Overview

The focus of this Blueprint is to demonstrate how IBM FlashSystem® with IBM Spectrum® Virtualize can be used as a preferred back-end persistent storage for VMware Tanzu-based deployments.

This document describes the use of IBM® FlashSystem storage volumes as virtual volumes (vVols) that are made available to provision persistent volumes for a VMware Tanzu deployment.

All models of IBM FlashSystem family are supported by this document, including:

- FlashSystem 9100 and 9200
- FlashSystem 7200
- FlashSystem 5000
- IBM SAN Volume Controller
- All storage that is running IBM Spectrum Virtualize software

By using IBM Spectrum Connect VASA provider with IBM Spectrum Virtualize, the vVols are used to create a data store under vCenter. Post provisioning of VMware Tanzu Kubernetes grid service (TKGS), the vVols data store is used to provision the persistent volumes for future applications that are deployed on the worker nodes.

Executive summary

Container adoption is growing rapidly as enterprises increasingly create and deploy containerized applications into production environments. Most companies are building and containerizing new applications to support their evolving business challenges, which gives them the agility that is needed to address dynamic market needs.

Another key area for container growth concerns developing container native applications. These applications provide developers with the ability to spin up environments for application development with persistent self-service storage capabilities that support fast, flexible application delivery.

VMware Tanzu allows businesses to run Kubernetes in vSphere and manage Kubernetes across multiple clouds, whether its public or private, while allowing customers to automate the delivery of containerized workloads.

According to VMware, VMware Tanzu Basic simplifies the operation of Kubernetes on-premises by placing cloud native constructs at the virtualization administrator's fingertips as part of vSphere 7. It delivers an open source-aligned Kubernetes distribution, which is packaged for the enterprise and delivered as part of your infrastructure to support application modernization.

Whether the use case is operations or development, providing persistent storage that reliable, available, secure, and Enterprise-class is a key requirement for customers. As customers scale containerized applications in Tanzu beyond dev/test or departmental use, IBM's award-winning FlashSystem storage solutions deliver the enterprise data resources and storage to containers. Therefore, mission-critical infrastructure is now possible, delivering shared-storage operational efficiency, price-performance leadership, and security.

IBM integrated, qualified, and documented a step-by-step approach for IBM FlashSystem with VMware Tanzu environments, which reduces risk and speeds deployment time of the end-to-end solution.

Scope

The focus of this Blueprint is to use IBM FlashSystem storage as vVols volumes for TKGS-based container application deployments.

This document does not discuss installing VMWare Tanzu or IBM Spectrum Connect. The document focuses on how to use a vVol data store that is provisioned by using IBM Spectrum Connect VASA provider to a host TKGS cluster. This document also discusses how to provision a persistent volume by using a StorageClass entity in TKGS clusters during deployment of MySQL database image.

For more information about installing and configuring IBM Spectrum Connect, see [this IBM Docs web page](#).

For more information about configuring vVols with IBM Spectrum Virtualize, see *Quick-start Guide to Configuring VMware Virtual Volumes for Systems Powered by IBM Spectrum Virtualize*, [REDP-5321](#).

For more information about installing Tanzu with vSphere, see [vSphere with Tanzu Configuration and Management](#).

Introduction

VMware Tanzu is the suite of products and solutions that allows customers to build, run, and manage Kubernetes-controlled, container-based applications. VMware Tanzu is available in three editions: Basic, Standard, and Advanced, all of which support running Kubernetes in vSphere. By using Tanzu Kubernetes Grid Service, informally known as TKGS, you can create and operate Tanzu Kubernetes clusters natively in vSphere with Tanzu.

This environment provides an end-to-end integrated platform that consists of vSphere, virtual machines, a TKGS cluster node template, and vSAN storage, which are tightly integrated with VMware vSphere platform.

The cluster nodes are created from the VMware Photon operating system. With the current release of TKGS, cluster provisioning by using Photon operating system images does not support external storage connectivity by using Fibre Channel, iSCSI, or NFS. However, vVols data stores are supported by the VMware Tanzu architecture, which allows users to connect enterprise-class storage products, such as IBM FlashSystem storage, to their Tanzu environment.

