

Analysis of LSD and Lampa

Application Pharmaceutical

Robert Ricker

There is a resurgence in the abuse of the psychoactive drug LSD. Detection of LSD-abuse is difficult because of its efficacy at extremely low dosages. The drug is also rapidly excreted, dropping to urine concentrations of < 200 pg/ml after 12 hours. LAMPA (<u>lysergic acid methylpropylamide</u>) has the same molecular weight as LSD and is used as an internal standard. The rapid separation of these two compounds is, therefore, of considerable importance.

Conditions: Instrument: Agilent 1100 LC/MSD System Column: ZORBAX Eclipse XDB-C8, 2.1 \times 50 mm, 5 μ m, Agilent P/N: 960967-906

Mobile Phase: as specified above, with % remaining 10 mM ammonium formate, pH 3.7

F=0.3 mL / min, Inj vol: 30 µl, Temp: 30°C, Det. MS HP 1100 MSD Conditions: SIM mode, Ions: 324.2, 223.1, 208.1

Fragmentor (dynamically ramped) 100V at 324.2, 148V at 223.1, 170V at 208.1

Highlights

- LSD and the LAMPA standard are eluted from the ZORBAX Eclipse XDB-C8 column with good peak shape in both the gradient and isocratic modes. Peak volumes are only 150µL for the gradient separation, and 200µL for the isocratic.
- These peak volumes and the volatile mobile phase are suitable for ES-MS detection.
- As expected, peak widths are smaller for the gradient separation; although, this may be due to shorter retention times in the gradient separation. The isocratic separation could be shortened by using a higher ACN concentration.
- ZORBAX Eclipse XDB columns have extremely good peak shapes over a broad pH range, including intermediate pH.
