What's new in Version 8.1	vii
----------------------------------	------------

Chapter 1. IBM Spectrum Protect for Virtual Environments: Data Protection for VMware overview 1

Backup and restore types	4
How IBM Spectrum Protect nodes are used in a virtual environment	5
Mount proxy node and data mover node requirements	8
Tape media guidelines	10
Controlling which disks are processed	11
VM templates and vApps in a vSphere environment	11
Automated client failover	12
Out-of-space errors on VMware datastores	13
Full VM instant restore environment requirements	14
VMware vCenter Server user privilege requirements	15

Chapter 2. Managing data with the IBM Spectrum Protect extension 19

Getting started	19
Available features	21
Connecting to the Data Protection for VMware vSphere GUI	21
Enabling tagging support	21
Setting a data mover node as a tag-based node	21
Creating tags in the VMware inventory	24
Configuring backup policies	24
Selecting a schedule for backing up virtual machines	26
Excluding or including virtual machines from scheduled backup services	27
Specifying the retention policy of virtual machine backups	28
Selecting a data mover for backing up virtual machines	29
Protecting virtual machine disks by setting the disk protection	31
Setting the data consistency of virtual machine backups	32
Enabling application protection for a virtual machine	33
Managing backup operations for virtual machines	34
Managing backup schedules in the vCenter	35
Starting an on-demand backup of a virtual machine	36
Canceling a backup of a virtual machine	38
Viewing the status of backup operations for virtual machines	38
Setting the at-risk policy for a virtual machine	39

Restoring a virtual machine	40
Dismounting an instant access virtual machine	42

Chapter 3. Getting started with file restore 43

Common tasks for restoring files	43
File restore prerequisites	44
Logging in to restore files	45
Restoring files from a virtual machine backup	46

Chapter 4. Protection for in-guest applications 49

Microsoft Exchange Server data protection in VMware environments	49
Configuring the software for Exchange Server data protection in a VMware environment	50
Managing backups	55
Restoring data	60
IBM Spectrum Protect file space information	73
Microsoft SQL Server data protection in VMware environments	74
Configuring the software for SQL Server data protection in a VMware environment	75
Managing backups	80
Restoring data	83
Sample script for validating full virtual machine backups	88
IBM Spectrum Protect file space information	89
Application protection for Active Directory domain controllers	89

Chapter 5. Data Protection for VMware commands and options 91

dsmc command-line interface	91
dsmc commands	91
dsmc command options	91
vmcli command-line interface	93
Backup	94
Restore	96
Inquire_config	101
Inquire_detail	103
Set_domain	106
Set_option	106
Set_password	107
Get_password_info	110
Start_guest_scan	111
Profile parameters	113
Recovery Agent command-line interface	118
Starting the Recovery Agent command-line interface	118
Recovery Agent command-line interface overview	119

Chapter 6. Backing up VMware data 127

Backing up virtual machine data to IBM Spectrum Protect	127
Setting options for an incremental forever backup schedule	129
Backing up migrated virtual machines	130
Backing up organization vDCs to IBM Spectrum Protect	131
Backing up data by disk usage	132
Scenario: Including four disks for backup processing	133
Scenario: Excluding four disks for backup processing	134
Scenario: Separating disks for backup and restore processing	135
Backing up virtual machines by domain level	136
Scenario: Backing up virtual machines by cluster server	137
Scenario: Backing up virtual machines by VMware datastore.	137
Scenario: Backing up virtual machines by name pattern	138
Backing up multiple virtual machines in parallel (optimized backup)	138
Examples: Backing up multiple virtual machines in parallel	140
Backing up virtual machines that host Active Directory controllers	143
Specifying a management class to associate objects	144
Scenario: Specifying a management class for VMware backups in a vSphere environment	145
Scenario: Specifying a management class for VMware control files in a vSphere environment	145
Specifying objects to include in backup and restore operations	146
Scenario: Specifying objects to include for backup and restore operations in a vSphere environment.	147

Chapter 7. Restoring VMware data 149

Mounting a virtual machine disk and exporting the volumes	149
vSphere environment restore scenario	152
Full VM instant restore scenarios.	153
Full VM instant restore cleanup and repair scenarios	154
Full VM instant restore integrity validation scenarios	156

Verifying that the Active Directory Domain Controller replicated successfully.	157
Restoring a virtual disk using multiple sessions	159

Appendix A. Troubleshooting 161

Troubleshooting file restore operations	166
Trace options for file restore	167
File restore solutions	168
VMware attributes.	168
Troubleshooting IBM Spectrum Protect extension problems	169
Resolving Platform Services Controller connection problems	169
Enabling tracing	170
Resolving administrator ID not found messages	171
Messages for the IBM Spectrum Protect extension.	171

Appendix B. IBM Spectrum Protect recovery agent operations. 175

Mounting snapshots with the recovery agent	175
Restoring files with the recovery agent	176
Restoring files from a Windows system with the recovery agent	178
Restoring volumes instantly with the recovery agent	180
Restoring volumes instantly from a Windows system with the recovery agent	180

Appendix C. Data Protection for VMware vSphere GUI messages . . . 185

Appendix D. IBM Spectrum Protect recovery agent messages 205

Appendix E. Accessibility features for the IBM Spectrum Protect product family. 229

About this publication

This publication provides overview, planning, and user instructions for Data Protection for VMware.

Who should read this publication

This publication is intended for administrators and users who are responsible for implementing a backup solution with IBM Spectrum Protect™ for Virtual Environments in one of the supported environments.

In this publication, it is assumed that you have an understanding of the following applications:

- IBM Spectrum Protect server
- VMware vSphere

Installation, configuration, and upgrade information is documented in the *IBM Spectrum Protect for Virtual Environments: Data Protection for VMware Installation Guide*.

Publications

The IBM Spectrum Protect product family includes IBM Spectrum Protect Snapshot, IBM Spectrum Protect for Space Management, IBM Spectrum Protect for Databases, and several other storage management products from IBM®.

To view IBM product documentation, see IBM Knowledge Center.

What's new in Version 8.1

Data Protection for VMware Version 8.1 introduces new features and updates.

For a list of new features and updates in this release, see Data Protection for VMware updates.

Chapter 1. IBM Spectrum Protect for Virtual Environments: Data Protection for VMware overview

IBM Spectrum Protect for Virtual Environments: Data Protection for VMware provides a comprehensive solution for protecting VMs.

Data Protection for VMware works with the integrated data mover to complete incremental-forever full, and incremental-forever incremental backups of VMs. The data mover node "moves" the data to the IBM Spectrum Protect server for storage, and for VM image-level restore at a later time. Instant restore is available at the disk volume level and full VM level.

The data mover is a separately licensed component that contains its own user interfaces and documentation. Familiarity with this product and its documentation is necessary in order to adequately integrate a comprehensive plan for protecting your VMs with Data Protection for VMware. IBM Spectrum Protect for Virtual Environments for Microsoft Windows includes the data mover data mover features on download package.

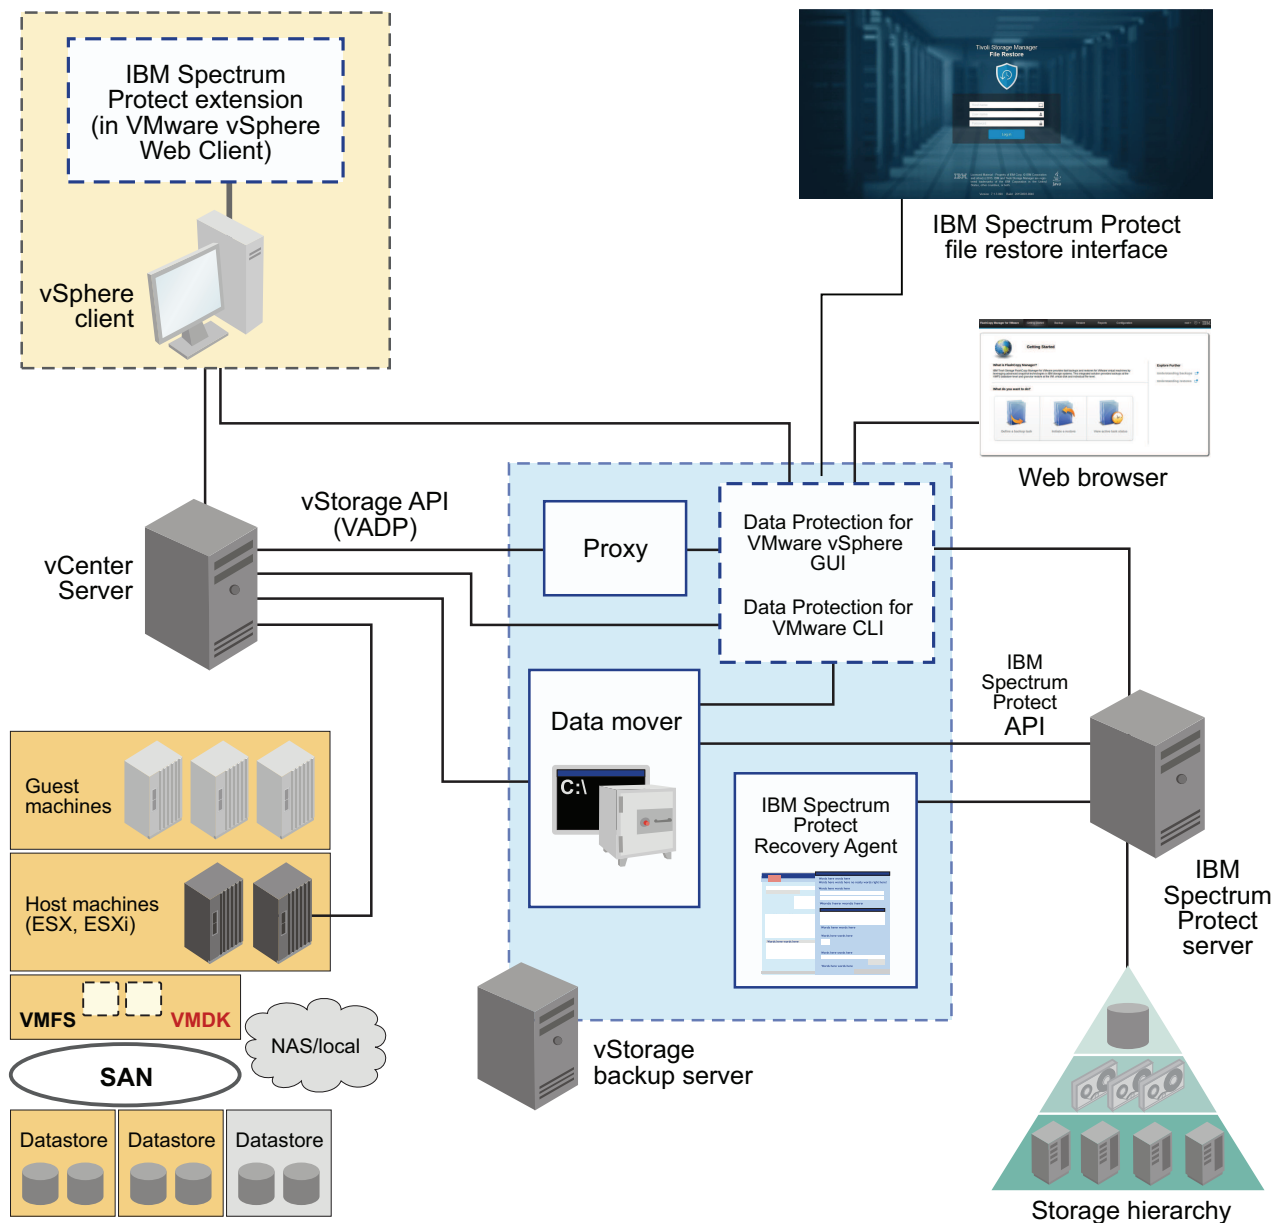

Figure 1. IBM Spectrum Protect for Virtual Environments system components in a VMware vSphere user environment

Data Protection for VMware provides several components to assist with protecting your VMs.

Data Protection for VMware vSphere GUI

This component is a graphical user interface (GUI) that accesses VM data on the VMware vCenter Server. The content of the GUI is available in two views:

- A web browser view. This view is accessed in a supported web browser by using the URL for the GUI web server host. For example:
<https://guihost.mycompany.com:9081/TsmVMwareUI/>
- The IBM Spectrum Protect extension view in the VMware vSphere Web Client. The panels in this view are uniquely designed to integrate within the web client, but data and commands for this view are obtained from the same GUI web server as the other views. The IBM Spectrum Protect extension provides a subset

of the functions that are available in the web browser view and some additional functions. Configuration and advanced reporting functions are not offered in this view.

The Data Protection for VMware vSphere GUI can be installed on any system that meets the operating system prerequisites. The Data Protection for VMware vSphere GUI resource requirements are minimal as it does not process I/O data transfers. Installing the Data Protection for VMware vSphere GUI on the vStorage Backup Server is the most common configuration.

For the web-browser view, you can register multiple Data Protection for VMware vSphere GUIs to a single vCenter Server. This scenario reduces the number of datacenters (and their VM guest backups) that are managed by a single VMware Data Protection for VMware vSphere GUI. Each GUI can then manage a subset of the total number of datacenters that are defined on the vCenter Server. For each GUI that is registered to the vCenter Server, one Data Protection for VMware package must be installed on a separate host. To update the managed datacenters, go to **Configuration > Edit IBM Spectrum Protect Configuration**. In the GUI Domain page, reduce the list of datacenters that are managed by the GUI. Managing a subset of all available datacenters reduces the query and processing time that is required by the GUI to complete operations.

When you register multiple Data Protection for VMware vSphere GUIs to a single vCenter Server, the following guidelines apply:

- Each datacenter can be managed by only one installed Data Protection for VMware vSphere GUI.
- A unique VMCLI node name is required for each installed Data Protection for VMware vSphere GUI.
- Using unique data mover node names for each installed Data Protection for VMware vSphere GUI simplifies managing the nodes.

The Data Protection for VMware vSphere GUI must have network connectivity to the following systems:

- vStorage Backup Server
- IBM Spectrum Protect server
- vCenter Server

In addition, ports for the Derby Database (default 1527) and GUI web server (default 9081) must be available.

IBM Spectrum Protect file restore GUI

The web-based file restore GUI enables you to restore files from a VMware virtual machine backup without administrator assistance. The GUI is installed automatically when the Data Protection for VMware vSphere GUI is installed. For more information, see Chapter 3, “Getting started with file restore,” on page 43.

IBM Spectrum Protect recovery agent

This service enables the mounting of any snapshot volume from the IBM Spectrum Protect server. You can view the snapshot locally, with read-only access, on the client system, or use an iSCSI protocol to access the snapshot from a remote computer. In addition, the recovery agent provides the instant restore function. A volume used in instant restore processing remains available while the restore

process proceeds in the background. The recovery agent is accessed with the recovery agent GUI or command-line interface.

The recovery agent command-line interface is installed on a Windows system to perform the following tasks from a remote machine:

- Gather information about available restorable data, including lists of:
 - Backed-up VMs
 - Snapshots available for a backed-up machine
 - Partitions available in a specific snapshot
- Mount a snapshot as a virtual device.
- Get a list of virtual devices.
- Remove a virtual device.

Important: Information about how to complete tasks with the recovery agent GUI is provided in the online help that is installed with the GUI. Click **Help** in any of the GUI windows to open the online help for task assistance.

For detailed information regarding commands, parameters, and return codes, see “Recovery Agent command-line interface” on page 118.

Data Protection for VMware command-line interface

The Data Protection for VMware CLI is a full-function command-line interface that is installed with the Data Protection for vSphere GUI. You can use it to complete these tasks:

- Initiate a backup of your VMs to the IBM Spectrum Protect server, or schedule a backup for a later time.
- Initiate a IFFULL recovery of your VMs, VM files, or VM Disks (VMDKs) from the IBM Spectrum Protect server.
- View configuration information about the backup database and environment.

Although the Data Protection for vSphere GUI is the primary task interface, the Data Protection for VMware CLI provides a useful secondary interface. For example, it can be used to implement a scheduling mechanism different from the one implemented by the Data Protection for vSphere GUI. Also, it is useful when evaluating automation results with scripts.

For detailed information regarding available commands, see “vmcli command-line interface” on page 93.

Backup and restore types

Data Protection for VMware provides the following types of backup and restore functions:

Incremental-forever incremental backup

Backs up the blocks that changed since the previous backup (full or incremental). The most recent incremental is appended to the previous backup. If a full backup does not exist for this VM, a full backup is automatically performed. As a result, you do not have to verify that a full backup exists.

Incremental-forever full backup

Creates an image of an entire VM. After the full backup is taken, there is no requirement to schedule additional full backups. When full is selected, VM templates that are unchanged since the last backup are also included.

File restore

Use the IBM Spectrum Protect file restore interface to restore files with a web-based interface. File owners can search, locate, and restore files from a VM backup without administrator assistance.

Instant restore

With instant restore, you can restore the content of a single volume from a snapshot. This restore uses the snapshot data that is generated by the backup-archive client. Instant restore can be done from a full or incremental VM backup. You can use the volume immediately, while the restore process continues in the background. Instant restore requires an in-guest installation.

Full VM restore

Restore a full or incremental VM backup. The entire VM is restored to the state it existed in when originally backed up.

Full VM instant restore

With full VM instant restore, the restored VM becomes available for instant use, either for validating the backed up VM or for restoring the VM to permanent storage. The restored VM is available for instant use in read/write mode.

How IBM Spectrum Protect nodes are used in a virtual environment

Data Protection for VMware communicates to VMs during backup, restore, and mount operations through IBM Spectrum Protect nodes.

A node represents a system on which the data mover, Data Protection for VMware, or other application client is installed. This system is registered to the IBM Spectrum Protect server. Each node has a unique name (node name) that is used to identify the system to the server. Communication, storage policy, authority, and access to VM data are defined based on a node.

In a Data Protection for VMware vSphere production environment, the most basic node is the data mover node. This node represents a specific data mover (data mover) that "moves data" from one system to another. In a basic vSphere environment, where VMs are backed up by a single client, the VM data is stored directly under the data mover node.

In some scenarios, several data movers are used to back up a complete virtual environment, such as a VMware datacenter. In this scenario, since the backup work is distributed among multiple data movers, the VM data is stored in a shared node (instead of a specific data mover node). This shared node is called the datacenter node. Thus, in this large system vSphere environment, the data mover nodes store VM data into the datacenter node.

In a large vSphere virtual environment, where multiple data movers and datacenter are operative, a third node is used to communicate among the nodes and the IBM Spectrum Protect server. This node is the VMCLI node.

A mount proxy node represents the Linux or Windows proxy system that accesses the mounted VM disks through an iSCSI connection. These nodes enable the file systems on the mounted VM disks to be accessible as mount points on the proxy system. You can then retrieve the files by copying them from the mount points to your local disk. Mount proxy nodes are created in pairs and are required by the datacenter node for each Windows or Linux system that serves as a proxy. To increase the number of available mount points, you can configure a datacenter node to have multiple pairs of mount proxy nodes.

Use the Data Protection for VMware vSphere GUI configuration wizard or configuration notebook to set these nodes in a vSphere environment.

Table 1. IBM Spectrum Protect nodes in a vSphere environment

Node	Description
vCenter node	The virtual node that represents a vCenter.
datacenter node	The virtual node that maps to a data center. The datacenter nodes hold the data.
VMCLI node	The node that connects the Data Protection for VMware command-line interface to the IBM Spectrum Protect server and the data mover node.
data mover node	This node performs the data movement. Important: Data Protection for VMware stores sensitive information locally on the data mover, and the data mover might also have direct access to VM storage. Access to the data mover must be protected. Allow only trusted users access to the data mover system.
mount proxy node	This node represents the Linux or Windows proxy system that accesses the mounted VM disks through an iSCSI connection. These nodes enable the file systems on the mounted VM disks to be accessible as mount points.

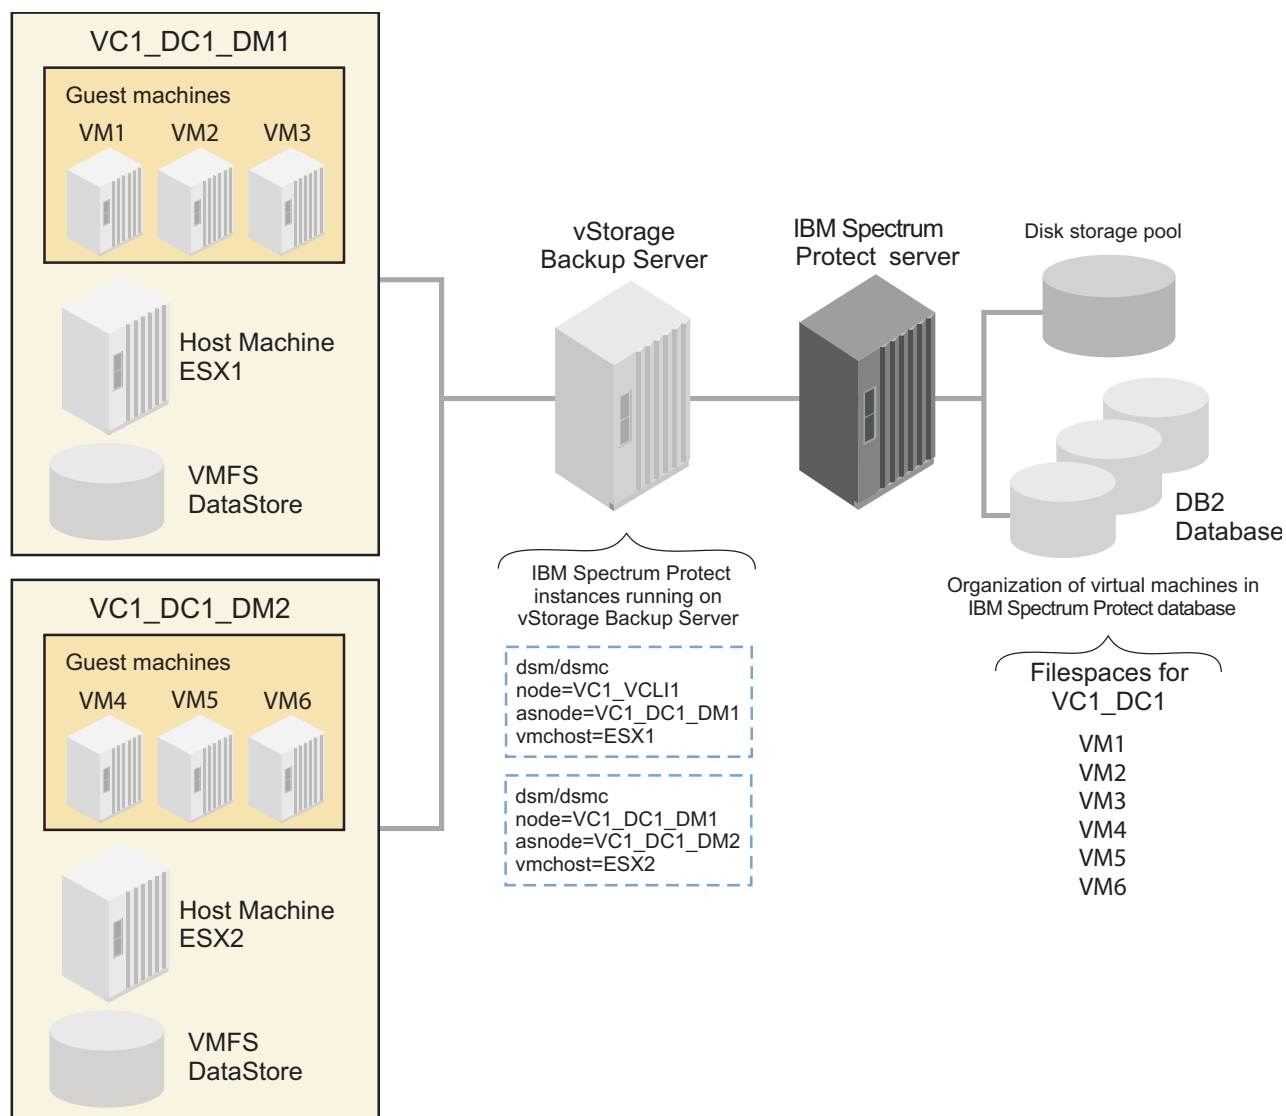

Figure 2. Node relationships and applications in a vSphere production environment that contains one VMware data center and two data move nodes.

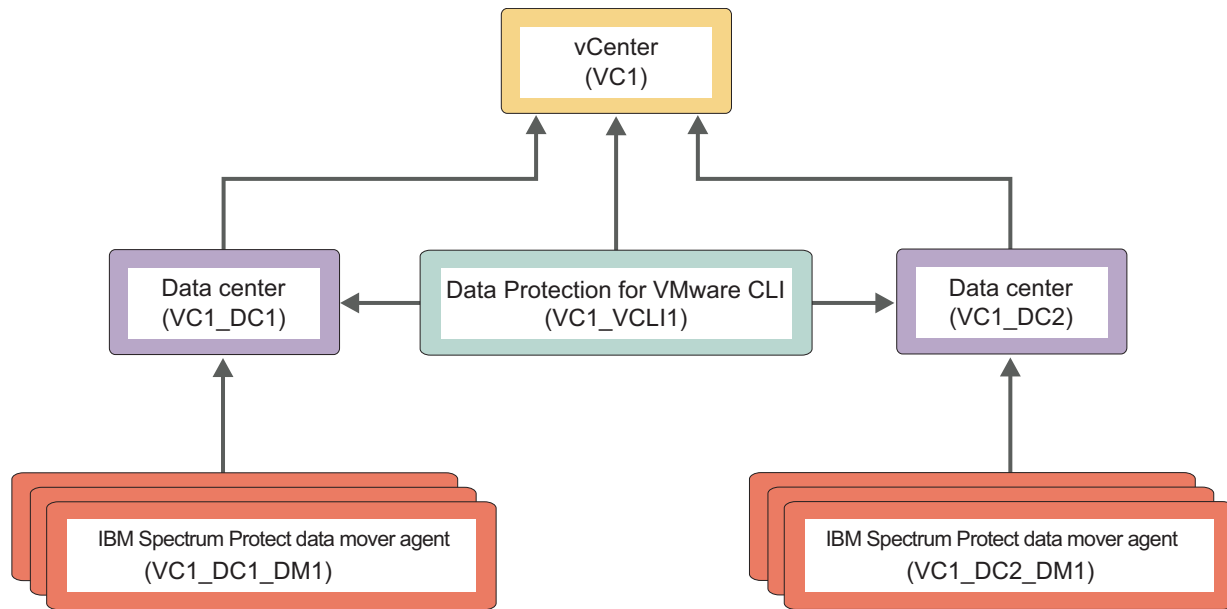

Figure 3. Proxy relationships among the nodes in a vSphere environment that uses two VMware datacenters. The arrows point from the proxy agent node to the proxy target node.

Mount proxy node and data mover node requirements

Operations require specific node types and certain environment settings.

Consider these Data Protection for VMware node requirements before you attempt any tasks:

- Data mover nodes are required for the following operations:
 - IFINCREMENTAL - indicates the incremental-forever incremental backup type.
 - IFFULL - indicates the incremental-forever full backup type.
- Mount proxy nodes are required for the following operations:
 - Full VM instant access
 - Full VM instant restore
 - Mount
- A mount operation accesses a Windows system and a Linux system that function as mount proxy systems. The Windows proxy system also requires the recovery agent to be installed. These two mount proxy nodes function together during a mount operation. Mount proxy nodes are created in pairs and are required by the datacenter node for each Windows or Linux system that serves as a proxy.
- Only one mount proxy node is allowed for each physical or virtual Windows mount proxy system. If you want to use multiple mount proxy node pairs, you must install each Windows mount proxy node on a separate system, along with a recovery agent.
- You cannot mount the backup of a Windows mount proxy node or Linux mount proxy node to itself.

The recovery agent is restricted to one node assignment. This node must be a mount proxy node. Although a Windows system might contain multiple data mover nodes, only one proxy mount node is allowed for the recovery agent to use. As a result, operations that use the recovery agent fail when you attempt to connect to a system with a node that is not assigned to the recovery agent.

These examples show types of operations that fail when a node that is not assigned to the recovery agent is used:

Mount operations

When you run a mount operation with the mount proxy node from VMware datacenter DC1, the recovery agent connects to that mount proxy node. Because that connection to the mount proxy node is the only correct connection, the recovery agent does not use another mount operation with any other nodes on that mount proxy system. As a result, the mount operation fails when you use a mount proxy node from VMware datacenter DC2.

Before you attempt a mount operation, you must disable multipathing on the Linux mount proxy system.

Note: Logical Volume Manager (LVM) filtering can block iSCSI connections.

Note: The Linux mount proxy system does not support LVM auto activation.

Instant access or instant restore operations

You attempt to run an instant access or instant restore operation with a mount proxy node from a Windows system that is used as a mount proxy system. A Windows mount proxy system requires the recovery agent to be installed. Because the connection from the recovery agent to the Windows mount proxy node (to run the mount operation) is the only correct connection, an instant access or instant restore operation that attempts to use this mount proxy node (from the same Windows system) fails.

Mount proxy nodes and mount proxy nodes require proxy authority to the datacenter node. This proxy authority is granted automatically when you set up your nodes with the Data Protection for VMware vSphere GUI Configuration Wizard. However, if you manually set up your mount proxy nodes and data mover nodes, you must grant this proxy authority to the datacenter nodes on the IBM Spectrum Protect server with the **GRANT PROXYNODE** command. For example:

```
GRANT PROXYNODE TARGET=DC_NODE AGENT=LOCAL_MP_WIN
GRANT PROXYNODE TARGET=DC_NODE AGENT=LOCAL_MP_LNX
```

File sharing security

When you share a mounted virtual machine snapshot, certain security issues can occur that are related to NFS (Linux) and CIFS (Windows) protocols. Review these issues to better understand the security impact when you share a mounted virtual machine snapshot.

When all of the following conditions exist on Linux systems, respective users can access directories on the shared system:

- The mounted volumes that belong to Linux system (B) are shared to a different Linux host (A).
- The Linux host (A) has the same user names as the Linux system (B) that was backed up

For example, *root* user (A) can access all *root* user (B) files, and *tester* (A) can access all of *tester* (B) files. In this situation, the permission group and user are changed to *nobody*.

This output is an example of access to mounted volumes:

```
esx2vm55:/opt/tivoli/tsm/client/ba/bin # ls -la /CVT/TSM/ESX2VM21/2014-05-22-01_32_53/Volume7
total 19
drwx----- 4 500 500 1024 Apr 28 23:53 .
drwxr-xr-x 8 root root 4096 May 27 22:06 ..
drwxrwxr-x 2 500 500 1024 Apr 28 23:52 RAID_0
drwx----- 2 root root 12288 Apr 28 23:52 lost+found
```

This output is an example of access to shared volumes:

```
[tester1@ESX2VM51 Volume7]$ ls -la
total 19
drwx----- 4 nobody nobody 1024 Apr 28 23:53 .
drwxr-xr-x 8 nobody nobody 4096 May 27 22:06 ..
drwxrwxr-x 2 nobody nobody 1024 Apr 28 23:52 RAID_0
drwx----- 2 nobody nobody 12288 Apr 28 23:52 lost+found
```

Make sure that the correct Linux hostname/IP address or Windows user name is specified. If the correct hostname/IP address or user name is not specified, the share operation fails. This failure is identified by the operating system.

On Windows systems, a user with the same credentials as the backed up Windows virtual machine can access the shared volumes on any Windows system.

Tape media guidelines

If your environment contains virtual machine backup data on tape media (such as a tape storage pool or virtual tape library), and the data was either directly stored on tape or migrated to tape over time, consider these guidelines.

Configuration

- Ensure that virtual machine control file data is always on a disk storage pool. You can specify the destination storage pool for virtual machine control file data with the data mover `vmctlmc` option. For more information, see `Vmctlmc`.
- Use collocation by file space to optimize the tape that contains virtual machine backup data.

When a virtual machine is backed up to the IBM Spectrum Protect server, each backup is represented as a separate file space on the server. The collocation by file space setting saves data from multiple `IFINCREMENTAL` backups of the same virtual machine to the same volume (disk file). When migration to tape occurs, these backups are together on the physical tape.

You can enable collocation at the file space level with the server **COLLOCATE=FILESPEC** parameter. For more information, see `DEFINE STGPOOL`.

- Be aware of migration thresholds and how data availability is affected by thresholds. For example, a block in Data Protection for VMware that never changes can be migrated to tape even though the most active backup needs the block.

Recovery

File restore from tape media is not supported. File restore from disk storage is the preferred method.

Consider moving target virtual machine backup data from tape media to disk storage before you attempt a file restore operation. Do not move the virtual machine control data because this data should already be in separate disk storage pool. Also, do not move backup data to the disk storage pool on which the control data resides. If you move backup and control data to the same pool, you will have to complete an IFFULL backup to move the backup and control data to separate pools.

To move backup data, use the server **MOVE NODEDATA** command and ensure that the **FROMstgpool** and **T0stgpool** parameters do not specify pools that contain control data.

Long term retention

Run traditional IFFULL VM backups to tape storage regularly as a solution for long-term storage or tape retention of your data. For example, you can run a IFFULL VM backup to tape monthly as a solution for archive needs.

For additional information related to tape media, see technote 7021081.

Controlling which disks are processed

Set include and exclude statements to control the disks to be processed.

Use Data Protection for VMware in conjunction with the IBM Spectrum Protect backup-archive client to determine which disks in the VM environment are backed up and restored. VM environments typically contain a combination of system, normal, independent, and raw device mapping (RDM) disks. The ability to extend control granularity to specific disks provides benefits in these situations:

- Recover the disk where the operating system is located in order to replace a corrupted system drive.
- Protect disks in VM environments that use IBM Spectrum Protect Data Protection applications as guests that contain large database and log files.
- VM configuration information is lost. The VM configuration information is recovered while the disks remain in place.

In previous versions of Data Protection for VMware, a new VM was required whenever a VM restore was performed. If the VM already existed, the restore failed. With this feature, you can restore selected virtual disks but leave the rest of an existing VM intact.

VM templates and vApps in a vSphere environment

Data Protection for VMware supports backing up and restoring VM templates and vApps.

A VM template is a master image of a VM. The template can include an installed guest operating system and a set of applications.

VM templates can be restored to the original VM template, or to an alternative VM template and data store location. Because Data Protection for VMware marks the VM template as one unit, a single file restore of a VM template is not feasible. A single virtual disk cannot be restored, nor can a single virtual disk backup be attached on an ESX host to a target VM.

VMs that are contained in a vApp can be backed up and restored. A vApp is a logical entity that consists of one or more VMs. By using a vApp, you can specify and include all components of a multitier application. A vApp also includes the operational policies and associated service levels of the application contained in the vApp.

The VMs in the vApp are identified in the Data Protection for VMware vSphere GUI as VMs. While you select the VM to back up, you cannot select a vApp. When you restore the VM, the VM is added to one of the following locations:

- If the vApp is present with the original full inventory path, the VM is restored to that location.
- When the original full inventory path is not present or was changed, the VM is restored to the top-level default location on the target ESX host. No containers are created during the restore operation.

When backing up a VM template, and a full backup does not exist for this VM template, the following occurs:

- If the selected backup type is incremental-forever-incremental, and the VM template contains changes, the backup type changes to incremental-forever-full.
- If the selected backup type is incremental-forever-full, this type ensures that the VM template is backed up regardless of whether it contains changes.

Automated client failover

If you backed up data to the IBM Spectrum Protect server, Data Protection for VMware can automatically fail over to the secondary server for data recovery when there is an outage on the IBM Spectrum Protect server.

The server that the IBM Spectrum Protect data mover node connects to during normal production processes is called the *primary server*. When the primary server and data mover node are set up for node replication, the client data on the primary server can be replicated to another IBM Spectrum Protect server, which is the *secondary server*.

During normal operations, connection information for the secondary server is automatically sent to the data mover node from the primary server during the logon process. The secondary server information is automatically saved to the client options file on the data mover node. No manual intervention is required by you to add the information for the secondary server.

Each time the data mover node logs on to the server, it attempts to contact the primary server. If the primary server is unavailable, the data mover node automatically fails over to the secondary server, according to the secondary server information in the client options file. In failover mode, you can restore any replicated client data. When the primary server is online again, the data mover node automatically fails back to the primary server the next time the data mover node connects to the server.

Requirements: Before the connection information for the secondary server is sent to the client options file, the following processes must occur:

- The primary server, secondary server, and data mover node must be at the V7.1 level.
- The primary and secondary servers must be set up for node replication, and the client node must be configured for node replication on the server.

- You must back up VMware data at least one time to the primary server.
- Client data on the primary server must be replicated to the secondary server at least one time.

Restriction: The following restrictions apply to Data Protection for VMware during failover:

- Any operations that require data to be stored on the server, such as backup operations, are not available.
- Schedules are not replicated to the secondary server. Therefore, schedules are not run while the primary server is unavailable.
- Instant restore of virtual machines is not available.
- Validation of virtual machine backups is not available.
- The Data Protection for VMware GUI does not fail over. You must use the data mover on the data mover node to restore data from the secondary server.
- For more information about the failover capabilities of IBM Spectrum Protect components, see technote 1649484.

Out-of-space errors on VMware datastores

Linux

Windows

To prevent out-of-space errors during virtual machine backups, you can set a data usage threshold for VMware datastores by using the `vmdatastorethreshold` option.

Use the `vmdatastorethreshold` option to set the threshold percentage of space usage for each VMware datastore of a virtual machine. When you initiate a virtual machine backup, the client checks the data usage of the VMware datastores before the virtual machine snapshot is created. If the threshold is exceeded in any of the VMware datastores, the virtual machine is not backed up.

For example, virtual machine `vm1` spans `datastore1` and `datastore2`. You can issue the following command to ensure that the VMware datastores of a virtual machine are at most 90% full before the virtual machine is backed up:

```
dsmc backup vm vm1 -vmdatastorethreshold=90
```

As a result, the client checks the space usage of both `datastore1` and `datastore2` before the snapshot operation begins. If the space usage of either VMware datastore exceeds the 90% threshold, the backup request for `vm1` is not started.

Requirements:

- Ensure that the threshold is low enough so that the snapshot does not use up all the available space in the VMware datastores. Otherwise, you will run out of space on the VMware datastores and the snapshot will not be created.
- If you use multiple clients that act as data mover nodes, you must add the `vmdatastorethreshold` option to the options file for each data mover.

The client checks the data usage of the VMware datastore that contains the virtual machine disk snapshots. By default, the snapshots are created in the same directory as that of the parent virtual disk (`.vmdk`) file. The client checks the data usage only in the default location.

If you use the EXCLUDE.VMDISK option to exclude one or more disks from a backup, the threshold check is still run on these disks. Even though these disks are not backed up, VMware still takes a snapshot of these disks.

Independent disks are not checked during space verification processing because a snapshot of these disks does not use any VMware datastore space.

For more information about the vmdatastorethreshold option, see Vmdatastorethreshold.

Full VM instant restore environment requirements

Windows

Review the applications, systems, and versions that are required for full VM instant restore operations.

The following environment requirements must exist before attempting a full VM instant restore operation:

- Full VM instant restore is supported only for IBM Spectrum Protect data mover 7.1 (or later) Windows 64-bit and Windows vStorage Backup servers.
- Instant access and instant restore capability is supported only for VMware VMs that are hosted on VMware ESXi 5.1 servers, or later versions.
- Full VM instant restore is supported only for disks and virtual tape libraries (VTL). Physical tape storage pools are not supported.
- The IBM Spectrum Protect recovery agent 7.1 (or later) must be installed on the same system as the data mover 7.1 (or later) data mover system.
- A data mover node that was used for version 7.1.0 instant restore and instant access operations cannot be used for version 8.1.0 instant restore and instant access operations. After you upgrade IBM Spectrum Protect for Virtual Environments to version 8.1.0, you must create a pair of mount proxy nodes to run instant restore and instant access operations. You can create a mount proxy node pair by using either of the following methods:
 - Go to the Configuration window in the Data Protection for VMware vSphere GUI and click **Edit Configuration**. Go to the Mount Proxy Node Pairs page and follow the instructions on that page.
 - Follow the steps in Manually configuring the mount proxy nodes on a remote Windows system.
- VMs that were backed up with data mover 6.3 (or later) can be restored by using full VM instant restore.
- The data mover system requires the IBM Spectrum Protect for Virtual Environments 7.1 (or later) license file.
- iSCSI mount (with the recovery agent) is used to expose the VM disks to the ESX as virtual RDMs. Instant access and instant restore operations require an iSCSI software or hardware adapter that is configured on the ESX host that is used for these operations.
- Storage vMotion must be installed and configured on the ESX servers that host the VMs to be used during instant restore operations. Instant access operations (that validate the VM backup data) do not require Storage vMotion.
- Instant access and instant restore operations require vSphere privileges that power on VMs (**Virtualmachine.Interaction.PowerOn**).

For detailed configuration instructions, see *Configuring your environment for full virtual machine instant restore operations*.

VMware vCenter Server user privilege requirements

Certain VMware vCenter Server privileges are required to run Data Protection for VMware operations.

vCenter Server privileges required to protect VMware datacenters with the web-browser view for the Data Protection for VMware vSphere GUI

The vCenter Server user ID that signs on to the browser view for the Data Protection for VMware vSphere GUI

must have sufficient VMware privileges to view content for a datacenter that is managed by the GUI.

For example, a VMware vSphere environment contains five datacenters. A user, “jenn”, has sufficient privileges for only two of those datacenters. As a result, only those two datacenters where sufficient privileges exist are visible to “jenn” in the views. The other three datacenters (where “jenn” does not have privileges) are not visible to the user “jenn”.

The VMware vCenter Server defines a set of privileges collectively as a role. A role is applied to an object for a specified user or group to create a privilege. From the VMware vSphere web client, you must create a role with a set of privileges. To create a vCenter Server role for backup and restore operations, use the VMware vSphere Client **Add a Role** function. You must assign this role to a user ID for a specified vCenter Server or datacenter. If you want to propagate the privileges to all datacenters within the vCenter, specify the vCenter Server and select the propagate to children check box. Otherwise, you can limit the permissions if you assign the role to the required datacenters only with the propagate to children check box selected. Enforcement for the browser GUI is at the datacenter level.

The following example shows how to control access to datacenters for two VMware user groups. First, create a role that contains all of the privileges defined in technote 7047438. The set of privileges in this example are identified by the role named “TDPVMwareManage”. Group 1 requires access to manage virtual machines for the Primary1_DC and Primary2_DC datacenters. Group 2 requires access to manage virtual machines for the Secondary1_DC and Secondary2_DC datacenters.

For Group 1, assign the “TDPVMwareManage” role to the Primary1_DC and Primary2_DC datacenters. For Group 2, assign the “TDPVMwareManage” role to the Secondary1_DC and Secondary2_DC datacenters.

The users in each VMware user group can use the Data Protection for VMware GUI to manage virtual machines in their respective datacenters only.

Tip: When you create a role, consider adding extra privileges to the role that you might need later to complete other tasks on objects.

vCenter Server privileges required to use the data mover

The IBM Spectrum Protect data mover that is installed on the vStorage Backup server (the data mover node) requires the VMCUser and VMCPw options. The VMCUser option specifies the user ID of the vCenter or ESX server that you want to back up, restore, or query. The required privileges that are assigned to this user ID (VMCUser) ensure that the client can run operations on the virtual machine and the VMware environment. This user ID must have the VMware privileges that are described in technote 7047438.

To create a vCenter Server role for backup and restore operations, use the VMware vSphere Client **Add a Role** function. You must select the propagate to children option when you add privileges for this user ID (VMCUser). In addition, consider adding other privileges to this role for tasks other than backup and restore. For the VMCUser option, enforcement is at the top-level object.

vCenter Server privileges required to protect VMware datacenters with the IBM Spectrum Protect extension view for the Data Protection for VMware vSphere GUI

The IBM Spectrum Protect extension requires a set of privileges that are separate from the privileges that are required to sign in to the GUI.

During the installation the following custom privileges are created for the IBM Spectrum Protect extension:

- **Datacenter > IBM Data Protection**
- **Global > Configure IBM Data Protection**

Custom privileges that are required for the IBM Spectrum Protect extension are registered as a separate extension. The privileges extension key is `com.ibm.tsm.tdpvmware.IBMDataProtection.privileges`.

These privileges allow the VMware administrator to enable and disable access to IBM Spectrum Protect extension content. Only users with these custom privileges on the required VMware object can access the IBM Spectrum Protect extension content. One IBM Spectrum Protect extension is registered for each vCenter Server and is shared by all GUI hosts that are configured to support the vCenter Server.

From the VMware vSphere web client, you must create a role for users who can complete data protection functions for virtual machines by using the IBM Spectrum Protect extension. For this role, in addition to the standard virtual machine administrator role privileges required by the web client, you must specify the **Datacenter > IBM Data Protection** privilege. For each datacenter, assign this role for each user or user group where you want to grant permission for the user to manage virtual machines.

The **Global > IBM Data Protection** privilege is required for the user at the vCenter level. This privilege allows the user to manage, edit, or clear the connection between the vCenter Server and the Data Protection for VMware vSphere GUI web server. Assign this privilege to administrators that are familiar with the Data Protection for VMware vSphere GUI that protects their respective vCenter Server. Manage your IBM Spectrum Protect extension connections on the extension Connections page.

The following example shows how to control access to datacenters for two user groups. Group 1 requires access to manage virtual machines for the NewYork_DC and Boston_DC datacenters. Group 2 requires access to manage virtual machines for the LosAngeles_DC and SanFrancisco_DC datacenters.

From the VMware vSphere client, create for example the “IBMDDataProtectManage” role, assign the standard virtual machine administrator role privileges and also the **Datacenter > IBM Data Protection** privilege.

For Group 1, assign the “IBMDDataProtectManage” role to the NewYork_DC and Boston_DC datacenters. For Group 2, assign the “IBMDDataProtectManage” role to the LosAngeles_DC and SanFrancisco_DC datacenters.

The users in each group can use the IBM Spectrum Protect extension in the vSphere web client to manage virtual machines in their respective datacenters only.

Issues related to insufficient permissions

When the web browser user does not have sufficient permissions for any datacenter, access to the view is blocked. Instead, the error message GVM2013E is issued to advise that the user is not authorized to access any managed datacenters due to insufficient permissions. Other new messages are also available that inform users of issues that result from insufficient permissions. To resolve any permissions-related issues, make sure that the user role is set up as described in the previous sections. The user role must have all privileges that are identified in the Required privileges vCenter Server user ID and data mover table, and these privileges must be applied at the datacenter level with the propagate to children check box.

When the IBM Spectrum Protect extension user does not have sufficient permissions for a datacenter, the data protection functions for that datacenter and its content are made unavailable in the extension.

When the IBM Spectrum Protect user ID (specified by the VMUser option) contains insufficient permissions for a backup and restore operation, the following message is shown:

```
ANS9365E VMware vStorage API error.  
"Permission to perform this operation was denied."
```

When the IBM Spectrum Protect user ID contains insufficient permissions to view a machine, the following messages are shown:

```
Backup VM command started. Total number of virtual machines to process: 1  
ANS4155E Virtual Machine 'tango' could not be found on VMware server.  
ANS4148E Full VM backup of Virtual Machine 'foxtrot' failed with RC 4390
```

To retrieve log information through the VMware Virtual Center Server for permission problems, complete these steps:

1. In vCenter Server Settings, select **Logging Options** and set "**vCenter Logging to Trivia (Trivia)**".
2. Re-create the permission error.
3. Reset **vCenter Logging** to its previous value prevent recording excessive log information.
4. In System Logs, look for the most current vCenter Server log (vpzd-wxyz.log) and search for the string NoPermission. For example:

```
[2011-04-27 15:15:35.955 03756 verbose 'App'] [VpxVmomi] Invoke error:  
vim.VirtualMachine.createSnapshot session: 92324BE3-CD53-4B5A-B7F5-96C5FAB3F0EE  
Throw: vim.fault.NoPermission
```

This log message indicates that the user ID did not contain sufficient permissions to create a snapshot (createSnapshot).

Chapter 2. Managing data with the IBM Spectrum Protect extension

The IBM Spectrum Protect extension is a VMware vSphere Web Client extension that provides a view of the Data Protection for VMware vSphere GUI.

The IBM Spectrum Protect extension is designed to integrate within the VMware vSphere Web Client, but data and commands for this extension are obtained from the Data Protection for VMware vSphere GUI web server.

The IBM Spectrum Protect extension provides a subset of the functions that are available in the browser view for the Data Protection for VMware vSphere GUI and some additional functions. Depending on your environment, you can use this extension to configure backup policies to fit your backup management needs, such as excluding or including virtual machines (VMs) in scheduled backup services, changing the retention policy of backups, selecting the VM disks you want to protect, setting the data consistency for backups, and providing application protection for VM backups.

You can also use the extension to start on-demand backup and restore operations and to view the most recent backup information for all VMs that are in a vSphere object. This information includes identification of VMs that are at risk of being unprotected because the VM has never been backed up or a backup did not occur in the time interval that is set in the at-risk policy.

Getting started

Learn about the tasks for installing, setting up, and using the IBM Spectrum Protect extension to manage data protection for your VMware datacenter.

Available features

The features that are available in the IBM Spectrum Protect extension depend on the version of VMware vSphere that you are using.

If you are using VMware vSphere 6.0 or later, restore, backup, and tagging functions are available. If you are using VMware vSphere 5.5, only restore and backup features are available.

Related tasks:

“Enabling tagging support”

Connecting to the Data Protection for VMware vSphere GUI

The IBM Spectrum Protect extension relies on back-end services that are provided by the Data Protection for VMware vSphere GUI that has been preconfigured for a vCenter. To use the extension, you must create a connection to the host where the Data Protection for VMware vSphere GUI is installed.

Procedure

To create a connection to the Data Protection for VMware vSphere GUI host:

1. In the vSphere Web Client object navigator, click **IBM Spectrum Protect**.
2. Click the **Manage** tab. The vCenters that you can manage by using the IBM Spectrum Protect extension are shown on the **Connections** page.
3. Select a vCenter, and then click the **Edit** icon.
4. Enter the host name or IP address and port for the Data Protection for VMware vSphere GUI server, and then click **Save**.

Results

If the connection is successful, **Verified Connection** is displayed in the **Connection Status** column for the vCenter.

Enabling tagging support

IBM Spectrum Protect uses VMware vSphere tags to establish backup policies for managing protection of virtual machines.

These policies are described in “Configuring backup policies” on page 24. However, before you can configure backup policies, you must enable tagging support.

Setting a data mover node as a tag-based node

When tagging support is enabled on a data mover node, administrators can apply data protection tags to VMware inventory objects such as host clusters, datacenters, hosts, resource pools, virtual machines, and folders (Host and Cluster folders and VM and Template folders).

Before you begin

Ensure that the following requirements are met:

- VMware vCenter Server must be at Version 6.0 Update 1 or later.

- In order for the Data Protection for VMware vSphere GUI to function correctly with tagging support, ensure that the following requirements are met during the installation of the GUI:

- At least one data mover and the Data Protection for VMware vSphere GUI must be installed on the same server. This data mover node must be configured so that the vCenter server credentials are saved. You can save the credentials by running the configuration wizard to save the data mover node password, or by using the **dsmc set password** command on the data mover command line.

If you use other data movers, running on virtual machines or physical machines as additional data movers, you can install them on other servers. For tagging support, all these data movers must also be configured with the `vmtagdatamover=yes` option. These additional data movers do not require the Data Protection for VMware vSphere GUI to be installed on the same server in order for them to work correctly as tag-based data movers.

- **Linux** For Linux data movers, ensure that you specify the data mover installation directory and the Java™ shared library `libjvm.so` in the `LD_LIBRARY_PATH` environment variable. The path to `libjvm.so` is used for tagging support when you enable the `vmtagdatamover` option on the data mover. For instructions, see *Setting up the data mover nodes in a vSphere environment*.
- **Linux** On Linux operating systems, the Data Protection for VMware vSphere GUI must be installed by using the default user name (`tdpvmware`).
- **Linux** For Linux data mover nodes, the default password file (`/etc/adsm/TSM.PWD`) must be used.

About this task

You can use data protection tags to configure the backup policy of virtual machines in VMware inventory objects. These data protection tags are presented as settings that can be changed in the IBM Spectrum Protect extension. For tags that are related to schedules, the virtual machines must be in a protection set that is protected by a schedule. A protection set consists of the virtual machines in a container that is assigned the Schedule (IBM Spectrum Protect) tag.

Procedure

Use one of the following methods:

- To configure a *new* data mover for tagging support on Windows by using the Data Protection for VMware vSphere GUI, complete the following steps:
 1. On the Windows system where the Data Protection for VMware vSphere GUI is installed, start the GUI by opening a web browser and entering the GUI web server address. For example:
`https://<GUI web server address>:9081/TsmVMwareUI/`
 - Log on with the vCenter user ID and password.
 2. Go to the **Configuration** tab, and select the **Edit IBM Spectrum Protect Configuration** action.
 3. Go to the Data Mover Nodes page of the configuration notebook.
 4. Add a data mover node by completing the following steps:
 - a. For the data mover node that you want to set up tagging support for, select **Create Services**, then select **Tag Based Node**.

- b. To designate the tag-based node as a default data mover node, select **Default Data Mover**. A default data mover node backs up any new VMs that are added to any container in the datacenter, if the container is already in a protection set. The default data mover also backs up any VMs in the protection set that are not assigned the Data Mover tag.

Tip: If you edit the configuration, add a new data mover node, and select this new data mover to be the default data mover for the datacenter, and the `vmtagdefaultdatamover` option is set in your other data mover option files, you must manually edit the data mover options files for the other data movers in the datacenter to change the `vmtagdefaultdatamover` value to the newly created data mover.

- c. Click **OK** to save your changes.

The `vmtagdefaultdatamover` and `vmtagdefaultdatamover (if set)` options are added to the data mover options file (`dsm.opt`).

- To configure a *new* or *existing* Linux data mover node, or an *existing* Windows data mover node, for tagging support:
 1. Add the `vmtagdatamover yes` option in the data mover options file (`dsm.sys` for Linux and `dsm.opt` for Windows).
 2. To designate the tag-based node as a default data mover node, add the `vmtagdefaultdatamover yes` or `vmtagdefaultdatamover dm_name` option to the data mover options file.

Tip: If you edit the configuration, add a new data mover node, and select this new data mover to be the default data mover for the datacenter, and the `vmtagdefaultdatamover` option is set in your other data mover option files, you must manually edit the data mover options files for the other data movers in the datacenter to change the `vmtagdefaultdatamover` value to the newly created data mover.

Results

After the data mover node is enabled for tagging support, the data mover queries the VMware inventory for tagging information when it runs a backup. The data mover then backs up the virtual machines according to the data protection tags that are set. If the data mover node is not configured for tagging support, any data protection tags are ignored during a backup operation.

Creating tags in the VMware inventory

IBM Spectrum Protect tags must be created in the VMware inventory before you can use tagging functions. The tags are created when you use the IBM Spectrum Protect extension or when you run a command on the data mover command line.

About this task

After the data protection tags and categories are created in the VMware inventory, you can use tools such as vSphere PowerCLI Version 5.5 R2 or later to apply these tags to the inventory objects to change their backup policy.

Procedure

Use one of the following methods to create data protection tags and categories in the VMware inventory:

- Use the IBM Spectrum Protect extension to configure backup policies for an inventory object. Changing the backup policy of an inventory object automatically applies the appropriate data protection tags to the object.
- Run the **dsmc set vmtags** command on the data mover node. You need to run this command only one time to create the tags. You do not need to run the command on every data mover node.

If you are upgrading from a previous version of the data mover software, run the **dsmc set vmtags** command again to create any new tags that are available in the new version of the client.

- From the data mover node, back up a virtual machine in an inventory object with the **vmtagdatamover yes** option in the client options file or as part of the **backup vm** command. For example: **backup vm testvm -vmtagdatamover=yes**

Results

The data protection settings are created in the VMware inventory. For a list of tags that are created, see Supported data protection tags.

 [Set Vmtags](#)

Configuring backup policies

You can change the way the backups of your VMware assets are managed, such as excluding or including virtual machines (VMs) in scheduled backup services, changing the retention policy of backups, selecting the VM disks you want to protect, setting the data consistency for backups, and providing application protection for VM backups.

Before you begin

Review the information in Tips for configuring backup policies.

About this task

The following VMware inventory objects are the containers that you can use to configure backup policies:

- Datacenter
- Folder (Host and Cluster folders and VM and Template folders)
- Host
- Host cluster
- Resource pool
- Virtual machine

Procedure

1. Navigate to the IBM Spectrum Protect window by selecting an inventory object in the vSphere Web Client and completing one of the following actions:
 - Click **Actions > IBM Spectrum Protect > Manage Data Protection**.
 - **VMware vSphere 6.0 or earlier:** Click **Manage > IBM Spectrum Protect > Edit**.
 - **VMware vSphere 6.5 or later:** Click **Configure > IBM Spectrum Protect > Edit**.

Tip: To view the existing backup policy for an inventory object, select an inventory object and click **Manage > IBM Spectrum Protect** or **Configure > IBM Spectrum Protect** depending on the version of vSphere that you are using.

2. Update one or more of the following data protection settings. Click one of the links in the **Description** column to learn more about the data protection setting.

Option	Description
Schedule Name	"Selecting a schedule for backing up virtual machines" on page 26
Exclude from backup	"Specifying the retention policy of virtual machine backups" on page 28 "Excluding or including virtual machines from scheduled backup services" on page 27
Retention policy	
Data mover (VM only)	"Selecting a data mover for backing up virtual machines" on page 29
Disk protection	"Protecting virtual machine disks by setting the disk protection" on page 31
Data consistency	"Setting the data consistency of virtual machine backups" on page 32
Application protection (VM only)	"Enabling application protection for a virtual machine" on page 33

Tip: If an inheritance icon and object name are displayed in a field, the data protection setting that is shown is inherited from that higher-level inventory object. By changing this setting, you are overriding the inherited property for the current object level and any lower-level objects. For more information about inheritance of data protection settings, see Inheritance of data protection settings.

