Figure 17: Ic vs Frequency

For a fast IGBT suitable for high frequency applications, the typical collector current vs. maximum operating frequency curve is reported. That frequency is defined as follows:

$$f_{MAX} = (P_D - P_C) / (E_{ON} + E_{OFF})$$

1) The maximum power dissipation is limited by maximum junction to case thermal resistance:

$$P_D = \Delta T / R_{THJ-C}$$

considering $\Delta T = T_j - T_c = 125^\circ C - 75^\circ C = 50^\circ C$

2) The conduction losses are:

$$P_C = I_c * V_{CE(SAT)} * \delta$$

with 50% of duty cycle, V_{CESAT} typical value @ $125^\circ C$.

3) Power dissipation during ON & OFF commutations is due to the switching frequency:

$$P_{SW} = (E_{ON} + E_{OFF}) * freq.$$

4) Typical values @ $125^\circ C$ for switching losses are used (test conditions: $V_{CE} = 390V$, $V_{GE} = 15V$, $R_G = 3.3 \text{ Ohm}$). Furthermore, diode recovery energy is included in the E_{ON} (see note 2), while the tail of the collector current is included in the E_{OFF} measurements (see note 3).
