TDA7850

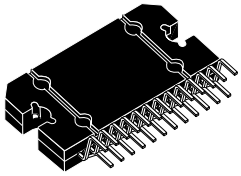
4 x 50W MOSFET Quad bridge power amplifier plus HSD

Features

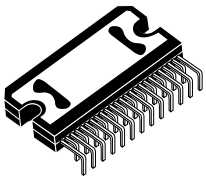
- Superior output power capability:
  4 x 50W/4Ω Max.
  4 x 30W/4Ω @ 14.4V, 1KHz, 10%
  4 x 80W/2Ω Max.
  4 x 55W/2Ω @ 14.4V, 1KHz, 10%
- MOSFET Output power stage
- Excellent 2Ω driving capability
- HI-FI class distortion
- Low output noise
- ST-BY Function
- Mute function
- Automute at min. supply voltage detection
- Low external component count:
  - Internally fixed gain (26dB)
  - No external compensation
  - No bootstrap capacitors
- On board 0.35A high side driver

Protections:

- Output short circuit to GND, to V_s, across the load
- Very inductive loads
- Overrating chip temperature with soft thermal limiter
- Output DC offset detection
- Load dump voltage
- Fortuitous open GND
- Reversed battery
- ESD



Flexiwatt25 (Vertical)



Flexiwatt25 (Horizontal)

Description

The TDA7850 is a breakthrough MOSFET technology class AB audio power amplifier in Flexiwatt 25 package designed for high power car radio. The fully complementary P-Channel/N-Channel output structure allows a rail to rail output voltage swing, which, combined with high output current and minimised saturation losses, sets new power references in the car-radio field, with unparalleled distortion performances.

The TDA7850 integrates a DC offset detector.

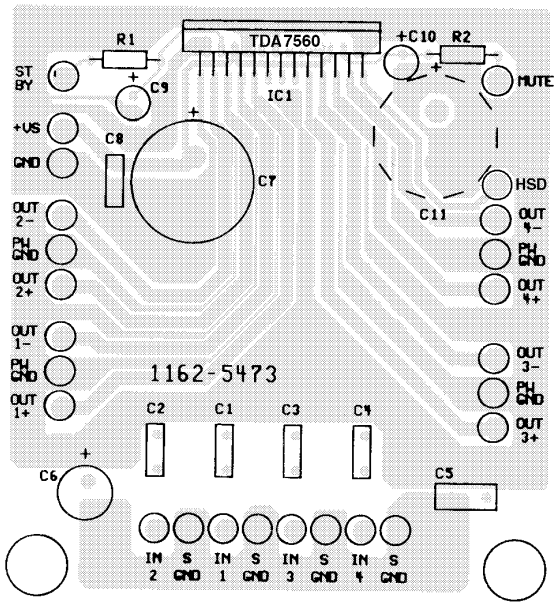
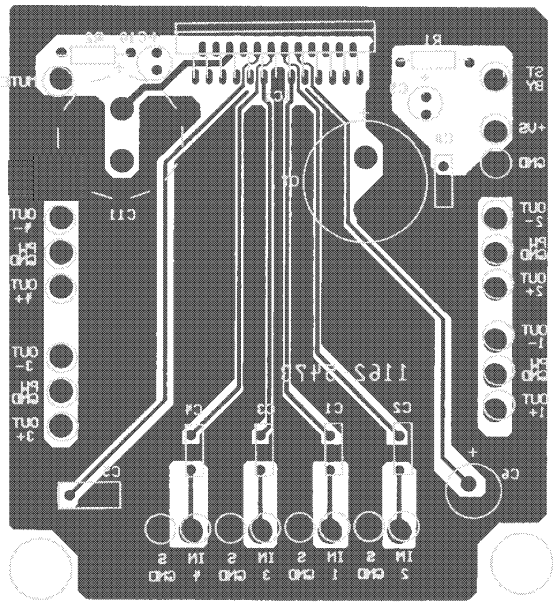
Components & top copper layer



Bottom copper layer



3 Application hints (ref. to the circuit of *Figure 3*)

3.1 SVR

Besides its contribution to the ripple rejection, the SVR capacitor governs the turn ON/OFF time sequence and, consequently, plays an essential role in the pop optimization during ON/OFF transients. To conveniently serve both needs, **Its minimum recommended value is 10μF**.

3.2 Input stage

The TDA7850's inputs are ground-compatible and can stand very high input signals (± 8Vpk) without any performance degradation.
If the standard value for the input capacitors (0.1μF) is adopted, the low frequency cut-off will amount to 16 Hz.

3.3 Stand-by and muting

STAND-BY and MUTING facilities are both CMOS compatible. In absence of true CMOS ports or microprocessors, a direct connection to Vs of these two pins is admissible but a 470 kOhm equivalent resistance should be present between the power supply and the muting and stand-by pins.
R-C cells have always to be used in order to smooth down the transitions for preventing any audible transient noises.
About the stand-by, the time constant to be assigned in order to obtain a virtually pop-free transition has to be slower than 2.5V/ms.

3.4 DC offset detector

The TDA7850 integrates a DC offset detector to avoid an anomalous DC offset on the inputs of the amplifier which may be multiplied by the gain, and result in a dangerous large offset on the outputs, which may lead to speaker damage through overheating.

The feature is enabled by the MUTE pin and works with the amplifier unmuted and with no signal on the inputs. The DC offset detection is signaled out on the HSD pin.

3.5 Heatsink definition

Under normal usage (4 Ohm speakers) the heatsink's thermal requirements have to be deduced from fig. 18, which reports the simulated power dissipation when real music/speech programmes are played out. Noise with gaussian-distributed amplitude was employed for this simulation. Based on that, frequent clipping occurence (worst-case) will cause Pdiss = 26W. Assuming T_{amb} = 70°C and T_{CHIP} = 150°C as boundary conditions, the heatsink's thermal resistance should be approximately 2°C/W. This would avoid any thermal shutdown occurence even after long-term and full-volume operation.

4 Package Information

In order to meet environmental requirements, ST offers these devices in ECOPACK® packages. These packages have a lead-free second level interconnect. The category of second level interconnect is marked on the package and on the inner box label, in compliance with JEDEC standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark.

ECOPACK specifications are available at: www.st.com.
