

- **Low-Cost, High-Performance Fixed-Point DSP – TMS320C6411**
 - 3.33-ns Instruction Cycle Time
 - 300-MHz Clock Rate
 - Eight 32-Bit Instructions/Cycle
 - Twenty-Eight Operations/Cycle
 - 2400 MIPS
 - Fully Software-Compatible With TMS320C62x™
- **VelociTI.2™ Extensions to VelociTI™ Advanced Very-Long-Instruction-Word (VLIW) TMS320C64x™ DSP Core**
 - Eight Highly Independent Functional Units With VelociTI.2™ Extensions:
 - Six ALUs (32-/40-Bit), Each Supports Single 32-Bit, Dual 16-Bit, or Quad 8-Bit Arithmetic per Clock Cycle
 - Two Multipliers Support Four 16 x 16-Bit Multiplies (32-Bit Results) per Clock Cycle or Eight 8 x 8-Bit Multiplies (16-Bit Results) per Clock Cycle
 - Non-Aligned Load-Store Architecture
 - 64 32-Bit General-Purpose Registers
 - Instruction Packing Reduces Code Size
 - All Instructions Conditional
- **Instruction Set Features**
 - Byte-Addressable (8-/16-/32-/64-Bit Data)
 - 8-Bit Overflow Protection
 - Bit-Field Extract, Set, Clear
 - Normalization, Saturation, Bit-Counting
 - VelociTI.2™ Increased Orthogonality
- **L1/L2 Memory Architecture**
 - 128K-Bit (16K-Byte) L1P Program Cache (Direct Mapped)
 - 128K-Bit (16K-Byte) L1D Data Cache (2-Way Set-Associative)
 - 2M-Bit (256K-Byte) L2 Unified Mapped RAM/Cache (Flexible RAM/Cache Allocation)
- **32-Bit External Memory Interface (EMIF)**
 - Glueless Interface to Asynchronous Memories (SRAM and EPROM) and Synchronous Memories (SDRAM, SBSRAM, ZBT SRAM, and FIFO)
 - 512M-Byte Total Addressable External Memory Space
- **Enhanced Direct-Memory-Access (EDMA) Controller (64 Independent Channels)**
- **Host-Port Interface (HPI)**
 - User-Configurable Bus Width (32-/16-Bit)
 - Access to Entire Memory Map
- **32-Bit/33-MHz, 3.3-V Peripheral Component Interconnect (PCI) Master/Slave Interface Conforms to PCI Specification 2.2**
 - Access to Entire Memory Map
 - Three PCI Bus Address Registers:
 - Prefetchable Memory
 - Non-Prefetchable Memory I/O
 - Four-Wire Serial EEPROM Interface
 - PCI Interrupt Request Under DSP Program Control
 - DSP Interrupt Via PCI I/O Cycle
- **Two Multichannel Buffered Serial Ports (McBSPs)**
 - Direct Interface to T1/E1, MVIP, SCSA Framers
 - ST-Bus-Switching Compatible
 - Up to 256 Channels Each
 - AC97-Compatible
 - Serial Peripheral Interface (SPI) Compatible (Motorola™)
- **Three 32-Bit General-Purpose Timers**
- **Sixteen General-Purpose I/O (GPIO) Pins**
 - Programmable Interrupt/Event Generation Modes
- **Flexible PLL Clock Generator**
- **IEEE-1149.1 (JTAG†) Boundary-Scan-Compatible**
- **532-Pin Ball Grid Array (BGA) Package (GLZ and ZLZ Suffix), 0.8-mm Ball Pitch**
- **0.13-μm/6-Level Copper Metal Process**
 - CMOS Technology
- **3.3-V I/Os, 1.2-V Internal**

REVISION HISTORY

This data sheet revision history highlights the technical changes made to the SPRS196G device-specific data sheet to make it an SPRS196H revision.

Scope: Applicable updates to the C64x device family, specifically relating to the C6411 devices, have been incorporated. Added C6411A silicon revision 2.0 devices and associated device-specific information at the product data (PD) stage of development.

The extended temperature devices for silicon revision 2.0 (C641x A-5E0, C641xA-6E3) are at the advance information (AI) stage of development. All other devices are at the Production Data (PD) stage of development.

PAGE(S) NO.	ADDITIONS/CHANGES/DELETIONS
6	GLZ and ZLZ BGA packages (bottom view) section: Added "and ZLZ" to the "GLZ 532-PIN BALL GRID ARRAY (BGA) PACKAGE (BOTTOM VIEW)" figure title Added a ZLZ clarification footnote to the GLZ and ZLZ BGA packages (bottom view) figure
7	Description section: "With performance of up to 2400 million instructions per second (MIPS) ..." paragraph Changed "The C6411 can produce two 32-bit multiply-accumulates (MACs) per ..." sentence to "The C6411 can produce four 16-bit multiply-accumulates (MACs) per ..."
8	Table 1, Characteristics of the C6411 Processor: Changed the EDMA INTERNAL CLOCK SOURCE reference from "CPU Clock Frequency" to "CPU/2 Clock Frequency"
15	L2 architecture expanded section: Added <i>new</i> section Added Figure 2, TMS320C6411 L2 Architecture Memory Configuration
17	Peripheral register descriptions section: Table 5, L2 Cache Registers: Added "Reserved" row "0184 1004 – 0184 1FFC" Changed "Reserved" row "0184 4050 – 0184 4FFF" to "0184 4050 – 0184 4FFC"
20	Peripheral register descriptions section: EDMA Parameter RAM table: Updated associated table footnote from "The C64x device ..." to "The C6411 device ..."
55	Added "device support" section title (<i>new</i>)
55–56	Device and development-support tool nomenclature section: Updated/changed "Table 1 displays the device part numbers and ordering information for ..." paragraph Deleted the "TMX and TMP devices and TMDX development-support tools are shipped with ..." paragraph Figure 5, TMS320C6411 DSP Device Nomenclature: Updated/changed the "For the actual device part number (P/N), ..." footnote Added, below Figure 5, "For additional information, see the <i>TMS320C6411 Digital Signal Processor Silicon Errata</i> (literature number SPRZ194)" paragraph (<i>new</i>)
57	Documentation support section: Deleted "See the Worldwide Web URL for Texas Instruments" from the SPRA718 and SPRA374 reference paragraph Moved the SPRA718 and SPRA374 reference paragraph up

TMS320C6411

FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS196H – MARCH 2002 – REVISED JULY 2004

PAGE(S) NO.	ADDITIONS/CHANGES/DELETIONS
64	Power-supply decoupling section: Updated/changed the "In order to properly decouple the supply planes from system noise, place as many capacitors ..." paragraph Added two subsequent paragraphs
65	IEEE 1149.1 JTAG compatibility statement section: Updated/added paragraphs for clarity
66	Reset section: Added <i>new</i> section
75	Asynchronous Memory Timing section: Timing Requirements for Asynchronous Memory Cycles table: Added/split silicon revisions "Rev 1.1" and "Rev 2.0" for the MIN value of parameter #7 " $t_{h(EKO1H-ARDY)}$, Hold time, ARDY valid after ECLKOUTx high" Added the MIN value of "1.3" ns for "Rev 2.0"
89	<u>HOLD/HOLDA</u> Timing section: Timing Requirements for the <u>HOLD/HOLDA</u> Cycles table: Changed parameter NO. 3 from " $t_{oh}(HOLDAL-HOLDL)$ " to " $t_h(HOLDAL-HOLDL)$ "
91	Reset Timing section: Timing Requirements for Reset table: Changed the MIN value of parameter No. 16, $t_{su}(boot)$ from "4P" to "4E or 4C" ns Added associated footnote to identify "E" and "C" Added parameter NO. 18, " $t_d(PCLK-RSTH)$ Delay time, PCLK active to <u>RESET</u> high" with a MIN value of "32N" ns Changed parameter NO. 18 description from " $t_d(PCLK-RSTH)$ Delay time, PCLK active to <u>RESET</u> high" to " $t_{su}(PCLK-RSTH)$, Setup time, PCLK active before <u>RESET</u> high" Added associated footnote to identify "N" and restraints Switching Characteristics Over Recommended Operating Conditions During Reset table: Moved parameter NO. 18, " $t_d(PCLK-RSTH)$ Delay time, PCLK active to <u>RESET</u> high" to the Timing Requirements for Reset table Updated footnote symbols
94	Host-Port Interface (HPI) Timing section: Switching Characteristics Over Recommended Operating Conditions During Host-Port Interface Cycles table: Added "mode, 2nd half-word" to parameter NO. 16 " $t_d(HSTBL-HDV)$, Delay time, <u>HSTROBE</u> low to HD valid (HPI16 only)"
103–104	Multichannel Buffered Serial Port (McBSP) Timing section: Switching Characteristics Over Recommended Operating Conditions for McBSP table: Changed the MIN value of parameter #12 " $t_{dis}(CKXH-DXHZ)$, Disable time, DX high impedance following last data bit from CLKX high, CLKX ext " from "–2.1" to "2.0" ns Changed the MIN value of parameter #13 " $t_d(CKXH-DXV)$, Delay time, CLKX high to DX valid, CLKX ext " from "–2.1 + D1" to "2.0 + D1" ns Changed the MIN value of parameter #14 " $t_d(FXH-DXV)$, Delay time, FSX high to DX valid, FSX int " from "–2.3" to "–2.3 + D1 \square " ns Changed the MAX value of parameter #14 " $t_d(FXH-DXV)$, Delay time, FSX high to DX valid, FSX int " from "5.6" to "5.6 + D2 \square " ns Changed the MIN value of parameter #14 " $t_d(FXH-DXV)$, Delay time, FSX high to DX valid, FSX ext " from "1.9" to "1.9 + D1 \square " ns Changed the MAX value of parameter #14 " $t_d(FXH-DXV)$, Delay time, FSX high to DX valid, FSX ext " from "9" to "9 + D2 \square " ns Added associated footnote Figure 51, McBSP Timing: Added footnote for clarity

PAGE(S) NO.	ADDITIONS/CHANGES/DELETIONS
101	PERIPHERAL COMPONENT INTERCONNECT (PCI) TIMING section: Switching Characteristics Over Recommended Operating Conditions for Serial EEPROM Interface table: Changed parameter NO. 6 description from "t _{osu} (DOV-CLKH), Output setup time, XSP_DO valid after XSP_CLK high" to "t _{osu} (DOV-CLKH), Output setup time, XSP_DO valid before XSP_CLK high"
114	General-Purpose Input/Output (GPIO) Port Timing section: Switching Characteristics Over Recommended Operating Conditions for GPIO Outputs table: Changed the MIN value of parameter #3 "t _w (GPOH), Pulse duration, GPOx high" from "32P" to "24P – 8" ns Changed the MIN value of parameter #4 "t _w (GPOL), Pulse duration, GPOx low" from "32P" to "24P – 8" ns Added associated footnote
116	MECHANICAL DATA section: Deleted the " GLZ and ZLZ (S-PBGA-N532), PLASTIC BALL GRID ARRAY" mechanical data package diagram; now an automated merged process Added the "thermal resistance characteristics (S-PBGA package) [ZLZ]" table Added lead-in sentence for the thermal resistance characteristics table(s) and the "merged" mechanical data packages

description

The TMS320C64x™ DSPs (including the TMS320C6411 device) are the highest-performance fixed-point DSP generation in the TMS320C6000™ DSP platform. The TMS320C6411 (C6411) device is based on the second-generation high-performance, advanced VelociTI™ very-long-instruction-word (VLIW) architecture (VelociTI.2™) developed by Texas Instruments (TI), making these DSPs an excellent choice for multichannel and multifunction applications. The C64x™ is a code-compatible member of the C6000™ DSP platform.

With performance of up to 2400 million instructions per second (MIPS) at a clock rate of 300 MHz, the C6411 device offers cost-effective solutions to high-performance DSP programming challenges. The C6411 DSP possesses the operational flexibility of high-speed controllers and the numerical capability of array processors. The C64x™ DSP core processor has 64 general-purpose registers of 32-bit word length and eight highly independent functional units—two multipliers for a 32-bit result and six arithmetic logic units (ALUs)—with VelociTI.2™ extensions. The VelociTI.2™ extensions in the eight functional units include new instructions to accelerate the performance in key applications and extend the parallelism of the VelociTI™ architecture. The C6411 can produce four 16-bit multiply-accumulates (MACs) per cycle for a total of 600 million MACs per second (MMACS), or eight 8-bit MACs per cycle for a total of 2400 MMACS. The C6411 DSP also has application-specific hardware logic, on-chip memory, and additional on-chip peripherals similar to the other C6000™ DSP platform devices.

The C6411 uses a two-level cache-based architecture and has a powerful and diverse set of peripherals. The Level 1 program cache (L1P) is a 128-Kbit direct mapped cache and the Level 1 data cache (L1D) is a 128-Kbit 2-way set-associative cache. The Level 2 memory/cache (L2) consists of a 2-Mbit memory space that is shared between program and data space. L2 memory can be configured as mapped memory or combinations of cache (up to 256K bytes) and mapped memory. The peripheral set includes two multichannel buffered serial ports (McBSPs); three 32-bit general-purpose timers; a user-configurable 16-bit or 32-bit host-port interface (HPI16/HPI32); a peripheral component interconnect (PCI); a general-purpose input/output port (GPIO) with 16 GPIO pins; and a glueless external memory interface (32-bit EMIF), which is capable of interfacing to synchronous and asynchronous memories and peripherals.

The C6411 has a complete set of development tools which includes: a new C compiler, an assembly optimizer to simplify programming and scheduling, and a Windows™ debugger interface for visibility into source code execution.

device compatibility

The C64x™ family of devices has a diverse and powerful set of peripherals. The common peripheral set that the C6411 and C6415 devices offer lead to easier system designs and faster time to market.

The C6411 device is a low-cost C64x device which features significant enhancements from the C6211/C6211B devices and can be considered a subset of the C6415 device. Table 2 identifies the C6411 features in comparison with the C6211 and C6415 devices.

Table 2. C6211, C6411, and C6415 Device Comparison†‡

functional block and CPU (DSP core) diagram

† The PCI peripheral is muxed with the HPI peripheral and the GPIO[15:9] port. For more details on the multiplexed pins of these peripherals, see the Device Configurations section of this data sheet.

CPU (DSP core) description

The CPU fetches VelociTI™ advanced very-long instruction words (VLIWs) (256 bits wide) to supply up to eight 32-bit instructions to the eight functional units during every clock cycle. The VelociTI™ VLIW architecture features controls by which all eight units do not have to be supplied with instructions if they are not ready to execute. The first bit of every 32-bit instruction determines if the next instruction belongs to the same execute packet as the previous instruction, or whether it should be executed in the following clock as a part of the next execute packet. Fetch packets are always 256 bits wide; however, the execute packets can vary in size. The variable-length execute packets are a key memory-saving feature, distinguishing the C64x CPUs from other VLIW architectures. The C64x™ VelociTI.2™ extensions add enhancements to the TMS320C62x™ DSP VelociTI™ architecture. These enhancements include:

- Register file enhancements
- Data path extensions
- Quad 8-bit and dual 16-bit extensions with data flow enhancements
- Additional functional unit hardware
- Increased orthogonality of the instruction set
- Additional instructions that reduce code size and increase register flexibility

The CPU features two sets of functional units. Each set contains four units and a register file. One set contains functional units .L1, .S1, .M1, and .D1; the other set contains units .D2, .M2, .S2, and .L2. The two register files each contain 32 32-bit registers for a total of 64 general-purpose registers. In addition to supporting the packed 16-bit and 32-/40-bit fixed-point data types found in the C62x™ VelociTI™ VLIW architecture, the C64x™ register files also support packed 8-bit data and 64-bit fixed-point data types. The two sets of functional units, along with two register files, compose sides A and B of the CPU [see the functional block and CPU (DSP core) diagram, and Figure 1]. The four functional units on each side of the CPU can freely share the 32 registers belonging to that side. Additionally, each side features a “data cross path”—a single data bus connected to all the registers on the other side, by which the two sets of functional units can access data from the register files on the opposite side. The C64x CPU pipelines data-cross-path accesses over multiple clock cycles. This allows the same register to be used as a data-cross-path operand by multiple functional units in the same execute packet. All functional units in the C64x CPU can access operands via the data cross path. Register access by functional units on the same side of the CPU as the register file can service all the units in a single clock cycle. On the C64x CPU, a delay clock is introduced whenever an instruction attempts to read a register via a data cross path if that register was updated in the previous clock cycle.

In addition to the C62x™ DSP fixed-point instructions, the C64x™ DSP includes a comprehensive collection of quad 8-bit and dual 16-bit instruction set extensions. These VelociTI.2™ extensions allow the C64x CPU to operate directly on packed data to streamline data flow and increase instruction set efficiency.