IBM FlashSystem storage that is powered by IBM's award-winning IBM Spectrum Virtualize software supported vVols' functions since it was introduced by VMware. IBM's Spectrum Connect product seamlessly integrates with VMware's vStorage APIs for storage awareness (VASA) provider.

The IBM Spectrum Connects VASA plug-in is registered in VMware vCenter as storage provider. It communicates to a wide range of IBM storage systems that are available within the customer environment to provision required storage.

In this Blueprint, we demonstrate how IBM FlashSystem can be used to provision persistent storage to Tanzu Kubernetes clusters running natively in vSphere with Tanzu by way of the vVols functions.

Prerequisites

This document does not describe the process to installation or configure IBM Spectrum Connect, IBM Spectrum Connect VASA provider, or VMware Tanzu Basic Edition.

For more information about various resources and a compatibility matrix about installing these components, see “More information” on page 13.

The document assumes that the following components are installed and configured per best practices:

- Tanzu Basic Edition with vSphere
- IBM Spectrum Connect: The configuration includes, but is not limited to:
 - vCenter registration
 - vVol storage service creation
 - Addition of a Storage system to Spectrum Connect
 - vVol services are attached to storage pool
 - vCenter interface is registered in Spectrum Connect
- vVol functions are enabled on the IBM Storage. Although we focus on IBM FlashSystem FS9100 storage product in this document, any of the IBM FlashSystem storage products that use IBM Spectrum Virtualize software can be used in this environment. This also includes IBM Storage Volume Controller, IBM SAN Volume Controller, and IBM Spectrum Virtualize for Public Cloud.
- IBM Spectrum Connect VASA storage provider is registered in vCenter that is managing TKGS and the storage provider can detect FS9100 storage system.

Lab setup

The lab setup that was used in this validation process is shown in Figure 1.

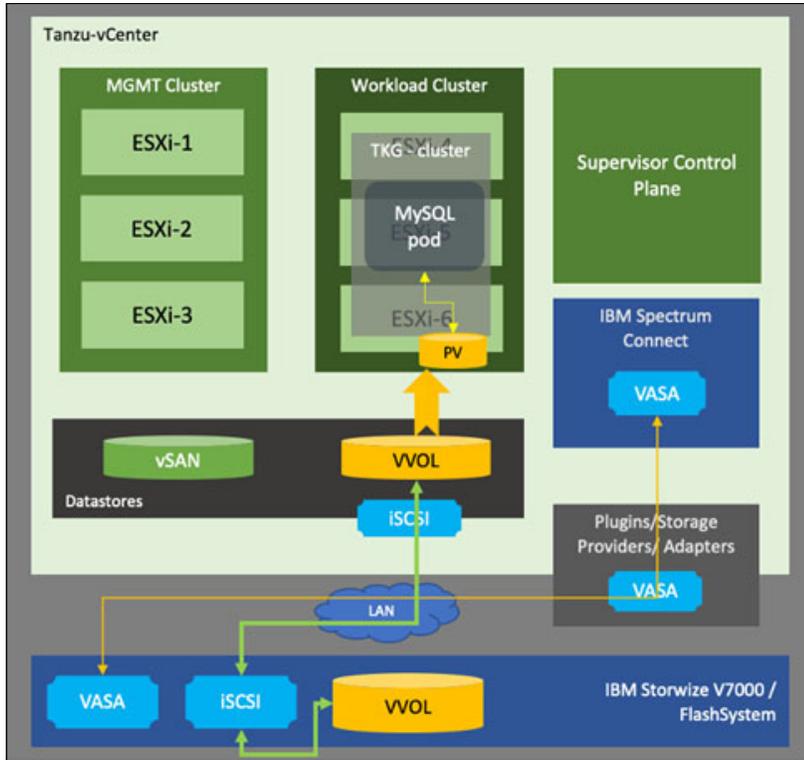

Figure 1 Lab setup

As shown in Figure 1, the lab setup is orchestrated by vCenter, which is available with VMware Tanzu Basic Edition. The IBM Spectrum Connect VASA storage provider plug-in is registered with vCenter and can detect the FS9100 storage system.