The data protection settings correspond to data protection tags. For detailed information about the tags, see Supported data protection tags.

3. Click **OK**.

The **OK** button is disabled if any data protection setting is invalid in the IBM Spectrum Protect window. If you are modifying the settings for a VM, all fields except for the **Schedule** field can be updated in the window. To choose another schedule, select the container object that the schedule is assigned to. Then, select the VM and modify the data protection settings before you click **OK**.

If you want to change all data protection settings back to the inherited states (if any), click **Clear Local Settings**.

Results

After you update the backup policy of an inventory object, data protection tags are assigned to the object. The assigned tags and categories are displayed in the **Tags** portlet in the Summary tab of the inventory object.

Selecting a schedule for backing up virtual machines

Select a schedule from the **Schedule** field to specify how often and when to automatically back up virtual machines in a vSphere inventory object.

About this task

When you select a schedule, the Schedule category and tag are assigned to a container object such as a host or cluster. The value of the tag (the schedule name) must match the name of the IBM Spectrum Protect schedule to be used. All VMs in that container or in child container objects will be backed up by this schedule. If you do not want to back up certain VMs, you can set the Excluded tag on those VMs or on a higher-level container object such as a VM folder.

Schedules are defined by the IBM Spectrum Protect server administrator or VMware administrator. For ease of use, administrators can use IBM Spectrum Protect Operations Center Version 8.1 to create schedules that are compatible with tagging.

The schedules contain the following key attributes:

- The scheduled start time
- The frequency that the schedule is run
- The identification of at least one data mover to use for backing up VMs
- Specification of the `-domain.vmfull=Schedule-Tag` option (and no other domain-level options)

However, the VMs to be protected are not part of the schedule definition. Instead, you define the set of VMs by assigning a schedule to an vSphere object, such as a host cluster or folder in the IBM Spectrum Protect extension.

Schedules can be inherited from a parent inventory object. The **Schedule** field shows the schedule that is used for the inventory object and all child objects. If no schedule is inherited or assigned to the inventory object, a warning message is displayed in the field, and the VMs are not included in any scheduled backups. If you selected multiple inventory objects, a schedule name is not shown in the field. You must select an available schedule.

You can override a parent schedule by selecting an available schedule in the **Schedule** field.

Tip: You cannot change the schedule at the VM level. Instead, select a parent object, such as a folder, and assign the schedule to that parent. If the parent object contains more child objects or child virtual machines than what you intend to protect, click **Yes** in the **Exclude from backup** field on those objects or virtual machines. The excluded objects or virtual machines are not backed up when the schedule runs.

Procedure

1. Select an inventory object in the vSphere Web Client and complete one of the following actions. You can select a datacenter, folder (Host and Cluster folders and VM and Template folders), host, host cluster, or resource pool.
 - Click **Actions > IBM Spectrum Protect > Manage Data Protection**.
 - **VMware vSphere 6.0 or earlier:** Click **Manage > IBM Spectrum Protect > Edit**.
 - **VMware vSphere 6.5 or later:** Click **Configure > IBM Spectrum Protect > Edit**.
2. Select a schedule from the **Schedule** field.

Only schedules that are compatible with the Schedule (IBM Spectrum Protect) category and tag are available for selection. For a definition of compatible schedules, see the information about the Schedule category and tag in Supported data protection tags.
3. Click **OK**.

For more information about the **OK** and **Clear Local Settings** buttons, see “Configuring backup policies” on page 24.

Results

All the VMs in the inventory object and any child objects are protected by the selected schedule, except for any objects that are excluded from scheduled backups.

You can also view the list of IBM Spectrum Protect schedules that are created for the vCenter. For more information, see “Managing backup schedules in the vCenter” on page 35.

Related tasks:

“Excluding or including virtual machines from scheduled backup services”

Excluding or including virtual machines from scheduled backup services

You can use the IBM Spectrum Protect extension to include or exclude virtual machines (VMs) from scheduled backup services.

About this task

Typically, the VMs in your VMware datacenter are protected by scheduled backup services with IBM Spectrum Protect for Virtual Environments: Data Protection for VMware. In some scenarios, you might want to exclude a VM from scheduled backups. For example, you might exclude a VM if it is used only for testing or if it is accessed infrequently.

In other scenarios, you might need to back up only VMs in a certain level of vSphere inventory objects.

The virtual machines must be in a protection set that is protected by a schedule. A protection set consists of the virtual machines in a container that is assigned the Schedule (IBM Spectrum Protect) tag.

Procedure

1. Select an inventory object in the vSphere Web Client and complete one of the following actions. You can select a datacenter, folder (Host and Cluster folders and VM and Template folders), host, host cluster, resource pool, or VM.
 - Click **Actions > IBM Spectrum Protect > Manage Data Protection**.
 - **VMware vSphere 6.0 or earlier:** Click **Manage > IBM Spectrum Protect > Edit**.
 - **VMware vSphere 6.5 or later:** Click **Configure > IBM Spectrum Protect > Edit**.
2. Select an item from the **Exclude from backup** field:
 - **Yes** - Excludes the VM from scheduled backups.
 - **No** - Includes the VM in scheduled backups. This selection is the default.
Select **No** to ensure that VMs are included in scheduled backups regardless of inherited settings.

If the selected object is a VM, the **Exclude from backup** setting applies only to the selected VMs.

Tip: If an inheritance icon and object name are displayed in a field, the data protection setting that is shown is inherited from that higher-level inventory object. By changing this setting, you are overriding the inherited property for the current object level and any lower-level objects. For more information about inheritance of data protection settings, see Inheritance of data protection settings.

3. Click **OK**.

For more information about the **OK** and **Clear Local Settings** buttons, see “Configuring backup policies” on page 24.

Results

Virtual machines in the excluded VMware objects will not be backed up in future scheduled backup operations. However, you can still run an on-demand backup of an excluded object.

Related tasks:

“Starting an on-demand backup of a virtual machine” on page 36

Specifying the retention policy of virtual machine backups

You can specify how long to keep a virtual machine (VM) backup or how many versions of the backup to keep on the IBM Spectrum Protect server.

About this task

The retention policy can be either the number of days that backup versions can exist on the server before they expire, or the number of backup versions that exist on the server before they expire. When backup versions expire on the server, they are removed from server storage.

If you do not specify the management class, the retention policy is inherited from a parent object. If no inherited setting exists, the management class that is specified in the `vmnc` option is used. If the `vmnc` option is not set, the default retention policy for the datacenter node is used.

The available retention policies are associated with the datacenter, and are created by the IBM Spectrum Protect server administrator. If more retention policies are required, contact the server administrator.

Procedure

1. Select an inventory object in the vSphere Web Client and complete one of the following actions. You can select a datacenter, folder (Host and Cluster folders and VM and Template folders), host, host cluster, resource pool, or VM.
 - Click **Actions > IBM Spectrum Protect > Manage Data Protection**.
 - **VMware vSphere 6.0 or earlier:** Click **Manage > IBM Spectrum Protect > Edit**.
 - **VMware vSphere 6.5 or later:** Click **Configure > IBM Spectrum Protect > Edit**.
2. Select a policy from the **Retention policy** list.

If the selected object is a VM, the data protection setting applies only to the selected VM.

Tip: If an inheritance icon and object name are displayed in a field, the data protection setting that is shown is inherited from that higher-level inventory object. By changing this setting, you are overriding the inherited property for the current object level and any lower-level objects. For more information about inheritance of data protection settings, see *Inheritance of data protection settings*.

3. Click **OK**.

For more information about the **OK** and **Clear Local Settings** buttons, see “Configuring backup policies” on page 24.

Results

The retention policy that you set for the VMs in the selected inventory objects will be used for all future backup operations. If the retention policy is changed, the existing backups are rebound to the new retention policy during the next backup.

 `domain.vmfull`

Selecting a data mover for backing up virtual machines

Select a data mover to use for backing up virtual machines from the **Data mover** field. This field is available only for a virtual machine object.

About this task

The data mover is part of the IBM Spectrum Protect for Virtual Environments: Data Protection for VMware program that backs up VMs to the IBM Spectrum Protect server. The data mover resides on the server where Data Protection for VMware is installed.

The **Data mover** field identifies the data mover that is assigned to a VM or inherited from a parent inventory object. The data mover is inherited from a parent object through the schedule that is assigned to the parent object.

In order for VMs to be backed up by a schedule, they must be in a container object that belongs to the schedule, and at least one data mover must be associated with the schedule.

If a schedule that is assigned to a container object specifies a single data mover, the VMs inherit the data mover assignment from the container object. However, if the schedule has multiple data mover associations, each VM needs an explicit data mover assignment. Otherwise, the VM will be backed up by the default data mover if one of the associated data movers is configured as the default data mover.

Procedure

1. Select a VM in the vSphere Web Client and complete one of the following actions:
 - Click **Actions > IBM Spectrum Protect > Manage Data Protection**.
 - **VMware vSphere 6.0 or earlier:** Click **Manage > IBM Spectrum Protect > Edit**.
 - **VMware vSphere 6.5 or later:** Click **Configure > IBM Spectrum Protect > Edit**.
2. In the **Data mover** field, select a data mover from the list. All the data movers in the list are associated with the schedule that is assigned to the VM and displayed in the **Schedule** field. If no schedule is associated with a VM, no data movers are shown.

Tips:

- You can set a data mover for multiple VMs only if you navigated to the **Monitor > IBM Spectrum Protect** tab, selected multiple VMs that are backed up by the same schedule, and clicked **Actions > Manage Data Protection**.
- If you need to add or remove data movers that are associated with a schedule, click **IBM Spectrum Protect > Manage > Schedules**, select the schedule, and click **Edit**.

If you do not assign a data mover to a virtual machine, the data mover is inherited from the parent object. If no inherited setting exists, or the **Default Data Mover** tag is set or inherited, the virtual machines are backed up by the default data mover that is assigned to a schedule, if any. Otherwise, the virtual machines are not backed up and are identified in the IBM Spectrum Protect extension with the **At Risk** status until a data mover is assigned to the virtual machines.

3. Optional: To set the data mover selection back to its inherited state (if any), select **Clear** from the **Data mover** field.
If you want to change all data protection settings back to their inherited states, click **Clear Local Settings**.
4. Click **OK**.

For more information about the **OK** and **Clear Local Settings** buttons, see “Configuring backup policies” on page 24.

Related tasks:

“Managing backup schedules in the vCenter” on page 35

Protecting virtual machine disks by setting the disk protection

Select the virtual machine (VM) disks to include in virtual machine backups.

About this task

VM disks are identified by the disk number. For example, in most cases, disk 1 is the system disk.

Complete this procedure if you want to change the default backup behavior, which includes all VM disks in a backup operation. You can also change a non-default behavior that is inherited from a parent object.

Procedure

1. Select an inventory object in the vSphere Web Client and complete one of the following actions. You can select a datacenter, folder (Host and Cluster folders and VM and Template folders), host, host cluster, resource pool, or VM.
 - Click **Actions > IBM Spectrum Protect > Manage Data Protection**.
 - **VMware vSphere 6.0 or earlier:** Click **Manage > IBM Spectrum Protect > Edit**.
 - **VMware vSphere 6.5 or later:** Click **Configure > IBM Spectrum Protect > Edit**.
2. Select one of the following items from the **Disk protection** field in the IBM Spectrum Protect window.

All disks

Includes all disks in a VM backup.

All disks except disk 1

Includes all disks except disk 1 in a VM backup.

Only disk 1

Includes only disk 1 in a VM backup.

Only disks *n,n,n,...*

Includes a custom set of disks in a VM backup. For example, **Only disks 1,3,5** backs up only disks 1, 3, and 5.

This item is available only if the Disk Backup List category and the `Include:disk number,disk number,...` tag value are set outside of the IBM Spectrum Protect window. For example, the tag `Include:1,3,5` includes only disks 1, 3, and 5 in a VM backup.

All disks except disks *n,n,n,...*

Includes all disks except a custom set of disks in a VM backup. For example, **All disks except disks 2,3,4** backs up all disks except for disks 2, 3, and 4.

This item is available only if the Disk Backup List category and the `Exclude:disk number,disk number,...` tag value are set outside of the IBM Spectrum Protect window. For example, with the tag, `Exclude:2,3,4`, all disks are backed up except for disks 2, 3, and 4.

If you do not specify the disks to include or exclude and no inherited setting exists, all virtual machine disks are backed up.

Tip: If an inheritance icon and object name are displayed in a field, the data protection setting that is shown is inherited from that higher-level inventory object. By changing this setting, you are overriding the inherited property for

the current object level and any lower-level objects. For more information about inheritance of data protection settings, see Inheritance of data protection settings.

3. Click **OK**.

For more information about the **OK** and **Clear Local Settings** buttons, see “Configuring backup policies” on page 24.

Setting the data consistency of virtual machine backups

Select the data consistency to achieve for a virtual machine backup operation that fails due to snapshot failure.

About this task

You can set the level of data consistency by specifying the number of snapshot attempts to make, and whether to quiesce the virtual machine file system, including any applications, before attempting the snapshot.

If you do not specify the snapshot attempts and no inherited setting exists, the snapshot attempts that are specified in the `include.vmsnapshotattempts` option are used.

Procedure

1. Select an inventory object in the vSphere Web Client and complete one of the following actions. You can select a datacenter, folder (Host and Cluster folders and VM and Template folders), host, host cluster, resource pool, or VM.
 - Click **Actions > IBM Spectrum Protect > Manage Data Protection**.
 - **VMware vSphere 6.0 or earlier:** Click **Manage > IBM Spectrum Protect > Edit**.
 - **VMware vSphere 6.5 or later:** Click **Configure > IBM Spectrum Protect > Edit**.
2. In the IBM Spectrum Protect window, select one of the following items in the **Data consistency** field:

Always application consistent

Attempts two file system and Microsoft Windows VSS quiesced snapshots before failing the backup. This selection is the default.

Attempt application consistency

Attempts two quiesced snapshots and, as a final attempt, a nonquiesced, crash-consistent snapshot.

Machine consistent only

Attempts only a nonquiesced snapshot, for VMs that can never complete a quiesced snapshot.

Custom *quiesce,nonquiesce*

Specifies the number of attempts to take a snapshot with quiescing, followed with the number of attempts to take a snapshot without quiescing.

This choice is available only if the Snapshot Attempts category and tag value are set outside of the IBM Spectrum Protect window. In this field, *quiesce* is the number of times to take a snapshot with quiescing, and *nonquiesce* is the number of times to take a snapshot without first quiescing the file system.

For example, with the 2,2 setting, IBM Spectrum Protect attempts two quiesced snapshots, and if they fail, attempts two nonquiesced snapshots.

Tip: If an inheritance icon and object name are displayed in a field, the data protection setting that is shown is inherited from that higher-level inventory object. By changing this setting, you are overriding the inherited property for the current object level and any lower-level objects. For more information about inheritance of data protection settings, see *Inheritance of data protection settings*.

3. Click **OK**.

For more information about the **OK** and **Clear Local Settings** buttons, see “Configuring backup policies” on page 24.

Enabling application protection for a virtual machine

You can use application protection that is provided by IBM Spectrum Protect.

About this task

When application protection is enabled, IBM Spectrum Protect notifies virtual machine (VM) applications that a backup is about to occur. This action allows an application to truncate logs and commit transactions before the backup operation begins, so that the application can resume from a consistent state when the backup is completed.

You can enable application protection only on VMs. Ensure that you do not exclude a VM disk (with the **Disk protection** setting) if the disk contains application data that you want to protect.

If you do not enable application protection, the setting in the `include.vmtsmvss` option is used. This setting cannot be inherited.

Procedure

1. Select a VM in the vSphere Web Client and complete one of the following actions:
 - Click **Actions > IBM Spectrum Protect > Manage Data Protection**.
 - **VMware vSphere 6.0 or earlier:** Click **Manage > IBM Spectrum Protect > Edit**.
 - **VMware vSphere 6.5 or later:** Click **Configure > IBM Spectrum Protect > Edit**.
2. In the **Application protection** field, select **Enabled**.
3. Optional: If you are backing up a VM that is running a Microsoft SQL Server and want to prevent Microsoft SQL Server logs from being truncated, select **Keep Microsoft SQL Server logs**.

This option enables the Microsoft SQL Server administrator to manually manage the SQL server logs, so that they can be preserved and be used to restore SQL transactions to a specific checkpoint after the virtual machine is restored. The SQL server administrator must manually back up, and possibly truncate the SQL server logs on the guest virtual machine.

4. Click **OK**.

For more information about the **OK** and **Clear Local Settings** buttons, see “Configuring backup policies” on page 24.

5. Ensure that you complete the following configuration steps on each data mover that you are using to back up VMs:

- a. Store the guest VM credentials to Data Protection for VMware by running the following command from the data mover command line:

```
dsmc set password -type=vmguest vm_guest_display_name guest_admin_ID  
guest_admin_pw
```

where *vm_guest_display_name* specifies the name of the guest VM as shown in the VMware vSphere Web Client.

If you use the same credentials to log on to multiple VMs that are enabled for application protection, set the password for the all of the VMs by specifying the **allvm** parameter on the following command:

```
dsmc set password -type=vmguest allvm guest_admin_ID guest_admin_pw
```

- b. The command in step 5a stores the guest virtual machine credentials, which are encrypted on the system that hosts the data mover. Ensure that the following minimum permissions are required for *guest_admin_ID* *guest_admin_pw*:

Backup rights: Microsoft Exchange Server 2013 and 2016: Organization Management permissions (membership in the management role group, Organization Management)

Backup rights: Microsoft SQL Server 2014 and 2016: Organization Management permissions (membership in the management role group, Organization Management)

Managing backup operations for virtual machines

You can use the IBM Spectrum Protect extension to back up your VMware virtual machines (VMs) on the IBM Spectrum Protect server and to manage and monitor your backups.

About this task

Typically, the VMs in your VMware datacenter are backed up when a schedule is run. Schedules are set up by the IBM Spectrum Protect server administrator or the VMware administrator to automatically back up virtual machines regularly. You can select a schedule to specify how often and when to automatically back up virtual machines in a vSphere inventory object.

You can also start an on-demand backup of a VM. For example, if you notice that a VM was not backed up recently or if a backup completed with errors, you can start the backup operation again without waiting for the backup to run as scheduled.

You can view the most recent backup information for all VMs that are in a vSphere object. This information includes the backup completion date, duration, and size. This information also includes identification of VMs that are at risk of being unprotected because the VM has never been backed up or a backup did not occur in the time interval that is set in the at-risk policy.

Related tasks:

“Selecting a schedule for backing up virtual machines” on page 26

Managing backup schedules in the vCenter

To help you manage scheduled backups, you can view the list of IBM Spectrum Protect schedules that are created for the vCenter.

About this task

Schedules are set up by the IBM Spectrum Protect server administrator or VMware administrator to automatically back up virtual machines regularly.

A summary of the schedules is displayed in a table that is sortable and filterable on the columns to help you identify and compare the properties of the schedules. For example, you can sort on the **Repeats** column to see which schedules are run the most often.

Procedure

1. In the vSphere Web Client, click **IBM Spectrum Protect > Manage > Schedules**.
2. Select a vCenter server from the drop-down list. The schedules that are defined for the vCenter are shown.
3. To sort the entries in the table, click a column heading.

Information such as the name, start time, frequency, and description of each schedule is shown in the table. You can also see the datacenter that is valid for a schedule. To show more columns, use the scroll bar at the bottom of the table.

The **Compatible** column displays whether a schedule is compatible with the Schedule (IBM Spectrum Protect) category and tag. Only compatible schedules are supported for tagging and can be assigned to inventory objects in the vSphere Web Client. For information about compatible schedules, see the description for the Schedule tag in Supported data protection tags.

The details of each selected schedule are shown in the **Schedule Details** section of the window.

- The **Data movers** field shows the data movers that are associated with the schedule.
- The **Objects** field shows the inventory objects that are assigned to the schedule. Any virtual machines that are contained in these inventory objects are affected by this schedule.
- To help you diagnose problems with the schedule, the **Options** field shows the IBM Spectrum Protect options that are defined in the schedule. If necessary, you can validate this information with the IBM Spectrum Protect administrator.

Tip: Compatible schedules do not use the **Options** field to identify the inventory of VMs to back up.

4. Optional: To modify the data movers that are associated with the schedule to use for backup operations, select a schedule and click **Edit** to open the Edit Schedules window. You can edit only a schedule that is compatible with tagging.
 - a. In the **Data movers** list, select one or more data movers to use to back up the VMs in the inventory objects that are protected by the schedule.

By default, the selected data movers are assigned to those VMs that either do not have data mover assignments, or are assigned to an invalid data mover for this schedule. Existing data mover assignments that are still valid for the schedule are not overwritten.

Requirement: If you want to use the same data mover in multiple schedules, ensure that the run times of the schedules do not overlap. The data mover can perform backup operations for only one schedule at a time.

- b. If you selected more than one data mover and want to redistribute the workload among the data movers, click **Full rebalance of data movers**. This option assigns the selected data movers to all virtual machines in this schedule.

During a data mover rebalance:

- VMs are sorted by size (storage usage).
- Data movers are assigned to the VMs by size, with the largest VM being assigned to the first data mover on the list, the next largest VM assigned to the next data mover, and so on.
- Existing data mover assignments are overwritten.

For example, if there are only three data movers (DM1, DM2, and DM3) and 10 VMs in a datacenter, the following assignments take place:

- 1) DM1 is assigned to the largest VM.
- 2) DM2 is assigned to the second largest VM.
- 3) DM3 is assigned to the third largest VM.
- 4) DM1 is assigned to the fourth largest VM, and so on.

- c. To save your changes and close the Edit Schedules window, click **OK**.

Starting an on-demand backup of a virtual machine

When you start an on-demand backup of a virtual machine (VM), the backup operation begins immediately without waiting for a schedule to run.

About this task

Typically, the VMs in your VMware datacenter are backed up when a schedule is run. However, you might want to start an on-demand backup if you notice that a VM was not backed up recently or if a backup completed with errors. You can also start an on-demand backup of a VM that is excluded from scheduled backup services.

Tip: Any retention policy settings are observed during an on-demand backup. The retention policy for a VM determines how many backup versions of a VM can exist on the IBM Spectrum Protect server. Depending on how many backup versions of a VM can exist on the server, running an on-demand backup of a VM might cause older backups to expire. When backup versions expire on the server, they are removed from server storage. For example, if a VM was backed up four times, and only four backup versions can exist on the server, running an on-demand backup causes the oldest backup version to expire.

To check the number of backup versions that can exist on the server, select a VM in the vSphere Web Client and complete one of the following actions:

- **VMware vSphere 6.0 or earlier:** Click **Manage > IBM Spectrum Protect**.
- **VMware vSphere 6.5 or later:** Click **Configure > IBM Spectrum Protect**.

You can back up an existing VM by selecting the VM in the vSphere Web Client object inventory and using the **Actions** menu. You can also view and back up an existing VM from the object that contains the VM, such as a datacenter, pool, host, or host cluster.

Procedure

To start an on-demand backup of a VM, complete the following steps:

1. Select a VM in the vSphere Web Client object navigator and click **Actions > IBM Spectrum Protect > Backup**.

You can also select an inventory object that contains the VM and click **Monitor > IBM Spectrum Protect**. Complete one of the following actions:

- Right-click the VM, and click **Backup**.
 - Select the VM, and click the **Backup** icon.
 - Select the VM, and click **Backup** in the **Actions** menu.
2. In the Backup a Virtual Machine window, select a type of backup to run. IFINCREMENTAL indicates the incremental-forever incremental backup type and IFFULL indicates the incremental-forever full backup type. These backup types are applicable only if you have a license to use IBM Spectrum Protect for Virtual Environments.
 - **Incremental:** Backs up the blocks that changed since the previous backup (full or incremental). The most recent incremental is appended to the previous backup. If a full backup does not exist for this VM, a full backup is automatically performed. As a result, you do not have to verify that a full backup exists.
 - **Full:** Creates an image of an entire VM. After the full backup is taken, there is no requirement to schedule additional full backups. When full is selected, VM templates that are unchanged since the last backup are also included.
 3. Select a data mover node to back up the VMs. The data mover node contains the IBM Spectrum Protect data mover that runs the backup operations.

Typically, you can accept the default data mover node. However, to improve workload balancing in some situations, you might select a data mover that is not heavily used.
 4. Click **OK** to begin the backup operation.
 5. Click **Recent Tasks** in the vSphere Web Client status bar and select **All Users' Tasks** to view the progress of the backup operation. You can also click **Tasks** in the vSphere Web Client object navigator to view the progress.

Results

After the backup operation is completed, select an inventory object that contains the VM and click **Monitor > IBM Spectrum Protect** to view the backup information for the VM.

Related tasks:

“Excluding or including virtual machines from scheduled backup services” on page 27

Canceling a backup of a virtual machine

You can cancel an on-demand or scheduled backup operation that is in progress for a virtual machine (VM).

Procedure

To cancel a backup operation:

1. Click **Tasks** in the vSphere Web Client object navigator.
2. Locate the task for the backup operation that you want to cancel and click the **Cancel Task** icon.

To see backup tasks, you might have to make sure that tasks for all users are shown. For more information about viewing tasks for all users, refer to the documentation for the version of VMware vSphere that you are using.

Results

The backup operation is canceled and **The task was canceled by a user** is shown in the **Status** column for the task.

Viewing the status of backup operations for virtual machines

You can view the most recent backup information for all virtual machines (VMs) that are in a vSphere object. This information includes identification of VMs that are at risk of being unprotected because the VM has never been backed up or a backup did not occur in the time interval that is set in the at-risk policy.

About this task

You can view the backups for virtual machines that are in the following objects in the vSphere Web Client:

- Datacenter
- Folder (host, cluster, and VM)
- Host
- Host Cluster
- Resource Pool

Procedure

To view backup information for the virtual machines that are in an object:

1. Select an inventory object in the vSphere Web Client and click **Monitor > IBM Spectrum Protect**. For each VM, information about the most recent backup is shown. For datacenter objects, you can use the **View** list to show all VMs that are in the object, only existing VMs, or only deleted VMs. For all other objects, only existing VMs are shown.
2. For each VM, you can view information such as the backup risk status, completion date, duration, and size. To view a description of a risk status, hover over the status in the **Risk Status** column.

Related tasks:

“Setting the at-risk policy for a virtual machine” on page 39

Viewing the backup history for virtual machines

You can view the recent backup history of an individual virtual machine (VM) to identify backup tasks that might require attention.

About this task

For each task, information such as the backup time, the status of the backup, and the amount of data that was transmitted is shown in the **Backup History** table.

The number of backup tasks that are shown in the **Backup History** table depends on the number of days that are set by the IBM Spectrum Protect server **SET SUMMARYRETENTION** command.

What to do next

To view additional information about the backup tasks for a VM, select the VM, click **Summary**, and view the information in the **Notes** portlet.

Related information:

 [SET SUMMARYRETENTION](#)

Setting the at-risk policy for a virtual machine

Virtual machines (VMs) can be at risk of being unprotected because of failed or missed backup operations. You can set a policy for a VM that specifies if or when the VM is shown as at-risk if a backup operation does not occur in a specified time interval.

About this task

By default, the default at-risk policy is set for each VM. You can use the default policy, set a custom policy, or choose to ignore the policy.

You can also change the value for the default policy. This value is applied to all VMs that use the default policy.

Procedure

To change the default at-risk policy, select a custom at-risk policy for selected VMs, or set selected VMs to ignore the at-risk policy, complete the following steps:

1. Select an inventory object that contains the VM in the vSphere Web Client object navigator and click **Monitor > IBM Spectrum Protect**.
2. Complete one of the following actions:

Option	Description
To set the default at-risk policy	<ol style="list-style-type: none">1. From the Actions menu, click Set Default At-Risk Policy.2. Set the time from the last backup in which the backup operation must occur. The default is 24 hours.

Option	Description
To set a custom at-risk policy	<ol style="list-style-type: none"> 1. Select the VMs for which you want to set a custom policy. 2. From the Actions menu, click Set At-Risk Policy. You can also access the Set At-Risk Policy option by selecting the VMs and clicking the policy icon or right-clicking the selected VMs. 3. Click Custom and set the time from the last backup in which the backup operation must occur. The default is 6 hours.
To ignore the at-risk policy	<ol style="list-style-type: none"> 1. Select the VMs for which you want to suppress at-risk warnings. 2. From the Actions menu, click Set At-Risk Policy. You can also access the Set At-Risk Policy option by selecting the VMs and clicking the policy icon or right-clicking the selected VMs. 3. Click Ignore.

Results

If the at-risk policy is set to default or custom for a VM, **At Risk** is shown for the VM if a backup does not occur within the time interval that is set by the policy. If the VM has never been backed up, the VM is also considered at-risk and **No Backup** is shown.

If the at-risk policy is set to **Ignore** for a VM, the risk status **Ignored** is shown for the VM regardless of the status of the backup.

Restoring a virtual machine

You can restore a virtual machine (VM) that has a backup.

About this task

You can restore an existing VM by selecting the VM in the vSphere Web Client object inventory and using the **Actions** menu. You can also view and restore an existing VM from the object that contains the VM, such as a datacenter, pool, host, or host cluster. However, if you want to view and restore deleted VMs, you must do so from a datacenter object, which allows you to view all VMs that are in the object, only existing VMs, or only deleted VMs.

Procedure

To restore a VM:

1. Select a VM in the vSphere Web Client object navigator and click **Actions > IBM Spectrum Protect > Restore**.

You can also select an inventory object that contains the VM and click **Monitor > IBM Spectrum Protect**. Complete one of the following actions:

- Right-click the VM, and click **Restore**.
- Select the VM, and click the **Restore** icon.

- Select the VM, and click **Restore** in the **Actions** menu.
2. Complete the following pages in the **Restore a Virtual Machine** wizard.

Option	Description
Select restore point	Use this page to select the backup that you want to use for the restore operation. The VM is restored to the state that it existed for the selected backup.
Select options	<p>Use this page to create a new VM or replace the existing VM with the data from the selected restore point. If you create a new VM, the default VM name is the original name appended with a date and time. You can use this name or enter another name that is not already used by another VM in the datacenter.</p> <p>You can select one of the following restore types:</p> <p>Restore The virtual machine is restored and is available when the restore operation completes.</p> <p>Instant restore The virtual machine is restored and is available during the restore operation.</p> <p>Instant access A temporary virtual machine is created for verification of the backup data, but the virtual machine is not restored.</p> <p>This restore type requires that you dismount the VM when you are finished with it. Use the Data Protection for VMware vSphere GUI to dismount the VM as described in Dismounting an instant access virtual machine.</p> <p>The host that was used when the backup operation was completed is selected by default in the Select the host to restore the virtual machine to list. You can accept the default or select another host.</p>
Select resources	<p>Use this page to restore all disks for the VM and the VM configuration or to restore only selected disks. If you restore to selected disks, you can specify whether you want to restore just the disks, just the configuration, or both for the VM.</p> <p>If you selected Create a new virtual machine on the Select options page, the Restore the virtual machine configuration option is not available.</p>

Option	Description
Select storage	<p>Use this page to select the datastore for the VM. For instant restore operations, you must also select a temporary datastore in the Select temporary datastore list or accept the selected default temporary datastore. Files that are created or updated for the restore operation are saved in the temporary datastore and then copied to primary datastore when the restore operation is complete.</p> <p>If you selected the restore type Instant restore, you can select Thick or Thin from the Select the virtual disk format list. The default is Thick.</p> <p>To view datastores that are compatible with VMware storage policies, select the policy from the Filter by virtual machine storage policy list. The datastores are listed as compatible or incompatible with the selected policy.</p>
Select data mover or Select mount proxy	Use this page to select the data mover or mount proxy that you want to use to for the restore operation.
Ready to complete	Use this page to review the options that you selected in the wizard. Click Finish to start the restore operation.

- Click **All Users' Tasks** in the **Recent Tasks** section of the vSphere Web Client to view the progress of the restore operation in a task view.

Results

After the restore operation is complete, the VM is restored in the location that you selected.

Dismounting an instant access virtual machine

The instant access restore type requires that you dismount the virtual machine (VM) when you are finished with it. Use the Data Protection for VMware vSphere GUI to dismount the VM.

Procedure

To dismount the VM:

- In the Data Protection for VMware vSphere GUI, click **Restore**.
- Click **Instant Access/Restore Status**.
- Select the VM and click **Dismount**.
- When prompted to confirm the operation, click **Dismount and Delete**.

Results

The VM is dismounted and deleted from the selected datacenter.

Chapter 3. Getting started with file restore

To restore files from a web-based interface without administrator assistance, file restore is available for use. After the configuration is complete, file owners can search, locate, and restore files.

The web-based interface does not require a file manager application to manually copy files. When you restore a file, you specify a restore point, search or browse to locate the file, and start the restore.

When the configuration is complete, no administrator interaction is required to access or restore files. During the configuration process, the administrator gives the file owner access to the virtual machine that contains their data. File owners access the data with local virtual machine credentials so administrators can monitor file restore resources. File owner permissions do not have to be managed.

You can view demonstration videos that help you learn about the IBM Spectrum Protect file restore interface. The *Find and Restore Files* and *Monitoring Restores* videos display when you first log in to the file restore interface. Videos are available in English only.

Common tasks for restoring files

Different types of users set up and use the file restore feature. Each user is responsible for a set of tasks.

File owner

The file owner maintains business data such as text documents, spreadsheets, and presentation files.

The file owner completes the following tasks:

- “Logging in to restore files” on page 45.
- “Restoring files from a virtual machine backup” on page 46

Administrator

The administrator creates initial software deployments, schedules virtual machine backups to the IBM Spectrum Protect server, and manages user accounts and permissions in the VMware environment.

The administrator completes the following tasks to set up the environment for file restore:

1. Enabling the environment for file restore operations
2. “Backing up virtual machine data to IBM Spectrum Protect” on page 127
3. Optional: Setting up file restore operations on Linux

When running Data Protection for VMware in a Linux environment, the file restore feature must be installed on a Windows system to enable the file restore feature.

After the environment is ready for file restore operations, the following optional tasks can be done by the administrator:

- Modifying options for file restore operations
- Configuring log activity for file restore operations

File restore prerequisites

Before you restore files with the IBM Spectrum Protect file restore interface, ensure that your environment meets the minimum prerequisites.

To enable the file restore feature, Data Protection for VMware must be installed on a Windows system.

VMware virtual machine prerequisites

The following prerequisites apply to the VMware virtual machine that contains the files to be restored:

- Linux Windows VMware Tools must be installed on the virtual machine.
- Linux Windows The virtual machine must be running during the file restore operation.
- Windows The virtual machine must belong to the same Windows domain as the data mover system.
- Windows When a virtual machine is deleted from a Windows domain and then restored later, the virtual machine must rejoin the domain to ensure the domain trust relationship. Do not attempt a file restore from the virtual machine until the domain trust relationship is restored.
- Windows If the user does not own the file to be restored, the Microsoft Windows Restore Files and Directories privilege must be assigned to the user for that virtual machine.
- Linux Local user authentication is required for the virtual machine. Authentication is not available through Windows domain, Lightweight Directory Access Protocol (LDAP), Kerberos, or other network authentication methods.
- Linux On a Red Hat Enterprise Linux 6 operating system, the `ChallengeResponseAuthentication` option in the `sshd` daemon configuration file (`/etc/ssh/sshd_config`) must specify `YES` or be commented out. For example, either of the following statements are valid:
`ChallengeResponseAuthentication yes`
`#ChallengeResponseAuthentication no`

Restart the `sshd` daemon after you modify this option.

Data mover prerequisites

The data mover system represents a specific data mover that "moves data" from one system to another.

- Windows The data mover system must belong to the same Windows domain as the virtual machine that contains the files to be restored.

Mount proxy prerequisites

The mount proxy system represents the Linux or Windows proxy system that accesses the mounted virtual machine disks through an iSCSI connection. This system enables the file systems on the mounted virtual machine disks to be accessible as restore points to the file restore interface.

Linux Linux operating systems provide a daemon that activates Logical Volume Manager (LVM) volume groups as these groups become available to the system. Set this daemon on the Linux mount proxy system so that LVM volume groups are not activated as they become available to the system. For detailed information about how to set this daemon, see the appropriate Linux documentation.

Linux **Windows** The Windows mount proxy system and Linux mount proxy system must be on the same subnet.

Microsoft Windows domain account prerequisites

The following prerequisites apply to Windows domain accounts:

- **Windows** Windows domain administrator credentials are required to access the network share. An administrator enters these credentials in the Data Protection for VMware vSphere GUI configuration wizard or notebook to enable the environment for file restore operations.
- **Windows** A file owner accesses the remote virtual machine (that contains the files to be restored) with Windows domain user credentials. These credentials are entered in the file restore interface during login. Domain user credentials verify that the file owner has permission to log in to the remote virtual machine and restore files into the remote virtual machine. These credentials do not require any special permissions.
- **Windows** If a file owner uses a Windows domain user account that limits access to specific computers (instead of access to all computers within the domain), ensure that the mount proxy system is included in the list of computers that are accessible to this domain user account. Otherwise, the file owner is unable to log in to the file restore interface.

Tape media prerequisites

File restore from tape media is not supported. File restore from disk storage is the preferred method.

Logging in to restore files

Linux **Windows**

You can log in to the IBM Spectrum Protect file restore interface to restore your files with minimal assistance from the administrator.

About this task

When you log in to this interface, you can locate and restore your files at your convenience.

Procedure

1. Access the file restore interface by opening a web browser and entering the URL that you received from your administrator.
2. Enter the network name or IP address of the virtual machine that contains your files. For example, myhost.mycompany.com.
3. Enter the user account that you use to access your files.

Windows Use the Windows_domain_name\user_name format.
4. Enter the user account password and click **Log in**.

Restoring files from a virtual machine backup

Linux

Windows

Locate your files and restore them to a preferred location.

Before you begin

Ensure that you are logged in to the IBM Spectrum Protect file restore interface. A backup must exist before you can restore your files.

About this task

Only those files and directories for which you have permission to view on the operating system are visible.

Procedure

1. Select a backup by completing the following steps:
 - a. Click a date in the calendar.
 - b. If necessary, select a time in the **Available backups** field.
 - c. Click **Choose backup**.

The virtual machine disks or directories are displayed in the table.

2. Optional: If the default backup is not the one you want, select a different backup by completing the following steps:
 - a. Click the calendar.
 - b. Click a date in the calendar.
 - c. If necessary, select a time.
 - d. Click **Change backup**.

Restriction: If you change the backup date or time, any file selections that you made are lost. However, the new backup loads to the directory where you previously explored. If that directory is unavailable, the backup loads to the top directory.

The virtual machine disks or directories are displayed in the table.

3. To select files to restore, complete the following steps:
 - a. Click a disk or directory in the table to view the subdirectories and files.
 - b. Optional: To search for a file in the current directory and subdirectories, type a name in the **Search** field and press **Enter**. The results are displayed in the order they are found.
 - c. Select one or more files and directories to restore. If you select a directory that has no contents, the empty directory is not restored.

4. Select where to restore files.
 - To restore files and directories to the original location, select **Restore to > Original Location**.
 - To restore files and directories to a different location, select **Restore to > Alternate Location**.
5. After you make your selections, click **Restore**. If you are restoring files to an alternative directory, select an existing directory on your virtual machine or create a directory to place restored files. Then, click **Restore**. If a file with the same name exists, the restored file's original modification date and time is added to the file name. Subsequent restores of the same file contain a number (_N) after the original modification date and time. For example:
t2.2015-03-07-07-28-03_1.txt

What to do next

Click the restore icon () to view information about active and recent restores. By default, information is kept for 7 days after a restore completes.

If a restore completed with an error or warning, view additional information by clicking **Details**. To save the error or warning information, click **Export** and save the information in .CSV format.

Chapter 4. Protection for in-guest applications

Data Protection for VMware protects Microsoft Exchange Server, Microsoft SQL Server, and Active Directory Domain Controllers that run inside VMware VM guests in a VMware vSphere environment.

Microsoft Exchange Server data protection in VMware environments

For Microsoft Exchange Server workloads that are running in a VMware ESXi virtual guest machine, you can take application-consistent backups of virtual machines that are hosting Microsoft Exchange Server data. By using IBM Spectrum Protect Snapshot software, you can recover database-level and mailbox-level backups from a virtual machine.

Before you back up data, identify your recovery point objective (RPO). The *RPO* helps you decide how often to back up data and affects the cost that is associated with data backups.

For example, you can schedule frequent virtual machine backups for necessary recovery points. The recovery point of a virtual machine backup is the time of the backup. While change-block tracking and data deduplication offer savings, virtual machine backups can be expensive if you create and delete many virtual machine snapshots.

Most traditional in-guest data protection methods provide appropriate RPOs, but these in-guest methods lose the efficiencies that are introduced by backing up data at the virtual machine level.

You can use IBM Spectrum Protect for Virtual Environments: Data Protection for VMware and IBM Spectrum Protect Snapshot with Data Protection for Microsoft Exchange Server to back up data at a virtual machine level in a way that preserves backup efficiencies.

To protect Microsoft Exchange Server data in a VMware environment, ensure that the following products are installed and configured on your system:

- IBM Spectrum Protect for Virtual Environments: Data Protection for VMware V8.1.0 (which includes the IBM Spectrum Protect client)
- IBM Spectrum Protect Snapshot with Data Protection for Microsoft Exchange Server V8.1.0

These software offerings work together to protect Microsoft Exchange Server data in a VMware environment when no other software products are used to back up Microsoft Exchange Server data.

For permission required to back up and restore application data for Microsoft Exchange Server, see technote 1647986.

Application protection is supported for VMware VMs in a VMware vSphere environment only.

Configuring the software for Exchange Server data protection in a VMware environment

To protect Microsoft Exchange Server workloads that are running in a VMware ESXi virtual guest machine, install and configure Data Protection for VMware. Then, install and configure Data Protection for Microsoft Exchange Server.

Before you begin

The configuration instructions that follow are based on a configuration scenario that might not match your environment. Adjust the configuration for your environment.

The following list summarizes the scenario for quick reference:

Windows host name

EXC10

VSS requestor node name

EXC10_VSS

Data Protection for Microsoft Exchange Server node name

EXC10_EXC

Virtual machine name

vm_exc10

Data mover node names

datamover10 and datamover20

Datacenter node name

datacenter10

VM file space

\VMFULL-vm_exc10

About this task

The following details describe the scenario that is used.

- A single Microsoft Exchange Server database on a virtual machine that is named vm_exc10 must be recovered.
- Virtual machine vm_exc10 is protected by Data Protection for VMware by using the node name datacenter10. This node name in the IBM Spectrum Protect server represents the vSphere datacenter. The data mover nodes are called datamover10 and datamover20.
- The virtual machine guest is configured with the virtual machine name of vm_exc10 and the Microsoft Windows host name is EXC10.
- Data Protection for Microsoft Exchange Server is installed in the virtual guest machine and is configured to the IBM Spectrum Protect server to use node name EXC10_EXC.
- The IBM Spectrum Protect client in the virtual guest machine is configured as the VSS requestor node and is using the node name EXC10_VSS.

Procedure

1. Follow the installation and configuration instructions that are provided with each software package.

If you install Data Protection for Microsoft Exchange Server before Data Protection for VMware, you cannot specify the VMware datacenter node in the Data Protection for Microsoft Exchange Server configuration wizard because the field is disabled.

Tip: In this case, reconfigure Data Protection for Microsoft Exchange Server to enable the VMware datacenter node after Data Protection for VMware is installed.

2. Complete the tasks in this checklist:
 - Verify that Microsoft Exchange Server databases and mailboxes are hosted on VMware virtual disks.
 - Verify that no Exchange Server database is hosted on raw device mapped (RDM) disks in physical compatibility mode, independent disks, or on disks that are attached directly to the guest through in-guest iSCSI.
3. Outside of the VM guest, in the data mover, configure Data Protection for VMware to protect Microsoft Exchange Server databases and mailboxes.
4. Within the guest, take the following actions:
 - Verify that the Data Protection for VMware recovery agent command-line interface is configured to work with the recovery agent on the guest virtual machine.
 - Configure Data Protection for Microsoft Exchange Server to complete backup and restore operations from a virtual machine backup.

“Configuring Data Protection for VMware”

“Configuring Data Protection for Microsoft Exchange Server” on page 53

Configuring Data Protection for VMware

You must configure Data Protection for VMware to preserve Microsoft VSS metadata information during a virtual machine backup for systems that are hosting Microsoft Exchange Server data.

About this task

Data Protection for VMware provides application consistency when you back up virtual machines that are hosting Microsoft Exchange Servers. With these backups, you can recover the virtual machine with Microsoft Exchange Server in a consistent state.

To recover only selected databases or mailboxes from this type of backup with IBM Spectrum Protect, without having to recover the entire virtual machine, preserve information about the state of the Microsoft Exchange Server at the time of the virtual machine snapshot and backup. This information is collected as part of the Microsoft Volume Shadow Copy Services (VSS) interaction that occurs during a virtual machine snapshot.

For Data Protection for VMware to collect the Microsoft VSS metadata for Microsoft Exchange Server, you must configure Data Protection for VMware to obtain this information from the virtual machine during the backup operation.

Procedure

1. Configure Data Protection for VMware to preserve the Microsoft VSS metadata information during a virtual machine backup for systems that are hosting Microsoft Exchange Server data.

- a. Locate the options file for the Data Protection for VMware data mover. On Windows systems, the options file is `dsm.opt`. On Linux systems, the options file is `dsm.sys`.
 - b. Specify the `INCLUDE.VMTSMVSS` option for the virtual machine. You must set this option for virtual machine backups to preserve the Microsoft VSS metadata information. For example, specify `INCLUDE.VMTSMVSS vm_display_name` where `vm_display_name` refers to the name of the virtual machine as shown in the VMware vSphere Client and vSphere Web Client.
 - c. Optional: Back up a passive copy of a database that is part of an Exchange Server Database Availability Group (DAG). Specify the `vmpreferdagpassive yes` option for the virtual machine. Backing up the passive copy typically reduces the performance impact to the active copy in the production database. If no valid passive copy is available, the active database copy is backed up.
 - d. Verify that the Virtual Machine Disks (VMDK) that host the Microsoft Exchange Server database are not being excluded from the virtual machine backup operation. Repeat the preceding steps for all data movers that protect virtual machines that are hosting Microsoft Exchange Server.
2. On each data mover, for example, *datamover10*, store the guest virtual machine credentials to Data Protection for VMware by running the following command from the IBM Spectrum Protect backup-archive client command line:

```
dsmc set password -type=vmguest vm_guest_display_name
guest_admin_ID guest_admin_pw
```

This command stores the guest virtual machine credentials, which are encrypted on the system that hosts the data mover. The following minimum permissions are required for *guest_admin_ID* *guest_admin_pw*:

- Backup rights: Microsoft Exchange Server 2010 and 2013: Organization Management permissions (membership in the management role group, Organization Management).

What to do next

You can verify the virtual machine backup configuration and ensure that the VMDKs are included. In addition, you can view other parameters by issuing the **backup** command with the preview option from the data mover, for example:

```
dsmc backup vm vm_display_name -preview -asnode=datacenter_node
```

You can also use the IBM Spectrum Protect scheduler to schedule periodic backups of your virtual machines. You can also back up the virtual machine that is hosting the Microsoft Exchange Server by using the data mover command line:

```
dsmc backup vm vm_display_name -asnode=datacenter_node
```

Verifying that the configuration backs up data that can be restored

Before you can restore individual Microsoft Exchange Server databases from a Data Protection for VMware virtual machine backup, you must complete at least one successful virtual machine backup. For the restore operation to work, the backup must contain Microsoft Exchange Server database metadata.

Procedure

1. Issue the following data mover **query** command on one of the data mover nodes:

```
dsmc query vm vmname -detail -asnode=datacenter_node
```

where:

- *vmname* specifies the name of the virtual machine
- *datacenter_node* specifies the name of the datacenter node

2. In the command output, look for the following details:

Application(s) protected: MS Exchange 2013 (database-level recovery)

Ensure that Excluded is not indicated in any Virtual Machine Disk (VMDK) status fields for virtual disks that host Microsoft Exchange Server database files. The Excluded status indicates that one or more of the VMDKs that are required to recover a Microsoft Exchange Server database are not being protected. For example:

```
Query Virtual Machine for Full VM backup
# Backup Date  Mgmt Class  Size   Type   A/I   Virtual Machine
-----
1 02/20/2015   STANDARD  43.94GB IFFULL  A     vm_exc10
12:43:59

Size of this incremental backup: n/a
Number of incremental backups since last full: 0
Amount of extra data: 0
Object fragmentation: 0
Backup is represented by: 328 objects
Application protection type: TSM VSS
Application(s) protected: MS EXC 2013 (database-level recovery)
VMDK[1]Label: Hard Disk 1
VMDK[1]Name: [ess800_dev2] vm_exc10/vm_exc10 .vmdk
VMDK[1]Status: Protected
...
VMDK[6]Label: Hard Disk 6
VMDK[6]Name: [ess800_dev2] vm_exc10/vm_exc10_5.vmdk
VMDK[6]Status: Protected
```

Configuring Data Protection for Microsoft Exchange Server

After you configure Data Protection for VMware and verify that you created a virtual machine backup that is suitable for recovery of a single Microsoft Exchange Server database, configure Data Protection for Microsoft Exchange Server in the guest virtual machine.

Procedure

1. Log on to the virtual machine that hosts the Microsoft Exchange Server database.
2. Verify that the following packages are installed:
 - The IBM Spectrum Protect recovery agent, recovery agent command-line interface (CLI), and license (from the Data Protection for VMware product package)
 - IBM Spectrum Protect data mover
 - Data Protection for Microsoft Exchange Server

You can install the recovery agent, CLI, license, and data mover together by using the Data Protection for VMware installation program. To install the packages together, select the following advanced installation option: **Install a complete data mover for in-guest application protection**. Data Protection for Microsoft Exchange Server is installed separately.

3. Configure Data Protection for Microsoft Exchange Server by using the IBM Spectrum Protect configuration wizard. When you open the **IBM Spectrum**

Protect Node Names page of the wizard, enter the VMware datacenter node name, Microsoft Exchange Server node name, and VSS requestor node name. If the datacenter node name field is disabled, the recovery agent is not installed correctly.

4. After Data Protection for Microsoft Exchange Server is configured, verify that the **Configuring Recovery Agent** rule status indicates Passed.
5. Log on to a data mover instance and complete the following steps. Do not repeat these steps for all data mover instances.
 - a. Copy the contents of the data mover options file `dsm.opt` to a temporary file named `dsm.setaccess.opt` and make the following changes to the file. Do not make these changes in the `dsm.opt` file.
 - 1) Delete any line that contains an **ASNODE** entry.
 - 2) Set the **NODENAME** option to the VMware datacenter node name. For example:
`NODENAME datacenter10`

Tip: If the `dsm.opt` file does not contain **ASNODE** entries and the **NODENAME** option is set to the correct data center node, you can use this file rather than creating the `dsm.setaccess.opt` file.

- b. From the datacenter node that was defined in the **NODENAME** option, issue the **set access** command to grant the VSS requestor node access to the virtual machine backups as shown in the following example.

You must complete this step because the VSS requestor node accesses the virtual machine backups on behalf of Data Protection for Microsoft Exchange Server.

If the password for the datacenter node is unknown when you run the **set access** command, you will receive an error message and the IBM Spectrum Protect server administrator must reset the password to issue the command.

Example

The following example shows the required parameters for the **set access** command. The parameters specify the virtual machine name (`vm_exc10`), the VSS requestor node name (`EXC10_VSS`), and the name of the options file that defines the datacenter node name (`dsm.setaccess.opt`).

The example also shows the results of the **query access** command, which shows the backup access authorization for the VSS requestor node.

```
dsmc set access backup -type=VM vm_exc10 EXC10_VSS -optfile=dsm.setaccess.opt

ANS1148I "Set Access" command successfully completed.

dsmc query access
Node name: datacenter10
Type      Node      User      Path
-----
Backup    EXC10_VSS  *        \VMFULL-vm_exc10\*\*

ANS1148I "Query Access" command completed successfully
```

Managing backups

After you configure Data Protection for Microsoft Exchange Server, you can schedule virtual machine backups and separately, you can update the mailbox information in Exchange Server database backups on the virtual machine.

Scheduling virtual machine backups

To ensure that your data is protected, schedule virtual machine backups.

Before you begin

Before you back up virtual machines that are hosting Microsoft Exchange Server databases, mount the databases.

By default, the maximum size allowed for a VMDK in a backup operation is 2 TB. However, the maximum is 8 TB. To increase the maximum size, use the `vmmaxvirtualdisks` option. For more information, see `Vmmaxvirtualdisks`.

About this task

During backup processing, Data Protection for VMware bypasses a guest Microsoft Exchange Server database that is dismounted, corrupted, suspended, or not in a healthy state in a Database Availability Group (DAG). Databases in such invalid states are excluded from virtual machine backups and are not available to restore.

Procedure

1. Log on to the Data Protection for VMware user interface.
2. Click the **Backup** tab.
3. Click **Create Schedule** to specify a backup schedule name, source (the virtual machines to include in the backup schedule), and other scheduling options.
4. Verify that the source of the schedule includes the virtual machines that are hosting Microsoft Exchange Server.
5. Verify that one of the following services is running:
 - If you are using scheduler that is managed by a Client Acceptor Daemon (CAD), ensure that the CAD service is running on the data mover.
 - If you are using the stand-alone scheduler, ensure that the scheduler service is running.

Updating mailbox information in Microsoft Exchange Server backups

When you back up a virtual machine that is hosting Microsoft Exchange Server data, mailbox history is automatically uploaded with the virtual machine backup if Data Protection for Microsoft Exchange Server is detected on virtual machine.

About this task

Unless Data Protection for Microsoft Exchange Server is installed on the virtual machine, mailbox history information is not automatically updated in Exchange Server database backup operations. Automatic uploading of mailbox history might also be disabled by specifying the `VMBACKUPMAILBOXHISTORY No` in the data mover options file, that is, `dsm.opt` on Windows systems or `dsm.sys` on Linux systems.

You can manually update mailbox history information by using the Data Protection for Microsoft Exchange Server command-line interface.

Tip: Complete this task before you back up the virtual machines that contain Microsoft Exchange servers. In this way, you can ensure that you have consistent location information for the mailbox history and the mailboxes in database backups.

Procedure

1. To update only the mailbox history information in Exchange Server database backups, issue the **backup /UpdateMailboxInfoOnly** command as shown in the following example:

```
tdpexcc backup DB1 full /UpdateMailboxInfoOnly
```

where DB1 is the database name, and full is the type of database backup.

Tip: To update information for all the mailboxes in the Exchange organization, specify an asterisk (*) character as the database name.

2. Optional: Verify that the mailbox information is updated correctly by completing the following steps.
 - a. Review the mailbox information for database backups on IBM Spectrum Protect server by issuing the **query /SHOWMAILBOXInfo** command as shown in the following example:

```
tdpexcc query tsm /showmailboxinfo
```
 - b. Start Microsoft Management Console (MMC), and in the **Mailbox Restore** or **Mailbox Restore Browser** view, verify the list of updated mailboxes that are available to restore.

Verifying backups

After you create a backup, verify that you can query the virtual machine backups and the database backups from the Data Protection for Microsoft Exchange Server interface.

About this task

You can recover one or more Microsoft Exchange databases based on your recovery point objectives (RPO).

Procedure

1. From Microsoft Management (MMC), select a Microsoft Exchange Server.
2. Click the **Recover** tab.
3. Select **View > Databases**. A list of Microsoft Exchange Server database backups that can be restored is displayed.

Microsoft Exchange Server databases that are backed up with Data Protection for VMware are identified with the vmvss backup method.

Troubleshooting VSS backup operations on guest virtual machines

If you encounter a problem during Volume Shadow Copy Service (VSS) backup processing on a guest VM, try to reproduce the problem in your environment.

About this task

Contact IBM Support for further assistance if you have a problem that you are unable to solve by reproducing the issue or reviewing the information that follows.

VSS writer service causes a VM backup to fail:

You can bypass any VSS writer that is causing a VM backup to fail and exclude it from the backup.

About this task

Before a VM backup, the VSS writer is in a stable state and has no errors. During VM backup processing, a VSS writer might encounter an error that causes the entire VM backup to fail.

For example, if the Microsoft Forefront Protection VSS Writer is installed on a guest VM, the VM backup fails and the VSS writer status changes to Retryable error, Waiting for completion, or a status other than Stable. Complete the following steps to exclude the writer service from the VM backup.

Procedure

1. In the VSS administrative command-line tool on the guest VM, list the VSS writers by issuing the **vssadmin list writers** command. In the following command example, the Microsoft Forefront Protection VSS Writerservice is identified by writer name, ID, and instance ID:

```
Writer name: 'FSCVSSWriter'
  Writer Id: {68124191-7787-401a-8afa-12d9d7ccc6ee}
  Writer Instance Id: {f4cc5385-39a5-463b-8ab4-aafeb2b35e21e}
  State: [1] Stable
  Last error: No error
```

2. In the datamover options file, `dsm.opt` or `dsm.sys`, add the `EXCLUDE.VMSYSTEMSERVICE` option followed by the *Writer Name* as shown in the following example.

```
EXCLUDE.VMSYSTEMSERVICE FSCVSSWriter
```

Tip: If the data mover machine is on a UNIX system, the option file is `dsm.sys`. If the guest VM and datamover machine use different language sets, specify the *Writer ID* or *Writer Instance Id* instead of the *Writer Name*.

For example:

```
EXCLUDE.VMSYSTEMSERVICE {68124191-7787-401a-8afa-12d9d7ccc6ee}
```

Results

The VM backup completes successfully even if the Microsoft Forefront Protection VSS Writer service is running on the guest VM.

No application protection file APPPROTECTIONDBINFO.XML and no warning messages for skipped databases:

Under certain conditions, a dismounted Exchange 2010 Server database is skipped during a backup operation and no warning is issued.

About this task

When the following conditions exist during a VM backup of a guest VM with Exchange 2010 Server:

- The Exchange 2010 Server is not a member of a Database Availability Group (DAG).
- All Exchange 2010 Server databases are dismounted.

