## Configuring the agent by using the silent response file

The silent response file contains the agent configuration parameters. You can edit the silent response file to modify the values of these parameters, and run the configuration script to create an instance and update the agent configuration values. This mode of configuration is called the silent mode.

### About this task

The silent response file contains the agent configuration parameters with default values that are defined for some parameters. You can edit the silent response file to specify different values for the configuration parameters.

After you update the configuration values in the silent response file, you must run the configuration script to configure the agent with these updated values.

### Procedure

1. Open the `oracle_silent_config.txt` file in a text editor:

- **Linux** | **UNIX** `install_dir/samples/oracle_database_silent_config.txt`.
- **Windows** `install_dir\samples\oracle_database_silent_config.txt`

2. For **Default Username**, type the name of the default database user for database connections that are created for this agent instance. For example, **KRZ\_CONN\_USERID=user1**.

**Note:** This user must have sufficient privileges to complete the tasks that this agent performs while it is connected to the database, such as querying tables.

3. For **Default Password**, you must enter the password that is associated with the specified default database user. For example, **KRZ\_CONN\_PASSWORD=Password**.
4. If the Oracle agent version is 8.0, perform this step.
  - a) Enter the **Oracle JDBC Jar File**. This is the full path to the Oracle JDBC driver jar file used to communicate with the Oracle database.

The Oracle Java Database Connectivity (JDBC) driver that supports the Oracle database versions monitored by the Oracle agent must be available on the agent computer.

5. If the Oracle agent version is 6.3.1.10, perform these steps.

- a) If the Oracle Database agent is installed on the Oracle database server that is monitored, type the Oracle home directory. For example, **KRZ\_ORACLE\_HOME=home\_path**.

**Note:** For optional parameters like this one, remove the leading hash symbol (#) to use them.

If the Oracle Database agent is not installed on the Oracle database server that will be monitored, leave this setting blank and complete the next step.

**Note:** Optionally for local monitoring, Oracle Home Directory and Oracle Instant Client Installation Directory can be left blank (commented out using a hash symbol (#) in the first position of the parameter line in the silent configuration text file) and the `ORACLE_HOME` system environment variable is used.

- b) If the Oracle Database agent is remote from the Oracle database server that is monitored, type the Oracle Instant Client Installation Directory directory. If you enter the Oracle Home Directory directory in the previous step, this value is ignored.
  - **Windows** Define the full folder path of the **Oracle Home** directory that contains the Oracle Call Interface (OCI) library files. If the full path of the `oci.dll` file is `C:\instantclient_10_2\oci.dll` you must define this `C:\instantclient_10_2` path. For example, **KRZ\_INSTANT\_CLIENT\_LIBPATH=C:\instantclient\_10\_2**
  - **AIX** Define the full folder path of the **Oracle Home** directory that contains the Oracle Call Interface (OCI) library files. If the full path of the `libocci.so.10.1` file is `/home/tivoli/oci/libocci.so.10.1`, you must define this `/home/tivoli/oci` path. For example, **KRZ\_INSTANT\_CLIENT\_LIBPATH=/home/tivoli/oci**

6. Net Configuration Files Directories can be left blank and the default directory is used. The Oracle Database agent uses this file path to obtain the `tnsnames.ora` file. This directory is defined by the `TNS_ADMIN` environment variable for each Oracle database instance. The default directory is **Linux** **UNIX** `$ORACLE_HOME/network/admin` or **Windows** `%ORACLE_HOME%\NETWORK\ADMIN`. If you enter this setting with multiple net configuration file directories, use **Windows** `","` or **Linux** **UNIX** `":"` to separate the directories.

If you are monitoring Oracle databases remotely, you can copy net configuration files from the remote system to the system where the agent is installed. Also, you can merge the content of net configuration files on the remote system to the net configuration files on the system where the agent is installed.