Another key feature of the C64x CPU is the load/store architecture, where all instructions operate on registers (as opposed to data in memory). Two sets of data-addressing units (.D1 and .D2) are responsible for all data transfers between the register files and the memory. The data address driven by the .D units allows data addresses generated from one register file to be used to load or store data to or from the other register file. The C64x .D units can load and store bytes (8 bits), half-words (16 bits), and words (32 bits) with a single instruction. And with the new data path extensions, the C64x .D unit can load and store doublewords (64 bits) with a single instruction. Furthermore, the non-aligned load and store instructions allow the .D units to access words and doublewords on any byte boundary. The C64x CPU supports a variety of indirect addressing modes using either linear- or circular-addressing with 5- or 15-bit offsets. All instructions are conditional, and most can access any one of the 64 registers. Some registers, however, are singled out to support specific addressing modes or to hold the condition for conditional instructions (if the condition is not automatically “true”).

TMS320C62x is a trademark of Texas Instruments.

TMS320C6411

FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS196H – MARCH 2002 – REVISED JULY 2004

CPU (DSP core) description (continued)

The two .M functional units perform all multiplication operations. Each of the C64x .M units can perform two 16×16 -bit multiplies or four 8×8 -bit multiplies per clock cycle. The .M unit can also perform 16×32 -bit multiply operations, dual 16×16 -bit multiplies with add/subtract operations, and quad 8×8 -bit multiplies with add operations. In addition to standard multiplies, the C64x .M units include bit-count, rotate, Galois field multiplies, and bidirectional variable shift hardware.

The two .S and .L functional units perform a general set of arithmetic, logical, and branch functions with results available every clock cycle. The arithmetic and logical functions on the C64x CPU include single 32-bit, dual 16-bit, and quad 8-bit operations.

The processing flow begins when a 256-bit-wide instruction fetch packet is fetched from a program memory. The 32-bit instructions destined for the individual functional units are “linked” together by “1” bits in the least significant bit (LSB) position of the instructions. The instructions that are “chained” together for simultaneous execution (up to eight in total) compose an execute packet. A “0” in the LSB of an instruction breaks the chain, effectively placing the instructions that follow it in the next execute packet. A C64x™ DSP device enhancement now allows execute packets to cross fetch-packet boundaries. In the TMS320C62x™/TMS320C67x™ DSP devices, if an execute packet crosses the fetch-packet boundary (256 bits wide), the assembler places it in the next fetch packet, while the remainder of the current fetch packet is padded with NOP instructions. In the C64x™ DSP device, the execute boundary restrictions have been removed, thereby, eliminating all of the NOPs added to pad the fetch packet, and thus, decreasing the overall code size. The number of execute packets within a fetch packet can vary from one to eight. Execute packets are dispatched to their respective functional units at the rate of one per clock cycle and the next 256-bit fetch packet is not fetched until all the execute packets from the current fetch packet have been dispatched. After decoding, the instructions simultaneously drive all active functional units for a maximum execution rate of eight instructions every clock cycle. While most results are stored in 32-bit registers, they can be subsequently moved to memory as bytes, half-words, words, or doublewords. All load and store instructions are byte-, half-word-, word-, or doubleword-addressable.

For more details on the C64x CPU functional units enhancements, see the following documents:

How To Begin Development Today With the TMS320C6411 DSP application report (literature number SPRA374)

TMS320C67x is a trademark of Texas Instruments.

The diagram illustrates the internal structure of Register File A (A0-A31) and Register File B (B0-B31). It shows two data paths, Data Path A and Data Path B, each with multiple store (ST) and load (LD) instructions. The instructions are connected to various sources (src1, src2) and destinations (dst) within the register files. The diagram also shows the 32 MSBs and 32 LSBs of the data paths, and the 2X and 1X data paths. The Control Register File is also shown at the bottom.

Data Path A:

- ST1b (Store Data) / ST1a (Store Data):** 32 MSBs / 32 LSBs. Connected to .L1, .S1, and .M1 instructions.
- LD1b (Load Data) / LD1a (Load Data):** 32 MSBs / 32 LSBs. Connected to .D1 and .D2 instructions.
- DA1 (Address) / DA2 (Address):** 32 MSBs / 32 LSBs. Connected to .D1 and .D2 instructions.
- LD2a (Load Data) / LD2b (Load Data):** 32 LSBs / 32 MSBs. Connected to .M2 and .S2 instructions.
- ST2a (Store Data) / ST2b (Store Data):** 32 MSBs / 32 LSBs. Connected to .L2 instruction.

Data Path B:

- LD2a (Load Data) / LD2b (Load Data):** 32 LSBs / 32 MSBs. Connected to .M2 and .S2 instructions.
- ST2a (Store Data) / ST2b (Store Data):** 32 MSBs / 32 LSBs. Connected to .L2 instruction.

Register File A (A0-A31):

- .L1:** long src, long dst, long src. Connected to src1, src2, and dst.
- .S1:** long src, long dst, dst. Connected to src1, src2, and dst.
- .M1:** long dst, dst. Connected to src1 and src2.
- .D1:** dst, src1, src2. Connected to src1, src2, and dst.
- .D2:** src2, src1, dst. Connected to src1, src2, and dst.
- .M2:** src2, src1, dst. Connected to src1, src2, and dst.
- .S2:** src2, src1, dst, long dst, long src. Connected to src1, src2, and dst.
- .L2:** long src, long dst, dst. Connected to src1, src2, and dst.

Register File B (B0-B31):

- .L1:** long src, long dst, long src. Connected to src1, src2, and dst.
- .S1:** long src, long dst, dst. Connected to src1, src2, and dst.
- .M1:** long dst, dst. Connected to src1 and src2.
- .D1:** dst, src1, src2. Connected to src1, src2, and dst.
- .D2:** src2, src1, dst. Connected to src1, src2, and dst.
- .M2:** src2, src1, dst. Connected to src1, src2, and dst.
- .S2:** src2, src1, dst, long dst, long src. Connected to src1, src2, and dst.
- .L2:** long src, long dst, dst. Connected to src1, src2, and dst.

memory map summary

Table 3 shows the memory map address ranges of the C6411 device. Internal memory is always located at address 0 and can be used as both program and data memory. The external memory address range in the C6411 device begins at the hex address location 0x8000 0000 for the EMIF.

Table 3. TMS320C6411 Memory Map Summary

MEMORY BLOCK DESCRIPTION	BLOCK SIZE (BYTES)	HEX ADDRESS RANGE
Internal RAM (L2)	256K	0000 0000 – 0003 FFFF
Reserved	24M – 256K	0004 0000 – 017F FFFF
External Memory Interface (EMIF) Registers	256K	0180 0000 – 0183 FFFF
L2 Registers	256K	0184 0000 – 0187 FFFF
HPI Registers	256K	0188 0000 – 018B FFFF
McBSP 0 Registers	256K	018C 0000 – 018F FFFF
McBSP 1 Registers	256K	0190 0000 – 0193 FFFF
Timer 0 Registers	256K	0194 0000 – 0197 FFFF
Timer 1 Registers	256K	0198 0000 – 019B FFFF
Interrupt Selector Registers	256K	019C 0000 – 019F FFFF
EDMA RAM and EDMA Registers	256K	01A0 0000 – 01A3 FFFF
Reserved	512K	01A4 0000 – 01AB FFFF
Timer 2 Registers	256K	01AC 0000 – 01AF FFFF
GPIO Registers	256K	01B0 0000 – 01B3 FFFF
Reserved	768K	01B4 0000 – 01BF FFFF
PCI Registers	256K	01C0 0000 – 01C3 FFFF
Reserved	4M – 256K	01C4 0000 – 01FF FFFF
QDMA Registers	52	0200 0000 – 0200 0033
Reserved	736M – 52	0200 0034 – 2FFF FFFF
McBSP 0 Data	64M	3000 0000 – 33FF FFFF
McBSP 1 Data	64M	3400 0000 – 37FF FFFF
Reserved	1G + 128M	3800 0000 – 7FFF FFFF
EMIF CE0†	256M	8000 0000 – 8FFF FFFF
EMIF CE1†	256M	9000 0000 – 9FFF FFFF
EMIF CE2†	256M	A000 0000 – AFFF FFFF
EMIF CE3†	256M	B000 0000 – BFFF FFFF
Reserved	1G	C000 0000 – FFFF FFFF

† The number of EMIF address pins (EA[22:3]) limits the maximum addressable memory (SDRAM) to 128MB per CE space. To get 256MB of addressable memory, an additional general-purpose output pin or external logic is required.

L2 architecture expanded

Figure 2 shows the detail of the L2 architecture on the TMS320C6411 device. For more information on the L2MODE bits, see the cache configuration (CCFG) register bit field descriptions in the *TMS320C64x Two-Level Internal Memory Reference Guide* (literature number SPRU610).

peripheral register descriptions

Table 4 through Table 17 identify the peripheral registers for the C6411 device by their register names, acronyms, and hex address or hex address range. For more detailed information on the register contents, bit names and their descriptions, see the specific peripheral reference guide listed in the *TMS320C6000 DSP Peripherals Overview Reference Guide* (literature number SPRU190).

Table 4. EMIF Registers

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME
0180 0000	GBLCTL	EMIF global control
0180 0004	CECTL1	EMIF CE1 space control
0180 0008	CECTL0	EMIF CE0 space control
0180 000C	–	Reserved
0180 0010	CECTL2	EMIF CE2 space control
0180 0014	CECTL3	EMIF CE3 space control
0180 0018	SDCTL	EMIF SDRAM control
0180 001C	SDTIM	EMIF SDRAM refresh control
0180 0020	SDEXT	EMIF SDRAM extension
0180 0024 – 0180 003C	–	Reserved
0180 0040	PDTCTL	Peripheral device transfer (PDT) control
0180 0044	CESEC1	EMIF CE1 space secondary control
0180 0048	CESEC0	EMIF CE0 space secondary control
0180 004C	–	Reserved
0180 0050	CESEC2	EMIF CE2 space secondary control
0180 0054	CESEC3	EMIF CE3 space secondary control
0180 0058 – 0183 FFFF	–	Reserved

FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS196H – MARCH 2002 – REVISED JULY 2004

EDMA channel synchronization events

The C64x EDMA supports up to 64 EDMA channels which service peripheral devices and external memory. Table 18 lists the source of C64x EDMA synchronization events associated with each of the programmable EDMA channels. For the C6411 device, the association of an event to a channel is fixed; each of the EDMA channels has one specific event associated with it. These specific events are captured in the EDMA event registers (ERL, ERH) even if the events are disabled by the EDMA event enable registers (EERL, EERH). The priority of each event can be specified independently in the transfer parameters stored in the EDMA parameter RAM. For more detailed information on the EDMA module and how EDMA events are enabled, captured, processed, linked, chained, and cleared, etc., see the *TMS320C6000 DSP Enhanced Direct Memory Access (EDMA) Controller Reference Guide* (literature number SPRU234).

Table 18. TMS320C6411 EDMA Channel Synchronization Events†

EDMA CHANNEL	EVENT NAME	EVENT DESCRIPTION
0	DSP_INT	HPI/PCI-to-DSP interrupt
1	TINT0	Timer 0 interrupt
2	TINT1	Timer 1 interrupt
3	SD_INT	EMIF SDRAM timer interrupt
4	GPINT4/EXT_INT4	GPIO event 4/External interrupt pin 4
5	GPINT5/EXT_INT5	GPIO event 5/External interrupt pin 5
6	GPINT6/EXT_INT6	GPIO event 6/External interrupt pin 6
7	GPINT7/EXT_INT7	GPIO event 7/External interrupt pin 7
8	GPINT0	GPIO event 0
9	GPINT1	GPIO event 1
10	GPINT2	GPIO event 2
11	GPINT3	GPIO event 3
12	XEVT0	McBSP0 transmit event
13	REVT0	McBSP0 receive event
14	XEVT1	McBSP1 transmit event
15	REVT1	McBSP1 receive event
16–18	–	None
19	TINT2	Timer 2 interrupt
20–47	–	None
48	GPINT8	GPIO event 8
49	GPINT9	GPIO event 9
50	GPINT10	GPIO event 10
51	GPINT11	GPIO event 11
52	GPINT12	GPIO event 12
53	GPINT13	GPIO event 13
54	GPINT14	GPIO event 14
55	GPINT15	GPIO event 15
56–63	–	None

† In addition to the events shown in this table, each of the 64 channels can also be synchronized with the transfer completion or alternate transfer completion events. For more detailed information on EDMA event-transfer chaining, see the *TMS320C6000 DSP Enhanced Direct Memory Access (EDMA) Controller Reference Guide* (literature number SPRU234).

interrupt sources and interrupt selector

The C64x DSP core supports 16 prioritized interrupts, which are listed in Table 19. The highest-priority interrupt is INT_00 (dedicated to RESET) while the lowest-priority interrupt is INT_15. The first four interrupts (INT_00–INT_03) are non-maskable and fixed. The remaining interrupts (INT_04–INT_15) are maskable and default to the interrupt source specified in Table 19. The interrupt source for interrupts 4–15 can be programmed by modifying the selector value (binary value) in the corresponding fields of the Interrupt Selector Control registers: MUXH (address 0x019C0000) and MUXL (address 0x019C0004).

Table 19. C6411 DSP Interrupts

CPU INTERRUPT NUMBER	INTERRUPT SELECTOR CONTROL REGISTER	SELECTOR VALUE (BINARY)	INTERRUPT EVENT	INTERRUPT SOURCE
INT_00†	–	–	RESET	
INT_01†	–	–	NMI

INT_04‡	MUXL[4:0]	00100	GPINT4/EXT_INT4	GPIO interrupt 4/External interrupt pin 4
INT_05‡	MUXL[9:5]	00101	GPINT5/EXT_INT5	GPIO interrupt 5/External interrupt pin 5
INT_06‡	MUXL[14:10]	00110	GPINT6/EXT_INT6	GPIO interrupt 6/External interrupt pin 6
INT_07‡	MUXL[20:16]	00111	GPINT7/EXT_INT7	GPIO interrupt 7/External interrupt pin 7
INT_08‡	MUXL[25:21]	01000	EDMA_INT	EDMA channel (0 through 63) interrupt
INT_09‡	MUXL[30:26]	01001	EMU_DTDMA	EMU DTDMA
INT_10‡	MUXH[4:0]	00011	SD_INT	EMIF SDRAM timer interrupt
INT_11‡	MUXH[9:5]	01010	EMU_RTDXR	EMU real-time data exchange (RTDX) receive
INT_12‡	MUXH[14:10]	01011	EMU_RTDXT	EMU RTDX transmit
INT_13‡	MUXH[20:16]	00000	DSP_INT	HPI/PCI-to-DSP interrupt
INT_14‡	MUXH[25:21]	00001	TINT0	Timer 0 interrupt
INT_15‡	MUXH[30:26]	00010	TINT1	Timer 1 interrupt
–	–	01100	XINT0	McBSP0 transmit interrupt
–	–	01101	RINT0	McBSP0 receive interrupt
–	–	01110	XINT1	McBSP1 transmit interrupt
–	–	01111	RINT1	McBSP1 receive interrupt
–	–	10000	GPINT0	GPIO interrupt 0
–	–	10001	Reserved	Reserved. Do not use.
–	–	10010	Reserved	Reserved. Do not use.
–	–	10011	TINT2	Timer 2 interrupt
–	–	10100 – 11111	Reserved	Reserved. Do not use.

† Interrupts INT_00 through INT_03 are non-maskable and fixed.

