### 查询307C1171供应商 307C Lighting Thermistors

## Vishay Cera-Mite

# **PTC Thermistors For Electronic Fluorescent Ballasts**

### **FEATURES**

- Electrode preheat thermistors for use in compact fluorescent lamps (CFL) and electronic ballasts.
- Current limiting, time-delayed start-up extends lamp life.
- Quiet, flicker-free operation.
- · Developed in cooperation with leading ballast designers.
- · Both standard and custom parts are available.
- Economical, reliable and proven in millions of lamps throughout the world.

### **APPLICATION CONSIDERATIONS**

- · Ignition time can be optimized to increase life of lamp.
- PTC resistance (R<sub>25</sub>) is chosen, along with filament resistance and application voltage, to control desired electrode preheat current.
- Lamp preheat time is determined by time required for thermistor to switch from low to high resistance state.
   Preheat currents shown result in switch times of approximately 1 second at 25°C. Lower currents result in longer switch times.

|   | PTC THERMISTORS FOR ELECTRONIC FLUORESCENT BALLASTS |                       |                       |                 |        |          |

Note 1: R<sub>25</sub> - Nominal zero power resistance ± 25% at 25°C. For given diameter, higher resistance thermistors offer higher maximum voltages.

Note 2: Instantaneous Voltage - Maximum rms voltage permitted across thermistor during fluorescent lamp start-up cycle.

Note 3: Continuous Voltage - Maximum rms voltage continuously applied across thermistor during normal lamp operation.

Note 4: Preheat Current - rms current (60Hz) which switches thermistor to high resistance in approximately 1 second at 25°C ambient.

Note 5: Size (mass) of PTC influences rate of I<sup>2</sup>R temperature increase. For given resistance, larger thermistors have longer switch times. Optional coating slightly increases switch time.

Note 6: P/N suffix (not shown) describes wire lead forms and other options.
