1700MHz to 2200MHz High-Linearity, SPI-Controlled DVGA with Integrated Loopback Mixer

MAX2059

General Description

The MAX2059 high-linearity digital-variable-gain amplifier (DVGA) is designed to provide 56dB of total gain range and typical output IP3 and output P1dB levels of +31.8dBm and +18.4dBm, respectively. The device is ideal for a variety of applications, including single and multicarrier 1700MHz to 2200MHz DCS 1800/PCS 1900 EDGE, cdma2000®, WCDMA/UMTS, and TD-SCDMA base stations. The MAX2059 yields a high level of component integration, which includes two 5-bit digital attenuators, a two-stage driver amplifier, a loopback mixer, and a serial interface to control the attenuators.

The MAX2059 is pin compatible with the MAX2058 700MHz to 1200MHz DVGA, facilitating an easy design-in for applications where a common PC board layout is used for both frequency bands.

The MAX2059 is available in a 40-pin thin QFN package with an exposed paddle. Electrical performance is guaranteed over a -40°C to +85°C temperature range.

Applications

DCS 1800/PCS 1900 EDGE Base-Station Transmitters and Power Amplifiers
cdmaOne™ and cdma2000 Base-Station Transmitters and Power Amplifiers
WCDMA, TD-SCDMA, and Other 3G Base-Station Transmitters and Power Amplifiers
Transmitter Gain Control
Receiver Gain Control
Broadband Systems
Automatic Test Equipment
Digital and Spread-Spectrum Communication Systems
Microwave Terrestrial Links

Features

- ◆ +31.8dBm Typical Output IP3
- ◆ +18.4dBm Typical Output 1dB Compression Point
- ◆ 1700MHz to 2200MHz RF Frequency Range
- ◆ 700MHz to 1200MHz RF Frequency Range (MAX2058)
- ◆ 10.9dB Typical Small-Signal Gain
- ◆ Includes Two Independent 5-Bit Digital Attenuator Stages, Yielding 56dB of Total Gain-Control Range with 1dB Steps
- ◆ 3-Wire SPI™/MICROWIRE™ Compatible
- ◆ Integrated Loopback Mixer for Tx/Rx Self-Diagnostics
- ◆ +5V Single-Supply Operation
- ◆ External Current-Setting Resistors for Scalable Device Power
- ◆ Lead-Free Package Available

ABSOLUTE MAXIMUM RATINGS

V_{CC} to GND-0.3V to +5.5V
 RSET1, RSET2+1.2V to +4.0V
 LBBIAS(V_{CC} - 1.5V) to +5.5V
 LB_EN, DATA, $\overline{\text{CS}}$, CLK-0.3V to (V_{CC} + 0.3V)
 ATTEN_INA, ATTEN_INB, ATTEN_OUTA, ATTEN_OUTB
 Input Power+24dBm
 AMPIN, Differential LO Input Power+12dBm
 Continuous Power Dissipation (T_A = +70°C)
 40-Pin TQFN (derated 26.3mW/°C above +70°C)2100mW

Operating Temperature Range (Note A)-40°C to +85°C
 Junction Temperature+150°C
 θ_{JC} 10°C/W
 θ_{JA} 38°C/W
 Storage Temperature Range-65°C to +150°C
 Lead Temperature (soldering, 10s)+300°C

Note A: T_C is the temperature on the exposed paddle of the package.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

DC ELECTRICAL CHARACTERISTICS

(MAX2059 Typical Application Circuit, V_{CC} = +4.75V to +5.25V, R1 = 1.2k Ω , R2 = 2k Ω , R3 = 2k Ω , T_C = -40°C to +85°C. Typical values are at V_{CC} = +5.0V and T_C = +25°C, unless otherwise noted.) (Note 1)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Supply Voltage	V _{CC}	Reference to V _{CC} , VCC _{LB} , VCC _{LOGIC} , VCC _{BIAS1} , VCC _{BIAS2} , VCC _{CAMP}	4.75	5.0	5.25	V