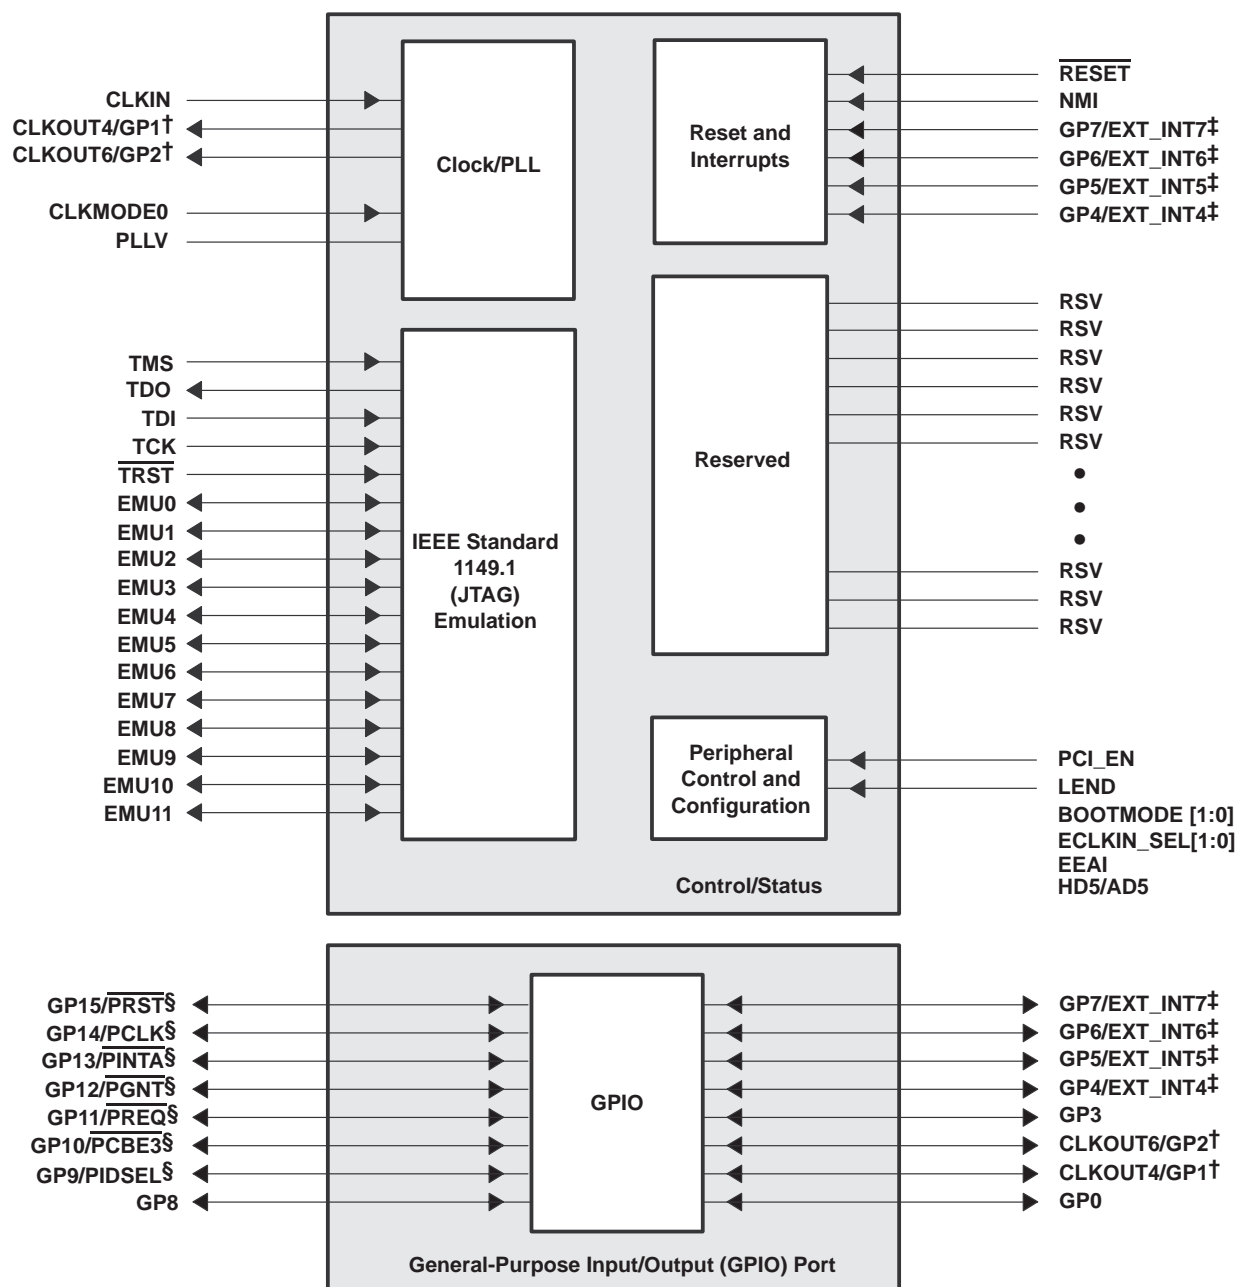

‡ Interrupts INT_04 through INT_15 are programmable by modifying the binary selector values in the Interrupt Selector Control registers fields. Table 19 shows the default interrupt sources for Interrupts INT_04 through INT_15. For more detailed information on interrupt sources and selection, see the *TMS320C6000 DSP Interrupt Selector Reference Guide* (literature number SPRU646).

TMS320C6411

FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS196H – MARCH 2002 – REVISED JULY 2004

signal groups description

† These pins are muxed with the GPIO port pins and by default these signals function as clocks (CLKOUT4 or CLKOUT6). To use these muxed pins as GPIO signals, the appropriate GPIO register bits (GPxEN and GPxDIR) must be properly enabled and configured. For more details, see the Device Configurations section of this data sheet.

‡ These pins are GPIO pins that can also function as external interrupt sources (EXT_INT[7:4]). Default after reset is EXT_INTx or GPIO as input-only.

§ These GPIO pins are muxed with the PCI peripheral pins and by default these signals are set up to no function with both the GPIO and PCI pin functions *disabled*. For more details on these muxed pins, see the Device Configurations section of this data sheet.

TMS320C6411

FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS196H – MARCH 2002 – REVISED JULY 2004

DEVICE CONFIGURATIONS

The C6411 peripheral selections and other device configurations are determined by external pullup/pulldown resistors on the following pins (all of which are latched during device reset):

- peripherals selection
 - PCI_EN
- other device configurations
 - LEND
 - BOOTMODE [1:0]
 - ECLKIN_SEL[1:0]
 - EEAI
 - HD5/AD5

peripherals selection

Some C6411 peripherals share the same pins (internally muxed) and are mutually exclusive (i.e., HPI, general-purpose input/output pins GP[15:9], and PCI). Other C6411 peripherals (i.e., EMIF, three Timers, two McBSPs, and the GP[8:0] pins), are always available.

- HPI/GP[15:9] versus PCI

The PCI_EN pin is latched at reset. This pin determines the HPI/GP[15:9] versus the PCI peripheral selection, summarized in Table 20.

DEVICE CONFIGURATIONS (CONTINUED)

Table 20. PCI_EN Peripheral Selection (HPI/GP[15:9] or PCI)

PCI_EN Pin [AA4] [†]	PERIPHERALS SELECTED			
	HPI	GP[15:9]	PCI	DESCRIPTION
0	√	√		<p>[default] HPI is enabled, GP[15:9] pins can be programmed as GPIO, PCI is disabled.</p> <p>This means all multiplexed HPI/PCI pins function as HPI and all standalone PCI pins (PCBE0, XSP_DO, XSP_DI, XSP_CLK, and XSP_CS) are tied-off (Hi-Z). Also, the multiplexed GPIO/PCI pins can be used as GPIO with the proper software configuration of the GPIO enable (GPxEN) and direction (GPxDIR) registers (for more details, see Table 22).</p>
1			√	<p>PCI is enabled, HPI/GP[15:9] are disabled.</p> <p>This means all multiplexed HPI/PCI pins function as PCI. Also, the multiplexed GPIO/PCI pins function as PCI pins (for more details, see Table 22).</p> <p>Auto-initialization through PCI EEPROM or initialization via specified PCI default values is controlled by the EEAI pin, see Table 21.</p>

[†] The PCI_EN pin is latched at reset and *must* be driven valid at all times and the user *must not* switch values throughout device operation.

other device configurations

Table 21 describes the C6411 device configuration pins, which are set up via external pullup/pulldown resistors through the specified pins. For more details on these device configuration pins, see the Terminal Functions table and the Debugging Considerations section.

TMS320C6411

FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS196H – MARCH 2002 – REVISED JULY 2004

DEVICE CONFIGURATIONS (CONTINUED)

Table 21. Device Configuration Pins (LEND, BOOTMODE[1:0], ECLKIN_SEL[1:0], EEAI, and HD5/AD5)

CONFIGURATION PIN	NO.	FUNCTIONAL DESCRIPTION
LEND	E16	Device Endian mode (LEND) 0 – System operates in Big Endian mode 1 – System operates in Little Endian mode (default)
BOOTMODE[1:0]	[D18, C18]	Bootmode [1:0]. Default is reserved. External pullup and/or pulldown resistors must be used to select a valid bootmode configuration. 00 – No boot 01 – HPI boot 10 – Reserved 11 – EMIF 8-bit ROM boot with default timings (default mode)
ECLKIN_SEL[1:0]	[B18, A18]	EMIF input clock select Clock mode select for EMIF (ECLKIN_SEL[1:0]) 00 – ECLKIN (default mode) 01 – CPU/4 Clock Rate 10 – CPU/6 Clock Rate 11 – Reserved
EEAI	B17	PCI EEPROM Auto-Initialization (EEAI) PCI auto-initialization via external EEPROM 0 – PCI auto-initialization through EEPROM is disabled; the PCI peripheral uses the specified PCI default values (default). 1 – PCI auto-initialization through EEPROM is enabled; the PCI peripheral is configured through EEPROM provided the PCI peripheral pin is enabled (PCI_EN = 1). Note: If the PCI peripheral is disabled (PCI_EN pin = 0), this pin must not be pulled up. For more information on the PCI EEPROM default values, see the <i>TMS320C6000 DSP Peripheral Component Interconnect (PCI) Reference Guide</i> (literature number SPRU581).
HD5/AD5	Y1	HPI configuration bus width (HPI_WIDTH) 0 – HPI operates as an HPI16. (HPI bus is 16 bits wide. HD[15:0] pins are used and the remaining HD[31:16] pins are reserved pins in the Hi-Z state.) 1 – HPI operates as an HPI32. (HPI bus is 32 bits wide. All HD[31:0] pins are used for host-port operations.)

DEVICE CONFIGURATIONS (CONTINUED)

multiplexed pins

Multiplexed pins are pins that are shared by more than one peripheral and are internally multiplexed. Some of these pins are configured by software, and the others are configured by external pullup/pulldown resistors only at reset. Those muxed pins that are configured by software can be programmed to switch functionalities at any time. Those muxed pins that are configured by external pullup/pulldown resistors are mutually exclusive; only one peripheral has primary control of the function of these pins after reset. Table 22 identifies the multiplexed pins on the C6411 device; shows the default (primary) function and the default settings after reset; and describes the pins, registers, etc. necessary to configure specific multiplexed functions.

debugging considerations

It is recommended that external connections be provided to device configuration pins, including CLKMODE0, LEND, BOOTMODE[1:0], ECLKIN_SEL[1:0], EEAI, HD5/AD5, and PCI_EN. Although internal pullup/pulldown resistors exist on these pins, providing external connectivity adds convenience to the user in debugging and flexibility in switching operating modes.

Internal pullup/pulldown resistors also exist on specified reserved (RSV) pins. Do not oppose the internal pullup/pulldown resistors, unless otherwise noted, on these RSV pins.

For the internal pullup/pulldown resistors for all device pins, see the terminal functions table.

TMS320C6411

FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS196H – MARCH 2002 – REVISED JULY 2004

DEVICE CONFIGURATIONS (CONTINUED)

Table 22. C6411 Device Multiplexed Pins†

MULTIPLEXED PINS NAME NO.		DEFAULT FUNCTION	DEFAULT SETTING	DESCRIPTION
CLKOUT4/GP1	AE6	CLKOUT4	GP1EN = 0 (disabled)	These pins are software-configurable. To use these pins as GPIO pins, the GPxEN bits in the GPIO Enable Register and the GPxDIR bits in the GPIO Direction Register must be properly configured. GPxEN = 1: GPx pin enabled GPxDIR = 0: GPx pin is an input GPxDIR = 1: GPx pin is an output
CLKOUT6/GP2	AD6	CLKOUT6	GP2EN = 0 (disabled)	
GP9/PIDSEL	M3	None	GPxEN = 0 (disabled) PCI_EN = 0 (disabled)†	To use GP[15:9] as GPIO pins, the PCI needs to be disabled (PCI_EN = 0), the GPxEN bits in the GPIO Enable Register and the GPxDIR bits in the GPIO Direction Register must be properly configured. GPxEN = 1: GPx pin enabled GPxDIR = 0: GPx pin is an input GPxDIR = 1: GPx pin is an output
GP10/PCBE3	L2			
GP11/PREQ	F1			
GP12/PGNT	J3			
GP13/PINTA	G4			
GP14/PCLK	F2			
GP15/PRST	G3			
HD[31:0]/AD[31:0]	‡	HD[31:0]	PCI_EN = 0 (disabled)†	By default, HPI is enabled upon reset (PCI is disabled). To enable the PCI peripheral an external pullup resistor (1 kΩ) must be provided on the PCI_EN pin (setting PCI_EN = 1 at reset and keeping valid “1” after reset).
HAS/PPAR	T3	HAS

FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS196H – MARCH 2002 – REVISED JULY 2004

development support

TI offers an extensive line of development tools for the TMS320C6000™ DSP platform, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules.

The following products support development of C6000™ DSP-based applications:

Software Development Tools:

Code Composer Studio™ Integrated Development Environment (IDE): including Editor

C/C++/Assembly Code Generation, and Debug plus additional development tools

Scalable, Real-Time Foundation Software (DSP BIOS), which provides the basic run-time target software needed to support any DSP application.

Hardware Development Tools:

Extended Development System (XDS™) Emulator (supports C6000™ DSP multiprocessor system debug)
EVM (Evaluation Module)

The *TMS320 DSP Development Support Reference Guide* (SPRU011) contains information about development-support products for all TMS320™ DSP family member devices, including documentation. See this document for further information on TMS320™ DSP documentation or any TMS320™ DSP support products from Texas Instruments. An additional document, the *TMS320 Third-Party Support Reference Guide* (SPRU052), contains information about TMS320™ DSP-related products from other companies in the industry. To receive TMS320™ DSP literature, contact the Literature Response Center at 800/477-8924.

For a complete listing of development-support tools for the TMS320C6000™ DSP platform, visit the Texas Instruments web site on the Worldwide Web at <http://www.ti.com> uniform resource locator (URL). For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

Code Composer Studio, XDS, and TMS320 are trademarks of Texas Instruments.

device support

device and development-support tool nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all TMS320™ DSP devices and support tools. Each TMS320™ DSP commercial family member has one of three prefixes: TMX, TMP, or TMS. Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMX/TMDX) through fully qualified production devices/tools (TMS/TMDS).

Device development evolutionary flow:

TMX	Experimental device that is not necessarily representative of the final device's electrical specifications
TMP	Final silicon die that conforms to the device's electrical specifications but has not completed quality and reliability verification
TMS	Fully qualified production device

Support tool development evolutionary flow:

TMDX	Development-support product that has not yet completed Texas Instruments internal qualification testing.
TMDS	Fully qualified development-support product

TMX and TMP devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

TMS devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (TMX or TMP) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, GLZ) and the temperature range (for example, blank is the default commercial temperature range). Figure 5 provides a legend for reading the complete device name for any TMS320C6000™ DSP platform member.

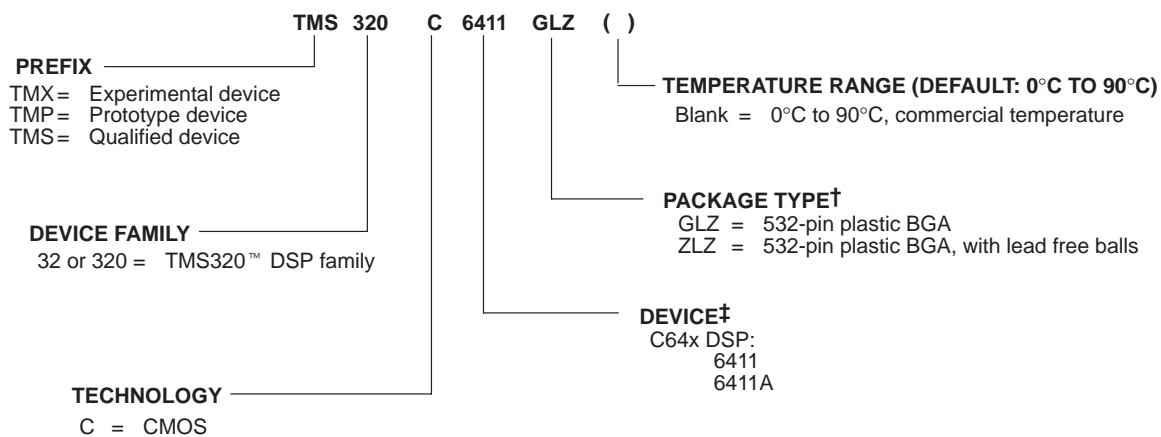

The ZLZ package, like the GLZ package, is a 532-pin plastic BGA *only* with lead-free balls. The ZLZ package type is available upon request. For device part numbers and further ordering information for TMS320C6411 in the GLZ and ZLZ package types, see the TI website (<http://www.ti.com>) or contact your TI sales representative.

documentation support

Extensive documentation supports all TMS320™ DSP family generations of devices from product announcement through applications development. The types of documentation available include: data sheets, such as this document, with design specifications; complete user's reference guides for all devices and tools; technical briefs; development-support tools; on-line help; and hardware and software applications. The following is a brief, descriptive list of support documentation specific to the C6000™ DSP devices:

The *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189) describes the C6000™ DSP CPU (core) architecture, instruction set, pipeline, and associated interrupts.

