

### 3.3V 1:10 LVCMOS PLL Clock Generator

#### Features

- 1:10 PLL based low-voltage clock generator
- Supports zero-delay operation
- 3.3V power supply
- Generates clock signals up to 250MHz
- Maximum output skew of 120pS
- Differential LVPECL reference clock input
- External PLL feedback
- Drives up to 20 clock lines
- 32 lead LQFP packaging
- Pin and function compatible to the MPC958 and MPC9658

#### Functional Description

The ASM5I9658 is a 3.3V compatible, 1:10 PLL based clock generator and zero-delay buffer targeted for high performance low-skew clock distribution in mid-range to high-performance telecom, networking and computing applications. With output frequencies up to 250MHz and output skews less than 120pS the device meets the needs of the most demanding clock applications. The ASM5I9658 is specified for the temperature range of 0°C to +70°C.

The ASM5I9658 utilizes PLL technology to frequency lock its outputs onto an input reference clock. Normal operation of the ASM5I9658 requires the connection of the QFB output to the feedback input to close the PLL feedback path (external feedback). With the PLL locked, the output frequency is equal to the reference frequency of the device and VCO\_SEL selects the operating frequency range of 50 to 125MHz or 100 to 250MHz. The two available post-PLL dividers selected by VCO\_SEL (divide-by-2 or divide-by-4)

and the reference clock frequency determines the VCO frequency. Both must be selected to match the VCO frequency range. The internal VCO of the ASM5I9658 is running at either 2x or 4x of the reference clock frequency.

The ASM5I9658 has a differential LVPECL reference input along with an external feedback input. The ASM5I9658 is ideal for use as a zero delay, low skew fanout buffer. The device performance has been tuned and optimized for zero delay performance.

The PLL\_EN and  $\overline{\text{BYPASS}}$  controls select the PLL bypass configuration for test and diagnosis. In this configuration, the selected input reference clock is bypassing the PLL and routed either to the output dividers or directly to the outputs. The PLL bypass configurations are fully static and the minimum clock frequency specification and all other PLL characteristics do not apply. The outputs can be disabled (high-impedance) and the device reset by asserting the  $\text{MR}/\overline{\text{OE}}$  pin. Asserting  $\text{MR}/\overline{\text{OE}}$  also causes the PLL to loose lock due to missing feedback signal presence at FB\_IN. Deasserting  $\text{MR}/\overline{\text{OE}}$  will enable the outputs and close the phase locked loop, enabling the PLL to recover to normal operation.

The ASM5I9658 is fully 3.3V compatible and requires no external loop filter components. The inputs (except PCLK) accept LVCMOS except signals while the outputs provide LVCMOS compatible levels with the capability to drive terminated 50Ω transmission lines. For series terminated transmission lines, each of the ASM5I9658 outputs can drive one or two traces giving the devices an effective fanout of 1:16. The device is packaged in a 7x7 mm<sup>2</sup> 32-lead LQFP & TQFP Packages.

Table 1: Pin Configuration

Pin #	Pin Name	I/O	Type	Function
6 7	PCLK, PCLK	Input	LVPECL	LVPECL reference clock signal
2	FB_IN	Input	LVC MOS	PLL feedback signal input, connect to QFB
32	VCO_SEL	Input	LVC MOS	Operating frequency range select
3	$\overline{\text{BYPASS}}$	Input	LVC MOS	PLL and output divider bypass select
4	PLL_EN	Input	LVC MOS	PLL enable/disable
5	MR/ $\overline{\text{OE}}$	Input	LVC MOS	Output enable/disable (high-impedance tristate) and device reset
28,26,24, 22,20,18, 16,14,12, 10	Q0-9	Output	LVC MOS	Clock outputs
30	QFB	Output	LVC MOS	Clock output for PLL feedback, connect to FB_IN
8,9,13,17 21,25,29	GND	Supply	Ground	Negative power supply (GND)
1	VCC_PLL	Supply	VCC	PLL positive power supply (analog power supply). It is recommended to use an external RC filter for the analog power supply pin V <sub>CC_PLL</sub> . Please see applications section for details.
11,15,19, 23,27,31	VCC	Supply	VCC	Positive power supply for I/O and core. All V <sub>CC</sub> pins must be connected to the positive power supply for correct operation