7. For **Dynamic listener**, check if the default dynamic listener is configured. The default dynamic listener is `(PROTOCOL=TCP)(HOST=localhost)(PORT=1521)`. If the default dynamic listener is configured, set this value to `TRUE` as shown here; **KRZ\_DYNAMIC\_LISTENER=TRUE**.

The valid values are `TRUE` and `FALSE`.

8. Leave the Customized SQL definition file name blank. It is not used.
9. Beginning here the actual database connection instances are defined. You need to add at least one. Entries for one instance are given in the `oracle_silent_config.txt` with the instance name `config1`. If you change the instance name, be sure to change all references.

This alias can be anything that you choose to represent the database connection with the following restrictions. Only letters, Arabic numerals, the underline character, and the minus character can be used in the connection name. The maximum length of a connection name is 25 characters.

10. For **Connection Type**, specify one of the following connection types: **Basic**, **TNS**, or **Advanced**. For example, **KRZ\_CONN\_TYPE.config1=Basic**.
11. For the connection type that you selected in the previous step, specify the required parameters:

#### Basic

- For **Hostname**, specify the host name or the IP address of the Oracle database, for example: **KRZ\_CONN\_HOST.config1=hostname**.
- For **Port**, specify the Listener port for the Oracle database, for example: **#KRZ\_CONN\_PORT.config1=1521**.
- For **Service Name**, specify the logical representation of the database by using a string for the global database name, for example: **KRZ\_CONN\_SERVICE.config1=orcl**.

**Important:** If you do not define the Service Name, you must specify the Oracle System Identifier (SID).

For the **Oracle System Identifier (SID)**, specify an SID that identifies a specific instance of a running database, for example: **KRZ\_CONN\_SID.config1=sid**.

#### TNS

For **TNS alias**, specify the Network alias name from the `tnsnames.ora` file. For example, **KRZ\_CONN\_TNS.config1=tnsalias**.

#### Advanced

For **Oracle Connection String**, specify the database connection string for OCI. For example, **KRZ\_CONN\_STR.config1=//host:port/service**

This string supports all Oracle Net naming methods as shown here.

- For an SQL Connect URL string:

```
//host:[port][/service name]
```

- For an Oracle Net keyword-value pair:

```
"(DESCRIPTION=(ADDRESS=(PROTOCOL=tcp) (HOST=d1sun242) (PORT=1521))
(CONNECT_DATA=(SERVICE_NAME=bjava21)))"
```

This string also supports **TNSNAMES** entries, for example, **inst1** where the *TNS\_ADMIN* or the *ORACLE\_HOME* environment variable is set and the configuration files are configured.

**Important:** This attribute applies only to the advanced type of connection.

12. For **Database Username**, you can specify the name of the database user for the connection, for example: **KRZ\_CONN\_USERID=UserID**.

This user must have sufficient privileges to complete the tasks that the agent requires while it is connected to the database, for example, creating, editing, and deleting tables.

If this field is empty, the agent uses the default user name in the default database configuration section. If **Database Username** was not configured, the default user name is used for this connection.

13. For **Database Password**, you can specify the password that is associated with the specified database user, for example: **KRZ\_CONN\_PASSWORD=Passsword**.

If this field is empty, the agent uses the default password in the default database configuration section. If **Database Password** was not configured, the default password is used for this connection.

14. For **Role**, you can specify the set of privileges that are associated with the connection, for example: **KRZ\_CONN\_MODE.config1=DEFAULT**.

The valid values include *SYSDBA*, *SYSOPER*, *SYSASM*, and *DEFAULT*.

For a user that is granted the *SYSDBA* system privilege, you can specify a connection that includes this privilege. If this item is not defined, you can assign the *DEFAULT* role to the user.

15. For **Oracle Alert Log File Paths**, when the alert log file name is included, you can specify the absolute file path of the mapped alert log files for the remote database instances in this database connection. For example, **KRZ\_LOG\_PATHS.config1=AlertLogPath**.

