

16-CHANNEL LED DRIVER WITH DOT CORRECTION

FEATURES

- 16 Channels
- Drive Capability
 - 0 to 80 mA (Constant-Current Sink)
- Constant Current Accuracy: ±1% (typical)
- Serial Data Interface
- Fast Switching Output: T_r / T_f = 10ns (typical)
- CMOS Level Input/Output
- 30 MHz Data Transfer Rate
- V_{CC} = 3.0 V to 5.5 V
- Operating Temperature = -40°C to 85°C
- LED Supply Voltage up to 17 V
- 32-pin HTSSOP(PowerPAD[™]) and QFN Packages
- Dot Correction
 - 7 bit (128 Steps)
 - individual adjustable for each channel
- Controlled In-Rush Current
- Error Information
 - LOD: LED Open Detection
 - TEF: Thermal Error Flag

FUNCTIONAL BLOCK DIAGRAM

APPLICATIONS

Monocolor, Multicolor, Fullcolor LED Display

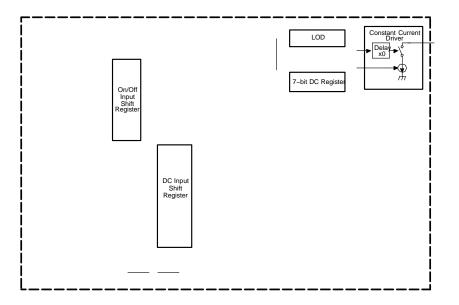

SLVS550A-DECEMBER 2004-REVISED NOVEMBER 2005

- Monocolor, Multicolor LED Signboard
- Display Backlighting
- Multicolor LED lighting applications

DESCRIPTION

The TLC5923 is a 16 channel constant-current sink driver. Each channel has a On/Off state and a 128-step adjustable constant current sink (dot correction). The dot correction adjusts the brightness variations between LED, LED channels and other LED drivers. Both dot correction and On/Off state are accessible via a serial data interface. A single external resistor sets the maximum current of all 16 channels.

The TLC5923 features two error information circuits. The LED open detection (LOD) indicates a broken or disconnected LED at an output terminal. The thermal error flag (TEF) indicates an overtemperature condition.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet. PowerPAD is a trademark of Texas Instruments. 

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

PRINCIPLES OF OPERATION

Setting Maximum Channel Current

٠,

The maximum output current per channel is set by a single external resistor, $R_{(IREF)}$, which is placed between IREF and GND. The voltage on IREF is set by an internal band gap $V_{(IREF)}$ with a typical value of 1.24V. The maximum channel current is equivalent to the current flowing through $R_{(IREF)}$ multiplied by a factor of 40. The maximum output current can be calculated by Equation 1:

$$I_{MAX} = \frac{V_{IREF}}{R_{IREF}} \times 40$$
(1)

where:

 $V_{IREF} = 1.24V$ typ.

 R_{IREF} = User selected external resistor (R_{IREF} should not be smaller than 600 Ω)

Figure 12 shows the maximum output current, $I_{O(LC)}$, versus $R_{(IREF)}$. In Figure 12, $R_{(IREF)}$ is the value of the resistor between IREF terminal to ground, and $I_{O(LC)}$ is the constant output current of OUT0,.....OUT15.

Setting Dot-Correction

The TLC5923 has the capability to fine adjust the current of each channel, OUT0 to OUT15 independently. This is also called dot correction. This feature is used to adjust the brightness deviations of LED connected to the output channels OUT0 to OUT15. Each of the 16 channels can be programmed with a 7-bit word. The channel output can be adjusted in 128 steps from 0% to 100% of the maximum output current I_{MAX} . Equation 2 determines the output current for each OUTn:

$$I_{\text{Outn}} = \frac{I_{\text{MAX}} \times DC_{\text{n}}}{127}$$

where:

 I_{Max} = the maximum programmable current of each output

DCn = the programmed dot-correction value for output n (DCn = 0, 1, 2 ... 127)

n = 0, 1, 2 ... 15

Dot correction data are entered for all channels at the same time. The complete dot correction data format consists of 16 x 7-bit words, which forms a 112-bit wide serial data packet. The channel data is put one after another. All data is clocked in with MSB first. Figure 7 shows the DC data format.