The *TMS320C6000 DSP Peripherals Overview Reference Guide* (literature number SPRU190) provides an overview and briefly describes the functionality of the peripherals available on the C6000™ DSP platform of devices. This document also includes a table listing the peripherals available on the C6000 devices along with literature numbers and hyperlinks to the associated peripheral documents.

The *TMS320C64x Technical Overview* (literature number SPRU395) gives an introduction to the C64x™ digital signal processor, and discusses the application areas that are enhanced by the C64x™ DSP Velocity™ VLIW architecture.

The *TMS320C6414, TMS320C6415, and TMS320C6416 Fixed-Point Digital Signal Processors* data sheet (literature number SPRS146) describes the features of the TMS320C6414, TMS320C6415, and TMS320C6416 DSP devices and provides pinouts, electrical specifications, and timings.

The *TMS320C6414, TMS320C6415, and TMS320C6416 Digital Signal Processors Silicon Errata* (literature number SPRZ011) describes the known exceptions to the functional specifications for the TMS320C6414, TMS320C6415, and TMS320C6416 DSP devices.

The *TMS320C6411 Digital Signal Processor Silicon Errata* (literature number SPRZ194) describes the known exceptions to the functional specifications for particular silicon revisions of the TMS320C6411 device.

The *Using IBIS Models for Timing Analysis* application report (literature number SPRA839) describes how to properly use IBIS models to attain accurate timing analysis for a given system.

For more detailed information on the device compatibility and similarities/differences among the C6211, C6411, C6414, C6415, and C6416 devices, see the *How To Begin Development Today With the TMS320C6414, TMS320C6415, and TMS320C6416 DSPs* application report (literature number SPRA718) and *How To Begin Development Today With the TMS320C6411 DSP* application report (literature number SPRA374).

The tools support documentation is electronically available within the Code Composer Studio™ Integrated Development Environment (IDE). For a complete listing of C6000™ DSP latest documentation, visit the Texas Instruments web site on the Worldwide Web at <http://www.ti.com> uniform resource locator (URL).

TMS320C6411

FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS196H – MARCH 2002 – REVISED JULY 2004

clock PLL

Most of the internal C64x™ DSP clocks are generated from a single source through the CLKIN pin. This source clock either drives the PLL, which multiplies the source clock frequency to generate the internal CPU clock, or bypasses the PLL to become the internal CPU clock.

To use the PLL to generate the CPU clock, the external PLL filter circuit must be properly designed. Figure 6 shows the external PLL circuitry for either x1 (PLL bypass) or other PLL multiply modes.

To minimize the clock jitter, a single clean power supply should power both the C64x™ DSP device and the external clock oscillator circuit. The minimum CLKIN rise and fall times should also be observed. For the input clock timing requirements, see the *input and output clocks* electricals section.

Rise/fall times, duty cycles (high/low pulse durations), and the load capacitance of the external clock source must meet the DSP requirements in this data sheet (see the *electrical characteristics over recommended ranges of supply voltage and operating case temperature* table and the *input and output clocks* electricals section). Table 23 lists some examples of compatible CLKIN external clock sources:

Table 23. Compatible CLKIN External Clock Sources

NOTES:

- A. Place all PLL external components (C1, C2, and the EMI Filter) as close to the C6000™ DSP device as possible. For the best performance, TI recommends that all the PLL external components be on a single side of the board without jumpers, switches, or components other than the ones shown.
- B. For reduced PLL jitter, maximize the spacing between switching signals and the PLL external components (C1, C2, and the EMI Filter).
- C. The 3.3-V supply for the EMI filter must be from the same 3.3-V power plane supplying the I/O voltage, DV_{DD}.
- D. EMI filter manufacturer TDK part number ACF451832-333, -223, -153, -103. Panasonic part number EXCCET103U.

Table 24. TMS320C6411 PLL Multiply Factor Options, Clock Frequency Ranges, and Typical Lock Time††

GLZ and ZLZ PACKAGE – 23 x 23 mm BGA						
CLKMODE0	CLKMODE (PLL MULTIPLY FACTORS)	CLKIN RANGE (MHz)	CPU CLOCK FREQUENCY RANGE (MHz)	CLKOUT4 RANGE (MHz)	CLKOUT6 RANGE (MHz)	TYPICAL LOCK TIME (μs)§
0	Bypass (x1) [default]	30–75.75	30–75.75	7.5–18.93	5–12.62	N/A
1	x6	30–50.5	180–303	45–75.75	30–50.5	75

§ Under some operating conditions, the maximum PLL lock time may vary by as much as 150% from the specified typical value. For example, if the typical lock time is specified as 100 μ s, the maximum value may be as long as 250 μ s.

TMS320C6411

FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS196H – MARCH 2002 – REVISED JULY 2004

general-purpose input/output (GPIO)

To use the GP[15:0] software-configurable GPIO pins, the GPxEN bits in the GP Enable (GPEN) Register and the GPxDIR bits in the GP Direction (GPDIR) Register must be properly configured.

GPxEN = 1 GP[x] pin is enabled

GPxDIR = 0 GP[x] pin is an input

GPxDIR = 1 GP[x] pin is an output

where “x” represents one of the 15 through 0 GPIO pins

Figure 7 shows the GPIO enable bits in the GPEN register for the C6411 device. To use any of the GPx pins as general-purpose input/output functions, the corresponding GPxEN bit must be set to “1” (enabled). Default values are device-specific, so refer to Figure 7 for the C6411 default configuration.

Legend: R/W = Readable/Writeable; -n = value after reset, -x = undefined value after reset

Figure 7. GPIO Enable Register (GPEN) [Hex Address: 01B0 0000]

Figure 8 shows the GPIO direction bits in the GPDIR register. This register determines if a given GPIO pin is an input or an output providing the corresponding GPxEN bit is enabled (set to “1”) in the GPEN register. By default, all the GPIO pins are configured as input pins.

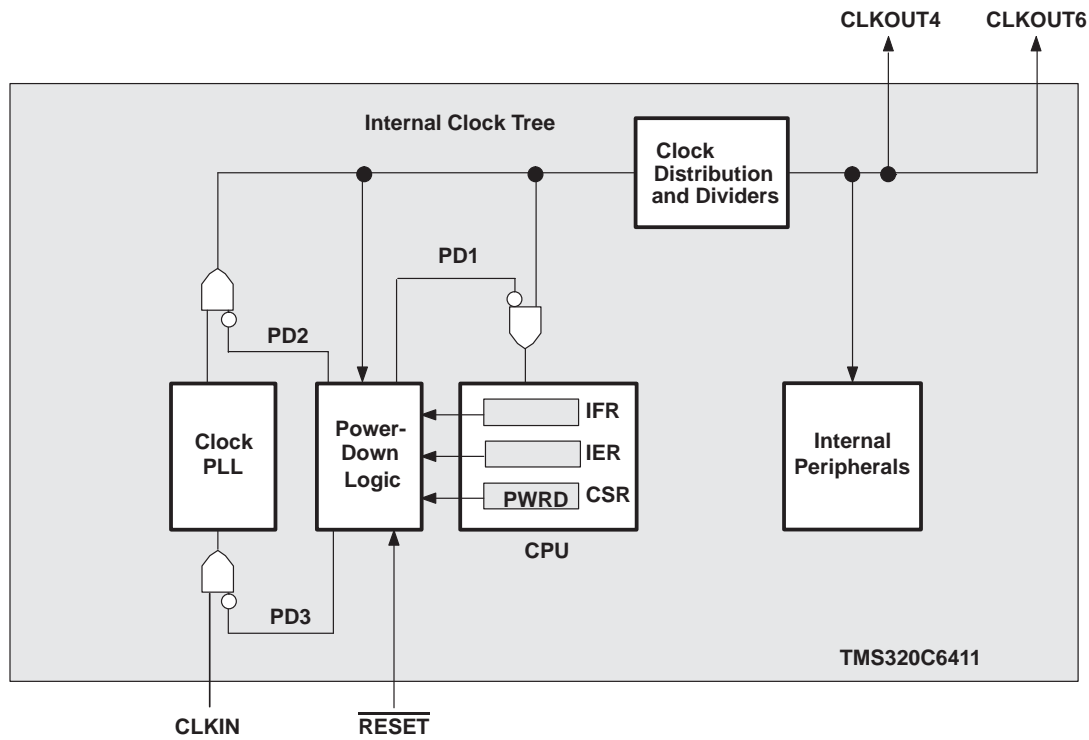

Legend: R/W = Readable/Writeable; -n = value after reset, -x = undefined value after reset

Figure 8. GPIO Direction Register (GPDIR) [Hex Address: 01B0 0004]

For more detailed information on general-purpose inputs/outputs (GPIOs), see the *TMS320C6000 DSP General-Purpose Input/Output (GPIO) Reference Guide* (literature number SPRU584).

power-down mode logic

Figure 9 shows the power-down mode logic on the C6411.

† External input clocks, with the exception of CLKIN, are *not* gated by the power-down mode logic.

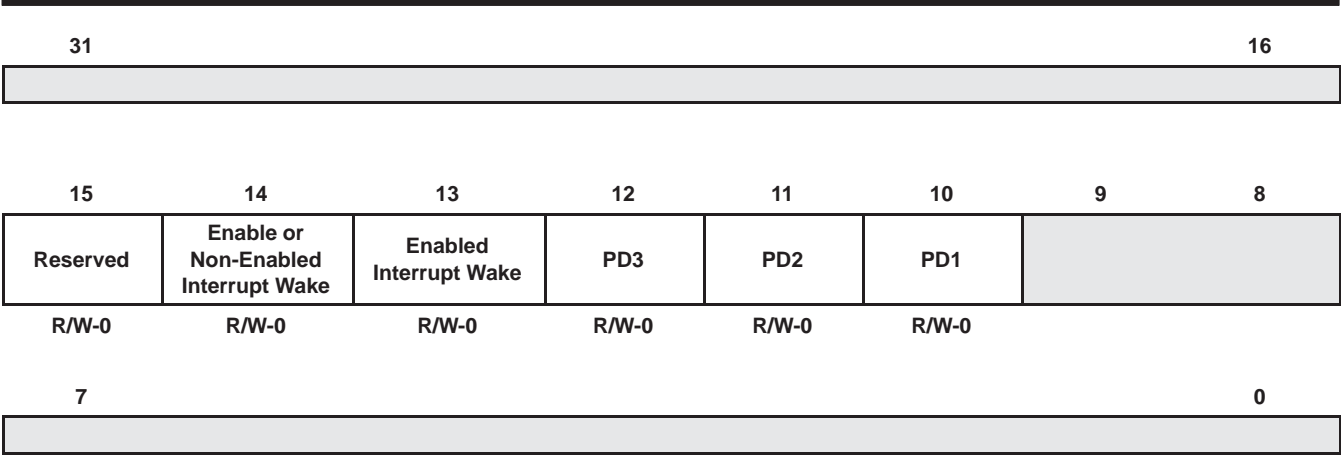

Figure 9. Power-Down Mode Logic†

triggering, wake-up, and effects

The power-down modes and their wake-up methods are programmed by setting the PWRD field (bits 15–10) of the control status register (CSR). The PWRD field of the CSR is shown in Figure 10 and described in Table 25. When writing to the CSR, all bits of the PWRD field should be set at the same time. Logic 0 should be used when writing to the reserved bit (bit 15) of the PWRD field. The CSR is discussed in detail in the *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189).

TMS320C6411
FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS196H – MARCH 2002 – REVISED JULY 2004

Legend: R/W-x = Read/write reset value
NOTE: The shadowed bits are not part of the power-down logic discussion and therefore are not covered here. For information on these other bit fields in the CSR register, see the *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189).

Figure 10. PWRD Field of the CSR Register

A delay of up to nine clock cycles may occur after the instruction that sets the PWRD bits in the CSR before the PD mode takes effect. As best practice, NOPs should be padded after the PWRD bits are set in the CSR to account for this delay.

If PD1 mode is terminated by a non-enabled interrupt, the program execution returns to the instruction where PD1 took effect. If PD1 mode is terminated by an enabled interrupt, the interrupt service routine will be executed first, then the program execution returns to the instruction where PD1 took effect. In the case with an enabled interrupt, the GIE bit in the CSR and the NMIE bit in the interrupt enable register (IER) must also be set in order for the interrupt service routine to execute; otherwise, execution returns to the instruction where PD1 took effect upon PD1 mode termination by an enabled interrupt.

PD2 and PD3 modes can only be aborted by device reset. Table 25 summarizes all the power-down modes.

Table 25. Characteristics of the Power-Down Modes

PRWD FIELD (BITS 15–10)	POWER-DOWN MODE	WAKE-UP METHOD	EFFECT ON CHIP'S OPERATION
000000	No power-down	—	—
001001	PD1	Wake by an enabled interrupt	CPU halted (except for the interrupt logic) Power-down mode blocks the internal clock inputs at the boundary of the CPU, preventing most of the CPU's logic from switching. During PD1, EDMA transactions can proceed between peripherals and internal memory.
010001	PD1	Wake by an enabled or non-enabled interrupt	
011010	PD2 [†]	Wake by a device reset	Output clock from PLL is halted, stopping the internal clock structure from switching and resulting in the entire chip being halted. All register and internal RAM contents are preserved. All functional I/O "freeze" in the last state when the PLL clock is turned off.
011100	PD3 [†]	Wake by a device reset	Input clock to the PLL stops generating clocks. All register and internal RAM contents are preserved. All functional I/O "freeze" in the last state when the PLL clock is turned off. Following reset, the PLL needs time to re-lock, just as it does following power-up. Wake-up from PD3 takes longer than wake-up from PD2 because the PLL needs to be re-locked, just as it does following power-up.
All others	Reserved	—	—

[†] When entering PD2 and PD3, all functional I/O remains in the previous state. However, for peripherals which are asynchronous in nature or peripherals with an external clock source, output signals may transition in response to stimulus on the inputs. Under these conditions, peripherals will not operate according to specifications.

C64x power-down mode with an emulator

If user power-down modes are programmed, and an emulator is attached, the modes will be masked to allow the emulator access to the system. This condition prevails until the emulator is reset or the cable is removed from the header. If power measurements are to be performed when in a power-down mode, the emulator cable should be removed.

When the DSP is in power-down mode PD2 or PD3, emulation logic will force any emulation execution command (such as Step or Run) to spin in IDLE. For this reason, PC writes (such as loading code) will fail. A DSP reset will be required to get the DSP out of PD2/PD3.

power-supply sequencing

TI DSPs do not require specific power sequencing between the core supply and the I/O supply. However, systems should be designed to ensure that neither supply is powered up for extended periods of time (>1 second) if the other supply is below the proper operating voltage.

power-supply design considerations

A dual-power supply with simultaneous sequencing can be used to eliminate the delay between core and I/O power up. A Schottky diode can also be used to tie the core rail to the I/O rail (see Figure 11).

TMS320C6411

FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS196H – MARCH 2002 – REVISED JULY 2004

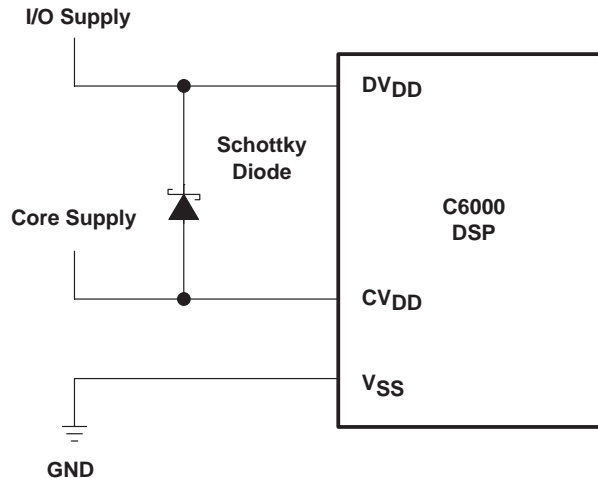

Figure 11. Schottky Diode Diagram

Core and I/O supply voltage regulators should be located close to the DSP (or DSP array) to minimize inductance and resistance in the power delivery path. Additionally, when designing for high-performance applications utilizing the C6000™ platform of DSPs, the PC board should include separate power planes for core, I/O, and ground, all bypassed with high-quality low-ESL/ESR capacitors.

power-supply decoupling

In order to properly decouple the supply planes from system noise, place as many capacitors (caps) as possible close to the DSP. Assuming 0603 caps, the user should be able to fit a total of 60 caps, 30 for the core supply and 30 for the I/O supply. These caps need to be close to the DSP power pins, no more than 1.25 cm maximum distance to be effective. Physically smaller caps, such as 0402, are better because of their lower parasitic inductance. Proper capacitance values are also important. Small bypass caps (near 560 pF) should be closest to the power pins. Medium bypass caps (220 pF or as large as can be obtained in a small package) should be next closest. TI recommends no less than 8 small and 8 medium caps per supply (32 total) be placed immediately next to the BGA vias, using the “interior” BGA space and at least the corners of the “exterior”.