Table 2: FUNCTION TABLE

Control	Default	0	1
PLL_EN	1	Test mode with PLL bypassed. The reference clock (PCLK) is substituted for the internal VCO output. ASM59658 is fully static and no minimum frequency limit applies. All PLL related AC characteristics are not applicable.	Selects the VCO output <sup>1</sup>
$\overline{\text{BYPASS}}$	1	Test mode with PLL and output dividers bypassed. The reference clock (PCLK) is directly routed to the outputs. ASM59658 is fully static and no minimum frequency limit applies. All PLL related AC characteristics are not applicable.	Selects the output dividers.
VCO_SEL	1	VCO ÷ 1 (High frequency range). $f_{\text{REF}} = f_{\text{Q0-9}} = 2 \cdot f_{\text{VCO}}$	VCO ÷ 2 (Low frequency range). $f_{\text{REF}} = f_{\text{Q0-9}} = 4 \cdot f_{\text{VCO}}$
MR/ $\overline{\text{OE}}$	0	Outputs enabled (active)	Outputs disabled (high-impedance state) and reset of the device. During reset the PLL feedback loop is open. The VCO is tied to its lowest frequency. The length of the reset pulse should be greater than one reference clock cycle (PCLK).

Note: 1 PLL operation requires BYPASS=1 and PLL\_EN=1.

**Table 5: DC CHARACTERISTICS** ( $V_{CC} = 3.3V \pm 5\%$ ,  $T_A = 0^\circ C$  to  $70^\circ C$ )

Symbol	Characteristics	Min	Typ	Max	Unit	Condition
$V_{IH}$	Input high voltage	2.0		$V_{CC} + 0.3$	V	LVC MOS
$V_{IL}$	Input low voltage			0.8	V	LVC MOS
$V_{PP}$	Peak-to-peak input voltage (PCLK)	250			mV	LVPECL
$V_{CMR}^1$	Common Mode Range (PCLK)	1.0		$V_{CC} - 0.6$	V	LVPECL
$V_{OH}$	Output High Voltage	2.4			V	$I_{OH} = -24 \text{ mA}^2$
$V_{OL}$	Output Low Voltage <sup>3</sup>			0.55 0.30	V V	$I_{OL} = 24 \text{ mA}$ $I_{OL} = 12 \text{ mA}$
$Z_{OUT}$	Output impedance		14 - 17		$\Omega$	
$I_{IN}$	Input Current <sup>4</sup>			$\pm 200$	$\mu A$	$V_{IN} = V_{CC}$ or GND
$I_{CC\_PLL}$	Maximum PLL Supply Current		12	15	mA	$V_{CC\_PLL}$ Pin
$I_{CCQ}$	Maximum Quiescent Supply Current		13	15	mA	All $V_{CC}$ Pins

Note: 1.  $V_{CMR}$  (DC) is the cross point of the differential input signal. Functional operation is obtained, when the crosspoint is within the  $V_{CMR}$  range and the input swing lies within the  $V_{PP}$  (DC) specification.

2. The ASM3P9658 is capable of driving 50 $\Omega$  transmission lines on the incident edge. Each output drives one 50 $\Omega$  parallel terminated transmission line to a termination voltage of  $V_{TT}$ . Alternatively, the device drives up to two 50 $\Omega$  series terminated transmission lines.