Figure 7. DC Data Format

To input data into dot correction register, MODE must be set to high. The internal input shift register is then set to 112 bit width. After all serial data is clocked in, a rising edge of XLAT latch the data to the dot correction register (Figure 11).

Output Enable

All OUTn channels of TLC5923 can switched off with one signal. When BLANK signal is set to high, all OUTn are disabled, regardless of On/Off status of each OUTn. When BLANK is the to low, all OUTn work under normal conditions.

(2)

| | • |
|-------|------------------|
| BLANK | OUT0 - OUT15 |
| LOW | Normal condition |
| HIGH | Disabled |

Table 1. BLANK Signal Truth Table

Setting Channel On/Off Status

All OUTn channels of TLC5923 can be switched on or off independently. Each of the channels can be programmed with a 1-bit word. On/Off data are entered for all channels at the same time. The complete On/Off data format consists of 16 x 1-bit words, which form a 16-bit wide data packet. The channel data is put one after another. All data is clocked in with MSB first. Figure 8 shows the On/Off data format.

| LSB | | | | | | | | | | | | | | | MSB |
|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| 0 | | | | | | | | | | | | | | | 15 |
| On/Off OUT0 | On/Off OUT1 | On/Off OUT2 | On/Off OUT3 | On/Off OUT4 | On/Off OUT5 | On/Off OUT6 | On/Off OUT7 | On/Off OUT8 | On/Off OUT9 | On/Off OUT10 | On/Off OUT11 | On/Off OUT12 | On/Off OUT13 | On/Off OUT14 | On/Off OUT15 |
| | On/Off Data | | | | | | | | | | | | | | |

Figure 8. On/Off Data

To input On/Off data into On/Off register MODE must be set to low. The internal input shift register is then set to 16 bit width. After all serial data is clocked in, a rising edge of XLAT is used to latch data into the On/Off register. Figure 11 shows the On/Off data input timing chart.

With the falling edge of XLAT signal all data in input shift register is replaced with LOD channel data. These data is clocked out to SOUT when new On/Off data is clocked in.

Delay Between Outputs

The TLC5923 has graduated delay circuits between outputs. These delay circuits can be found in the constant current block of the device (see Functional Block Diagram). The fixed delay time is 20 ns (typical), OUT0 has no delay, OUT1 has 20 ns delay, OUT2 has 40 ns delay, etc. This delay prevents large inrush currents, which reduce power supply bypass capacitor requirements when the outputs turn on. The delay works during switch on and switch off of each output channel. LEDs that have not turned on before BLANK is pulled high will still turn on and off at the determined delayed time regardless of the state of BLANK. Therefore, every LED will be illuminated for the amount of time BLANK is low.

Serial Interface Data Transfer Rate

The TLC5923 includes a flexible serial interface, which can be connected to microcontroller or digital signal processor. Only 3 pins are in required to input data into the device. The rising edge of SCLK signal shifts the data from SIN pin to internal shift register. After all data is clocked in, a rising edge of XLAT latches the serial data to the internal registers. All data is clocked in with MSB first. Multiple TLC5923 devices can be cascaded by connecting SOUT pin of one device with SIN pin of following device. The SOUT pin can also be connected to controller to receive LOD information from TLC5923.

(3)

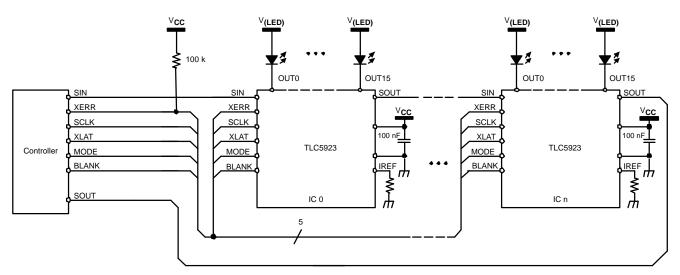

Figure 9. Cascading Devices

Figure 9 shows a example application with n cascaded TLC5923 devices connected to a controller. The maximum number of cascaded TLC5923 devices depends on application system and data transfer rate. Equation 3 calculates the minimum data input frequency needed.

$$f_(SCLK) = 112 \times f_(update) \times n$$

where:

f_(SCLK): The minimum data input frequency for SCLK and SIN.

f_(update): The update rate of the whole cascaded system.

n: The number of cascaded TLC5923 devices.

