## description

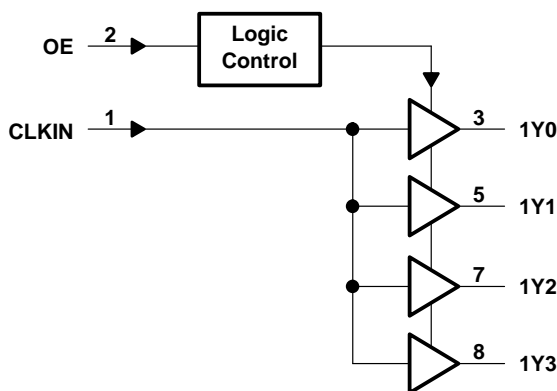

The CDCV304 is a high-performance, low-skew, general-purpose and PCI-X clock buffer. It distributes one input clock signal (CLKIN) to the output clocks (1Y[0:3]). It is specifically designed for use with PCI-X applications. The CDCV304 operates at 3.3 V.

The CDCV304 is characterized for operation from –40°C to 85°C for automotive and industrial applications.

 Storage temperature range, T<sub>stg</sub> ..... –65°C to 150°C

<sup>†</sup> Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTES: 1. The input and output negative-voltage ratings may be exceeded if the input and output clamp-current ratings are observed.  
 2. This value is limited to 4.6 V maximum.  
 3. The package thermal impedance is calculated in accordance with JESD 51.