Eight larger caps (4 for each supply) can be placed further away for bulk decoupling. Large bulk caps (on the order of 100 μ F) should be furthest away (but still as close as possible). No less than 4 large caps per supply (8 total) should be placed outside of the BGA.

Any cap selection needs to be evaluated from a yield/manufacturing point-of-view. As with the selection of any component, verification of capacitor availability over the product's production lifetime should be considered.

IEEE 1149.1 JTAG compatibility statement

The TMS320C6411 DSP requires that both $\overline{\text{TRST}}$ and $\overline{\text{RESET}}$ be asserted upon power up to be properly initialized. While $\overline{\text{RESET}}$ initializes the DSP core, $\overline{\text{TRST}}$ initializes the DSP's emulation logic. Both resets are required for proper operation.

Note: $\overline{\text{TRST}}$ is synchronous and **must** be clocked by TCLK; otherwise, BSCAN may not respond as expected after $\overline{\text{TRST}}$ is asserted.

While both $\overline{\text{TRST}}$ and $\overline{\text{RESET}}$ need to be asserted upon power up, only $\overline{\text{RESET}}$ needs to be released for the DSP to boot properly. $\overline{\text{TRST}}$ may be asserted indefinitely for normal operation, keeping the JTAG port interface and DSP's emulation logic in the reset state. $\overline{\text{TRST}}$ only needs to be released when it is necessary to use a JTAG controller to debug the DSP or exercise the DSP's boundary scan functionality. $\overline{\text{RESET}}$ must be released in order for boundary-scan JTAG to read the variant field of IDCODE correctly. Other boundary-scan instructions work correctly independent of current state of $\overline{\text{RESET}}$.

For maximum reliability, the TMS320C6411 DSP includes an internal pulldown (IPD) on the $\overline{\text{TRST}}$ pin to ensure that $\overline{\text{TRST}}$ will always be asserted upon power up and the DSP's internal emulation logic will always be properly initialized. JTAG controllers from Texas Instruments actively drive $\overline{\text{TRST}}$ high. However, some third-party JTAG controllers may not drive $\overline{\text{TRST}}$ high but expect the use of a pullup resistor on $\overline{\text{TRST}}$. When using this type of JTAG controller, assert $\overline{\text{TRST}}$ to initialize the DSP after powerup and externally drive $\overline{\text{TRST}}$ high before attempting any emulation or boundary scan operations.

Following the release of $\overline{\text{RESET}}$, the low-to-high transition of $\overline{\text{TRST}}$ must occur to latch the state of EMU1 and EMU0. The EMU[1:0] pins configure the device for either Boundary Scan mode or Normal/Emulation mode. For more detailed information, see the terminal functions section of this data sheet.

Note: The DESIGN_WARNING section of the TMS320C6411 BSDL file contains information and constraints regarding proper device operation while in Boundary Scan Mode.

EMIF device speed

The rated EMIF speed of this device only applies to the SDRAM interface when in a system that meets the following requirements:

- 1 chip-enable (CE) space (maximum of 2 chips) of SDRAM connected to EMIF
- up to 1 CE space of buffers connected to EMIF
- EMIF trace lengths between 1 and 3 inches
- 143-MHz SDRAM for 75-MHz operation

Other configurations may be possible, but timing analysis must be done to verify all AC timings are met. Verification of AC timings is mandatory when using configurations other than those specified above.

TI recommends utilizing the input/output buffer information specification (IBIS) models to analyze all AC timings. To properly use IBIS models to attain accurate timing analysis for a given system, see the *Using IBIS Models for Timing Analysis* application report (literature number SPRA839).

To maintain signal integrity, serial termination resistors should be inserted into all EMIF output signal lines (see the Terminal Functions table for the EMIF output signals).

TMS320C6411

FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS196H – MARCH 2002 – REVISED JULY 2004

bootmode

The C6411 device resets using the active-low signal $\overline{\text{RESET}}$. While $\overline{\text{RESET}}$ is low, the device is held in reset and is initialized to the prescribed reset state. Refer to reset timing for reset timing characteristics and states of device pins during reset. The release of $\overline{\text{RESET}}$ starts the processor running with the prescribed device configuration and boot mode.

The C6411 has three types of boot modes:

- Host boot

If host boot is selected, upon release of $\overline{\text{RESET}}$, the CPU is internally “stalled” while the remainder of the device is released. During this period, an external host can initialize the CPU’s memory space as necessary through the host interface, including internal configuration registers, such as those that control the EMIF or other peripherals. For the C6411 device, the HPI peripheral is used for host boot if $\text{PCI_EN} = 0$, and the PCI peripheral is used if $\text{PCI_EN} = 1$. Once the host is finished with all necessary initialization, it must set the DSPINT bit in the HPIC register to complete the boot process. This transition causes the boot configuration logic to bring the CPU out of the “stalled” state. The CPU then begins execution from address 0. The DSPINT condition is not latched by the CPU, because it occurs while the CPU is still internally “stalled”. Also, DSPINT brings the CPU out of the “stalled” state only if the host boot process is selected. All memory may be written to and read by the host. This allows for the host to verify what it sends to the DSP if required. After the CPU is out of the “stalled” state, the CPU needs to clear the DSPINT, otherwise, no more DSPINTs can be received.

- EMIF boot (using default ROM timings)

Upon the release of $\overline{\text{RESET}}$, the 1K-Byte ROM code located in the beginning of $\overline{\text{CE1}}$ is copied to address 0 by the EDMA using the default ROM timings, while the CPU is internally “stalled”. The data should be stored in the endian format that the system is using. In this case, the EMIF automatically assembles consecutive 8-bit bytes to form the 32-bit instruction words to be copied. The transfer is automatically done by the EDMA as a single-frame block transfer from the ROM to address 0. After completion of the block transfer, the CPU is released from the “stalled” state and starts running from address 0.

- No boot

With no boot, the CPU begins direct execution from the memory located at address 0. Note: operation is undefined if invalid code is located at address 0.

reset

A hardware reset ($\overline{\text{RESET}}$) is required to place the DSP into a known good state out of power-up. The $\overline{\text{RESET}}$ signal can be asserted (pulled low) prior to ramping the core and I/O voltages or after the core and I/O voltages have reached their proper operating conditions. As a best practice, reset should be held low during power-up. Prior to deasserting $\overline{\text{RESET}}$ (low-to-high transition), the core and I/O voltages should be at their proper operating conditions and CLKIN should also be running at the correct frequency.

absolute maximum ratings over operating case temperature range (unless otherwise noted)[†]

Supply voltage ranges:	CV _{DD} (see Note 1)	– 0.3 V to 1.8 V
	DV _{DD} (see Note 1)	–0.3 V to 4 V
Input voltage ranges:	(except PCI), V _I	–0.3 V to 4 V
	(PCI), V _{IP}	–0.5 V to DV _{DD} + 0.5 V
Output voltage ranges:	(except PCI), V _O	–0.3 V to 4 V
	(PCI), V _{OP}	–0.5 V to DV _{DD} + 0.5 V
Operating case temperature range, T _C		0°C to 90°C
Storage temperature range, T _{stg}		–65°C to 150°C

[†] Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 1: All voltage values are with respect to V_{SS}.

recommended operating conditions

	MIN	NOM	MAX	UNIT
CV _{DD} Supply voltage, Core [‡]	1.14	1.2	1.26	V
DV _{DD} Supply voltage, I/O	3.14	3.3	3.46	V
V _{SS} Supply ground	0	0	0	V
V _{IH} High-level input voltage (except PCI)	2			V
V _{IL} Low-level input voltage (except PCI)			0.8	V
V _{IP} Input voltage (PCI)	–0.5		DV _{DD} + 0.5	V
V _{IHP} High-level input voltage (PCI)	0.5DV _{DD}		DV _{DD} + 0.5	V
V _{ILP} Low-level input voltage (PCI)	–0.5		0.3DV _{DD}	V
V _{OS} Maximum voltage during overshoot/undershoot	–1.0§		4.3§	V
T _C Operating case temperature	0		90	°C

[‡] Future variants of the C6411 DSP may operate at voltages ranging from 0.9 V to 1.4 V to provide a range of system power/performance options. TI highly recommends that users design-in a supply that can handle multiple voltages within this range (i.e., 1.2 V, 1.25 V, 1.3 V, 1.35 V, 1.4 V with ± 3% tolerances) by implementing simple board changes such as reference resistor values or input pin configuration modifications. Examples of such supplies include the PT4660, PT5500, PT5520, PT6440, and PT6930 series from Power Trends, a subsidiary of Texas Instruments. Not incorporating a flexible supply may limit the system’s ability to easily adapt to future versions of C641x devices.

§ The absolute maximum ratings should *not* be exceeded for more than 30% of the cycle period.

C _o Output capacitance				10	pF

[†] For test conditions shown as MIN, MAX, or NOM, use the appropriate value specified in the recommended operating conditions table.

[‡] Applies only to pins with an internal pullup (IPU) or pulldown (IPD) resistor.

[§] PCI input leakage currents include Hi-Z output leakage for all bidirectional buffers with 3-state outputs.

[¶] These rated numbers are from the PCI specification version 2.3. The DC specification and AC specification are defined in Tables 4-3 and 4-4, respectively.

[#] Measured with average activity (50% high/50% low power). The actual current draw is highly application-dependent. For more details on core and I/O activity, refer to the *TMS320C6411 Power Consumption Summary* application report (literature number SPRA373).

recommended clock and control signal transition behavior

All clocks and control signals **must** transition between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}) in a monotonic manner.

PARAMETER MEASUREMENT INFORMATION

NOTE: The data sheet provides timing at the device pin. For output timing analysis, the tester pin electronics and its transmission line effects must be taken into account. A transmission line with a delay of 2 ns or longer can be used to produce the desired transmission line effect. The transmission line is intended as a load only. It is not necessary to add or subtract the transmission line delay (2 ns or longer) from the data sheet timings.

Input requirements in this data sheet are tested with an input slew rate of < 4 Volts per nanosecond (4 V/ns) at the device pin.

Figure 12. Test Load Circuit for AC Timing Measurements

The tester load circuit is for characterization and measurement of AC timing signals. This load does not indicate the maximum load the device is capable of driving.

signal transition levels

All input and output timing parameters are referenced to 1.5 V for both “0” and “1” logic levels.

Figure 13. Input and Output Voltage Reference Levels for AC Timing Measurements

All rise and fall transition timing parameters are referenced to $V_{IL\ MAX}$ and $V_{IH\ MIN}$ for input clocks, $V_{OL\ MAX}$ and $V_{OH\ MIN}$ for output clocks, $V_{ILP\ MAX}$ and $V_{IHP\ MIN}$ for PCI input clocks, and $V_{OLP\ MAX}$ and $V_{OHP\ MIN}$ for PCI output clocks.

Figure 14. Rise and Fall Transition Time Voltage Reference Levels

signal transition rates

All timings are tested with an input edge rate of 4 Volts per nanosecond (4 V/ns).

PARAMETER MEASUREMENT INFORMATION (CONTINUED)

timing parameters and board routing analysis

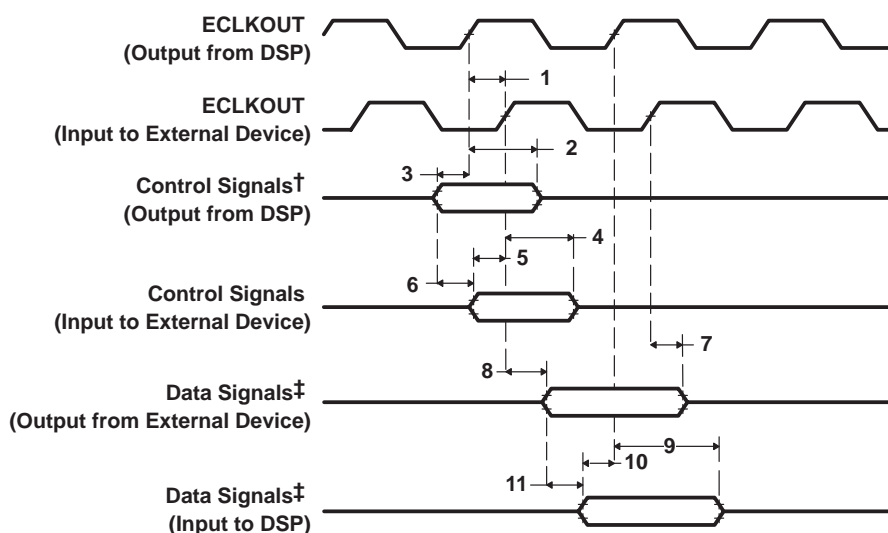

The timing parameter values specified in this data sheet do *not* include delays by board routings. As a good board design practice, such delays must *always* be taken into account. Timing values may be adjusted by increasing/decreasing such delays. TI recommends utilizing the available I/O buffer information specification (IBIS) models to analyze the timing characteristics correctly. To properly use IBIS models to attain accurate timing analysis for a given system, see the *Using IBIS Models for Timing Analysis* application report (literature number SPRA839). If needed, external logic hardware such as buffers may be used to compensate any timing differences.

For inputs, timing is most impacted by the round-trip propagation delay from the DSP to the external device and from the external device to the DSP. This round-trip delay tends to negatively impact the input setup time margin, but also tends to improve the input hold time margins (see Table 26 and Figure 15).

Figure 15 represents a general transfer between the DSP and an external device. The figure also represents board route delays and how they are perceived by the DSP and the external device.

Table 26. Board-Level Timings Example (see Figure 15)

NO.	DESCRIPTION
1	Clock route delay
2	Minimum DSP hold time
3	Minimum DSP setup time
4	External device hold time requirement
5	External device setup time requirement
6	Control signal route delay
7	External device hold time
8	External device access time
9	DSP hold time requirement
10	DSP setup time requirement
11	Data route delay

† Control signals include data for Writes.

‡ Data signals are generated during Reads from an external device.

5	$t_d(EKOxH-EAIV)$ Delay time, ECLKOUTx high to EAx invalid	1.3		ns
8	$t_d(EKOxH-ADSV)$ Delay time, ECLKOUTx high to $\overline{SADS/SRE}$ valid	1.3	9.7	ns
9	$t_d(EKOxH-OEV)$ Delay time, ECLKOUTx high to \overline{SOE} valid	1.3	9.7	ns
10	$t_d(EKOxH-EDV)$ Delay time, ECLKOUTx high to EDx valid		9.7	ns
11	$t_d(EKOxH-EDIV)$ Delay time, ECLKOUTx high to EDx invalid	1.3		ns
12	$t_d(EKOxH-WEV)$ Delay time, ECLKOUTx high to \overline{SWE} valid	1.3	9.7	ns

[†] The following parameters are programmable via the EMIF CE Space Secondary Control register (CExSEC):

- Read latency (SYNCRL): 0-, 1-, 2-, or 3-cycle read latency
- Write latency (SYNCWL): 0-, 1-, 2-, or 3-cycle write latency
- CEx assertion length (CEEXT): For standard SBSRAM or ZBT SRAM interface, \overline{CEx} goes inactive after the final command has been issued (CEEXT = 0). For synchronous FIFO interface with glue, \overline{CEx} is active when \overline{SOE} is active (CEEXT = 1).
- Function of $\overline{SADS/SRE}$ (RENEN): For standard SBSRAM or ZBT SRAM interface, $\overline{SADS/SRE}$ acts as \overline{SADS} with deselect cycles (RENEN = 0). For FIFO interface, $\overline{SADS/SRE}$ acts as \overline{SRE} with NO deselect cycles (RENEN = 1).
- Synchronization clock (SNCCLK): Synchronized to ECLKOUT1 or ECLKOUT2

PROGRAMMABLE SYNCHRONOUS INTERFACE TIMING (CONTINUED)

† The read latency and the length of $\overline{CE_x}$ assertion are programmable via the SYNCRL and CEEXT fields, respectively, in the EMIF CE Space Secondary Control register (CExSEC). In this figure, SYNCRL = 2 and CEEXT = 0.