The following warning message is generated:

```
ANS4063W IBM Spectrum Protect application protection cannot copy
the application metafile 'APPPROTECTIONDBINFO.XML ' from the following VM: '<name_name>'.
Individual database restore from this backup is not supported.

ANS4063W IBM Spectrum Protect application protection cannot copy the
application metafile '_____L' from the following VM: '<vm_name>'.
Individual database restore from this backup is not supported.
```

In this situation, the VM backup is available for only full VM restore. Individual database restore from this VM backup is not available.

To prevent this situation, mount the Exchange 2010 Server databases before you start the VM backup operation.

When Exchange 2010 Server DAG databases or Exchange Server 2013 databases are dismounted, a VM backup operation of a guest VM generates the following warning message:

```
ANS2234W Restore from virtual machine backup is not available for
dismounted database <database>
```

For a dismounted Exchange 2010 Server database that is not a member of a DAG, IBM Spectrum Protect does not detect that the databases are dismounted. As a result, warning message ANS4063W is generated instead of ANS2234W.

Transaction error due to mixing of deduplicated and non-deduplicated data in the same transaction:

Under certain conditions, a transaction error occurs when deduplicated and non-deduplicated data is mixed in the same transaction.

About this task

When data deduplication is enabled, a Data Protection for VMware backup with application protection of a virtual machine might generate the following error in the dsmmerror.log file:

```

ANS0246E Issue dsmEndTxn and then begin a new transaction session.
ANS5250E An unexpected error was encountered.
  IBM Spectrum Protect function name : vmSendViaFile()
  IBM Spectrum Protect function      : Failed sending file
                                     /tmp/tsmvmbackup/fullvm/vmtsmvss/member1/IIS CONFIG WRITER.XML
  IBM Spectrum Protect return code   : 2070
  IBM Spectrum Protect file          : vmmigration.cpp (1383)

```

This error is recoverable and can be ignored. The error occurs when Data Protection for VMware attempts to send the XML file (that was excluded from deduplication due to its small size) in the same transaction with deduplicated data. Data Protection for VMware resends the XML file (identified in the error message) in a new transaction.

Verifying that virtual machine backups do not exclude Microsoft Exchange Server volumes

The volumes in Virtual Machine Disks (VMDKs) must contain the Microsoft Exchange Server databases that are not excluded from the Data Protection for VMware backup processing.

About this task

The databases cannot be on physical compatibility mode raw device mapping (RDM) disks, independent disks, or on disks that are attached directly to the guest operating system through iSCSI.

Procedure

1. Ensure that any EXCLUDE.VMDISK statements in the Data Protection for VMware data mover that is used to back up the virtual machine do not inadvertently exclude VMDKs that are hosting volumes that contain Microsoft Exchange Server files, file space, database, and mailboxes.

For example:

- vm_exc10.vmdk contains logical volume C:
- vm_exc10.vmdk contains logical volumes E: and F:
- The label for vm_exc10_1.vmdk is *Hard Disk 1*.
- The label for vm_exc10_2.vmdk is *Hard Disk 2*.
- The Microsoft Exchange Server database files to be backed up are on the E: and F: drive.

2. Verify that no statements exclude vm_exc10_2.vmdk from the virtual machine backup by ensuring that the data mover does not contain the following or similar statements:

```

EXCLUDE.VMDISK VM_EXC10 "Hard Disk 2"
EXCLUDE.VMDISK * "Hard Disk 2"

```

Alternatively, if you exclude most hard disks, you must explicitly include the virtual machine disks by using one of the following statements:

```

INCLUDE.VMDISK VM_EXC10 "Hard Disk 2"
INCLUDE.VMDISK * "Hard Disk 2"

```

Include and exclude statements are processed from bottom to top as they are displayed in the dsm.opt file. To achieve the goal, enter the statements in the correct order.

You can specify the exclusion and inclusion of a virtual machine disk from the command-line interface:

```
dsmc backup vm "VM_EXC10:-vmdisk=Hard Disk 2" -asnode=datacenter10
```

Restoring data

After you back up data, you can recover the data based on a recovery point objective (RPO).

A recovery operation restores a full backup of the Microsoft Exchange Server database or mailbox from the Data Protection for VMware backup.

If you restore the entire virtual machine, all Microsoft Exchange Server databases and mailboxes on the virtual machine are restored and recovered to the point of the virtual machine backup.

Starting the Microsoft iSCSI Initiator Service

The iSCSI protocol is used to mount the disks that are used for a recovery operation. Ensure that the Microsoft iSCSI Initiator Service is started and is set to the automatic startup type on the system where the data is to be restored.

Procedure

1. In the Windows **Services** list, right-click **Microsoft iSCSI Initiator Service**.
2. Click **Properties**.
3. On the **General** tab, set the following options:
 - a. In the **Startup type** list, select **Automatic**.
 - b. Click **Start**, and then click **OK**.

Results

In the **Services** list, **Microsoft iSCSI Initiator Service** shows a status of **Started** and the startup type is **Automatic**.

Restoring database backups by using the graphical user interface

You can recover a full Microsoft Exchange Server database backup from a virtual machine backup by using the Data Protection for Microsoft Exchange Server graphical user interface.

Procedure

1. To start a full database recovery from a virtual machine, start Microsoft Management (MMC). In the navigation pane, expand the Protect and Recover node and select a Microsoft Exchange Server server.
2. On the **Recover** tab, select **Database Restore**. All backups, including all database backups from a virtual machine backup, are listed.
3. Select a full database backup to restore.
4. In the Actions pane, click **Restore**.

Restoring backups of another virtual machine

By using Data Protection for Microsoft Exchange Server, you can access backups of another virtual machine on IBM Spectrum Protect server and restore the backup.

About this task

You can restore database and mailbox backups to a different Database Availability Group (DAG) node than the original backup node.

The following scenario assumes that you have Exchange virtual machines in your virtual environment: vm1 and vm2. You want to enable Data Protection for Microsoft Exchange Server on vm2 to access and restore database and mailbox backups on vm1 and vm2.

Procedure

1. Configure self-contained application protection to protect Microsoft Exchange Server data on vm1 and vm2.
2. Back up vm1 and vm2 by issuing the **dsmc backup vm** command on the command-line interface.
3. On vm2, install Data Protection for Microsoft Exchange Server and configure the software for Exchange Server data protection in a VMware environment.
4. To enable Data Protection for Microsoft Exchange Server on vm2 to access backups on vm1 and vm2, issue the **set access** command as shown in the following examples:

```
dsmc set access backup -type=vm vm1 vm2_vss  
dsmc set access backup -type=vm vm2 vm2_vss
```

5. Restore database or mailbox backups on vm1 or vm2.

Restoring mailbox data

IBM Spectrum Protect Snapshot backs up mailbox data at the database level, and also restores individual mailbox items from the database backup.

Before you begin

You must have role-based access control (RBAC) permissions to complete individual mailbox restore operations. For more information, see the topic that explains security requirements for backup and restore operations in the *Data Protection for Microsoft Exchange Server Installation and User's guide*.

If you plan to restore mail or folders by using a Simple Mail Transfer Protocol (SMTP) server, ensure that you configure the SMTP server before you start a restore operation. To set the configuration in the Management Console, right-click **Dashboard** in the tree view and select **Properties**. From the E-mail property page, enter the SMTP server and port.

About this task

- In Exchange Server 2013, you can restore a public folder mailbox database, a public folder mailbox, or only a part of the mailbox, for example, a specific public folder.
 - To restore an Exchange 2013 public folder mailbox, the Exchange user must have the Public Folders management role.
 - You can restore a public folder mailbox only to an existing public folder mailbox that is on the Exchange Server.
 - You can restore a public folder only to an existing public folder. The public folder on the Exchange Server must have the same folder path as the public folder to be restored. If the public folder is deleted from the public folder mailbox on the Exchange Server, you must re-create the public folder with the same folder path as the public folder to be restored, before you start the restore operation.
 - As a best practice, restore public folder mailboxes separately from user mailboxes. Select only one public folder mailbox to restore at a time if you want to restore a specific public folder in the mailbox, or if you want to restore to a different public folder mailbox than the original mailbox.

If you restore multiple mailboxes in a single restore operation, and at least one of the mailboxes is a public folder mailbox, the mailboxes are restored only to their original mailbox locations. You cannot specify a filter or an alternate mailbox destination.
 - You might restore to a different public folder mailbox than the original mailbox if, for example, the public folder is relocated after the time of the backup. Before you complete the public folder restore operation, ensure that the public folder exists with the same folder path in the alternate mailbox location.
- In Exchange Server 2010 or later, you can restore an archive mailbox or a part of the mailbox, for example, a specific folder. You can restore archive mailbox messages to a mailbox that is on the Exchange Server, to an archive mailbox, or to an Exchange Server .pst file.

If you enable a user mailbox to be archived, ensure that the user is logged on to that mailbox at least once before you complete a backup and restore operation on the mailbox.
- If you restore multiple mailboxes, and you want to retain the recovery database after the restore operation is complete, ensure that all the mailboxes are in the same recovery database.
- By default, IBM Spectrum Protect Snapshot restores the latest backup that is available for the specified mailbox.

The amount of time that it takes to complete the restore process depends on the size of the mailbox databases, the network speed, and the number of mailboxes to process.

Procedure

1. Start Microsoft Management Console (MMC) and select **Exchange Server** in the navigation tree.
2. On the **Recover** tab for the Exchange Server instance, select the **Mailbox Restore** view.
3. Select one or more mailboxes to restore. A list of mailboxes that are backed up is displayed. If you restore mail to a Unicode personal folder (.pst) file, or you restore a mailbox that is deleted or re-created after the time of the backup, IBM

Spectrum Protect Snapshot requires a temporary mailbox to store the mailbox messages. Create a temporary mailbox by setting the Alias of temporary mailbox option on the Properties page, under the **General** tab.

Attention: Ensure that the temporary mailbox that you create is on a database with enough disk storage capacity to accommodate all of the mailbox items that you are restoring.

4. Optional: Optional: To restore individual messages instead of the entire mailbox, select **Item-Level Mailbox Filters**.
 - a. Click **Show Filter Options** and **Add Row**.
 - b. In the **Column Name** field, click the down arrow and select an item to filter.
 - You can filter public mailbox folders only by the **Folder Name** column.
 - You can filter Unicode .pst files only by **Backup Date**, **Folder Name** and **All Content** filters.
 - You can filter by backup date, and click the default date and time to edit the table cell. To change the date, click the arrow at the end of the cell. The calendar date selection tool is displayed. After you select a date, to display the date in the field, press **Enter**. To edit the time, enter the time by using the 12-hour clock time convention such as 2 p.m.

When you specify a backup date, Data Protection for Exchange Server searches for a backup that corresponds to that exact date. If a backup with that exact date is not found, Data Protection for Exchange Server selects the first backup after that date.
 - c. In the **Operator** field, select an operator.
 - d. In the **Value** field, specify a filter value.
 - e. If you want to filter on more items, click **Add Row**.
5. Specify the restore options by clicking **Show Restore Options**.

Table 3. Database restore options

Task	Action
Keep Recovery Database After Restore	Use this option to retain a recovery database after a mailbox restore operation is complete. The default value is No . If you set the value to Yes , Data Protection for Exchange Server automatically retains the recovery database after mailbox restore processing.
Mailbox	If the alias of the mailbox to restore is not displayed in the list of mailboxes, specify the alias. This option overrides any selected mailboxes.
Mailbox Original Location	Use this option only if the mailbox was deleted or re-created since the time of the selected backup, and mailbox history is disabled. Specify the Exchange Server and the database where the mailbox was at the time of the backup. Use the following format: server-name,db-name, for example, serv1,db1.
Mark Restored Messages As Unread	Use this option to automatically mark the mailbox messages as unread after the restore operation is completed. The default value is Yes .

Table 3. Database restore options (continued)

Task	Action
Use Existing Recovery Database	<p>Use this option to restore the mailbox from an existing recovery database. The default value is Yes.</p> <p>If you set the value to No and a recovery database is mounted on the server before you restore the mailbox, Data Protection for Exchange Server automatically removes the recovery database during mailbox restore processing.</p>

6. To complete the restore operation, click one of the following **Restore** options.

Table 4. Restore options

Task	Action
Restore Mail to Original Location	Select this action to restore mail items to their location at the time of the backup operation.
Restore Mail to Alternate Location	Select this action to restore the mail items to a different mailbox.
Restore Mail to non-Unicode PST file	<p>Select this action to restore the mail items to a non-Unicode personal folders (.pst) file.</p> <p>When you restore mail items to a .pst file with one selected mailbox, you are prompted for a file name. When you restore mail items to a .pst file with more than one selected mailbox, you are prompted for a directory location. Each mailbox is restored to a separate .pst file that reflects the name of the mailbox at the specified directory.</p> <p>If the .pst file exists, the file is used. Otherwise, the file is created.</p> <p>Restriction: The contents of each folder cannot exceed 16,383 mail items.</p>

Table 4. Restore options (continued)

Task	Action
Restore Mail to Unicode PST file	<p>Select this action to restore the mail items to a Unicode .pst file.</p> <p>When you restore mail items to a .pst file with one selected mailbox, you are prompted for a file name. When you restore mail items to a .pst file with more than one selected mailbox, you are prompted for a directory location.</p> <p>You can enter a standard path name (for example, c:\PST\mailbox.pst) or a Universal Naming Convention (UNC) path (for example, \\server\c\$\PST\mailbox.pst). When you enter a standard path, the path is converted to a UNC path. If the UNC path is a non-default UNC path, enter the UNC path directly.</p> <p>Each mailbox is restored to a separate .pst file that reflects the name of the mailbox at the specified directory. If the .pst file exists, the file is used. Otherwise, the file is created.</p>
Restore Public Folder Mailbox	<p>Select this action to restore a public folder mailbox to an existing online public folder mailbox.</p> <p>You can filter the mailbox and restore a specific public folder to an existing online public folder. In the Folder to be restored field, enter the name of the public folder that you want to restore. If you are restoring a subfolder in a parent folder, specify the full folder path in this format: <i>parent_folder_name/sub_folder_name</i>. To restore all subfolders in a parent folder, use <i>parent_folder_name/*</i>. If the full folder path includes spaces, enclose the folder path in double quotation marks, and do not append a backslash character (\) at the end of the folder path.</p> <p>You can also restore all or part of a public folder mailbox to a different public folder mailbox than the original mailbox. In the Target public folder mailbox field, specify the destination public folder mailbox that you want to restore to.</p>

Table 4. Restore options (continued)

Task	Action
Restore Mail to Archive Mailbox	<p>This action applies to a primary mailbox or an archive mailbox. Select this action to restore all or part of either type of mailbox to the original archive mailbox or to an alternate archive mailbox.</p> <p>You can filter the archive mailbox and restore a specific mailbox folder. In the Folder to be restored field, enter the name of the folder in the archive mailbox that you want to restore. If you are restoring a subfolder in a parent folder, specify the full folder path in this format: <i>parent_folder_name/sub_folder_name</i>. To restore all subfolders in a parent folder, use <i>parent_folder_name/*</i>. If the full folder path includes spaces, enclose the folder path in double quotation marks, and do not append a backslash character (\) at the end of the folder path.</p> <p>In the Target archive mailbox field, specify the archive mailbox destination that you want to restore to.</p>

Tip: Because a status indicator does not appear in MMC during the restore operation, you might assume that the operation has stopped because it is taking a long time to complete. However, depending on the amount of data, a restore operation can take several hours.

Restoring relocated and deleted mailboxes

The backup solution for restoring mailboxes that are relocated and deleted after a virtual machine backup consists of Data Protection for VMware and Data Protection for Microsoft Exchange Server.

Before you begin

Decide where the mailbox data from the deleted mailbox is to be restored.

If you restore mail to a Unicode personal folder (.pst) file, or you restore a mailbox that is deleted or re-created after the time of the backup, Data Protection for Exchange Server requires a temporary mailbox to store the mailbox messages. Create a temporary mailbox by setting the Alias of temporary mailbox option on the Properties page, under the **General** tab.

Attention: Ensure that the temporary mailbox that you create is on a database with enough disk storage capacity to accommodate all of the mailbox items that you are restoring.

About this task

When you restore the backups, and complete a full database restore operation from the backup, Data Protection for VMware restores the files to their original location.

If database or log files are relocated during the backup cycle, Data Protection for Microsoft Exchange Server restores the files in their original locations.

If any databases or mailboxes were created during the backup cycle, Data Protection for Microsoft Exchange Server re-creates the new files. If database or log files were deleted during the backup cycle, those files are not restored.

Procedure

Complete one of the following actions:

- Restore the deleted mailbox data to the original location. Before you run the mailbox restore operation, re-create the mailbox that is using Exchange.
If the backup that contains the deleted mailbox was created with a version of IBM Spectrum Protect Snapshot for Microsoft Exchange Server earlier than version 6.1, or if the mailbox history is disabled, and the mailbox was relocated after the time it was backed up, you must specify the Exchange Server and the database where the mailbox was at the time of backup. Use the **Mailbox Original Location** option in the GUI to specify this information. Alternatively, issue the **restoremailbox** command parameter, **/MAILBOXORIGLOCATION**.
- Restore the deleted mailbox data into an active alternative mailbox in an online Exchange Server.
- Restore the deleted mailbox data into an Exchange Server personal folders (.pst) file.

Restoring mailbox messages interactively with the Mailbox Restore Browser

You can use the Mailbox Restore Browser to interactively restore a mailbox or items from a mailbox on Exchange Server.

Before you begin

You must have role-based access control (RBAC) permissions to complete individual mailbox restore operations.

If you plan to restore mail or folders by using a Simple Mail Transfer Protocol (SMTP) Server, ensure that you configure the SMTP Server before you attempt a restore operation. Set the configuration in Microsoft Management Console (MMC) by right-clicking **Dashboard** in the tree view and selecting **Properties**. Then, in the E-mail property page, enter the SMTP server and port.

About this task

- In Exchange Server 2013, you can restore a public folder mailbox database, a public folder mailbox, or only a part of the mailbox, for example, a specific public folder. However, you cannot restore individual messages in a public folder by using the Mailbox Restore Browser interface.
 - To restore an Exchange 2013 public folder mailbox, the Exchange user must have the Public Folders management role.
 - You can restore a public folder mailbox only to an existing public folder mailbox that is on the Exchange Server.
 - You can restore a public folder only to an existing public folder. The public folder on the Exchange Server must have the same folder path as the public folder to be restored. If the public folder is deleted from the public folder

mailbox on the Exchange Server, you must re-create the public folder with the same folder path as the public folder to be restored, before you start the restore operation.

- As a best practice, restore public folder mailboxes separately from user mailboxes. Select only one public folder mailbox to restore at a time if you want to restore a specific public folder in the mailbox, or if you want to restore to a different public folder mailbox than the original mailbox.

If you restore multiple mailboxes in a single restore operation, and at least one of the mailboxes is a public folder mailbox, the mailboxes are restored only to their original mailbox locations. You cannot specify a filter or an alternate mailbox destination.

- You might restore to a different public folder mailbox than the original mailbox if, for example, the public folder is relocated after the time of the backup. Before you complete the public folder restore operation, ensure that the public folder exists with the same folder path in the alternate mailbox location.
- If you restore multiple mailboxes, and you want to retain the recovery database after the restore operation is complete, ensure that all the mailboxes are in the same recovery database.
- By default, IBM Spectrum Protect Snapshot restores the latest backup that is available for the specified mailbox.

Restriction: Only mailboxes within the same database can be restored in a single mailbox restore action.

Procedure

1. Start MMC.
2. Under the **Protect and Recover Data** node in the navigation tree, select **Exchange Server**.
3. On the Recover panel, click **View > Mailbox Restore Browser**.
4. In the Select Source window, specify the mailbox that you want to restore. Choose from the actions in the following table:

Table 5. Selecting mailboxes to restore

Task	Action
Browse mailboxes and select one to restore	<ol style="list-style-type: none">1. From the drop-down list, select Browse Mailboxes.2. Select a mailbox.3. Click OK. <p>Tip: Use the Search field to filter the mailboxes. You can also sort the mailboxes by columns.</p>
Specify a mailbox to restore by name	<ol style="list-style-type: none">1. In the Mailbox Name field, enter the name of the mailbox to restore.2. Click OK.

Table 5. Selecting mailboxes to restore (continued)

Task	Action
Restore a mailbox backup that was created at a specific time	<ol style="list-style-type: none"> 1. In the Backup Date/Time field, click the default date and time to edit the details. 2. To change the date, click the calendar icon, select a date, and press Enter. 3. To change the time of day, use the 12-hour system convention such as 2 p.m. 4. Click OK.
Review the mailbox backups that are available to restore before you complete the restore operation	<ol style="list-style-type: none"> 1. From the drop-down list, select Browse Mailboxes. 2. Select a mailbox for which backups exist. 3. From the Available Database Backups list, review the backups that are available for the mailbox and select a backup version to restore. 4. Ensure that the Backup Date/Time field reflects the time stamp for the selected mailbox backup. 5. Click OK.
Restore a mailbox that was deleted or re-created after the time of the backup	<p>In the Actions pane, click Properties, and on the General page, enter the temporary mailbox alias.</p> <p>Tip: If you do not enter the alias, the mailbox restore operation uses the administrator mailbox as a temporary storage location.</p>
Browse all databases in a backup	<ol style="list-style-type: none"> 1. From the drop-down list, select Browse Databases. 2. Select a database. 3. Click OK. <p>Tip: Use the Search field to filter the databases. You can also sort the mailboxes by columns.</p>

After the selected mailbox is restored to the recovery database, the restored mailbox and folders are displayed in the results pane.

5. In the results pane, browse the folders and messages that are contained within the selected mailbox. Choose from the following actions to select the mailbox, folder, or message to restore:

Table 6. Previewing and filtering mailbox items

Task	Action
Preview mailbox items	<ol style="list-style-type: none"> 1. Select a mailbox item to display its contents in the preview pane. 2. When an item contains an attachment, click the attachment icon to preview its contents. Click Open or save the item by clicking Save.

Table 6. Previewing and filtering mailbox items (continued)

Task	Action
Filter mailbox items	<p>Use the filter options to narrow the list of folders and messages in the result pane.</p> <ol style="list-style-type: none"> 1. Click Show Filter Options and Add Row. 2. Click the down arrow in the Column Name field and select an item to filter. You can filter by folder name, subject text, and so on. You can filter public mailbox folders only by the Folder Name column. When you select All Content, the mailbox items are filtered by attachment name, sender, subject, and message body. 3. In the Operator field, select an operator. 4. In the Value field, specify a filter value. 5. If you want to filter on more items, click Add Row. 6. Click Apply Filter to filter the messages and folders.

6. In the Actions pane, click the folder or messages restore task that you want to run. If you click **Save Mail Message Content**, which becomes available only when a message is selected in the preview pane, a Windows Save File window is displayed. Specify the location and message name and click **Save**. The Restore Progress window opens and shows the progress of the restore operation. IBM Spectrum Protect Snapshot restores the mailbox backup to its original mailbox location.
7. To restore a mailbox or mailbox item to either of the following locations, complete the following steps. Choose from the actions in the following table:

Table 7. Restoring a mailbox to another mailbox or .pst file

Task	Action
Restore a mailbox or mailbox item to a different mailbox	<ol style="list-style-type: none"> 1. On the Actions pane, click Open Exchange Mailbox. 2. Enter the alias of the mailbox to identify it as the restore destination. 3. Drag the source mailbox to the destination mailbox on the results pane.

Table 7. Restoring a mailbox to another mailbox or .pst file (continued)

Task	Action
Restore a mailbox to an Outlook personal folders (.pst) file	<ol style="list-style-type: none"> 1. On the Actions pane, click Open PST File. 2. When the Windows File window opens, select an existing .pst file or create a .pst file. 3. Drag the source mailbox to the destination .pst file on the results pane. <p>Restriction: You can use the Mailbox Restore Browser only with non-Unicode .pst files.</p>
Restore Public Folder Mailbox	<p>Select this action to restore a public folder mailbox to an existing online public folder mailbox.</p> <p>You can filter the mailbox and restore a specific public folder to an existing online public folder. In the Folder to be restored field, enter the name of the public folder that you want to restore. If you are restoring a subfolder in a parent folder, specify the full folder path in this format: <i>parent_folder_name/sub_folder_name</i>. To restore all subfolders in a parent folder, use <i>parent_folder_name/*</i>. If the full folder path includes spaces, enclose the folder path in double quotation marks, and do not append a backslash character (\) at the end of the folder path.</p> <p>You can also restore all or part of a public folder mailbox to a different public folder mailbox than the original mailbox. In the Target public folder mailbox field, specify the destination public folder mailbox that you want to restore to.</p>

In the Actions pane, the **Close Exchange Mailbox** and **Close PST File** tasks are displayed only when a destination mailbox or .pst file is opened.

8. Optional: Remove the recovery database by clicking **Close Mailbox to Restore**. This option is displayed only after a recovery database is created. IBM Spectrum Protect Snapshot removes the recovery database and cleans up the restored files. If you do not select **Close Mailbox to Restore**, the recovery database is not removed even if you exit MMC.
- If MMC also detects a recovery database that is created outside of IBM Spectrum Protect Snapshot, it automatically connects to it. When you complete your mailbox restore tasks, you must manually remove the recovery database. You cannot use the **Close Mailbox to Restore** option.

Restoring data by using the command-line interface

If you prefer, you can use the command-line interface to start a full Microsoft Exchange Server database recovery from a virtual machine.

Procedure

1. Issue the **query** command to find the database full backups. The following example finds all backups for the Microsoft Exchange Server database called `exc_db10`.

```
tdpexcc q tsm exc_db10 IBM Spectrum Protect for Mail:
Data Protection for Microsoft Exchange Server Version 8, Release 1, Level 0.0
...
Querying IBM Spectrum Protect server for a list of
data backups, please wait....
```

```
Connecting to IBM Spectrum Protect Server as node "exc_db10"...
Connecting to Local DSM Agent "exc"...
Using backup node "exc_db10"...
```

```
Exchange Server : exc
```

```
Database       : exc_db10
```

```
Backup Date Size S Type Loc Object Name
-----
10/15/2014 19:17:26 5.40 B A full Srv 20141015191726 (VMVSS)
```

```
The operation completed successfully. (rc = 0)
```

2. To restore the database without applying transaction logs, issue the database **restore** command as shown in the following example:

```
TDPEXCC RESTore databaseName FULL /BACKUPDestination=TSM
/BACKUPMethod=VMVSS
```

The following sample output results when you issue the command with the Microsoft Exchange Server database called `exc_db10`.

```
TDPEXCC RESTore exc_db10 FULL /BACKUPDestination=TSM /BACKUPMethod=VMVSS
IBM Spectrum Protect for Mail:
Data Protection for Microsoft Exchange Server
Version 8, Release 1, Level 0.0 (C) Copyright
IBM Corporation 1997, 2016. All rights reserved.
```

```
Connecting to IBM Spectrum Protect Server as node "exc_db10"...
```

```
Connecting to Local DSM Agent "exc"...
Using backup node "exc_db10"...
```

```
Starting Microsoft Exchange restore...
Beginning VSS restore of "exc_db10"...
```

```
Restoring "exc_db10" via file-level copy from snapshot(s).
This operation could take a while, please wait
```

```
...
```

```
The operation completed successfully. (rc = 0)
```

You can restore the database to a different location by adding the **/INTODB** parameter. For example:

```
TDPEXCC RESTore TestDB1 FULL /INTODB=Test2
/BACKUPDestination=TSM /BACKUPMethod=VMVSS
```

What to do next

You can restore inactive backups by using the Data Protection for Microsoft Exchange Server command-line interface, **TDPEXCC**. When you issue the **restore** command, specify the database object name for the specific backup.

To obtain the database object name, issue the following command:

```
tdpexcc q tsm dbname full /all
```

After you have the database object name value, specify the database object name on the */Object=objectname* parameter of the **TDPEXCC restore** command, where *objectname* is the database object name. For example:

```
TDPEXCC RESTore db44 FULL /Object=20140311131051 /BACKUPDEstination=TSM  
/BACKUPMethod=VMVSS
```

Restoring data by using Windows PowerShell cmdlets

If you prefer, you can use Windows PowerShell cmdlets with IBM Spectrum Protect Snapshot to start a full Microsoft Exchange Server database recovery from a virtual machine.

Procedure

1. Issue the query cmdlet to find the database full backups. For example, to find all of the database full backups, enter the following command:

```
Get-DpExcBackup -Name * -FromExcServer *
```

2. Issue the database restore cmdlet. For example:

```
Restore-DpExcBackup -Name ExchDb01 -Full  
-BACKUPDESTINATION TSM -FROMEXCSErVer PALADIN20  
-INTODB Zwen
```

3. Issue the restore cmdlets with parameter **intodb** to restore to an alternative location. For example:

```
Restore-DpExcBackup -Name ExchDb01 -Full  
-BACKUPDESTINATION TSM -FROMEXCSErVer PALADIN20  
-Object 20140923100738 -INTODB ExchDb01_altRdb
```

IBM Spectrum Protect file space information

You might never need to know the file names or locations for your virtual machine files. However, if the underlying file structure interests you, Data Protection for VMware backups are stored under the node name of the vSphere datacenter (for example, *datacenter10*).

The following example shows the file space information for the virtual machine that is called *vm_exc10*.

```

Protect: ORION>q file datacenter10 f=d

Microsoft SQL Server data protection in VMware environments

For Microsoft SQL Server workloads that are running in a VMware ESXi virtual guest machine, you can take application-consistent backups of virtual machines that are hosting Microsoft SQL Server data. By using IBM Spectrum Protect software, you can also recover backups from the virtual machine.

Before you back up data, identify your recovery point objective (RPO). The *RPO* helps you decide how often to back up data and affects the cost that is associated with data backups.

For example, you can schedule frequent virtual machine backups for necessary recovery points. The recovery point of a virtual machine backup is the time of the backup. While change-block tracking and data deduplication offer savings, virtual machine backups can be expensive if you create and delete many virtual machine snapshots.

Most traditional in-guest data protection methods provide appropriate RPOs, but these in-guest methods lose the efficiencies that are introduced by backing up data at the virtual machine level.

You can use IBM Spectrum Protect for Virtual Environments: Data Protection for VMware and IBM Spectrum Protect Snapshot with Data Protection for Microsoft SQL Server to back up data at a virtual machine level in a way that preserves backup efficiencies.

To protect Microsoft SQL Server data in a VMware environment, ensure that the following products are installed and configured on your system:

- IBM Spectrum Protect for Virtual Environments: Data Protection for VMware V8.1.0 (which includes the IBM Spectrum Protect client)

- IBM Spectrum Protect Snapshot with Data Protection for Microsoft SQL Server V8.1.0

For permission required to back up and restore application data for Microsoft SQL Server, see technote 1647995.

Application protection is supported for VMware VMs in a VMware vSphere environment only.

Configuring the software for SQL Server data protection in a VMware environment

To protect Microsoft Exchange Server workloads that are running in a VMware ESXi virtual guest machine, install and configure Data Protection for VMware. Then, install and configure Data Protection for Microsoft SQL Server.

Before you begin

The following instructions are based on a configuration scenario that might not match your environment. Adjust the configuration for your environment.

The following list summarizes the scenario for quick reference:

Windows host name

SQL10

VSS requestor node name

SQL10_VSS

Data Protection for Microsoft SQL Server node name

sql10_SQL

Virtual machine name

vm_sql10

Data mover node names

datamover10 and datamover20

Datacenter node name

datacenter10

VM file space

\VMFULL-vm_sql10

About this task

The following details describe the scenario that is used.

- A single Microsoft SQL Server database on a virtual machine that is named vm_sql10 must be recovered.
- Virtual machine vm_sql10 is protected by Data Protection for VMware by using the node name datacenter10. This node name in the IBM Spectrum Protect server represents the vSphere datacenter). The data mover nodes are called datamover10 and datamover20.
- The virtual machine guest is configured with the virtual machine name of vm_sql10 and the Microsoft Windows host name is SQL10.
- Data Protection for Microsoft SQL Server is installed in the guest and is configured to the IBM Spectrum Protect server to use node name sql10_SQL.

- The IBM Spectrum Protect client in the virtual guest machine is configured as the VSS requestor node and is using the node name SQL10_VSS.

Procedure

1. Follow the installation and configuration instructions that are provided with each software package.
If you install Data Protection for Microsoft SQL Server before Data Protection for VMware, you cannot specify the VMware datacenter node in the Data Protection for Microsoft SQL Server configuration wizard because the field is disabled.
2. Complete the tasks in this checklist:
 - Verify that Microsoft SQL Server databases and mailboxes are hosted on VMware virtual disks.
 - Verify that no Microsoft SQL Server database is hosted on raw device mapped (RDM) disks in physical compatibility mode, independent disks, or on disks that are attached directly to the guest through in-guest iSCSI.
 - Verify that policies are set to keep sufficient versions of Microsoft SQL Server logs and virtual machine backups.
 - Verify that SQL Server databases are on a single server and are not participating in any type of clustering, for example, failover clusters, AlwaysOn Availability Groups or AlwaysOn Failover Cluster instances.
3. Outside of the virtual guest machine, in the datamover, configure Data Protection for VMware to protect Microsoft SQL Server databases
4. Within the virtual guest machine, take the following actions:
 - Verify that the Data Protection for VMware recovery agent command-line interface is configured to work with the recovery agent on the guest virtual machine.
 - Configure Data Protection for Microsoft SQL Server to complete SQL Server log backups and restore SQL Server databases from a virtual machine backup.

Configuring Data Protection for VMware

You must configure Data Protection for VMware to preserve Microsoft VSS metadata information during a virtual machine backup for systems that are hosting Microsoft SQL Server data.

About this task

Data Protection for VMware provides application consistency when you back up virtual machines that are hosting Microsoft SQL Servers. With these backups, you can recover the virtual machine with Microsoft SQL Server in a consistent state.

To recover only selected databases from this type of backup with IBM Spectrum Protect, without having to recover the entire virtual machine, preserve information about the state of the Microsoft SQL Server at the time of the virtual machine snapshot and backup. This information is collected as part of the Microsoft Volume Shadow Copy Services (VSS) interaction that occurs during a virtual machine snapshot.

For Data Protection for VMware to collect the Microsoft VSS metadata for Microsoft SQL Server, you must configure Data Protection for VMware to obtain this information from the virtual machine during the backup operation.

Procedure

1. Configure Data Protection for VMware to preserve the Microsoft VSS metadata information during a virtual machine backup for systems that are hosting Microsoft SQL Server data.

- a. Locate the options file for the Data Protection for VMware data mover. On Windows systems, the options file is `dsm.opt`. On Linux systems, the options file is `dsm.sys`.
- b. Specify the `INCLUDE.VMTSMVSS` option for the virtual machine. You must set this option for virtual machine backups to preserve the Microsoft VSS metadata information. Choose from the options in the following table:

Table 8. INCLUDE.VMTSMVSS options

Option	Result
<code>INCLUDE.VMTSMVSS vm_display_name</code>	When you set this option, virtual machine applications receive a notification when a backup is going to occur. This notification allows the application to commit transactions and truncate transaction logs so that the application can resume from a consistent state when the backup completes. <code>vm_display_name</code> refers to the name of the virtual machine as shown in the VMware vSphere Client and vSphere Web Client.
<code>INCLUDE.VMTSMVSS vm_display_name OPTions=KEEPSqllog</code>	When you set this option, SQL server logs are not truncated when a data mover node backs up a virtual machine that runs a SQL server. By specifying this parameter, you can manually preserve the SQL Server logs and restore SQL transactions to a specific checkpoint after the virtual machine is restored. When you specify this option, the SQL log is not truncated.

- c. Verify that the Virtual Machine Disks (VMDK) that host the Microsoft SQL Server database are not being excluded from the virtual machine backup operation. Repeat the preceding steps for all data movers that protect virtual machines that are hosting Microsoft SQL Server.
2. On each data mover, for example, `datamover10`, store the guest virtual machine credentials to Data Protection for VMware by running the following command from the IBM Spectrum Protect backup-archive client command line:

```
dsmc set password -type=vmguest vm_guest_display_name
guest_admin_ID guest_admin_pw
```

This command stores the guest virtual machine credentials, which are encrypted on the system that hosts the data mover. The following minimum permissions are required for `guest_admin_ID guest_admin_pw`:

- Backup rights: Users with the `db_backupoperator` database role are granted to run the self-contained application data backup. If the user is a member of

the SQL Server sysadmin fixed server role, the user can back up any databases of Microsoft SQL Server instance. The user can also back up the databases for which the user is the owner and does not have backup rights to a specific database. The guest VM user must have permission to create Volume Shadow Copies and to truncate SQL Server logs.

- **Restore rights:** If the database exists, you can complete the restore operation if you are a member of the dbcreator fixed server role, or if you are the database owner. Users with a Microsoft SQL Server sysadmin fixed server role have permission to restore a database from any backup sets. For other users, the situation depends on whether the database exists.

What to do next

You can verify the virtual machine backup configuration and ensure that the VMDKs are included. In addition, you can view other parameters by issuing the **backup** command with the preview option from the data mover, for example:

```
dsmc backup vm vm_display_name -preview -asnode=datacenter_node
```

You can also use the IBM Spectrum Protect scheduler to schedule periodic backups of your virtual machines. You can also back up the virtual machine that is hosting the Microsoft SQL Server by using the data mover command line:

```
dsmc backup vm vm_display_name -asnode=datacenter_node
```

Verifying that the configuration backs up data that can be restored

Before you can restore individual Microsoft SQL Server databases from a Data Protection for VMware virtual machine backup, you must complete at least one successful virtual machine backup. For the restore operation to work, the backup must contain Microsoft SQL Server database metadata.

Procedure

1. Issue the following data mover **query** command on one of the data mover nodes:

```
dsmc query vm vmname -detail -asnode=datacenter_node
```

where:

- *vmname* specifies the name of the virtual machine
- *datacenter_node* specifies the name of the datacenter node

.

2. In the command output, look for the following details:

Application(s) protected: MS SQL 2012 (database-level recovery)

Ensure that Excluded is not indicated in any Virtual Machine Disk (VMDK) status fields for virtual disks that host Microsoft SQL Server database files. The Excluded status indicates that one or more of the VMDKs that are required to recover a Microsoft SQL Server database are not being protected. For example:

```

Query Virtual Machine for Full VM backup
# Backup Date  Mgmt Class  Size   Type   A/I   Virtual Machine
-----
1 02/20/2016   STANDARD  43.94GB IFFULL A     vm_sql10
12:43:59

Size of this incremental backup: n/a
Number of incremental backups since last full: 0
Amount of extra data: 0
Object fragmentation: 0
Backup is represented by: 328 objects
Application protection type: TSM VSS
Application(s) protected: MS SQL 2012 (database-level recovery)
VMDK[1]Label: Hard Disk 1
VMDK[1]Name: [ess800_dev2] vm_sql10/vm_sql10 .vmdk
VMDK[1]Status: Protected
...
VMDK[6]Label: Hard Disk 6
VMDK[6]Name: [ess800_dev2] vm_sql10/vm_sql10_5.vmdk
VMDK[6]Status: Protected

```

Configuring Data Protection for Microsoft SQL Server

After you configure Data Protection for VMware and verify that you created a virtual machine backup that is suitable for recovery of a single Microsoft SQL Server database, configure Data Protection for Microsoft SQL Server in the guest virtual machine.

Procedure

1. Log on to the virtual machine that hosts the Microsoft SQL Server database.
2. Verify that the following packages are installed:
 - IBM Spectrum Protect recovery agent, recovery agent command-line interface (CLI), and license (from the Data Protection for VMware product package)
 - IBM Spectrum Protect data mover
 - Data Protection for Microsoft SQL Server

You can install the recovery agent, CLI, license, and data mover together by using the Data Protection for VMware installation program. To install the packages together, select the following advanced installation option: **Install a complete data mover for in-guest application protection**. Data Protection for Microsoft SQL Server is installed separately.

3. Configure Data Protection for Microsoft SQL Server by using the IBM Spectrum Protect configuration wizard. When you open the **IBM Spectrum Protect Node Names** page of the wizard, enter the VMware datacenter node name, Microsoft SQL Server node name, and VSS requestor node name. If the datacenter node name field is disabled, the recovery agent is not installed correctly.
4. After Data Protection for Microsoft SQL Server is configured, verify that the **Configuring Recovery Agent** rule status indicates Passed.
5. Log on to a data mover instance and complete the following steps. Do not repeat these steps for all data mover instances.
 - a. Copy the contents of the data mover options file `dsm.opt` to a temporary file named `dsm.setaccess.opt` and make the following changes to the file. Do not make these changes in the `dsm.opt` file.
 - 1) Delete any line that contains an **ASNODE** entry.
 - 2) Set the **NODENAME** option to the VMware datacenter node name. For example:
`NODENAME datacenter10`

Tip: If the `dsm.opt` file does not contain **ASNODE** entries and the **NODENAME** option is set to the correct datacenter node, you can use this file rather than creating the `dsm.setaccess.opt` file.

- b. From the datacenter node that was defined in the **NODENAME** option, issue the **set access** command to grant the VSS requestor node access to the virtual machine backups as shown in the following example.

You must complete this step because the VSS requestor node accesses the virtual machine backups on behalf of Data Protection for Microsoft SQL Server.

If the password for the datacenter node is unknown when you run the **set access** command, you will receive an error message and the IBM Spectrum Protect server administrator must reset the password to issue the command.

Example

The following example shows the required parameters for the **set access** command. The parameters specify the virtual machine name (`vm_sql10`), the VSS requestor node name (`SQL10_VSS`), and the name of the options file that defines the datacenter node name (`dsm.setaccess.opt`).

The example also shows the results of the **query access** command, which shows the backup access authorization for the VSS requestor node.

```
dsmc set access backup -type=VM vm_sql10 SQL10_VSS -optfile=dsm.setaccess.opt
ANS1148I "Set Access" command successfully completed.

dsmc query access
Node name: datacenter10
Type   Node   User   Path
-----
Backup      SQL10_VSS  *      \VMFULL-vm_sql10\*\*
```

ANS1148I "Query Access" command completed successfully

Managing backups

After you configure Data Protection for Microsoft SQL Server, you can schedule backups. You must set up a virtual machine backup schedule and a Microsoft SQL Server log backup before you can start a backup.

Scheduling virtual machine backups

To ensure that your data is protected, schedule virtual machine backups.

Before you begin

By default, the maximum size allowed for a VMDK in a backup operation is 2 TB. However, the maximum is 8 TB. To increase the maximum size, use the `vmmaxvirtualdisks` option. For more information, see `Vmmaxvirtualdisks`.

Procedure

1. Log on to the Data Protection for VMware user interface.
2. Click the **Backup** tab.
3. Click **Create Schedule** to specify a backup schedule name, source (the virtual machines to include in the backup schedule), and other scheduling options.

4. Verify that the source of the schedule includes the virtual machines that are hosting Microsoft SQL Server.
5. Verify that one of the following services is running:
 - If you are using a scheduler that is managed by a Client Acceptor Daemon (CAD), ensure that the CAD service is running on the data mover.
 - If you are using the stand-alone scheduler, ensure that the scheduler service is running.

Scheduling Microsoft SQL Server log backups

After the virtual machine backup schedule is created, you can create the Microsoft SQL Server log backup schedule.

About this task

Backing up SQL server logs provides a more granular level of recovery points. You might find it unnecessary to back up SQL server logs if the frequency of your backups provides you with enough recovery points, and assuming that you did not specify the `INCLUDE.VMTSMVSS vm_display_name OPTions=KEEPSqllog` option for the backup.

Procedure

1. Start the Data Protection for Microsoft SQL Server user interface from the virtual machine that is hosting Microsoft SQL Server.
2. In the navigation pane, expand the Manage node.
3. Under the Manage node, right-click **Scheduling > Scheduling Wizard**.
4. Open the **Scheduling Wizard** to identify the schedule name and time.
5. For the Define the Scheduled Task page, select **Command Line**.
6. Click the icon to select the SQL Server template. Click **Next**.
7. Use the command-line interface and SQL Server template to specify the database log backup, for example:

```
tdpsqlc backup * log /truncate=yes 2>&1
```

Tip: Alternatively, you can schedule Microsoft SQL Server backups by using the IBM Spectrum Protect centralized scheduling service. This service helps you to create a backup schedule for all Microsoft SQL Server instances on a virtual machine.

Verifying backups

After you create a backup, verify that you can query the virtual machine backups and the database backups from the Data Protection for Microsoft SQL Server interface.

About this task

You can recover one or more Microsoft SQL databases based on your recovery point objectives.

Procedure

1. From Microsoft Management (MMC), select a Microsoft SQL Server.
2. Click the **Recover** tab.
3. Select **View > Databases**. A list of Microsoft SQL Server database backups that can be restored is displayed.

Microsoft SQL Server databases that are backed up with Data Protection for VMware are identified with the backup method *vmvss*. Microsoft SQL Server logs that are backed up with Data Protection for Microsoft SQL Server are identified with the backup method *Legacy*.

Managing versions of backups

By using Data Protection for Microsoft SQL Server, you can manage expiration of backups. You can specify the number of snapshot backups to retain and the length of time to retain snapshots.

About this task

To set the retention for Microsoft SQL Server backups, complete the following steps. This procedure assumes that you want to retain backups for 30 days.

Procedure

1. Define the retention parameters in the management class that is used for virtual machine backups. For example:

```
Retain extra versions = 30
Retain only versions = 30
Versions data exists = nolimit
Versions data deleted = nolimit
```

Use the *vmmc* option in the data mover option file to specify the management class that is used for the virtual machine backups.

Scheduled virtual machine backups are associated with the Data Protection for VMware client.

2. Define the retention parameters in the management class that is used for Microsoft SQL Server backups. For example:

```
Retain extra versions = 0
Retain only versions = 1
Versions data exists = nolimit
Versions data deleted = nolimit
```

Specify the management class for the Microsoft SQL Server backups in the *dsm.opt* file that is used by the Data Protection for Microsoft SQL Server agent. See the following **INCLUDE** options:

```
INCLUDE *:\...\*log management_class_name
INCLUDE *:\...\log\...\* management_class_name
```

3. With Data Protection for Microsoft SQL Server running on the virtual machine, issue the **inactivate** command to explicitly deactivate all active log backups for all databases on the Microsoft SQL Server. For example:

```
tdpsqlc inactivate * log=* /OLDER THAN=30
```

Log backups that are created by Data Protection for Microsoft SQL Server must be explicitly deactivated because the full database backups are being completed by Data Protection for VMware. This configuration allows for a one-day grace period after the Microsoft SQL Server log backups are deactivated before the IBM Spectrum Protect server deletes them.

Tip: You can retain log backups on the server only if the full database backup with which they are associated are retained. In the management class, set the **REONLY** value for log backups to match the **RETEXTA** parameter for full database backups.

Verifying that virtual machine backups do not exclude Microsoft SQL Server volumes

The volumes in Virtual machine disks (VMDKs) must contain the Microsoft SQL Server databases that are not excluded from the Data Protection for VMware backup processing.

About this task

The databases cannot be on physical compatibility mode raw device mapping (RDM) disks, independent disks, or on disks that are attached directly to the guest operating system through iSCSI.

Procedure

1. Ensure that any EXCLUDE.VMDISK statements in the Data Protection for VMware data mover that is used to back up the virtual machine do not inadvertently exclude VMDKs that are hosting volumes that contain Microsoft Exchange Server files, file space, database, and mailboxes.

For example:

- vm_sql10.vmdk contains logical volume C:
- vm_sql10.vmdk contains logical volumes E: and F:
- The label for vm_sql10_1.vmdk is *Hard Disk 1*.
- The label for vm_sql10_2.vmdk is *Hard Disk 2*.
- The Microsoft SQL Server database files to be backed up are on the E: and F: drive.

2. Verify that no statements exclude vm_exc10_2.vmdk from the virtual machine backup by ensuring that the data mover does not contain the following or similar statements:

```
EXCLUDE.VMDISK VM_SQL10 "Hard Disk 2"  
EXCLUDE.VMDISK * "Hard Disk 2"
```

Alternatively, if you exclude most hard disks, you must explicitly include the virtual machine disks by using one of the following statements:

```
INCLUDE.VMDISK VM_SQL10 "Hard Disk 2"  
INCLUDE.VMDISK * "Hard Disk 2"
```

Include and exclude statements are processed from bottom to top as they are displayed in the dsm.opt file. To achieve the goal, enter the statements in the correct order.

You can specify the exclusion and inclusion of a virtual machine disk from the command-line interface:

```
dsmc backup vm "VM_SQL10:-vmdisk=Hard Disk 2" -asnode=datacenter10
```

Restoring data

After you back up data, you can recover the data based on a recovery point objective (RPO).

A recovery operation restores a full backup of the Microsoft SQL Server database from the Data Protection for VMware backup.

If you restore the entire virtual machine, all Microsoft SQL Server databases on the virtual machine are restored and recovered to the point of the virtual machine backup. In this scenario, you cannot restore and recover any backups that were created after that point.

Starting the Microsoft iSCSI Initiator Service

The iSCSI protocol is used to mount the disks that are used for a recovery operation. Ensure that the Microsoft iSCSI Initiator Service is started and is set to the automatic startup type on the system where the data is to be restored.

Procedure

1. In the Windows **Services** list, right-click **Microsoft iSCSI Initiator Service**.
2. Click **Properties**.
3. On the **General** tab, set the following options:
 - a. In the **Startup type** list, select **Automatic**.
 - b. Click **Start**, and then click **OK**.

Results

In the **Services** list, **Microsoft iSCSI Initiator Service** shows a status of **Started** and the startup type is **Automatic**.

Restoring database backups by using the graphical user interface

You can recover a full Microsoft SQL Server database backup from a virtual machine backup by using the Data Protection for Microsoft SQL Server graphical user interface.

Procedure

1. To start a full database recovery from a virtual machine, start Microsoft Management (MMC). In the navigation pane, expand the Protect and Recover node and select a Microsoft SQL Server server.
2. On the **Recover** tab, select **Database Restore**. All backups, including all database backups from a virtual machine backup, are listed.
3. Select a full database backup to restore.
4. In the Actions pane, click **Restore**.

Restoring data by using the command-line interface

If you prefer, you can use the command-line interface to start a full Microsoft SQL Server database recovery from a virtual machine.

Procedure

1. Issue the **query** command to find the full and log database backups. The following example finds all backups for the Microsoft SQL Server database called sql_db10.

```
tdpsqlc q tsm sql_db10
IBM Spectrum Protect for Databases:
Data Protection for Microsoft SQL Server
Version 8, Release 1, Level 0.0
...
Querying IBM Spectrum Protect Server for Backups ....
Backup Object Information -----
SQL Server Name ..... SQL10
SQL Database Name ..... sql_db10
Backup Method ..... VMVSS
...
Backup Creation Date / Time ..... 11/14/2014 13:41:18
...
Backup Object Information
-----
SQL Server Name .....
```

```

SQL10 SQL Database Name .....sql_db10
Backup Method ..... Lgcy
...
Backup on Secondary Replica .....
No Backup Object State .....
Active Backup Creation Date / Time ..... 11/14/2014 15:46:07
...
The operation completed successfully. (rc = 0)

```

2. To restore the database without applying transaction logs, issue the database **restore** command as shown in the following example:

```
tdpsqlc restore databaseName /backupMethod=vmvss
```

The following examples show the output of the command when you specify the Microsoft SQL Server database called sql_db10.

```

tdpsqlc restore sql_db10 /backupmethod=vmvss /sqlserver=sql10
/fromsqlserver=sql10 /recovery=no
IBM Spectrum Protect for Databases:
Data Protection for Microsoft SQL Server

Files Completed : 2
Files Failed : 0
Total Bytes : 3146070
Total LanFree Bytes : 0

```

```
The operation completed successfully. (rc = 0)
```

3. After the full database restore operation is completed successfully, issue the command to restore the logs. For example, to restore all logs based on the restored Microsoft SQL database sql_db10, issue the following command.

```
tdpsqlc restore databaseName /backupMethod=vmvss
/recovery=no
```

You can also use the /stopat option to specify a more granular point in time.

```

tdpsqlc restore sql_db10 log=* /sqlserver=sql10
/fromsqlserver=sql10 /recovery=yes

The operation completed successfully. (rc = 0)

```

What to do next

You can restore inactive backups by using the Data Protection for Microsoft SQL Server command-line interface, **TDPSQLC**. When you issue the **restore** command, specify the database object name for the specific backup.

To obtain the database object name, issue the following command:

```
tdpsqlc q tsm dbname full /all
```

After you have the database object name value, specify the database object name on the */OBJECT=objectname* parameter of the **TDPSQLC restore** command, where *objectname* is the database object name. For example:

```
tdpsqlc restore db44 /object=20140311131051 /backupdestination=tsm
/backupmethod=vmvss
```

Restriction: You cannot recover a Microsoft SQL database to an alternative location on the virtual machine.

Restoring Microsoft SQL Server log backups

After the full database is restored successfully, you can restore transaction logs.

Procedure

1. Select a Microsoft SQL Server, and click the **Recover** tab.
2. Verify that the **AutoSelect** option is set to False.
3. Change the **RunRecovery** option to True.
4. Select all the logs that you want to recover.
5. Click **Restore**.

Restoring relocated and deleted mailboxes

The backup solution for restoring databases and log files that are relocated and deleted after a virtual machine backup consists of Data Protection for VMware and Data Protection for Microsoft SQL Server.

Before you begin

Decide where the database and log file data is to be restored.

About this task

When you restore the backups, and complete a full database restore operation from the backup, Data Protection for VMware restores the files to their original location.

If database or log files are relocated during the backup cycle, Data Protection for Microsoft SQL Server restores the files in their original locations.

If any databases or log files were created during the backup cycle, Data Protection for Microsoft SQL Server re-creates the new files. If database or log files were deleted during the backup cycle, those files are not restored.

Procedure

1. Use Data Protection for VMware to back up the virtual machine. Consider the following example. You back up virtual machine `vm_sql10` that includes Microsoft SQL Server database `moose` at 2:00 p.m. The Microsoft SQL Server database consists of the following files at 2:00 p.m:
 - `C:\sql dbs\moose\moose.mdf`
 - `C:\sql dbs\moose\moose_log.ldf`
2. Relocate a database backup to an alternate location. Consider the following example. You want to relocate the database `moose` at 6:00 p.m. to the following location:
 - `E:\sql dbs\moose\moose.mdf`
 - `F:\sql dbs\moose\moose_log.ldf`
3. Add files to the database backup. Consider the following example. You want to add two new files to database `moose` at 7:00 p.m. The database now consists of the following files:
 - `E:\sql dbs\moose\moose.mdf`
 - `F:\sql dbs\moose\moose_log.ldf`
 - `E:\sql dbs\moose\moose2.ndf`
 - `F:\sql dbs\moose\moose2_log.ldf`
4. Use Data Protection for Microsoft SQL Server to complete a log backup. Consider the following example. You start a log backup at 9:00 p.m.
5. Restore the database backup. Consider the following example. You want to restore the entire `moose` database.
 - You restore the full database from the Data Protection for VMware backup with `runrecovery=false`.
 - At 9:00 p.m, you restore the log backup and apply it.

The `moose` database is restored to the following location:

- `C:\sql dbs\moose\moose.mdf`
- `C:\sql dbs\moose\moose_log.ldf`
- `E:\ sql dbs\moose\moose2.ndf`

- F:\ sql dbs\moose\moose2_log.ldf

The full virtual machine restore restores the files to their original location. When you applied the log backup, the files that were added after the relocation are restored.

Sample script for validating full virtual machine backups

Before you back up Microsoft SQL Server logs, verify that you have a valid full virtual machine backup. One procedure for checking for the existence of a full virtual machine backup is to schedule the usage of a script.

This sample script checks for the instance of a full backup and then runs the Microsoft SQL Server log backups if a full virtual machine backup exists. This script can be used with a scheduler service such as the IBM Spectrum Protect scheduler.

```
@echo off
dsmc q vm sql01_SQL -detail -asnode=datacenter01 | find /c
"database-level recovery" > c:\temp.txt
SET /p VAR=<c:\temp.txt

if %VAR% == "1" (
tdpsqlc back * log
) ELSE (
echo "There is no full backup"
set ERRORLEVEL=1
)
```

This script produces the following output:

```

```

You can also use the IBM Spectrum Protect activity log and extended summary table to determine whether virtual machine backups are successful.

IBM Spectrum Protect file space information

You might never need to know the file names or locations for your virtual machine files. However, if the underlying file structure interests you, Data Protection for VMware backups are stored under the node name of the vSphere datacenter (for example, datacenter10).

The following example shows the file space information for the virtual machine that is called vm_sql10.

```
Protect: ORION>q file datacenter10 f=d

Application protection for Active Directory domain controllers

Data Protection for VMware provides back up and restore protection for VMs that host Microsoft Active Directory Domain Controllers in both stand-alone and clustered environments. A clustered environment contains multiple domain controllers that participate in Active Directory.

Non-authoritative restore recovers the Active Directory (or domain controller) to the version taken at the time of the backup. When the recovered Active Directory (or domain controller) is restored, it is updated with information from the other domain controllers through the existing replication process.

Environment requirements

Data Protection for VMware protects Windows VM guests that host Active Directory Domain Controllers. The following guest versions that host Active Directory Domain Controllers are supported:

-  Microsoft Windows Server 2012

Important: To protect Active Directory on a VM guest that is running on Microsoft Windows Server 2012, the vSphere version must be one of the versions listed in Hardware and Software Requirements: Data Protection for VMware V8.1.0 .

- **Windows** A current version of VMware Tools must be installed and must be running on the VM guest at the time that it is backed up. This VM guest must be powered on for Data Protection for VMware to detect Active Directory. Otherwise, Active Directory will not be detected and restore protection will be unavailable.

Restriction:

When a VM guest contains Active Directory or a domain controller, ensure that Windows NT Directory Services (NTDS) is running so that the VSS backups and domain controller discovery can function correctly. You cannot use application protection for domain controllers to complete these tasks:

- Restore backups that are created by Data Protection for VMware.
- Run a file restore of Active Directory objects
- Back up and restore VMs that run Active Directory Lightweight Directory Services (AD LDS)
- Recover expired Active Directory tombstone objects

Tip: To help prevent Active Directory objects from expiring, run backups more frequently than the default tombstone life of 60 days.