Pin Description

PIN	NAME	FUNCTION
1	LO+	Loopback Mixer Local Oscillator Positive Input
2	LO-	Loopback Mixer Local Oscillator Negative Input
3	VCCLB	Loopback Mixer Supply Voltage. +5V supply for the internal loopback mixer. Bypass to GND with 22pF and 0.1μF capacitors as close as possible to the pin.
4	LBOUT	Loopback Mixer RF Output. Internally matched to 50Ω. AC-couple with a capacitor.
5	LB_EN	Loopback Mixer Logic Input. Set to logic-low 0 to enable the mixer. Set to logic-high 1 to disable the mixer.
6	DATA	SPI Digital Data Input
7	CLK	SPI Clock Input
8	\overline{CS}	SPI Chip-Select Input
9	VCCLOGIC	Logic Supply Voltage. +5V supply for the internal logic circuitry. Bypass to GND with 22pF and 0.1μF capacitors as close as possible to the pin.
10, 11, 13, 14, 16, 17, 19, 22, 24, 25, 26, 30, 32, 34, 35, 37, 38	GND	Ground
12	ATTEN_OUTB	Attenuator B Output. Internally matched to 50Ω.
15	VCC	Attenuator B Supply. +5V supply for attenuator B. Bypass to GND with 22pF and 0.01μF capacitors as close as possible to the pin.
18	ATTEN_INB	Attenuator B Input. Internally matched to 50Ω.
20	RSET2	Output Amplifier Bias-Current-Setting Resistor. Sets the bias current for the output amplifier stage. Connect a 2kΩ resistor to ground.
21	VCCBIAS2	Bias Circuit Supply Voltage. +5V supply for the internal bias circuitry. Bypass to GND with 1000pF and 0.1μF capacitors as close as possible to the pin.
23	AMPOUT	RF Amplifier Output. Internally matched to 50Ω.
27	VCCAMP	RF Amplifier Supply Voltage. +5V supply for the RF amplifier. Bypass to GND with 1000pF and 0.1μF capacitors as close as possible to the pin.
28	AMPIN	RF Amplifier Input. Internally matched to 50Ω.
29	VCCBIAS1	Bias Circuit Supply Voltage. +5V supply for the internal bias circuitry. Bypass to GND with 1000pF and 0.1μF capacitors as close as possible to the pin.
31	RSET1	Input Amplifier Bias-Current-Setting Resistor. Sets the bias current for the input amplifier stage. Connect a 1.2kΩ resistor to ground.
33	ATTEN_OUTA	Attenuator A Output. Internally matched to 50Ω.
36	VCC	Attenuator A Supply Voltage. +5V supply for attenuator A. Bypass to GND with 22pF and 0.01μF capacitors as close as possible to the pin.
39	ATTEN_INA	Attenuator A Input. Internally matched to 50Ω.
40	LBBIAS	Loopback Mixer Bias-Current-Setting Resistor. Sets the bias current for the mixer. Connect a 2kΩ resistor to ground.
EP	EP	Exposed Ground Paddle. Solder the exposed paddle to GND using multiple vias.

1700MHz to 2200MHz High-Linearity, SPI-Controlled DVGA with Integrated Loopback Mixer

Detailed Description

The MAX2059 high-linearity DVGA consists of two 5-bit digital attenuators, a fixed-gain two-stage driver amplifier, a loopback mixer, and a serial interface to control the attenuators. This high level of component integration makes the MAX2059 ideal for base-station transmitter applications. The MAX2059 is designed to operate in the 1700MHz to 2200MHz frequency range. The overall cascaded performance of the MAX2059 produces a typical 10.9dB gain, a +31.8dBm OIP3, an 18.4dBm OP1dB, and a total 56dB gain-control range.

5-Bit Attenuators

The MAX2059 integrates two 5-bit digital attenuators to achieve a high dynamic range. Each attenuator is programmed with a 3-wire SPI interface, with a total effective range of 28dB and step size of 1dB. See the *Applications Information* section and Table 1 for attenuator programming details. The attenuators can be used for both static and dynamic power control.

Table 1. Attenuator Programming

ATTENUATOR A (5 MSBs)	ATTENUATOR B (5 LSBs)
Bit 9 = 16dB step	Bit 4 = 16dB step
Bit 8 = 8dB step	Bit 3 = 8dB step
Bit 7 = 4dB step	Bit 2 = 4dB step
Bit 6 = 2dB step	Bit 1 = 2dB step
Bit 5 = 1dB step	Bit 0 = 1dB step

Note: Due to finite circuit isolation, the total effective range of each attenuator is limited to 28dB.

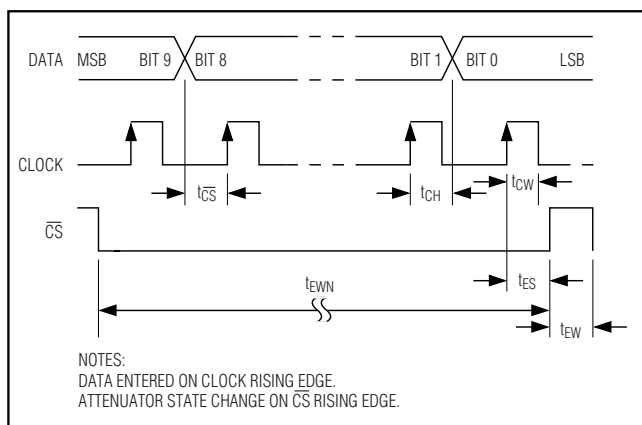

Figure 1. SPI Timing Diagram

Driver Amplifier

The MAX2059 includes a two-stage medium power amplifier with a fixed 18.5dB gain. The driver amplifier circuit is optimized for high linearity and medium output power capability for the 1800MHz to 2000MHz frequency range. The driver amplifier is intended to amplify a modulated signal and drive a high-power amplifier in base-station transmitters. In a typical application, the driver amplifier is cascaded in between the two digital attenuators. See the *Typical Application Circuit*.