**Windows** Use a semicolon (;) to separate the multiple files.

**Linux**      **UNIX** Use a colon (:) to separate the multiple files.

Each file is matched to a database instance by the *alert\_instance.log* file name pattern. Alternatively, it is ignored if it is not matched.

The local database instance alert log files are discovered automatically.

If **Oracle Alert Log File Paths** was not configured, the Alert Log is not available.

16. For **Oracle Alert Log File Charset**, you can specify the code page of the mapped alert log files. For example, **KRZ\_LOG\_CHARSET.config1= CharSet**

If this field is empty, the system's current locale setting is used as shown here:

```
ISO8859_1: ISO 8859-1 Western European encoding
UTF-8: UTF-8 encoding of Unicode
GB18030: Simplified Chinese GB18030 encoding
CP950: Traditional Chinese encoding
EUC_JP: Japanese encoding
```

17. Save and close the *oracle\_database\_silent\_config.txt* file. Then, enter:  
`install_dir/bin/oracle_database-agent.sh config instance_name install_dir/samples/oracle_database_silent_config.txt`  
where *instance\_name* is the name that you want to give to the instance.
18. To start the agent, enter:  
`install_dir/bin/oracle_database-agent.sh start instance_name.`

## What to do next

- Log in to the Cloud APM console to view the data that is collected by the agent in the dashboards. For information about using the Cloud APM console, see [“Starting the Cloud APM console” on page 1109](#).

## Granting privileges to the Oracle Database agent user

After you install the agent, you must grant privileges to the Oracle user account that is used by the Oracle Database agent.

You can grant privileges for the following users:

- Standard file system (non-ASM) instance users
- ASM with RAC instance non-SYS users

### Granting privileges to users for standard file system instances

For standard file system instances, the Oracle user ID that the Oracle Database agent uses must have select privileges on the dynamic performance views, tables, and data dictionary views that are required by the agent. It must also have other Oracle object and system privileges that are necessary to run some database commands.

#### Procedure

1. (Optional) If an Oracle database user ID does not exist, create this ID by using Oracle facilities and running the following command: `create user UserName identified by Password`
2. Grant select privileges for the dynamic performance views, tables, and data dictionary views to the Oracle user ID that you created by running the **krzgrant.sql** script that is provided with the Oracle Database agent. This step must be done before you configure the agent. For directions about how to customize and run the **krzgrant.sql** script, see [“Customizing the krzgrant.sql script” on page 723](#) and [“Running the krzgrant.sql script” on page 724](#).

**Note:** The select privileges for the dynamic performance views, tables, and data dictionary views rely on the capabilities of the Oracle database in specific application environments. You can grant authorized Oracle privileges to the Oracle database user ID only for the dynamic performance views, tables, and data dictionary views that are used by the Oracle Database agent.

3. Grant other Oracle object privileges and system privileges to the Oracle user ID that the Oracle Database agent uses by using Oracle facilities.

#### Customizing the **krzgrant.sql** script

If you do not want to allow Oracle authorized select privileges on some dynamic performance views, tables, and data dictionary views in the **krzgrant.sql** script, you can customize the **krzgrant.sql** script before running it.

**Note:** The agent instance checks all default privileges in the **krzgrant.sql** script and reports an agent event with a lack of privileges when the agent starts. You can disable privilege checking by using the following variable setting: `KRZ_CHECK_ORACLE_PRIVILEGE=FALSE`. The test connection step of GUI configuration checks all Oracle privileges that are defined in the **krzgrant.sql** file. If you confirm that the Oracle user has the correct privileges, ignore that checking privileges fails in the test connection step.

Edit the **krzgrant.sql** file in a plain text editor to remove or add the '--' prefix at the beginning of grant statements to skip the granting execution for those unauthorized Oracle tables or views.