3. The ASM5I9658 output levels are compatible to the MPC958 output levels.

4. Inputs have pull-down or pull-up resistors affecting the input current.

$t_{PD}$	Propagation Delay PLL and divider bypass, PCLK to Q0-9	1.0		4.0	nS	
$t_{sk(O)}$	Output-to-output Skew <sup>9</sup>			120	pS	
DC	Output duty cycle <sup>10</sup>	$(T \div 2) - 400$	$T \div 2$	$(T \div 2) + 400$	pS	
$t_R, t_F$	Output Rise/Fall Time	0.1		1.0	nS	0.55 to 2.4V
$t_{PLZ, HZ}$	Output Disable Time			7.0	nS	
$t_{PZL, LZ}$	Output Enable Time			6.0	nS	
$t_{JIT(CC)}$	Cycle-to-cycle jitter			80	pS	
$t_{JIT(PER)}$	Period Jitter			80	pS	
$t_{JIT(\emptyset)}$	I/O Phase Jitter $f_{VCO}=500 MHz$ and $\div 2$ feedback, RMS ( $1\sigma$ ) <sup>11</sup> $f_{VCO}=500 MHz$ and $\div 4$ feedback, RMS ( $1\sigma$ )			5.5	pS	
				6.5	pS	
BW	PLL closed loop bandwidth <sup>12</sup> $\div 2$ feedback <sup>8</sup>		6-20		MHz	
	PLL mode, external feedback $\div 4$ feedback <sup>9</sup>		2 - 8		MHz	
$t_{LOCK}$	Maximum PLL Lock Time			10	mS	

Note: 1. AC characteristics apply for parallel output termination of 50Ω to  $V_{TT}$ .

2.  $\div 2$  PLL feedback (high frequency range) requires  $V_{CO\_SEL}=0$ ,  $PLL\_EN=1$ ,  $BYPASS=1$  and  $MR/OE=0$ .

3.  $\div 4$  PLL feedback (low frequency range) requires  $V_{CO\_SEL}=1$ ,  $PLL\_EN=1$ ,  $BYPASS=1$  and  $MR/OE=0$ .

4. In bypass mode, the ASM3P9658 divides the input reference clock.

5. The input frequency  $f_{REF}$  must match the VCO frequency range divided by the feedback divider ratio FB:  $f_{REF} = f_{VCO} \div FB$ .

6.  $V_{CMR}$  (AC) is the crosspoint of the differential input signal. Normal AC operation is obtained when the crosspoint is within the  $V_{CMR}$  range and the input swing lies within the  $V_{PP}$  (AC) specification. Violation of  $V_{CMR}$  or  $V_{PP}$  impacts static phase offset  $t_{(\emptyset)}$ .

7. Calculation of reference duty cycle limits:  $DC_{REF,MIN} = t_{PW,MIN} \cdot f_{REF}$ . 100% and  $DC_{REF,MAX} = 100\% - DC_{REF,MIN}$ .

8. Valid for  $f_{REF}=50 MHz$  and  $FB=\div 8$  ( $V_{CO\_SEL}=1$ ). For other reference frequencies:  $t_{(\emptyset)} [pS] = 50 pS \pm (1 \div (120 \cdot f_{REF}))$ .

9. See application section for part-to-part skew calculation in PLL zero-delay mode.

10. Output duty cycle is  $DC = (0.5 \pm 400 pS \cdot f_{OUT}) V$  100%. E.g. the DC range at  $f_{OUT}=100MHz$  is  $46\% < DC < 54\%$ .  $T$  = output period.

11. See application section for a jitter calculation for other confidence factors than 1 and a characteristic for other VCO frequencies.

12. -3 dB point of PLL transfer characteristics.

## Applications Information

## Driving Transmission Lines

The ASM519658 supports output clock frequencies from 50 to 250MHz. Two different feedback divider configurations can be used to achieve the desired frequency operation range. The feedback divider (VCO\_SEL) should be used to situate the VCO in the frequency lock range between 200 and 500MHz for

stable and optimal operation. Two operating frequency ranges are supported: 50 to 125MHz and 100 to 250 MHz. Table 7 illustrates the configurations supported by the ASM519658. PLL zero-delay is supported if BYPASS=1, PLL\_EN=1 and the input frequency is within the specified PLL reference frequency range.