- Run a full VM instant restore operation

Chapter 5. Data Protection for VMware commands and options

Data Protection for VMware provides command-line interfaces (CLIs) that you can use as alternatives to the graphical user interfaces (GUIs) and option files that are provided with the product.

The primary CLI for Data Protection for VMware is run from the **dsmc** command. This CLI provides commands and options that you can use to manage virtual machines (VMs) that are in a vSphere environment.

A secondary CLI is available for troubleshooting problems with the Data Protection for VMware vSphere GUI. This CLI is run from the **vmcli** command.

A CLI is also available for the IBM Spectrum Protect recovery agent.

dsmc command-line interface

This is the primary CLI for use with Data Protection for VMware. This CLI must be run on a system that contains the data mover.

Related information:

 Using commands

dsmc commands

The following dsmc commands are available to back up, restore, and configure VMs in your vSphere environment.

For information about the commands, click the following links:

- Backup VM
- Delete Backup
- Expire
- Query VM
- Restore VM
- Set Access
- Set Password
- Set Vmtags

dsmc command options

The following options are available for use with specific dsmc commands. You can use these options to refine the operation of a command.

For information about the options, click the following links:

- Domain.vmfull

vmcli command-line interface

This is a secondary CLI that provides commands and options that you can use to troubleshoot problems with the Data Protection for VMware vSphere GUI.

Linux Windows

About this task

The following commands are available:

“Backup” on page 94

Initiate[®] full and incremental backups of your VMs.

“Restore” on page 96

Restore backups of your VMs.

“Inquire_config” on page 101

View configuration information about the backup database.

“Inquire_detail” on page 103

View configuration information about the backup environment.

“Set_domain” on page 106

Apply changes to the domain settings.

“Set_option” on page 106

Set a parameter in the vmcliprofile.

“Set_password” on page 107

Set the password for the Data Protection for VMware command-line interface node name.

“Get_password_info” on page 110

View the status of guest credentials that are set for the managed data centers.

“Start_guest_scan” on page 111

Scan guest VMs for application information.

Example

Access the CLI in the following directories:

Linux

/opt/tivoli/tsm/tdpvmware/common/scripts

Windows

(64-bit)

C:\Program Files (x86)\Common Files\Tivoli\TDPVMware\VMwarePlugin\scripts

For CLI messages that contain the FMM prefix, message information is available in the IBM Knowledge Center:
FMM, FME, FMV, FMX, FMY: IBM Spectrum Protect Snapshot messages

Backup

Use this **vmcli** command to start IFFULL and IFINCREMENTAL backups of your VMs or VM templates.

Syntax

The **vmcli -f backup** command uses this syntax:

```
vmcli -f backup -t backupType -I backupObjectListFile -d datacenternodename |  
providerDCnodename -o datamovernodename [--name taskName] [--description  
descriptionInFile.txt] [-s tsmserverhostname] [-n vctrclinodename] [-p tsmserverport]
```

Linux

You must issue the **vmcli -f backup** command as **tdpvmware** user, and not as root.

Parameters

Before you issue a **vmcli -f backup** command, issue the **vmcli -f inquire_config** command to verify that your configuration is correct. Also, use the information from the **vmcli -f inquire_config** command output as a guide for setting your backup parameters.

When a backup operation is running, there is no command or method available to stop the backup, including the Ctrl + C command. You must wait for the operation to complete on its own.

The **vmcli -f backup** command requires that the **VE_VCENTER_NODE_NAME** is set correctly in the **vmcli** profile. You cannot overwrite this parameter with a command-line entry.

The data mover system (the vStorage Backup Server where the IBM Spectrum Protect backup-archive client is installed) must not set the **ASNODENAME** option.

-t backupType

Specify the type of backup to complete. You can choose from one of the following types:

IFFULL

Creates an incremental forever full backup of the specified backup objects. When IFFULL is specified, template VMs that are unchanged since the last backup are also included.

IFINCREMENTAL

Creates an incremental forever incremental backup of the specified backup object. This type backs up only the changed data since the last backup. This type is the default.

The backup process does not create a snapshot of template VMs in the same manner that a snapshot is created for regular VMs. As a result, VMware VDDK advanced transports (SAN, HotAdd mode), change block tracking (CBT), and incremental backups are not available.

-I *backupObjectListFile*

Specify the file that contains the list of objects to back up. Each line contains one specification for backup.

In vSphere mode, the *backupObjectListFile* uses the following keyword:

vmname

Specify the name of the VM to back up. You can specify this keyword for each VM you want to back up. For example:

```
vmname:vm1  
vmname:vm2
```

Restrictions:

- Do not specify a VM host name in the *backupObjectListFile*. Data Protection for VMware does not support backing up a VM that is identified by the VM host name.
- When you specify the name of a VM by using the *vmname* keyword in the *backupObjectListFile*, Data Protection for VMware does not differentiate between a colon (:) used as a keyword separator or a colon that is used in the VM name. Therefore, use caution when you specify keyword values. In addition, backing up a VM that contains a comma in its name is not supported.
- Data Protection for VMware support for VM backup operations is limited to VM names and datacenter names that contain English 7-bit ASCII characters only. VM names and datacenter names that use other language characters are not currently supported. More character restrictions are listed in Appendix A, “Troubleshooting,” on page 161.
- A VMware vCenter allows the existence of two VMs with the same name. However, Data Protection for VMware does not support backing up two VMs with the same name. To prevent errors or backup failures, do not have two VMs with the same name in a vCenter.

-d *datacenternodename* | *providervDCnodename* | *organizationvDCnodename*

When the **VE_TSM_MODE** parameter specifies VSPHERE, specify the datacenter node name.

-o *datamovernodename*

Specify the data mover node name. This name is the node name for the data mover that is installed on the vStorage Backup Server. This node performs the data movement.

[--name *taskName*]

Specify the string that identifies the backup task.

[--description *descriptionInFile.txt*]

Specify the name of the text file that contains a description of the backup task.

[-s *tmsserverhostname*]

Specify the host name or IP address of the IBM Spectrum Protect server. If this parameter is not specified, the value in the profile is used.

[-n *vmclinodename*]

Specify the VMCLI node name. This node connects the Data Protection for VMware command-line interface to the IBM Spectrum Protect server and the data mover node. If this parameter is not specified, the value in the profile is used.

[-p tsmserverport]

Specify the port of the IBM Spectrum Protect server.

- If this parameter is not specified in the Data Protection for VMware command-line interface and not specified in the profile, the default port (1500) is used.
- If this parameter is not specified in the Data Protection for VMware command-line interface, but is specified in the profile, the value in the profile is used.

Restore

Use this **vmcli** command to restore backups of your VMs or VM templates.

Syntax

The **vmcli -f restore** command uses this syntax:

```
vmcli -f restore -I restoreObjectListFile -d datacenternodename -o datamovernodename  
[-s tsmserverhostname] [-n vmclinodename] [-p tsmserverport] [-vmrestoretype  
(noninstant | instantrestore | instantaccess | mount | vmcleanup |  
vmfullcleanup | mountcleanup)]
```

Linux

You must issue the **vmcli -f restore** command as **tdpvmware** user, and not as **root**.

Parameters

The **vmcli -f restore** command requires that the **VE_VCENTER_NODE_NAME** is set correctly in the **vmcliprofile**. You cannot overwrite this parameter with a command-line entry.

The data mover system (the vStorage Backup Server where the data mover is installed) must not set the **ASNODENAME** option.

-I restoreObjectListFile

Specify the file that contains the list of VMs to restore. Each line can contain only one VM identifier.

The *restoreObjectListFile* uses the following keyword:

backupid

Each line must begin with the backupid. The syntax is **backupid:your_backup_ID**. Specify the IBM Spectrum Protect Object ID for a specific VM backup. Locate the Object ID by using the **vmcli -f inquire_detail** command. This keyword is required for a restore operation.

The *restoreObjectListFile* uses the following keywords:

vmname

Specify the name of the VM that was originally backed up. If this keyword is not specified, the name **vmname** is used for the restore.

Restriction: Restrictions: When you specify a keyword in the *restoreObjectListFile*, Data Protection for VMware does not differentiate between a colon (:) used as a keyword separator or a colon that is used in a keyword value. Therefore, use caution when you specify keyword

values. In addition, Data Protection for VMware support for VM restore operations is limited to VM names and VMware datacenter names that contain English 7-bit ASCII characters only. VM names and datacenter names that use other language characters are not currently supported. Additional character restrictions are listed in Appendix A, “Troubleshooting,” on page 161.

The restore process does not create a snapshot of template VMs in the same manner that a snapshot is created for regular VMs. As a result, VMware VDDK advanced transports (SAN, HotAdd mode), change block tracking (CBT), and IFINCREMENTAL backups are not available.

vmname

Specify the name that you want the restored VM to be named. This keyword is the second entry. Existing VMs are not overwritten. Therefore, either rename the VM (by using this keyword) or delete the original VM before you issue the **vmcli -f restore** command.

-vmdk=cnfg

Specify that the virtual machine configuration information is restored. The configuration information is always restored when the entire virtual machine is restored. However, by default the configuration is not restored when you restore only selected disks with the **vmdk=disk label** option.

Ordinarily, restoring configuration information to an existing virtual machine fails because the restored configuration information conflicts with the existing virtual machine configuration information. Use this option if the existing configuration file for a virtual machine on the ESX server was deleted, and you want to use the backed up configuration to re-create it.

For example, this entry in *restoreObjectListFile* restores all VMDKs for virtual machine VM1 and keeps the same name:

```
backupid:26801107 vmname:VM1:-vmdk=cnfg
```

vmdk=disk label

Specify the disk label of the virtual disks to include in the restore operation. You specify this option only if you want to partially restore virtual machine data by restoring only specific disks.

For example, this entry in *restoreObjectListFile* restores only the VMDK named Hard Disk 1 as a new virtual machine:

```
backupid:26801107 vmanme:myvm:vmdk=Hard Disk 1:vmname:newname
```

-vmdk=disk label

Specify the disk label of one or more virtual disks to exclude from the restore operation.

For example, this entry in *restoreObjectListFile* restores all VMDKs except the one named Hard Disk 1 as a new virtual machine:

```
backupid:26801107 vmanme:myvm:-vmdk=Hard Disk 4:vmname:newname
```

This entry restores VMDKs for the virtual machine as a new virtual machine without configuration information:

```
backupid:26801107 vmname:oldvmname:-vmdk=cnfg::vmname:newname
```

newdatacentername

When you want the restore destination to be a different datacenter, specify the name of that datacenter with this keyword.

newesxhostname

When you want the restore destination to be a different ESX host, specify the name of that ESX host with this keyword.

newdatastoreurl

Specify the name (not the URL) of the VMware datastore where the VM is to be restored. For example, a datastore name such as `datastore1` is supported. A datastore URL such as `sanfs://vmfs_uuid:4d90pa2d-e9ju45ab-065d-00101a7f1a1d/` is not supported. The datastore can be on a SAN, NAS, iSCSI device, or VMware virtual volume (vVol).

vmtempdatastore

When you want to issue an instant restore operation, specify a temporary datastore on the ESX host. This temporary datastore contains the configuration information and data of the VM that is created during the operation.

vmautostartvm

When a VM is created for instant access (**vmrestoretype instantaccess**), specify whether to automatically start the VM:

YES The VM created for instant access is automatically started.

NO The VM created for instant access is not automatically started. It must be manually started by the user. This value is the default.

vmdiskprovision

Specify the type of provisioning for the VM disk that is restored during an instant restore process (**vmrestoretype instant**):

THICK

The disk is created with thick provisioning. This value is the default.

THIN The disk is created with thin provisioning.

An example *restoreObjectListFile*:

```
# restore of VM "678912345" named "vmName6" to new vmname "vm6newName" to datacenter
"DataCenter2" to ESX esxhostname:esxHost1Name to new datastore "datastore2"
backupid:678912345 vmname:vmName6::vmname:vm6newName newdatacentername:DataCenter2
newesxhostname:esxHost1Name newdatastoreurl:datastore2 vmtempdatastore:datastore2temp
vmdiskprovision:thin
```

Each restore specification must be on a single line. However, for the sake of page formatting, the restore specification in this example is on multiple lines.

The *restoreObjectListFile* uses the following keywords for mount operations:

vmostype

Specify the type of operating system for the backed up VM.

AUTOMATIC

The operating system of the backed up VM is automatically detected. This value is the default.

LINUX

The operating system of the backed up VM is Linux.

WINDOWS

The operating system of the backed up VM is Windows.

exportfs

Exports the mounted file system to the location specified by the value of the **exportparameter**.

YES The mounted file system is exported.

NO The mounted file system is not exported. This value is the default.

exportparameter

The location where the file system is exported.

Linux *IP or machine name*

The IP address or name of the machine that mounts the exported file system.

Windows *user name*

The user name that is allowed to access Windows Share. It is the user's responsibility to be aware of which users and groups have access to their shared files.

mountpoint *mount point path*

Specify the path of the mount point.

Linux The default value is */mnt/vmname*.

Windows The default value is *D:\tsmvemount\vmname*.

mounttag *string*

This string is text that you enter to make the mount point name easier to identify when you search on the local file system. Specify this string as part of the mount path.

Linux The full path to a disk is */mount root/tag/vmname/snapshot date and time/file system number*. For example:
/mnt/ticket-4711/VM1/2013-12-12-12:12:12/disk1

Windows The full path to a disk is *mount root\tag\vmname\snapshot date and time\file system number*. For example:
C:\Users\Admin\ticket-4711\VM1\2013-12-12-12:12:12\disk1

An example *restoreObjectListFile* for mount operations:

Linux

```
backupid:1167852 vmname:VM-Lin4 mounttag:limor exportparameters:9.123.456.78
exportfs:yes vmostype:linux mountpoint:/tmp/tsm-mounts
```

Windows

```
backupid:1167850 vmname:VM-Name3 mounttag:limor exportparameters:WinUser1
exportfs:yes vmostype:windows mountpoint:C:\temp\mnt
```

An example *restoreObjectListFile* is provided here:

```
# restore of VM "678912345" named "vmName6" to new vmname "vm6newName" to datacenter
"DataCenter2" to ESX esxhostname:esxHost1Name to new datastore "datastore2"
backupid:678912345 vmname:vmName6::vmname:vm6newName newdatacentername:DataCenter2
newesxhostname:esxHost1Name newdatastoreurl:datastore2 vmtempdatastore:datastore2temp
vmdiskprovision:thin
```

Each restore specification must be on a single line. However, for the sake of page formatting, the restore specification in this example is on multiple lines.

Tip: To make sure that correct information is specified in the *restoreObjectListFile*, you can issue the **inquire_detail** command. "Inquire_detail" on page 103 provides current configuration information about the backup environment.

- d** *datacenternodename*
Specify the datacenter node name.
- o** *datamovernodename*
Specify the data mover node name. This name is for the backup-archive client node that is installed on the vStorage Backup Server. This node performs the data movement.
- [-s** *tsmserverhostname***]**
Specify the host name or IP address of the IBM Spectrum Protect server. If this parameter is not specified, the value in the profile is used.
- [-n** *vmclinodename***]**
Specify the VMCLI node name. This name is the node that connects the Data Protection for VMware command-line interface to the IBM Spectrum Protect server and the data mover node. If this parameter is not specified, the value in the profile is used.
- [-p** *tsmserverport***]**
Specify the port of the IBM Spectrum Protect server.
 - If this parameter is not specified in the Data Protection for VMware command-line interface and not specified in the profile, the default port (1500) is used.
 - If this parameter is not specified in the Data Protection for VMware command-line interface but is specified in the profile, the value in the profile is used.

Windows **[-vmrestoretype (noninstant | instantrestore | instantaccess | mount | vmcleanup | vmfullcleanup | mountcleanup)]**

In a vSphere environment, specify this option to switch between the following operations: existing restore, instant access, or instant restore. Instant access and instant restore capability is supported only for VMware VMs that are hosted on VMware ESXi 5.1 servers, or later versions. The **vmrestoretype** parameter uses the following keywords:

noninstant

A full VM restore is issued.

instantrestore

The VM is started during the restore process.

instantaccess

The VM might be started but it is not restored.

mount The volumes of the VM defined in the input file are mounted in read-only mode on the data mover. On Linux, all the volumes of the VM are mounted as a Network File System (NFS). On Windows, all the volumes of the VM are mounted as a Common Internet File System (CIFS).

vmcleanup

Components that are no longer needed are cleaned up.

vmfullcleanup

The VM and all its components are cleaned up, regardless of the current state.

mountcleanup

All mounted volumes of the selected VM are cleaned up. This cleanup task includes removing file systems that were exposed for the restore operation and the file shares (CIFS, NFS).

Restriction: When an instant restore or instant access operation that is issued from the data mover (**dsmc**) is followed by an instant restore or instant access operation that is issued from the Data Protection for VMware command-line interface (**vmcli**) or Data Protection for VMware vSphere GUI, the TDPVMwareMount service must be restarted. This situation applies only when the Data Protection for VMware command-line interface accesses the IBM Spectrum Protect server with a node name different from the one used by the data mover. This restriction applies to any order of operations between the two products.

Restart the service by going to **Start > Administrative Tools > Computer Management > Services and Applications > Services**. Look for service name IBM Spectrum Protect recovery agent in the Services window. The path to the Services window might vary depending on your operating system.

The service does not have to be restarted when the VMware datacenter name is specified with the **asnodename** option in the **dsm.opt** file.

Inquire_config

Use this **vmcli** command to view configuration information about the IBM Spectrum Protect nodes associated with Data Protection for VMware.

Syntax

The **vmcli -f inquire_config** command uses this syntax:

```
vmcli -f inquire_config [ ] [-v vcenternodename] [-s tsmserverhostname] [-n vctrclinodename] [-p tsmserverport]
```

Linux

You must issue the **vmcli -f inquire_config** command as **tdpvmware** user, and not as root.

Parameters

[-v vcenternodename]

Depending on the backup environment, specify the virtual node that represents

a vCenter. If this parameter is not specified in the Data Protection for VMware command-line interface, the value in the profile is used.

[-s *tmsserverhostname*]

Specify the host name or IP address of the IBM Spectrum Protect server. If this parameter is not specified, the value in the profile is used.

[-n *vcctrclinodename*]

Specify the VMCLI node name. This name is the node that connects the Data Protection for VMware command-line interface to the IBM Spectrum Protect server and the data mover node. If this parameter is not specified, the value in the profile is used.

[-p *tmsserverport*]

Specify the port of the IBM Spectrum Protect server.

- If this parameter is not specified in the Data Protection for VMware command-line interface and not specified in the profile, the default port (1500) is used.
- If this parameter is not specified in the Data Protection for VMware command-line interface but is specified in the profile, the value in the profile is used.

vSphere environment example

The parameter values in this output for the `vmcli -f inquire_config -s TSM` command show that the Data Protection for VMware command-line interface recognizes the IBM Spectrum Protect node configuration. As a result, the configuration is correct:

```
#TASK 38 inquire_config 20140108213337381

#END
```

The PHASE INQUIRE_DATACENTER_NODES section shows the mapping of the datacenter name (DC1) from vSphere to the IBM Spectrum Protect node name for that datacenter (DPM02_DC1). The datacenter name is case sensitive and must be identical to the name shown in vSphere for the mapping to function.

The PHASE INQUIRE_PROXY_NODES section shows the data mover nodes with proxy access to each data center node. The format for this proxy relationship is shown in pairs:

```
#CHILD targetnode::<datacenter node name>
#PARENT peernode::<data mover node name>
```

Two types of proxy nodes are identified in the PHASE INQUIRE_PROXY_NODES section:

- The CHILD nodetype:DMNODE subsection identifies the data mover nodes and their proxy relationships.
- The CHILD nodetype:MPNODE subsection identifies the mount proxy nodes and their proxy relationships. These nodes represent the proxy system that accesses mounted VM disks through an iSCSI connection. Mount proxy nodes are required for file restore operations.

Inquire_detail

Use this **vmcli** command to view configuration information about the backup environment that is associated with Data Protection for VMware.

Syntax

The **vmcli -f inquire_detail** command uses this syntax:

```
vmcli -f inquire_detail -d datacenternodename | organizationvDCnodename [-a] [-n vmclinodename] [-o datamovernodename] [-p tsmserverport] [-e vmdetail] [-q dmverify] | vmfs | vmsingle [-I inputfile] [-s tsmserverhostname] [-vmrestoretype(instantrestore | instantaccess | alltype | mount)]
```

Linux

You must issue the **vmcli -f inquire_detail** command as **tdpvmware** user, and not as **root**.

Parameters

-d *datacenternodename*

Specify the datacenter node name.

[-a]

Specify to show only the active backups on the IBM Spectrum Protect server.

[-n *vmclinodename*]

Specify the VMCLI node name. This name is the node that connects the Data Protection for VMware command-line interface to the IBM Spectrum Protect server and the data mover node. If this parameter is not specified, the value in the profile is used.

[-o *datamovernodename*]

Specify the data mover node name.

[-p *tmsserverport*]

Specify the port of the IBM Spectrum Protect server.

- If this parameter is not specified in the Data Protection for VMware command-line interface and not specified in the profile, the default port (1500) is used.
- If this parameter is not specified in the Data Protection for VMware command-line interface but is specified in the profile, the value in the profile is used.

[-e vmdetail]

Specify **vmdetail** to show more detailed information about the backed up VMs. For example, the parameter shows information about disks that are attached to the VM.

[-q dmverify | vmfs | vmsingle (-I inputfile)]

dmverify

Specify to query the status of the data mover node identified by the **-o** parameter. You must specify the **-d** and **-o** parameters when you specify **dmverify**.

vmfs Specify to query all VMware Virtual Machine File Systems (VMFS). This parameter shows high-level information about all VMs.

vmsingle

Specify to query individual VMs that are being restored during an instant access or instant restore operation.

-I inputfile

The *inputfile* value defines the full path and name of the input file. This keyword is valid with the **vmsingle** parameter only. Specify the name of the VM to query.

When the **q** option is not specified, the default value is **vmfs**. When the *inputfile* entry contains spaces, enclose the entry with quotation marks. For example:

-I "/my dir/my file"

[-s *tmsserverhostname*]

Specify the host name or IP address of the IBM Spectrum Protect server. If this parameter is not specified, the value in the profile is used.

Windows [-vmrestoretype (instantrestore | instantaccess | alltype | mount)]

Specify this option to query active instant access or restore operations. This option also queries stale or orphan artifacts after a failure. The **vmrestoretype** parameter uses the following keywords:

instantrestore

The query lists VMs that are active in an instant restore operation.

instantaccess

The query lists VMs that are active in an instant access process.

alltype

The query lists VMs that are active in all instant operations.

mount The query lists all active mount operations. For each mount operation, the output lists the mounted snapshots (restore points) that were created during a restore operation for a particular VM.

Restriction: When an instant restore or instant access operation that is issued from the backup-archive client (**dsmc**) is followed by an instant restore or instant access operation that is issued from the Data Protection for VMware command-line interface (**vmcli**) or Data Protection for VMware vSphere GUI, the recovery agent service must be restarted. This situation applies only when the **vmcli** accesses the server with a node name different from the one used by the data mover. This restriction applies to any order of operations between the two products.

Restart the service by going to **Start > Administrative Tools > Computer Management > Services and Applications > Services**. Look for service name IBM Spectrum Protect recovery agent in the Services window. The path to the Services window might vary depending on your operating system.

The service does not have to be restarted when the VMware datacenter name is specified with the **asnodename** option in the **dsm.opt** file.

Example

In this example, the **vmcli -f inquire_detail** command is issued to query the VM named antures for details:

```
vmcli -f inquire_detail -s BORODIN.MAINZ.DE.IBM.COM -p 1505 -n JF_VMCLI_HANNE  
-v CHRISTO.MAINZ.DE.IBM.COM -o JF_MAINZ_DEVELOPMENT_DC_DM -d JF_MAINZ_DEVELOPMENT_DC  
-q vmsingle -I .\inputfile.txt --vmrestoretype (instantrestore | instantaccess)
```

The *inputfile* contains this statement:

vmname:antures

Set_domain

Use this **vmcli** command to apply changes to the domain settings.

Syntax

The **vmcli -f set_domain** command uses this syntax:

```
vmcli -f set_domain -I domainObjectListFile
```

Linux

You must issue the **vmcli -f set_domain** command as **tdpvmware** user, and not as **root**.

The new domain value is stored in the **vmcli** database.

Parameters

-I domain ObjectListFile

The *domainObjectListFile* has the following requirements:

- The file contains one VMware datacenter identifier per line.
- The valid identifier is the datacenter name.

If no domain is configured, the current instance is used to manage all datacenters that are available in the vCenter. When the **vmcli -f set_domain** command is run without **-I** parameter, the domain configuration is deleted.

An example *domainObjectListFile* is provided here:

```
#datacentername:datacenterName
datacentername:datacenterXYZ
datacentername:datacenterA*
datacentername:datacenterB*
...
```

Set_option

Use this **vmcli** command to set a parameter in the **vmcli** profile.

Syntax

The **vmcli -f set_option** command uses this syntax:

```
vmcli -f set_option [-m datacentermapping][ -n datamovernodename] [-p tsmserverport]
[-s tsmserverhostname] [-v vctrnodename]
```

Linux

You must issue the **vmcli -f set_option** command as the **tdpvmware** user, and not as **root**.

Parameters

-m datacentermapping

Specify the name of the data center that is associated with the datacenter node name (**DC_name::DC_nodename**). The **DC_name** value is case sensitive and must match the name of your datacenter.

[-n datamovernodename]

Specify the data mover node name. This name is the node name for the IBM

Spectrum Protect backup-archive client that is installed on the vStorage Backup Server. This node performs the data movement.

[-p *tmsserverport*]

Specify the port of the IBM Spectrum Protect server.

- If this parameter is not specified in the Data Protection for VMware command-line interface and not specified in the profile, the default port (1500) is used.
- If this parameter is not specified in the Data Protection for VMware command-line interface, but is specified in the profile, the value in the profile is used.

[-s *tmsserverhostname*]

Specify the host name or IP address of the IBM Spectrum Protect server. If this parameter is not specified, the value in the profile is used.

[-v *vcinternodename*]

Specify the vCenter node name. This node is the virtual node that represents a vCenter. If this parameter is not specified in the Data Protection for VMware command-line interface, the value in the profile is used.

Example

In this example, the `vmcli -f set_option` command is issued to set the IBM Spectrum Protect server and its port:

```
vmcli -f set_option -s TEMPLE.MYCOMPANY.XYZ.COM -p 1650
```

The following output is displayed:

```
Setting VE_TSM_SERVER_NAME to: TEMPLE.MYCOMPANY.XYZ.COM
Setting VE_TSM_SERVER_PORT to: 1650
#INFO FMM16014I The return code is 0.
```

In this example, the `vmcli -f set_option` command is issued to set the data center mapping:

```
vmcli -f set_option -m DataCenter2::NANO_DATACENTER123
```

The following mapping is set in the profile:

```
VE_DATACENTER_NAME    DataCenter2::NANO_DATACENTER123
```

Set_password

Use this **vmcli** command to set the password for the guest VM.

Syntax

The **vmcli -f set_password** command uses this syntax:

```
vmcli -f set_password [-type VMGuest] -I passwordfile
```

The **-type VMGuest** parameter is required when you set the password for application protection reporting.

Linux

You must issue the **vmcli -f set_password** command as tdpvmware user, and not as root.

Linux

Windows

You must issue the **vmcli -f set_password** command before you run a guest scan operation.

Parameters

-type VMGuest

This parameter identifies that the password applies to a VM. This parameter is required when you set the password for application protection reporting.

-I passwordfile

Specify the following information in this file:

datacentername: *data center in vmcliprofile*

Specify the datacenter that contains the VM guests. The datacenter must be defined in the *vmcliprofile*. The password is applied to that datacenter only. For example:

datacentername:DataCenter1

username: *common VM guest user*

Specify the user name that logs in to the VM guest. For Windows, the *DOMAIN\User* format is allowed for the user name. For example:

username:Domain1\Administrator

password: *password*

Specify the password to log in to the VM guest.

The settings in the *passwordfile* must be specified on the same line.

Examples

Linux

This example creates (or sets) a common VM guest name and password that is associated with DataCenter3. The *vmcliprofile* contains the following **VE_DATACENTER_NAME** settings:

```
VE_DATACENTER_NAME DataCenter1::TSM_DC1
VE_DATACENTER_NAME DataCenter2::TSM_DC2
VE_DATACENTER_NAME DataCenter3::TSM_DC3
VE_DATACENTER_NAME DataCenter4::TSM_DC4
```

The *passwordfile* contains the following settings. The settings in the *passwordfile* must be specified on the same line:

datacentername:DataCenter3 username:tdpvmwareuserY password:tdpvmwareuserYpwd

As a result, the **vmcli -f set_password -type VMGuest -I password.txt** sets the password as shown in the command output:

```

IBM Spectrum Protect Command Line Wrapper for Virtual Environments Version: 8.1.0
Build Date: Mon Dec 12 20:03:31 2016
IBM Spectrum Protect API Version 81000
IBM Spectrum Protect Command Line Wrapper Compile Version 81000
#PARAM OPERATION_TYPE 8
#PHASE_COUNT 3
#PHASE PREPARE
#PARAM BACKUP_TYPE=0
#PARAM TSM_SERVER_NAME=ORION.FINANCE.MYCOMPANY.COM
#PARAM TSM_SERVER_PORT=1500
#PARAM TSMCLI_NODE_NAME=KA3095_TSMCLI_SLUDGE
#PARAM VCENTER_NODE_NAME=
#PARAM DATACENTER_NODE_NAME=
#PARAM OFFLOAD_HOST_NAME=
#PARAM TSM_OPTFILE=/tmp/T4VE_OD3PZ9
#PARAM INPUT_FILE=/opt/tivoli/tsm/tdpvmware/common/scripts/password.txt
#PARAM TRACEFILE=
#PARAM TRACEFLAGS=
#PHASE INITIALIZE
#PHASE SET_PASSWORD
STATUS=success
#END

```

Windows This example creates (or sets) a common VM guest name and password that is associated with DataCenter1. The *vmcliprofile* contains the following **VE_DATACENTER_NAME** settings:

```

VE_DATACENTER_NAME DataCenter1::TSM_DC1
VE_DATACENTER_NAME DataCenter2::TSM_DC2

```

The *passwordfile* contains the following settings. The settings in the *passwordfile* must be specified on the same line:

```
datacentername:DataCenter1 username:Domain1\Administrator password:secret1
```

As a result, the **vmcli -f set_password -type VMGuest -I password.txt** sets the password as shown in the command output:

```

IBM Spectrum Protect Command Line Wrapper for Virtual Environments Version: 8.1.0
Build Date: Mon Dec 12 20:03:31 2016
IBM Spectrum Protect API Version 81000
IBM Spectrum Protect Command Line Wrapper Compile Version 81000
#PARAM OPERATION_TYPE 8
#PHASE_COUNT 3
#PHASE PREPARE
#PARAM BACKUP_TYPE=0
#PARAM TSM_SERVER_NAME=ORION.FINANCE.MYCOMPANY.COM
#PARAM TSM_SERVER_PORT=1500
#PARAM TSMCLI_NODE_NAME=KA3095_TSMCLI_SLUDGE
#PARAM VCENTER_NODE_NAME=
#PARAM DATACENTER_NODE_NAME=
#PARAM OFFLOAD_HOST_NAME=
#PARAM TSM_OPTFILE=/tmp/T4VE_OD3PZ9
#PARAM INPUT_FILE=C:\Program Files\Common Files\Tivoli\TDPVMware\VMwarePlugin\
scripts\password.txt
#PARAM TRACEFILE=
#PARAM TRACEFLAGS=
#PHASE INITIALIZE
#PHASE SET_PASSWORD
STATUS=success
#END

```

Windows When you create the password file by using the **echo** command, make sure that a space does not exist between the password (*password1*) and the greater-than sign (>). For example:

```
echo password1> pwd.txt
```

or

```
echo password1>pwd.txt
```

This example sets the password (*password1*) in file *pwd.txt*:

```
vmcli -f set_password -I pwd.txt
```

Linux

Create the password file (*pwd.txt*) by specifying the **echo** command:

```
echo password1 > pwd.txt
```

This example sets the password (*password1*) in file *pwd.txt*:

```
vmcli -f set_password -I pwd.txt
```

Linux

Windows

This example sets the password in file *pwd.txt* for domain *mydomain* and user *user1*:

```
set -f set_password -I pwd.txt -pwtype domain -domain mydomain -user user1
```

Get_password_info

Use this **vmcli** command to view the status of guest credentials that are set for the managed datacenters.

Syntax

The **vmcli -f get_password_info** command uses this syntax:

```
vmcli -f get_password_info -type VMGuest
```

Linux

You must issue the **vmcli -f get_password_info** command as *tdpvmware* user, and not as *root*.

Parameters

-type VMGuest

This required parameter identifies that the password information is returned for a guest VM. The **username** value (shown in the **#CHILD** statement) of the command output confirms that the password is set for that **username**. The **datacentername** value (shown in the **#PARENT** statement) of the command output identifies the associated datacenter for which the password is set.

Example

Windows

This example shows the status of the managed datacenters that are associated with the VM guest:

```
vmcli -f get_password_info -type VMGuest
#TASK 0 get_password_info 20130129162344670
#RUN 0 20130129162344685
#LANG en_US
#PARAM BACKEND=TSM
#PARAM OPERATION_TYPE 4
#PHASE PREPARE
#PARAM BACKUP_TYPE=0
#PARAM TSM_SERVER_NAME=
#PARAM TSM_SERVER_PORT=
#PARAM TSMCLI_NODE_NAME=
#PARAM VCENTER_NODE_NAME=
#PARAM DATACENTER_NODE_NAME=
```

```
#PARAM OFFLOAD_HOST_NAME=
#PARAM PASSWORD_TYPE=VMGUEST
#PARAM TSM_OPTFILE=C:\Users\ADMINI~1\AppData\Local\Temp\2\T4V3B15.tmp
#PARAM INPUT_FILE=
#PARAM TRACEFILE=
#PARAM TRACEFLAGS=
#CHILD username:<mydomain\myuser>
#PARENT datacentername:DataCenter1
#CHILD username:<mydomain\myuser>
#PARENT datacentername:DataCenter2
#CHILD username:<mydomain\myuser>
#PARENT datacentername:DataCenter3
#PARAM STATUS=success
#END RUN 0 2013012916234513
#END TASK 0
#INFO FMM16014I The return code is 0.
#END
```

Start_guest_scan

Use this **vmcli** command to scan guest VMs for application information.

The **vmcli -f start_guest_scan** command saves VM name, application, and globally unique identifier (GUID) information to the IBM Spectrum Protect server.

You must issue the **vmcli -f set_password** command before you run a guest scan operation.

Syntax

The **vmcli -f start_guest_scan** command uses this syntax:

```
vmcli -f start_guest_scan -dcscan "datacenterNvmcliprofile,...," | ALL_DC -o  
datamovernodename
```

Required Parameters

-dcscan *datacenterNvmcliprofile* | **ALL_DC**

Specify one or more datacenter names that are defined in the *vmcliprofile*.

Repeat datacenter names with a comma. Double quotation marks (") must be specified at the beginning and at the end of the datacenter name list. For example:

```
-dcscan "Local DC,svc"
```

To scan all VM guests in all datacenters, specify the **ALL_DC** parameter.

-o *datamovernodename*

Specify the data mover node that is configured with proxy authority access to the datacenters specified by **-dcscan**.

During a **vmcli -f start_guest_scan** operation, Data Protection for VMware copies files to a temporary subdirectory in the remote directory (\$TEMP_REMOTE\TSMSCAN) on the guest VM. The remote directory must be unlocked and not used by another application. Data Protection for VMware determines the location of the remote directory in the following order:

1. If the **TEMP** environment variable is set, **TEMP_REMOTE** is set as the **TEMP** environment variable.
2. If the **TEMP** environment variable is not set, **TEMP_REMOTE** is set as C:\TEMP.

Example

Windows In this example, the *vmcli* profile contains the following **VE_DATACENTER_NAME** settings:

```
VE_DATACENTER_NAME: DataCenter1:TSM_DC1
VE_DATACENTER_NAME: DataCenter2:TSM_DC2
```

The data mover node, VC1_DC1_DM1, is configured with proxy authority access to DataCenter1 and DataCenter2.

Windows The following command is issued to scan all guest VMs in DataCenter1 and DataCenter2:

```
vmcli -f start_guest_scan -dcscan "DataCenter1,DataCenter2" -o VC1_DC1_DM1
```

The following application information is displayed:

```
IBM Spectrum Protect Command Line Wrapper for Virtual Environments
Version: 8.1.0
Build Date: Mon Dec 12 20:03:31 2016

```

```
#PARENT peernode:J_VC1_DC1_DM1
#CHILD 11address:50408
#PARENT peernode:VC1_DC1_DM1
#PHASE READ_DATACENTER_GUEST_PASSWORD
#PHASE SCANGUEST
#PARAM STATUS=success
#CHILD scanid: DataCenter2::VC1_DC2.1358316054281
#PARENT datacentername:DataCenter2::VC1_DC2
#INFO FMM16014I The return code is 0.
#END
```

Windows The #PARAM STATUS=success message (in the #PHASE SCANGUEST section) confirms only that the datacenter was successfully submitted for processing by the data mover. The actual scan status for each VM is available only after the data mover completed processing that VM. To view the scan status of an individual VM, see the value in the Scan Status column of the Data Protection for VMware vSphere GUI Application Configuration Status report. To view the overall status of the scan operation, see the **Overall Scan Status** value in the Data Protection for VMware vSphere GUI Report window.

Important: If you receive an error after you run the `vmcli -f start_guest_scan` command, view the contents of the `dsmerror.log` file for more information. The `dsmerror.log` file is on the system that is associated with the data mover node defined by the **OFFLOAD_HOST_NAME** parameter in the command output. By default, error log files are in the installation directory:
C:\Program Files\Tivoli\TSM\baclient

Profile parameters

Use the Data Protection for VMware command-line interface profile to configure settings for backup and restore tasks in your environment.

The profile is located in this directory on the system where the Data Protection for VMware vSphere GUI is installed:

Linux /home/tdpvmware/tdpvmware/config

Windows C:\Program Files\Common Files\Tivoli\TDPVMware\VMwarePlugin\scripts

DERBY_HOME <path to Derby database>

This parameter specifies the location of the Derby database that is used by the Data Protection for VMware command-line interface.

Example:

Linux

DERBY_HOME /home/tdpvmware/tdpvmware

Windows

DERBY_HOME C:\Program Files\Common Files\Tivoli\TDPVMware\VMwarePlugin\derby

VE_DATACENTER_NAME <data_center_name::DATA_CENTER_NODE_NAME>

Specify the VMware datacenter (datacenter name) with a value that is case-sensitive and that matches the datacenter name used in the vCenter.

Specify the virtual node (DATA_CENTER_NODE_NAME) that maps to the datacenter.

If the vCenter manages several datacenters, you can specify this parameter for each datacenter. However, the Data Protection for VMware vSphere GUI does not support datacenters with the same name in the vCenter.

Example:

```
VE_DATACENTER_NAME DataCenter1::Fin_Datacenter1
VE_DATACENTER_NAME DataCenter2::Fin_Datacenter2
```

This parameter is valid only in a vSphere environment.

Restriction: Data Protection for VMware support for VM backup and restore operations is limited to VM names and datacenter names that contain English 7-bit ASCII characters only. VM names and datacenter names that use other language characters are not currently supported. Additional character restrictions are listed in Appendix A, “Troubleshooting,” on page 161.

After a datacenter name is created and associated with the IBM Spectrum Protect node, be aware of these restrictions:

- Do not change the datacenter name in the vCenter without also creating the IBM Spectrum Protect node name and associating it with the new datacenter name.
- Do not change the datacenter name and the profile without also changing the IBM Spectrum Protect node name.
- Do not create a datacenter mapping value in the profile with a previously used IBM Spectrum Protect node.

When the datacenter name in the vCenter has changed, you must complete these steps before attempting any operations:

1. Register a datacenter node for the new datacenter name.
2. Grant proxy authority to the new datacenter node to perform tasks on behalf of the vCenter node.
3. Update the profile with the new datacenter mapping.
4. Grant proxy authority to the data mover nodes to perform tasks on behalf of the new datacenter node.
5. Remove any entry from the profile that used the previous datacenter node or vCenter node name.

VE_TRACE_FILE *<path and name of trace file>*

Specify the full path and name of the file to be used to contain trace information. Activate tracing only when instructed to do so by IBM Software Support.

VE_TRACE_FLAGS *<flags>*

Specify one or more trace flags. Multiple trace flags are separated with a space. Activate tracing only when instructed to do so by IBM Software Support.

VE_TSMCLI_NODE_NAME *<VMCLI node>*

Specify the VMCLI node. This node connects the Data Protection for VMware command-line interface to the IBM Spectrum Protect server and data mover node.

Example:

```
VE_TSMCLI_NODE_NAME VC1_VCLI1
```

Restriction: The VMCLI node does not support the SSL protocol or LDAP authentication when communicating with the IBM Spectrum Protect server.

VE_TSM_SERVER_NAME <*server host name or IP address*>

Specify the host name or IP address of the IBM Spectrum Protect server used for backup operations. There is no default value.

Example:

```
VE_TSM_SERVER_NAME tmsserver.xyz.yourcompany.com
```

VE_TSM_SERVER_PORT <*port name*>

Specify the port name to use for the IBM Spectrum Protect server. The default value is 1500.

Example:

```
VE_TSM_SERVER_PORT 1500
```

VE_VCENTER_NODE_NAME <*vCenter node*>

Specify the vCenter node. This virtual node represents a vCenter.

Example:

```
VE_VCENTER_NODE_NAME VC1
```

VMCLI_DB_BACKUP *NO AT[day[, day[,.....]]] time TO backup location*

This parameter controls the backup of the Derby database containing the metadata of the Data Protection for VMware command-line interface. Specify one of these values:

NO This option does not perform a backup of the Derby database.

AT [*day[, day[,....]]] time_in _24_H*

This option creates a backup on the specified day or days at the specified time, which is triggered by the scheduler. If the day value is not specified, a daily backup is created. Specify one of these values: MON, TUE, WED, THU, FRI, SAT, SUN.

You can separate these values by a comma or a blank space.

AFTER_BACKUP

This option creates a backup of the Derby database after each Data Protection for VMware backup operation.

The default location for the backups of the Derby database is *install_dir/derby_backups*. Specify *TO path* to set a custom path.

Example:

```
VMCLI_DB_BACKUP AT 00:00
```

VMCLI_DB_BACKUP_VERSIONS <*number*>

Specify the maximum number of backup generations that are maintained for the Derby database, before the oldest version is overwritten by a new version. This parameter applies only to the backups of the Derby database containing metadata. It has no effect on the number of backup generations that are maintained for the backups of a vSphere environment. The default value is 3.

Example:

```
VMCLI_DB_BACKUP_VERSIONS 3
```

VMCLI_DB_HOST *<Derby database local host name>*

Specify the local host name of the Derby database. You can specify the host name (localhost) or the IP address (0.0.0.0).

Example:

```
VMCLI_DB_HOST localhost
```

VMCLI_DB_NAME *<Derby database name>*

Specify the name of the Derby database. The default value is VMCLIDB.

Example:

```
VMCLI_DB_NAME VMCLIDB
```

VMCLI_DB_PORT *<Derby database port number>*

Specify the Derby database port on which the Data Protection for VMware command-line interface starts and connects to the database. The default value is 1527. If this port is in use by another application, specify a different port.

Example:

```
VMCLI_DB_PORT 1527
```

VMCLI_GRACE_PERIOD *<seconds>*

When a backup is no longer available on the IBM Spectrum Protect server, the backup is marked for deletion as defined by a deletion date. However, before the backup is deleted, a grace period exists. Use this parameter to specify the grace period (length of time) between the deletion date and the date the backup is deleted from the Derby database. The default value is 2592000 seconds (30 days).

Example:

```
VMCLI_GRACE_PERIOD 1296000
```

VMCLI_LOG_DIR *<path of log file>*

Specify the absolute location or the relative location of the installation directory where the Data Protection for VMware command-line interface writes its log files. The default value is logs. If the default value logs is used, then all logs (and trace information) are written to these locations:.

```
Linux /opt/tivoli/tsm/tdpvmware/common/logs
```

```
Windows C:\Program Files\Common Files\Tivoli\TDPVMware\logs
```

Example:

```
VMCLI_LOG_DIR logs
```

VMCLI_RECON_INTERVAL_TSM *<seconds>*

This parameter specifies the interval between *reconciliation* operations on the Derby database with Data Protection for VMware. Reconciliation operations delete metadata for backups that are no longer available. This action ensures

the Derby database remains synchronized with the Data Protection for VMware repository. The default value is 1200 seconds.

Example:

```
VMCLI_RECON_INTERVAL_TSM 1200
```

VMCLI_RESTORE_TASK_EXPIRATION_TIME <seconds>

Specify the time that a Data Protection for VMware command-line interface restore task is stored in the Derby database. The default value is 2592000 seconds (30 days).

Example:

```
VMCLI_RESTORE_TASK_EXPIRATION_TIME 2592000
```

VMCLI_SCHEDULER_INTERVAL <seconds>

Specify the interval, in seconds, between scheduler checks for scheduled tasks due to begin. The default value is 1 second.

Example:

```
VMCLI_SCHEDULER_INTERVAL 60
```

VMCLI_TASK_EXPIRATION_TIME <seconds>

This parameter specifies the time that a task is stored in the Data Protection for VMware command-line interface Derby database. This parameter applies only to the **inquire_config** command. The default value is 864000 seconds (10 days).

Example:

```
VMCLI_TASK_EXPIRATION_TIME 864000
```

VMCLI_TRACE YES|NO

Specify that tracing files are activated. Activate tracing only when instructed to do so by IBM Software Support.

Example Linux profile in a vSphere environment

Linux

```
VE_TSM_SERVER_NAME      9.11.90.28
VE_TSM_SERVER_PORT      1500
VE_TSMCLI_NODE_NAME     my_vc1_vcli1
VE_VCENTER_NODE_NAME    my_vc1
VE_DATACENTER_NAME      Clovis Lab::MY_VC1_DC1
VMCLI_TASK_EXPIRATION_TIME 864000 # in seconds, defaults to 864000s = 10 days
VMCLI_RESTORE_TASK_EXPIRATION_TIME 2592000 # in seconds, defaults to 2592000s = 30 days
VMCLI_GRACE_PERIOD      2592000 # in seconds, defaults to 2592000s = 30 days
VMCLI_SCHEDULER_INTERVAL 60 # in seconds, defaults to 1s
VMCLI_DB_HOST           localhost
VMCLI_DB_PORT           1527
VMCLI_CACHE_EXPIRATION_TIME 600 # in seconds, defaults to 600s = 10 min
VMCLI_DB_NAME           VMCLIDB
VMCLI_RECON_INTERVAL_FCM 600 # setting in seconds default 600s = 10 min

Recovery Agent command-line interface

Use the Recovery Agent command-line interface (CLI) to access Data Protection for VMware functions.

The Recovery Agent CLI can be viewed as a command-line API to the IBM Spectrum Protect recovery agent. Changes completed with the Recovery Agent CLI to the recovery agent take effect immediately.

You can use the Recovery Agent CLI to manage only one system running the recovery agent.

Starting the Recovery Agent command-line interface

Start the Recovery Agent CLI from the Windows Start menu.

About this task

To start the Recovery Agent CLI, complete the following steps:

Procedure

1. From the Windows Start menu, click **Programs > IBM Spectrum Protect > Data Protection for VMware > IBM Spectrum Protect recovery agent**.
2. In the command prompt window, enter one of the following commands:
 - To run the Recovery Agent CLI:
RecoveryAgentShell.exe -c *command type tag parameter*
 - Windows To display the help for the Recovery Agent CLI:
RecoveryAgentShell.exe -h

Recovery Agent command-line interface overview

When you use the commands, some parameters are not required. See the following sections for details regarding required parameters.

For the parameters that are not required and not entered, default values are used. Parameters with spaces must be enclosed in quotation marks. For example, if you want to use the *Accounting, Daily* parameter, type "Accounting, Daily".

To read a syntax diagram for entering a command, follow the path of the line. Read from left to right, and from top to bottom, and use the following guidelines:

- The >>- character sequence indicates the beginning of a syntax diagram.
- The --> character sequence at the end of a line indicates that the syntax diagram continues on the next line.
- The >-- character sequence at the beginning of a line indicates that a syntax diagram continues from the previous line.
- The -->< character sequence indicates the end of a syntax diagram.

Symbols

Enter these symbols exactly as they are displayed in the syntax diagram:

*	Asterisk
{ }	Braces
:	Colon
,	Comma
=	Equal sign
-	Hyphen
()	Parentheses
.	Period
	Space
"	Quotation mark
'	Single quotation mark

Variables

Italicized lowercase items such as *<variable_name>* indicate variables. In this example, you can specify a *<variable_name>* when you enter the **cmd_name** command.

►►--cmd_name--<variable_name>—————►►

Required choices

When two or more items are in a stack and one of them is on the line, you must specify one item. In the following example, you must choose either *A*, *B*, or *C*:

Optional choices

When an item is below the line, that item is optional. In the following example, you can select either *A* or nothing at all:

When two or more items are in a stack below the line, all items are optional. In the following example, you can choose either *A*, *B*, *C*, or nothing.

Mount command

Use the **mount** command to complete various recovery agent tasks.

The Recovery Agent CLI can be used to mount (**mount add**) and unmount (**mount del**) volumes and disks, and to view a list of mounted volumes (**mount view**). To use the **mount** command, the IBM Spectrum Protect recovery agent must be running. Use the **set_connection** command to connect a RecoveryAgentShell.exe to the mount application.

Snapshots are mounted or unmounted on the system where the recovery agent is running.

The **mount** command is supported in command mode. The following command types are available. The appropriate tags and parameters are listed alongside each command type.

add Use this command type to mount a disk or volume of a snapshot to the system where the recovery agent is running. The following list identifies the tags and parameters for the **add** type:

- **-target** - This tag is required.

Use this tag to specify the following targets:

- **Windows** Virtual volume - only for a partition mount
- **Windows** Reparse point - only for a partition mount
- **Windows** **Linux** iSCSI target

The following examples use the **-target** tag:

- **Windows** In the following example *V:* is the virtual volume mount target:
-target "V:"
- In the following example a reparse point volume mount target is specified:

```
-target "C:\SNOWBIRD@FASTBACK\SnowbirdK\Snowbird\K\\"
```

- Windows Linux In the following example an iSCSI target is specified:

```
-target "ISCSI: target=<target_name> initiator=<initiator_name>"
```

When you use the recovery agent in an iSCSI network, and the Recovery Agent does not use a data mover, go to the C:\ProgramData\Tivoli\TSM\RecoveryAgent\mount\RecoveryAgent.conf file and specify the [IMOUNT] tag and **Target IP** parameter:

```
[IMOUNT config]
Target IP=<IP address of the network card on the system
that exposes the iSCSI targets.>
```

For example:

```
[General config]
param1
param2
...
[IMount config]
Target IP=9.11.153.39
```

After you add or change the Target IP parameter, restart the Recovery Agent GUI or Recovery Agent CLI.

- **-rep** - This tag is required.

Use it to specify the IBM Spectrum Protect server that is storing the VMware snapshots, and the IBM Spectrum Protect node that has access to the VMware backups. For example:

```
tsm: ip=<ip/host_name> port=<port_number>
node=<node_name> pass=<node_password>
```

You can also specify the as_node and from_node options. If the password field is empty, the recovery agent attempts to use the password for the stored node.

- **-type** - This tag is required. Use it to specify that you want to mount a disk or a partition. The options are:
 - type disk
 - type partition
- **-VMname** - This tag is required. Use it to specify the VMware machine name that is source of the snapshot. The specified value is case-sensitive.
- **-disk** - This tag is required. Use it to specify the disk number of the source backed up VMware machine to be mounted.
- **-date** - This tag is required. Use it to specify the date of the snapshot that you want to mount. The date format is yyyy-Mmm-dd hh:mm:ss. For example:
 - date "2013-Apr-12 22:42:52 AM"

To view the active (or latest) snapshot, specify last snapshot.

- **-PartitionNumber** - This tag is optional. If the -type is partition, enter the partition number to mount.
- **-ro|-fw** - Use this tag to specify whether the mounted volume is read-only (**-ro**) or fake-write (**-fw**).

- **-disk** - This tag is required. Use it to specify the disk number of the source backed up VMware machine to be mounted.
- **-ExpireProtect** - This tag is optional. During a mount operation, the snapshot on the IBM Spectrum Protect server is locked to prevent it from expiring during the operation. Expiration might occur because another snapshot is added to the mounted snapshot sequence. This value specifies whether to disable expiration protection during the mount operation. You can specify one of the following values:

Yes Specify Yes to protect the snapshot from expiration. This value is the default. The snapshot on the server is locked and the snapshot is protected from expiration during the mount operation.

No Specify No to disable expiration protection. The snapshot on the server is not locked and the snapshot is not protected from expiration during the mount operation. As a result, the snapshot might expire during the mount operation. This expiration can produce unexpected results and negatively impact the mount point. For example, the mount point can become unusable or contain errors. However, expiration does not affect the current active copy. The active copy cannot expire during an operation.

When the snapshot is on a target replication server, the snapshot cannot be locked because it is in read-only mode. A lock attempt by the server causes the mount operation to fail. To avoid the lock attempt and prevent such a failure, disable expiration protection by specifying No.

The following example shows how to specify the **add** type to mount a disk:

```
mount add -rep "tsm: ip=10.10.10.01 port=1500 node=tsm-ba pass=password"
-target "iscsi: target=test1 initiator=initiator_name" -type disk
-vmname VM-03ENT -disk 1 -date "2014-Jan-21 10:46:57 AM -ExpireProtect=Yes"
```

In this example, a snapshot of VMware named VM-03ent is located on a server with IP 10.10.10.01. Disk number 1 of this snapshot is mounted to the system where the recovery agent is running.

del Use this command type to dismount one or all mounted backups from the system where the recovery agent is running. The following list identifies the tags and parameters for the **del** type:

- **-target** - This tag is required. Use this tag to specify the target for dismounting. The target for dismounting can be a virtual volume, repare point, or iSCSI target created using the **mount** command. Use the *everything* variable to dismount all mounted backups.
- **-force** - Use this tag to force an unmount. The default option is not to force an unmount if the target is currently in use.

For example, to force an unmount of a snapshot that is currently mounted at the directory, *c:\gever*, use the following command:

```
mount del -target "c:\gever" -force
```

To dismount a snapshot currently mounted as volume *V*;, use the following command:

```
mount del -target V:
```

To dismount a snapshot currently mounted as an iSCSI target, use the following command:

```
mount del -target "ISCSI:<target_name>"
```

dump Use this command type to get a list of all the available backups to mount.

- **-rep** - This tag is required. Use this tag to specify the IBM Spectrum Protect server storing the VMware snapshots, and to specify the IBM Spectrum Protect node that has access to the VMware backups. For example:

```
tsm: ip=<IP/host name> port=<PortNumber>  
node=<NodeName> pass=<NodePassword>
```
- **-file** - This tag is optional. Use this tag to identify a file name to store the dump text. If this tag is not specified, the dump text is printed only to stdout.

The following examples show how to specify the dump type:

- List all the available backed up VMs.

```
mount dump -type TSM -for TSMVE -rep P -request  
ListVM [-file <FileNameAndPath>]
```
- List all the available disk snapshots of a VMware.

```
mount dump -type TSM -for TSMVE -rep P -request  
ListSnapshots -VMName P [-file <FileNameAndPath>]
```
- List all the available partitions of a disk snapshot.

```
mount dump -type TSM -for TSMVE -rep P -request  
ListPartitions -VMName P -disk P -date P [-file <FileNameAndPath>]
```

remove

Use this type to remove the connection to the IBM Spectrum Protect server. A connection cannot be removed when it is in use, such as when mounted volumes exist. There is only one tag for the **remove** type:

- **-rep** - This tag is required. Use this tag to specify the IBM Spectrum Protect server connection to be removed.

In the following example, remove the connection to a server (10.10.10.01) using node NodeName:

```
mount remove -rep "tsm: NodeName@ip"
```

view Use this type to view a list of all mounted snapshots. This type has no tags. The following example uses the **view** type:

```
mount view
```

Mounting a disk

The following syntax diagram is for the command for mounting a disk:

```
►--target—"ISCSI:—target—==—target_name—initiator—==—initiator_name"—————▶
```

Mounting a partition

The following syntax diagram is for the command for mounting a partition:

```

▶▶ RecoveryAgentShell.exe -c mount add --rep "tsm:ip==IP"
                                     └─ host_name ─┘
▶ port == portNumber --node == nodeName
                                     └─ as_node == nodeName ─┘
▶ pass == NodePassword --vmname vmname --disk disk_number
                                               └─ vmdk ─┘
▶ date date_format --type partition --PartitionNumber partNum
▶ --target volume_letter
          └─ "ISCSI:target == target name initiator == initiator name" ─▶▶

```

Set_connection command

The **set_connection** command sets the Recovery Agent CLI to work with a specified recovery agent.

Use the following format for the **set_connection** command:

```
RecoveryAgentShell.exe -c set_connection Command_Tag <hostname or IP address>
```

The following tag can be used with the **set_connection** command:

mount_computer - Use to set the recovery agent connection.

In the following example, the Recovery Agent CLI is set to work with recovery agent on the *ComputerName* host.