For example, change the following lines:

```
execute immediate 'grant select on DBA_HIST_SNAPSHOT to '||userName;  
execute immediate 'grant select on DBA_HIST_SQLSTAT to '||userName;  
execute immediate 'grant select on DBA_HIST_SQLTEXT to '||userName;  
execute immediate 'grant select on DBA_HIST_SQL_PLAN to '||userName;  
execute immediate 'grant select on DBA_HIST_SYSMETRIC_SUMMARY to '||userName;
```

to these lines:

```
-- execute immediate 'grant select on DBA_HIST_SNAPSHOT to '||userName;  
-- execute immediate 'grant select on DBA_HIST_SQLSTAT to '||userName;  
-- execute immediate 'grant select on DBA_HIST_SQLTEXT to '||userName;  
-- execute immediate 'grant select on DBA_HIST_SQL_PLAN to '||userName;  
-- execute immediate 'grant select on DBA_HIST_SYSMETRIC_SUMMARY to '||userName;
```

## Granting privileges to non-SYS users for ASM instances

You must connect to ASM instances that are using the SYSDBA and SYSASM roles for users. If you do not want to use the SYS account to connect to ASM instances, create a user account and grant the SYSDBA and SYSASM roles to the account.

### Procedure

1. Run the following commands to create a user account and grant roles:

- Log in to the ASM database with the SYSASM role to create a new user for an agent and grant the SYSDBA role or SYSASM role:

a. `create user UserName identified by Password`

b. `grant sysdba to UserName`

or

`grant sysasm to UserName`

2. When you create the ASM connection in the configuration window, specify the *UserName* user and the SYSDBA or SYSASM role.

**Note:** If you choose the SYSASM role to access the ASM database, you must configure the agent instance by using Oracle home or Oracle instant client to connect to the Oracle database.

### Running the *krzgrant.sql* script

#### Before you begin

- If you do not run the **krzgrant.sql** script, an event is raised in the agent event workspace.
- To complete the installation procedure, see [Chapter 7, “Installing your agents,” on page 181](#).

After the installation, you can find the **krzgrant.sql** script in the following directory:

- **Windows** `install_dir\TMAITM6_X64`
- **Linux** | **UNIX** `install_dir/architecture/rz/bin`

where:

#### **install\_dir**

Installation directory for the Oracle Database agent.

#### **architecture**

The IBM Application Performance Management or Cloud APM system architecture identifier. For example, lx8266 represents Linux Intel v2.6 (64-bit). For a complete list of the architecture codes, see the `install_dir/registry/archdsc.tbl` file.

The **krzgrant.sql** script has the following usage: `krzgrant.sql user_ID temporary_directory`

where:

#### **user\_ID**

The ID of the Oracle user. This user ID must be created before you run this SQL file. Example value: *tivoli*.

#### **temporary\_directory**

The name of the temporary directory that contains the `krzagent.log` output file of the **krzgrant.sql** script. This directory must exist before you run this SQL script. Example value: `install_dir/tmp`.

You must have the Oracle database administrator (DBA) authorization role and write permission to the temporary directory to perform the following procedure.

## Procedure

1. From the command line, run the commands to set environment variables.

- **Windows**

```
SET ORACLE_SID= sid
SET ORACLE_HOME= home
```

- **Linux** | **UNIX**

```
ORACLE_SID = sid
export ORACLE_SID
ORACLE_HOME = home
export ORACLE_HOME
```

where:

***sid***

Oracle system identifier, which is case-sensitive.

***home***

Home directory for the monitored Oracle instance.

2. From the same command-line window where you set environment variables, start the Oracle SQL Plus or an alternative tool that you use to issue SQL statements.
3. Log on to the Oracle database as a user that has Oracle DBA privileges.
4. Go to the directory that contains the **krzgrant.sql** script and run the following command to grant select privileges:

```
@krzgrant.sql user_ID temporary_directory
```

The output is logged in the `krzagent.log` file in the temporary directory. This log records the views and tables to which the Oracle Database agent is granted select privileges.

After the privileges are successfully granted, you can configure and start the Oracle Database agent.