The vVol data store is backed by FS9100 storage internally and uses iSCSI protocol to map the storage volume to ESXi hosts. This data store was mounted on all ESXi hosts from the workload domain.

Post availability of the data store, storage policies were assigned to the data store, followed by the creation of the namespace entity and eventually a TKGS cluster. With the defaults chosen after a four-node TKGS cluster was provisioned, a persistent storage volume was provisioned from the storage class that points to vVol data store. This volume was used by the containerized IBM MySQL application deployment to store the database data.

Configuring VM Storage Policy

Complete the following steps to configure VM Storage Policy. After the VM Storage Policy is created, it is assigned to a namespace:

1. Log on to vSphere client (see Figure 2).

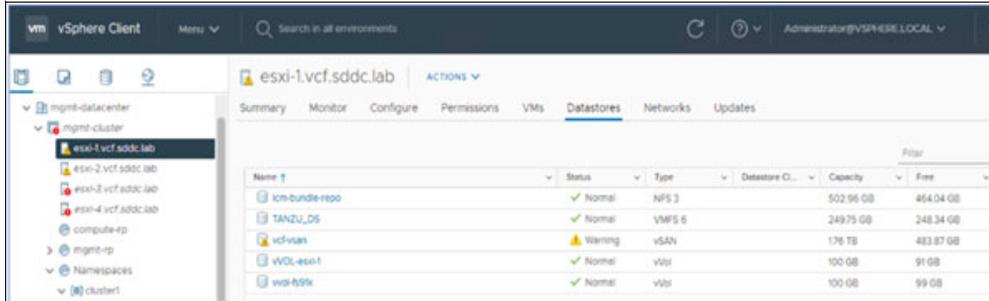

Figure 2 vSphere client view

2. Click **vSphere Client** in the upper left of the window and choose **VM Storage Policies** to assign the policies to the data store, as shown in Figure 3.