‡ The following parameters are programmable via the EMIF CE Space Secondary Control register (CExSEC):

- Read latency (SYNCRL): 0-, 1-, 2-, or 3-cycle read latency
- Write latency (SYNCWL): 0-, 1-, 2-, or 3-cycle write latency
- $\overline{CE_x}$ assertion length (CEEXT): For standard SBSRAM or ZBT SRAM interface, $\overline{CE_x}$ goes inactive after the final command has been issued (CEEXT = 0). For synchronous FIFO interface with glue, $\overline{CE_x}$ is active when \overline{SOE} is active (CEEXT = 1).
- Function of SADS/ \overline{SRE} (RENEN): For standard SBSRAM or ZBT SRAM interface, SADS/ \overline{SRE} acts as \overline{SADS} with deselect cycles (RENEN = 0). For FIFO interface, SADS/ \overline{SRE} acts as \overline{SRE} with NO deselect cycles (RENEN = 1).
- Synchronization clock (SNCLK): Synchronized to ECLKOUT1 or ECLKOUT2

§ ARE/SDCAS/SADS/ \overline{SRE} , AOE/SDRAS/ \overline{SOE} , and AWE/SDWE/ \overline{SWE} operate as \overline{SADS} / \overline{SRE} , \overline{SOE} , and \overline{SWE} , respectively, during programmable synchronous interface accesses.

Figure 24. Programmable Synchronous Interface Read Timing (With Read Latency = 2)†‡

PROGRAMMABLE SYNCHRONOUS INTERFACE TIMING (CONTINUED)

† The write latency and the length of $\overline{\text{CEx}}$ assertion are programmable via the SYNCWL and CEEXT fields, respectively, in the EMIF CE Space Secondary Control register (CExSEC). In this figure, SYNCWL = 0 and CEEXT = 0.

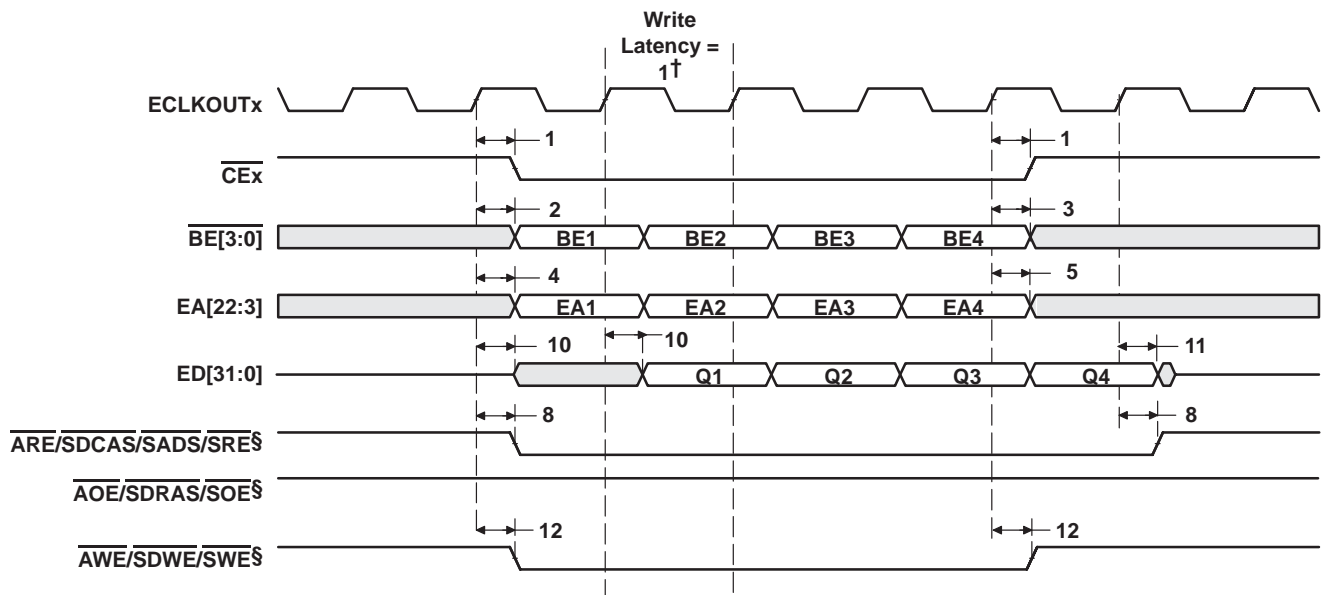

‡ The following parameters are programmable via the EMIF CE Space Secondary Control register (CExSEC):

- Read latency (SYNCRL): 0-, 1-, 2-, or 3-cycle read latency
- Write latency (SYNCWL): 0-, 1-, 2-, or 3-cycle write latency
- $\overline{\text{CEx}}$ assertion length (CEEXT): For standard SBSRAM or ZBT SRAM interface, $\overline{\text{CEx}}$ goes inactive after the final command has been issued (CEEXT = 0). For synchronous FIFO interface with glue, $\overline{\text{CEx}}$ is active when $\overline{\text{SOE}}$ is active (CEEXT = 1).
- Function of $\overline{\text{SADS/SRE}}$ (RENEN): For standard SBSRAM or ZBT SRAM interface, $\overline{\text{SADS/SRE}}$ acts as $\overline{\text{SADS}}$ with deselect cycles (RENEN = 0). For FIFO interface, $\overline{\text{SADS/SRE}}$ acts as $\overline{\text{SRE}}$ with NO deselect cycles (RENEN = 1).
- Synchronization clock (SNCLK): Synchronized to ECLKOUT1 or ECLKOUT2

§ $\overline{\text{ARE/SDCAS/SADS/SRE}}$, $\overline{\text{AOE/SDRAS/SOE}}$, and $\overline{\text{AWE/SDWE/SWE}}$ operate as $\overline{\text{SADS/SRE}}$, $\overline{\text{SOE}}$, and $\overline{\text{SWE}}$, respectively, during programmable synchronous interface accesses.

Figure 25. Programmable Synchronous Interface Write Timing (With Write Latency = 0)†‡

PROGRAMMABLE SYNCHRONOUS INTERFACE TIMING (CONTINUED)

† The write latency and the length of \overline{CEx} assertion are programmable via the SYNCWL and CEEXT fields, respectively, in the EMIF CE Space Secondary Control register (CEXSEC). In this figure, SYNCWL = 1 and CEEXT = 0.

‡ The following parameters are programmable via the EMIF CE Space Secondary Control register (CEXSEC):

- Read latency (SYNCRL): 0-, 1-, 2-, or 3-cycle read latency
- Write latency (SYNCWL): 0-, 1-, 2-, or 3-cycle write latency
- \overline{CEx} assertion length (CEEXT): For standard SBSRAM or ZBT SRAM interface, \overline{CEx} goes inactive after the final command has been issued (CEEXT = 0). For synchronous FIFO interface with glue, \overline{CEx} is active when \overline{SOE} is active (CEEXT = 1).
- Function of SADS/ \overline{SRE} (RENEN): For standard SBSRAM or ZBT SRAM interface, SADS/ \overline{SRE} acts as \overline{SADS} with deselect cycles (RENEN = 0). For FIFO interface, SADS/ \overline{SRE} acts as \overline{SRE} with NO deselect cycles (RENEN = 1).
- Synchronization clock (SNCLK): Synchronized to ECLKOUT1 or ECLKOUT2

§ $\overline{ARE}/\overline{SDCAS}/\overline{SADS}/\overline{SRE}$, $\overline{AOE}/\overline{SDRAS}/\overline{SOE}$, and $\overline{AWE}/\overline{SDWE}/\overline{SWE}$ operate as $\overline{SADS}/\overline{SRE}$, \overline{SOE} , and \overline{SWE} , respectively, during programmable synchronous interface accesses.

13	$t_d(EKO1H-SDCKEV)$ Delay time, ECLKOUTx high to SDCKE valid	1.3	9.7	ns
14	$t_d(EKO1H-PDTV)$ Delay time, ECLKOUTx high to \overline{PDT} valid	1.3	9.7	ns

SYNCHRONOUS DRAM TIMING (CONTINUED)

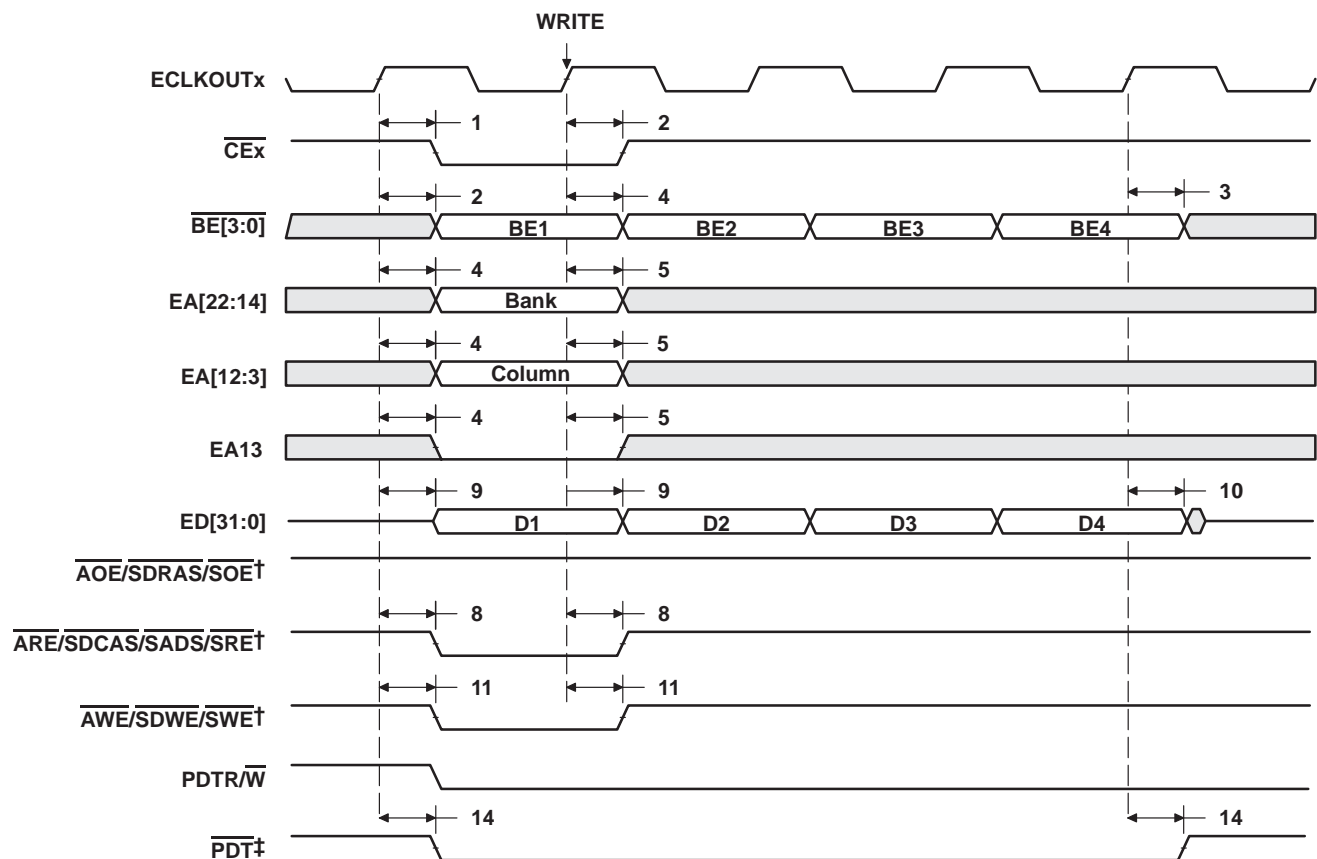

† $\overline{\text{ARE}}/\text{SDCAS}/\text{SADS}/\text{SRE}$, $\overline{\text{AWE}}/\text{SDWE}/\text{SWE}$, and $\overline{\text{AOE}}/\text{SDRAS}/\text{SOE}$ operate as SDCAS , SDWE , and SDRAS , respectively, during SDRAM accesses.

‡ PDT signal is only asserted when the EDMA is in PDT mode (set the PDTS bit to 1 in the EDMA options parameter RAM). For PDT read, data is not latched into EMIF. The PDTRL field in the PDT control register (PDTCTL) configures the latency of the PDT signal with respect to the data phase of a read transaction. The latency of the PDT signal for a read can be programmed to 0, 1, 2, or 3 by setting PDTRL to 00, 01, 10, or 11, respectively. PDTRL equals 00 (zero latency) in Figure 27.

Figure 27. SDRAM Read Command (CAS Latency 3)

SYNCHRONOUS DRAM TIMING (CONTINUED)

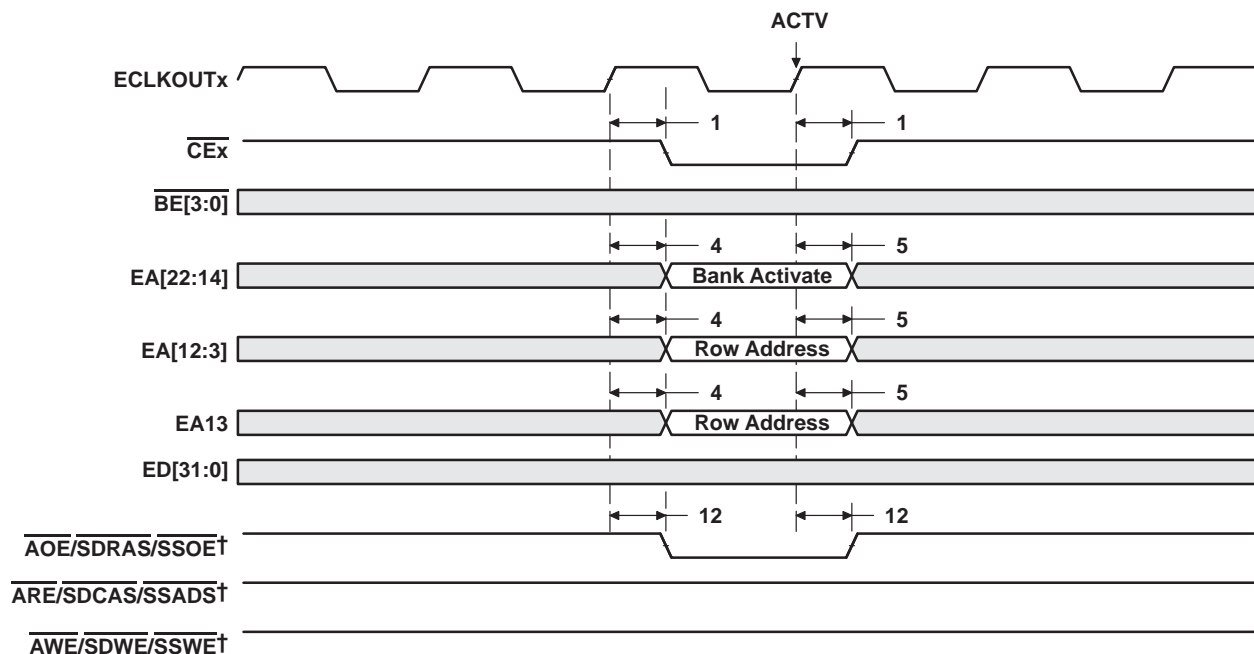

† $\overline{\text{ARE}}/\text{SDCAS}/\text{SADS}/\text{SRE}$, $\overline{\text{AWE}}/\text{SDWE}/\text{SWE}$, and $\overline{\text{AOE}}/\text{SDRAS}/\text{SOE}$ operate as $\overline{\text{SDCAS}}$, $\overline{\text{SDWE}}$, and $\overline{\text{SDRAS}}$, respectively, during SDRAM accesses.

‡ $\overline{\text{PDT}}$ signal is only asserted when the EDMA is in PDT mode (set the PDTD bit to 1 in the EDMA options parameter RAM). For $\overline{\text{PDT}}$ write, data is not driven (in High-Z). The PDTWL field in the PDT control register (PDTCTL) configures the latency of the $\overline{\text{PDT}}$ signal with respect to the data phase of a write transaction. The latency of the $\overline{\text{PDT}}$ signal for a write transaction can be programmed to 0, 1, 2, or 3 by setting PDTWL to 00, 01, 10, or 11, respectively. PDTWL equals 00 (zero latency) in Figure 28.