The two-stage amplifier stage can be disabled for applications where only the digital attenuators and/or loopback mixer are used. To disable the two-stage amplifier, ground or leave unconnected the amplifier supplies VCCBIAS2, VCCAMP, VCCBIAS1, and also the inputs for setting the amplifier bias currents RSET1, RSET2. This reduces the supply current by approximately 187mA under typical conditions.

Loopback Mixer

The MAX2059 loopback mixer uses a double-balanced active architecture designed to operate with a 1700MHz to 2200MHz RF frequency range, and a 40MHz to 100MHz LO frequency range. The RF port of the mixer is connected internally (with an on-chip switch) to the input of the first attenuator stage. The mixer's IF port is matched for a single-ended 50Ω impedance, while the LO port requires a differential input impedance of 100Ω.

The loopback mixer facilitates a self-diagnostic mode for cellular transceivers, whereby the Tx band signal at the input of the mixer can be translated up or down to the corresponding Rx band. This translated signal can then be fed back to the radio's receiver for complete Tx/Rx loop diagnostics. The loopback mixer is enabled and disabled with LB_EN. Set LB_EN to a logic-low 0 to enable the mixer, set LB_EN to a logic-high 1 to disable the mixer.

The MAX2059 loopback mixer accepts a nominal -6dBm LO input power and exhibits a -12.6dBm output power and an output IP3 of 6.2dBm (PIN = +5dBm).

Applications Information

SPI Interface and Attenuator Settings

The two 5-bit attenuators are programmed with the 3-wire SPI/MICROWIRE-compatible serial interface using 10-bit words. Bit 9 of the 10-bit data is shifted in first, along with all remaining data bits, on the rising edge of the clock regardless of CS being high or low. Once all the data bits are shifted in, all will be sent to the attenuators on the rising edge of CS, thus changing the attenuation state. For standard SPI operation, pull CS low for the

1700MHz to 2200MHz High-Linearity, SPI-Controlled DVGA with Integrated Loopback Mixer

duration of a valid 10-bit data set (t_{EWN}). This \overline{CS} negative pulse width includes the setup time of the rising clock edge to \overline{CS} transitioning high (t_{ES}). See Figure 1.

The 5 MSBs of the 10-bit word program attenuator A, and the 5 LSBs of the 10-bit word program attenuator B. Each bit sets the attenuators to a corresponding attenuation level. For example, logic-low 0 for bit 5 and bit 0 of attenuator A and B, respectively, sets both attenuators at 1dB. 00000 configures both attenuators for maximum attenuation and 11111 sets for minimum attenuation. See Table 1 for programming details.

External Bias

Bias currents for the two-stage amplifier and the loopback mixer are set and optimized with external resistors. Resistor R1 (pin 31) sets the bias current for the input amplifier, R2 (pin 20) sets the bias current for the output amplifier, and R3 (pin 40) sets the bias for the loopback mixer. The external biasing resistor values can be increased for reduced current operation at the expense of performance. Contact the factory for details.

Board Layout

The pin configuration of the MAX2059 has been optimized to facilitate a very compact physical layout of the device and its associated discrete components.

The exposed paddle (EP) of the MAX2059's thin QFN-EP package provides a low thermal-resistance path to the die. It is important that the PC board on which the MAX2059 is mounted be designed to conduct heat

from the EP. In addition, provide the EP with a low-inductance path to electrical ground. The EP **MUST** be soldered to a ground plane on the PC board, either directly or through an array of plated via holes.