## Configuring OS monitoring

The Monitoring Agent for Linux OS, Monitoring Agent for UNIX OS, and Monitoring Agent for Windows OS agents are configured automatically. You can configure log file monitoring for the OS agents so that you can monitor application log files. You can run the OS agents as a non-root user. Also, there are some additional configuration options for the Linux OS agent.

### Running the OS agents as a non-root user

You can run the Monitoring Agent for Windows OS, Monitoring Agent for UNIX OS, and Monitoring Agent for Linux OS as a non-root user.

To run the Windows OS agent as a non-root user, see [“Running the Monitoring Agent for Windows OS as a non-root user”](#) on page 726.

To run the Monitoring Agent for UNIX OS and Monitoring Agent for Linux OS agents as a non-root user, see [“Starting agents as a non-root user”](#) on page 1159.

**Restriction:**

While running as a nonroot user, the agent cannot access `/proc/pid/status`, and therefore cannot report the following attributes:

- -User CPU Time (UNIXPS.USERTIME)
- -System CPU Time (UNIXPS.SYSTIME)
- -Total CPU Time (UNIXPS.TOTALTIME)
- -Thread Count (UNIXPS.THREADCNT)

- -Child User CPU Time (UNIXPS.CHILDUTIME)
- -Child System CPU Time (UNIXPS.CHILDSTIME)
- -Total Child CPU Time (UNIXPS.CHILDTIME)
- -Wait CPU Time (UNIXPS.WAITCPUTIM)
- -Terminal (UNIXPS.USERTTY)

These attributes are not visible in the Cloud APM console but are available to create thresholds.

## Running the Monitoring Agent for Windows OS as a non-root user

You can run the Windows OS agent as a non-root user. However, some functions are unavailable.

When you run the Windows OS agent as a non-root user, some functions are unavailable in the following attribute groups, if they are owned solely by the administrator account:

- Registry
- File Trend
- File Change

Remote deployment of other agents is not available because administrator rights are required to install the new agents.

For Agent Management Services, the watchdog cannot stop or start any agent that it does not have privileges to stop or start.

To create a non-root user, create a new Limited (non-root) user and set up registry permissions for the new user as in the following example:

- Full access to HKEY\_LOCAL\_MACHINE\SOFTWARE\Candle
- Read access to HKEY\_LOCAL\_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Perflib

The user that starts the Monitoring Agent for Windows OS – Primary service must have rights to manage the Monitoring Agent for Windows OS - Watchdog service. The user that starts the Monitoring Agent for Windows OS - Watchdog service must also have rights to manage any services that are managed by the Agent Management Services, including the Monitoring Agent for Windows OS – Primary service. To grant users the authority to manage system services in Windows, use security templates, group policy, or edit the Subinac1.exe file. For more information, see the following Microsoft documentation: <http://support.microsoft.com/kb/325349> (<http://support.microsoft.com/kb/325349>).

The following example shows how to grant users the authority to manage system services by using security templates:

1. Click **Start > Run**, enter `mmc` in the Open box, and then click **OK**.
2. On the **File** menu, click **Add/Remove Snap-in**.
3. Click **Add > Security Configuration and Analysis**, and then click **Add** again.
4. Click **Close** and then click **OK**.
5. In the console tree, right-click **Security Configuration and Analysis**, and then click **Open Database**.
6. Specify a name and location for the database, and then click **Open**.
7. In the **Import Template** dialog box that is displayed, click the security template that you want to import, and then click **Open**.
8. In the console tree, right-click **Security Configuration and Analysis**, and then click **Analyze Computer Now**.
9. In the **Perform Analysis** dialog box that is displayed, accept the default path for the log file that is displayed in the Error log file path box. Otherwise, specify the location that you want. Click **OK**.
10. After the analysis is complete, configure the service permissions as follows:
  - a. In the console tree, click **System Services**.