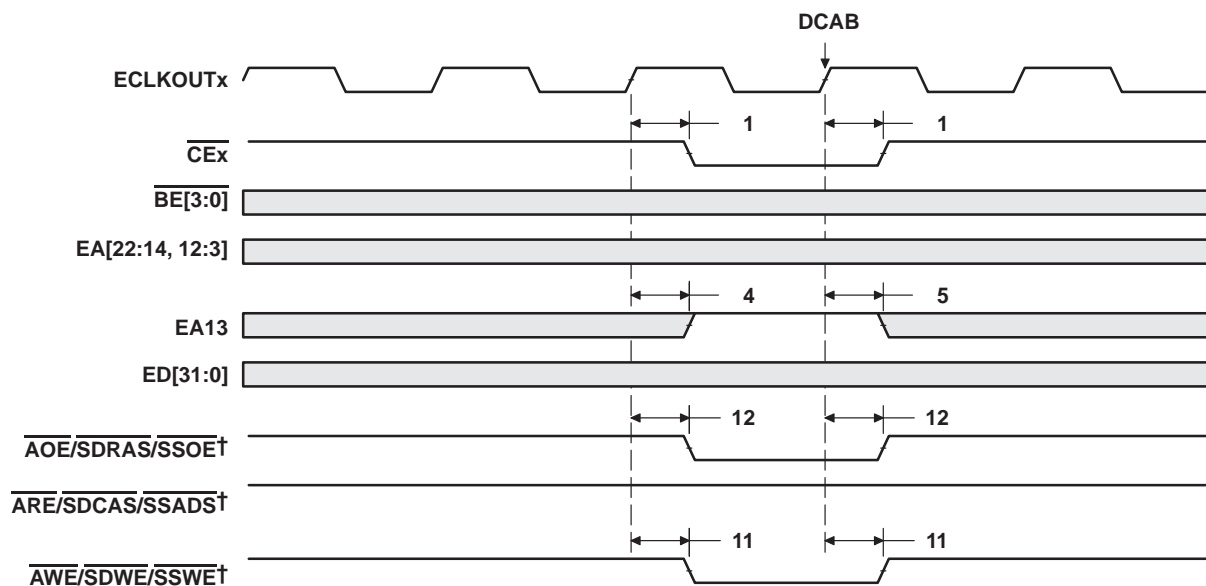

Figure 28. SDRAM Write Command

SYNCHRONOUS DRAM TIMING (CONTINUED)

† $\overline{\text{ARE/SDCAS/SSADS}}$, $\overline{\text{AWE/SDWE/SSWE}}$, and $\overline{\text{AOE/SDRAS/SSOE}}$ operate as $\overline{\text{SDCAS}}$, $\overline{\text{SDWE}}$, and $\overline{\text{SDRAS}}$, respectively, during SDRAM accesses.

Figure 29. SDRAM ACTV Command

† $\overline{\text{ARE/SDCAS/SSADS}}$, $\overline{\text{AWE/SDWE/SSWE}}$, and $\overline{\text{AOE/SDRAS/SSOE}}$ operate as $\overline{\text{SDCAS}}$, $\overline{\text{SDWE}}$, and $\overline{\text{SDRAS}}$, respectively, during SDRAM accesses.

SYNCHRONOUS DRAM TIMING (CONTINUED)

† $\overline{\text{ARE}}/\overline{\text{SDCAS}}/\overline{\text{SADS}}/\overline{\text{SRE}}$, $\overline{\text{AWE}}/\overline{\text{SDWE}}/\overline{\text{SWE}}$, and $\overline{\text{AOE}}/\overline{\text{SDRAS}}/\overline{\text{SOE}}$ operate as $\overline{\text{SDCAS}}$, $\overline{\text{SDWE}}$, and $\overline{\text{SDRAS}}$, respectively, during SDRAM accesses.

Figure 34. SDRAM Self-Refresh Timing

HOLD/HOLDA TIMING

timing requirements for the HOLD/HOLDA cycles[†] (see Figure 35)

NO.		–300		UNIT
		MIN	MAX	
3	$t_h(\text{HOLDAL-HOLDL})$ Hold time, <u>HOLD</u> low after <u>HOLDA</u> low	E		ns

[†] E = the EMIF input clock (ECLKIN, CPU/4 clock, or CPU/6 clock) period in ns.

switching characteristics over recommended operating conditions for the HOLD/HOLDA cycles^{†‡§} (see Figure 35)

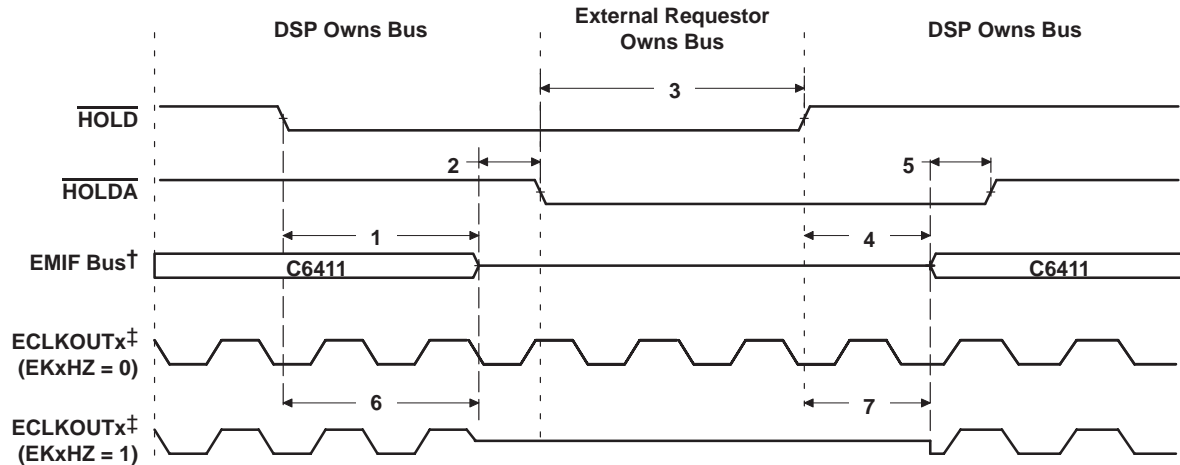

NO.	PARAMETER		–300		UNIT
			MIN	MAX	
1	$t_d(\text{HOLDL-EMHZ})$	Delay time, <u>HOLD</u> low to EMIF Bus high impedance	2E	†	ns
2	$t_d(\text{EMHZ-HOLDAL})$	Delay time, EMIF Bus high impedance to <u>HOLDA</u> low	0	2E	ns
4	$t_d(\text{HOLDH-EMLZ})$	Delay time, <u>HOLD</u> high to EMIF Bus low impedance	2E	7E	ns
5	$t_d(\text{EMLZ-HOLDAH})$	Delay time, EMIF Bus low impedance to <u>HOLDA</u> high	0	2E	ns
6	$t_d(\text{HOLDL-EKOHZ})$	Delay time, <u>HOLD</u> low to ECLKOUTx high impedance	2E	†	ns
7	$t_d(\text{HOLDH-EKOLZ})$	Delay time, <u>HOLD</u> high to ECLKOUTx low impedance	2E	7E	ns

[†] E = the EMIF input clock (ECLKIN, CPU/4 clock, or CPU/6 clock) period in ns.

[‡] EMIF Bus consists of: CE[3:0], BE[3:0], ED[31:0], EA[22:3], ARE/SDCAS/SADS/SRE, AOE/SDRAS/SOE, and AWE/SDWE/SWE, SDCKE, SOE3, and PDT.

[§] The EKxHZ bits in the EMIF Global Control register (GBLCTL) determine the state of the ECLKOUTx signals during HOLDA. If EKxHZ = 0, ECLKOUTx continues clocking during Hold mode. If EKxHZ = 1, ECLKOUTx goes to high impedance during Hold mode, as shown in Figure 35.

† All pending EMIF transactions are allowed to complete before HOLDA is asserted. If no bus transactions are occurring, then the minimum delay time can be achieved. Also, bus hold can be indefinitely delayed by setting NOHOLD = 1.

[†] EMIF Bus consists of: CE[3:0], BE[3:0], ED[31:0], EA[22:3], ARE/SDCAS/SADS/SRE, AOE/SDRAS/SOE, and AWE/SDWE/SWE, SDCKE, SOE3, and PDT.

[‡] The EKxHZ bits in the EMIF Global Control register (GBLCTL) determine the state of the ECLKOUTx signals during HOLDA. If EKxHZ = 0, ECLKOUTx continues clocking during Hold mode. If EKxHZ = 1, ECLKOUTx goes to high impedance during Hold mode, as shown in Figure 35.

FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS196H – MARCH 2002 – REVISED JULY 2004

BUSREQ TIMING

switching characteristics over recommended operating conditions for the BUSREQ cycles
(see Figure 36)

NO.	PARAMETER	–300		UNIT
		MIN	MAX	
1	$t_{d(EKO1H-BUSRV)}$ Delay time, ECLKOUTx high to BUSREQ valid	0.6	7.1	ns

Figure 36. BUSREQ Timing

RESET TIMING

timing requirements for reset[†] (see Figure 37)

NO.			–300		UNIT
			MIN	MAX	
1	$t_{w(RST)}$	Width of the \overline{RESET} pulse (PLL stable) [‡]	10P		ns
		Width of the \overline{RESET} pulse (PLL needs to sync up) [§]	250		μs
16	$t_{su(boot)}$	Setup time, boot configuration bits valid before \overline{RESET} high [¶]	4E or 4C [#]		ns
17	$t_h(boot)$	Hold time, boot configuration bits valid after \overline{RESET} high [¶]	4P		ns
18	$t_{su(PCLK-RSTH)}$	Setup time, PCLK active before \overline{RESET} high	32N		ns

[†] P = 1/CPU clock frequency in ns. For example, when running parts at 300 MHz, use P = 3.33 ns.

[‡] This parameter applies to CLKMODE x1 when CLKIN is stable, and applies to CLKMODE x6 when CLKIN and PLL are stable.

[§] This parameter applies to CLKMODE x6 only (it does not apply to CLKMODE x1). The \overline{RESET} signal is not connected internally to the clock PLL circuit. The PLL, however, may need up to 250 μs to stabilize following device power up or after PLL configuration has been changed. During that time, \overline{RESET} must be asserted to ensure proper device operation. See the *clock PLL* section for PLL lock times.

[¶] LEND, BOOTMODE[1:0], ECLKIN_SEL[1:0], EEAI, and HD5/AD5 are the boot configuration pins during device reset.

[#] E = 1/AECLKIN clock frequency in ns. C = 1/CLKIN clock frequency in ns. Select whichever value is larger for the **MIN** parameter.

^{||} N = the PCI input clock (PCLK) period in ns. When PCI is enabled (PCI_EN = 1), this parameter **must** be met.

switching characteristics over recommended operating conditions during reset^{†☆□} (see Figure 37)

NO.	PARAMETER		–300		UNIT
			MIN	MAX	
2	$t_d(RSTL-ECKI)$	Delay time, \overline{RESET} low to ECLKIN synchronized internally	2E	3P + 20E	ns
3	$t_d(RSTH-ECKI)$	Delay time, \overline{RESET} high to ECLKIN synchronized internally	2E	8P + 20E	ns
4	$t_d(RSTL-ECKO1HZ)$	Delay time, \overline{RESET} low to ECLKOUT1 high impedance	2E		ns
5	$t_d(RSTH-ECKO1V)$	Delay time, \overline{RESET} high to ECLKOUT1 valid		8P + 20E	ns
6	$t_d(RSTL-EMIFZHZ)$	Delay time, \overline{RESET} low to EMIF Z high impedance	2E	3P + 4E	ns
7	$t_d(RSTH-EMIFZV)$	Delay time, \overline{RESET} high to EMIF Z valid	16E	8P + 20E	ns

10	$t_d(RSTL-EMIFLIV)$	Delay time, \overline{RESET} low to EMIF low group invalid	2E		ns
11	$t_d(RSTH-EMIFLV)$	Delay time, \overline{RESET} high to EMIF low group valid		8P + 20E	ns
12	$t_d(RSTL-LOWIV)$	Delay time, \overline{RESET} low to low group invalid	0		ns
13	$t_d(RSTH-LOWV)$	Delay time, \overline{RESET} high to low group valid		11P	ns
14	$t_d(RSTL-ZHZ)$	Delay time, \overline{RESET} low to Z group high impedance	0		ns
15	$t_d(RSTH-ZV)$	Delay time, \overline{RESET} high to Z group valid	2P	8P	ns

[†] P = 1/CPU clock frequency in ns. For example, when running parts at 300 MHz, use P = 3.33 ns.

[☆] E = the EMIF input clock (ECLKIN, CPU/4 clock, or CPU/6 clock) period in ns.

[□] EMIF Z group consists of: $\overline{EA}[22:3]$, $\overline{ED}[31:0]$, $\overline{CE}[3:0]$, $\overline{BE}[3:0]$, $\overline{ARE}/\overline{SDCAS}/\overline{SADS}/\overline{SRE}$, $\overline{AWE}/\overline{SDWE}/\overline{SWE}$, and $\overline{AOE}/\overline{SDRAS}/\overline{SOE}$, $\overline{SOE3}$, \overline{SDCKE} , and \overline{PDT} .

EMIF high group consists of: \overline{HOLDA} (when the corresponding \overline{HOLD} input is high)

EMIF low group consists of: \overline{BUSREQ} ; \overline{HOLDA} (when the corresponding \overline{HOLD} input is low)

Low group consists of: $\overline{XSP_CS}$, $\overline{XSP_CLK}$, and $\overline{XSP_DO}$; all of which apply only when PCI EEPROM (EEAI) is enabled (with $\overline{PCI_EN} = 1$). Otherwise, the $\overline{XSP_CLK}$ and $\overline{XSP_DO}$ pins are in the Z group. For more details on the PCI configuration pins, see the Device Configurations section of this data sheet.

Z group consists of: $\overline{HD}[31:0]/\overline{AD}[31:0]$, $\overline{CLKX0}$, $\overline{CLKX1}$, $\overline{XSP_CLK}$, $\overline{FSX0}$, $\overline{FSX1}$, $\overline{DX0}$, $\overline{DX1}$, $\overline{XSP_DO}$, $\overline{CLKR0}$, $\overline{CLKR1}$, $\overline{FSR0}$, $\overline{FSR1}$, $\overline{TOUT0}$, $\overline{TOUT1}$, $\overline{GP}[8:0]$, $\overline{GP10}/\overline{PCBE3}$, $\overline{HR}/\overline{W}/\overline{PCBE2}$, $\overline{HDS2}/\overline{PCBE1}$, $\overline{PCBE0}$, $\overline{GP13}/\overline{PINTA}$, $\overline{GP11}/\overline{PREQ}$, $\overline{HDS1}/\overline{PSERR}$, $\overline{HCS}/\overline{PPERR}$, $\overline{HCNTL1}/\overline{PDEVSEL}$, $\overline{HAS}/\overline{PPAR}$, $\overline{HCNTL0}/\overline{PSTOP}$, $\overline{HHWL}/\overline{PTRDY}$ (16-bit HPI mode only), $\overline{HRDY}/\overline{PIRDY}$, and $\overline{HINT}/\overline{PFRAME}$.

TMS320C6411 FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS196H – MARCH 2002 – REVISED JULY 2004

RESET TIMING (CONTINUED)

† EMIF Z group consists of: EA[22:3], ED[31:0], CE[3:0], BE[3:0], ARE/SDCAS/SADS/SRE, AWE/SDWE/SWE, and AOE/SDRAS/SOE, SOE3, SDCKE, and PDT.

EMIF high group consists of: HOLDA (when the corresponding HOLD input is high)

EMIF low group consists of: BUSREQ; HOLDA (when the corresponding HOLD input is low)

Low group consists of: XSP_CS, XSP_CLK, and XSP_DO; all of which apply only when PCI EEPROM (EEAI) is enabled (with PCI_EN = 1). Otherwise, the XSP_CLK and XSP_DO pins are in the Z group. For more details on the PCI configuration pins, see the Device Configurations section of this data sheet.

Z group consists of: HD[31:0]/AD[31:0], CLKX0, CLKX1, XSP_CLK, FSX0, FSX1, DX0, DX1, XSP_DO, CLKR0, CLKR1, FSR0, FSR1, TOUT0, TOUT1, GP[8:0], GP10/PCBE3, HR/W/PCBE2, HDS2/PCBE1, PCBE0, GP13/PINTA, GP11/PREQ, HDS1/PSERR, HCS/PPERR, HCNTL1/PDEVSEL, HAS/PPAR, HCNTL0/PSTOP, HHWIL/PTRDY (16-bit HPI mode only), HRDY/PIRDY, and HINT/PFRAME.

