TMP93PW32F

1. Outline and Device Characteristics

The TMP93PW32 is OTP type MCU which includes 128 Kbyte One-time PROM. Using the adapter-socket (BM11132), you can write and verify the data for the TMP93PW32. The TMP93PW32F has the same pin-assignment as TMP93CS32 (Mask ROM type).

Writing the program to Built-in PROM, the TMP93PW32 operates as the same way as the TMP93CS32. The memory map and capacity of built in ROM and RAM are different between TMP93CS32 and TMP93PW32. The TMP93PW32 has the PROM of 128 Kbyte and the RAM of 4 Kbyte, and the TMP93CS32 has the ROM of 64 Kbyte and the RAM of 2 Kbyte. Following figure shows each memory map.

3. Operation

This section describes the functions and basic operational blocks of the TMP93PW32.

The TMP93PW32 has PROM in place of the mask ROM which is included in the TMP93CS32. The other configuration and functions are the same as the TMP93CS32. Regarding the functions of the TMP93PW32 (not described), see the part of TMP93CS32.

The TMP93PW32 has two operational modes: MCU mode and PROM mode.

3.1 MCU mode

(1) Mode-setting and function

The MCU mode is set by opening the CLK pin (pin open). In the MCU mode, the operation is same as TMP93CS32 except the followings.

(2) Memory-map

The memory map of TMP93PW32 is not same as that of TMP93CS32. Figure 3.1.1 shows the memory map in MCU mode. Figure 3.1.2 show that in PROM mode.

Figure 3.1.1 Memory map in MCU mode

Figure 3.1.2 Memory map in PROM mode

(3) Care point of bus width / wait controller

The built in RAM capacity of the TMP93PW32 is larger than that of the TMP93CS32, therefor the following point is different about the accessing area of WAITC1.

Setting WAITC1<B1C1to 0> to "00"

TMP93PW32	TMP93CS32
1080H to 7FFFH	880 to 7FFFH

WAITC0 and WAITC2 addressing area are the same as TMP93CS32.

4. Electrical Characteristics

4.1 Absolute Maximum Ratings (TMP93PW32)

“X” used in an expression shows a cycle of clock f_{PPH} . If a clock gear or a low speed oscillator is selected, a value of “X” is different. The value as an example is gear = 1/fc (SYSCR1 < GEAR 2 to 0 > = “000”).

Parameter	Symbol	Rating	Unit
Power Supply Voltage	V _{CC}	– 0.5 to 6.5	V
Input Voltage	V _{IN}	except $\overline{EA}$ pin – 0.5 to V _{CC} + 0.5	V
		EA pin – 0.5 to 14.0	
Output current (Per 1 pin) P7	I _{OL1}	20	mA
Output current (Per 1 pin) except P7	I _{OL2}	2	mA
Output Current (total)	ΣI_{OL}	120	mA
Output Current (total)	ΣI_{OH}	– 80	mA
Power Dissipation (Ta = 85°C)	P _D	350	mW
Soldering Temperature (10 s)	T _{SOLDER}	260	°C
Storage Temperature	T _{STG}	– 65 to 150	°C
Operating Temperature	T _{OPR}	– 40 to 85	°C

Note: The absolute maximum ratings are rated values which must not be exceeded during operation, even for an instant. Any one of the ratings must not be exceeded. If any absolute maximum rating is exceeded, a device may break down or its performance may be degraded, causing it to catch fire or explode resulting in injury to the user. Thus, when designing products which include this device, ensure that no absolute maximum rating value will ever be exceeded.
