

# STM1810, STM1811, STM1812, STM1813 STM1815, STM1816, STM1817, STM1818

## Low Power Reset Circuit

PRELIMINARY DATA

### FEATURES SUMMARY

- PRECISION MONITORING OF 3V, 3.3V, AND 5V SUPPLY VOLTAGES
- FOUR OUTPUT CONFIGURATIONS
  - Push-Pull, Active-High (STM1812,1817)
  - Push-Pull, Active-Low (STM1810,1815)
  - Open Drain, Active-Low (STM1811,1816)
  - Open Drain, Active-Low with Push-Button Detect (STM1813,1818)
- RESET PULSE WIDTH - 100ms (min)
- LOW SUPPLY CURRENT - 4uA (typ)
- GUARANTEED ASSERTION DOWN TO  $V_{CC} = 1.0V$  (0°C to 105°C)
- FACTORY-TRIMMED RESET THRESHOLDS OF 2.55V, 2.88V, 3.06V, 4.37V, and 4.62V (typ)
- POWER SUPPLY TRANSIENT IMMUNITY
- PUSH-BUTTON/MANUAL RESET DETECT (STM1813/1818)
- OPERATING TEMPERATURE: -40°C TO 105°C
- ±2.5% RESET THRESHOLD ACCURACY (-40°C TO 105°C)
- AVAILABLE IN THE SOT23-3 PACKAGE
- FULLY COMPATIBLE WITH DS181x AND MXD181x PRODUCTS

SUMMARY DESCRIPTION

STM181x devices are low power reset devices used to monitor power supplies for microcontrollers. They perform a single function: asserting a reset signal whenever  $V_{CC}$  supply voltage drops below a preset value and keeping it asserted until  $V_{CC}$  has risen above the preset threshold for a minimum period of time ( $t_{rec}$ ). They provide excellent circuit reliability without additional external components when used with +3.0V/+3.3V (STM1815–STM1818), and +5V (STM1810–STM1813) power supply systems.

A precision voltage reference and comparator monitors the  $V_{CC}$  input for an out-of-tolerance condition. When an invalid  $V_{CC}$  condition occurs, the reset output (RST) is forced low (or high in the case of RST) and remains asserted for  $t_{rec}$  after  $V_{CC}$  rises above the reset threshold. The STM1813/1818 also keep reset asserted for  $t_{rec}$  after the output is momentarily pulled to ground by an external push-button switch.

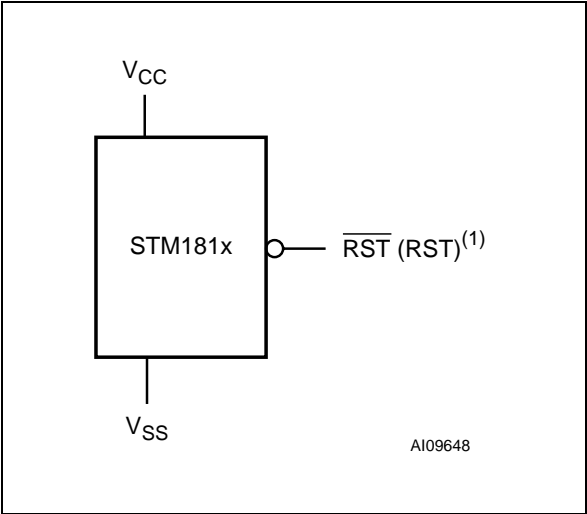

The STM1812 and STM1817 have an active-high, push-pull output. The STM1810 and STM1815 (push-pull) and STM1811, STM1813, STM1816,

and STM1818 (open drain) have an active-low  $\overline{RST}$  output. The open drain devices (STM1811/STM1813/STM1816/STM1818) also have an internal pull-up resistor to  $V_{CC}$ . The STM1813 and STM1818 feature a debounced manual reset feature that asserts a reset if the  $\overline{RST}$  pin is pulled low for more than 1.5 $\mu$ s. When used to initiate manual reset,  $\overline{RST}$  debounces signals from devices such as mechanical switches. For devices with this feature, the release of the external switch triggers the reset period.

The STM181x devices are guaranteed to output the correct logic state for  $V_{CC}$  down to 1.0V (0°C to +105°C). They also provide a reset comparator designed to ignore fast transients on  $V_{CC}$ .

Reset thresholds are available between +2.55V and +4.62V. These small, low power devices are ideal for use in portable equipment. All are available in the space-saving 3-pin SOT23 package, and are specified from –40°C to +105°C. [Figure 4., page 5](#) shows a typical hardware hookup for STM181x devices to a Microcontroller.

## PIN DESCRIPTIONS

See [Figure 2., Logic Diagram](#) and [Table 2., Signal Names](#) for a brief overview of the signals connected to this device.