- b. In the right pane, double-click the Monitoring Agent for Windows OS - Primary service.
  - c. Select the **Define this policy in the database** check box, and then click **Edit Security**.
  - d. To configure permissions for a new user or group, click **Add**.
  - e. In the **Select Users, Computers, or Groups** dialog box, type the name of the user or group that you want to set permissions for, and then click **OK**. In the **Permissions for User or Group** list, select the **Allow** check box (next to **Start**). Stop and pause permission is selected by default, so that the user or group can start, stop, or pause the service.
  - f. Click **OK** twice.
11. Repeat step 10 to configure the service permissions for the Monitoring Agent for Windows OS - Watchdog service.
  12. To apply the new security settings to the local computer, right-click **Security Configuration and Analysis**, and then click **Configure Computer Now**.

**Note:** You can use also the Secedit command line tool to configure and analyze system security. For more information about Secedit, click **Start > Run**, enter `cmd`, and then click **OK**. At the command prompt, type `secedit /?`, and then press **ENTER**. When you use this method to apply settings, all the settings in the template are reapplied. This method might override other previously configured file, registry, or service permissions.

The following example shows how to set the Monitoring Agent for Windows OS and Watchdog services to log on as a non-root user by using the Windows Services console:

1. Click **Start > Run**, enter `services.msc`, and then click **OK**.
2. Select **Monitoring Agent for Windows OS - Primary**.
3. Right-click **Properties**.
4. Verify the startup type as being Automatic.
5. Select the **Log On** tab, and then select **Log on as "This account"** and supply the ID and password. Click **OK**.
6. Select **Monitoring Agent for Windows OS - Watchdog**.
7. Right-click **Properties**.
8. Verify the startup type as being Manual.
9. Select the **Log On** tab, and then select **Log on as "This account"** and supply the ID and password. Click **OK**.

## Configuring OS agent log file monitoring

The Monitoring Agent for Linux OS, Monitoring Agent for UNIX OS, and Monitoring Agent for Windows OS agents are configured automatically. However, you can configure log file monitoring for the OS agents so that you can monitor application log files.

After the agents filter the log data, the data is sent in the form of a log event to the Cloud APM console.

## Adding or removing log file monitoring configuration for the OS agents

You add log file monitoring configuration for the OS agents so the OS agents can filter log file data. Then, subsequently, you can also remove the log file monitoring configuration for the OS agents, if necessary.

### Before you begin

The OS agents now include a sample `regex1.conf` file and a `regex1.fmt` file that you can view before you configure `.conf` and `.fmt` files. The files are located here:

- On UNIX/LINUX: `<install_dir>/samples/logfile-monitoring`
- On windows: `<install_dir>\samples\logfile-monitoring`

Use a text editor to create a configuration `.conf` file and a format `.fmt` file. For more information about the content of these files, see [“Configuration file” on page 732](#) and [“Format file ” on page 740](#). You

must ensure that you save these files on the system where you access the Performance Management console so that you can upload the files to the Cloud APM server.

## About this task

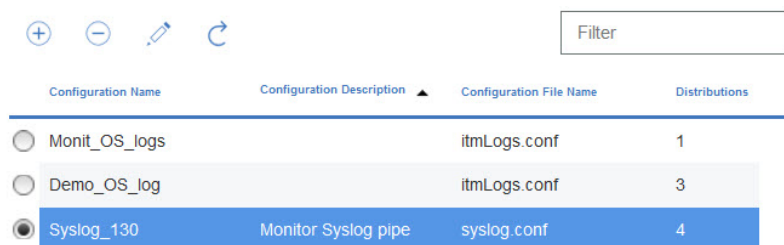

To enable the OS agents to monitor log files, you must upload the configuration file and format file and specify to which OS agent the configuration applies. The OS agent downloads the .conf and .fmt files and the agent monitors the log files that you specify in the configuration.