```
set_connection mount_computer ComputerName
```

Help command

The **help** command displays the help for all of the supported Recovery Agent CLI commands.

Use the following format for the **help** command:

RecoveryAgentShell.exe -h

Recovery Agent command-line interface return codes

Return codes help identify the results of Recovery Agent CLI operations.

Use these return codes to check the status of your Recovery Agent CLI operations.

Table 9. Recovery Agent CLI return codes

Return Code	Value	Description
0	FBC_MSG_MOUNT_SUCCESS	Command submitted successfully to Data Protection for VMware mount.
0	FBC_MSG_DISMOUNT_SUCCESS	Successfully dismounted a snapshot.
0	FBC_MSG_VIEW_SUCCESS	View operation successful.
0	FBC_MSG_DUMP_SUCCESS	Dump operation successful.

Table 9. Recovery Agent CLI return codes (continued)

Return Code	Value	Description
0	FBC_MSG_REMOVE_SUCCESS	Remove operation successful.
1	FBC_MSG_MOUNT_FAIL	Mount failed (See the mount logs for details).
2	FBC_MSG_MOUNT_DRIVER_ERROR	Mount driver error.
3	FBC_MSG_VOLUME_LETTER_BUSY	Volume letter or reparse point is in use.
4	FBC_MSG_MOUNT_WRONG_PARAMETERS	Incorrect parameters assigned to the mount command (See the mount logs for details).
5	FBC_MSG_MOUNT_ALREADY_MOUNTED	Job is already mounted on the requested target.
6	FBC_MSG_MOUNT_WRONG_PERMISSIONS	Insufficient permissions.
7	FBC_MSG_MOUNT_NETWORK_DRIVE	Cannot mount on network mapped volume.
8	FBC_MSG_MOUNT_LOCKED_BY_SERVER	Snapshot locked by the server.
9	FBC_MSG_CAN_NOT_CHANGE_REPOSITORY	Cannot change repository.
11	FBC_MSG_DISMOUNT_FAIL	Failed to dismount a mounted snapshot.
13	FBC_MSG_VIEW_FAIL	Retrieving list of virtual volumes failed.
15	FBC_MSG_DUMP_FAIL	Dump command list creation failed.
16	FBC_MSG_CONNECTION_FAILED	Disconnected from Data Protection for VMware mount.
17	FBC_MSG_CONNECTION_TIMEOUT	Operation timed out.
18	FBC_MSG_MOUNT_FAILED_TO_FIND_REPOSITORY	Failed to find a valid repository with snapshots.
19	FBC_MSG_MOUNT_JOB_NOT_FOUND	Failed to find the requested snapshot.
20	FBC_MSG_MOUNT_JOB_FOLDER_NOT_FOUND	Failed to find the requested snapshot data.
22	FBC_MSG_CAN_NOT_REMOVE_REPOSITORY	Cannot remove selected repository.
23	FBC_MSG_REPOSITORY_GOT_MOUNTS	Repository has mounted snapshots.
38	FBC_MSG_MOUNT_NOT_WRITABLE_VOLUME	The mount volume is not writable
39	FBC_MSG_NO_TSM_REPOSITORY	No IBM Spectrum Protect repository was located.
40	FBC_MSG_MOUNT_NOT_ALLOWED_AS_READONLY	Mounting the iSCSI target as read only is not allowed.
41	FBC_MSG_RESOURCE_BUSY_IN_TAPE_MODE	Data Protection for VMware is running in tape mode - media is busy.

Table 9. Recovery Agent CLI return codes (continued)

Return Code	Value	Description
42	FBC_MSG_DISK_TYPE_NOT_SUPPORTED	Partition operation not supported for this type of disk.
43	FBC_MSG_MOUNT_INITIALIZING	The operation failed, Data Protection for VMware mount is currently initializing. Try again later.
44	FBC_MSG_CANNOT_LOCK_SNAPSHOT	The snapshot cannot be protected against expiration during this operation. For more information, see the documentation.

Chapter 6. Backing up VMware data

Use Data Protection for VMware to store backup versions of your VMware virtual machines on the IBM Spectrum Protect server.

Restriction: The following restrictions apply to VMware VMDKs that are involved in a backup operation:

- For incremental forever backup mode, each individual VMDK involved in a backup operation cannot exceed 8 TB. If a VMDK exceeds 8 TB, the backup operation fails. To increase the size of the VMDK to be larger than the default 2 TB, specify the maximum size with the `vmmaxvirtualdisks` option. For more information, see `Vmmaxvirtualdisks`.
- For periodic full backup mode, each individual VMDK involved in a backup operation cannot exceed 2 TB. If a VMDK exceeds 2 TB, the backup operation fails.

To prevent a failure during either backup mode, you can skip processing the VMDK by specifying `vmskipmaxvirtualdisks yes` in the data mover options file. For more information, see `Vmskipmaxvirtualdisks`.

Backing up virtual machine data to IBM Spectrum Protect

Create a run now backup task or scheduled backup task for your virtual machine data. The data is stored on IBM Spectrum Protect server storage.

Before you begin

Before you back up virtual machines that are hosting Microsoft Exchange Server databases, mount the Exchange databases.

About this task

- During backup processing, Data Protection for VMware bypasses a guest Exchange Server database that is dismounted, corrupted, or in a Suspend state in a Database Availability Group (DAG). Databases in these states are excluded from virtual machine backups and are not available to restore.
- A run now backup task can be issued immediately or at a later time. A scheduled backup task is issued by the IBM Spectrum Protect server at the scheduled time. It cannot be issued immediately.

Procedure

Back up your virtual machine by following these steps:

1. Start the Data Protection for VMware vSphere GUI with either of these methods:
 - Click the Data Protection for VMware vSphere GUI icon in the Solutions and Applications window of the vSphere Client.
 - Open a web browser, and go to the GUI web server. For example:
`https://guihost.mycompany.com:9081/TsmVMwareUI/`

Log on with the vCenter user ID and password.

2. In the Getting Started window, click **Define a backup task** to open the Schedule a Backup wizard. Review the welcome information and click **Next** to create the backup task.
3. Click **Next** to begin the wizard. Follow the instructions in each page of the wizard and click **Next** to continue to the next page.
4. In the General page, specify a name for the backup schedule you are creating in the **Backup schedule name** field. The schedule name must not contain any spaces. You can optionally add a description for the schedule.
5. In the Source page, select a VMware datacenter and expand the branches in the navigation tree. Select the virtual machines, virtual machine templates, host cluster, or host that you want to back up.
If you want to include newly added or discovered virtual machines to future runs of this task, check **Newly added virtual machines are included in this backup task**. This check box has the following characteristics:
 - If you select all of the virtual machines on one ESX host and you select this option, the schedule backs up that ESX host. That is, all virtual machines on that host, present and future, are backed up.
 - If you select one or more virtual machines on an ESX host (but not all), and you select this option, then the schedule includes only the selected virtual machines and any future virtual machines that are added to the host. The remaining virtual machines on that host that are not selected are excluded.
 - If you rename a virtual machine, and you select this option, the schedule backs up the renamed virtual machine.
 - If you do not select this option, only virtual machines can be selected for backup. Host clusters and hosts cannot be selected.
 - To easily exclude virtual machines that follow a naming convention from being added, expand the **Advanced VM filter option**. Enter a text pattern that identifies the virtual machines to exclude. Specify an asterisk (*) to match any character. Specify a question mark (?) to match a single character. For example:
`vm=prod1*,*testvm,*dept*, dept4?prod`

Click **Apply filter** to disable selection for these virtual machines. If you enter a virtual machine name without wildcard characters, and the virtual machine is known in the source tree, then this virtual machine is removed from the filter display. However, it is shown in the tree as not checked.
6. In the Destination page, select the data mover node that runs the backup operation. Select a data mover node that is not currently used in a backup or restore operation.
7. In the Schedule page, specify when to run the backup by clicking **Run the backup now** or **Schedule for later**. If your user authority is insufficient, **Schedule for later** is unavailable. Select the appropriate **Backup strategy** from the drop-down list:

IFINCREMENTAL / IFFULL

Indicates the incremental-forever incremental backup type and the incremental-forever full backup type. These backup types are applicable only if you have a license to use IBM Spectrum Protect for Virtual Environments.

Select the appropriate **Backup type**:

- Click **Incremental** to back up the blocks that changed since the previous backup (full or incremental). The most recent incremental is appended to the previous backup. If a full backup does not exist for

this VM, a full backup is automatically performed. As a result, you do not have to verify that a full backup exists.

- Click **Full** to create an image of an entire VM. After the full backup is taken, there is no requirement to schedule additional full backups. When full is selected, VM templates that are unchanged since the last backup are also included.
 - If you selected **Schedule for later**, click **Next** and proceed to Step 8.
 - If you selected **Run the backup now**, click **Next**, and proceed to Step 9.
8. In the Repetition page, specify the following information:
 - a. If you selected **A full backup, followed by six incremental backups** in the previous step:
 - 1) Specify the date and time to run the first backup. The first full backup is scheduled to run at this date and time.
 - 2) The six incremental backups are scheduled to run on the remaining six days of the week and at the selected time.
 - b. If you selected **Incremental** or **Full** in the previous step:
 - 1) Specify the date and time to run the first backup.
 - 2) Specify the interval that you want the backup to run.
 - c. Click **Next**.
 9. In the Summary page, review your backup settings and click **Finish** to save your task. If you selected **Run the backup now**, the backup operation begins immediately when you click **Finish**.

What to do next

After the backup schedule has completed, you can verify that the virtual machines have been backed up in the **Reports** tab.

Setting options for an incremental forever backup schedule

When you schedule incremental forever backups, you can ensure that there are frequent backups of the VMs and reduce the size of each backup.

Before you begin

Ensure that client-side data deduplication is enabled for the storage pool.

Procedure

1. Start a data mover command-line session:
 - **Windows** Open a command prompt and change to the data mover installation directory. For example:
`cd "C:\Program Files\tivoli\tsm\baclient"`
 - **Linux** Open a terminal window and change to the data mover installation directory. For example:
`cd /opt/tivoli/tsm/client/ba/bin`
2. Edit the IBM Spectrum Protect client backup-archive client options file.
 - **Windows** Specify these options in the `dsm.opt` options file.
 - **Linux** Specify these options in the `dsm.sys` file in the stanza for the data mover node.
 - a. Enable compression by adding the option `compression yes` to the file.

- b. Enable deduplication by adding the option `deduplication yes` to the file.
- c. Modify the trigger values for megablock refreshes by setting one of the following options:
 - Enable a number of objects as the trigger by adding `mbobjrefreshthresh number` to the file.
 - Enable a percentage of objects as the trigger by adding `mbpctrefreshthresh percentage` to the file.

For more information, see the data mover `mbobjrefreshthresh` and `mbpctrefreshthresh` options in options reference.

3. Repeat Step 2 for each VMware guest.

Backing up migrated virtual machines

When you migrate virtual machines to a different VMware datacenter or vCenter server, you can back up the virtual machines.

Before you begin

To back up migrated virtual machines, meet the following prerequisites:

- The migrated virtual machine must be running in a VMware vSphere 6 environment.
- Before you migrate the virtual machine, back up the virtual machine with Data Protection for VMware V7.1.3 or later. Verify that the backup completed without error.
- On the virtual machine, verify that VMware Storage vMotion is installed.

The following environment migrations are supported:

- Migrate from one vCenter to another vCenter. For example: vCenter A, datacenter A, and data mover A migrated to vCenter B, datacenter B, and data mover B.
- Migrate from one datacenter to another datacenter within the same vCenter. For example: vCenter A, datacenter A, and data mover A migrated to vCenter A, datacenter C, and data mover C.

About this task

To migrate a virtual machine from one VMware datacenter to another datacenter within the same vCenter server, complete the following steps:

Procedure

1. Start a data mover command-line session:
 - **Windows** Open a command prompt and change to the data mover installation directory. For example:
`cd "C:\Program Files\tivoli\tsm\baclient"`
 - **Linux** Open a terminal window and change to the data mover installation directory. For example:
`cd /opt/tivoli/tsm/client/ba/bin`
2. Create a full VM backup of the migrated virtual machine. Store the backup on the original datacenter node from where the virtual machine was migrated.

For example, if virtual machine VM_1 was migrated from VMware datacenter DC_A to datacenter DC_C, then back up VM_1 from data mover DM_A to datacenter DC_C directly. The following sample command is provided:

```
dsmc backup vm VM_1 -vmbackuptype=fullvm -nodename=DC_C nodename  
-password=DC_C nodename_password
```

3. Deactivate the active backup of the migrated virtual machine on the original datacenter. Issue this command on the original datacenter node from where the virtual machine was migrated. For example, if virtual machine VM_1 was migrated from VMware datacenter DC_A to datacenter DC_C, then issue this command on datacenter node DC_A. The following sample command is provided:

```
dsmc expire -objtype=vm VM_1 -nodename=DC_A nodename  
-password=DC_A nodename_password
```

Backing up organization vDCs to IBM Spectrum Protect

You can create an immediate backup (**Back Up Now**) or schedule a backup (**Create Backup Schedule**) for an organization vDC. The data that is backed up is stored on IBM Spectrum Protect server storage.

Procedure

Back up your organization vDCs by following these steps:

1. In the Cloud Resources window, click **Organization VDCs**. You can also click **Organizations** (in the Cloud Resources window), then drill down to the organization that contains the organization vDC.
2. Select one or more organization vDCs to back up and click one of the following backup tasks:
 - To start an immediate organization vDC backup to server storage, click **Back Up Now**.
 - To create a scheduled organization vDC backup to server storage, click **Create Backup Schedule**.
3. In the wizard, complete the following steps:
 - a. Select the backup type:

Incremental Forever - Incremental (Default)

Backs up the blocks that changed since the previous backup (full or incremental). If a full backup does not exist for a vApp in this organization vDC, a full backup is automatically started. As a result, you do not have to verify that a full backup exists. After the initial full backup is taken, an ongoing (forever) sequence of incremental backups occurs. This strategy requires no additional backup tasks to be defined.

Incremental Forever - Full

Creates an image of all vApps in this organization vDC. After the full backup is taken, there is no requirement to schedule more full backups.

- b. Select the data mover node that runs the backup operation. Select a data mover node that is not currently used in a backup or restore operation.
- c. If you clicked **Create Backup Schedule**, enter a name to identify this task. The task name must not contain any spaces. You can add a description for the task. If you clicked **Back Up Now**, you can change the default backup name (BackUpNow) and also add a description.

- d. Click **Next**.
 - If you clicked **Back Up Now**, click **Next** and proceed to Step 5.
 - If you clicked **Create Backup Schedule**, click **Next**, and proceed to Step 4.
4. In the Schedule page of the Create Schedule wizard, complete the following steps:
 - a. Specify the date and time to run the first backup.
 - b. Specify the interval that you want the backup to run.
5. Review the Summary page. If the information reflects your backup objective, click **Finish** to start the backup task or to create the schedule. Otherwise, click **Back** to make revisions.

Backing up data by disk usage

Specify the virtual machine disks that you want to include or exclude for backup services by setting include and exclude options.

Before you begin

Review the data mover `domain.vmfull`, `include.vmdisk`, and `exclude.vmdisk` options in options reference.

About this task

To include virtual machines in your full virtual machine image backup operations, use the `domain.vmfull` option.

To include a virtual machine disk in a Backup VM operation, use the `include.vmdisk` option.

To exclude a virtual machine's disk from a Backup VM operation, use the `exclude.vmdisk` option.

Use these options for virtual disks that do not require backup. For example, use the options for those virtual disks that contain data that does not need to be restored, or the data is preserved by another backup mechanism.

Restriction: A virtual disk excluded from the backup operation is considered as deleted from the VM for that backup. If the VM is restored from that backup, the excluded virtual disk is not restored. Only the disk definition is restored.

Procedure

1. Start a data mover command-line session:
 - **Windows** Open a command prompt and change to the data mover installation directory. For example:

```
cd "C:\Program Files\tivoli\tsm\baclient"
```
 - **Linux** Open a terminal window and change to the data mover installation directory. For example:

```
cd /opt/tivoli/tsm/client/ba/bin
```
2. Optional: View the disk name and label of the virtual disk by issuing the preview option. For example:

```
dsmc backup vm VM1 -preview
```

3. Exclude a virtual disk, set the `exclude.vmdisk` option in the IBM Spectrum Protect data mover `dsm.opt` options file. For example:

```
EXCLUDE.VMDISK VM1 "Hard Disk 3"
```

4. Issue the backup command:
`dsmc backup vm VM1`

Scenario: Including four disks for backup processing

Use the `include.vmdisk` and `domain.vmfull` options to include four virtual machine disks for backup services.

About this task

In the following examples, virtual machine `vm5_fin_com` contains four disks:

```
Hard Disk 1  
Hard Disk 2  
Hard Disk 3  
Hard Disk 4
```

Procedure

1. Start a data mover command-line session:
 - **Windows** Open a command prompt and change to the data mover installation directory. For example:
`cd "C:\Program Files\tivoli\tsm\baclient"`
 - **Linux** Open a terminal window and change to the data mover installation directory. For example:
`cd /opt/tivoli/tsm/client/ba/bin`
2. Use the `include.vmdisk` statement to back up disks Hard Disk 1 and Hard Disk 2. For example:
`INCLUDE.VMDISK vm5_fin_com "Hard Disk 1"`
`INCLUDE.VMDISK vm5_fin_com "Hard Disk 2"`
3. Issue the backup command:
`dsmc backup vm vm5_fin_com`

Because an include disk statement is specified, this statement implies that only disks specifically included are backed up. As a result, Hard Disk 3 and Hard Disk 4 are not backed up.

4. Use the `domain.vmfull` statement to back up disks Hard Disk 1 and Hard Disk 2: For example:
`DOMAIN.VMFULL "vm5_fin_com:vmdk=Hard Disk 1:vmdk=Hard Disk 2"`
5. Issue the backup command:
`dsmc backup vm vm5_fin_com`

Hard Disk 3 and Hard Disk 4 are not backed up.

You can include or exclude one or more disks with a `domain.vmfull` statement. You can specify include and exclude on the same statement. For example, the following statement is valid:

```
domain.vmfull "vm5_fin_com:vmdk=Hard Disk 1:-vmdk=Hard Disk 2:vmdk=Hard  
Disk 3:vmdk=Hard Disk 4"
```

If an include statement is present, it causes all other disks in the virtual machine to be excluded from a backup operation, unless the other disks are also specified with an include statement. For example, the following statement excludes all disks except for Hard Disk 1:

```
domain.vmfull "vm5_fin_com:vmdk=Hard Disk 1"
```

Scenario: Excluding four disks for backup processing

Use the `exclude.vmdisk` and `domain.vmfull` options to exclude four virtual machine disks for backup services.

About this task

In the following examples, virtual machine `vm5_fin_com` contains four disks:

```
Hard Disk 1  
Hard Disk 2  
Hard Disk 3  
Hard Disk 4
```

Procedure

1. Start a data mover command-line session:
 - **Windows** Open a command prompt and change to the data mover installation directory. For example:

```
cd "C:\Program Files\tivoli\tsm\baclient"
```
 - **Linux** Open a terminal window and change to the data mover installation directory. For example:

```
cd /opt/tivoli/tsm/client/ba/bin
```
2. Use the `exclude.vmdisk` statement to back up disks Hard Disk 1 and Hard Disk 2. For example:

```
EXCLUDE.VMDISK vm5_fin_com "Hard Disk 3"  
EXCLUDE.VMDISK vm5_fin_com "Hard Disk 4"
```
3. Issue the backup command:

```
dsmc backup vm vm5_fin_com
```

Because an exclude disk statement is specified, this statement implies that only disks specifically excluded are not backed up. As a result, Hard Disk 3 and Hard Disk 4 are not backed up.

4. Use the `domain.vmfull` statement to back up disks Hard Disk 3 and Hard Disk 4: For example:

```
DOMAIN.VMFULL "vm5_fin_com:vmdk=Hard Disk 3:vmdk=Hard Disk 4"
```
5. Issue the backup command:

```
dsmc backup vm vm5_fin_com
```

Hard Disk 3 and Hard Disk 4 are not backed up.

Scenario: Separating disks for backup and restore processing

To protect your data, coordinate the backup and restore capability of Data Protection for VMware and an IBM Data Protection agent installed in a guest virtual machine.

Before you begin

IBM Spectrum Protect provides applications that protect specific database and mail server data. The data protection application servers typically run in a virtual machine. To use Data Protection for VMware effectively with the IBM Spectrum Protect data protection applications, you must coordinate the backup and restore processing for each application. One way to coordinate backup and restore processing for each application is to separate processing by disk usage.

About this task

In this scenario, virtual machine VM2-08R2EX10-1 has IBM Spectrum Protect for Mail: Data Protection for Microsoft Exchange Server installed on Disk1 and uses this disk (.vmdk) configuration:

- Disk1: Operating system files
- Disk2: Microsoft Exchange Server database files
- Disk3: Microsoft Exchange Server log files
- Disk4: Contains files other than Microsoft Exchange Server files

Procedure

1. Use Data Protection for Microsoft Exchange Server to back up Disk2 and Disk3:
 - a. Start a Data Protection for Microsoft Exchange Server command-line session by opening a command prompt and changing to the installation directory: For example:

```
cd "C:\program files\tivoli\tsm\tdpexc"
```
 - b. Issue the following backup command:

```
tdpexcc backup * full /backupmethod=vss /backupdestination=tsm
```
2. Use the data mover to back up Disk1 and Disk4:
 - a. Start a data mover command-line session by opening a command prompt and changing to the data mover installation directory: For example:

```
cd "C:\Program Files\tivoli\tsm\baclient"
```
 - b. Issue the following backup command:

```
dsmc backup vm "VM2-08R2EX10-1_orig:vmdk=Hard Disk 1:vmdk=Hard Disk 4"
```
3. Use the data mover to restore virtual machine VM2-08R2EX10-1 to a new virtual machine: Issue the following restore command:

```
dsmc restore vm VM2-08R2EX10-1_orig -vmname=user_story_Exch  
-datacenter=VC4-VE-2_DATACENTER1 -host=ESX41-VE-2.QA1.COM  
-DATASTORE=ESX41-VE-3
```

The following output is displayed.

```
Restore processing finished.
Session established with server VM-03R2-TSM62-5: Windows
Server Version 7, Release 1, Level 2.0
Server date/time: 12/16/2014 12:32:54 Last access: 12/16/2014 11:13:13
```

```
Total number of objects restored:      2
Total number of objects failed:        0
Total number of bytes transferred:    42.00 GB
Data transfer time:                   4,708.17 sec
Network data transfer rate:           9,353.97 KB/sec
Aggregate data transfer rate:         9,210.25 KB/sec
Elapsed processing time:               01:19:41
```

4. Start the VMware vSphere Client and go to **Summary > Edit Settings** to verify that the restored virtual machine (user_story_Exch) contains the same configuration as the original virtual machine (VM2-08R2EX10-1_orig). In this example, the configuration of the restored virtual machine shows four disks like the original virtual machine. However, only the data for Disk1 and Disk4 are restored. Disk2 and Disk3 must first be formatted for use. Then use Data Protection for Microsoft Exchange Server to restore Disk2 and Disk3.
5. Start the restored virtual machine:
 - a. Go to **Server Manager > Disk Management**.
 - b. Select Disk2 and Disk3 to complete disk initialization requirements.
 - c. Select partition style MBR and click **OK**.
 - d. Both disks are formatted with the same drive letters as the original virtual machine.
 - e. Use Data Protection for Microsoft Exchange Server to restore the Exchange data files to Disk2 and Disk3.

Backing up virtual machines by domain level

Narrow the focus of an operation to a subset of the virtual machines that are running on the system by setting the `domain.vmfull` option.

Before you begin

The `domain.vmfull` option backs up the virtual machines that are running on the system that is identified by the `vmchost` option.

Review the data mover `domain.vmfull` option. For more information, see `Domain.vmfull`.

About this task

Complete these steps on the data mover system:

Procedure

1. Start a data mover command-line session:
 - **Windows** Open a command prompt and change to the data mover installation directory: `cd "C:\Program Files\tivoli\tsm\baclient"`.
 - **Linux** Open a terminal window and change to the data mover installation directory: `cd /opt/tivoli/tsm/client/ba/bin`.
2. Open the data mover options file (`dsm.opt`) with your preferred text editor.

3. Enter the option name and one or more blank spaces, followed by the option value. For example:

```
domain.vmfull vmhostcluster=Dev0105
```

Scenario: Backing up virtual machines by cluster server

Use the `domain.vmfull vmhostcluster` option to back up virtual machines for a specific cluster server.

About this task

The VMware environment consists of more than 3,000 VMs. Host clusters are used to manage the hardware resources. Although most of the clusters each contain 3 - 4 ESXi hosts, some clusters contain as many as 10 ESXi hosts. However, some ESXi hosts are running 1 - 3 VMs for larger, critical VMs. To manage the load, additional VMware hosts are frequently added or removed as they are needed. Each ESXi host in the cluster manages 10 - 30 VMs. Because the total number of VMs in each cluster ranges from 100 - 200, each host cluster is backed up to a dedicated vStorage backup server. Each server uses a dedicated data mover node to back up data.

Procedure

1. Start a data mover command-line session:
 - **Windows** Open a command prompt and change to the data mover installation directory. For example:

```
cd "C:\Program Files\tivoli\tsm\baclient"
```
 - **Linux** Open a terminal window and change to the data mover installation directory. For example:

```
cd /opt/tivoli/tsm/client/ba/bin
```
2. Include all virtual machines in cluster server TivDev01 in full VM backup operations.
 - a. Set the `domain.vmfull` option with the `vmhostcluster` parameter in the client options file (`dsm.opt`). For example:

```
domain.vmfull vmhostcluster=TivDev01
```
 - b. Issue the backup command. For example:

```
dsmc backup vm -vmbackuptype=fullvm
```
3. Repeat Step 2 for each cluster server.

Scenario: Backing up virtual machines by VMware datastore

Use the `domain.vmfull vmdatastore` option to back up virtual machines for a specific VMware datastore.

Procedure

1. Start a data mover command-line session:
 - **Windows** Open a command prompt and change to the data mover installation directory. For example:

```
cd "C:\Program Files\tivoli\tsm\baclient"
```
 - **Linux** Open a terminal window and change to the data mover installation directory. For example:

```
cd /opt/tivoli/tsm/client/ba/bin
```

2. Include all virtual machines in VMware datastore `datastore_03` in full VM backup operations.
 - a. Set the `domain.vmfull` option with the **vmdatastore** parameter in the client options file (`dsm.opt`). For example:

```
domain.vmfull vmhostcluster=datastore_03
```
 - b. Issue the backup command. For example:

```
dsmc backup vm -vmbackuptype=fullvm
```
3. Repeat Step 2 for each datastore.

Scenario: Backing up virtual machines by name pattern

Use the `domain.vmfull vm` option to back up virtual machines by a specific name pattern.

Procedure

1. Start a data mover command-line session:
 - **Windows** Open a command prompt and change to the data mover installation directory. For example:

```
cd "C:\Program Files\tivoli\tsm\baclient"
```
 - **Linux** Open a terminal window and change to the data mover installation directory. For example:

```
cd /opt/tivoli/tsm/client/ba/bin
```
2. Include all virtual machines that contain MailDept at the beginning of their name in full VM backup operations.
 - a. Set the `domain.vmfull` option with the **vm** parameter in the client options file (`dsm.opt`). For example:

```
domain.vmfull vm=MailDept*
```
 - b. Issue the backup command. For example:

```
dsmc backup vm -vmbackuptype=fullvm
```
3. Repeat Step 2 for each name pattern.

Backing up multiple virtual machines in parallel (optimized backup)

With parallel backup processing, you can use a single data mover node to back up multiple virtual machines (VMs) at the same time to optimize your backup performance.

Before you begin

To back up VMware VMs, the following options are provided so you can optimize the backups without adversely affecting the ESXi servers that are hosting the VMs. The options are described in detail in the options reference. For backing up Hyper-V VMs, only the `vmmaxparallel` option is valid.

vmmaxparallel

The `vmmaxparallel` option is used to control the maximum number of VMs that can be backed up at any one time. The optimal value for `vmmaxparallel` is not obvious; it depends on the processing power of the vStorage server that the data mover node runs on, and the performance of I/O between the data mover and the IBM Spectrum Protect server. For example, if you are moving data to the server over a busy LAN, you might need to limit the number of VMs in each parallel backup operation.

Similarly, if the vStorage server processing capabilities are limited, for any reason, this is also a reason to restrict the value for `vmmaxparallel`. The default for this option is 1.

vmmaxbackupsessions

The `vmmaxbackupsessions` option is used to control the maximum number of data movement sessions that can be included in the backup operation at any one time. Although this option sets the maximum number of sessions that are allowed, the `datamover` determines the actual number of sessions that are required based on the incoming workload and will use that number.

The value of the `vmmaxbackupsessions` option must be equal to or greater than the value of the `vmmaxparallel` option. If the value is less than the value of the `vmmaxparallel` option, a message is returned and the value is changed to the same value as `vmmaxparallel` option to ensure that there are as many sessions as there are VMs.

You might have to experiment with this setting to find the optimum value. Each dispatched VM is guaranteed one session and then extra sessions are applied to the dispatched VMs. The number of sessions will not exceed the value that is specified by the `vmmaxbackupsessions` option.

Other considerations for using this option include:

- If you are using the HotAdd data transport method, you will get better scale per session than if you are using network block device (NBD) data transports. This difference allows a higher value for the `vmmaxbackupsessions` option relative to a low value for the `vmmaxparallel` option. If you are using NBD transport, the difference between the `vmmaxbackupsessions` and `vmmaxparallel` options should be less because of scaling issues caused by having multiple NBD sessions per VM.
- There is no performance benefit for setting the `vmmaxbackupsessions` option if your storage system performance is slower than the available network speed between the data mover and the server.

vmmlimitperhost

The `vmmlimitperhost` option is used to control how many VMs and virtual disks can be backed up from an ESXi host at the same time.

You might have to experiment with this setting to find the optimum value. On ESXi servers that are heavily used, you might need to restrict the value for `vmmlimitperhost` so you do not adversely affect the vSphere server performance. On servers that are not as heavily used, you can include more VMs.

If you are using the NBD data transport method, you might also exceed the network file copy (NFC) protocol limit on the host if the value for `vmmlimitperhost` is too high. In this situation, a memory allocation error is returned as shown in the following example:

```
ANS9365E  VMware vStorage API error for virtual machine 'VM1'.
IBM Spectrum Protect function name : VixDiskLib_Read
IBM Spectrum Protect file          : .....\common\vm\vmvddksdk.cpp (3062)
API return code                   : 2
API error message                  : Memory allocation failed. Out of memory.
```

vmmlimitperdatastore

The `vmmlimitperdatastore` is used to control how many VMs and virtual disks can be backed up from a datastore at the same time. In a multiple

datastore VMware environment, you can use this option to reduce the burden that is placed on any one datastore during a parallel backup operation.

Procedure

Complete these steps on the data mover system:

1. Start a command-line session:
 - **Windows** Open a command prompt and change to the directory: `cd "C:\Program Files\tivoli\tsm\baclient"`.
 - **Linux** Open a terminal window and change to the directory: `cd /opt/tivoli/tsm/client/ba/bin`.
2. Open the `dsm.opt` file with your preferred text editor.
3. Enter the option name and one or more blank spaces, followed by the option value. For example:

```
vmmaxparallel 5
vmmaxbackupsessions 10
vmlimitperdatastore 5
vmlimitperhost 5
```
4. Issue the **backup vm** command. For example:

```
dsmc backup vm vm1 -vmbackuptype=fullvm
```

Using the examples provided, the backup operations for the VM `vm1` at the VM, virtual disk, or subdisk level can include 5 virtual machines and 10 sessions and that backup operations are limited to 5 VMs per datastore and 5 VMs per host.

Related information:

 Backup VM

Examples: Backing up multiple virtual machines in parallel

Parallel backup examples

In the following figures, the circled virtual machines are the virtual machines that are selected for backup processing, which is based on the option settings in `domain.vmfull`.

Example 1: Each VM is stored in a single datastore

Figure 4 on page 141 shows that each of the circled VMs has its data saved in a unique datastore. Assume that the parallel backup options are set to the following values:

- `vmmaxparallel 3`
- `vmmaxbackupsessions 3`
- `vmlimitperhost 1`
- `vmlimitperdatastore 1`

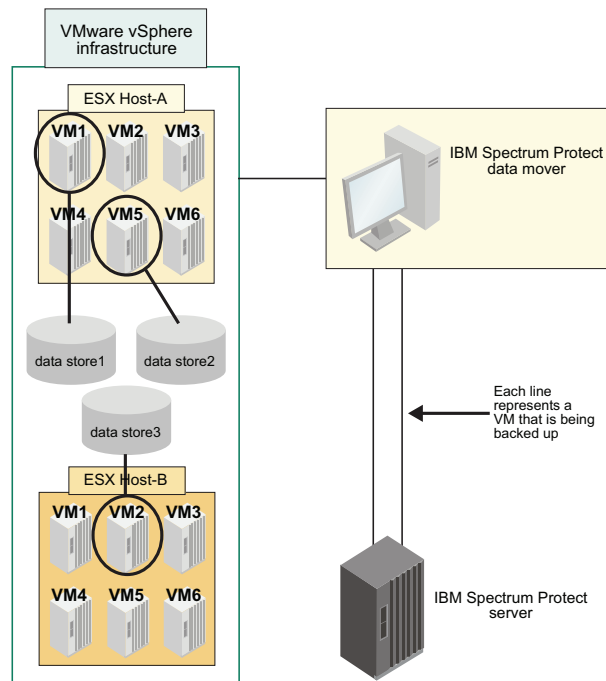

Figure 4. Virtual machines using unique datastores.

In Host A, only VMs 1 and 5 match the selection criteria on a `domain.vmfull` statement. In Host B, only VM 2 matches the selection criteria. In this configuration, each VM has a separate datastore, so the `vm_limit_per_datastore` setting is valid. But, since `vm_limit_per_host` is set to one, only one VM (vm1 or vm5) from Host A and one VM (vm2) from Host B are included when the Backup VM operation is run; only two VMs are included.

The `vm_max_backup_sessions` setting of 3 indicates that a backup operation for each of the two VMs will get a data movement session. Because there are three maximum backups sessions specified and only two VMs that are backed up, the backup operation for one of the VMs can get a second session. Sessions are obtained by the session pool manager.

Example 2: Same as example 1, but with a different setting for `vm_limit_per_host`

Figure 5 on page 142 shows that each of the circled VMs has its data saved in a unique datastore. In this configuration, the `vm_limit_per_host` is increased to two to illustrate how the option increase changes the Backup VM operation. Assume that the parallel backup options are now set to the following values:

- `vm_max_parallel 3`
- `vm_max_backup_sessions 3`
- `vm_limit_per_host 2` (an increase of 1)
- `vm_limit_per_datastore 1`

Figure 5. Virtual machines using unique datastores, with different option value for `vm.limitperhost`.

The same VMs match the `domain.vmfull` criteria as they did in the previous example. However, with the increase in the `vm.limitperhost` setting, now a total of three VMs are included in a Backup VM operation (vm1 and vm5 from Host A, and vm2 from Host B).

The `vm.maxbackupsessions` setting of 3 indicates that the backup operation for each of the three VMs will get a data movement session.

Example 3: Some VMs share datastores

Figure 6 on page 143 shows that the VMDK and configuration files for VM 5 in Host A is stored in two datastores. To include both vm1 and vm5 in Host A in the parallel backup operation, the value of `vm.limitperdatastore` must be increased to at least two. If `vm.limitperdatastore` is not increased to two, or higher, the backup of the second VM (vm5), in Host A, cannot be started until the first VM (vm1)

backup is completed because the two VMs share data in datastore1.

Figure 6. Virtual machines sharing a datastore.

Backing up virtual machines that host Active Directory controllers

About this task

The environment consists of a data center with five domain controllers (VDC1 - VDC5). The domain controllers are in two geographic locations. Each domain controller is on a VMware guest. One physical domain controller is included. The domain controllers are in two geographic locations and replicate by using an Active Directory replication process.

Procedure

1. Start a data mover command-line session: **Windows** Open a command prompt and change to the data mover installation directory: `cd "C:\Program Files\tivoli\tsm\baclient"`.

2. Back up the virtual machine guests that host VDC1 and VDC3. In these examples, virtual machine guest VM1 hosts domain controller VDC1, and virtual machine guest VM3 hosts domain controller VDC3:

```
dsmc backup vm VM1
```

```
dsmc backup vm VM3
```

3. Recover the virtual machine guest that hosts VDC1. In this example, virtual machine guest VM1 hosts domain controller VDC1:

```
dsmc restore vm VM1
```

The domain controller is restored to the version taken at the time of the backup. After the server restarts, the restored Active Directory domain controller (on VDC1) replicates data by using other domain controllers in the network.

4. Restart the restored virtual machine guest.
5. Verify that replication processing completed successfully.

Related tasks:

“Verifying that the Active Directory Domain Controller replicated successfully” on page 157

Specifying a management class to associate objects

Specify how to manage virtual machine and vApp backups operations on the IBM Spectrum Protect server.

Before you begin

Review the data mover `vmmc`, `vmctlmc`, and `vappmc` options in options reference.

Procedure

1. Start a data mover command-line session:
 - **Windows** Open a command prompt and change to the data mover installation directory. For example:

```
cd "C:\Program Files\tivoli\tsm\baclient"
```
 - **Linux** Open a terminal window and change to the data mover installation directory. For example:

```
cd /opt/tivoli/tsm/client/ba/bin
```
2. Open the data mover options file (`dsm.opt`) with your preferred text editor.
3. Enter the option name and one or more blank spaces, followed by the option value. For example:

```
vmmc myManagmentClass  
vmctlmc diskonlymc  
vappmc MCPRODVAPPS
```

Scenario: Specifying a management class for VMware backups in a vSphere environment

Use the `vmmc` option to store the VMware backups with a management class other than the default management class.

About this task

Assign a virtual machine backup to a non-default management class.

Procedure

1. Start a data mover command-line session:

- **Windows** Open a command prompt and change to the data mover installation directory. For example:

```
cd "C:\Program Files\tivoli\tsm\baclient"
```
- **Linux** Open a terminal window and change to the data mover installation directory. For example:

```
cd /opt/tivoli/tsm/client/ba/bin
```

2. Create a full VM backup of the virtual machine. Assign the backup to a non-default management class.

For example, to assign the backup of virtual machine `myVirtualMachine` to management class `myManagementClass`, specify the `vmmc` option in the command. For example:

```
dsmc backup vm "myVirtualMachine" -vmmc=myManagementClass
```

For information about how management class rebinding applies to VMware backup data on the IBM Spectrum Protect server, see technote 1665032.

Scenario: Specifying a management class for VMware control files in a vSphere environment

Use the `vmctlmc` option to assign the VMware control files to a management class other than the default management class.

Before you begin

VMware control files are assigned to the default management class. Use the `vmmc` option to assign VMware data and VMware control files to a non-default management class. The `vmctlmc` option overrides the default management class and the `vmmc` option for VMware control files.

Under certain conditions, it might be necessary to assign VMware control files to a different management class than the VMware data files.

Use the `vmctlmc` option if VMware data files are backed up to tape. Back up the VMware control files to a disk-based storage pool that is not migrated to tape. The storage pool can contain random access volumes and sequential file volumes; the storage pool can be a deduplicated pool. Use the `vmctlmc` option to specify a management class that stores control files in such a storage pool.

Restriction: The management class that is specified by the `vmctlmc` option determines only the destination storage pool for VMware control files. Retention of VMware control files is determined by the `vmmc` option, if specified, or by the

default management class. The retention for the VMware control files always matches the retention of the VMware data files.

About this task

Assign a virtual machine backup to a non-default management class.

Procedure

1. Start a data mover command-line session:
 - **Windows** Open a command prompt and change to the data mover installation directory. For example:
`cd "C:\Program Files\tivoli\tsm\baclient"`
 - **Linux** Open a terminal window and change to the data mover installation directory. For example:
`cd /opt/tivoli/tsm/client/ba/bin`
2. Create a full VM backup of the virtual machine. Assign the backup to a non-default management class.
For example, to assign the backup of virtual machine `myVirtualMachine` to management class `myManagementClass`, specify the `vmmc` option in the command:
`dsmc backup vm "myVirtualMachine" -vmmc=myManagementClass`

Specifying objects to include in backup and restore operations

Specify the VMs or vApps that you want to include for backup services by setting include options.

Before you begin

Review the data mover `include.vm` and `include.vapp` options. For more information, see [Virtual machine include options](#).

About this task

Complete these steps on the data mover system:

Procedure

1. Start a data mover command-line session:
 - **Windows** Open a command prompt and change to the data mover installation directory: `cd "C:\Program Files\tivoli\tsm\baclient"`.
 - **Linux** Open a terminal window and change to the data mover installation directory: `cd /opt/tivoli/tsm/client/ba/bin`.
2. Open the data mover options file (`dsm.opt`) with your preferred text editor.
3. Enter the option name and one or more blank spaces, followed by the option value. For example:
`include.vm vmtest*`

Scenario: Specifying objects to include for backup and restore operations in a vSphere environment

Use include options to specify the objects that you want to include in backup and restore operations.

Before you begin

To define when objects are included in a backup, how long they are kept on the server, and how many versions of the object the server keeps, use a management class. Set the management class for an object by using the data mover **vmmc** option. Place this option in the client options file `dsm.opt` or in the client system options file `dsm.sys`.

You can also change how files are processed, for example to use a different management class, by using the data mover **include.vm** option.

About this task

This scenario assumes the following active management classes on the IBM Spectrum Protect server:

- MCFORTESTVMS
- MCFORPRODVMS
- MCUNIQUEVM

Procedure

1. Start a data mover command-line session:

- **Windows** Open a command prompt and change to the data mover installation directory: `cd "C:\Program Files\tivoli\tsm\baclient"`.
- **Linux** Open a terminal window and change to the data mover installation directory: `cd /opt/tivoli/tsm/client/ba/bin`.

2. Open the data mover options file (`dsm.opt`) with your preferred text editor.
3. Associate all virtual machine backups, with names that begin with VMTEST, to management class MCFORTESTVMS:

```
include.vm vmtest* MCFORTESTVMS
```

4. Associate virtual machine backup WINDOWS VM1 [PRODUCTION] to management class MCFORPRODVMS:

```
include.vm "WINDOWS VM1 ?PRODUCTION?" MCFORPRODVMS
```

The following values are used:

- The virtual machine is enclosed in quotation marks because it contains space characters.
 - The question mark (?) wildcard is used to match the special characters in the virtual machine name.
5. Associate virtual machine backup VM1 to management class MCUNIQUEVM:

```
include.vm VM1 MCUNIQUEVM
```

Chapter 7. Restoring VMware data

Data Protection for VMware restore scenarios are provided in this section.

Mounting a virtual machine disk and exporting the volumes

You can restore one (or more) files from a virtual machine that was backed up to IBM Spectrum Protect server storage.

Before you begin

File restore from tape media is not supported. File restore from disk storage is the preferred method.

Consider moving target virtual machine backup data from tape media to disk storage before you attempt a file restore operation. You can move data with the server **MOVE NODEDATA** command. You can also run traditional full VM backups regularly.

Procedure

To mount a backed up virtual machine disk and export the mounted volume for a file restore operation, complete the following steps:

1. Configure the mount proxy nodes:
 - a. Go to the Configuration window in the Data Protection for VMware vSphere GUI.
 - b. Click **Edit IBM Spectrum Protect Configuration** in the Tasks list. The configuration notebook might take a few moments to load.
 - c. Go to the Mount Proxy Node Pairs page and select a VMware datacenter in the table.
 - d. Click **Add Mount Proxy Node Pair**.
 - e. Click **New Settings** in the table.

For Linux operating systems, the Linux mount proxy node must be configured manually. Use the sample `dsm.sys` file content that is shown in the **Mount Proxy Settings** dialog when you configure the Linux mount proxy node.

For Windows operating systems, only one client acceptor is created. If you want to add a second Windows mount proxy node, you must manually configure the client acceptor on a remote system.
 - f. Specify the storage device type from which the snapshot is mounted by setting the client `vmstoragetype` option in the client options file on the Windows mount proxy node.
 - 1) Open a command prompt and change to the data mover installation directory. For example:

```
cd "C:\Program Files\tivoli\tsm\baclient"
```
 - 2) Open the data mover options file (`dsm.opt`) with your preferred text editor.
 - 3) Set the `vmstoragetype` option with one of the following device types:

DISK The snapshots to be mounted are on Disk or File storage pools. This value is the default.

VTL The snapshots to be mounted are on VTL storage pools.

TAPE The snapshots to be mounted are on Tape storage pools.

2. Validate that the mount proxy nodes are online and that the iSCSI service is running:
 - a. Go to the Configuration window in the Data Protection for VMware vSphere GUI.
 - b. Select a VMware datacenter in the navigation tree.
 - c. Select the mount proxy node (created in Step 1) in the table and click **Validate Selected Node**. The validation results might take a few moments to complete. A successful validation shows the **Status: Running** message for each mount proxy node in the Status Details pane. An unsuccessful validation shows the **Status: error** message for each mount proxy node that encountered an error.

Remember: By default, the iSCSI service is started manually. If the system where this service is running restarts, the iSCSI service must be restarted manually.

If you receive an error message, investigate possible causes that are based on error messages that are shown in the Task Details pane of the **Recent Tasks** report.

3. Go to the Restore window in the Data Protection for VMware vSphere GUI and click **Restore Points** in the header.
4. Expand the list of VMware datacenters and select a virtual machine from the navigation pane. All active and inactive backup versions for the selected virtual machine are identified as restore points in the Restore Points table. Virtual machine template backups are identified in the Template column in the Restore Points table.

Depending on the number of managed vCenters, the list might take a few moments to load.
5. Select one or more restore points for one virtual machine in the table and click **Mount** to open the Mount wizard.
6. On the Mount Options page, complete the following steps:
 - a. Select the mount proxy node.
 - b. Optional: To select the operating system where the backed up virtual machine disks are to be mounted, click the **Guest Operating System** list and make your selection.

Tip: When the operating system where the disks are to be mounted is different from the operating system of the mount proxy node, the mount point path updates automatically.

- c. Enter the absolute path of the mount point. The following characters are supported: a-z, A-Z, 0-9, colon (:), forward slash (/), backward slash (\), and underscore (_). The maximum length is 200 characters.
 - **Windows** The absolute path to a disk is *mount root\tag\vmname\snapshot date and time\file system number*. For example:
C:\tsmmount\ticket_9471\tangowin2k12test\2014-07-01-10_35_50\Volume1\

The default value is C:\tsmvemount\vmname.

Restriction: The maximum length of the path and file name that is accessed in a mounted volume on Windows cannot exceed 6255

characters. This maximum length includes the total characters in the path, volume name, mount point, virtual machine name, tag description, and snapshot date.

- **Linux** For Linux operating systems, the absolute path to a disk is *mount root/tag/vmname/snapshot date and time/file system number*. For example:
`/tsmmount/ticket_9471/vm1/2014-07-01-10_35_23/Volume1`

The default value is `/mnt/vmname`.

Restriction: The maximum length of the path and file name that is accessed in a mounted volume on Linux cannot exceed 4096 characters. This maximum length includes the total characters in the path, volume name, mount point, virtual machine name, tag description, and snapshot date.

- d. Enter a description of this mount operation in the **Description Tag** field. This description becomes part of the mount path so that the administrator can easily identify the operation. The following characters are supported: a-z, A-Z, 0-9, and underscore (_). The maximum length is 20 characters.
- e. Optional: If you want the mounted virtual machine disks on a network share, select **Create Network share** and enter the appropriate credentials.
 - For Windows operating systems, enter the user name that is allowed to access Windows Share.

Tip: For security reasons, ensure that files are shared only by users and groups who are authorized to access those files.

- For Linux operating systems, enter the IP address or name of the system that mounts the exported file system.

- f. Click **Next**.

7. In the Summary page, review the settings and click **Finish** to start the mount operation. To change your mount settings, click **Back**. After the operation starts, you can monitor its progress (**Recent Tasks**) in the Reports window.

If the mount operation does not complete successfully, investigate possible causes that are based on error messages that are shown in the Task Details pane of the **Recent Tasks** report.

8. Export (or share) the mounted volumes from the virtual machine:
 - a. Go to the Restore window in the Data Protection for VMware vSphere GUI.
 - b. Click **Mount Status** in the header.
 - c. Select the mount operation that contains the volumes you want to export.
 - d. Copy the content in the Network Share pane by using Ctrl + C and send to the user who accesses the mounted volumes to restore the files.
9. Log in to the system where the files will be restored and complete the following step:
 - For Windows operating systems, connect to the Common Internet File System (CIFS) where the files are mounted. Copy the files with a file manager application such as Windows Explorer.
 - For Linux operating systems, connect to the Network File System (NFS) where the files are mounted. Copy the files with a file manager application.

What to do next

After the files are restored by the user, dismount the volumes:

1. Go to the Restore window in the Data Protection for VMware vSphere GUI.
2. Click **Mount Status** in the header.
3. Select the mount operation that contains the volumes you want to export and click **Dismount**. Your mount operation is identified by Type=HelpDesk in the Mount Status table.

vSphere environment restore scenario

This scenario demonstrates how to restore VMs with the **vmcli -f restore** command.

The VMs can also be restored with the following user interfaces:

Data Protection for VMware vSphere GUI

Information about how to complete restore tasks with the Data Protection for VMware vSphere GUI is provided in the online help that is installed with the GUI. Click **Learn More** in any of the GUI windows to open the online help for task assistance.

IBM Spectrum Protect backup-archive client GUI

Information about how to complete restore tasks with the backup-archive client GUI is provided in the online help that is installed with the GUI. Click **Help** in any of the GUI windows to open the online help for task assistance.

IBM Spectrum Protect backup-archive client command-line interface

Information about how to complete restore tasks with the **dsmc Restore VM** command is provided in the command-line help that is installed with the product (**dsmc help restore vm**). Information is also available at Restore VM.

This scenario completes an instant restore of vmName6 to a new VM, data center, ESX host, and data store. During the restore process, the disk is created with thin provisioning.

The following **vmcli -f restore** command is issued:

```
vmcli -f restore -vmrestoretype instantrestore -I vmlistfile
```

The vmpplistfile contains this statement:

```
backupid:678912345 vmname:vmName6::vmname:vm6newName  
newdatacentername:DataCenter2 newesxhostname:esxHost1Name  
newdatastoreurl:datastore2 vmtempdatastore:datastore2temp  
vmdiskprovision:thin
```

Full VM instant restore scenarios

Windows

A backed up VM is restored and available for immediate use.

Instant access and instant restore capability is supported only for VMware VMs that are hosted on VMware ESXi 5.1 servers, or later versions.

This command completes an instant restore of the VM with the name Cologne.

```
dsmc restore vm Cologne -vmrest=INSTANTRestore -vmtempdatastore=Verify_datastore
```

This command completes a regular restore (without starting the VM) when the VM named San_Jose is being restored.

```
dsmc restore vm San_Jose
```

Alternatively, you can also use the following command:

```
dsmc restore vm San_Jose -vmrest=noni
```

In this command, the `-vmtempdatastore` option specifies a temporary data store on the ESX host. The data for the new VM is stored in this temporary data store:

```
dsmc restore vm Haifa -VMRESToretype=INSTANTRestore -vmname=Haifa_verify  
-VMTEMPDatastore=Verify_Datastore
```

The temporary data store is used by Storage vMotion to store the configuration of the restored virtual machine during the instant restore process. The name that you specify must be unique. It cannot match the name of any of the original data stores that were used by the virtual machine when it was backed up, and it cannot be the same as the name specified on the optional `-datastore` option. If the `-datastore` option is omitted, the virtual machine files are restored to the data stores that they used when the virtual machine was backed up.

This command completes an instant restore of the VM with the name Oslo with the `-pick` option to pick a specific backup version.

```
dsmc restore vm Oslo -vmrest=INSTANTRestore -pick -vmtempdatastore=datastore_temp
```

This command queries to find all active and failed instant restore sessions.

```
dsmc query vm * -VMRESToretype=INSTANTRestore
```

This command retrieves the metadata for all instant restore session from the IBM Spectrum Protect server and prints that information as a list.

This command completes a cleanup of the VM and all its components. These components include iSCSI mounts, devices, and temporary data that are identified by the VM name on the ESX host.

```
dsmc restore vm Oslo -VMRESToretype=VMCCleanup -vmname=Oslo_Verify
```

This command queries information about the real state of the listed VMs based on information from the vSphere SDK on the ESX host.