‡ If LEND, BOOTMODE[1:0], ECLKIN_SEL[1:0], EEAI, and HD5/AD5 pins are actively driven, care must be taken to ensure no timing contention between parameters 6, 7, 14, 15, 16, and 17.

§ Boot and Device Configurations Inputs (during reset) include: LEND, BOOTMODE[1:0], ECLKIN_SEL[1:0], EEAI, and HD5/AD5.

The PCI_EN pin *must* be driven valid at all times and the user *must not* switch values throughout device operation.

Figure 37. Reset Timing†

EXTERNAL INTERRUPT TIMING

timing requirements for external interrupts[†] (see Figure 38)

NO.			–300		UNIT
			MIN	MAX	
1	$t_{w(ILOW)}$	Width of the NMI interrupt pulse low	4P		ns
		Width of the EXT_INT interrupt pulse low	8P		ns
2	$t_{w(IHIGH)}$	Width of the NMI interrupt pulse high	4P		ns
		Width of the EXT_INT interrupt pulse high	8P		ns

[†] P = 1/CPU clock frequency in ns. For example, when running parts at 300 MHz, use P = 3.33 ns.

FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS196H – MARCH 2002 – REVISED JULY 2004

HOST-PORT INTERFACE (HPI) TIMING

timing requirements for host-port interface cycles^{†‡} (see Figure 39 through Figure 46)

NO.			–300		UNIT
			MIN	MAX	
1	$t_{su}(\text{SELV-HSTBL})$	Setup time, select signals [§] valid before $\overline{\text{HSTROBE}}$ low	5		ns
2	$t_h(\text{HSTBL-SELV})$	Hold time, select signals [§] valid after $\overline{\text{HSTROBE}}$ low	2.4		ns
3	$t_w(\text{HSTBL})$	Pulse duration, $\overline{\text{HSTROBE}}$ low	4P [¶]		ns
4	$t_w(\text{HSTBH})$	Pulse duration, $\overline{\text{HSTROBE}}$ high between consecutive accesses	4P		ns
10	$t_{su}(\text{SELV-HASL})$	Setup time, select signals [§] valid before $\overline{\text{HAS}}$ low	5		ns
11	$t_h(\text{HASL-SELV})$	Hold time, select signals [§] valid after $\overline{\text{HAS}}$ low	2		ns
12	$t_{su}(\text{HDV-HSTBH})$	Setup time, host data valid before $\overline{\text{HSTROBE}}$ high	5		ns
13	$t_h(\text{HSTBH-HDV})$	Hold time, host data valid after $\overline{\text{HSTROBE}}$ high	2.8		ns
14	$t_h(\text{HRDYL-HSTBL})$	Hold time, $\overline{\text{HSTROBE}}$ low after $\overline{\text{HRDY}}$ low. $\overline{\text{HSTROBE}}$ should not be inactivated until $\overline{\text{HRDY}}$ is active (low); otherwise, HPI writes will not complete properly.	2		ns
18	$t_{su}(\text{HASL-HSTBL})$	Setup time, $\overline{\text{HAS}}$ low before $\overline{\text{HSTROBE}}$ low	2		ns
19	$t_h(\text{HSTBL-HASL})$	Hold time, $\overline{\text{HAS}}$ low after $\overline{\text{HSTROBE}}$ low	2.1		ns

[†] $\overline{\text{HSTROBE}}$ refers to the following logical operation on $\overline{\text{HCS}}$, $\overline{\text{HDS1}}$, and $\overline{\text{HDS2}}$: $[\text{NOT}(\overline{\text{HDS1}} \text{ XOR } \overline{\text{HDS2}})] \text{ OR } \overline{\text{HCS}}$.

[‡] $P = 1/\text{CPU clock frequency}$ in ns. For example, when running parts at 300 MHz, use $P = 3.33$ ns.

[§] Select signals include: $\overline{\text{HCNTL}}[1:0]$ and $\overline{\text{HR/W}}$. For HPI16 mode only, select signals also include $\overline{\text{HHWIL}}$.

[¶] Select the parameter value of 4P or 12.5 ns, whichever is greater.

switching characteristics over recommended operating conditions during host-port interface cycles^{†‡} (see Figure 39 through Figure 46)

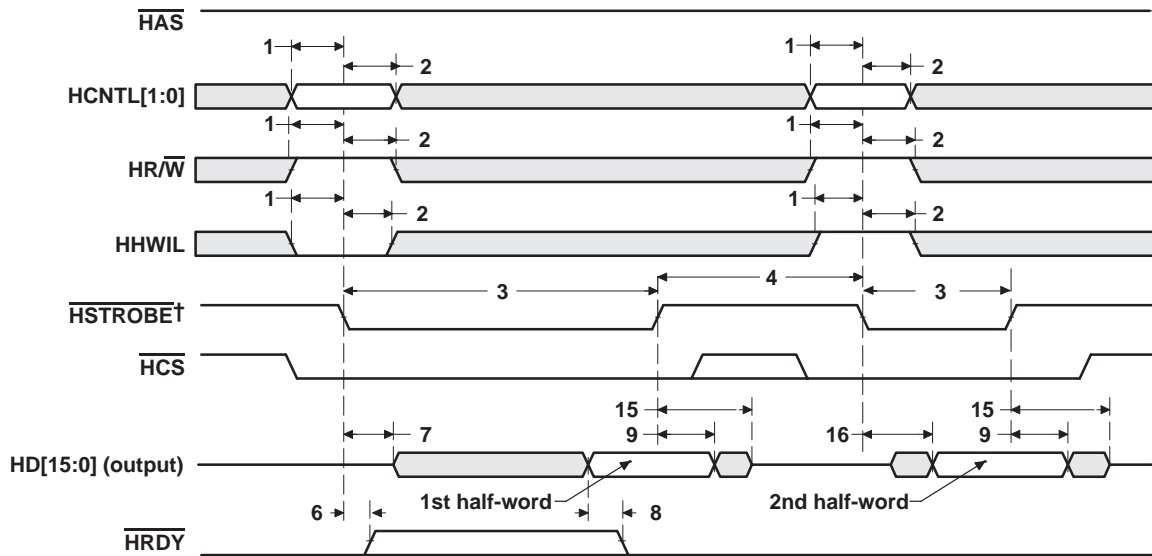

NO.	PARAMETER		–300		UNIT
			MIN	MAX	
6	$t_d(\text{HSTBL-HRDYH})$	Delay time, $\overline{\text{HSTROBE}}$ low to $\overline{\text{HRDY}}$ high [#]	1.3	4P+8	ns
7	$t_d(\text{HSTBL-HDLZ})$	Delay time, $\overline{\text{HSTROBE}}$ low to HD low impedance for an HPI read	2		ns
8	$t_d(\text{HDV-HRDYL})$	Delay time, HD valid to $\overline{\text{HRDY}}$ low	–3		ns
9	$t_{oh}(\text{HSTBH-HDV})$	Output hold time, HD valid after $\overline{\text{HSTROBE}}$ high	1.5		ns
15	$t_d(\text{HSTBH-HDZH})$	Delay time, $\overline{\text{HSTROBE}}$ high to HD high impedance		12	ns
16	$t_d(\text{HSTBL-HDV})$	Delay time, $\overline{\text{HSTROBE}}$ low to HD valid (HPI16 mode, 2nd half-word only)		4P+8	ns

[†] $\overline{\text{HSTROBE}}$ refers to the following logical operation on $\overline{\text{HCS}}$, $\overline{\text{HDS1}}$, and $\overline{\text{HDS2}}$: $[\text{NOT}(\overline{\text{HDS1}} \text{ XOR } \overline{\text{HDS2}})] \text{ OR } \overline{\text{HCS}}$.

[‡] $P = 1/\text{CPU clock frequency}$ in ns. For example, when running parts at 300 MHz, use $P = 3.33$ ns.

[#] This parameter is used during HPID reads and writes. For reads, at the beginning of a word transfer (HPI32) or the first half-word transfer (HPI16) on the falling edge of $\overline{\text{HSTROBE}}$, the HPI sends the request to the EDMA internal address generation hardware, and $\overline{\text{HRDY}}$ remains high until the EDMA internal address generation hardware loads the requested data into HPID. For writes, $\overline{\text{HRDY}}$ goes high if the internal write buffer is full.

HOST-PORT INTERFACE (HPI) TIMING (CONTINUED)

† $\overline{\text{HSTROBE}}$ refers to the following logical operation on $\overline{\text{HCS}}$, $\overline{\text{HDS1}}$, and $\overline{\text{HDS2}}$: $[\text{NOT}(\overline{\text{HDS1}} \text{ XOR } \overline{\text{HDS2}})] \text{ OR } \overline{\text{HCS}}$.

2	t _d (FXL-CKXL)	Delay time, FSX low to CLKX low#	T – 2	T + 1			ns
3	t _d (CKXH-DXV)	Delay time, CLKX high to DX valid	–2	4	12P + 4	20P + 17	ns
6	t _{dis} (CKXH-DXHZ)	Disable time, DX high impedance following last data bit from CLKX high	–2	4	12P + 3	20P + 17	ns
7	t _d (FXL-DXV)	Delay time, FSX low to DX valid	L – 2	L + 4	8P + 2	16P + 17	ns

† P = 1/CPU clock frequency in ns. For example, when running parts at 300 MHz, use P = 3.33 ns.

‡ For all SPI Slave modes, CLKG is programmed as 1/4 of the CPU clock by setting CLKSM = CLKGDV = 1.

§ S = Sample rate generator input clock = 4P if CLKSM = 1 (P = 1/CPU clock frequency)

= Sample rate generator input clock = P_clks if CLKSM = 0 (P_clks = CLKS period)

T = CLKX period = (1 + CLKGDV) * S

H = CLKX high pulse width = (CLKGDV/2 + 1) * S if CLKGDV is even

= (CLKGDV + 1)/2 * S if CLKGDV is odd or zero

L = CLKX low pulse width = (CLKGDV/2) * S if CLKGDV is even

= (CLKGDV + 1)/2 * S if CLKGDV is odd or zero

¶ FSRP = FSXP = 1. As a SPI Master, FSX is inverted to provide active-low slave-enable output. As a Slave, the active-low signal input on FSX and FSR is inverted before being used internally.

CLKXM = FSXM = 1, CLKRM = FSRM = 0 for Master McBSP

CLKXM = CLKRM = FSXM = FSRM = 0 for Slave McBSP

FSX should be low before the rising edge of clock to enable Slave devices and then begin a SPI transfer at the rising edge of the Master clock (CLKX).

MULTICHANNEL BUFFERED SERIAL PORT (McBSP) TIMING (CONTINUED)

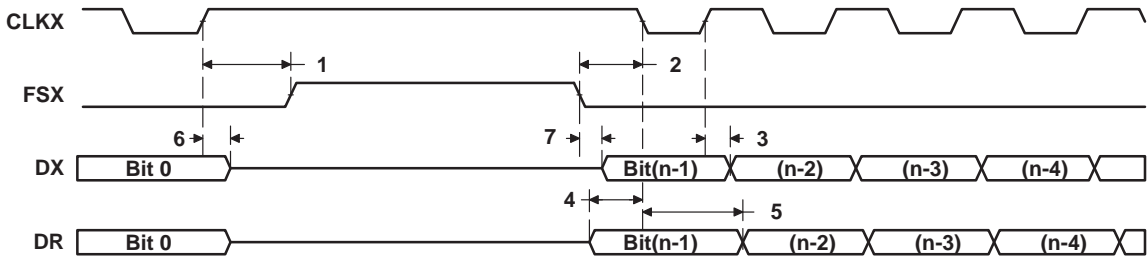

Figure 56. McBSP Timing as SPI Master or Slave: CLKSTP = 11b, CLKXP = 1

TIMER TIMING

timing requirements for timer inputs[†] (see Figure 57)

NO.		–300		UNIT
		MIN	MAX	
1	$t_w(\text{TINPH})$ Pulse duration, TINP high	8P		ns
2	$t_w(\text{TINPL})$ Pulse duration, TINP low	8P		ns

[†] P = 1/CPU clock frequency in ns. For example, when running parts at 300 MHz, use P = 3.33 ns.

switching characteristics over recommended operating conditions for timer outputs[†] (see Figure 57)

NO.	PARAMETER	–300		UNIT
		MIN	MAX	
3	$t_w(\text{TOUTH})$ Pulse duration, TOUT high	8P–3		ns
4	$t_w(\text{TOUTL})$ Pulse duration, TOUT low	8P–3		ns

[†] P = 1/CPU clock frequency in ns. For example, when running parts at 300 MHz, use P = 3.33 ns.

Figure 57. Timer Timing

GENERAL-PURPOSE INPUT/OUTPUT (GPIO) PORT TIMING

timing requirements for GPIO inputs†‡ (see Figure 58)

NO.			–300		UNIT
			MIN	MAX	
1	$t_w(\text{GPIH})$	Pulse duration, GPIx high	8P		ns
2	$t_w(\text{GPIL})$	Pulse duration, GPIx low	8P		ns

† $P = 1/\text{CPU clock frequency}$ in ns. For example, when running parts at 300 MHz, use $P = 3.33$ ns.

‡ The pulse width given is sufficient to generate a CPU interrupt or an EDMA event. However, if a user wants to have the DSP recognize the GPIx changes through software polling of the GPIO register, the GPIx duration must be extended to at least 12P to allow the DSP enough time to access the GPIO register through the CFGBUS.

switching characteristics over recommended operating conditions for GPIO outputs† (see Figure 58)

NO.	PARAMETER		–300		UNIT
			MIN	MAX	
3	$t_w(\text{GPOH})$	Pulse duration, GPOx high	24P – 8‡		ns
4	$t_w(\text{GPOL})$	Pulse duration, GPOx low	24P – 8‡		ns

† $P = 1/\text{CPU clock frequency}$ in ns. For example, when running parts at 300 MHz, use $P = 3.33$ ns.

‡ This parameter value should not be used as a maximum performance specification. Actual performance of back-to-back accesses of the GPIO is dependent upon internal bus activity.

Figure 58. GPIO Port Timing

JTAG TEST-PORT TIMING

timing requirements for JTAG test port (see Figure 59)

NO.		–300		UNIT
		MIN	MAX	
1	$t_c(\text{TCK})$ Cycle time, TCK	35		ns
3	$t_{su}(\text{TDIV-TCKH})$ Setup time, TDI/TMS/TRST valid before TCK high	10		ns
4	$t_h(\text{TCKH-TDIV})$ Hold time, TDI/TMS/TRST valid after TCK high	9		ns

switching characteristics over recommended operating conditions for JTAG test port (see Figure 59)

NO.	PARAMETER	–300		UNIT
		MIN	MAX	
2	$t_d(\text{TCKL-TDOV})$ Delay time, TCK low to TDO valid	0	18	ns

Figure 59. JTAG Test-Port Timing

FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS196H – MARCH 2002 – REVISED JULY 2004

MECHANICAL DATA

The following table(s) show the thermal resistance characteristics for the PBGA — GLZ and ZLZ mechanical packages.

thermal resistance characteristics (S-PBGA package) [GLZ]

NO.		°C/W	Air Flow (m/s†)
1	R _{θJC} Junction-to-case	1.55	N/A
2	R _{θJB} Junction-to-board	9.1	N/A
3	R _{θJA} Junction-to-free air	17.9	0.00
4	R _{θJA} Junction-to-free air	15.02	0.5
5	R _{θJA} Junction-to-free air	13.4	1.0
6	R _{θJA} Junction-to-free air	11.89	2.00
7	Ψ _{iJT} Junction-to-package top	0.5	N/A
8	Ψ _{iJB} Junction-to-board	7.4	N/A

† m/s = meters per second

thermal resistance characteristics (S-PBGA package) [ZLZ]

NO.		°C/W	Air Flow (m/s†)
1	R _{θJC} Junction-to-case	1.55	N/A
2	R _{θJB} Junction-to-board	9.1	N/A
3	R _{θJA} Junction-to-free air	17.9	0.00
4	R _{θJA} Junction-to-free air	15.02	0.5
5	R _{θJA} Junction-to-free air	13.4	1.0
6	R _{θJA} Junction-to-free air	11.89	2.00
7	Ψ _{iJT} Junction-to-package top	0.5	N/A
8	Ψ _{iJB} Junction-to-board	7.4	N/A

† m/s = meters per second

The following mechanical package diagram(s) reflect the most up-to-date mechanical data released for these designated device(s).

 - E. This package is lead-free.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.