Table 7: ASM519658 Configurations (QFB connected to FB\_IN)

BYPASS	PLL_EN	VCO_SEL	Operation	Frequency		
				Ratio	Output range (fQ0-7)	VCO
0	X	X	Test mode: PLL and divider bypass	$f_{Q0-9} = f_{REF}$	0-250 MHz	n/a
1	0	0	Test mode: PLL bypass	$f_{Q0-9} = f_{REF} \div 2$	0-125 MHz	n/a
1	0	1	Test mode: PLL bypass	$f_{Q0-9} = f_{REF} \div 4$	0-62.5 MHz	n/a
1	1	0	PLL mode (high frequency range)	$f_{Q0-9} = f_{REF}$	100 to 250 MHz	$f_{VCO} = f_{REF} \times 2$
1	1	1	PLL mode (low frequency range)	$f_{Q0-9} = f_{REF}$	50 to 125 MHz	$f_{VCO} = f_{REF} \times 4$

## Power Supply Filtering

The ASM519658 is a mixed analog/digital product. Its analog circuitry is naturally susceptible to random noise, especially if this noise is seen on the power supply pins. Random noise on the  $V_{CCA\_PLL}$  power supply impacts the device characteristics, for instance I/O jitter. The ASM519658 provides separate power supplies for the output buffers ( $V_{CC}$ ) and the phase-locked loop ( $V_{CCA\_PLL}$ ) of the device. The purpose of this design technique is to isolate the high switching noise digital outputs from the relatively sensitive internal analog phase-locked loop. In a digital system environment where it is more difficult to minimize noise on the power supplies a second level of isolation may be required. The simple but effective form of isolation is a power supply filter on the  $V_{CC\_PLL}$  pin for the ASM519658. Figure 3. illustrates a typical power supply filter scheme. The ASM519658 frequency and phase stability is most susceptible to noise with spectral content in the 100KHz to 20MHz range. Therefore the filter should be designed to target this range. The key parameter that needs to be met in the final filter design is the DC voltage drop across the series filter resistor  $R_F$ . From the data sheet the  $I_{CC\_PLL}$  current (the current sourced through the  $V_{CC\_PLL}$  pin) is typically 12 mA (20 mA maximum), assuming that a minimum of 2.835V must be maintained on the  $V_{CC\_PLL}$  pin.

The minimum values for  $R_F$  and the filter capacitor  $C_F$  are defined by the required filter characteristics: the RC filter should provide attenuation greater than 40 dB for

Figure 3. VCC\_PLL Power Supply Filter

noise whose spectral content is above 100 KHz. In the example RC filter shown in Figure 3. "VCC\_PLL Power Supply Filter", the filter cut-off frequency is around 3-5 kHz and the noise attenuation at 100 kHz is better than 42dB.

As the noise frequency crosses the series resonant point of an individual capacitor its overall impedance begins to look inductive and thus increases with increasing frequency. The parallel capacitor combination shown ensures that a low impedance path to ground exists for frequencies well above the bandwidth of the PLL. Although the ASM519658 has several design features to minimize the susceptibility to power supply noise (isolated power and grounds and fully differential PLL) there still may be applications in which overall performance is being degraded due to system power supply noise. The power

## rev 0.2

supply filter schemes discussed in this section should be adequate to eliminate power supply noise related problems in most designs.

### Using the ASM5I9658 in zero-delay applications

Nested clock trees are typical applications for the ASM5I9658. Designs using the ASM5I9658, as LVCMOS PLL fanout buffer with zero insertion delay will show significantly lower clock skew than clock distributions developed from CMOS fanout buffers. The external feedback option of the ASM5I9658 clock driver allows for its use as a zero delay buffer. The PLL aligns the feedback clock output edge with the clock input reference edge resulting a near zero delay through the device (the propagation delay through the device is virtually eliminated). The maximum insertion delay of the device in zero-delay applications is measured between the reference clock input and any output. This effective delay consists of the static phase offset, I/O jitter (phase or long-term jitter), feedback path delay and the output-to-output skew error relative to the feedback output.

