

# Octal Ultrasound AFE With Digital Demodulator

AD9670

### **Preliminary Technical Data**

### **FEATURES**

8 channels of LNA, VGA, AAF, ADC, and digital demodulator/decimator Low power: 130 mW per channel, TGC mode, 40 MSPS; 55mW per channel, CW mode; <5mW at power-up 10 mm × 10 mm, 144-ball CSP-BGA TGC channel input-referred noise: 0.8 nV/ $\sqrt{Hz}$ , max gain Flexible power-down modes Fast recovery from low power standby mode: <2 µs Low noise preamplifier (LNA) Input-referred noise: 0.78 nV/√Hz, gain = 21.6 dB Programmable gain: 15.6 dB/17.9 dB/21.6 dB 0.1 dB compression: 1000 mV p-p/750 mV p-p/450 mV p-p Flexible active input impedance matching Overload recovery: <10 ns Variable gain amplifier (VGA) Attenuator range: 45dB, Linear-in-dB gain control Postamp gain (PGA): 21 dB/24 dB/27 dB/30 dB Antialiasing filter (AAF) Programmable second-order LPF from 8 MHz to 18 MHz or 13.5MHz to 30MHz and HPF Analog-to-digital converter (ADC) SNR: 75dB, 14 bits up to 125 MSPS **Configurable Serial LVDS** CW mode harmonic rejection I/Q demodulator Individual programmable phase rotation Output dynamic range per channel: >160 dBc/√Hz Output-referred SNR: 156 dBc/√Hz, 1 kHz offset, –3dBFS Digital demodulator/decimator

I/Q demodulator with programmable oscillator FIR decimation filter: 16 taps per decimation factor

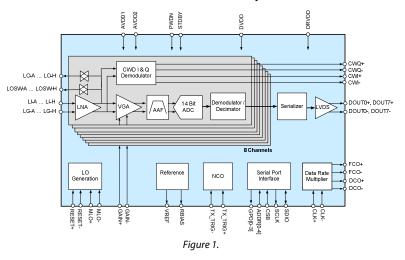

#### **GENERAL DESCRIPTION**

The AD9670 is designed for low cost, low power, small size, and ease of use for medical ultrasound. It contains eight channels of a variable gain amplifier (VGA) with a low noise preamplifier (LNA), a CW harmonic rejection I/Q demodulator with programmable phase rotation, an anti-aliasing filter (AAF), an analog-to-digital converter (ADC), and a digital demodulator and decimator for data processing and bandwidth reduction.

Each channel features a maximum gain of up to 52 dB, a fully differential signal path, and an active input preamplifier termination. The channel is optimized for high dynamic performance and low power in applications where a small package size is critical.

The LNA has a single-ended-to-differential gain that is selectable through the SPI. Assuming a 15 MHz noise bandwidth (NBW) and a 21.6 dB LNA gain, the LNA input SNR is 94 dB. In CW Doppler mode, each LNA output drives an I/Q demodulator that has independently programmable phase rotation with 16 phase settings.

Power-down of individual channels is supported to increase battery life for portable applications. Standby mode allows quick power-up for power cycling. In CW Doppler operation, the VGA, AAF, and ADC are powered down. The ADC contains several features designed to maximize flexibility and minimize system cost, such as a programmable clock, data alignment, and programmable digital test pattern generation. The digital test patterns include built-in fixed patterns, built-in pseudo random patterns, and custom user-defined test patterns entered via the serial port interface.