Operating Modes

The TLC5923 has different operating modes depending on MODE signal. Table 2 shows the available operating modes.

| MODE SIGNAL | INPUT SHIFT REGISTER | MODE |
|-------------|----------------------|--------------------------------|
| LOW | 16 bit | On/Off Mode |
| HIGH | 112 bit | Dot Correction Data Input Mode |

Table 2. TLC5923 Operating Modes Truth Table

Error Information Output

The open-drain output XERR is used to report both of the TLC5923 error flags, TEF and LOD. During normal operating conditions, the internal transistor connected to the XERR pin is turned off. The voltage on XERR is pulled up to V_{CC} through a external pullup resistor. If TEF or LOD is detected, the internal transistor is turned on, and XERR is pulled to GND. Since XERR is an open-drain output, multiple ICs can be OR'ed together and pulled up to V_{CC} with a single pullup resistor. This reduces the number of signals needed to report a system error.

To differentiate LOD and TEF signal from XERR pin, LOD can be masked out with BLANK = HIGH.

| ERROR CO | NDITION | ERROR IN | FORMATION | SIGNALS | | |
|-------------------|---------------------------|----------|-----------|---------|------|--|
| TEMPERATURE | OUNTn VOLTAGE | TEF | LOD | BLANK | XERR | |
| $T_J < T_{(TEF)}$ | Don't Care | L | Х | Н | Н | |
| $T_J > T_{(TEF)}$ | Don't Care | Н | Х | | L | |
| $T_J < T_{(TEF)}$ | OUTn > V _(LOD) | L | L | L | н | |
| | OUTn < V _(LOD) | L | Н | - | L | |
| $T_J > T_{(TEF)}$ | OUTn > V _(LOD) | Н | L | | L | |
| | OUTn < V _(LOD) | Н | Н | | L | |

Table 3. XERR Truth Table

TEF: Thermal Error Flag

The TLC5923 provides a temperature error flag (TEF) circuit to indicate an overtemperature condition of the IC. If the junction temperature exceeds the threshold temperature $T_{(TEF)}$ (160°C typical), the TEF circuit trips and pulls XERR to ground.

LOD: LED Open Detection

The TLC5923 provides an LED open-detection circuit (LOD). This circuit reports an error if any one of the 16 LEDs is open or disconnected from the circuit. The LOD circuit trips when the following two conditions are met simultaneously:

- 1. BLANK is set to LOW
- 2. When the voltage at OUTn is less than $V_{(LOD)}$ (0.3 V typ.) (Note: the voltage at each OUTn is sampled 1 μ s after being turned on).

The LOD circuit also pulls XERR to GND when tripped.

The LOD status of each channel can also be read out from the TLC5923 SOUT pin. When MODE is low and On/Off data is latched with rising edge of XLAT, LOD data is written to the input shift register with the falling edge of XLAT. These LOD data is clocked out to SOUT when new On/Off data is clocked in. These allow to control the LOD status of each OUTn channel. Figure 10 shows the LOD data format.

| LSB 0 | | | | | | | | | | | | | | | MSB 15 |

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details. TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

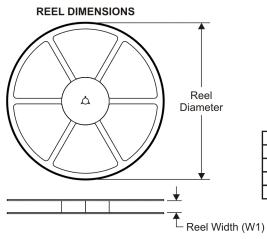

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

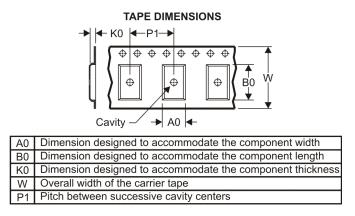

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

NOTES: A. All linear dimensions are in millimeters.

- B. This drawing is subject to change without notice.
- C. QFN (Quad Flatpack No-Lead) Package configuration.
- D The Package thermal pad must be soldered to the board for thermal and mechanical performance.
- See product data sheet for details regarding the exposed thermal pad dimensions.
- E. Falls within JEDEC MO-220.

