Digital Isolation For A/D, D/A Conversion

Direct Replacement For HCPL-2601

The TOSHIBA TLP2601 a photocoupler which combines a GaAlAs IRed as the emitter and an integrated high gain, high speed photodetector. The output of the detector circuit is an open collector, Schottky clamped transistor.

A Faraday shield integrated on the photodetector chip reduces the effects of capacitive coupling between the input LED emitter and the high gain stages of the detector. This provides an effective common mode transient immunity of 1000V/μs.

- Input current thresholds: $I_F = 5\text{mA max.}$
- Isolation voltage: 2500Vrms min.
- Switching speed: 10MBd
- Common mode transient immunity: 1000V/μs min.
- Guaranteed performance over temp.: 0°C~70°C
- UL Recognized: UL1577, file No. E67349

Notes

1. The VCC supply voltage to each TLP2601 isolator must be bypassed by a 0.1μF capacitor of larger. This can be either a ceramic or solid tantalum capacitor with good high frequency characteristic and should be connected as close as possible to the package VCC and GND pins of each device.
2. t_{pHL} · Propagation delay is measured from the 3.75mA level on the low to high transition of the input current pulse to the 1.5V level on the high to low transition of the output voltage pulse.
3. t_{pLH} · Propagation delay is measured from the 3.75mA level on the high to low transition of the input current pulse to the 1.5V level on the low to high transition of the output voltage pulse.
4. t_f · Fall time is measured from the 10% to the 90% levels of the high to low transition on the output pulse.
5. t_r · Rise time is measured from the 90% to 10% levels of the low to high transition on the output pulse.
6. t_{EHL} · Enable input propagation delay is measured from the 1.5V level on the low to high transition of the input voltage pulse to the 1.5V level on the high to low transition of the output voltage pulse.
7. t_{ELH} · Enable input propagation delay is measured from the 1.5V level on the high to low transition of the input voltage pulse to the 1.5V level on the low to high transition of the output voltage pulse.
8. CM_L · The maximum tolerable rate of fall of the common mode voltage to ensure the output will remain in the low output state (i.e., $V_{OUT} < 0.8V$).
Measured in volts per microsecond (V / μs).
9. CM_H · The maximum tolerable rate of fall of the common mode voltage to ensure the output will remain in the high state (i.e., $V_{OUT} > 2.0V$).
Measured in volts per microsecond (V / μs).
Volts/microsecond can be translated to sinusoidal voltages:

$$V / \mu s = \frac{(dv_{CM})}{dt}_{Max.} = f_{CM} V_{CM} (p.p.)$$

Example:
 $V_{CM} = 318V_{pp}$ when $f_{CM} = 1MHz$ using CM_L and $CM_H = 1000V / \mu s$ data sheet specified minimum.
10. · Device considered a two-terminal device: Pins 1, 2, 3 and 4 shorted together, and Pins 5, 6, 7 and 8 shorted together.
11. Enable input · No pull up resistor required as the device has an internal pull up resistor.
