## 36K, 64K, and 128K Serial EPROM Family

### FEATURES

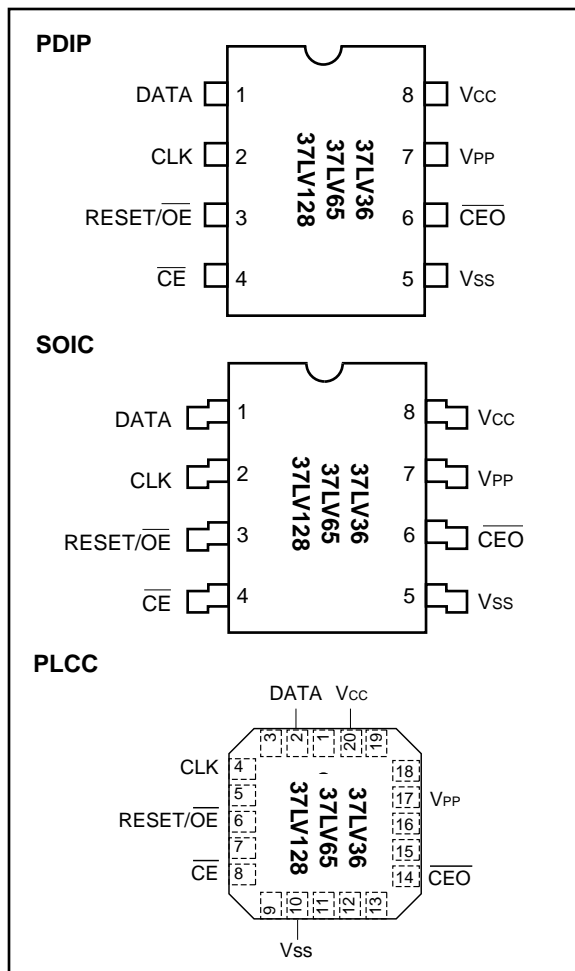

- Operationally equivalent to Xilinx<sup>®</sup> XC1700 family
- Wide voltage range 3.0 V to 6.0 V
- Maximum read current 10 mA at 5.0 V
- Standby current 100  $\mu$ A typical
- Industry standard Synchronous Serial Interface/  
1 bit per rising edge of clock
- Full Static Operation
- Sequential Read/Program
- Cascadable Output Enable
- 10 MHz Maximum Clock Rate @ 5.0 Vdc
- Programmable Polarity on Hardware Reset
- Programming with industry standard EPROM programmers
- Electrostatic discharge protection > 4,000 volts
- 8-pin PDIP/SOIC and 20-pin PLCC packages
- Data Retention > 200 years
- Temperature ranges:
  - Commercial: 0°C to +70°C
  - Industrial: -40°C to +85°C

### DESCRIPTION

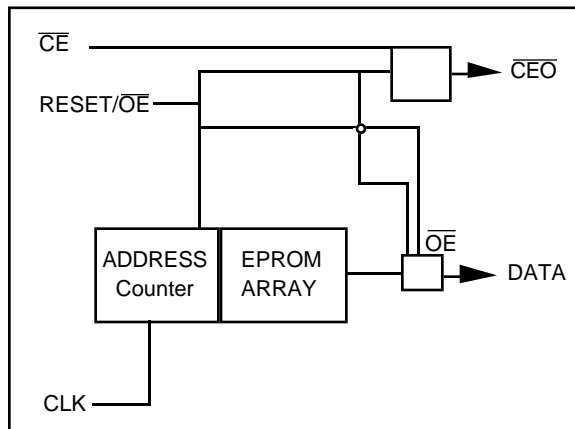

The Microchip Technology Inc. 37LV36/65/128 is a family of Serial OTP EPROM devices organized internally in a x32 configuration. The family also features a cascadable option for increased memory storage where needed. The 37LV36/65/128 is suitable for many applications in which look-up table information storage is desirable and provides full static operation in the 3.0V to 6.0V Vcc range. The devices also support the industry standard serial interface to the popular RAM-based Field Programmable Gate Arrays (FPGA). Advanced CMOS technology makes this an ideal bootstrap solution for today's high speed SRAM-based FPGAs. The 37LV36/65/128 family is available in the standard 8-pin plastic DIP, 8-pin SOIC and 20-pin PLCC packages.

### 1.1 Maximum Ratings\*

V<sub>CC</sub> and input voltages w.r.t. V<sub>SS</sub> ..... -0.6V to +0.6V  
V<sub>PP</sub> voltage w.r.t. V<sub>SS</sub> during programming ..... -0.6V to +14.0V  
Output voltage w.r.t. V<sub>SS</sub> ..... -0.6V to V<sub>CC</sub> +0.6V  
Storage temperature ..... -65°C to +150°C  
Ambient temp. with power applied ..... -65°C to +125°C  
Soldering temperature of leads (10 sec.) ..... +300°C  
ESD protection on all pins ..... ≥ 4 kV

\*Notice: Stresses above those listed under "Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

## 2.0 DATA

### 2.1 Data I/O

Three-state DATA output for reading and input during programming.

## 3.0 CLK

### 3.1 Clock Input

Used to increment the internal address and bit counters for reading and programming.

## 4.0 RESET/ $\overline{OE}$

### 4.1 Reset Input and Output Enable

A LOW level on both the  $\overline{CE}$  and RESET/ $\overline{OE}$  inputs enables the data output driver. A HIGH level on RESET/ $\overline{OE}$  resets both the address and bit counters. In the 37LVXXX, the logic polarity of this input is programmable as either RESET/ $\overline{OE}$  or  $\overline{OE}$ /RESET. This document describes the pin as RESET/ $\overline{OE}$  although the opposite polarity is also possible. This option is defined and set at device program time.