```
dsmc query vm * -VMRESToretype=INSTANTRestore -Detail
```

Full VM instant restore cleanup and repair scenarios

When an instant restore operation fails after the VM is powered on, manual cleanup and repair tasks are required.

An instant restore operation that fails with storage vMotion running creates either of the following situations:

- The instant restore operation generates an error message.
- The instant restore operation suspends indefinitely and the VM is not responsive.

To determine the cause of the problem, perform a detailed query of the VM by using the following command:

```
dsmc q vm * -vmrestoretype=instantrestore -detail
```

In the output that is produced by this command, for each VM in the output, look for the line that contains *Action Needed*. Use the following *Action Needed* paragraphs to recover from failed instant restore operation, depending on the *Action Needed* status.

Instant access and instant restore capability is supported only for VMware VMs that are hosted on VMware ESXi 5.1 servers, or later versions.

Action Needed: Cleanup

In the output of the query `vm * -vmrestoretype=instantrestore -detail` command, verify that the storage vMotion status is successful (`vMotion Status: Successful`) and that all VM disks are physical disks (`Disk Type: Physical`). This status confirms that the VM was restored and cleanup of orphaned components, such as iSCSI mounts, is needed.

This type of failure occurs as a result of either of the following situations:

- The instant restore failed and Storage vMotion is running. VMware vSphere continues the vMotion process.
- Storage vMotion finished successfully, but the automatic cleanup of the iSCSI mounts fails.

To clean up any orphaned components, run the **restore vm** command with the **-VMRESToretype=VMCleanup** parameter. For example:

```
dsmc restore vm original_vmname -vmname=new_vm_name -VMRESToretype=VMCleanup
```

Action Needed: Repair

In the output of the query `vm * -vmrestoretype=instantrestore -detail` command, verify that the iSCSI device that is attached to the VM is dead (status is `Disk Path: Dead`).

This type of failure occurs as a result of one of the following three situations:

- The VM that is used as a data mover or the physical data mover machine failed.
- A network failure occurred between the data mover and the ESX host or the data mover and the IBM Spectrum Protect server.
- The IBM Spectrum Protect recovery agent Service failed.

The iSCSI device must be returned to an active state before any other instant operation is attempted.

To attempt to recover from a data mover failure, complete the following steps:

1. Investigate that cause of the failure and restart the data mover machine if it does not start automatically. This action starts an automatic recovery of the mounted iSCSI disks.
2. In the output of the query `vm * -vmrestoretype=instantrestore -detail` command, verify that the VM disks are active (Disk Path: Active). This status means that the VM was restored and is available for use.
3. Restart storage vMotion in the vSphere client and monitor its progress in the vSphere client status bar.
4. If storage vMotion processing completed successfully, run the **restore vm** command with the **-vmrestoretype=VMCleanup** parameter to clean up the iSCSI disks. For example:

```
dsmc restore vm original_vmname -vmname=new_vm_name -VMRESToretype=VMCleanup
```

To attempt recovery after a network failure, complete the following steps:

1. Repair the network issue so that communication between the data mover and the ESX host, and the data mover and the IBM Spectrum Protect server resumes.
2. In the output of the query `vm * -vmrestoretype=instantrestore -detail` command, verify that the VM disks are active (Disk Path: Active). This status means that the VM was restored and is available for use.
3. If the network failure did not cause storage vMotion to time out, no action is required.
4. If the network failure caused storage vMotion to time out, and the error message indicates that the source disk is not responding, restart storage vMotion in the vSphere client. When storage vMotion processing completes, run the **restore vm** command with the **-vmrestoretype=VMCleanup** parameter to clean up the iSCSI disks. For example:

```
dsmc restore vm original_vmname -vmname=new_vm_name -VMRESToretype=VMCleanup
```

To attempt recovery after a recovery agent service failure, complete the following steps:

1. Investigate that cause of the failure and restart the recovery agent service if it does not start automatically. This action starts an automatic recovery of the mounted iSCSI disks.
2. In the output of the query `vm * -vmrestoretype=instantrestore -detail` command, verify that the VM disks are active (Disk Path: Active). This status means that the VM was restored and is available for use.
3. If the recovery agent service failure did not cause storage vMotion to time out, no action is required.
4. If the recovery agent service failure caused storage vMotion to time out, and the error message indicates that the source disk as not responding, restart storage vMotion in the vSphere client. When storage vMotion processing completes, run the **restore vm** command with the **-vmrestoretype=VMCleanup** parameter to clean up the iSCSI disks. For example:

```
dsmc restore vm original_vmname -vmname=new_vm_name -VMRESToretype=VMCleanup
```

Full cleanup

If you are not able to recover from a failure and want to remove the VM and its components, run the **restore vm** with the **-vmrestoretype=VMFULLCleanup** parameter. For example:

```
dsmc restore vm original_vmname -vmname=new_vm_name -VMRESToretype=VMFULLCleanup
```

A **VMFULLCleanup** operation forces removal of the VM and all of its components, regardless of the state of the virtual machine. Do not start a full clean up operation while vMotion is still migrating a virtual machine.

Full VM instant restore integrity validation scenarios

Windows

A new VM is built from the requested VM backup and is available for immediate use.

The process that creates a VM for verification is referred to as instant access. The verification itself is done by a specific application that the user must provide and operate. In this scenario, since the VM guest data remains in the IBM Spectrum Protect server repository, no additional storage is required on the primary data store.

Instant access and instant restore capability is supported only for VMware VMs that are hosted on VMware ESXi 5.1 servers, or later versions.

Start an instant access scenario

Start the instant access operation by entering the following IBM Spectrum Protect backup-archive client command and options:

```
dsmc restore vm Haifa -VMRESToretype=instanta -vmname=Haifa_verify
```

This command verifies the VM backup named Haifa without having to restore the VM. Since the original VM exists, the `-vmname` option assigns the new VM name Haifa_verify.

In this command, the `-vmautostart` option specifies that the VM created for verification is powered on automatically:

```
dsmc restore vm Haifa -VMRESToretype=instanta -vmname=Haifa_verify  
-VMAUTOSTARTvm=YES
```

By default, the VM created for verification is not powered on automatically. This default value allows the VM to be reconfigured before startup (if needed).

Specify the `-inactive` and `-pick` options to select the VM backup to validate from a list of all backed up VMs. Or, specify the `-pitdate` and `-pittime` options to select a VM backup by its backup date and time.

All location options (such as `-vmname`, `-datacenter`, `-host`, and `-datastore`) are supported by the `-vmrestoretype=instantaccess` and `-vmrestoretype=instantrestore` options.

This command returns a list of VMs that are running in instant access mode:

```
dsmc query vm * -VMRESToretype=instanta
```

This command starts the cleanup process for a VM backup:

```
dsmc restore vm Haifa -VMRESToretype=VMCleanup -vmname=Haifa_Verify
```

This command completes the instant access session. A cleanup process includes these actions:

- The temporary VM created for verification is deleted on the ESX host.
- The iSCSI mounts are unmounted on the vStorage Backup Server.
- The iSCSI device list is cleaned on the ESX host.
- The temporary data that is generated during verification is deleted by removing the VMware snapshot.

You cannot use the `-VMRESToretype=VMCleanup` option or the `-VMRESToretype=VMFULLCleanup` option to clean up a virtual machine while Storage vMotion is migrating it to a host.

Verifying that the Active Directory Domain Controller replicated successfully

When a VM guest that contains an Active Directory Domain Controller (AD DC) is restored with Data Protection for VMware, the DC (on that VM) is restored from a backup copy of the AD database.

Before you begin

The original VM must be powered off before the restored VM is started. In addition, the restored VM must be manually rebooted for replication to occur.

About this task

The following tasks occur upon a successful Data Protection for VMware restore and subsequent reboot of the VM guest that contains the AD DC:

Procedure

1. The DC is updated from a backup copy of the AD DC database. A new invocationID is assigned to the Directory Server. This update is indicated by event 1109 in the event log on the VM guest. To verify this update:
 - a. In the Computer Management window on the restored system, go to **System Tools > Event Viewer**.
 - b. When the AD DC restored successfully, the Information type event for the restored DC displays the following message:

ActiveDirectory 1109 Replication

The message in the Event Viewer also confirms a successful restore because of the changed invocationID attribute:

The invocationID attribute for this directory server has been changed.
The highest update sequence number at the time the backup was created is <time>
InvocationID attribute (old value):<Previous InvocationID value>
InvocationID attribute (new value):<New InvocationID value>
Update sequence number:<USN>
The InvocationID is changed when a directory server is restored from backup media or is configured to host a writeable application directory partition.

2. The restored DC replicates itself non-authoritatively with its replication partners in the network. It is updated with the most current domain, schema, configuration, and application partitions:

Note: Data Protection for VMware does not support authoritative restore.

- a. Log in to the VM guest that was restored by using Data Protection for VMware as an Administrator.
- b. Open a Windows command prompt.
- c. Check the status of the last replication that involved the restored DC by issuing the `repadmin /showrepl` command¹. This command shows the replication partners for each directory partition on the DC and the status of the last replication.

If the replication schedule did not start, you can manually start the replication operation. Go to the Active Directory Sites and Services, select the replication partners, and right-click **Replicate Now**.

For detailed information about initiating replication, see the following Microsoft Knowledge Base article:

<http://support.microsoft.com/kb/232072>

When the status is newer than the restore time, this status means that the replication was successful and completed automatically. The following output shows that replication was successful:

```
Repadmin: running command /showrepl against full DC localhost
Default-First-Site-Name\DC12012
DSA Options: IS_GC
Site Options: <none>
DSA Object GUID: 8393da24-f18b-453a-b197-b8dc6956d51f
DSA invocationID: 8393da24-f18b-453a-b197-b8dc6956d51f

==== INBOUND NEIGHBORS =====

CN=Configuration,DC=his,DC=local
Default-First-Site-Name\DC22012 via RPC
  DSA Object GUID: 790c6f2d-61f1-4704-bdcf-6ef731bcb96e
  Last attempt @ 2013-01-25 14:33:10 was successful.
```

When the `repadmin /showrepl` command displays a successful replication, the AD DC replication is considered successful. No additional tasks are required.

- d. When the `repadmin /showrepl` command shows that replication was not successful, output similar to the following is shown:

```
Repadmin: running command /showrepl against full DC localhost
Default-First-Site-Name\DC12012
DSA Options: IS_GC
Site Options: <none>
DSA Object GUID: 8393da24-f18b-453a-b197-b8dc6956d51f
DSA invocationID: 8393da24-f18b-453a-b197-b8dc6956d51f

==== INBOUND NEIGHBORS =====

CN=Schema,CN=Configuration,DC=his,DC=local
Default-First-Site-Name\DC22012 via RPC
  DSA Object GUID: 790c6f2d-61f1-4704-bdcf-6ef731bcb96e
  Last attempt @ 2013-01-25 14:30:32 failed, result 1908 <0x774>:
  Could not find the domain controller for this domain.
  1 consecutive failure(s).
  Last success @ 2012-12-14 15:01:36.
```

If a replication failure exists or persists, follow the instructions provided in the next section.

¹ Repadmin.exe is a Microsoft command-line tool that is installed with Microsoft Active Directory.

Recover from Replication Failures

Use the following methods to investigate the cause of a persistent replication failure:

1. Use the Microsoft Domain Controller Diagnostics tool (dcdiag.exe) to view information about all components, objects, and permissions that are required for successful replication. For example:
 - a. Open a Windows command prompt as an administrator.
 - b. Issue the dcdiag /test:replications command. Use the output information to resolve any issues. If the command fails, investigate the events that are at **Event Viewer > Directory Service > ActiveDirectory_DomainServices**.
2. Use the Microsoft Repadmin.exe command-line tool to view the retired invocationID on a DC. For example:
 - a. Open a Windows command prompt as an administrator.
 - b. Issue the repadmin /showsig [DC_LIST] command. This output shows that restore from the IBM Spectrum Protect server was successful because a retired invocationID exists:

```
C:\Users\Administrator>repadmin /showsig rodc
Default-First-Site-Name\RODC

Current DSA invocationID: ed8ea6b9-d347-4695-b886-b5128be280c4
2c995946-2389-4d98-bc78-3708ba906e01 retired on 2012-12-19 16:56:21
at USN 17703
```

When the output contains the statement No retired signatures, the AD was not restored from the server correctly. As a result, replication cannot be completed because the partner DCs mistake the new invocationID as evidence for a completed replication. For example:

```
C:\Users\Administrator>repadmin /showsig rodc
Default-First-Site-Name\RODC

Current DSA invocationID: ed8ea6b9-d347-4695-b886-b5128be280c4
No retired signatures
```

When the invocationID is retired, the replication can be started. However, this statement does not guarantee success of the replication.

Restoring a virtual disk using multiple sessions

To optimize performance for restore operations, multiple sessions can be used to restore a virtual disk.

Before you begin

To restore a virtual disk using multiple sessions, use the vmmaxrestoresessions option. This option specifies the maximum number of IBM Spectrum Protect server sessions that can be used in an optimized restore operation for a virtual disk.

This option is not valid for Hyper-V virtual machines backups.

About this task

Complete these steps on the data mover system:

Procedure

1. Start a command-line session:
 - **Windows** Open a command prompt and change to the directory: `cd "C:\Program Files\tivoli\tsm\baclient"`.
 - **Linux** Open a terminal window and change to the directory: `cd /opt/tivoli/tsm/client/ba/bin`.
2. Open the `dsm.opt` file with your preferred text editor.
3. Enter the `vmmaxrestoresessions` option and one or more blank spaces, followed by the option value. For example:
`vmmaxrestoresessions 3`
4. Issue the **restore vm** command. For example:
`dsmc restore vm vm1`

Using the examples provided, the restore operations for virtual disks in the VM `vm1` can use a maximum of 3 sessions.

 [Restore VM](#)

Appendix A. Troubleshooting

Solutions to Data Protection for VMware vSphere GUI and Data Protection for VMware command-line interface issues are provided.

Locating log files

For information about Data Protection for VMware log files, see the following topics:

- Log file activity
- File restore log activity options
- “Trace options for file restore” on page 167

Data Protection for VMware vSphere GUI backup or restore operation fails

Complete these tasks to resolve a backup or restore failure:

1. Log on to the system where the data mover is installed.
2. Start a command-line session:
 - **Windows** Open the Windows **Start** menu and select **Programs > IBM Spectrum Protect > Backup-Archive Command Line**.
 - **Linux** Open a terminal window.
3. If not already there, go to the installation directory:

Windows

```
cd C:\Program Files\Tivoli\TSM\baclient
```

Linux

```
cd /opt/tivoli/tsm/client/ba/bin
```

By default, error log files are in the installation directory.

4. View these data mover log files to see if an error was generated:
 - dsmerror.log: All client messages.
 - dsmwebcl.log: All web client messages.
 - dsmj.log: All client Oracle Java™ GUI messages.

These log files are located in the directory you specify with the DSM_LOG environment variable or in the current working directory.

Tip: You can view error explanations in IBM Knowledge Center at Messages, return codes, and error codes.

5. If neither of these files contain an error, run a backup-archive client backup and restore operation to see if it fails.
6. If the data mover operations complete successfully, run a Data Protection for VMware command-line interface “Backup” on page 94 and “Restore” on page 96 operation. Set the appropriate trace parameters (as described in “Profile parameters” on page 113) so you can view any errors that might be generated.

Data Protection for VMware command-line interface backup fails with scSignOnAsAdmin: Error 53

In this situation, a Data Protection for VMware command-line interface backup operation failed and this error was generated to the data mover dsmerror.log:
scSignOnAsAdmin: Error 53 receiving SignOnAsAdminResp verb from server

Typically, this error results when the VMCLI node name is different from its administrator name. These two names must be the same.

Data mover nodes are not visible during a backup operation

Verify that the correct proxy node authority was granted on the IBM Spectrum Protect server. If the correct authority exists, then the data center mapping specified by the VE_DATACENTER_NAME profile parameter is incorrect. See “Profile parameters” on page 113 for a complete description and correct syntax of the VE_DATACENTER_NAME parameter.

The inquire_detail command failed with Return Code 53

In this situation, the vmcli -f inquire_detail command failed and this error was generated to your log file:

```
ANS1033E (RC-53) An invalid TCP/IP address was specified.
```

This error occurs when a node name does not match its administrator name. This issue can happen when you rename a node but do not rename its administrator. The solution is to either rename the administrator to match the new node name or register a new administrator for the new node.

The commands in these examples are issued from the IBM Spectrum Protect administrative command Line:

- Rename the administrator at the same time you rename the node:

```
rename node <current_node_name> <new_node_name>  
rename admin <current_admin_name> <new_node_name>
```

For example:

```
rename node DC_VC5 DC_WIN2K8_X64  
rename admin DC_VC5 DC_WIN2K8_X64
```

As a result, the new administrator name matches the new node name.

- Register the administrator directly after renaming the node:

```
rename node <current_node_name> <new_node_name>  
register admin <new_admin_name> <password>
```

For example:

```
rename node DC_VC5 DC_WIN2K8_X64  
register admin DC_WIN2K8_X64 DC_WIN2K8_X64PWD
```

As a result, the new administrator name matches the new node name.

Session timeout

The IBM Spectrum Protect server COMMTIMEOUT option affects the duration of the Data Protection for VMware session. If the processing time of the Data

Protection for VMware operation exceeds this value, the server ends the session with Data Protection for VMware. Therefore, if you are sure that no error occurred during a Data Protection for VMware operation and the COMMTIMEOUT value has been reached, increase the value. Likewise, if an error occurred but Data Protection for VMware did not report the error in a timely manner, then decrease the value for better real-time reporting.

Resolving a VM guest (with application protection) backup failure

In this situation, a backup (with application protection) of a guest machine is stopped by the user. When the data mover backup process (**dsmagent** or **dsmc**) ends in this manner, the cleanup of the application protection does not take place. As a result, the next backup (with application protection) of the same guest machine can be issued only after a 10-minute interval. This interval is the length of time necessary for the process to recognize that the guest machine is not backed up.

To manually clean up application protection without waiting 10 minutes for communication to clear, complete these steps:

1. Log on to the guest machine with the same user ID and password that was entered when you issued the backup operation.
2. Open a command prompt window and issue this command:
`echo %TEMP%`
3. Go to the %TEMP% directory, then change to the TSM directory. For example:
`C:\Users\Administrator\AppData\Local\Temp\TSM`
4. Delete the BackupHeartBeat.txt file.
5. Back up the guest machine.

Event log contains event ID 8194, VSS message

After a backup of a VM guest with application protection completes, the event log contains the event ID 8194, VSS error message. This cause of this message is an incorrect security setting in the Volume Shadow Copy Service (VSS) writer or requestor process.

To resolve this error, complete these steps:

1. Log on to the VM guest as an administrator and run the Microsoft `dcomcnfg.exe` utility in the **Start > Run** dialog:
`dcomcnfg.exe`

Click **OK**.
The `dcomcnfg.exe` utility is used to modify registry settings.
2. In the Component Services interface, go to **Component Services > Computers**. Right-click **My Computer** and select **Properties**.
3. In the My Computer properties panel, go to **COM Security > Access Permissions: Edit Default**.
4. In the Access Permission panel, add the Network Service account with Local Access permission set to Allow.
5. Apply your changes and close all open Component Services panels.
6. Restart the VM guest.
7. Back up the VM guest and verify that the event ID 8194, VSS error message is not issued to the event log.

Data Protection for VMware installation failure: deployment engine initialization

The Data Protection for VMware installation might be stopped due to a deployment engine initialization failure due to .lock files. If the deployment engine interferes with the Data Protection for VMware installation, the following error message is produced:

```
Deployment Engine failed to initialize.  
The installer will now shutdown. Please check with the log files for a more  
complete description of the failure.  
PRESS ENTER TO CONTINUE:
```

The cause might be deployment engine .lock files that come from a concurrent installation that is running or from an installation that stopped before it completed. If another installation is running, wait until that installation finishes before you install Data Protection for VMware. If there are no other installations that are started and you encounter this problem, delete any .lock files.

Important: Do not delete any .lock files if there are other Data Protection for VMware installations running.

Windows To delete .lock files on Windows, issue the following command:

```
cd C:\Program Files\IBM\Common\acsi\logs  
del .lock*
```

Linux To delete .lock files on Linux, issue the following command:

```
cd /usr/ibm/common/acsi/logs  
rm .lock*
```

After you remove these files, restart the installation.

Unsupported characters in VM or datacenter name

Data Protection for VMware does not support backing up VMs or datacenters that contain any of the following characters in their name:

- " Double quotation mark
- ' Single quotation mark
- :
- ;
- *
- ?
- ,
- <
- >
- /
- \
- |

Issues encountered after changing the vCenter

After you change the vCenter in the Data Protection for VMware vSphere GUI, the following two issues might occur:

- A data center that is associated with the new vCenter does not appear on the Configuration Status page.

To resolve this issue, manually set the domain for the new vCenter. See “Set_domain” on page 106 for details about issuing this command.

- In the Restore tab, an ESX host (associated with a previous data center) displays under a new data center within the new vCenter. This issue is a known limitation. There is not a workaround for this issue.

Consolidating VM backups

After a VM backup, the VM might contain preexisting snapshots even though no snapshots are present in the Snapshot Manager. For example, the VM hard disk points to snapshot VMDK files (for example *-000001.vmdk) instead of regular VMDK files. Although preexisting snapshots might be intentionally retained, Data Protection for VMware does not provide a mechanism to verify whether the VMDK points to a valid snapshot. When snapshots are not consolidated, and a VM with preexisting snapshot files is backed up, Data Protection for VMware might report an incorrect size for the backup on the IBM Spectrum Protect server. Snapshot consolidation also prevents other VMware related issues. As a result, consolidate your snapshots whenever this situation occurs.

To resolve this potential problem, VMware vSphere Client 5.x (or later) notifies you when a VM requires snapshot consolidation. For detailed information, see the following VMware Knowledge Base article: http://kb.vmware.com/selfservice/microsites/search.do?language=en_US&cmd=displayKC&externalId=2003638

For vSphere 4.1 (or earlier), no consolidation option is available. However, the equivalent task is to create a snapshot and then complete a Delete All action.

An error occurred while making the Web server request (GVM0103E)

In this situation, the Data Protection for VMware vSphere GUI shows the following error when you tried to access it:

GVM0103E: An error occurred while making the Web server request. If this error persists, check the network connection with the Web server and verify that the Web server is running.

To prevent this error, make sure that the following conditions exist before you start the GUI:

- **Linux** **Windows** The Data Protection for VMware vSphere GUI is installed on a system that meets the operating system prerequisites. It must have network connectivity to the following systems:
 - vStorage Backup Server
 - IBM Spectrum Protect server
 - vCenter Server (Data Protection for VMware vSphere GUI)
- **Windows** The Data Protection for VMware vSphere GUI host URL address must be set in your Internet Explorer trusted sites zone. In the Internet Explorer menu

bar, go to **Tools > Internet Options > Security > Trusted sites**. Click **Sites** and add the host URL address. Make sure to apply your changes. For example:

Add this website to the zone:http://myvctrmachine.xyzco.com

Return codes for VM backup operations

The following return codes apply to VM backup operations on Linux or Windows systems:

Table 10. Return codes for VM backup operations

Return Code	Description
0	A command to process one or more VMs completed successfully.
8	A command to process multiple VMs succeeded on only some of the VMs that were targeted by the command. Examine the log file to determine the processing status for each of the targeted VMs.
12	A command was issued to process one or more VMs. The command did not complete for any of the VMs that were targeted by the command. Examine the log file to determine possible reasons for the failure.

Troubleshooting file restore operations

You can retrieve diagnostic information to resolve file restore issues, by running Microsoft Windows PowerShell cmdlet commands.

Before you begin

Ensure that Microsoft Windows PowerShell 3 or later is available on the system where Data Protection for VMware is installed. To view which version of PowerShell is installed, enter the following command in a PowerShell session:

```
PS C:\> $PSVersionTable.PSVersion
```

The number that displays in the Major column is the PowerShell version.

About this task

Complete these steps on the system where Data Protection for VMware is installed.

Procedure

1. Start a Microsoft Windows PowerShell or Microsoft Windows PowerShell ISE session with administrator authority. For example:
Start > All Programs > Accessories > Windows PowerShell.
Right-click **Windows PowerShell** and select **Run as administrator**.

2. Verify that execution policy is set to RemoteSigned by issuing the following command:

```
PS C:\> Get-ExecutionPolicy
```

If another policy is shown, set the execution policy to RemoteSigned by issuing the following command:

```
PS C:\> Set-ExecutionPolicy RemoteSigned
```

This policy allows the vetools.psml script to run on the system.

Tip: The **Set-ExecutionPolicy** command must be issued only once.

3. Import the Data Protection for VMware PowerShell module to make the cmdlets available:

```
PS C:\> Import-Module C:\ibm\tivoli\tsm\tdpvmware\webserver\usr\servers\veProfile\tsmVmGUI\vetools.psm1
```

4. Display log file information in a PowerShell Viewer by issuing the following command:

```
PS C:\> Show-VeFileRestoreLogEntries
```

You can investigate and share log information in the PowerShell Viewer with any of the following actions:

- Enter a term to filter the results.
 - Click **Add criteria** to filter the information by more detailed specifications.
 - Click one or more rows to save or copy their content for sharing.
5. Optional: Display trace information from a trace file by issuing the following command:

```
PS C:\> Show-VeFileRestoreTraceEntries
```

6. Optional: If you need to gather logs to review detailed diagnostic information (-review) or to send to IBM Support, save the logs in a compressed file by issuing the following command:

```
PS C:\> Get-VeProblemDeterminationInfo -review
```

By default, this command saves the `VeProblemDetermination.zip` file on the desktop.

Tip: If this command returns an error in the default "PowerShell" interface, start the "PowerShell ISE" interface as an administrator. Then, run the command again.

7. Optional: Each cmdlet provides parameters. To view parameters, issue the following **help** command:

```
help cmdlet name -ShowWindow
```

Related information:

 [File restore log activity options](#)

 [Log file activity](#)

Trace options for file restore

By setting tracing options in the `FRLog.config` file, you can troubleshoot problems that you might encounter during file restore operations.

Modify the options in the `FRLog.config` file with a text editor in administrator mode. The `FRLog.config` file is in the following directory:

```
C:\IBM\tivoli\tsm\tdpvmware\webserver\usr\servers\veProfile\logs
```

FR.API.TRACE=ON | OFF

Specify whether to trace API activity at the recommended level of detail.

Note: The following values are also supported and indicate the least, recommended, and highest level of detail: `DEBUG`, `TRACE`, `ALL`.

API_MAX_TRACE_FILES=number

Specify the maximum number of trace files to be created or used. The default value is 8.

API_MAX_TRACE_FILE_SIZE=number

Specify the maximum size of each trace file in KB. The default value is 8192 KB.

API_TRACE_FILE_NAME=API_trace_file_name

Specify the name of the API trace file. The default value is fr_api.trace.

API_TRACE_FILE_LOCATION=API_trace_file_location

Specify the location of the API trace file. Specify the location by using a forward slash (/). The default location is Install_Directory/IBM/tivoli/tsm/tdpvmware/webserver/usr/servers/veProfile/logs.

File restore solutions

Resolve unique or infrequent issues that interfere with file restore operations.

Log in issues

In this scenario, the following information message displays when a fully qualified host name (myhost.mycompany.com) or numeric IP address (192.0.2.0) is entered in the login page:

The host cannot be found. Verify the host name and log in again.
If the problem persists, contact your administrator.

To resolve this issue, enter either the fully qualified domain name (myhost.mydomain) or the short host name (myhost).

VMware attributes

Review how Data Protection for VMware interacts with VMware attributes.

VMware custom attributes

Data Protection for VMware includes VMware custom attributes in backup and restore operations. However, custom attributes are only included when the data mover node is connected directly to a vCenter Server and not an ESXi Server. To set this connection, specify a vCenter Server with the VMCHost option that is on the data mover node.

For more information, see the following VMware Knowledge Base article:
<http://kb.vmware.com/kb/1005720>

VMware configuration attributes

Data Protection for VMware does not directly access, modify, or back up the .vmx file. The .vmx file is non-portable. As a result, Data Protection for VMware does not save values that are contained in the file or save the actual file. The main objective of Data Protection for VMware is to recover the VM to a usable (or startable) state.

To view a list of VMware configuration attributes that are preserved by Data Protection for VMware, see technote 1631315.

Troubleshooting IBM Spectrum Protect extension problems

Solutions are provided for IBM Spectrum Protect extension issues. You can learn how to resolve Platform Services Controller connection problems, enable tracing, and get more details about IBM Spectrum Protect extension messages.

- “Resolving Platform Services Controller connection problems”
- “Enabling tracing” on page 170
- “Messages for the IBM Spectrum Protect extension” on page 171

Resolving Platform Services Controller connection problems

Tags and categories that are used for the management of virtual machine backups are stored and managed on the VMware Platform Services Controller (PSC). To be able to use the tagging feature for data protection, the tag-based data mover node and the IBM Spectrum Protect extension must be able to connect to the Platform Services Controller by using the Single Sign On process.

The Platform Services Controller server hosts the VMware Lookup Service that registers the location of vSphere components and handles the vCenter Single Sign On process.

Symptoms

When connection problems occur, the data mover node cannot complete the Single Sign On process and cannot access the tags and categories in the Platform Services Controller.

If the Platform Services Controller cannot be reached, the tag information will not be displayed in the IBM Spectrum Protect extension. Virtual machine backup operations will also fail.

Resolving the problem

Complete the following tasks to diagnose and resolve connectivity problems:

- Ensure that the Platform Services Controller host is powered on and accessible over the network.
- Ensure that the VMware Lookup Service is active and accepting connections at the following address: `https://PSC-FQDN/lookupservice/sdk`, where *PSC-FQDN* is the fully qualified domain name of the Platform Services Controller host.
- Ensure that a data mover is installed on the same server that hosts the Data Protection for VMware vSphere GUI. The data mover node must be configured so that the vCenter server credentials are saved, for example, by using the **dsmc set password** command in the backup-archive command-line.
-  For Linux data mover nodes, ensure that the default password file (`/etc/adsm/TSM.PWD`) is used.
- Ensure that client option `vmchost` is set by using the same value and format that was used for the vCenter server field during the installation of Data Protection for VMware. The preferred format for the vCenter server address is the vCenter server's fully qualified domain name (FQDN). Use the vCenter server IP address only if it was used during the registration of the vCenter, although the IP address is not preferred by VMware.
- The system time on the data mover host must be in sync with the system time on the Platform Services Controller and vCenter. The system time and time zone must be set correctly on all three systems. Otherwise, a Platform Services Controller connection error occurs. The following message is typical of this type of error:

ANS2378E Single Sign On login to the vSphere Server failed in function visdkGetSecurityToken - Issue. "The time now Wed Apr 20 21:31:58 UTC 2016 does not fall in the request lifetime interval extended with clock tolerance of 600000 ms: [Wed Apr 20 16:20:46 UTC 2016; Wed Apr 20 16:50:46 UTC 2016). This might be due to a clock skew problem."

- For more information about messages that occurred, see "Messages for the IBM Spectrum Protect extension" on page 171.

Enabling tracing

By enabling the tracing feature, you can troubleshoot problems that you might encounter during operations with the IBM Spectrum Protect extension or the tag-based data mover node.

About this task

To enable tracing in the common VMware vCloud Suite layer for both the backup-archive command-line client and the IBM Spectrum Protect extension, the following trace files and trace properties files are used:

Log location

Trace output is added to the following log files:

- **Windows** (Client) C:\Program Files\Tivoli\TSM\baclient\vcspgugin.log
- **Linux** (Client) /opt/tivoli/tsm/client/ba/bin/vcspgugin.log
- **Windows** (Data Protection for VMware) C:\IBM\tivoli\tsm\tdpvmware\webserver\usr\servers\veProfile\logs\vcspgugin.log
- **Linux** (Data Protection for VMware) /opt/tivoli/tsm/tdpvmware/common/webserver/usr/servers/veProfile/logs/vcspgugin.log

Log property location

The property values are updated in the following trace properties files to enable tracing:

- **Windows** (Client) C:\Program Files\Tivoli\TSM\baclient\plugins\vccloudsuite\sdk\log4j.properties
- **Linux** (Client) /opt/tivoli/tsm/client/ba/bin/plugins/vccloudsuite/sdk/log4j.properties
- **Windows** (Data Protection for VMware) C:\IBM\tivoli\tsm\tdpvmware\webserver\usr\servers\veProfile\apps\tsmVmGUI.war\WEB-INF\classes\log4j.properties
- **Linux** (Data Protection for VMware) /opt/tivoli/tsm/tdpvmware/common/webserver/usr/servers/veProfile/apps/tsmVmGUI.war\WEB-INF\classes/log4j.properties

Procedure

1. To view more detailed trace information for the common VMware vCloud Suite layer, change the following property value from INFO to TRACE in the corresponding log4j.properties file:
log4j.logger.com.ibm.tivoli.tsm.ve=TRACE
2. To view more detailed trace information for the common vCloud Suite layer, VMware vCloud Suite SDK, and associated .jar files, change the following property value from WARN to TRACE, in the corresponding log4j.properties file

```
log4j.rootLogger=TRACE,file
```

3. Rerun the actions or commands that caused the error. If the error occurred in the IBM Spectrum Protect extension, you must restart the server that hosts the Data Protection for VMware vSphere GUI.

Resolving administrator ID not found messages

Some data and options are not shown in IBM Spectrum Protect extension if the IBM Spectrum Protect server administrator ID is not available. This ID must be configured in the Data Protection for VMware vSphere GUI.

Procedure

If data or options are not shown in IBM Spectrum Protect extension and a message is displayed specifying that the administrator ID cannot be found, complete the following steps in the Data Protection for VMware vSphere GUI to set and save the administrator ID:

1. In the GUI menu bar, click **Configuration**.
2. Select **Edit IBM Spectrum Protect Configuration** in the **Tasks** menu.
3. On the **Server Credentials** page, complete the following steps:
 - a. Enter the administrator ID in the **IBM Spectrum Protect Admin ID** field if it is not already entered and complete the corresponding fields and options for the password and port.
 - b. Select the **Save the administrator ID, password, and port settings for use in future sessions** check box. If an administrator ID is configured, but this check box is not selected, the administrator ID will not be available for IBM Spectrum Protect extension sessions.
4. Click **OK** to save the changes.

Messages for the IBM Spectrum Protect extension

To help you understand IBM Spectrum Protect extension messages, review the following information:

- GVM5107E
- GVM5110E
- GVM5111E
- GVM5112E

GVM5107E: Data protection settings are not available because the login credentials provided are invalid for the 'name' Platform Services Controller

The symptoms, cause, and user response are provided for this IBM Spectrum Protect extension message.

Symptoms

Data protection settings cannot be displayed in the IBM Spectrum Protect extension.

Causes

The credentials that are required to log in to the Platform Services Controller are invalid for the vCenter.

Resolving the problem

Ask the IBM Spectrum Protect server administrator to update the vCenter Server credentials by using the **dsmc set password** command in the backup-archive command-line client on the server where the Data Protection for VMware vSphere GUI is installed.

```
dsmc set password -type=vm vmchost username password
```

The value for the `vmchost` option must match the value that is in the client options file. It must also match the vCenter server address that was used during the installation of the Data Protection for VMware vSphere GUI.

You might also receive the following data mover messages that are associated with this error:

- Client message ANS9331W
- Client message ANS9332E

Related information

 Set Password

GVM5110E: Data protection settings are not available because an error occurred connecting to the 'name' Platform Services Controller

The symptoms, cause, and user response are provided for this IBM Spectrum Protect extension message.

Symptoms

Data protection settings cannot be displayed in the IBM Spectrum Protect extension.

Causes

Other errors are causing connection issues to the Platform Services Controller and vCenter.

Resolving the problem

Ensure that the Platform Services Controller listed is running as expected. For more information, see “Resolving Platform Services Controller connection problems” on page 169.

You might also receive the following data mover message that is associated with this error:

- Client message ANS2373E

GVM5111E: Data protection settings are not available because no login credentials are found for the 'name' Platform Services Controller

The symptoms, cause, and user response are provided for this IBM Spectrum Protect extension message.

Symptoms

Data protection settings cannot be displayed in the IBM Spectrum Protect extension.

Causes

The credentials that are required to log in to the Platform Services Controller cannot be found for the vCenter. For example:

- **Windows** The value for the `vmchost` option cannot be found in the Windows registry.
- **Linux** The IBM Spectrum Protect password file (`TSM.PWD`) cannot be accessed or the value for the `vmchost` option cannot be found in the `TSM.PWD` file.

Resolving the problem

Windows

Ask the IBM Spectrum Protect server administrator to update the vCenter Server credentials by using the **`dsmc set password`** command in the backup-archive command-line client on the server where the Data Protection for VMware vSphere GUI is installed.

```
dsmc set password -type=vm vmchost username password
```

The value for the `vmchost` option must match the value that is in the client options file. It must also match the vCenter server address that was used during the installation of the Data Protection for VMware vSphere GUI.

Linux

If the `TSM.PWD` file cannot be found, try the following actions:

- The default location for the `TSM.PWD` file is `/etc/adsm/TSM.PWD`. Verify that this file exists. If it does not, ask the IBM Spectrum Protect administrator to create the password file. The administrator must complete the following steps in the backup-archive command-line client (data mover) on the server where the Data Protection for VMware vSphere GUI is installed:

1. Generate and save the password for the data mover node by running the following command:

```
dsmc set password
```

2. Refresh or restart the client acceptor daemon (**`dsmcad`**).

3. Run the following command:

```
dsmc set password -type=vm vmchost username password
```

The value for the `vmchost` option must match the value that is in the client options file. It must also match the vCenter server address that was used during the installation of the Data Protection for VMware vSphere GUI.

- If you specified an alternative location for the password file with the `passworddir` option in the `dsm.sys` file, you must also specify the following option in the `vcs.properties` file. The following location is typical for the `vcs.properties` file:

```
/opt/tivoli/tsm/tdpvmware/common/webserver/usr/servers/veProfile/apps/  
tsmVmGUI.war/WEB-INF/config/vcs.properties
```

Add the following statement to the file:

```
passwordfile=<absolute path of the TSM.PWD file>
```

For example:

```
passwordfile=/etc/security/tsm/TSM.PWD
```

If the `TSM.PWD` file cannot be accessed due to permission issues, complete the following steps:

1. Ensure that the `TSM.PWD` file is accessible by the `tdpvmware` user.

2. If you receive a permission error, check that the permissions for the TSM.PWD appear as follows:

```
-rw-r----- 1 root tdpvware
```

If the permissions do not match, go to the directory that contains the TSM.PWD file and change the permissions with the following commands:

```
chgrp tdpvware TSM.PWD  
chmod g+r TSM.PWD
```

You might also receive the following data mover messages that are associated with this error:

- Client message ANS9331W
- Client message ANS9332E

Related information

 **Set Password**

GVM5112E: Data protection settings are not available because an error occurred processing the login credentials that are provided for the '*name*' Platform Services Controller

The symptoms, cause, and user response are provided for this IBM Spectrum Protect extension message.

Symptoms

Data protection settings cannot be displayed in the IBM Spectrum Protect extension.

Causes

The credentials that are required to log in to the Platform Services Controller are available but one or more of the following errors occurred:

- An error occurred processing the credentials.
- An error occurred loading the native library that is needed to process the credentials.

Resolving the problem

Contact the IBM Spectrum Protect server administrator for assistance.

You might also receive the following data mover messages that are associated with this error:

- Client message ANS2635E
- Client message ANS9365E

Appendix B. IBM Spectrum Protect recovery agent operations

This service enables the mounting of any snapshot volume from the IBM Spectrum Protect server. You can view the snapshot locally, with read-only access, on the client system, or use an iSCSI protocol to access the snapshot from a remote computer.

In addition, the recovery agent provides the instant restore function. A volume that is used in instant restore processing remains available while the restore process proceeds in the background. The recovery agent is accessed with the recovery agent GUI or command-line interface.

Important: Previous versions of IBM Spectrum Protect for Virtual Environments delivered mount and file restore function with the recovery agent. Although this function is still supported by the recovery agent, the IBM Spectrum Protect file restore interface is the preferred method, as described in the following topic:

Chapter 3, “Getting started with file restore,” on page 43

The content in this “IBM Spectrum Protect recovery agent operations” collection is provided as a reference for users who prefer the recovery agent method.

Mounting snapshots with the recovery agent

Linux

Windows

You can use the IBM Spectrum Protect recovery agent to mount a snapshot and use the snapshot to complete data recovery.

Mount snapshots with either the recovery agent GUI or with the “Mount command” on page 120. Install and run the recovery agent on a system that is connected to the IBM Spectrum Protect server through a LAN. You cannot use the recovery agent component operations in a LAN-free path.

Be aware of these three situations when running mount operations:

- When the recovery agent is installed on a guest machine, you cannot start an instant restore or a mount operation for any file system or disk while the guest machine is being backed up. You must either wait for the backup to complete, or you must cancel the backup before running an instant restore or a mount operation. These operations are not allowed because the locking mechanism is for a full VM.
- When you browse the snapshot backup inventory, the operating system version of the VM is the version that was specified when the VM was originally created. As a result, the recovery agent might not reflect the current operating system.
- A volume becomes unstable when a network failure interrupts a mount operation. A message is issued to the event log. When the network connection is reestablished, another message is issued to the event log. These messages are not issued to the recovery agent GUI.

A maximum of 20 iSCSI sessions is supported. The same snapshot can be mounted more than one time. If you mount a snapshot from the same tape storage pool by using multiple instances of the recovery agent, one of the following actions occurs:

- The second recovery agent instance is blocked until the first instance is complete.
- The second recovery agent instance might interrupt the activity of the first instance. For example, it might interrupt a file copy process on the first instance.
- The recovery agent cannot connect to multiple servers or nodes simultaneously.

As a result, avoid concurrent recovery agent sessions on the same tape volume.

Mounting snapshot guidelines for Windows systems

Snapshots can be mounted in either read-only or read/write mode. In read/write mode, the recovery agent saves changes to data in memory. If the service is restarted, the changes are lost.

The recovery agent operates in either of the following two modes:

No user is logged in

The recovery agent runs as a service. This service enables remote connections through the Data Protection for VMware command-line interface.

User is logged in

The recovery agent continues to run as a service until you start the recovery agent and use the GUI. When you close the recovery agent and GUI, the service restarts. You can use only the recovery agent application and GUI when running with administrator login credentials. Only one copy of the recovery agent application can be active at any time.

When mounted volumes exist and you start Mount from the Start menu on Microsoft Windows operating systems, this message is displayed:

Some snapshots are currently mounted. If you choose to continue, these snapshots will be dismounted. Note that if a mounted volume is currently being used by an application, the application may become unstable. Continue?

When **Yes** is clicked, the mounted volumes are unmounted, even when they are in use.

Restriction: When exposing snapshots as iSCSI targets, and a snapshot of a dynamic disk is displayed to its original system, the UUIDs become duplicated. Likewise when a snapshot of a GPT disk is displayed to its original system, the GUIDs become duplicated. To avoid this duplication, expose dynamic disks and GPT disks to a system other than the original system. For example, expose these disk types to a proxy system, unless the original disks no longer exist.

Restoring files with the recovery agent

Linux

Windows

Use the IBM Spectrum Protect recovery agent for efficient file restores and to minimize downtime by mounting snapshots to virtual volumes.

You can use the recovery agent for the following tasks:

- Recovering lost or damaged files from a backup
- Mounting a VM guest volume and creating an archive of the VM guest files
- Mounting database applications for batch reports

The virtual volume can be viewed by using any file manager, for example Windows Explorer. The directories and files in the snapshot can be viewed and managed like any other file. If you edit the files and save your changes, after you unmount the volume, your changes are lost because the changed data is held in memory and never saved to disk. Because the changes are written to memory, the recovery agent can use a large amount of RAM when working in read/write mode.

You can copy the changed files to another volume before unmounting the volume.

The default *read only* mount option is the preferred method, unless a mounted volume must be writeable. For example, an archive application might require write access to the archived volume.

The recovery agent mounts snapshots from the IBM Spectrum Protect server. In the recovery agent GUI, click **Remove** to close an existing connection to a server. You must remove any existing connection before you can establish a new connection to a different server or different node. Dismount all volumes before you click **Remove**. The remove operation fails if there are active mount and restore sessions in the Windows Mount machines. You cannot remove the connection to a server when you are running a file restore or an instant restore from that server. You must first dismount all virtual devices and stop all instant restore sessions before you disconnect from a server. If you do not do so, the connection is not removed.

You must unmount all virtual volumes before uninstalling the recovery agent. Otherwise, these mounted virtual volumes cannot be unmounted after the recovery agent is reinstalled.

Restoring file information for a block-level snapshot is a random-access process. As a result, processing might be slow when a sequential-access device (such as a tape) is used. To run a file restore of data that is stored on tape, you must first move the data to disk or file storage as file restore from tape media is no longer supported. From the IBM Spectrum Protect server administrative command-line client (dsmadm), issue the **QUERY OCCUPANCY** command to see where the data is stored. Then, issue the **MOVE NODEDATA** command to move the data back to disk or file storage.

When restoring data from a mirrored volume, mount only one of the disks that contains the mirrored volume. Mounting both disks causes Windows to attempt a resynchronization of the disks. However, both disks contain a different timestamp if mounted. As a result, all data is copied from one disk to the other disk. This amount of data cannot be accommodated by the virtual volume. When you must recover data from a volume that spans two disks, and those disks contain a mirrored volume, complete these steps:

1. Mount the two disks.
2. Use the iSCSI initiator to connect to the first disk.
3. Use Windows Disk Manager to import this disk. Ignore any message regarding synchronization.
4. Delete the mirrored partition from the first (or imported) disk.
5. Use the iSCSI initiator to connect to the second disk.
6. Use Windows Disk Manager to import the second disk.

Both volumes are now available.

Restriction: Do not change the IBM Spectrum Protect node password while running a file restore or an instant restore from snapshots stored in that node.

Restoring files from a Windows system with the recovery agent

Windows

You can use the IBM Spectrum Protect recovery agent for efficient file restore and to minimize downtime by mounting snapshots to virtual volumes.

Before you begin

Important: Previous versions of IBM Spectrum Protect for Virtual Environments delivered mount and file restore function with the recovery agent. Although this function is still supported by the recovery agent, the IBM Spectrum Protect file restore interface is the preferred method, as described in the following topic:

Chapter 3, “Getting started with file restore,” on page 43

The content in this “IBM Spectrum Protect recovery agent operations” collection is provided as a reference for users who prefer the recovery agent method.

You can use the recovery agent for efficient file restore and to minimize downtime by mounting snapshots to virtual volumes. On supported Windows operating systems, file restore is supported from snapshots of NTFS, FAT, or FAT32 volumes.

In order to recover Microsoft Exchange Server mailbox items, you must use the IBM Spectrum Protect for Mail: Data Protection for Microsoft Exchange Server product and documentation. As a result, IBM Spectrum Protect for Mail: Data Protection for Microsoft Exchange Server must be purchased separately with a valid license. For more information, see the following product website:
<http://www.ibm.com/software/products/tivostormanaformail/>

The mount function cannot be used to mount a snapshot of partitions from a dynamic or GPT-based disk as a virtual volume. Only partitions from an MBR-based, basic disk can be mounted as virtual volumes. File restore from GPT, dynamic, or any other non-MBR or non-basic disk is possible by creating a virtual iSCSI target and using an iSCSI initiator to connect it to your system.

Important: The ACL values associated with the folders and files that are restored in a file restore operation are not transferred to the recovered files. In order to maintain ACL values, use the XCOPY command when copying files from the target.

Before proceeding, make sure you have reviewed the following information:

- “Mounting snapshots with the recovery agent” on page 175

To mount a backed up VM disk from a Windows system for file restore, use the Data Protection for VMware vSphere GUI mount wizard.

In order to recover Microsoft Exchange Server mailbox items, you must use the IBM Spectrum Protect for Mail: Data Protection for Microsoft Exchange Server product and documentation. As a result, IBM Spectrum Protect for Mail: Data Protection for Microsoft Exchange Server must be purchased separately with a valid license. For more information, see the following product website:

About this task

Windows

To run a file restore for a Windows system, complete the following steps:

Procedure

1. Log on to the system where you want to restore files. The recovery agent must be installed on the system.
2. Start the recovery agent GUI from the **Start > All Programs** menu or by clicking the recovery agent icon in the taskbar.
3. Connect to the IBM Spectrum Protect server by clicking **Select IBM Spectrum Protect server**. The target node is where the backups are located. You can manage the level of access to the target node data by specifying a different node name in the Node access method section.
A list of VMs with snapshots stored in the specified node displays.
4. Select a VM from the list. A list of snapshots for the selected VM displays.

Tip: You can find your VM quickly by typing the first few letters of the machine name in the edit portion of the list box. The list shows only those machines that match the letters you entered. Machine names are case-sensitive.

A VM might display in the list, but if you select it, the snapshots list might be empty. This situation occurs because of one of the following reasons:

- No snapshots completed successfully for that VM.
 - The **Fromnode** option was used and the specified node is not authorized to restore the selected VM.
5. Select the preferred snapshot date. A list of VM disks that are backed up in the selected snapshot displays. Select a disk and click **Mount**.
 6. In the Select Mount Destination dialog, check **Create virtual volume from selected partition**. A list of partitions available on the selected disk is shown. For each partition, its size, label, and file system type are displayed.
 - If the disk is not MBR-based, an error message is displayed.
 - By default, only partitions that can be used for file restore are displayed.
 - To display all partitions that existed on the original disk, clear the **Show only mountable partitions** check box.
 7. Select the required partition. Partitions formatted using unsupported file systems cannot be selected.
 8. Specify a drive letter or an empty folder as a mount point for the virtual volume.
 9. Click **OK** to create a Virtual Volume that can be used to recover the files.
 10. When the Virtual Volume is created, use Windows Explorer to copy the files to your preferred location.

Important: The ACL values associated with the folders and files that are restored in a file restore operation are not transferred to the recovered files. In order to maintain ACL values, use the XCOPY command when copying files from the target.

Restoring volumes instantly with the recovery agent

Linux

Windows

Unlike a conventional volume restore, instant restore provides access to volume contents while the restore process is in progress. Less downtime is required before a recovered volume can be used. After you start an instant restore, you can use data on the disk while the restore is in progress.

Instant restore works only with local volumes. The term "local" is used regarding the IBM Spectrum Protect recovery agent since it must be installed on the guest machine that contains the volume to be restored. Local volumes must have an assigned drive letter. Instant restore cannot be used to restore the system volume.

Instant restore destination volumes must be either on basic disks, or simple volumes on dynamic disks. Destination volumes cannot be spanned volumes, mirrored volumes, or Software RAID 0, RAID 1, and RAID 5 volumes. You can use a basic disk as a destination volume and then convert the basic disk to a dynamic disk. The file system on the destination volume cannot be a FAT file system. If you plan to restore into a FAT volume, you must format it as NTFS before attempting an instant restore.

You can complete an instant restore of a volume in a supported clustered environment. While instant restore process is running, you can access the volume. Other volumes in the cluster might not be affected, and you can work with the cluster, and with that volume, in parallel. During the instant restore, the disk that is being restored cannot fail over if the node fails.

If a system is shut down while instant restore is in progress, the instant restore automatically continues from the same point when power is restored.

Restoring volumes instantly from a Windows system with the recovery agent

Windows

With instant restore, you can restore a volume and almost immediately use the restored volume. Less downtime is required before a recovered volume can be used because you can use data on the disk while the restore is in progress.

Before you begin

Important: Previous versions of IBM Spectrum Protect for Virtual Environments delivered mount and file restore function with the IBM Spectrum Protect recovery agent. Although this function is still supported by the recovery agent, the IBM Spectrum Protect file restore interface is the preferred method, as described in the following topic:

Chapter 3, "Getting started with file restore," on page 43

The content in this "IBM Spectrum Protect recovery agent operations" collection is provided as a reference for users who prefer the recovery agent method.

Instant restore operations on Windows require the recovery agent to be installed on the guest machine.

Instant restore is available only from Data Protection for VMware snapshots on a source volume that is on a simple, MBR-based disk. The volume format of volumes on those disks must be NTFS, FAT, or FAT32. However, instant restore to a destination partition on FAT volumes is not supported. As a result, if you plan to restore to a destination partition that is formatted as FAT, you must format the partition as NTFS before attempting a restore. In addition, when selecting a destination volume for instant restore, make sure that the volume is on a physical disk, and not on a virtual iSCSI disk.

- Restoring a volume involves overwriting data on the existing storage volume. After the restore begins, the current volume contents are permanently erased. Before you start the restore, verify that the correct volume is selected, and that there are no open handles or processes that are using that volume.
- The restore operation fails if there are open files or applications that are running on the target restore volume. Selecting **Ignore open handles on the destination volume** causes Data Protection for VMware to ignore the open files and applications that are running on the destination volume. This situation can cause a problem with applications and loss of data in files that are open on the target volume.

Use the **Max CPU** slider to adjust the processor usage for the restore process.

To cancel the restore process, select the instant restore session that is in progress and click **Abort**. All data on the target drive is lost. You can click **Abort All** to cancel all processes. If you stop an instant restore without clicking **Abort** or **Abort all**, the restored volume is displayed as a valid volume, but the data on the volume is invalid. The data is invalid because the data was partially restored, but the restore process did not have time to complete, and the shutdown was abnormal.

If the service is stopped while instant restore is running, the volume appears to be a valid volume. Trying to access the area of the volume that is not yet restored fails, and the data appears corrupted. After the service restarts, the restore process continues, and the data appears valid. If a power failure occurs during instant restore, after the machine restarts, the volume appears to be unformatted. Do not attempt to format or modify the volume. After the service starts, the instant restore process resumes, and the volume appears valid.

A temporary problem might prevent the session from running. For example, a network problem might cause a temporary loss of access to the IBM Spectrum Protect server. In that case, the instant restore session pauses. To continue to the restore process after the pause, select the appropriate line in the instant restore list and click **Resume**. During the period when the session is paused, the parts of the volume that are not yet restored are inaccessible.

You can use instant restore to restore into a simple volume that is on a dynamic disk. However, the source volume must be an MBR-based disk. The source volume cannot be a dynamic disk. This restore might cause the disk status to change to *Online (Errors)*. In addition, the status of all volumes on the disk might change to *At Risk*. This change in disk status can occur when network traffic is too heavy for instant restore to operate. In this situation, the volumes are online and mounted. You can return the disk and volume status to normal by going to the Computer Management Console. Right-click the disk; then, click **Reactivate Disk**.

Before proceeding, make sure you have reviewed the following information:

- “Mounting snapshots with the recovery agent” on page 175

- “Restoring volumes instantly with the recovery agent” on page 180

The recovery agent GUI must be configured before attempting a file restore operation. To configure, click **Select IBM Spectrum Protect server** and **Settings** in the recovery agent GUI and enter the required information.

About this task

Use the **Max CPU** slider to adjust the processor usage for the restore process.

To cancel the restore process, select the instant restore session that is in progress and click **Abort**. All data on the target drive is lost. You can click **Abort All** to cancel all processes. If you stop an instant restore without clicking **Abort** or **Abort all**, the restored volume is displayed as a valid volume, but the data on the volume is invalid. The data is invalid because the data was partially restored, but the restore process did not have time to complete, and the shutdown was abnormal.

If the service is stopped while instant restore is running, the volume appears to be a valid volume. Trying to access the area of the volume that is not yet restored fails, and the data appears corrupted. After the service restarts, the restore process continues, and the data appears valid. If a power failure occurs during instant restore, after the machine boots up, the volume appears to be unformatted. After the service starts, the instant restore process resumes, and the volume appears valid.

A temporary problem might prevent the session from running. For example, a network problem might cause a temporary loss of access to the IBM Spectrum Protect server. In that case, the instant restore session pauses. To continue to the restore process after the pause, select the appropriate line in the instant restore list and click **Resume**. During the period when the session is paused, the parts of the volume that are not yet restored are inaccessible.

You can use instant restore to restore a simple volume that is located on a dynamic disk. The destination volume can be a dynamic disk; however, the source volume cannot be a dynamic disk. This restore might cause the disk status to change to *Online (Errors)*. In addition, the status of all volumes on the disk might change to *At Risk*. This change in disk status can occur when network traffic is too heavy for instant restore to operate. In this situation, the volumes are online and mounted. You can return the disk and volume status to normal by going to the Computer Management Console. Right-click the disk; then, click **Reactivate Disk**.

Procedure

To perform an instant restore, complete the following steps:

1. On the guest machine, start the recovery agent GUI from the **Start > All Programs** menu or by clicking the recovery agent icon in the taskbar.
2. In the recovery agent window, select the IBM Spectrum Protect server to use as the source by clicking **Select IBM Spectrum Protect server**. Although the **Select IBM Spectrum Protect server** list appears to contain multiple servers, this list contains a maximum of one server only. The recovery agent queries the server for a list of protected VMs and displays the list.
3. Select a VM, date, time, and disk, and then click **Restore**.
4. The recovery agent displays a list of partitions available on the selected disk. For each partition, its size, label, and file system type are displayed. Select the

required partition. By default, only partitions that can be restored are displayed. To display all the partitions that are available on one or more disks, clear the **Show only restorable partitions** check box. Select the required partition from the list.

Note:

- Drive letters are not displayed.
 - If a disk cannot be parsed, an error message is displayed and the **Instant Restore** dialog is closed. For example, this occurs when the disk is dynamic or a GUID partition table (GPT).
5. Select the destination partition into which the data is to be restored. The destination location size must be equal or larger than the source size.
 6. Click **Restore**.
 7. A confirmation message is displayed. Verify the information and click **Yes**. The restore process begins. In the instant restore section, you can see the status of the restore process. When the status changes to restoring, the volume is available for use.

Appendix C. Data Protection for VMware vSphere GUI messages

This information contains explanations and suggested actions for messages issued by the Data Protection for VMware vSphere GUI.

For messages shown in the Data Protection for VMware vSphere GUI that contain the FMM prefix, message information is available at the following web site: FMM, FME, FMV, FMX, FMY: IBM Spectrum Protect Snapshot messages

GVM0001E The operation failed with return code
return code

GVM0002E An internal error occurred: *type of error*

GVM0003E A connection with the IBM Spectrum Protect server could not be established.

Explanation: The server might not be running.

Administrator response: Check the network connection with the server machine. Verify that the server is running and try to log in again.

GVM0004W Are you certain that you want to delete this data?

Explanation: You cannot recover the data after it is deleted. Ensure that the data is not needed before you delete it.

Administrator response: Click OK to delete the data or click Cancel to cancel this action.

GVM0005W The connection with the IBM Spectrum Protect server has timed out.

Explanation: Possible causes include a long-running operation, a problem on the server, or a communications problem.

Administrator response: If the operation is long-running, the operation might be complete or it might soon be complete. Before trying the operation again, determine if the expected result occurred. Check the activity log of the IBM Spectrum Protect server for errors related to the operation. Using a SSL port without selecting SSL can cause this error.

GVM0006I A server connection with the name
server name has been successfully
created. Click OK to continue.

GVM0007W There is no IBM Spectrum Protect server definition found.

Explanation: A connection for a IBM Spectrum Protect server must be defined before any server operations or queries are performed.

Administrator response: To define a server:

1. Click the Configuration tab.
2. Click the Edit Configuration Settings action link.
3. Click the IBM Spectrum Protect Server Credentials tab.

GVM0008E An error occurred while writing to the server's database file, *tsmsserver.props*

Explanation: The server definition could not be written to the *tsmsserver.props* file.

Administrator response: The file must reside in the install directory of IBM Spectrum Protect. Before you try the action again, verify that the file exists and that the file is not write protected.

GVM0011I The VM *VM name* is spanned into multiple datastores. It can only be restored to its original location.

GVM0011W The VM *VM name* exists, are you going to over-write it?

GVM0012W The VM *VM name* is running, make sure the system is powered down, then hit OK to continue.

GVM0020E A connection with the vCenter server could not be established.

Explanation: The server might not be running.

Administrator response: This might indicate a network problem. Ensure that the server is running and the machine is accessible. Try the action again.

GVM0021I A connection with the vCenter server has been established.

GVM0022E The VMCLI inquire configuration command failed, the following messages describe the error.

Explanation: The Derby database might not be running.

Administrator response: Correct the problem. Try the action again.

GVM0023I The VMCLI inquire configuration command completed successfully.

GVM0024E Failed to determine which product or products are installed.

Explanation: See message.

Administrator response: Correct the problem. Try the action again.

GVM0025I Successfully determined which product or products are installed.

GVM0026E Multiple restore points have been selected, but they are not located in the same datacenter.

Explanation: Selecting restore points from different datacenters is not permitted. The restore points must all be located in the same datacenter.

Administrator response: Select the restore points from the same datacenter or select just a single restore point.

GVM0027E Multiple restore points have been selected, but they are not from the same backup.

Explanation: Selecting restore points from different backups is not permitted. The restore points must all be located in the same backup.

Administrator response: For restores from IBM Spectrum Protect Snapshot, all restore points must come from the same backup. You cannot restore multiple VMs that come from of different backups.

GVM0028E A key configuration file is missing: vmcliConfiguration.xml.

Explanation: The file vmcliConfiguration.xml is required for the GUI to operate, but has not been found during GUI session startup. This is an unusual problem, it may be due to an install issue or manual editing of the file.

Administrator response: Make sure the file is located in the correct directory, has correct access permissions, and has valid syntax for its content. Retry accessing the GUI.

GVM0029E Invalid mode tag in file vmcliConfiguration.xml.

Explanation: The xml tag mode in file vmcliConfiguration.xml is required for the GUI to operate, but is missing or has an incorrect value. This may be due to an install issue or manual editing of the file.

Administrator response: Make sure the tag is specified with a valid value. Retry accessing the GUI.

GVM0030E Invalid enable_direct_start tag in file vmcliConfiguration.xml.

Explanation: The xml tag enable_direct_start in file vmcliConfiguration.xml is required for the GUI to operate, but is missing or has an incorrect value. This may be due to an install issue or manual editing of the file.

Administrator response: Make sure the tag is specified with a valid value. Retry accessing the GUI.

GVM0031E Invalid URL tag for the specified mode tag in file vmcliConfiguration.xml.

Explanation: In file vmcliConfiguration.xml, the URL tag corresponding to the specified mode tag is required for the GUI to operate, but is missing or has an incorrect value. This may be due to an install issue or manual editing of the file.

Administrator response: Make sure the correct URL tag is specified with a valid value for the specified mode. Retry accessing the GUI.

GVM0032E Invalid VMCLIPath tag in file vmcliConfiguration.xml.

Explanation: The xml tag VMCLIPath in file vmcliConfiguration.xml is required for the GUI to operate, but is missing or has an incorrect value. This may be due to an install issue or manual editing of the file.

Administrator response: Make sure the tag is specified with a valid value. Retry accessing the GUI.

GVM0033E Invalid interruptDelay tag in file vmcliConfiguration.xml.

Explanation: The xml tag interruptDelay in file vmcliConfiguration.xml is required for the GUI to operate, but is missing or has an incorrect value. This may be due to an install issue or manual editing of the file.

Administrator response: Make sure the tag is specified with a valid value. Retry accessing the GUI.

GVM0099E The VM name entered *VM name* conflicts with an existing VM. Please enter a different name.

GVM0100E An error occurred while processing the request to the Web server. If this error persists, check the network connection with the Web server and verify that the Web server is running. **Detail:** *exception message*

GVM0101E A request to the server took too long to complete. If this error persists, check the network connection with the Web server and verify that the Web server is running.

GVM0102E An error occurred while processing the response from the Web server. **Detail:** *error*

GVM0103E An error occurred while making the Web server request. If this error persists, check the network connection with the Web server and verify that the Web server is running. **Error:** *message*

GVM0104E No matching device class found. Please return to source page and reselect.

GVM0105E No matching proxy node found. Please return to source page and reselect.

GVM0106E No proxy ESX hosts available.

GVM0107I Password set successfully.

GVM0108E Set password failed. **Error:** *message*

Explanation: The password may be incorrect or the server is not running.

Administrator response: Verify the password is correct then try the action again. Or check the network connection with the server machine and verify that the server is running then try the action again.

GVM0109E Get managed domain failed. **Error:** *message*

GVM0110E Multiple restore points have been selected, but they are not the same backup type.

Explanation: Selecting restore points of different types is not allowed. The restore points must all be located

on either a IBM Spectrum Protect server or in the IBM Spectrum Protect Snapshot repository.

Administrator response: Select the same type of restore points or select just a single restore point.

GVM0111E Backup ID is null.

Explanation: An internal error occurred.

Administrator response: Refresh the table and perform the action again.

GVM0112E Task ID is null.

Explanation: An internal error occurred.

Administrator response: Refresh the table and perform the action again.

GVM0113E Could not open a pop-up window.

Explanation: An internal error occurred.

Administrator response: Try the action again.

GVM0114E Virtual machine name is null.

Explanation: An internal error occurred.

Administrator response: Refresh the table and perform the action again.

GVM0115E Datastore does not exist.

Explanation: An internal error occurred.

Administrator response: Refresh the table and perform the action again.

GVM0116I No selection was made, the whole virtual machine will be attached.

Explanation: No selection was made.

Administrator response: Continue with the action or cancel the action.

GVM0117I Domain set successfully.

GVM0118E Set domain failed. **Error:** *message*

Explanation: The server might not be running. The permissions on the file directory may be incorrect.

Administrator response: Check the network connection with the server machine. Verify that the server is running and try the action again. Check the permissions of the directory indicated in SystemErr.log if error indicates incorrect permissions.

GVM0119E The schedule requires use of the following datacenters that are not in the active domain. Datacenters: *list* Action: This schedule may not be updated, instead either update the domain construct to include the datacenters, or create a new schedule without dependence on these datacenters. Detail: The schedule definition is as follows: Schedule Summary *summary*

GVM0120E The schedule requires use of the following datacenters that are not known to the system. Datacenters: *list* Action: This schedule may not be updated, instead create a new schedule without dependence on these datacenters. Detail: The schedule definition is as follows: Schedule Summary: *summary*

GVM0121E The schedule requires use of the following hosts that are not known to the system. Hosts: *list* Action: This schedule may not be updated, instead create a new schedule without dependence on these hosts. Detail: The schedule definition is as follows: Schedule Summary: *summary*

GVM0122E The schedule requires use of the following datastores that are not known to the system. Datastores: *list* Action: This schedule may not be updated, instead create a new schedule without dependence on these datastores. Detail: The schedule definition is as follows: Schedule Summary: *summary*

GVM0123E The schedule requires use of the following virtual machines that are not known to the system. Virtual Machines: *list* Action: This schedule may not be updated, instead create a new schedule without dependence on these virtual machines. Detail: The schedule definition is as follows: Schedule Summary: *summary*

GVM0124I Password set successfully. Warning: *message*

Explanation: The password was set successfully with a warning.

Administrator response: Follow the action described in the warning message.

GVM0125E An error occurred while making the Web server request. If this error persists, check the network connection with the Web server and verify that the Web server is running. Error: *error*

GVM1100E The following command requires confirmation from the server: *Command*

Explanation: A command was issued, and a reply was expected. Some commands require a confirmation, which you cannot issue through the IBM Spectrum Protect GUI.

Administrator response: Issue the command from the command line.

GVM1101E The following command is unknown to the server: *Command*

Explanation: An unknown command was issued to the server. The command might not be valid on the server version and platform or the command syntax might be incorrect.

Administrator response: Verify that the command is valid for the server version and platform, and verify that the command syntax is correct.

GVM1102E The syntax of the following command is incorrect: *Command*.

Explanation: See message.

Administrator response: Correct the syntax and issue the command from the command line. The activity log of the IBM Spectrum Protect Server shows all the commands issued before and after this command.

GVM1103E An internal server error occurred.

Explanation: See message.

Administrator response: Try the command again. If this does not work, contact customer support. You might be asked to provide tracing information and information about the actions performed before the failure occurred.

GVM1104E The server ran out of memory while processing the request. Close any unnecessary processes on the IBM Spectrum Protect server and try the operation again.

Explanation: See message.

Administrator response: Before trying the action again, contact the administrator of the IBM Spectrum Protect server.

GVM1105E The database recovery log is full.

Explanation: See message.

Administrator response: Before trying the action again, extend the recovery log or back up the IBM Spectrum Protect server database. Contact the administrator of the IBM Spectrum Protect server.

GVM1106E The server database is full.

Explanation: See message.

Administrator response: Before trying the action again, extend the server database. Contact the administrator of the IBM Spectrum Protect server.

GVM1107E The server is out of storage space.

Explanation: See message.

Administrator response: Before trying the action again, contact the administrator of the IBM Spectrum Protect server.

GVM1108E You are not authorized to perform this action. An administrator with system authority can change your authority level to allow you to perform this action.

GVM1109E The object that you are attempting to access does not exist on the server.

GVM1110E The object that you are attempting to access is currently in use by another session or process. Retry the action at a later time.

GVM1111E The object that you are attempting to remove is referenced by another object defined to the server. Remove the other object before removing this one.

GVM1112E The object that you are attempting to access or remove is not available.

Explanation: See message.

Administrator response: Before trying the action again, contact the administrator of the IBM Spectrum Protect server.

GVM1113E The server encountered an I/O error while processing the request. For more information, see the operating system event or error log.

GVM1114E The action failed because the transaction could not be committed.

Explanation: See message.

Administrator response: Retry the action at a later time. Before trying the action again, contact the administrator of the IBM Spectrum Protect server.

GVM1115E The action failed because of a resource lock conflict.

Explanation: See message.

Administrator response: Retry the action at a later time. Before trying the action again, contact the administrator of the IBM Spectrum Protect server.

GVM1116E The action failed because of a mode conflict.

Explanation: See message.

Administrator response: Retry the action at a later time. Before trying the action again, contact the administrator of the IBM Spectrum Protect server.

GVM1117E The action failed because the server could not start a new thread.

Explanation: See message.

Administrator response: Retry the action at a later time. Before trying the action again, contact the administrator of the IBM Spectrum Protect server.

GVM1118E The server is not licensed to perform this action. If a license was purchased, use the command line to register the license.

GVM1119E The specified destination is not valid.

Explanation: See message.

Administrator response: Enter a different destination or update the configuration with a valid destination, and try the action again.

GVM1120E The specified input file cannot be opened. Verify the file name and directory permissions, then try the action again.

GVM1121E The specified output file cannot be opened. Verify the file name and directory permissions, then try the action again.

GVM1122E An error occurred while writing to the specified output file.

Explanation: See message.

Administrator response: Check the file system to ensure that there is enough space. Check the operating system event or error log for more information.

GVM1123E The specified administrator is not defined to this server.

Explanation: See message.

Administrator response: Ensure that the administrator name was entered correctly. Before trying the action again, contact the administrator of the IBM Spectrum Protect server.

GVM1124E The SQL statement could not be processed.

Explanation: An exception occurred while processing the SQL statement. Possible exceptions include divide-by-zero, math overflow, temporary table storage space unavailable, and data-type errors.

Administrator response: Correct the SQL query and try again.

GVM1125E This operation is not allowed with this object.

Explanation: See message.

Administrator response: Before trying the action again, contact the administrator of the IBM Spectrum Protect server.

GVM1126E The table was not found in the server database.

Explanation: See message.

Administrator response: Before trying the action again, contact the administrator of the IBM Spectrum Protect server.

GVM1127E The specified file space name is not compatible with the filespace type.

Explanation: Unicode file space names are incompatible with non-unicode names.

Administrator response: Enter a file space name of the correct type and try the action again.

GVM1128E The specified TCP/IP address is not valid. Verify the TCP/IP address and try the action again.

GVM1129E No objects were found that match the search conditions.

GVM1130E Your administrative ID on this server is locked. An administrator with system authority can unlock your ID.

GVM1131E The connection to the server was lost while performing the action.

Explanation: See message.

Administrator response: This might indicate a network problem. Ensure that the server is running and the machine is accessible. Retry the action.

GVM1132E Your ID or password is not valid for this server.

Explanation: See message.

Administrator response: Launch the Configuration Editor from the Configuration Tab and enter a valid ID or password for your IBM Spectrum Protect Server.

GVM1133E Your password expired on this server.

Explanation: Your IBM Spectrum Protect password has expired.

Administrator response: Reset your password on the IBM Spectrum Protect Server or contact your IBM Spectrum Protect Server administrator to reset it.

GVM1134E The server cannot accept new sessions. If sessions are disabled for this server, issue the ENABLE SESSIONS command from the command line.

GVM1135E A communications failure occurred while processing the request. Retry the action at a later time.

GVM1136E The administrative API encountered an internal error while processing the request.

GVM1137E The administrative API cannot process the command document sent from the server.

Explanation: The XML command document could not be parsed. Either the file could not be read, or the file is corrupted.

Administrator response: Before trying the action again, contact the administrator of the IBM Spectrum Protect server.

GVM1138E The following command contains one or more invalid parameters: *command*.

Explanation: The IBM Spectrum Protect GUI tried to run a command, but the call to the API contained one or more invalid parameters.

Administrator response: Check the parameters in the command. If you entered text in a field, you might find the error in the parameters and correct it. Viewing the activity log might help to determine the cause of the problem. Before trying the action again, contact the administrator of the IBM Spectrum Protect server.

GVM1139E The administrative API encountered invalid parameters while processing the request.

Explanation: A command was run through the administrative API, but one of the parameters to an API method was invalid.

Administrator response: This is typically an internal error, but it can be caused by unusual parameters. For example, characters such as: < > & can cause the problem. Check the parameters in the command. If you entered text in a field, you might find the error in the parameters and correct it.

GVM1140E The administrator's authority level on this server cannot be determined.

Explanation: See message.

Administrator response: Use a different administrator ID. Before trying the action again, contact the administrator of the IBM Spectrum Protect server.

GVM1141E An object with the name that you specified already exists on the server. Enter a different name.

GVM1142E The version of the server is not supported by the IBM Spectrum Protect GUI.

GVM1143E An internal error has occurred.

Explanation: The operation failed after encountering an internal error.

Administrator response: Retry the operation. If this does not work, contact customer support. You might be asked to provide tracing information and information about the actions performed before the failure occurred.

GVM1144E The operation failed, please go to the log for more details.

GVM1145E Wrong format of the end date and time. Please enter the end date and time format as yyyyMMddHHmmss.

GVM1146E Sorry, the description of the backup task was not created in a file. Please try again.

Explanation: On the general page of the backup wizard, you can describe your backup task in general.

GVM1147E The ESXHOST name you entered is too long. Please change to a shorter one.

GVM1148E Wrong Backup ID. Please try again.

GVM1150E An error occurred when processing the backup object file. Please try again later.

Explanation: When you click submit in the backup wizard, the object list will be stored in a file. When processing this file, an error occurred.

GVM1151E No backup object is selected. You must choose a source node to backup.

Explanation: To initiate a backup task, you have to choose an object on the source page of the backup wizard.

GVM1152E Wrong format of the start date and time. Please enter the start date and time format as yyyyMMddHHmmss.

GVM1153I Backup task *Task Name* started, would you like to monitor this task now?

GVM1154I Delete backup task completed successfully.

GVM1155E Delete backup task failed, please check log for more detail.

GVM1156I Restore Task *Task ID* is started successfully, would you like to monitor this task now?

GVM1157E *Error Or Warning*

GVM1158I Mounted backup Item could not be restored.

GVM1159I Result of attach is *status* (Task ID: *Task ID*), refer to events list to get the details.

GVM1160I Result of detach is *status* (Task ID: *Task ID*), refer to events list to get the details.

GVM1161I Command successfully submitted to the IBM Spectrum Protect server. Detail: *Server Messages*

GVM1162E The command submitted to the IBM Spectrum Protect server failed. Error: *Error Code Error Messages*

Explanation: The cause of the problem is identified in the message text.

Administrator response: Correct the problem based on the information that is provided in the message text. Then, try the action again.

GVM1163E No IBM Spectrum Protect server connection, please configure the IBM Spectrum Protect server in the configuration panel.

GVM1164E The selected items can only be under ONE datacenter.

GVM1165E Authentication failed. Could not connect to vCenter. Make sure you log in using the VMware vSphere client and have a valid session.

GVM1166E Authentication failed. Please log in using the VMware vSphere client.

GVM1167E The virtual machine *VM name* exists. Delete the virtual machine first before restoring it.

GVM1168E The target virtual machine *VM name* is running. Close the virtual machine before restoring virtual disks to it.

GVM1169E Some of selected virtual disks exist in target virtual machine. Remove those virtual disks from target virtual machine before restoring to it.

GVM1170E A VMCLI command failed. Error: *Error Messages*

Explanation: The cause of the problem is identified in the message text.

Administrator response: Correct the problem based on the information that is provided in the message text. Then, try the action again.

GVM1171E A request submitted to the VMware vCenter server failed. Error: *Error Messages*

Explanation: The cause of the problem is identified in the message text.

Administrator response: Correct the problem based on the information that is provided in the message text. Then, try the action again.

GVM1172E A command submitted to the IBM Spectrum Protect server failed. Error: *Error Messages*

Explanation: The cause of the problem is identified in the message text.

Administrator response: Correct the problem based on the information that is provided in the message text. Then, try the action again.

GVM1173E Cannot find the file with format 'summary.date.log' in the path: *path*

GVM1174E Cannot find the IBM Spectrum Protect Snapshot installation path using the VMCLI inquire_config command.

GVM1175E A VMCLI command to get version failed.

GVM1176I Backup task *Task ID* started, would you like to monitor this task now?

GVM1177E The IBM Spectrum Protect Web Server could not be contacted.

Explanation: The IBM Spectrum Protect GUI has attempted to contact its Web Server. The operation was not successful.

Administrator response: Perform one or more of the following steps to try and determine the problem: Verify that the IBM Spectrum Protect Web Server is running. Verify that the Web Server machine is running. Verify that the Web Server machine is accessible over the network. Close the IBM Spectrum Protect GUI. Start the GUI again when the problem is resolved.

GVM1178I Command successfully submitted to the server.

GVM1179E No host is found in datacenter *datacenter name*. Select another datacenter to restore.

GVM1180W The schedule does not contain all the required parameters. It cannot be displayed in the properties notebook.

Explanation: This schedule may have been created or modified outside of the IBM Spectrum Protect GUI.

Administrator response: This schedule must be modified outside the the IBM Spectrum Protect GUI.

GVM1181W One or more VMs exist. Do you want to continue the restore operation and overwrite the existing VMs?

GVM1182E The Administrator Id provided does not have sufficient privileges.

Explanation: The operation you are attempting requires a IBM Spectrum Protect Server Administrator Id to have at least Unrestricted Policy privilege.

Administrator response: Contact your IBM Spectrum Protect Server Administrator to grant you Unrestricted Policy privilege for your Administrative Id. Or, use an alternate Id with such privilege and try again.

GVM1183E The nodename *node name* is already in use. Please choose another nodename.

Explanation: The node name chosen already exists on the server. Choose another name.

Administrator response: Pick another node name to use. If you want to re-use this node, then unselect the 'Register Node' checkbox.

GVM1184E The node name *node name* is not defined on server. Make sure the node name you entered exists on the server.

Explanation: The node name entered does not exist on the server. Since you did not select 'Register Node' checkbox, the node name you enter must have been previously defined and exist on the server.

Administrator response: Check the node name you are supposed to use and enter it again. If you want to register this node, then select the 'Register Node' checkbox.

GVM1185E The passwords in the entry field and the verify field do not match. Please try again.

Explanation: The new passwords entered do not match.

Administrator response: Clear the fields and enter the same password in both password fields.

GVM1186W Please select one or more Datacenters to be managed.

Explanation: At least one Datacenter must be selected.

Administrator response: Add one or more Datacenter(s) into the Managed Datacenters list.

GVM1187W One or more nodes do not have their password set. Make sure all nodes have their password set.

Explanation: If a node has 'Register Node' checkbox set, then that node's password must be set.

Administrator response: Assign a password for nodes that are to be registered.

GVM1188I No datacenter node was found mapped to *datacenter name*. Select a datacenter node from the list to associate with *datacenter name*. Leave the selection empty to have the Configuration Wizard create a new datacenter node for it.

GVM1189I Are you sure you want to proceed without entering a IBM Spectrum Protect Administrative ID? Without IBM Spectrum Protect Administrative access, the Wizard will not validate node names or register nodes. Instead, a macro file will be generated at the end of this Wizard for you to give to your IBM Spectrum Protect Administrator to execute.

GVM1190I This task was skipped because it was not necessary or a pre-requisite task failed.

GVM1191E There was an error writing to script file: *file path*.

Explanation: An error was encountered when trying to write to file at the path indicated.

Administrator response: Try the operation again.

GVM1192I Managed datacenters have changed. Please go to the data mover page to verify or change your current mappings.

GVM1193I No datacenter nodes were found for the vCenter node *vCenter node* and VMCLI node *VMCLI node* configuration. The Wizard will generate a default set of datacenter nodes for you.

GVM1194E The password entered is not acceptable. Choose another password.

Explanation: IBM Spectrum Protect Server could not accept the password chosen. It could be because the password did not meet certain password rule(s).

Administrator response: Try with another password.

GVM1195W Unchecking this checkbox means you are supplying a node name that is already defined on the IBM Spectrum Protect Server AND that it is meant to be used for your configuration. Since this Wizard is proceeding without Administrative access, it cannot verify if the node exists or not. You should only proceed if you understand what you are doing.

Explanation: Since you are using the Configuration Wizard without a IBM Spectrum Protect Administrative ID, you should be very careful. The macro script file generated at the end of running the Configuration Wizard could contain errors because values are not validated.

Administrator response: We strongly recommend you use the Configuration Wizard with a proper IBM Spectrum Protect Administrative ID.

GVM1196W The IBM Spectrum Protect node *node* has already been identified. If you want a different name other than the default name, edit this field again. If you want to use the same data mover for multiple Datacenters, please use Configuration Settings to do this.

Explanation: The node is already being used in this configuration.

Administrator response: Try using another node name.

GVM1197W The IBM Spectrum Protect node *node* has invalid characters or exceeds 64 characters. Choose a different name and edit this field again.

Explanation: The node name is invalid or longer than 64 characters.

Administrator response: Try using another node name.

GVM1198E The password entered is not acceptable on this Server because it contains invalid characters. The valid characters are: *validCharsString*

Explanation: IBM Spectrum Protect Server could not accept the password chosen because of invalid characters in the password.

Administrator response: Try with another password that only contain valid characters.

GVM1199E The password entered is not acceptable on this Server because of the reason below. Choose another password. Error: *message*

Explanation: IBM Spectrum Protect Server could not accept the password chosen. The reason why this password is not valid is given in the message.

Administrator response: Try with another password that meets the rule(s).

GVM1200E Filter has changed, select Apply filter before continuing.

Explanation: Filter pattern must be applied after it is changed.

Administrator response: Click the Apply filter button.

GVM1201E Select at least one item from a datacenter to continue.

Explanation: A host, host cluster, or VM must be selected to do a backup.

Administrator response: Select an item under a datacenter.

GVM1202E Your selections exceed the 512 character limit allowed for backups, change your selection.

Explanation: The number of characters required to list the selected items exceeds the limit of 512 characters. Also, if hosts have been partially selected, characters are needed to list the VMs that are excluded from the backup.

Administrator response: Create multiple backup tasks, with less selected items per task.

GVM1203I Changing the newly added virtual machines checkbox clears all selections of host clusters, hosts, and virtual machines. Press OK to proceed, or Cancel to leave unchanged.

Explanation: The state of the newly added virtual machines checkbox significantly impacts what is allowed to be selected on the source panel, so selections are cleared when the state changes.

Administrator response: Select OK to proceed, or select Cancel to retain all selections.

GVM1204E Datacenter node *datacenter node name* does not have a IBM Spectrum Protect node mapped in the vmcli configuration file.

Explanation: The datacenter node must have a corresponding IBM Spectrum Protect node listed in the configuration file named vmcliprofile.

Administrator response: Correct the problem by going to the Configuration tab in the GUI and selecting Edit Configuration to update the mapping for the datacenter. Also resolve any other configuration errors that are reported on the Configuration tab.

GVM1205E IBM Spectrum Protect datacenter node *datacenter node name* maps to vCenter datacenter name *datacenter name* in the vmcli configuration file, but *datacenter name* does not exist in the vCenter.

Explanation: The vCenter datacenter name maps to a datacenter node in the vmcli configuration file named vmcliprofile, but the data enter name does not exist in the vCenter.

Administrator response: Correct the problem by going to the Configuration tab in the GUI and selecting Edit Configuration to update the mapping for the datacenter. Also resolve any other configuration errors that are reported on the Configuration tab.

GVM1206E You have selected items from multiple datacenters: *datacenter list*. This is not allowed, all selections must be from one datacenter.

Explanation: A backup task only supports items from one datacenter. If this is an existing task, changes in the vCenter configuration after task creation may have caused this problem.

Administrator response: Check and correct the selections to make sure all selections are under the same datacenter.

GVM1207E The selected items *item list* are not found under datacenter *datacenter name* in the vCenter, please review and de-select them.

Explanation: Items originally selected are no longer found under the datacenter associated with the backup task. This may be caused by changes in the vCenter configuration.

Administrator response: Review if the items are now located under a different datacenter. De-select the not found items, and make new selections under the other datacenter or create a new backup task for these items.

GVM1208I The datacenter in the source page has changed, please reselect the data mover node in the Destination page.

Explanation: When item selection is changed to a different datacenter, the valid data movers may change. You are required to select the data mover again on the Destination page.

Administrator response: Reselect the data mover node in the Destination Page.

GVM1209I Are you sure you want to use node *data mover node* as a data mover for datacenter *datacenter*?

GVM1210I Are you sure you want to use node *node name* that is already registered on the IBM Spectrum Protect server as a data mover for datacenter *datacenter*? If so, we will mark the node as such and you will be unable to make any further changes to the node.

GVM1211E The password entered is not acceptable on this Server because it is too short. Passwords must have a least *minPasswordLength* characters.

Explanation: IBM Spectrum Protect Server could not accept the password chosen because it is too short.

Administrator response: Try with another password that is longer than the required minimum length.

GVM1212E Component is downlevel, so its use is disabled in the GUI. You will only be able to use the GUI for *component*.

GVM1213E Mismatching IBM Spectrum Protect Server entries in the current settings is detected. IBM Spectrum Protect Server definition used by the GUI: *server1* IBM Spectrum Protect Server where backups are stored: *server2* Click Reset Server definition to clear the IBM Spectrum Protect definition and enter new credentials. Or click on Reconfigure Environment to launch the Configuration Wizard to reconfigure your IBM Spectrum Protect environment.

Explanation: IBM Spectrum Protect detected mismatching IBM Spectrum Protect Server entries between the vmcliprofile and the current GUI's IBM Spectrum Protect Server connection.

Administrator response: Pick one of the two actions available. You may either reset the IBM Spectrum Protect Server definition/credentials OR use the Configuration Wizard to set up a new environment.

GVM1214E The SSL Connection could not be made. The IBM Spectrum Protect SSL certificate is missing. Check for valid IBM Spectrum Protect certificate in the TSM-ve-truststore.jks

Explanation: IBM Spectrum Protect Server did not accept the SSL connection. SSL keystore is not in the default location or does not contain a IBM Spectrum Protect certificate.

Administrator response: Check the TSM-ve-truststore.jks for a valid certificate, ensure TSM-ve-truststore.jks is in the correct default location.

GVM1215E The password entered is not acceptable on this Server because it is too long. Passwords cannot have more than *maxPasswordLength* characters.

Explanation: IBM Spectrum Protect Server could not accept the password chosen because it is too long.

Administrator response: Try with another password that is shorter than the allowed maximum length.

GVM1216E The SSL Connection could not be made. The IBM Spectrum Protect SSL certificate has expired.

Explanation: IBM Spectrum Protect Server did not accept the SSL connection. The TSM-ve-truststore.jks has an expired IBM Spectrum Protect SSL certificate.

Administrator response: Obtain a new valid IBM Spectrum Protect SSL certificate from the IBM Spectrum Protect server and place it in the TSM-ve-truststore.jks.

GVM1217E The non-SSL connection could not be made. This IBM Spectrum Protect Admin ID requires a IBM Spectrum Protect SSL connection.

Explanation: IBM Spectrum Protect Server did not accept the non-SSL connection. The IBM Spectrum Protect Server requires SSL be used with this Admin ID.

Administrator response: Use SSL with this Admin ID. Ensure that the TSM-ve-truststore.jks with a valid IBM Spectrum Protect server SSL certificate is installed in the default location.

GVM1218E Your selections have caused the backup task definition to require *count* characters, which exceeds the 512 character limit. This can be caused by a long virtual machine exclude list, which is the list of all VMs under host(s) that were not selected. Either select more VMs under selected hosts or de-select the newly added virtual machines checkbox.

Explanation: When the newly added virtual machines checkbox is selected, the resulting backup task must list all unselected VMs for hosts that are partially selected. The backup task definition has a 512 character limit, and the combination of selected items and excluded VMs exceeds this limit.

Administrator response: De-select the newly added virtual machines checkbox or create multiple backup tasks with less selected items per task.

GVM1219E Your selection of virtual machines has caused the backup task definition to require *count* characters, which exceeds the 512 character limit. Either create multiple backup tasks with less virtual machines per task, or select the newly added virtual machines checkbox and choose entire hosts with no more than a few unselected VMs.

Explanation: The backup task definition has a 512 character limit, and the total number of characters for the selected items exceeds this limit.

Administrator response: Create multiple backup tasks with less selected virtual machines per task, or select the newly added virtual machines checkbox and then select hosts instead of individual virtual machines (you can de-select a small number of virtual machines per host if desired.)

GVM1220E There is no data mover node proxy relationship for datacenter node *datacenter node name*. Review the data mover relationships on the Configuration tab or the IBM Spectrum Protect server.

GVM1221E There is no datacenter node defined for datacenter *datacenter name*. Review the node configuration on the Configuration tab.

GVM1222I Node *name name* is currently locked. The Configuration Wizard will attempt to unlock this node if you choose to continue.

GVM1223E A connection with the IBM Spectrum Protect server (*Address:Port*) could not be established. Please verify the server address and *Server or Admin port* are correct.

Explanation: The server might not be running or specified admin port or server port may be incorrect.

Administrator response: Check the network connection with the IBM Spectrum Protect server machine. Verify that the server is running and try to log in again. Also verify server port and admin port information is correct.

GVM1224E The vCenter user name or password is not valid. Please try again.

Explanation: The vCenter user name or password is not valid.

Administrator response: Enter the user name or password again.

GVM1225E Permission to perform this operation was denied. Please try with other user name.

Explanation: The vCenter user name is not valid.

Administrator response: Enter another user name.

GVM1250I A IBM Spectrum Protect Administrative ID and password is currently not set. The absence of this information limits the actions that you can take in the GUI. Click OK to be taken to the configuration settings panel and enter an ID and password. Click Cancel to continue without using an ID and password.

GVM1251W You have chosen an Administrative ID that has less authority than the current ID. Are you sure you want change this ID? Current IBM Spectrum Protect Authority Level: *Current Level* New IBM Spectrum Protect Authority Level: *New Level* Current Role: *Current Role* New Role: *New Role* Click OK to accept these changes, or Cancel to exit without change.

GVM1252I Here are the current and new roles for IBM Spectrum Protect Admin IDs. Review and confirm these changes. Current IBM Spectrum Protect Authority Level: *Current Level* New IBM Spectrum Protect Authority Level: *New Level* Current Role: *Current Role* New Role: *New Role* Click OK to accept these changes, or Cancel to exit without change.

GVM1253I ID has been changed without save. Previous ID will be loaded.

GVM1254I Your current UI role does not allow you to unlock or reset the VMCLI node. In order to make changes, go to the Server Credentials page and enter a IBM Spectrum Protect Admin ID and password that has the necessary privileges for making VMCLI node updates. Select OK to save these credentials, then re-open the Configuration Settings notebook and you can make VMCLI node updates.

GVM1255I Your current UI role does not allow you visit other panels. Select OK to save these credentials, then re-open the Configuration Settings notebook and you can make other updates.

GVM1256I There are non-English characters contained in one or more datacenters. The domain will be adjusted accordingly.

GVM1257E Datacenter *DataCenter Name* cannot be added to the domain because it contains non-English characters.

Explanation: Datacenters that contain non-English characters are not currently supported. Therefore, they cannot be added to the domain.

Administrator response: Datacenter will not be added to the domain.

GVM1258W Node *Node Name* already exists on the server. Attempt to rename node to *New Node Name*?

Explanation: Node name is already registered on the IBM Spectrum Protect server.

Administrator response: Click Yes to attempt to rename node. Click No to make other changes.
Example: unclick register node, rename node manually.

GVM1259W The following virtual machines for host *Host Name* have unsupported characters in their name: *Invalid Virtual Machine Names*. Therefore, these virtual machines are not backed up, regardless of your selections. You must rename these virtual machines to back them up.

Explanation: The following characters are not supported in virtual machine names: ' : ; * ? , < > / \ |

Administrator response: Rename the identified virtual machines to remove unsupported characters from their name.

GVM1260E The following host clusters have unsupported characters in their name: *Invalid Host Clusters*. These host clusters cannot be selected for backup because they contain unsupported characters. Rename these host clusters or remove them from selection.

Explanation: The following characters are not supported in host cluster names: ' : ; * ? , < > / \ |

Administrator response: Rename the identified host clusters to remove unsupported characters from their name. Or, remove them from your backup selection.

GVM1261E Your selections created an empty virtual machine list for backup. This issue might occur because all the selected virtual machines contain unsupported characters in their names. Make sure that you selected virtual machines that do not contain unsupported characters in their names.

Explanation: The following characters are not supported in virtual machine names: ' : ; * ? , < > / \ | . Virtual machine names that contain these characters are automatically removed from the backup task definition. This removal can cause an empty task definition.

Administrator response: Rename the identified virtual machines to remove unsupported characters from their name. Or, select different virtual machines to back up.

GVM1262E The filter pattern cannot be applied because it contains unsupported characters. Change the pattern to remove the unsupported characters, then apply the filter again.

Explanation: The following characters are not supported in filter pattern: ' : ; < > / \ |

Administrator response: Change the filter pattern to remove unsupported characters, then apply the filter again.

GVM1263E A temporary datastore is not available to perform this operation. This temporary datastore is required in addition to the restore destination datastore.

Explanation: A datastore is required for use as a temporary restore destination for this operation. This temporary datastore must be from the same ESX host as the datastore that is used for the actual restore destination. However, the temporary datastore cannot be the same datastore that is used for the actual restore destination.

Administrator response: Add a datastore to the destination ESX host. Then, select this datastore as the temporary restore destination.

GVM1264E There was an error creating opt file: *file name*.

Explanation: An error was encountered when trying to write to file.

Administrator response: Try the operation again.

GVM1265E Creating *service* has failed. No services were created for data mover node *node name*.

Explanation: An error was encountered when trying to create IBM Spectrum Protect service for data mover node specified.

Administrator response: Check environment and ensure user has proper rights before trying operation again.

GVM1266E Creating firewall for *service* has failed. Please manually add firewall rules for services installed.

Explanation: An error has occurred when attempting to add firewall rule for specified executable.

Administrator response: Check environment and ensure user has proper rights before trying operation again or manually add rule to firewall for IBM Spectrum Protect client acceptor , IBM Spectrum Protect Agent and IBM Spectrum Protect Scheduler.

GVM1267W Local services were setup successfully but were unable to verify firewall access for these executable files: *agentExe cadExe schedExe* If any problems are experienced related to local services, verify that firewall access is available for these executable files.

Explanation: Microsoft firewall may be disabled or another firewall may be in place.

Administrator response: Check environment and add rules manually if needed for the IBM Spectrum Protect client acceptor, IBM Spectrum Protect Agent, and IBM Spectrum Protect Scheduler.

GVM1268E Data mover node *node name* was successfully registered on the server, however no services were created.

Explanation: An error has occurred when trying to create services for specified node.

Administrator response: Check environment and ensure user has proper rights before trying operation again.

GVM1269E Reason Code *reason* This error was reported by the IBM Spectrum Protect data mover. No further description is available. For more information, review the error log *errorLog* on the data mover host machine *hostname* at address '*address*'.

Explanation: The data mover encountered an error with the reported reason code.

Administrator response: Log into the host machine specified and view the error log for more information.

GVM1270W Warning: If this task is canceled, all created data on the virtual machines that are not completely restored is lost and the virtual machines are removed from the ESX host. Are you sure that you want to cancel this task?

Explanation: A cancel task command is submitted. Refresh to see the cancel progress.

Administrator response: Cancel the selected task or allow the task to continue processing.

GVM1271W Scan schedule *schedule name* was successfully defined on the server and associated with node *node name*, however no services were created to run the schedule. Detail: *error*

Explanation: An error was encountered in one of the steps below when trying to create IBM Spectrum Protect services for the VMCLI node.

1. Create the option file for the VMCLI node.
2. Set the password for the VMCLI node to a temporary password for the next step.
3. Run the IBM Spectrum Protect Client Service Configuration Utility to create the services.
4. Run the IBM Spectrum Protect Client Service Configuration Utility to start the client acceptor service.
5. Reset the VMCLI node password.

Administrator response: Delete the schedule and create the schedule again to automatically configure the services or manually configure the services. Check environment and ensure user has proper rights before trying operation again.

GVM1272W Scan schedule *schedule name* was successfully defined on the server and associated with node *node name*. IBM Spectrum Protect services were created to run the schedule. However, resetting the VMCLI node password failed. Detail: *error*

Explanation: An error was encountered while trying to reset the VMCLI node password.

Administrator response: Use the Configuration Settings to reset the VMCLI node password.

GVM1273W A dismount operation removes the iSCSI disks but does not remove the VM or its data. Before proceeding with dismount, make sure the following conditions exist: -The mounted iSCSI disk is recovered. -Storage vMotion completed migrating the VM to a local datastore. If the recovery operation failed and you want to delete the VM, its data, and dismount any iSCSI targets, click Dismount and Delete. Dismount and Delete is a destructive action and deletes the VM and its data, regardless of the success or failure of the instant restore operation. Based on this information, do you want dismount the VMs that are selected for instant restore?

Explanation: A dismount operation removes the iSCSI disks but does not remove the VM or its data. Before proceeding with dismount, make sure the following conditions exist: The mounted iSCSI disk is recovered, Storage vMotion completed migrating the VM to a local datastore. If the recovery operation failed and you want to delete the VM, its data, and dismount any iSCSI targets, click Dismount and Delete. Dismount and Delete is a destructive action and deletes the VM and its data, regardless of the success or failure of the instant restore operation.

Administrator response: Click 'Dismount' to dismount the virtual machines that are selected for the instant restore operation. Click 'Dismount and Delete' to dismount the virtual machines that are selected for the instant restore operation, remove them from the ESX host, and verify that Storage vMotion is not running.

GVM1274W During a dismount operation, all created data on the virtual machines is lost and the virtual machines are removed from the ESX host. Dismount the selected Instant Access virtual machines?

Explanation: All created data on the virtual machines is lost and the virtual machines are removed from the ESX host.

Administrator response: Click 'Dismount' to dismount (cleanup) the instant access virtual machines.

GVM1275E Selecting multiple virtual machines with different restore types is not allowed.

Explanation: Restoring multiple virtual machines with different restore types is not supported.

Administrator response: Select virtual machines that have the same restore type.

GVM1276I Cleanup Task *Task ID* is started successfully, would you like to monitor this task now?

GVM1277W Are you sure that you want to cancel this task?

Explanation: A cancel task command is submitted. Refresh to see the cancel progress.

Administrator response: Cancel the selected task or allow the task to continue processing.

GVM1278I Your current UI role does not allow you to view backup property notebook.

GVM1279I Your current UI role does not allow you to edit nodes. In order to make changes, open the Configuration Settings notebook and go to the Server Credentials page and enter a IBM Spectrum Protect Admin ID and password that has the necessary privileges for making node updates.

GVM1280E Reason Code *reason* This error was reported by the IBM Spectrum Protect data mover. No further description is available. For more information, review the error log 'dsmerror.log' on the data mover host machine.

Explanation: The data mover encountered an error with the reported reason code.

Administrator response: Log into the host machine where data mover resides and view the error log for more information.

GVM1281W Login information for vCenter needed.

Explanation: In order to install new local dm services, vCenter credentials are needed.

Administrator response: Enter vCenter credentials in order to continue.

GVM1282E You do not have the privileges required to access the GUI.

Explanation: In order to access GUI content, the user must have the necessary vSphere privileges.

Administrator response: Add the required privileges for the user.

GVM1283E You do not have the permissions required to access the GUI.

Explanation: In order to access GUI content, the user must have the necessary vSphere permissions.

Administrator response: Add the required permissions for the user.

GVM1284I A new data center (*name*) was detected. Go to the Data Mover Nodes page to add a data center node for it.

GVM1285W The following shares and mounts will be removed and that data in there will be no longer accessible to the end user. Dismount the selected shares and mounts?*mounts*

Explanation: The selected shares and mounts will be removed.

Administrator response: Click 'Dismount' to dismount (cleanup) the mounts and shares.

GVM1286I Dismount Task *Task ID* is started successfully, would you like to monitor this task now?

GVM1287W An error was encountered during the delete operation for option file: *file name*.

Explanation: An error was encountered during the delete operation. For example, this error might be caused by insufficient user permissions or the file no longer exists.

Administrator response: Make sure the option file

was deleted. If it still exists, delete this file manually.

GVM1288W The remove operation for IBM Spectrum Protect service: *service* failed.

Explanation: An error prevented the IBM Spectrum Protect service from being removed.

Administrator response: Check the environment and ensure that the user has sufficient rights to run this operation. Then, try the operation again.

GVM1289E Fail to start iSCSI for mount proxy node *node name*.

Explanation: An error was encountered when trying to start iSCSI service for mount proxy node specified.

Administrator response: Start the iSCSI service manually.

GVM1500E You have selected organization VDCs from more than one provider VDC. For backup tasks, all selected organization VDCs must belong to the same provider VDC. Change your selections and retry the operation.

GVM1501E The following vcloud resources(vApp, organization, organization vDC) are invalid for selection because they have unsupported characters in their name:
reslist

Explanation: In order to create backup tasks, vcloud resources names must not contain any of the following characters: ' : ; * ? , < > / \ | .

Administrator response: Rename the identified resources to remove unsupported characters from their name. Or, remove them from your backup selection.

GVM1502E You have selected the vApp from a different organization VDC. For restore tasks, all selected vApps must belong to the same organization VDC. Change your selections and retry the operation.

GVM1503E The vApp *vApp name* exists. Choose a different vApp name to be the target of the restore.

GVM2001E Your selection of items to back up has caused the backup task definition to require *count* characters, which exceeds the 512 character limit. Please create multiple backup tasks with less items per task.

Explanation: The backup task definition has a 512

character limit, and the total number of characters for the selected items exceeds this limit.

Administrator response: Create multiple backup tasks with less items per task

GVM2002E The Organization VDC node can not be included because its Provider VDC node is not included. Please select the include checkbox for the Provider VDC node first, and try again.

GVM2004E The nodename *node name* is already in use. Please uncheck the register node checkbox or choose another nodename.

Explanation: The node name chosen already exists on the server. Either choose to not register it or use another name.

Administrator response: Pick another node name to use. If you want to re-use this existing node, then unselect the 'Register Node' checkbox.

GVM2005W Are you certain that you want to remove the data mover node *node name*?

GVM2006W The IBM Spectrum Protect node *IBM Spectrum Protect node* has already been used. If you want a different name other than the default name, edit this field again.

Explanation: The node is already being used in this configuration.

Administrator response: Try using another node name.

GVM2007E The Organization VDC node can not be registered because its provider VDC is not valid.

GVM2008E The Organization VDC name *OVDC name* is invalid. For information about supported characters, refer to the IBM Spectrum Protect Administrator's Reference publication section about naming IBM Spectrum Protect objects.

GVM2009I This task was skipped because it was not necessary. No further action is required.

GVM2010W Internet explorer version *version* is not supported, please use a supported version or another browser. You may see visual and functional issues if you continue to use this unsupported browser.

Explanation: Due to differences in Internet Explorer implementation by version number, only specific versions are supported. The use of a standards-compliant browser such as Mozilla Firefox is recommended. However, if you are accessing the GUI as a plug-in from the vSphere Client, you are limited to using the Internet Explorer browser installed on the system where the vSphere client is installed.

Administrator response: Use a supported version of Internet Explorer or another browser. Supported browser versions are documented in the online help.

GVM2011W The browser *version* is not supported, please use a supported browser. You may see visual and functional issues if you continue to use this unsupported browser.

Explanation: Due to differences in browser implementations, only specific versions are supported.

Administrator response: Use a supported browser. Supported browser versions are documented in the online help.

GVM2012E At least one virtual machine that you have selected for restore to alternate location already exists in the Datacenter, so restore is not allowed. To restore to an alternate location when the destination virtual machine already exists, select only one virtual machine for the restore operation and choose a new name for the destination virtual machine. Duplicated VM: *VM name*

Explanation: When restoring to an alternate location, the destination virtual machine must not already exist.

Administrator response: Use the single virtual machine restore wizard so that you can rename the destination virtual machine.

GVM2012W Target datastore not found, select a different destination datastore.

GVM2013E The user *User Name* is not authorized to any managed datacenters. Contact your system administrator.

GVM2014E You do not have required permissions to view virtual machines for this Event.

GVM2015E You do not have required permissions to view restore points for this virtual machine.

GVM2016E You do not have required permissions to view some attached points.

GVM2017E You do not have required permissions to view restore points for this datastore.

GVM2018E You do not have required permissions to detach for the restore point.

GVM2019E An error occurred processing user permissions. Contact your system administrator.

GVM2020I Some datacenters are not shown due to permissions requirements.

GVM2021E You do not have permissions to cancel this task.

GVM2022I The task is still in the starting state, please refresh the task and try the cancel again.

GVM2025E An error occurred while writing to the flrConfig.props configuration file.

Explanation: The flrConfig.props file contains configuration options for file level restore processing. Possible reasons for this error include the following situations: The flrConfig.props file is not in the IBM Tivoli Data Protection for VMware installation directory. The flrConfig.props file is write-protected.

Administrator response: Verify that the file exists in the IBM Tivoli Data Protection for VMware installation directory and that the file is not write-protected.

GVM2026E The local mount proxy node pair cannot be removed while the file level restore feature is enabled.

Explanation: File level restore processing requires a local mount proxy node.

Administrator response: Disable the file level restore feature. Then, choose whether you want to remove the mount proxy node pair.

GVM2027E An error occurred while reading the flrConfig.props configuration file.

Explanation: The flrConfig.props file contains configuration options for file level restore processing. The file cannot be read. A common reason for this error is that the file is read-protected.

Administrator response: Verify that the file is not read-protected.

GVM2030W The specified user does not have sufficient permissions to access the following data centers: *list of data centers*. Click OK to continue or cancel to enter another user name.

Explanation: The user credentials that you use to authenticate to the vCenter Server must have the correct privileges to access the VMware datacenters.

Administrator response: Verify that you have the correct privileges. See the vCenter Server credentials online help page to see the privileges that are required.

GVM2031I The specified user has sufficient permissions to access the following data centers: *list of data centers*. Click OK to continue or cancel to enter another user name.

Explanation: The user credentials that you use to authenticate to the vCenter Server must have the correct privileges to access the VMware datacenters.

Administrator response: Verify that you have the correct privileges. See the vCenter Server credentials online help page to see the privileges that are required.

GVM2032W The specified user does not have sufficient permissions to access any data center. Click OK to continue or cancel to enter another user name.

Explanation: The user credentials that you use to authenticate to the vCenter Server must have the correct privileges to access the VMware datacenters.

Administrator response: Verify that you have the correct privileges. See the vCenter Server credentials online help page to see the privileges that are required.

GVM2132E An error occurred when connecting to the IBM Tivoli Storage Manager server *server name*. Either your admin ID or password is not valid, or the TCPPORT number was entered in the admin port field instead of the TCPADMINPORT or SSLTCPADMINPORT number.

Explanation: See message.

Administrator response: Launch the Configuration Editor from the Configuration Tab and enter a valid ID or password for your IBM Tivoli Storage Manager Server.

GVM2133E The password for the administrative user ID *admin id* expired on the IBM Tivoli Storage Manager server *server name*.

Explanation: Your IBM Tivoli Storage Manager administrative password has expired.

Administrator response: Contact your IBM Tivoli Storage Manager Server administrator to reset the password for the administrative user ID.

GVM2134E The IBM Tivoli Storage Manager server port number *tcp port* is incorrect. The expected value for this port is *tcp port from query*, which is the value of the TCPPORT option. Please enter the expected value using the configuration wizard.

Explanation: The value entered in the IBM Tivoli Storage Manager server port field must match the TCPPORT option on the IBM Tivoli Storage Manager server.

Administrator response: Use the configuration wizard to change the IBM Tivoli Storage Manager server port field to the correct value.