Table 2. Component List Referring to the Typical Application Circuit

COMPONENT	VALUE	DESCRIPTION
C1, C4, C10, C13, C16	0.1 μ F	Microwave capacitors (0603)
C2, C3, C5, C8, C11, C14, C17, C24	22pF	Microwave capacitors (0402)
C6, C19	120pF	Microwave capacitors (0402)
C7, C18	0.01 μ F	Microwave capacitors (0402)
C9, C12, C15	1000pF	Microwave capacitors (0402)
C20, C21, C22	0.75pF	Microwave capacitors (0402)
C23	1pF	Microwave capacitor (0402)
R1	1.2k Ω	$\pm 1\%$ resistor (0402)
R2, R3	2.0k Ω	$\pm 1\%$ resistors (0402)
R4	110 Ω	$\pm 1\%$ resistor (0402)
TI	2:1	RF transformer (100:50) Mini-Circuits TC2-1T
U1	—	MAX2059

1700MHz to 2200MHz High-Linearity, SPI-Controlled DVGA with Integrated Loopback Mixer

Direct-Conversion Base-Station Transmitter

The MAX2058/MAX2059 are designed to interface directly with Maxim's direct-conversion quadrature modulators and high-speed DACs to provide a complete solution for GSM/EDGE base-station transmitter applications. See Figure 2. The MAX2058/MAX2059,

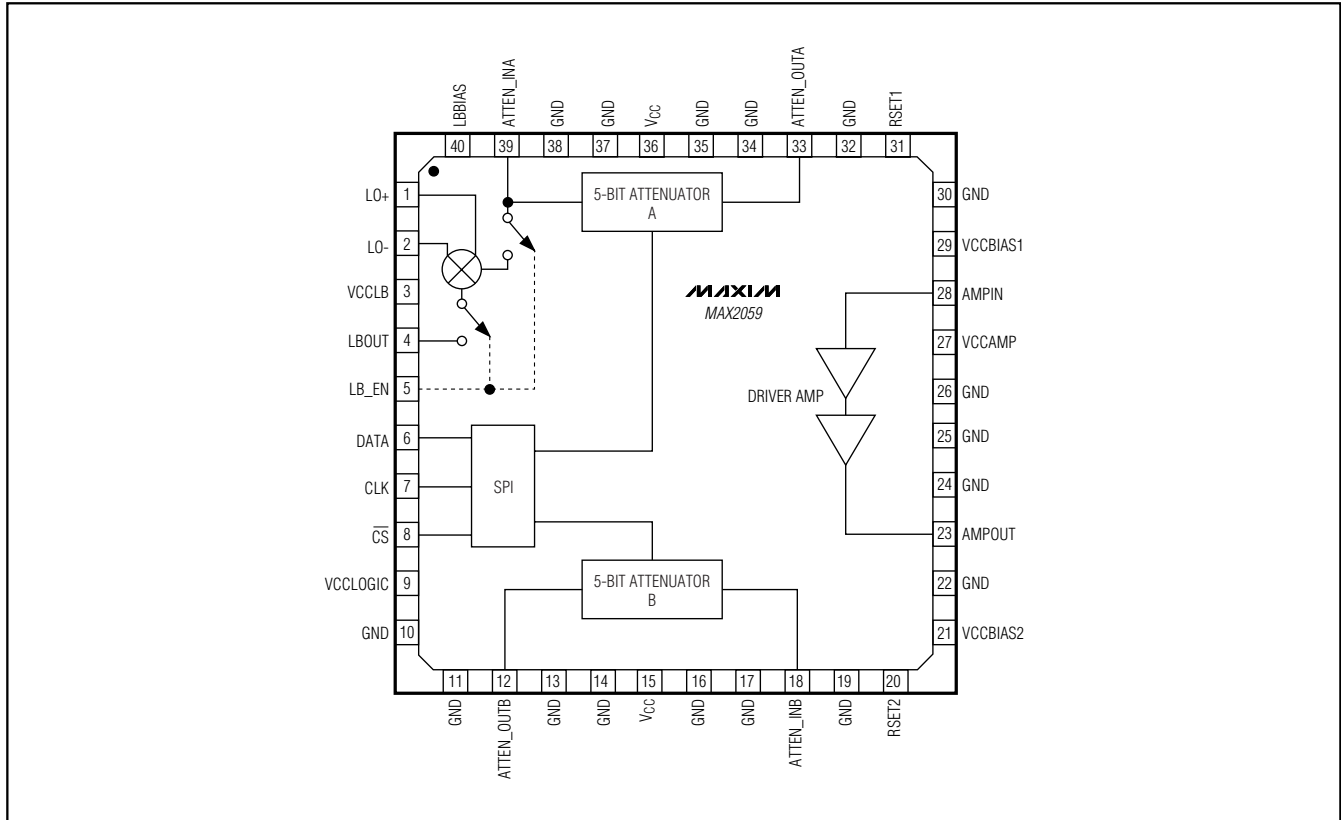

together with the MAX2021/MAX2022/MAX2023 direct-conversion modulators/demodulators, the MAX5873 dual-channel DAC, and the MAX4395 quad amplifier, form an ideal total transmitter lineup. This overall system is highly efficient and low cost, while maintaining high linearity and low-noise performance.

Typical Application Circuit

1700MHz to 2200MHz High-Linearity, SPI-Controlled DVGA with Integrated Loopback Mixer