## 5.0 $\overline{CE}$

### 5.1 Chip Enable Input

$\overline{CE}$  is used for device selection. A LOW level on both  $\overline{CE}$  and  $\overline{OE}$  enables the data output driver. A HIGH level on  $\overline{CE}$  disables both the address and bit counters and forces the device into a low power mode.

## 6.0 $\overline{CEO}$

### 6.1 Chip Enable Output

This signal is asserted LOW on the clock cycle following the last bit read from the memory. It will stay LOW as long as  $\overline{CE}$  and  $\overline{OE}$  are both LOW. It will then follow  $\overline{CE}$  until  $\overline{OE}$  goes HIGH. Thereafter,  $\overline{CEO}$  will stay HIGH until the entire EPROM is read again. This pin also used to sense the status of RESET polarity when Programming Mode is entered.

## 7.0 VPP

### 7.1 Programming Voltage Supply

Used to enter programming mode (+13 volts) and to program the memory (+13 volts). Must be connected directly to Vcc for normal Read operation. No overshoot above +14 volts is permitted.

## 8.0 CASCADING SERIAL EPROMS

Cascading Serial EPROMs provide additional memory for multiple FPGAs configured as a daisy-chain, or for future applications requiring larger configuration memories.

When the last bit from the first Serial EPROM is read, the next clock signal to the Serial EPROM asserts its  $\overline{CEO}$  output LOW and disables its DATA line. The second Serial EPROM recognizes the LOW level on its  $\overline{CE}$  input and enables its DATA output.

When configuration is complete, the address counters of all cascaded Serial EPROMs are reset if RESET goes LOW forcing the RESET/ $\overline{OE}$  on each Serial EPROM to go HIGH. If the address counters are not to be reset upon completion, then the RESET/ $\overline{OE}$  inputs can be tied to ground.

Additional logic may be required if cascaded memories are so large that the rippled chip enable is not fast enough to activate successive Serial EPROMs.

## 9.0 STANDBY MODE

The 37LVXXX enters a low-power Standby Mode whenever  $\overline{CE}$  is HIGH. In Standby Mode, the Serial EPROM consumes less than 100  $\mu$ A of current. The output will remain in a high-impedance state regardless of the state of the  $\overline{OE}$  input.

## 10.0 PROGRAMMING MODE

Programming Mode is entered by holding VPP HIGH (+13 volts) for two clock edges and then holding VPP = VDD for one clock edge. Programming mode is exited by driving a LOW on both  $\overline{CE}$  and  $\overline{OE}$  and then removing power from the device. Figures 4 through 7 show the programming algorithm.

## 11.0 37LVXXX RESET POLARITY

The 37LVXXX lets the user choose the reset polarity as either RESET/ $\overline{OE}$  or  $\overline{OE}$ /RESET. Any third-party commercial programmer should prompt the user for the desired reset polarity.

The programming of the overflow word should be handled transparently by the EPROM programmer; it is mentioned here as supplemental information only.

The polarity is programmed into the first overflow word location, maximum address+1. 00000000 in these locations makes the reset active LOW, FFFFFFFF in these locations makes the reset active HIGH. The default condition is RESET active HIGH.

**TABLE 11-3: PIN ASSIGNMENTS IN THE PROGRAMMING MODE**

DIP/SOIC Pin	PLCC Pin	Name	I/O	Description
1	2	DATA	I/O	The rising edge of the clock shifts a data word in or out of the EPROM one bit at a time.
2	4	CLK	I	Clock Input. Used to increment the internal address/word counter for reading and programming operation.
3	6	RESET/ $\overline{OE}$	I	The rising edge of CLK shifts a data word into the EPROM when $\overline{CE}$ and $\overline{OE}$ are HIGH; it shifts a data word out of the EPROM when $\overline{CE}$ is LOW and $\overline{OE}$ is HIGH. The address/word counter is incremented on the rising edge of CLK while $\overline{CE}$ is held HIGH and $\overline{OE}$ is held LOW.  Note 1: Any modified polarity of the RESET/ $\overline{OE}$ pin is ignored in the programming mode.
4	8	$\overline{CE}$	I	The rising edge of CLK shifts a data word into the EPROM when $\overline{CE}$ and $\overline{OE}$ are HIGH; it shifts a data word out of the EPROM when $\overline{CE}$ is LOW and $\overline{OE}$ is HIGH. The address/word counter is incremented on the rising edge of CLK while $\overline{CE}$ is held HIGH and $\overline{OE}$ is held LOW.
5	10	Vss		Ground pin.
6	14	$\overline{CEO}$	O	The polarity of the RESET/ $\overline{OE}$ pin can be read by sensing the $\overline{CEO}$ pin.  Note 1: The polarity of the RESET/ $\overline{OE}$ pin is ignored while in the Programming Mode. In final verification, this pin must be monitored to go LOW one clock cycle after the last data bit has been read.
7	17	VPP		Programming Voltage Supply. Programming Mode is entered by holding $\overline{CE}$ and $\overline{OE}$ HIGH and VPP at VPP1 for two rising clock edges and then lowering VPP to VPP2 for one more rising clock edge. A word is programmed by strobing the device with VPP for the duration TPGM. VPP must be tied to VCC for normal read operation.
8	20	Vcc		+5 V power supply input.