**Active-Low  $\overline{\text{RST}}$  Output (Push-pull).** Pulses low when  $V_{CC}$  drops below  $V_{RST}$ , and stays low as long as  $V_{CC}$  is below the reset threshold. It remains low for  $t_{rec}$  after  $V_{CC}$  rises above the reset threshold.

**Active-Low  $\overline{\text{RST}}$  Output (Open Drain).** Pulses low when  $V_{CC}$  drops below  $V_{RST}$ , and stays low as long as  $V_{CC}$  is below the reset threshold. It remains low for  $t_{rec}$  after  $V_{CC}$  rises above the reset threshold.  $\overline{\text{RST}}$  output has an internal 5.5k $\Omega$  pull-up resistor.

**Active-high RST Output (Push-pull).** Pulses high when  $V_{CC}$  drops below  $V_{RST}$ , and stays high as long as  $V_{CC}$  is below the reset threshold. It remains high for  $t_{rec}$  after  $V_{CC}$  rises above the reset threshold.

**Active-Low  $\overline{\text{RST}}$  Output (Open Drain with internal 5.5k $\Omega$  pull-up) with Manual Reset Detect.**

Pulses low when  $V_{CC}$  drops below  $V_{RST}$ , or  $\overline{\text{RST}}$  is externally pulled low for at least 1.5 $\mu\text{s}$ . It remains low for  $t_{PBRST}$  after  $V_{CC}$  rises above the reset threshold, or after the external manual reset is released (see [Figure 10., page 8](#)).  $\overline{\text{RST}}$  output has an internal 5.5k $\Omega$  pull-up resistor.

**$V_{CC}$ .** Supply voltage and input for  $V_{RST}$  comparator.

**$V_{SS}$ .** Ground, is the reference for the power supply. It must be connected to the system ground.

## OPERATION

### Reset Output

The STM181x asserts a reset signal to the Microcontroller (MCU) whenever  $V_{CC}$  goes below the reset threshold ( $V_{RST}$ ), and is guaranteed valid down to  $V_{CC} = 1.0V$  ( $0^{\circ}$  to  $105^{\circ}C$ ). A microcontroller's (MCU) reset input starts the MCU in a known state. The STM1810 - STM1813/ STM1815 - STM1818 Low Power Reset circuits assert reset to prevent code-execution errors during power-up, power-down, and brownout conditions (Figure 8., page 7).

During power-up, once  $V_{CC}$  exceeds the reset threshold an internal timer keeps  $\overline{RST}$  low for the reset time-out period,  $t_{rec}$ . After this interval,  $\overline{RST}$  returns high.

If  $V_{CC}$  drops below the reset threshold,  $\overline{RST}$  goes low. Each time  $\overline{RST}$  is asserted, it stays low for at least the reset time-out period. Any time  $V_{CC}$  goes below the reset threshold, the internal timer clears. The reset timer starts when  $V_{CC}$  returns above the reset threshold. Reset  $t_{rec}$  is also triggered by an externally initiated rising edge on the  $\overline{RST}$  pin (STM1813/STM1818), following a low signal of 1.5 $\mu s$  minimum duration.

### Push-Button Detect Reset (STM1813/1818)

Many systems require push-button reset capability (Figure 9., page 8), allowing the user or external logic circuitry to initiate reset. On the STM1813/STM1818, a logic low on  $\overline{RST}$  held for greater than 1.5 $\mu s$  asserts a reset.  $\overline{RST}$  deasserts following a 100ms minimum reset time-out delay ( $t_{rec}$ ). A manual reset input shorter than 1.5 $\mu s$  may release  $\overline{RST}$  without the 100ms minimum reset time-out delay. To facilitate use with mechanical switches, the STM1813/STM1818 contain internal debounce circuitry. A debounced waveform is shown in Figure 10., page 8 The  $\overline{RST}$  output has an internal 5.5k $\Omega$  pull-up resistor.

### Interfacing to Bidirectional Microcontrollers (MCU's)

As the  $\overline{RST}$  output on the STM1811/STM1816 is open drain, these devices interface easily with MCU's that have bidirectional reset pins. Connect-

ing the  $\mu P$  supervisor's reset ( $\overline{RST}$ ) output directly to the microcontroller's reset ( $\overline{RST}$ ) pin allows either device to assert reset (Figure 11., page 8). No external pull-up resistor is required, as it is within the STM1811/STM1816.