### Calculation of part-to-part skew

The ASM5I9658 zero delay buffer supports applications where critical clock signal timing can be maintained across several devices. If the reference clock inputs of two or more ASM5I9658 are connected together, the maximum overall timing uncertainty from the common PCLK input to any output is:

$$t_{SK(PP)} = t_{(\varphi)} + t_{SK(O)} + t_{PD, LINE(FB)} + t_{JIT(\varphi)} \cdot CF$$

This maximum timing uncertainty consist of 4 components: static phase offset, output skew, feedback board trace delay and I/O (phase) jitter:

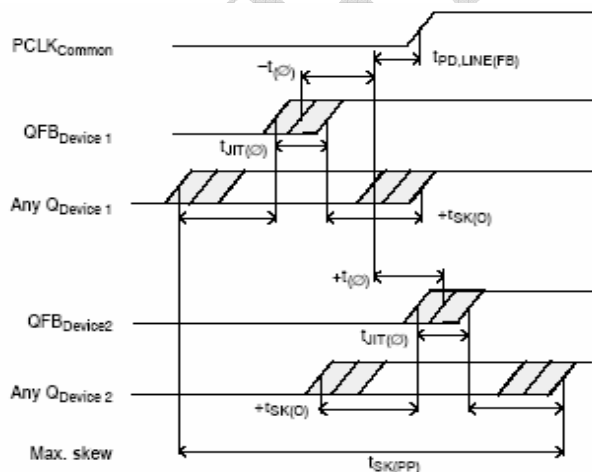

Figure 4. ASM5I9658 max device-to-device skew

Due to the statistical nature of I/O jitter a RMS value ( $1\sigma$ ) is specified. I/O jitter numbers for other confidence factors (CF) can be derived from Table 8.

Table 8: Confidence Factor CF

CF	Probability of clock edge within the distribution
$\pm 1\sigma$	0.68268948
$\pm 2\sigma$	0.95449988
$\pm 3\sigma$	0.99730007
$\pm 4\sigma$	0.99993663
$\pm 5\sigma$	0.99999943
$\pm 6\sigma$	0.99999999

The feedback trace delay is determined by the board layout and can be used to fine-tune the effective delay through each device. In the following example calculation a I/O jitter confidence factor of 99.7% ( $\pm 3\sigma$ ) is assumed, resulting in a worst case timing uncertainty from input to any output of -214 pS to 224 pS relative to PCLK

( $f_{REF} = 100 \text{ MHz}$ ,  $FB = +4$ ,  $t_{jit(\varphi)} = 8 \text{ pS RMS}$  at  $f_{VCO} = 400 \text{ MHz}$ ):

$$t_{SK(PP)} = [-70\text{pS} \dots 80\text{pS}] + [-120\text{pS} \dots 120\text{pS}] + [(8\text{pS} \cdot -3) \dots (8\text{pS} \cdot 3)] + t_{PD, LINE(FB)}$$

$$t_{SK(PP)} = [-214\text{pS} \dots 224\text{pS}] + t_{PD, LINE(FB)}$$

Due to the frequency dependence of the I/O jitter, Figure 5. can be used for a more precise timing performance analysis.

Figure 5. Maximum I/O Jitter versus frequency

## rev 0.2

## Driving Transmission Lines

The ASM519658 clock driver was designed to drive high speed signals in a terminated transmission line environment. To provide the optimum flexibility to the user the output drivers were designed to exhibit the lowest impedance possible. With an output impedance of less than  $20\Omega$  the drivers can drive either parallel or series terminated transmission lines. In most high performance clock networks point-to-point distribution of signals is the method of choice. In a point-to-point scheme either series terminated or parallel terminated transmission lines can be used. The parallel technique terminates the signal at the end of the line with a  $50\Omega$  resistance to  $V_{CC}/2$ .

