NOTE 1 When ordering devices with tighter tolerance than specified, use a nominal center voltage of 8.7 volts.

NOTE 2 Measured by superimposing 1.0 mA ac rms on 10 mA DC @ 25°C .

NOTE 3 The maximum allowable change observed over the entire temperature range i.e., the diode voltage will not exceed the specified mV at any discrete temperature between the established limits.

NOTE 4 Voltage measurements to be performed 15 seconds after application of DC current.

NOTE 5 Designate Radiation Hardened devices with "RH" prefix instead of "1N", i.e. RH3157A instead of 1N3157A.

NOTE 5

The curve in Figure 3 is typical of the diode series and greatly simplifies the estimation of the Temperature Coefficient (TC) when the diode is operated at currents other than 10 mA.

EXAMPLE: A diode in this series is operated at a current of 10 mA and has specified Temperature Coefficient (TC) limits of $\pm 0.005\%/^{\circ}\text{C}$. To obtain the typical Temperature Coefficient limits for this same diode operated at a current of 7.5 mA, the new TC limits ($\%/^{\circ}\text{C}$) can be estimated using the graph in FIGURE 3.

At a test current of 7.5 mA the change in Temperature Coefficient (TC) is approximately $-0.0012\%/^{\circ}\text{C}$. The algebraic sum of $\pm 0.005\%/^{\circ}\text{C}$ and $-0.0012\%/^{\circ}\text{C}$ gives the new limits of $+0.0038\%/^{\circ}\text{C}$ and $-0.0062\%/^{\circ}\text{C}$.

NOTE 6

The curve in Figure 4 illustrates the change of diode voltage arising from the effect of impedance. It is in effect an exploded view of the zener operating region of the I-V characteristic.

In conjunction with Fig. 3 this curve can be used to estimate total voltage regulation under conditions of both varying temperature and current.