## Procedure

Adding the log file monitoring configuration for the OS agents

1. Click **System configuration > Agent Configuration**.
2. Depending on the system on which you want to monitor the log files, click either the **Unix OS, Linux OS**, or **Windows OS** tab.
3. To create a new configuration, click the (+) icon to open the **New Log File Configuration** window. Enter a name for the configuration and a description of the configuration.
4. To view the contents of the .conf and the .fmt files, click **View**.
5. To upload the configuration by using the Cloud APM server, select the .conf file and the .fmt file from the same system where you open the Performance Management console and click **Done**.
6. On the OS agent tab, select the configuration that you uploaded.

**Important:** The .conf and .fmt files that are distributed to the agents are renamed to the configuration name that you define.

| Configuration Name                          | Configuration Description | Configuration File Name | Distributions |
|---|---------------------------|-------------------------|---------------|
| <input type="radio"/> Monit_OS_logs         |                           | itmLogs.conf            | 1             |
| <input type="radio"/> Demo_OS_log           |                           | itmLogs.conf            | 3             |
| <input checked="" type="radio"/> Syslog_130 | Monitor Syslog pipe       | syslog.conf             | 4             |

7. To deploy the configuration, in the **Log Configuration Distributions List** table, select the agents to which you want to deploy the configuration and click **Apply Changes**.