This technique draws a fairly high level of DC current and thus only a single terminated line can be driven by each output of the ASM519658 clock driver. For the series terminated case however there is no DC current draw, thus the outputs can drive multiple series terminated lines. Figure 6. "Single versus Dual Transmission Lines" illustrates an output driving a single series terminated line versus two series terminated lines in parallel. When taken to its extreme the fanout of the ASM519658 clock driver is effectively doubled due to its capability to drive multiple lines.

Figure 6. Single versus Dual Transmission Lines

The waveform plots in Figure 7. "Single versus Dual Line Termination Waveforms" show the simulation results of an output driving a single line versus two lines. In both cases the drive capability of the ASM519658 output buffer is more than sufficient to drive  $50\Omega$  transmission lines on the incident edge. Note from the delay measurements in the simulations a delta of only 43pS exists between the two differently loaded outputs. This suggests that the dual line driving need not be used exclusively to maintain the tight output-to-output skew of the ASM519658. The output waveform in Figure 7. "Single versus Dual Line Termination Waveforms" shows a step in the waveform,

this step is caused by the impedance mismatch seen looking into the driver. The parallel combination of the  $36\Omega$  series resistor plus the output impedance does not match the parallel combination of the line impedances. The voltage wave launched down the two lines will equal:

$$V_L = V_S (Z_0 / (R_S + R_0 + Z_0))$$

$$Z_0 = 50\Omega \parallel 50\Omega$$

$$R_S = 36\Omega \parallel 36\Omega$$

$$R_0 = 14\Omega$$

$$V_L = 3.0 (25 / (18 + 14 + 25)) \\ = 1.31V$$

At the load end the voltage will double, due to the near unity reflection coefficient, to 2.6V. It will then increment towards the quiescent 3.0V in steps separated by one round trip delay (in this case 4.0nS).

Figure 7. Single versus Dual Waveforms

Since this step is well above the threshold region it will not cause any false clock triggering, however designers may be uncomfortable with unwanted reflections on the line. To better match the impedances when driving multiple lines the situation in Figure 8. "Optimized Dual Line Termination" should be used. In this case the series terminating resistors are reduced such that when the parallel combination is added to the output buffer impedance the line impedance is perfectly matched.

Figure 8. Optimized Dual Line Termination

Figure 9. PCLK ASM519658 AC test reference

The pin-to-pin skew is defined as the worst case difference in propagation delay between any similar delay path within a single device

## Ordering Information

Part Number	Marking	Package Type	Operating Range
ASM5I9658-32-ER	ASM5I9658	32-pin TQFP	Industrial
ASM5I9658-32-LR	ASM5I9658	32-pin LQFP –Tape and Reel	Industrial
ASM5I9658G-32-ER	ASM5I9658G	32-pin TQFP, Green	Industrial
ASM5I9658G-32-LR	ASM5I9658G	32-pin LQFP –Tape and Reel, Green	Industrial

## Device Ordering Information

A S M 5 I 9 6 5 8 F - 3 2 - L R

R = Tape & reel, T = Tube or Tray

O = SOT	U = MSOP
S = SOIC	E = TQFP
T = TSSOP	L = LQFP
A = SSOP	U = MSOP
V = TVSOP	P = PDIP
B = BGA	D = QSOP
Q = QFN	X = SC-70

DEVICE PIN COUNT

F = LEAD FREE AND RoHS COMPLIANT PART  
G = GREEN PACKAGE

PART NUMBER

X= Automotive (-40C to +125C) I= Industrial (-40C to +85C) P or n/c = Commercial (0C to +70C)

1 = Reserved	6 = Power Management
2 = Non PLL based	7 = Power Management
3 = EMI Reduction	8 = Power Management
4 = DDR support products	9 = Hi Performance
5 = STD Zero Delay Buffer	0 = Reserved

ALLIANCE SEMICONDUCTOR MIXED SIGNAL PRODUCT