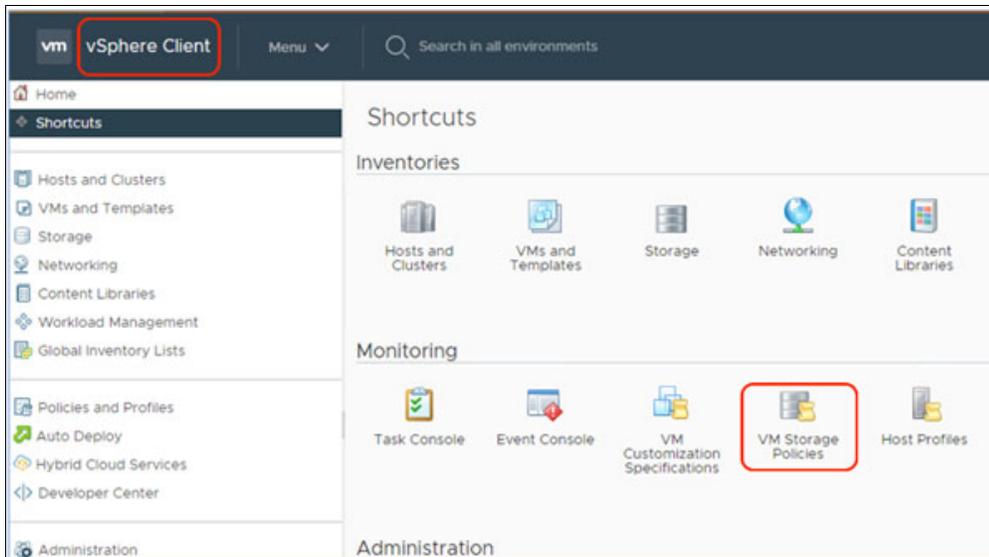

Figure 3 vSphere menu option to assign VM Storage policies

3. Click **CREATE** in the VM Storage Policies window, as shown in Figure 4.

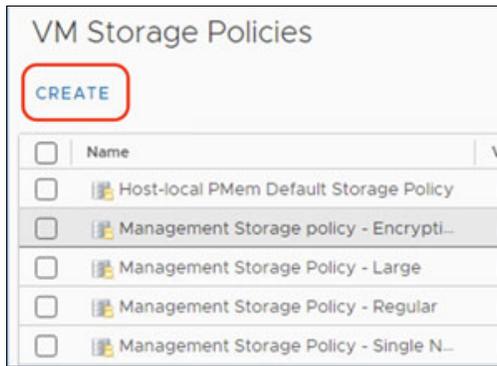

Figure 4 VM Storage Policies

4. In the Create VM Storage Policy wizard, choose the correct vCenter server and enter a relevant name and description. In the example that is shown in Figure 5, VVOL-FS9100 was chosen as name of the VM Storage Policy to indicate a vVol type of data store from IBM FS9100 storage system.

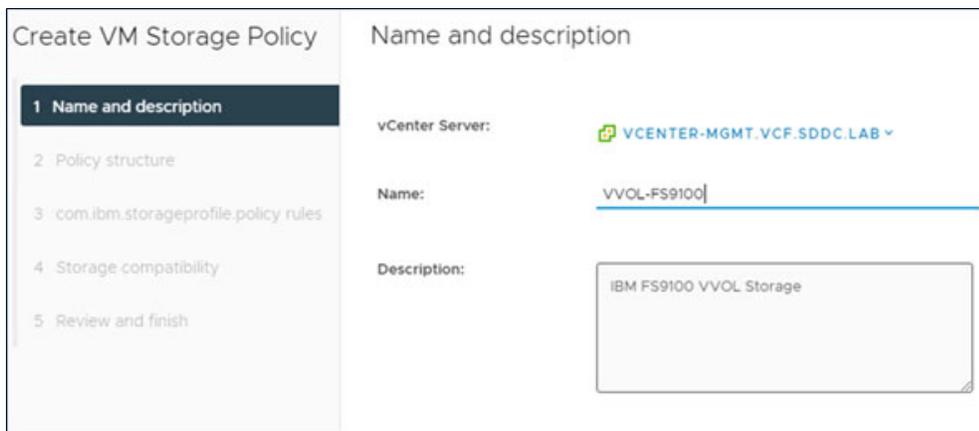

Figure 5 Name and description

5. Enable the data store-specific rules by selecting **Enable rules for com.ibm.storageprofile.policy storage**, as shown in Figure 6.

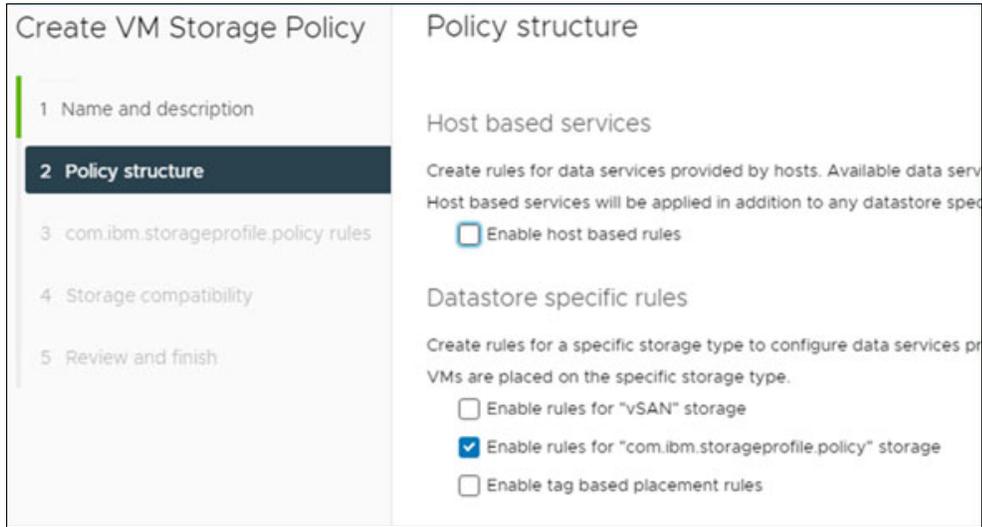

Figure 6 Policy structure

6. Choose the specific rule set that is displayed in the next window for the Storage Profile policy that was selected in Step 5, as shown in Figure 7.