GVM2135E This schedule contains an unsupported option so it cannot be edited. This situation can occur when the schedule was created or updated by a tool other than the Data Protection for VMware GUI.

GVM2136E An error occurred while processing a VMCLI command, and the GUI session will be closed. Log in and try the operation again. If the problem persists, contact your administrator.

GVM3000E Windows domain credentials are incorrect. Open the Configuration Editor, go to File Restore page, and try entering the credentials again.

Explanation: The Windows domain credentials that was entered on the File Restore page in the Configuration Editor is incorrect.

Administrator response: Run the Configuration Editor again and re-enter the correct Windows domain credentials.

Appendix D. IBM Spectrum Protect recovery agent messages

This information contains explanations and suggested actions for messages issued by the recovery agent.

Beginning with Version 8.1, recovery agent messages contain the IBM Spectrum Protect product name where the product is referenced in the message. This change is not reflected in the documented messages, which still contain the product name Tivoli Storage Manager.

FBP0001E The Recovery Agent is already running.

Explanation: This issue is encountered when multiple users are logged on to the system and attempting to run the Recovery Agent. Only one active Recovery Agent instance is supported.

System action: The Recovery Agent was not started.

User response: To resolve this issue, close the current Recovery Agent instance or start the Recovery Agent on a different system.

FBP0002E The Tivoli Storage Manager server connection cannot be removed.

Explanation: There are currently active instant restore sessions or mounted volumes that require the connection to the Tivoli Storage Manager server. As a result, the existing connection cannot be removed.

System action: The remove connection operation is canceled.

User response: To resolve this issue, wait until the instant restore sessions complete. Or, forcibly end the instant restore sessions or mounted volumes and then disconnect the Tivoli Storage Manager server.

FBP0003E 'Authentication node' and 'Target node' cannot specify the same node.

Explanation: Three node authentication methods are available to access snapshots on the Tivoli Storage Manager server: 'Asnodename' authenticates with a proxy node, 'Fromnode' authenticates with a node that contains limited access, and 'Direct' authenticates directly. When 'Fromnode' or 'Asnodename' are selected, a target node must be specified. The target node is the Tivoli Storage Manager node where the virtual machine backups are located.

System action: The system waits for a user response.

User response: Specify the correct 'Authentication node' and 'Target node'. See information about the node authentication methods in the product documentation.

FBP0004E Recovery Agent failed to mount.

Explanation: The mount operation on the Windows Recovery Agent proxy host failed.

System action: The operation is canceled.

User response: Check the Windows Recovery Agent proxy host logs for information about why the mount operation failed.

FBP0005E RAID mirror status was not obtained.

Explanation: During the instant restore session, the Recovery Agent failed to obtain the status of the mdadm mirror device.

System action: An attempt to recover the instant restore session is being made.

User response: Check the instant restore status in the Recovery Agent GUI and the Recovery Agent engine logs for solutions to this problem.

FBP0006E Incorrect parameters were specified during the Recovery Agent mount operation.

Explanation: The mount operation on the Windows Recovery Agent proxy host failed because incorrect parameters were specified.

System action: The operation is canceled.

User response: Check the Windows Recovery Agent proxy host logs for information about why the mount operation failed.

FBP0007E The selected snapshot is already mounted.

Explanation: The Windows Recovery Agent proxy host identified the selected snapshot as already mounted to the requested target.

System action: None.

User response: The instant restore session or mounted snapshot is available for use.

FBP0010E Failed to dismount.

Explanation: The dismount operation on the Windows Recovery Agent proxy host failed.

System action: The operation is canceled.

User response: Check the Windows Recovery Agent proxy host logs for information about why the dismount operation failed.

FBP0011E The node data was not retrieved.

Explanation: The Windows Recovery Agent proxy host failed to retrieve the node data when querying the Tivoli Storage Manager server.

System action: The operation is canceled.

User response: Check the Windows Recovery Agent proxy host logs for information about why the querying operation failed.

FBP0012E Tivoli Storage Manager server snapshots were not found.

Explanation: The Windows Recovery Agent proxy host failed to expose the snapshots on the specified Tivoli Storage Manager server.

System action: The operation is canceled.

User response: Verify that the correct Tivoli Storage Manager server and node that own the snapshots are specified.

FBP0013E The snapshot was not found. Click 'Refresh'.

Explanation: The selected snapshot was not found on the Tivoli Storage Manager server.

System action: The operation is canceled.

User response: Click Refresh in the Recovery Agent GUI to load the current snapshots on the Tivoli Storage Manager server.

FBP0016E Invalid parameters were specified.

Explanation: The mount operation on the Windows Recovery Agent proxy host failed.

System action: The operation is canceled.

User response: Check the Windows Recovery Agent proxy host logs for information about why the mount operation failed.

FBP0017E The mdadm version is not supported.

Explanation: The installed version of the mdadm utility on the Linux machine is not supported.

System action: The operation is canceled.

User response: Upgrade the mdadm utility on your Recovery Agent Linux machine to a supported version.

For current software requirements, see technote 1505139.

FBP0018E The mdadm utility was not found.

Explanation: The mdadm utility is not installed on the Linux machine.

System action: The operation is canceled.

User response: Install the mdadm utility on your Recovery Agent Linux machine. For current software requirements, see technote 1505139.

FBP0019E The iscsiadm version is not supported.

Explanation: The installed version of the iscsiadm utility (for Recovery Agent on RedHat Linux machines) or open-iscsi (for Recovery Agent on SUSE Linux machines) is not supported.

System action: The operation is canceled.

User response: Upgrade the iscsiadm or open-iscsi utility on your Recovery Agent Linux machine to a supported version. For current software requirements, see technote 1505139.

FBP0020E The iscsiadm utility was not found.

Explanation: The iscsiadm utility is not installed on the Linux machine.

System action: The operation is canceled.

User response: Install the iscsiadm utility on your Recovery Agent Linux machine. For current software requirements, see technote 1505139.

FBP0021E The lsscsi version is not supported.

Explanation: The installed version of the lsscsi utility is not supported.

System action: The operation is canceled.

User response: Upgrade the lsscsi utility on your Recovery Agent Linux machine to a supported version. For current software requirements, see technote 1505139.

FBP0022E The lsscsi utility was not found.

Explanation: The lsscsi utility is not installed on the Linux machine.

System action: The operation is canceled.

User response: Install the lsscsi utility on your Recovery Agent Linux machine. For current software requirements, see technote 1505139.

FBP0023E The Secure Shell (SSH) version is not supported.

Explanation: The installed version of the SSH client is not supported.

System action: The operation is canceled.

User response: Upgrade the SSH client on your Recovery Agent Linux machine to a supported version. For current software requirements, see technote 1505139.

FBP0024E The Secure Shell (SSH) was not found.

Explanation: The SSH client is not installed on the Linux machine.

System action: The operation is canceled.

User response: Install the SSH client on your Recovery Agent Linux machine. For current software requirements, see technote 1505139.

FBP0025E Not all instant restore sessions were stopped.

Explanation: The Recovery Agent was unable to stop all instant restore sessions.

System action: Some of the instant restore sessions are still visible in the Recovery Agent 'Instant Restore' panel.

User response: Try stopping the instant restore sessions one after the other. If the problem persists, check the Linux Recovery Agent engine log file. This file is usually located at /opt/tivoli/tsm/TDPVMWare/mount/engine/var/TSM4VE_IR_LOG_0040.sf. Also check the Windows Recovery Agent proxy host logs for any errors related to this issue.

FBP0026E Failed to read instant restore session.

Explanation: The Recovery Agent was unable to read the instant restore status file.

System action: Information about the instant restore is not available.

User response: Try restarting the instant restore session. If the problem persists, check the Linux system log (usually located at /var/log/messages) for any errors related to this issue.

FBP0027E Mount session already exists.

Explanation: The selected snapshot is already mounted to the requested target.

System action: None.

User response: The instant restore session or mounted snapshot is available for use.

FBP0028E Failed to create the mount sessions directory.

Explanation: The Recovery Agent was unable to create the directory for the mount operation.

System action: The operation is canceled.

User response: Try the mount operation again. If the problem persists, check the Linux system log (usually located at /var/log/messages) for any errors related to this issue.

FBP0029E Failed to encrypt node credentials.

Explanation: The Recovery Agent was unable to encrypt the node credentials.

System action: The operation is canceled.

User response: Try the operation again. If the problem persists, check the Linux system log (usually located at /var/log/messages) for any errors related to this issue.

FBP0030E Failed to decrypt node credentials.

Explanation: The Recovery Agent was unable to decrypt the node credentials.

System action: The operation is canceled.

User response: Try the operation again. If the problem persists, check the Linux system log (usually located at /var/log/messages) for any errors related to this issue.

FBP0031E Failed to remove mount session.

Explanation: The Recovery agent was unable to delete the mount status file.

System action: The mounted snapshot remain in the Recovery Agent 'Mounted Volumes' panel.

User response: Try unmounting the mounted snapshot again. If the problem persists, check the Linux Recovery Agent engine log file. This file is usually located at /opt/tivoli/tsm/TDPVMWare/mount/engine/var/TSM4VE_IR_LOG_0040.sf for more information. Also check the Linux system log (usually located at /var/log/messages) for any errors related to this issue.

FBP0032E Instant restore session already exists.

Explanation: A similar instant restore session already exists or a similar instant restore status file exists.

System action: The new instant restore session is canceled.

User response: Check the Linux Recovery Agent engine log file for more information. This file is usually located at /opt/tivoli/tsm/TDPVMWare/mount/engine/var/TSM4VE_IR_LOG_0040.sf.

FBP0033E Failed to create the instant restore sessions directory.

Explanation: The Recovery Agent was unable to create the directory for the instant restore operation.

System action: The instant restore operation is canceled.

User response: Try the instant restore operation again. If the problem persists, check the Linux system log (usually located at /var/log/messages) for any errors related to this issue.

FBP0034E Failed to remove the instant restore session.

Explanation: The Recovery Agent was unable to delete the instant restore status file.

System action: The instant restore session remains in the Recovery Agent 'Instant Restore' panel.

User response: Try stopping the instant restore session again. If the problem persists, check the Linux Recovery Agent engine log file. This file is usually located at /opt/tivoli/tsm/TDPVMWare/mount/engine/var/TSM4VE_IR_LOG_0040.sf for more information. Also check the Linux system log (usually located at /var/log/messages) for any errors related to this issue.

FBP0035E Failed to read from the configuration file that is used for mount and instant restore operations.

Explanation: The Recovery Agent was unable to read the configuration file.

System action: Information about the mount or instant restore is not available.

User response: Try the operation again. If the problem persists check the Linux system log (usually located at /var/log/messages) for any errors related to this issue.

FBP0036E Failed to write to the configuration file that is used for mount and instant restore operations.

Explanation: The Recovery Agent was unable to write to the configuration file.

System action: Information about the mount or instant restore is not available.

User response: Try the operation again. If the problem persists, check the Linux system log (usually located at /var/log/messages) for any errors related to this issue.

FBP0037E Failed to read from the configuration file section that is used for mount and instant restore operations.

Explanation: The Recovery Agent was unable to read the configuration file.

System action: Information about the mount or instant restore is not available.

User response: Try the operation again. If the problem persists, check the Linux system log (usually located at /var/log/messages) for any errors related to this issue.

FBP0038E Failed to write to the configuration file section that is used for mount and instant restore operations.

Explanation: The Recovery Agent was unable to write to the configuration file.

System action: Information about the mount or instant restore is not available.

User response: Try the operation again. If the problem persists, check the Linux system log (usually located at /var/log/messages) for any errors related to this issue.

FBP0039E Failed to unmount. Device is busy.

Explanation: The Recovery Agent was not able to unmount the file system of the selected mounted snapshot because the file system is in use.

System action: The unmount operation is canceled.

User response: Close any application that might be accessing this volume. Then, try the operation again. If the problem persists, check the Linux system log (usually located at /var/log/messages) for any errors related to this issue.

FBP0040E Not all mount sessions were unmounted.

Explanation: The Recovery Agent did not unmount all mounted snapshots.

System action: Some of the mounted snapshots sessions are still visible in the Recovery Agent 'Mounted Volumes' panel.

User response: Try to unmount the mounted snapshots one after the other. If the problem persists check the Linux Recovery Agent engine log file. This file is usually located at /opt/tivoli/tsm/TDPVMWare/mount/engine/var/TSM4VE_IR_LOG_0040.sf.

FBP0041E Failed to retrieve data from the Recovery Agent CLI.

Explanation: The Recovery Agent was unable to read the Recovery Agent CLI (TDPVMWareShell) output file.

System action: The operation is canceled.

User response: Try the operation again. If the problem persists, check the Linux system log (usually located at /var/log/messages) for any errors related to this issue.

FBP0042E Failed to parse data from the Recovery Agent CLI.

Explanation: The Recovery Agent was unable to parse the data from the Recovery Agent CLI (TDPVMWareShell) output file.

System action: The operation is canceled.

User response: Try the operation again. If the problem persists, check the Linux Recovery Agent engine log file. This file is usually located at /opt/tivoli/tsm/TDPVMWare/mount/engine/var/TSM4VE_IR_LOG_0040.sf.

FBP0043E Failed to create query for the Recovery Agent CLI.

Explanation: The Recovery Agent was unable to create the Recovery Agent CLI (TDPVMWareShell) output file.

System action: The operation is canceled.

User response: Try the operation again. If the problem persists, check the Linux system log (usually located at /var/log/messages) for any errors related to this issue.

FBP0044E Failed to retrieve mount data from the Recovery Agent CLI.

Explanation: The Recovery Agent was unable to create the Recovery Agent CLI (TDPVMWareShell) output file.

System action: The operation is canceled.

User response: Try the operation again. If the problem persists, check the Linux system log (usually located at /var/log/messages) for any errors related to this issue.

FBP0045E Failed to create mount query for the Recovery Agent CLI.

Explanation: None.

FBP0046E Failed to connect to the Recovery Agent CLI.

Explanation: The Linux Recovery Agent was unable to retrieve the Recovery Agent CLI (TDPVMWareShell) installation path from the registry on the Windows machine.

System action: The operation is canceled.

User response: Check the connectivity to the Windows machine, verify that the SSH is configured correctly, and that the user defined on Cygwin has administrative privileges. For more information, see the product documentation.

FBP0047E Failed to create the mount directory.

Explanation: The Recovery Agent was unable to locate or create the directory for the mount operation.

System action: The mount operation is canceled.

User response: Try the mount operation again. If the problem persists, check the Linux system log (usually located at /var/log/messages) for any errors related to this issue.

FBP0048E Failed to mount the file system of the snapshot.

Explanation: The Recovery Agent succeeded connecting to the mounted snapshot iSCSI device. However, the Recovery Agent was unable to mount the file system of the snapshot.

System action: The mount operation failed. The Recovery Agent automatically attempts to mount the file system every 5 minutes.

User response: Since the mounted snapshot is available as an iSCSI device, attempt to mount the file system of the device. If the problem persists, check the Linux system log (usually located at /var/log/messages) for any errors related to this issue.

FBP0049E Failed to set the SSH server address.

Explanation: The Recovery Agent was unable to set the SSH server address. The specified server address might be incorrect.

System action: The operation is canceled.

User response: Try the operation again. If the problem persists, check the Linux Recovery Agent engine log file for more information. This file is usually located at /opt/tivoli/tsm/TDPVMWare/mount/engine/var/TSM4VE_IR_LOG_0040.sf.

FBP0050E Failed to set SSH user name.

Explanation: The Recovery Agent cannot access the Windows Recovery Agent CLI (TDPVMWareShell) using the defined 'SSH login' user.

System action: The operation is canceled.

User response: Using Secure Shell verify that you can connect to the Windows Recovery Agent CLI machine using the user defined under 'Settings'>'SSH login'.

FBP0051E **Failed to run SSH command.**
Explanation: None.

FBP0052E **Failed to send query to the TDPVMware Shell.**
Explanation: None.

FBP0053E **Failed to send query to the Recovery Agent CLI.**
Explanation: While using SSH, the Recovery Agent failed to send an input command file to the Windows Recovery Agent CLI (TDPVMWare Shell). This issue might be caused by an SSH user without read and write privileges on the Windows Recovery Agent CLI machine.

System action: The operation is canceled.

User response: Verify that the SSH user defined under 'Settings' > 'SSH login' has read and write privileges on the Windows Recovery Agent CLI machine. Also check the Linux Recovery Agent engine log file for more information. This file is usually located at /opt/tivoli/tsm/TDPVMWare/mount/engine/var/TSM4VE_IR_LOG_0040.sf.

FBP0056E **Failed to locate the block device specified for the mount point.**
Explanation: The Recovery Agent failed to locate the block device for the mount point that was specified for the instant restore operation.

System action: The instant restore operation is canceled.

User response: Verify that the mount point specified for the instant restore operation is correct.

FBP0057E **Failed to locate the mount point for the specified block device.**
Explanation: The Recovery Agent failed to locate the mount point for the specified instant restore block device.

System action: The instant restore operation is canceled.

User response: Verify that the specified block device for the instant restore operation is correct and mounted.

FBP0058E **The specified mount point is not mounted on the block device.**
Explanation: The specified mount point is not mounted on the specified block device.

System action: The instant restore operation is canceled.

User response: Verify that the specified mount point and block device are correct, and that the mount point is mounted on that block device.

FBP0059E **Restore is not allowed to '/' or '/boot'.**
Explanation: The Recovery Agent does not support instant restore operations to target devices that are '/' or '/boot' volumes.

System action: The instant restore operation is canceled.

User response: Specify a different target device for the instant restore operation.

FBP0060E **Restore is not allowed to RAID devices.**
Explanation: The Recovery Agent does not support instant restore operations to RAID devices.

System action: The instant restore operation is canceled.

User response: Specify a different target device for the instant restore operation.

FBP0061E **The restore operation failed to start.**
Explanation: The Recovery Agent failed to start the instant restore operation.

System action: The instant restore operation is canceled.

User response: Try the operation again. If the problem persists, check the Linux Recovery Agent engine log file for more information. This file is usually located at /opt/tivoli/tsm/TDPVMWare/mount/engine/var/TSM4VE_IR_LOG_0040.sf.

FBP0062E **Failed to get the iSCSI initiator name.**
Explanation: No iSCSI initiator was specified.

System action: The operation is canceled.

User response: Verify that the iSCSI initiator name is specified correctly.

FBP0063E **iSCSI target is not logged in.**
Explanation: None.

FBP0064E **Failed to resolve the IP address to a hostname.**
Explanation: The Recovery Agent failed to associate a hostname with the specified IP address.

System action: The operation is canceled.

User response: Verify that the IP or hostname are correct. Then, try the operation again. If the problem persists, check the Linux Recovery Agent engine log

file for more information. This file is usually located at /opt/tivoli/tsm/TDPVMWare/mount/engine/var/TSM4VE_IR_LOG_0040.sf.

FBP0065E The iSCSI service was not found.

Explanation: The iSCSI daemon is not installed on the Recovery Agent Linux machine.

System action: The operation is canceled.

User response: Install the required iSCSI daemon on the Recovery Agent Linux machine. See information about related iSCSI tasks in the product documentation.

FBP0066E Failed to start the iSCSI daemon.

Explanation: The Recovery Agent was unable to start the iSCSI daemon.

System action: The operation is canceled.

User response: Try the operation again. If the problem persists, check the Linux system log (usually located at /var/log/messages) for any errors related to this issue.

FBP0067E Failed to discover iSCSI targets.

Explanation: The Recovery Agent was unable to discover the iSCSI targets.

System action: The operation is canceled.

User response: Try the operation again. If the problem persists, check the Linux system log (usually located at /var/log/messages) for any errors related to this issue.

FBP0068E Failed to log in to the iSCSI target.

Explanation: The Recovery Agent was unable to log in to the iSCSI target.

System action: The operation is canceled.

User response: Check the Linux system log (usually located at /var/log/messages) for any errors related to this issue.

FBP0069E Failed to log out of the iSCSI target.

Explanation: The Recovery Agent was unable to log out of the iSCSI target.

System action: The operation is canceled.

User response: Check the Linux system log (usually located at /var/log/messages) for any errors related to this issue.

FBP0070E Failed to delete the iSCSI target.

Explanation: The Recovery Agent was unable to delete the iSCSI target.

System action: The operation is canceled.

User response: Check the Linux system log (usually located at /var/log/messages) for any errors related to this issue.

FBP0071E Failed to identify the block device for the iSCSI target.

Explanation: The Recovery Agent successfully logged in to the iSCSI target; however, the iSCSI block device was not found.

System action: The operation is canceled.

User response: Check the Linux system log (usually located at /var/log/messages) for any errors related to this issue.

FBP0072E Failed to create the RAID mirror device.

Explanation: The Recovery Agent was unable to create the RAID mirror device using the mdadm utility.

System action: The instant restore operation is canceled.

User response: Check the Linux system log (usually located at /var/log/messages) for any errors related to this issue.

FBP0073E Failed to stop the RAID mirror device.

Explanation: The Recovery Agent uses the mdadm utility to stop the RAID mirror device. However, the Recovery Agent was unable to stop the RAID mirror device.

System action: The instant restore operation is canceled.

User response: Check the Recovery Agent engine log file on the Linux machine for more details about why the device did not stop. This file is usually located at /opt/tivoli/tsm/TDPVMWare/mount/engine/var/TSM4VE_IR_LOG_0040.sf. Also check the Linux system log (usually located at /var/log/messages).

FBP0074E Failed to add the target block device to the RAID mirror.

Explanation: The Recovery Agent uses the mdadm utility to add the target block device to the RAID mirror. However, the Recovery Agent was unable to add the target block device to the RAID mirror.

System action: The instant restore operation is canceled.

User response: Check the Recovery Agent engine log file on the Linux machine for more details about why the device was unable to add the target block device to the RAID mirror. This file is usually located at /opt/tivoli/tsm/TDPVMWare/mount/engine/var/TSM4VE_IR_LOG_0040.sf. Also check the Linux system log (usually located at /var/log/messages).

FBP0075E Failed to mark the target block device in RAID mirror as faulty.

Explanation: The Recovery Agent uses the mdadm utility to mark the target block device in the RAID mirror. However, the Recovery Agent was unable to mark the target block device as faulty.

System action: The instant restore session is paused.

User response: Check the Recovery Agent engine log file on the Linux machine for more details about why the device was not marked. This file is usually located at /opt/tivoli/tsm/TDPVMWare/mount/engine/var/TSM4VE_IR_LOG_0040.sf. Also check the Linux system log (usually located at /var/log/messages).

FBP0076E Failed to remove the target block device from the RAID mirror.

Explanation: The Recovery Agent uses the mdadm utility to remove the target block device from the RAID mirror. However, the Recovery Agent was unable to remove the target block device.

System action: The instant restore operation is canceled.

User response: Check the Recovery Agent engine log file on the Linux machine for more details about why the device was not removed. This file is usually located at /opt/tivoli/tsm/TDPVMWare/mount/engine/var/TSM4VE_IR_LOG_0040.sf. Also check the Linux system log (usually located at /var/log/messages).

FBP0079E Unknown key.

Explanation: None.

FBP0080E The operation timed-out.

Explanation: The Recovery Agent engine scripts did not reply to the Recovery Agent GUI in a timely manner.

System action: The operation is canceled.

User response: Try the operation again. If the problem persists, check the Recovery Agent engine log file on the Linux machine. This file is usually located at /opt/tivoli/tsm/TDPVMWare/mount/engine/var/TSM4VE_IR_LOG_0040.sf.

FBP0081E Internal error.

Explanation: None.

FBP0083E The snapshot does not contain a partition with a supported file system.

Explanation: The Recovery Agent successfully parsed the partition structure of the disk. However, the partitions do not use any of these supported file

systems: FAT, NTFS, EXT2, EXT3, EXT4, or ReiserFS. As a result, volume-level operations, such as 'Instant Restore' and 'Mount as Virtual Volume', are not supported for this snapshot.

System action: The operation is canceled.

User response: To restore data from the selected snapshot, use the Windows Recovery Agent proxy host to mount and expose the snapshot. See information about mounting as iSCSI targets in the product documentation.

FBP0084E Failed to retrieve partitions.

Explanation: The Windows Recovery Agent proxy host was unable to retrieve the partition list from the disk snapshot.

System action: The operation is canceled.

User response: Check the Windows Recovery Agent proxy host logs about why the partition list was not retrieved.

FBP0085E Recovery Agent can connect only to a Tivoli Storage Manager server node.

Explanation: None.

FBP0086E Failed to remove the Tivoli Storage Manager server connection.

Explanation: The Windows Recovery Agent proxy host reported that there are active instant restore sessions or mounted volumes that require the connection to the Tivoli Storage Manager server. As a result, the existing connection cannot be removed.

System action: The remove connection operation is canceled.

User response: Check the Windows Recovery Agent proxy host logs about the active instant restore sessions or mounted volumes.

FBP0088E Mount operation failed because the Write cache is either full or configured incorrectly.

Explanation: Mount and instant restore sessions (that run on the Linux machine) access the Virtual Volume write cache on the Windows Recovery Agent proxy host. This proxy host reported that the write cache is unavailable.

System action: The operation is canceled.

User response: Check the log files on the Windows Recovery Agent proxy host for information about why the write cache is unavailable. Verify that the Virtual Volume write cache is configured correctly in the Windows Recovery Agent GUI. See information about

setting the Virtual Volume write cache options in the product documentation.

FBP0089E The Recovery Agent GUI storage type option is 'Tape', and the requested media is busy.

Explanation: When the Recovery Agent GUI storage type option specifies 'Tape', only a single snapshot can be mounted.

System action: The operation is canceled.

User response: Dismount the currently mounted snapshot before you attempt to mount another snapshot.

FBP0090E Operation timed-out. Manual intervention might be required.

Explanation: The Linux Recovery Agent GUI operation timed-out during a mount or instant restore operation.

System action: The operation is canceled.

User response: Follow the "Responding to a timeout during a file restore or an instant restore (Linux)" procedure documented in the Data Protection for VMware Installation and User's Guide.

FBP0091E The selected disk is not an MBR disk.

Explanation: The Recovery Agent cannot parse the partition structure of the disk, because the disk is not a Basic, MBR-based disk. Volume-level operations, such as 'Instant Restore' and 'Mount as Virtual Volume', are not supported for this snapshot.

System action: Mount and instant restore operations are disabled.

User response: To restore data from the selected snapshot, use the Windows Recovery Agent proxy host to mount and expose the snapshot using 'Mount as iSCSI target' method.

FBP0092E Operation failed. Recovery Agent is initializing.

Explanation: Mount and instant restore operations cannot proceed when the Windows Recovery Agent proxy host is initializing.

System action: The mount or instant restore operation is canceled.

User response: Wait until the Windows Recovery Agent proxy host completes initializing. Then, try the operation again.

FBP0093E The mount point is already in use by another mount session.

Explanation: The mount operation failed because the target mount point is currently in use.

System action: The mount operation is canceled.

User response: Specify a target mount point that is not in use.

FBP0094E The mount point is already in use by another instant restore session.

Explanation: The instant restore operation failed because the target mount point is currently in use.

System action: The instant restore operation is canceled.

User response: Specify a target mount point that is not in use.

FBP1001I The folder:*folder path* does not exist. Do you want to create the folder?

Explanation: The selected folder does not exist. You can create the folder by proceeding with the instructions displayed on the screen.

System action: The system waits for a user response.

User response: Specify Yes to create the folder and continue with the operation. Specify No to not create the folder and end the current operation.

FBP1003I Specify a folder for the cache files

Explanation: A folder that is used to store the virtual disk and virtual volume cache files was not specified. The cache is used to store write operations to the virtual disk and virtual volume during the mount operation.

System action: The system waits for a user response.

User response: Specify a folder to store the virtual disk and virtual volume cache files.

FBP1005I *mount path* already has a mounted virtual volume. Do you want to dismount the volume before you continue?

Explanation: The selected path already has a mounted virtual volume. This existing mounted virtual volume must be dismounted to continue with the current mount operation.

System action: The system waits for a user response.

User response: Specify Yes to dismount the existing mounted virtual volume and continue with the current mount operation. Specify No to end the current mount operation.

FBP1008I Recovery Agent cannot be started because it is being used by another user

Explanation: The Recovery Agent application is already running on this machine. For example, this situation occurs when the application is started by another user on another session.

System action: The operation is canceled.

User response: Log in to the machine as the user that started the Recovery Agent application.

FBP1009I Recovery Agent cannot be closed while mounted volumes exist. Do you want to dismount all volumes?

Explanation: Existing mounted virtual volumes and virtual disks must be dismounted before closing the Recovery Agent application.

System action: The system waits for a user response.

User response: Specify Yes to dismount all the existing mounted virtual volumes and virtual disks and close the Recovery Agent application. Specify No to not dismount all the existing mounted virtual volumes and virtual disks and return to the Recovery Agent application.

FBP1011I The Virtual Volume Driver was registered successfully

Explanation: Successful Recovery Agent Virtual Volume Driver registration is required to use the mount function.

System action: Operation completed successfully.

User response: The Recovery Agent application is ready for operations.

FBP1013I Connection to Tivoli Storage Manager server resumed.

Explanation: Communication between the Recovery Agent application and the Tivoli Storage Manager server is established.

System action: Operation completed successfully.

User response: The Recovery Agent application is ready for operations.

FBP1014I You must restart the Recovery Agent application for changes to the Data Access options to take effect.

Explanation: Recent changes to the Data Access options cannot be implemented until the Recovery Agent application is restarted.

System action: The Recovery Agent application operates with the existing Data Access options setting until it is restarted.

User response: Restart the Recovery Agent application so that changes to the Data Access options are implemented.

FBP1100I Received CONTINUE from service manager

Explanation: The Recovery Agent service received a SERVICE_CONTROL_CONTINUE command.

System action: The Recovery Agent service resumes activities.&msgnl;The latest Recovery Agent driver events are written to the Recovery Agent log file.

User response: The Recovery Agent application is ready for operations.

FBP1101I Received PAUSE from service manager

Explanation: The Recovery Agent service received a SERVICE_CONTROL_PAUSE command.

System action: This command has no effect on the Recovery Agent service.

User response: The Recovery Agent application is ready for operations.

FBP1102I Received a STOP command from the service manager

Explanation: The Recovery Agent service received a SERVICE_CONTROL_STOP command. This message is issued when the service is stopped from the service manager. Opening the Recovery Agent GUI from the Start menu sends a stop command to the service.

System action: The Recovery Agent service stops.

User response: The Recovery Agent application is ready for operations.

FBP1103I Service stopped, reporting to service manager

Explanation: The Recovery Agent service stops. The service can be restarted from the service manager.

System action: The Recovery Agent application stops.

User response: No user action required.

FBP1104I --- Recovery Agent *version string* started ---

Explanation: The Recovery Agent application started. The version string is printed in the message.

System action: Operation completed successfully.

User response: The Recovery Agent application is ready for operations.

FBP1300I License is OK.

Explanation: The license file is valid.

System action: Operation completed successfully.

User response: The Recovery Agent application is ready for operations.

FBP1301W Not for resale license.

Explanation: The license file is valid.

System action: Operation completed successfully.

User response: The Recovery Agent application is ready for operations.

FBP1302E Error accessing license file.

Explanation: The license file could not be accessed. This situation occurs when the license file cannot be located, it cannot be opened because of permission restrictions, or the file is corrupted.

System action: The Recovery Agent application stops.

User response: Obtain a new license for the Recovery Agent application.

FBP1303E Corrupted license file.

Explanation: The license registration string is not valid.

System action: The Recovery Agent application stops.

User response: Obtain a new license for the Recovery Agent application.

FBP1304E Trial period has expired.

Explanation: The license registration string is not valid.

System action: The Recovery Agent application stops.

User response: Obtain a new license for the Recovery Agent application.

FBP1305I Try and buy license. days left.

Explanation: The license file is valid.

System action: Operation completed successfully.

User response: The Recovery Agent application is ready for operations.

FBP5003W *target volume* : The repository is not loaded. Load the repository and resume the session.

Explanation: The instant restore session is unable to resume since the Recovery Agent failed to reestablish connection to the Tivoli Storage Manager server where

the backup snapshots are located. The restored volume is inaccessible while the session is paused.

System action: The instant restore session is paused.

User response: Click "Select IBM Spectrum Protect server" in the Recovery Agent GUI to connect to the Tivoli Storage Manager server and resume the instant restore session.

FBP5005W Windows indicates the destination volume *target volume* might be a network-mapped drive. If volume *target volume* again is confirmed as a network-mapped drive, the operation fails. Continue anyway?

Explanation: The Recovery Agent does not support instant restore sessions to a network-mapped drive.

System action: The instant restore session is canceled.

User response: Specify a destination volume that is not on a network-mapped drive.

FBP5007W Read block from the source has failed. The problem might have been caused by a network failure. See log file for more details. If the problem was caused by a network failure, correct the problem and resume the session.

Explanation: The instant restore session is unable to retrieve data from the Tivoli Storage Manager server. As a result, the instant restore session is paused. The problem might be caused by a network failure. The restored volume is inaccessible while the session is paused.

System action: The instant restore session is paused.

User response: Check the Recovery Agent logs for information regarding the cause of the problem. After resolving the issue, resume the session.

FBP5008W There are open handles to the volume being restored (*volume name*). Close any application (such as Windows Explorer or a command prompt) that might be accessing this volume and try again. If you select Ignore, applications using these handles might become unstable once the restore process begins.

Explanation: The target volume for the restore is in use. Restoring a volume to a viewable storage volume involves overwriting data on that existing storage volume. After the restore begins, the current volume contents are permanently erased.

System action: The system waits for a user response.

User response: Close any application (such as Windows Explorer or a command prompt) that might

be accessing this volume and try the operation again.If you select Ignore, applications that currently use these open handles might become unstable when the restore operation begins.

FBP5010W **System is low on memory.Write operations to virtual volumes might be lost.**

Explanation: Changes that are done on mounted volumes are written to memory. As a result, the Recovery Agent can use a large amount of RAM when it operates in read/write mode.

System action: Write operations to virtual volumes might be lost.

User response: Dismount some of the mounted volumes (when possible) or mount the volumes as read-only.The value of the 'Read Ahead cache size' option affects the memory usage. See information about setting this option in the product documentation.

FBP5011W **Recovery Agent still has *number of mounted volumes* volumes mounted. Stopping the Recovery Agent might cause the system to become unstable. Are you sure you want to stop the Recovery Agent?**

Explanation: Stopping the Recovery Agent without first dismounting the virtual volumes might cause both the system and active applications to become unstable.

System action: The system waits for a user response.

User response: Specify No to prevent the Recovery Agent from stopping, then dismount any mounted volumes.Specify Yes to stop the Recovery Agent, even though both the system and active applications might become unstable.

FBP5012W **The Recovery Agent still has *number of active sessions* active instant restore session. These sessions will be paused and the restored volumes will appear unformatted, until the Recovery Agent service restarts.Are you sure you want to stop the Recovery Agent?**

Explanation: Stopping the Recovery Agent without waiting for the restore to complete makes the restored volumes display as if they are unformatted. The restore process resumes when the Recovery Agent service restarts.

System action: The system waits for a user response.

User response: Specify No to prevent the Recovery Agent from stopping and to continue the instant restore session.Specify Yes to stop the Recovery Agent, even though the volumes that are still being processed display as if they are unformatted.Do not attempt to

format these volumes as such an attempt causes data loss.

FBP5013W **Abort selected sessions?All data is lost and volumes require reformatting.**

Explanation: Aborting the instant restore sessions causes the loss of all data that was written to the restored volumes.The restored volumes display as unformatted and require reformatting.

System action: The system waits for a user response.

User response: Specify Yes to abort the instant restore sessions. All data that was written to the restored volumes during these sessions is lost.Specify No to continue the instant restore sessions.

FBP5015W **All data on target drive *volume name* will be lost. Note 1: Successful instant restore processing requires sufficient network connectivity and bandwidth to the repository. Note 2: Use of instant restore is recommended only for applications that primarily issue READ I/O's.Do you want to continue?**

Explanation: Instant restore processing overwrites data on the target storage volume.A sufficient data transfer rate from the Tivoli Storage Manager server is required for a successful instant restore operation.

System action: The system waits for a user response.

User response: Click YES to confirm that you understand the effects and to start the instant restore operation.

FBP5017W **There are open files on the volume mounted on:*mounted volume name*.A forced dismount invalidates all of the open files.Are you sure you want to continue?**

Explanation: The virtual volume that is being dismounted is in use by another application. For example, the volume might be open in Windows Explorer. For virtual iSCSI devices, the iSCSI initiator is still logged on to the device.Forcing this volume to dismount might cause the files or applications that are accessing the volume to become unstable.

System action: The system waits for a user response.

User response: Identify and close any files or applications that are accessing the volume. Or, specify 'Continue' to ignore the warning message and continue dismounting the volume.For iSCSI devices, make sure that the iSCSI initiator is logged off the device.

FBP5018W The volume selected for restore is located on a clustered disk. See the product documentation for guidelines when restoring clustered volumes. Failure to follow these guidelines might result in data loss, if a hardware or Windows error occurs. Do you want to continue?

Explanation: Instant restore of a volume in a clustered environment is supported. Other volumes in the cluster are not affected. You can work with the cluster and with the restored volume in parallel. During the instant restore operation, the disk that is being restored cannot fail over if the node fails.

System action: The system waits for a user response.

User response: Specify YES to confirm that you understand the guidelines and to start the instant restore operation.

FBP5020W The Virtual Volume Driver is not yet registered. Recovery Agent can register the driver now. During registration, a Microsoft Windows Logo warning may be displayed. Accept this warning to allow the registration to complete. Do you want to register the Virtual Volume Driver now?

Explanation: User should register the Virtual Volume Driver in order to work with the Recovery Agent. This message is displayed following the first attempt to mount after a silent install, since the driver registration is not performed in silent install.

System action: The system waits for a user response.

User response: Specifying Yes will start the registration process. After registration the Recovery Agent application is ready for operations.

FBP5021W The mounted volume '*mounted volume name*' is in use. Dismounting the volume might cause the application that is using it to become unstable. Do you want to continue?

Explanation: The virtual volume that is being dismounted is in use by another application. For example, the volume might be open in Windows Explorer. For virtual iSCSI devices, the iSCSI initiator is still logged on to the device.

System action: The system waits for a user response.

User response: Identify and close any applications that are accessing the volume. Or, specify 'Continue' to ignore the warning message and continue dismounting the volume. For iSCSI devices, make sure that the iSCSI initiator is logged off the device.

FBP5023W There are active instant restore sessions. These sessions will be paused and the restored volumes will appear unformatted, until the application finishes loading and resumes the sessions. Do you want to continue?

Explanation: Opening the Recovery Agent UI from the 'Start>All Programs' menu stops the service. The active instant restore sessions are paused until the application finishes loading and resumes the sessions.

System action: The system waits for a user response.

User response: Specify Yes to stop the service and load the Recovery Agent UI. This action pauses and then resumes the instant restore sessions. Specify No to not load the Recovery Agent UI. This action leaves the instant restore sessions to run in the background in service mode.

FBP5025W There are '*num active sessions*' sessions using the write cache. Updates to the cache settings are processed when there are no active sessions that use the cache. Do you want to continue?

Explanation: Updates to the write cache settings were detected. These updates are applied when there are no active sessions that use the cache.

System action: The Recovery Agent application operates with the existing write cache settings.

User response: Update the write cache settings when there are no active sessions that use the cache.

FBP5026W The size of the write cache is *num write cache percentage%* full.

Explanation: Mount and instant restore sessions that run on a Linux machine use the Recovery Agent Virtual Volume write cache for write operations. The Cache size is approaching its maximum limit. Linux mount and instant restore sessions might fail when the cache size reaches its limit.

System action: None.

User response: Do not start a new Recovery Agent mount or instant restore session on the Linux machine until the Virtual Volume write 'Cache size' value decreases. See information about setting this option in the product documentation.

FBP5028W The file system of the selected partition (*partition format*) might not be supported by the current operating system. The appropriate File System driver must be installed for Windows to read the volume. Do you want to continue?

Explanation: The partition file system must be supported and recognized by the Windows operating

system where the volume is mounted. This condition is required to view the file structure of the mounted partition. It is recommended to mount volumes with native Linux file systems on a Linux machine.

System action: The system waits for a user response.

User response: Make sure the appropriate file system driver is installed on the Windows operating system where the volume is mounted.

FBP5029W The connection to Tivoli Storage Manager server was lost.

Explanation: The connection between the Recovery Agent application and the Tivoli Storage Manager server was lost.

System action: Mounted volumes might become inaccessible. The instant restore sessions are paused.

User response: Check the Recovery Agent logs for information regarding the connection failure. After resolving the issue, resume any paused instant restore sessions.

FBP5030W No snapshots are available for the selected virtual machine. Or, the Authentication node is not authorized to restore this virtual machine.

Explanation: No snapshots were located for the selected virtual machine. Either no snapshot completed successfully, or if the 'From node' access method was used, the Authentication node does not have permission to restore the selected virtual machine.

System action: The operation is canceled.

User response: If the 'From node' access method is used, make sure sufficient permissions are set for the Authentication node. See the product documentation for details and an example of how to set permissions by using the IBM Spectrum Protect Data Mover 'set access' command.

FBP5031W Some snapshots are currently mounted. If you continue, these snapshots will be dismounted. If a mounted volume is currently being used by an application, the application might become unstable. Do you want to continue?

Explanation: Opening the Recovery Agent UI from the 'Start>All Programs' menu stops the service. The active mounted volumes are dismounted.

System action: The system waits for a user response.

User response: Close any application (such as Windows Explorer or a command prompt) that might be accessing the mounted volumes. Then, open the Recovery Agent UI. If you continue without closing the applications that are accessing the mounted volumes,

these applications might become unstable.

FBP5032W The selected snapshot will not be protected from expiration during this operation. See the product documentation for information about expiration.

Explanation: When the 'From node' authentication method is used, the Authentication node is granted Read-only access to the target node with the 'set access' command. The target node owns the snapshot. As a result, the snapshot cannot be marked as being in use on the server. Therefore, the snapshot might expire while the restore operation is in progress.

System action: The system waits for a user response.

User response: If you proceed, disable the expiration process for the snapshot during the operation. Or, make sure that no snapshots are created for the restored machine during the restore operation. Otherwise, cancel the restore operation.

FBP5033W No snapshots exist in the selected node.

Explanation: Either no snapshot was completed, or the selected Tivoli Storage Manager node is not the node that owns the snapshots.

System action: No snapshot is shown.

User response: If Tivoli Storage Manager for Virtual Environments snapshots were completed, select the Tivoli Storage Manager node that owns the snapshots.

FBP5034W The snapshots are not protected from expiration during the mount operation. An expiration can produce unexpected results and negatively impact the mount point.

Explanation: The mounted snapshots will not be marked as being in use on the server. Therefore, the snapshots might expire while the restore operation is in progress.

System action: The system waits for a user response.

User response: If you proceed, make sure that no snapshots are created for the restored machines during the restore operations. Otherwise, enable the expiration protection.

FBP5035W The selected snapshot is not protected from expiration during this mount operation. An expiration can produce unexpected results and negatively impact the mount point.

Explanation: The mounted snapshot will not be marked as being in use on the server. Therefore, the

snapshot might expire while the restore operation is in progress.

System action: The system waits for a user response.

User response: If you proceed, make sure that no snapshots are created for the restored machine during the restore operation. Otherwise, enable the expiration protection on the 'settings' panel and perform the operation again.

FBP7003E **The folder:***folder name* **is invalid.**

Explanation: The specified path is not a valid folder path.

System action: The system waits for a user response.

User response: Specify a valid folder path.

FBP7004E **The folder:***folder name* **could not be created.**

Explanation: The system failed to create the requested folder.

System action: The operation is canceled.

User response: Check the Recovery Agent logs for information about why the folder was not created.

FBP7005E *folder name* **is not empty. Only empty folders can be used as a mount point.**

Explanation: The system can mount a volume snapshot only to an empty folder.

System action: The operation is canceled.

User response: Specify an empty folder path.

FBP7006E **snapshot size** (*snapshot size*) **is larger than target size** (*partition name*)

Explanation: The volume size of the destination location must be equal to, or greater than, the size of the original volume on the snapshot to be restored.

System action: The instant restore operation is canceled.

User response: Specify a target volume with a size equal to, or greater than, the source volume on the snapshot to be restored.

FBP7007E **A valid iSCSI target name must be specified. Valid iSCSI names consist of the following items: lower-case English characters, digits, '.', ':' and '-'.**

Explanation: When a snapshot is exposed as an iSCSI target, a valid iSCSI target name must be entered.

System action: The system waits for a user response.

User response: Specify a valid iSCSI target name.

FBP7008E **A valid iSCSI initiator name must be specified. Valid iSCSI names consist of the following items: lower-case English characters, digits, '.', ':' and '-'.**

Explanation: The specified iSCSI initiator is not a valid initiator name. When a snapshot is exposed as an iSCSI target, a valid initiator name must be specified by the user.

System action: The system waits for a user response.

User response: Specify a valid iSCSI initiator name.

FBP7009E **A valid folder name must be specified.**

Explanation: The path to the folder is invalid or was not specified. The path to the mount point for the volume snapshot must include an empty folder.

System action: The system waits for a user response.

User response: Specify a valid path to an empty folder.

FBP7012E **Already connected to a Tivoli Storage Manager server. To connect to a different server, or to a different node within the server, select the current server from the list and click 'Remove'.**

Explanation: Recovery Agent can connect only to a single Tivoli Storage Manager server and node.

System action: The operation is canceled.

User response: Remove the existing connection by selecting the server from the list and click 'Remove'. You cannot remove a connection to a server that has active mounted volumes or instant restore sessions.

FBP7013E **Instant restore is not supported in Tape Mode.**

Explanation: Instant restore of snapshot data that is stored on tape is not supported.

System action: The operation is canceled.

User response: Either migrate the snapshot data to a disk storage pool, or use a different restore method.

FBP7014E **Cannot mount more than one snapshot in Tape Mode.**

Explanation: Only a single snapshot can be mounted when the snapshot data is stored on a tape.

System action: The operation is canceled.

User response: Dismount the currently mounted snapshot before you attempt to mount another snapshot.

FBP7015E **No local volume is available as a destination for instant restore.**

Explanation: Instant restore is done to a local volume that has a volume letter and is not the system volume.

System action: The operation is canceled.

User response: Make sure you have a local volume that has a volume letter and that is not the system volume as a destination for the instant restore.

FBP7016E **The Recovery Agent 'Read Ahead size' option requires a value of 0 through 8192.**

Explanation: The Recovery Agent 'Read Ahead size' value specifies the number of extra data blocks retrieved from the storage device after a read request is sent to a single block.

System action: The system waits for a user response.

User response: Specify a valid 'Read Ahead size' value of 0 through 8192. See information about setting this option in the product documentation.

FBP7017E **The Recovery Agent 'Read Ahead cache size' option requires a value of 1000 through 75000. The value must also be at least 1 block larger than the value of the 'Read Ahead size' option.**

Explanation: Recovery Agent 'Read Ahead cache size' value specifies the size of the cache where the 'Read Ahead' extra data blocks are stored.

System action: The system waits for a user response.

User response: Specify a valid 'Read Ahead cache size' value of 1000 through 75000 and at least 1 block larger than the value of the 'Read Ahead size' option. See information about setting this option in the product documentation.

FBP7018E **The Recovery Agent cannot read the snapshot data from the Tivoli Storage Manager server. Make sure that the storage type setting matches the actual storage device. For example, if the data resides on tape, make sure that the storage type is set to 'Tape'. If this does not solve the problem, check the Tivoli Storage Manager server activity log for additional errors.**

Explanation: The required data does not exist on the server or the data is inaccessible. Inaccessible data is typically caused by a 'Storage type' configuration that does not match the actual storage where the data is stored. Recovery Agent cannot read data stored on Tape or VTL if storage type is set to 'Disk'.

System action: The operation is canceled.

User response: Click 'Settings' in the Recovery Agent GUI and select the correct storage device from which to mount the snapshot. You can select 'Disk/File', 'Tape', or 'VTL'. When the storage type is changed, you must restart the Recovery Agent for the changes to take effect. Also, check the Recovery Agent logs and the Tivoli Storage Manager server activity log for any additional errors.

FBP7019E **The selected disk is not a basic disk with an MBR partition style.**

Explanation: Recovery Agent could not parse the partition structure of the disk, because the disk is not a Basic, MBR-based disk. Volume-level operations, such as 'Instant Restore' and 'Mount as Virtual Volume', are not supported for this snapshot.

System action: Volume-level operations are disabled.

User response: Use other methods, such as 'Mount as iSCSI target', to restore data from the selected snapshot.

FBP7020E **The partitions in the selected disk are not formatted with a supported file system.**

Explanation: Recovery Agent successfully parsed the partition structure of the disk. However, none of the partitions use these supported file systems: FAT, NTFS, EXT2, EXT3, EXT4, or ReiserFS. As a result, volume-level operations, such as 'Instant Restore' and 'Mount as Virtual Volume', are not supported for this snapshot.

System action: Volume-level operations are disabled.

User response: Use other methods, such as 'Mount as iSCSI target', to restore data from the selected snapshot.

FBP7021E **Select the node access method.**

Explanation: Three node authentication methods are available to access snapshots on the Tivoli Storage Manager server: 'Asnodename' authenticates with a proxy node, 'Fromnode' authenticates with a node that contains limited access, and 'Direct' authenticates directly.

System action: The system waits for a user response.

User response: Specify the node authentication method to access the snapshots on the Tivoli Storage Manager Server. See information about these three methods in the product documentation.

FBP7022E **You must specify a Tivoli Storage Manager server name or IP.**

Explanation: Recovery Agent requires this information to access the virtual machines backup snapshots on the Tivoli Storage Manager Server.

System action: The system waits for a user response.

User response: Specify the host name or IP address of the Tivoli Storage Manager Server where the backup snapshots are located.

FBP7023E You must specify a valid Tivoli Storage Manager Server port.

Explanation: Recovery Agent requires this information to access the virtual machines backup snapshots on the Tivoli Storage Manager Server.

System action: The system waits for a user response.

User response: Specify the port number that is used by the Tivoli Storage Manager Server where the backup snapshots are located.

FBP7024E You must specify an authentication node.

Explanation: No authentication node was specified. Specify the Tivoli Storage Manager node that owns the snapshots.

System action: The system waits for a user response.

User response: Specify the Tivoli Storage Manager node that owns the snapshots. See information about the node authentication methods in the product documentation.

FBP7025E You must specify a target node.

Explanation: Recovery Agent provides three node authentication methods. When 'Fromnode' or 'Asnodename' are selected, a target node must be specified. The target node is the Tivoli Storage Manager node where the virtual machine backups are located.

System action: The system waits for a user response.

User response: Specify the target node where the virtual machine backups are located. See information about the node authentication methods in the product documentation.

FBP7026E You must specify a node password.

Explanation: No password was specified for the authentication node.

System action: The system waits for a user response.

User response: Enter the password of the Tivoli Storage Manager node that owns the virtual machine snapshots.

FBP7027E The Recovery Agent 'Driver timeout' option requires a value of 60 through 300.

Explanation: The Recovery Agent 'Driver timeout' option specifies the amount of time (in seconds) to process data requests from the file system driver. When

processing does not complete within the specified time, the request is canceled and an error is returned to the file system driver.

System action: The system waits for a user response.

User response: Specify a valid 'Driver timeout' value of 60 through 300. See information about setting this option in the product documentation.

FBP7028E The Recovery Agent 'Write cache size' option requires a value of 1 through upper limit

Explanation: During Linux instant restore and mount operations, the Recovery Agent on the Windows backup proxy host saves data changes in the write cache folder. The maximum cache size is 90% of the available space for the selected folder.

System action: The system waits for a user response.

User response: Specify a valid Virtual Volume write 'Cache size' value. See information about setting this option in the product documentation.

FBP7029E The Recovery Agent CLI mount command is missing one or more required parameters.

Explanation: The Recovery Agent CLI mount command cannot complete without all required parameters.

System action: The operation is canceled.

User response: Issue the 'RecoveryAgentShell.exe -h mount' (Windows) or 'RecoveryAgentShell -h mount dump' (Linux) command to view the required parameters. Then, issue the mount command again with all required parameters.

FBP7030E Repository 'repository name' was not found

Explanation: The Tivoli Storage Manager Server connection specified in the Recovery Agent '-rep' tag was not found.

System action: The operation is canceled.

User response: Correct the Recovery Agent CLI command '-rep' tag to identify the Tivoli Storage Manager Server where the backup snapshots are located.

FBP7031E A valid iSCSI target name must be specified. Valid iSCSI names consist of the following items: lower-case English characters, digits, '.', ':', '-' and '-'.

Explanation: When a snapshot is exposed as an iSCSI target, a valid iSCSI target name must be entered.

System action: The operation is canceled.

User response: Specify a valid iSCSI target name.

FBP7032E Mount target '*mount target*' is not valid.

Explanation: The specified mount path is not a valid folder path.

System action: The operation is canceled.

User response: Specify a valid folder path.

FBP7033E Reparse point '*reparse point*' was not found and cannot be created

Explanation: The specified mount target path was not found and cannot be created.

System action: The operation is canceled.

User response: Specify a valid folder path.

FBP7035E Failed to load partition '*partition*'

Explanation: The Recovery Agent was unable to retrieve the partition list from the disk snapshot.

System action: The operation is canceled.

User response: Check the Recovery Agent logs for information about why the partition list was not retrieved.

FBP7036E Incorrect partition number '*partition number*'

Explanation: The specified partition was not found on the disk snapshot.

System action: The operation is canceled.

User response: Specify a valid partition number.

FBP7037E 'Cache size' must be at least 1GB.

Explanation: Mount and instant restore sessions that run on a Linux machine use the Recovery Agent Cache for write operations.

System action: The system waits for a user response.

User response: Specify a valid size for the 'Write Cache' size field. 'Cache size' must be at least 1GB.

FBP7038E The value of the Recovery Agent write 'Cache size' option must not exceed *max size* in GBGB

Explanation: During Linux instant restore and mount operations, the Recovery Agent on the Windows backup proxy host saves data changes in the write cache folder. The maximum cache size is 90% of the available space for the selected folder.

System action: Linux mount and instant restore sessions might fail when the cache size reaches its limit.

User response: Do not start a new Recovery Agent mount or instant restore session on the Linux machine until the Virtual Volume write 'Cache size' value decreases. See information about setting this option in the product documentation.

FBP8001E resume failed

Explanation: The instant restore session is unable to resume. As a result, the instant restore session pauses. The restored volume is inaccessible while the session is paused.

System action: The instant restore session pauses.

User response: Check the Recovery Agent logs for information about why the resume failed. After the issue is resolved, resume the session.

FBP8002E failed to mount because of too many mount points

Explanation: The Recovery Agent supports a maximum of 128 simultaneously mounted snapshots. That maximum was exceeded.

System action: The mounting operation is canceled.

User response: Dismount at least one of the currently mounted snapshots before an attempt to mount another snapshot.

FBP8003E failed to dismount *mounted volume name*

Explanation: The Recovery Agent failed to dismount the mounted snapshot. This issue might be caused by a disconnection from the Tivoli Storage Manager server that owns the snapshots.

System action: The dismount operation is canceled.

User response: Check the Recovery Agent logs for information about why the dismount operation failed.

FBP8004E failed to load *repository name*

Explanation: The Recovery Agent failed to expose the snapshots of the specified Tivoli Storage Manager server.

System action: The operation is canceled.

User response: Verify that the correct Tivoli Storage Manager server and node that own the snapshots are specified.

FBP8007E Virtual Volume Driver not enabled

Explanation: Mount operations require a working Recovery Agent Virtual Volume Driver.

System action: The mount operations are canceled.

User response: Check the Recovery Agent logs for

information about why the Virtual Volume Driver is not enabled.

FBP8008E snapshot not found.

Explanation: The selected snapshot was not found on the Tivoli Storage Manager server.

System action: The operation is canceled.

User response: Click Refresh in the Recovery Agent GUI to load the current snapshots on the Tivoli Storage Manager server.

FBP8009E already mounted

Explanation: The selected snapshot was already mounted to the requested target.

System action: None.

User response: The mounted snapshot is available for use.

FBP8012E target is a network-mapped drive

Explanation: Mounting snapshots to a network-mapped drive is not supported.

System action: The mount operation is canceled.

User response: Specify a target drive that is not on a network-mapped drive.

FBP8015E volume letter is in use. Select another

Explanation: The selected drive letter for the mount operation is in use.

System action: The mount operation is canceled.

User response: Select a target drive letter that is not in use.

FBP8016E failed to mount

Explanation: The Recovery Agent failed to complete the mount operation.

System action: The mount operation is canceled.

User response: Check the Recovery Agent logs for information about why the mount operation failed to complete.

FBP8019E failed to stop

Explanation: The current request to abort the selected instant restore session failed because the Recovery Agent could not locate the selected session.

System action: None.

User response: The abort request for the instant restore session was already done.

FBP8020E failed to finalize the session

Explanation: The product encountered an internal error when it attempted to finalize the instant restore session.

System action: The operation is canceled.

User response: Check the Recovery Agent logs for information about why the session did not finalize.

FBP8023E target partition is too small

Explanation: The volume size of the destination location must be equal to, or greater than, the size of the original volume on the snapshot to be restored.

System action: The instant restore operation is canceled.

User response: Specify a target volume with a size equal to, or greater than, the source volume on the snapshot to be restored.

**FBP8024E load repository *repository name* failed:
error message**

Explanation: The Recovery Agent failed to expose the snapshots of the specified Tivoli Storage Manager server.

System action: The operation is canceled.

User response: Verify that the correct Tivoli Storage Manager server and Node that own the snapshots are specified.

FBP8025E repository inaccessible. Dismounting volume

Explanation: The Recovery Agent is unable to retrieve data from the Tivoli Storage Manager server. As a result, the currently mounted snapshots are dismounted.

System action: Mounted snapshots are dismounted.

User response: Check the Recovery Agent logs for information about why the repository is inaccessible.

FBP8026E '*path to repository*' inaccessible or not a repository

Explanation: The Recovery Agent failed to expose the snapshots of the specified Tivoli Storage Manager server.

System action: The operation is canceled.

User response: Verify that the correct Tivoli Storage Manager server and Node that own the snapshots are specified.

FBP8027E failed to open repository

Explanation: The Recovery Agent failed to expose the snapshots of the specified Tivoli Storage Manager server.

System action: The operation is canceled.

User response: Verify that the correct Tivoli Storage Manager server and Node that own the snapshots are specified.

FBP8029E session stopped by user

Explanation: The user requested to abort the instant restore session. Aborting the instant restore sessions causes all data that was written to the restored volume to be lost.

System action: The instant restore session ends.

User response: The restored volume is shown as unformatted and requires reformatting.

FBP8031E Exclusive access to the mounted snapshot was not obtained on the Tivoli Storage Manager server.

Explanation: An exclusive access to the snapshot data on the Tivoli Storage Manager server could not be obtained. As a result, the version being restored could expire, leading to inability to complete the restore. Failure to obtain exclusive access is often the result of the snapshot data residing on a target replication server.

System action: The mount operation is canceled.

User response: If expiration protection is enabled, check the status of the target Tivoli Storage Manager server. If the target server is the replication server in failover mode, or if you verified no snapshots are running on the primary server, disable expiration protection. Then, try the operation again. If expiration protection was disabled when this error occurred, visit the IBM Support Portal for additional information at <http://www.ibm.com/support/entry/portal/>.

FBP8032E failed to unmount volume

Explanation: The target volume for the restore operation is in use. As a result, the instant restore operation did not start. Restoring a volume to a viewable storage volume involves overwriting data on that existing storage volume. After the restore session begins, the data on the existing volume is permanently erased.

System action: The instant restore session is canceled.

User response: Close any application (such as Windows Explorer or a command prompt) that might be accessing this volume. Then, try the operation again.

FBP8033E failed to restore blocks

Explanation: The instant restore operation is either unable to retrieve data from the Tivoli Storage Manager server or unable to write data to the target volume.

System action: The instant restore session ends.

User response: Check the Recovery Agent logs for information about why the blocks failed to restore. The restored volumes display as unformatted and require reformatting.

FBP8034E failed to mount volume

Explanation: The Recovery Agent failed to mount the target volume and start the instant restore operation.

System action: The instant restore operation is canceled.

User response: Check the Recovery Agent logs for information regarding why the target volume could not be mounted.

FBP8036E Failed to finalize

Explanation: The Recovery Agent failed to finalize the instant restore session.

System action: The instant restore session is canceled.

User response: Check the Recovery Agent logs for information about the cause of the problem. The restored volumes might display as unformatted and require reformatting.

FBP8037E initialization failed. See logs for the reason

Explanation: The Recovery Agent failed to initialize the instant restore operation.

System action: The instant restore operation is canceled.

User response: Check the Recovery Agent logs for information about the cause of the problem.

FBP8041E cannot restore to a dynamic disk

Explanation: Instant restore to a dynamic volume is not supported.

System action: The instant restore operation is canceled.

User response: Select a basic volume as the instant restore target. Then, try the operation again.

FBP8042E cannot restore to clustered disk

Explanation: Instant restore of a volume in a clustered environment is supported. However, the user canceled the restore to a volume in a clustered environment.

System action: The instant restore operation is canceled.

User response: Select a different volume as the instant restore target. Then, try the operation again.

FBP8043E failed to create bitmap

Explanation: The Recovery Agent failed to create the required internal data structure for the instant restore operation.

System action: The instant restore operation is canceled.

User response: Check the Recovery Agent logs for information about why the data structure was not created.

FBP8044E failed to scramble first block

Explanation: The Recovery Agent failed to overwrite the first sector of the disk.

System action: The instant restore operation is canceled.

User response: Check the Recovery Agent logs for information about why the overwrite to disk failed.

FBP8045E failed to notify driver

Explanation: The Recovery Agent failed to notify the kernel driver regarding the start of the instant restore session.

System action: The instant restore operation is canceled.

User response: Check the Recovery Agent logs for information about why the driver was not notified.

FBP8046E failed to unscramble first block

Explanation: The Recovery Agent failed to overwrite the first sector of the disk.

System action: The instant restore session ends.

User response: Check the Recovery Agent logs for information about why the overwrite to disk failed. The restored volumes might display as unformatted and require reformatting.

FBP8047E cannot restore to a FAT volume. Format target volume as NTFS

Explanation: Instant restore to a volume formatted as an FAT32 file system is not supported.

System action: The instant restore operation is canceled.

User response: Format the volume as an NTFS file system. Then, try the operation again.

FBP8048E session not responding

Explanation: The instant restore session did not respond to the abort request within 5 minutes. As a result, the instant restore session was forcibly stopped.

System action: The instant restore session ends.

User response: Check the Recovery Agent logs for information about why the Recovery Agent did not respond to the abort request. The restored volumes might display as unformatted and require reformatting.

FBP8050E failed to create first block file

Explanation: The Recovery Agent failed to create a memory-mapped file for the instant restore session.

System action: The instant restore operation is canceled.

User response: Check the Recovery Agent logs for information regarding why the memory-mapped file was not created.

FBP8051E cannot restore to disk with signature '0'

Explanation: Instant restore is not supported for disks without an MBR disk signature.

System action: The instant restore operation is canceled.

User response: Select an instant restore target volume on an MBR disk that contains a disk signature.

FBP8052E Recovery Agent is currently initializing.

Explanation: Mount and instant restore operations cannot proceed when the Recovery Agent is initializing.

System action: The mount or instant restore operation is canceled.

User response: Wait until the Recovery Agent completes initializing. Then, try the operation again.

FBP8053E failed to read data from server

Explanation: The Recovery Agent failed to expose the snapshots of the specified Tivoli Storage Manager server.

System action: The operation is canceled.

User response: Verify that the correct Tivoli Storage Manager server and Node that own the snapshots are specified. Check the Recovery Agent logs for more information.

FBP9000E failed connecting to a kernel driver

Explanation: Instant restore operations require a working Recovery Agent kernel driver.

System action: The instant restore operations are canceled.

User response: Check the Recovery Agent logs for information about why the Recovery Agent failed to connect to the driver.

FBP9001E Incompatible Virtual Volume Driver (FBVV) Version , expecting *expected major version.expected minor version* , installed *installed major version.installed minor version*

Explanation: The kernel driver version does not match the Recovery Agent version. A valid driver is required for the Recovery Agent to work properly.

System action: The Recovery Agent application closes.

User response: The Recovery Agent was not installed correctly. Follow the Recovery Agent installation instructions in the product documentation.

FBP9002E Cannot initialize Windows Sockets.

Explanation: The Recovery Agent failed to initialize the Windows Sockets DLL file.

System action: The Recovery Agent application closes.

User response: Check the Windows events logs for errors related to this issue. Also check the Recovery Agent logs for information about why the Windows Sockets DLL file failed to initialize.

FBP9003E Cannot obtain the application data directory path

Explanation: The Recovery Agent was unable to retrieve the application data directory path from the operating system.

System action: The Recovery Agent application closes.

User response: Check the Windows events log for errors related to this issue. Also check the Recovery Agent logs for information about why the Recovery Agent was unable to obtain the application data directory path.

FBP9004E Cannot create directory *directory name*

Explanation: The Recovery Agent failed to create the application data directory.

System action: The Recovery Agent application closes.

User response: Check the Windows events logs for any errors. Check the Recovery Agent logs for information about why the Recovery Agent failed to create the application data directory.

FBP9005E failed to initialize *module name* module

Explanation: The Recovery Agent failed to initialize.

System action: The Recovery Agent application closes.

User response: Check the Recovery Agent logs for information about why the Recovery Agent failed to initialize.

FBP9006E another instance of Recovery Agent is already running

Explanation: Only one active Recovery Agent instance is supported. This issue is encountered when multiple users are logged on to the system and attempting to run the Recovery Agent.

System action: The Recovery Agent is not started.

User response: Either close the current Recovery Agent instance or run the Recovery Agent on a different system.

FBP9007E unable to install the Recovery Agent

Explanation: The Recovery Agent failed to install. A valid installation is required for the Recovery Agent to function properly.

System action: The Recovery Agent is not started.

User response: Follow the Recovery Agent installation instructions in the product documentation.

FBP9008E Cannot get folder name for AFS.dll

FBP9009E Registration of Virtual Volume Driver failed .Check the file *file name*\\installFBVV.log for more information Do you want to retry registering the Virtual Volume Driver?

Explanation: The Virtual Volume Driver must be registered correctly in order for the Recovery Agent to function correctly.

System action: The system waits for a user response.

User response: >Check the Recovery Agent logs for information about why the Recovery Agent failed to register the driver.Click 'Retry' to make another attempt

to register the driver or click 'Cancel' to end the operation.

FBP9010E Write Cache is full.

Explanation: Mount and instant restore sessions that run on a Linux machine use the Recovery Agent Virtual Volume write cache for write operations. Linux mount and instant restore sessions might fail when the cache size reaches its limit.

System action: Write operations to the Linux instant restore and virtual volumes might be lost.

User response: Unmount some of the mounted volumes on the Linux machine to make available space in the write cache. Instant restore volumes on the Linux machine might display as unformatted. When the cache is full, all data that is written to the Linux instant restore volumes is lost.

Appendix E. Accessibility features for the IBM Spectrum Protect product family

Accessibility features assist users who have a disability, such as restricted mobility or limited vision, to use information technology content successfully.

Overview

The IBM Spectrum Protect family of products includes the following major accessibility features:

- Keyboard-only operation
- Operations that use a screen reader

The IBM Spectrum Protect family of products uses the latest W3C Standard, WAI-ARIA 1.0 (www.w3.org/TR/wai-aria/), to ensure compliance with US Section 508 (www.access-board.gov/guidelines-and-standards/communications-and-it/about-the-section-508-standards/section-508-standards) and Web Content Accessibility Guidelines (WCAG) 2.0 (www.w3.org/TR/WCAG20/). To take advantage of accessibility features, use the latest release of your screen reader and the latest web browser that is supported by the product.

The product documentation in IBM Knowledge Center is enabled for accessibility. The accessibility features of IBM Knowledge Center are described in the Accessibility section of the IBM Knowledge Center help (www.ibm.com/support/knowledgecenter/about/releasenotes.html?view=kc#accessibility).

Keyboard navigation

This product uses standard navigation keys.

Interface information

User interfaces do not have content that flashes 2 - 55 times per second.

Web user interfaces rely on cascading style sheets to render content properly and to provide a usable experience. The application provides an equivalent way for low-vision users to use system display settings, including high-contrast mode. You can control font size by using the device or web browser settings.

Web user interfaces include WAI-ARIA navigational landmarks that you can use to quickly navigate to functional areas in the application.

Vendor software

The IBM Spectrum Protect product family includes certain vendor software that is not covered under the IBM license agreement. IBM makes no representation about the accessibility features of these products. Contact the vendor for accessibility information about its products.

Related accessibility information

In addition to standard IBM help desk and support websites, IBM has a TTY telephone service for use by deaf or hard of hearing customers to access sales and support services:

TTY service
800-IBM-3383 (800-426-3383)
(within North America)

For more information about the commitment that IBM has to accessibility, see IBM Accessibility (www.ibm.com/able).

Notices

This information was developed for products and services offered in the US. This material might be available from IBM in other languages. However, you may be required to own a copy of the product or product version in that language in order to access it.

IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Terms and conditions for product documentation

Permissions for the use of these publications are granted subject to the following terms and conditions.

Applicability

These terms and conditions are in addition to any terms of use for the IBM website.

Personal use

You may reproduce these publications for your personal, noncommercial use provided that all proprietary notices are preserved. You may not distribute, display or make derivative work of these publications, or any portion thereof, without the express consent of IBM.

Commercial use

You may reproduce, distribute and display these publications solely within your enterprise provided that all proprietary notices are preserved. You may not make derivative works of these publications, or reproduce, distribute or display these publications or any portion thereof outside your enterprise, without the express consent of IBM.

Rights Except as expressly granted in this permission, no other permissions, licenses or rights are granted, either express or implied, to the publications or any information, data, software or other intellectual property contained therein.

IBM reserves the right to withdraw the permissions granted herein whenever, in its discretion, the use of the publications is detrimental to its interest or, as determined by IBM, the above instructions are not being properly followed.

You may not download, export or re-export this information except in full compliance with all applicable laws and regulations, including all United States export laws and regulations.

IBM MAKES NO GUARANTEE ABOUT THE CONTENT OF THESE PUBLICATIONS. THE PUBLICATIONS ARE PROVIDED "AS-IS" AND WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO IMPLIED WARRANTIES OF MERCHANTABILITY, NON-INFRINGEMENT, AND FITNESS FOR A PARTICULAR PURPOSE.

Privacy policy considerations

IBM Software products, including software as a service solutions, ("Software Offerings") may use cookies or other technologies to collect product usage information, to help improve the end user experience, to tailor interactions with the end user, or for other purposes. In many cases no personally identifiable information is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect personally identifiable information. If this Software Offering uses cookies to collect personally identifiable information, specific information about this offering's use of cookies is set forth below.

This Software Offering does not use cookies or other technologies to collect personally identifiable information.

If the configurations deployed for this Software Offering provide you as customer the ability to collect personally identifiable information from end users via cookies and other technologies, you should seek your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent.

For more information about the use of various technologies, including cookies, for these purposes, see IBM's Privacy Policy at <http://www.ibm.com/privacy> and IBM's Online Privacy Statement at <http://www.ibm.com/privacy/details> in the section entitled "Cookies, Web Beacons and Other Technologies," and the "IBM Software Products and Software-as-a-Service Privacy Statement" at <http://www.ibm.com/software/info/product-privacy>.

Glossary

A glossary is available with terms and definitions for the IBM Spectrum Protect family of products.

See the IBM Spectrum Protect glossary.

To view glossaries for other IBM products, see IBM Terminology.