### Negative Going $V_{CC}$ Transients

The STM181x are relatively immune to negative-going  $V_{CC}$  transients (glitches). Figure 20., page 13 shows typical transient duration versus reset comparator overdrive (for which the STM181x will NOT generate a reset pulse). The graph was generated using a negative pulse applied to  $V_{CC}$ , starting at 0.5V above the actual reset threshold and ending below it by the magnitude indicated (comparator overdrive). The graph indicates the maximum pulse width a negative  $V_{CC}$  transient can have without causing a reset pulse. As the magnitude of the transient increases (further below the threshold), the maximum allowable pulse width decreases. Any combination of duration and overdrive which lies under the curve will NOT generate a reset signal. Typically, a  $V_{CC}$  transient that goes 100mV below the reset threshold and lasts 20 $\mu s$  or less will not cause a reset pulse. A 0.1 $\mu F$  bypass capacitor mounted as close as possible to the  $V_{CC}$  pin provides additional transient immunity.

### Valid $\overline{RST}$ Output Down to $V_{CC} = 0V$

When  $V_{CC}$  falls below 1V, the  $\overline{RST}$  output no longer sinks current, but becomes an open circuit. In most systems this is not a problem, as most MCUs do not operate below 1V. However, in applications where  $\overline{RST}$  output must be valid down to 0V, a pull-down resistor may be added to hold the  $\overline{RST}$  output low (see Figure 12., page 9). This resistor must be large enough to not load the  $\overline{RST}$  output, and still be small enough to pull the output to ground. A 100k $\Omega$  resistor is recommended.

**Note:** The same situation applies for the active-high RST of the STM1810/1812. A 100k $\Omega$  pull-up resistor to  $V_{CC}$  should be used if RST must remain valid for  $V_{CC} < 1.0V$ .

## MAXIMUM RATING

Stressing the device above the rating listed in the Absolute Maximum Ratings table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not im-

plied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality documents.

**Table 7. Absolute Maximum Ratings**

Symbol	Parameter	Value	Unit
$T_{STG}$	Storage Temperature ( $V_{CC}$ Off)	-55 to 150	°C
$T_{SLD}^{(1)}$	Lead Solder Temperature for 10 seconds	260	°C
$V_{IO}$	Input or Output Voltage	-0.3 to $V_{CC} + 0.3$	V
$V_{CC}$	Supply Voltage	-0.3 to 7.0	V
$I_O$	Output Current	20	mA
$P_D$	Power Dissipation	320	mW

Note: 1. Reflow at peak temperature of 255°C to 260°C for < 30 seconds (total thermal budget not to exceed 180°C for between 90 to 150 seconds).

## DC AND AC PARAMETERS

This section summarizes the operating measurement conditions, and the DC and AC characteristics of the device. The parameters in the DC and AC characteristics Tables that follow, are derived from tests performed under the Measurement

Conditions summarized in Table 8, Operating and AC Measurement Conditions. Designers should check that the operating conditions in their circuit match the operating conditions when relying on the quoted parameters.

**Table 8. Operating and AC Measurement Conditions**

Parameter	STM1810 - 1818	Unit
$V_{CC}$ Supply Voltage	1.0 to 5.5	V
Ambient Operating Temperature ( $T_A$ )	-40 to 105	°C
Input Rise and Fall Times	$\leq 5$	ns

STM1816R	2.55V	Open Drain $\overline{\text{RST}}$	
STM1817T	3.06V	Push-Pull RST	
STM1817S	2.88V	Push-Pull RST	
STM1817R	2.55V	Push-Pull RST	
STM1818T	3.06V	Open Drain RST	
STM1818S	2.88V	Open Drain RST	
STM1818R	2.55V	Open Drain RST	

## REVISION HISTORY

**Table 13. Document Revision History**

Date	Revision	Revision Details
26-Aug-04	1.0	First Issue
05-Oct-04	2.0	Update reset characteristics, add typical graphs, remove SC70 references (Figure <a href="#">1</a> , <a href="#">2</a> , <a href="#">4</a> , <a href="#">7</a> , <a href="#">11</a> , <a href="#">12</a> , <a href="#">13</a> , <a href="#">14</a> , <a href="#">15</a> , <a href="#">16</a> , <a href="#">17</a> , <a href="#">18</a> , <a href="#">19</a> , <a href="#">20</a> ; Table <a href="#">9</a> , <a href="#">11</a> , <a href="#">12</a> )
19-Nov-04	3.0	Update dimensions (Table <a href="#">10</a> )
07-Dec-04	4.0	Remove some voltage options (Table <a href="#">1</a> , <a href="#">9</a> , <a href="#">11</a> , <a href="#">12</a> )
29-Jun-05	5	Temperature range change (Figure <a href="#">14</a> , <a href="#">15</a> , <a href="#">16</a> , <a href="#">19</a> ; Table <a href="#">8</a> , <a href="#">9</a> , <a href="#">11</a> )