Figure 7 Policy rules

During this step, the storage that is compatible with the selected policy rules is displayed, as shown in Figure 8.

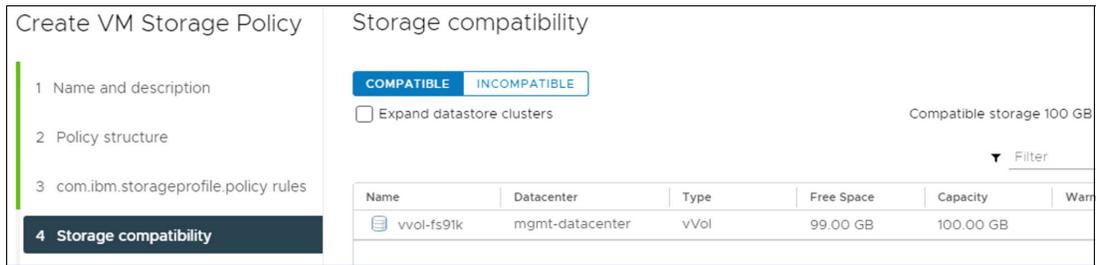

Figure 8 Storage compatibility

- Complete the wizard by reviewing the newly created VM Storage Policy summary, as shown in Figure 9.

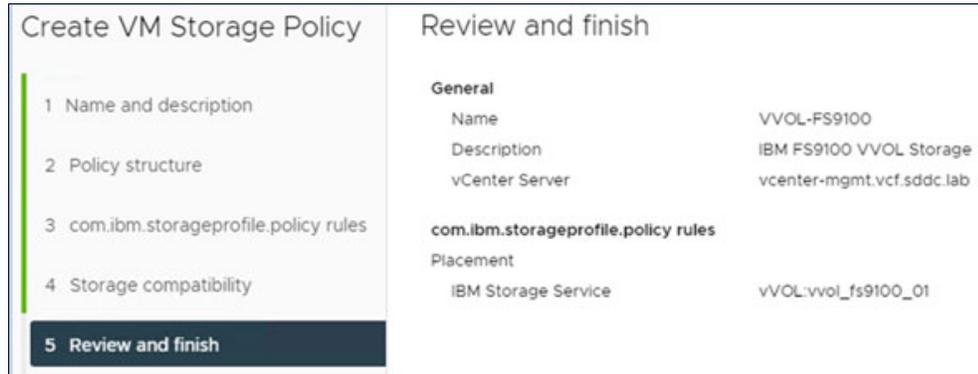

Figure 9 Review

The VM Storage Policy creation process is now complete.

Assigning VM Storage Policy to a namespace

After the required VM Storage Policy is created, it is assigned to a specific namespace, as shown in Figure 10. In this case, the name of the namespace was created as cluster1.

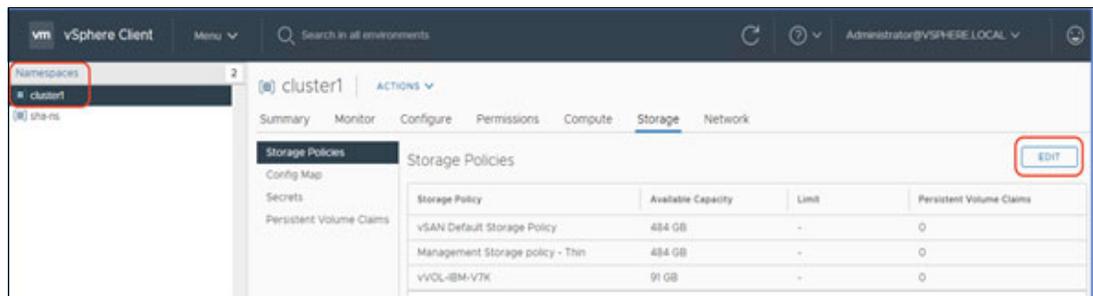

Figure 10 Assigning Storage Policy to a cluster

A namespace can have more than one Storage Policy, as shown in Figure 11.