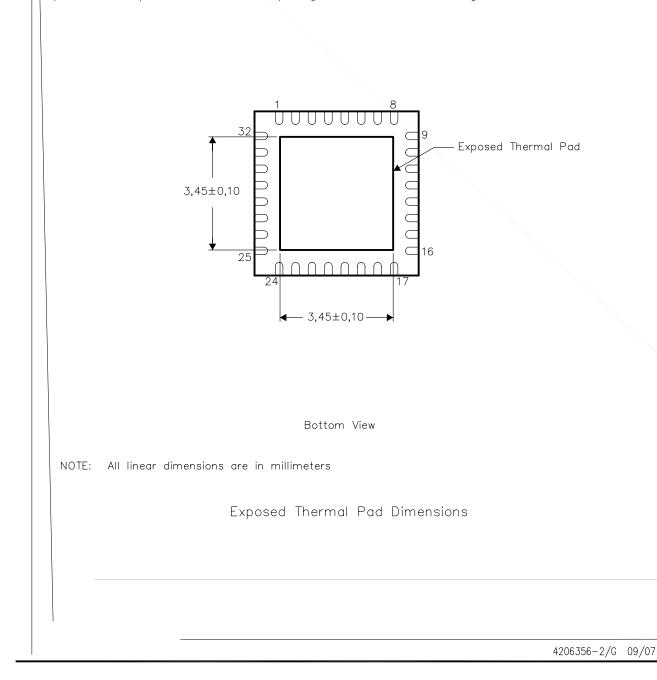

THERMAL PAD MECHANICAL DATA INSTRUMENTS www.ti.com RHB (S-PQFP-N32)