Removing the log file monitoring configuration for the OS agents

8. Select the configuration name.
9. Clear the manage systems, and click **Apply Changes**.

### Important:

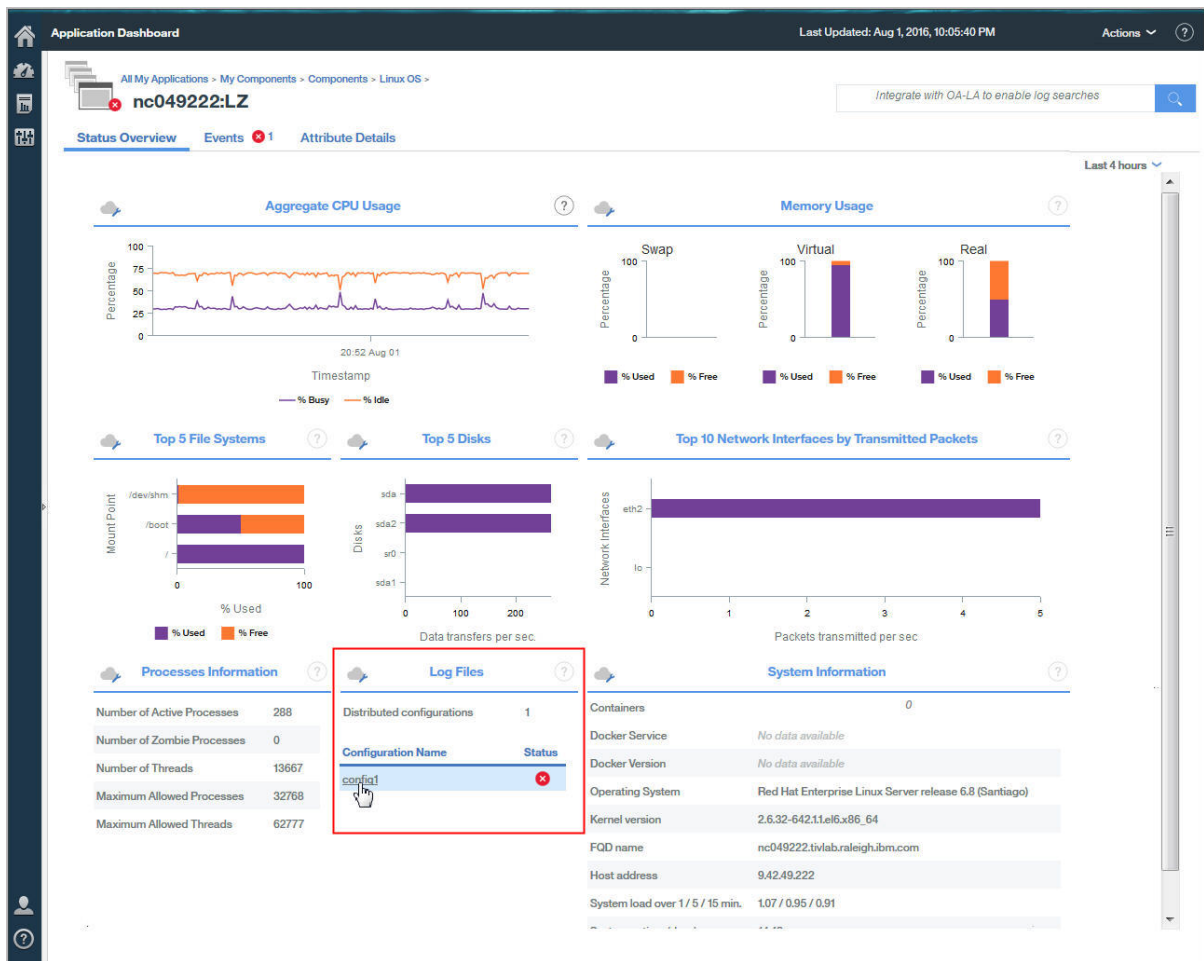

After you remove the log monitoring configuration, the log file monitoring resource remains and it stays online until you restart the OS agent. The offline log file monitoring resources are cleared after the time that is specified in the **Remove Offline System Delay** option.

## Viewing log file monitoring content

You can view the log file monitoring configuration for the OS agents that you deployed to monitor log files.

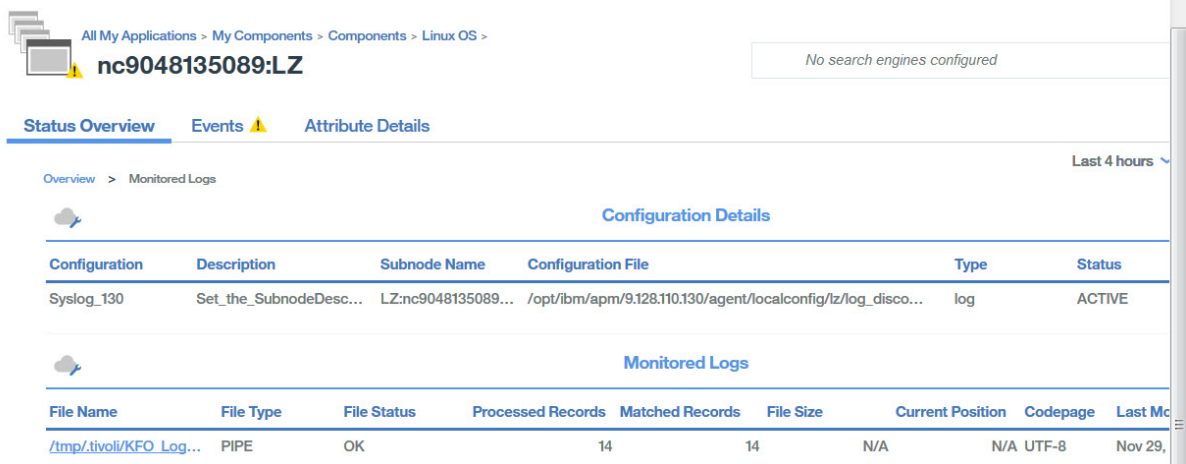

## Procedure

1. Click **Performance > Application Performance Dashboard**, and select an application that includes the OS agent where you deployed the log file monitoring configuration.
2. Drill down to the OS agent dashboard, and in the Log Files widget, click the profile to view the log monitoring configurations that are distributed and the monitored logs.

The configuration details include the configuration name, description, subnode, configuration file, status, and error code.

- Click the log file name to view all the log file events that are associated with the log file.

- Click the event to view the event details, for example, all the fields that you defined in the Format file.

| Overview > Monitored Logs > |                     | Event Details    |                                  |
|-----------------------------|---------------------|------------------|----------------------------------|
| Configuration               | File Name           |                  |                                  |