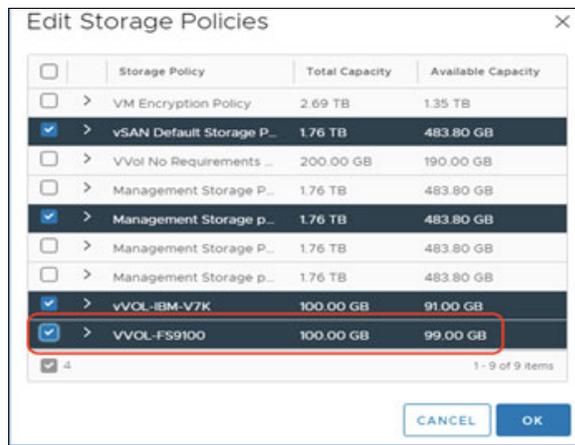

Figure 11 Choosing the suitable VM Storage Policy

By following these steps, the vVol volumes are now available for use by the TKS cluster workload.

StorageClass object and Persistent Volume Claim

The Storage Policy that is assigned to the namespace is now shown as a StorageClass object under the Kubernetes cluster, as shown in Figure 12.

```
[sha@tanzu-linux ~]$ cat bin/tanzu-cluster1-login
kubect1-vsphere login --server 10.0.0.63 -u "administrator@vsphere.local" --insecure-skip-tls-verify --tanzu-kubernetes-cluster-name tkg-cluster-1 --tanzu-kubernetes-cluster-namespace cluster1
[sha@tanzu-linux ~]$ . bin/tanzu-cluster1-login

Password:
Logged in successfully.

You have access to the following contexts:
 10.0.0.63
 cluster1
 cluster2
 tkg-cluster-1

If the context you wish to use is not in this list, you may need to try logging in again later, or contact your cluster administrator.

To change context, use `kubect1 config use-context <workload name>'
[sha@tanzu-linux ~]$ kubect1 config use-context cluster1
Switched to context "cluster1".
[sha@tanzu-linux ~]$ kubect1 get sc
NAME                                PROVISIONER             RECLAIMPOLICY           VOLUMEBINDINGMODE       ALLOWVOLUMEEXPANSION     AGE
management-storage-policy-thin      csi.vsphere.vmware.com Delete                  Immediate                true                     31d

Figure 13 PersistentVolumeClaim and IBM MySQL application deployment

Summary

This Blueprint described the use of IBM FlashSystems as persistent storage for VMWare Tanzu Kubernetes Grid Service deployment by using IBM FlashSystem VMware vVols integration through IBM Spectrum Connect's VASA provider.

The IBM FlashSystem family is a portfolio of hybrid cloud-enabled storage systems. Each system is easily deployed and quickly scaled to help optimize storage configurations, streamline issue resolution, and lower storage costs through IBM's award winning Spectrum Virtualize software.

IBM SAN Volume Controller, with IBM Spectrum Virtualize software, offers powerful technology that enables efficient, cost-effective SDS solutions for containers and hybrid multicloud environments.

It also provides comprehensive data services and storage virtualization capabilities, including advanced replication, high-performance, thin provisioning, encryption, compression, deduplication, and IBM Easy Tier®. These advanced functions improve administrator productivity and boost storage usage while also enhancing and extending the value of existing storage investments.

In addition to the support for VMware Tanzu Basic Edition that is described in this publication, these offerings support Red Hat OpenShift and Kubernetes container environments that accelerate deployment of persistent volumes with the IBM block storage CSI driver, which is certified by Red Hat and IBM.