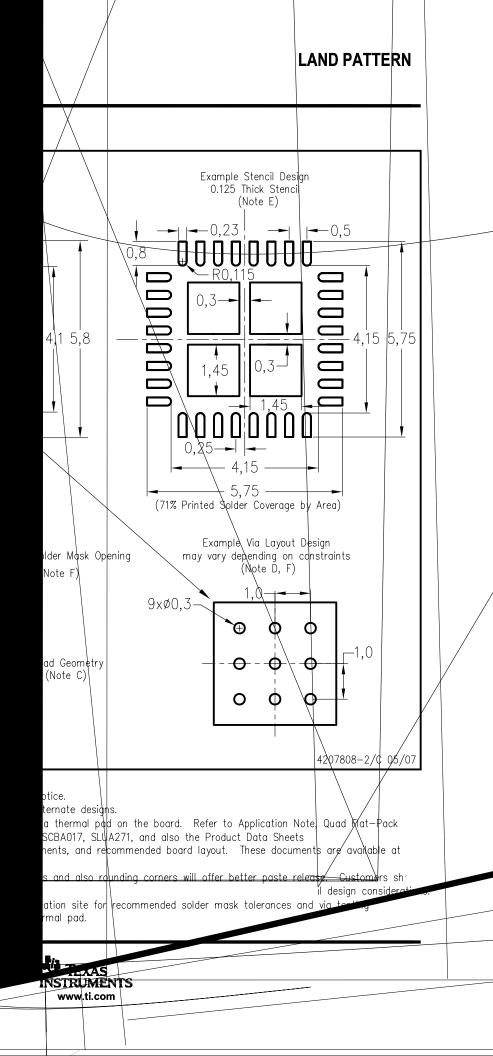

THERMAL INFORMATION

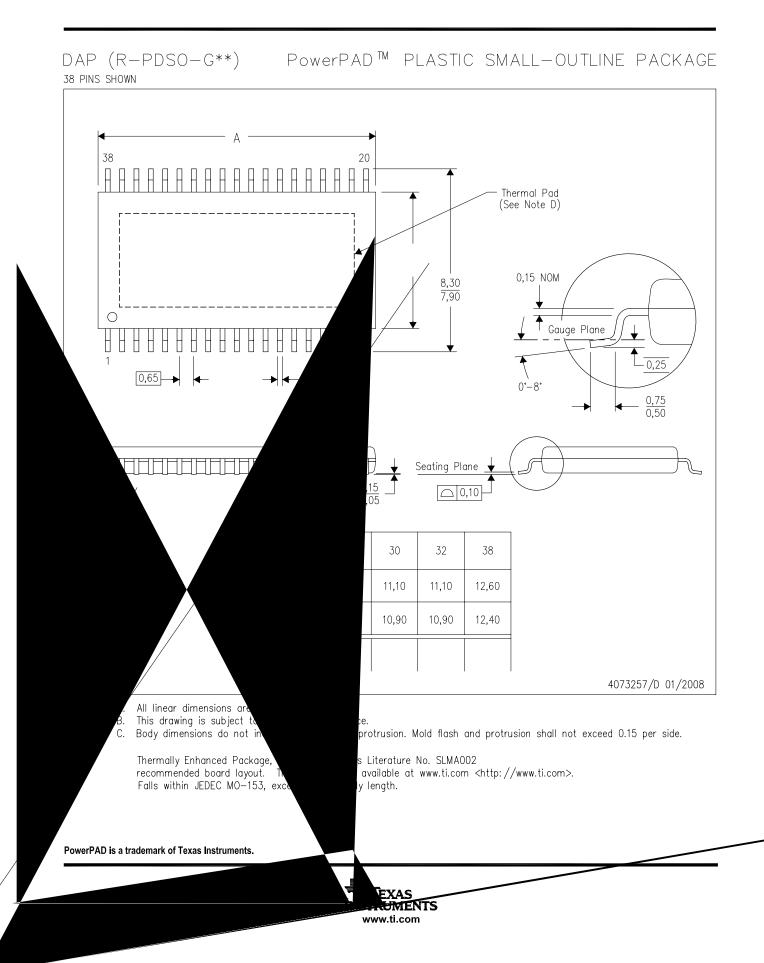

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

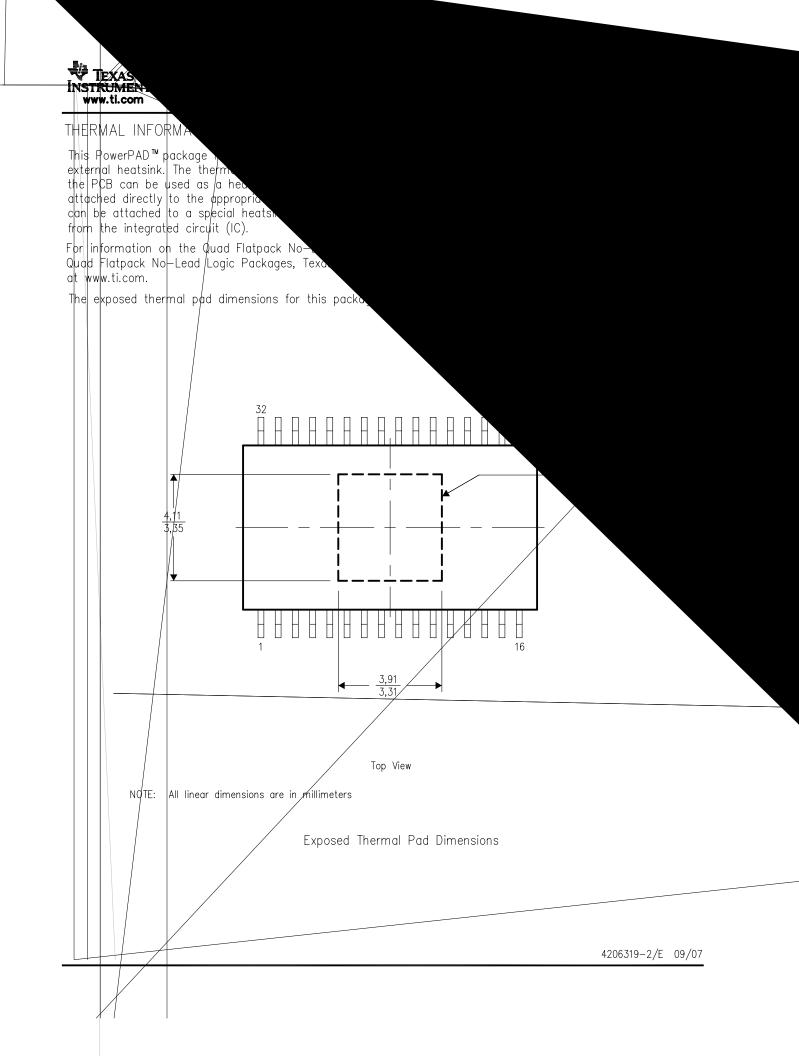

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, Quod Flatpack No-Lead Logic Packages, Texas Instruments Literature No. SCBA017. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
