

Features

- Processor Bus Frequency up to 100 MHz
- 64-bit or 32 bits Data Bus and 32-bit Address Bus
- Provides Support for Either Asynchronous SRAM, Burst SRAM, or Pipelined Burst SRAM
- Compliant with PCI Specification, Revision 2.1
- PCI Interface Operates up to 66 MHz/5.0V Compatible
- IEEE 1149.1 Compliant, JTAG Boundary-scan Interface
- PD Max = 1W (66 MHz), Full Operating Conditions
- Nap, Doze and Sleep Modes for Power Savings
- Two-channel Integrated DMA Controller
- Message Unit
 - Intelligent Input/Output (Two-wire Interface) Message Controller
 - Two Door Bell Registers
 - Inbound and Outbound Messaging Registers
- Inter-Integrated Circuit (Two-wire Interface) Controller, Full Master/Slave Support
- Embedded Programmable Interrupt Controller (EPIC)
 - Five Hardware Interrupts (IRQs) or 16 Serial Interrupts
 - Four Programmable Timers

Description

The PC107A PCI Bridge/Integrated Memory Controller provides a bridge between the Peripheral Component Interconnect, (PCI) bus and PowerPC 603e™, PowerPC 740™, PowerPC 750™ or PC7400 microprocessors.

PCI support allows system designers to design systems quickly using peripherals already designed for PCI and other standard interfaces available in the personal computer hardware environment. The PC107A provides many other necessities for embedded applications including a high-performance memory controller and dual processor support, 2-channel flexible DMA controller, an interrupt controller, an I₂O-ready message unit, an inter-integrated circuit controller (Two-wire Interface), and low skew clock drivers. The PC107A contains an Embedded Programmable Interrupt Controller (EPIC) featuring five hardware interrupts (IRQ's) as well as sixteen serial interrupts along with four timers. The PC107A uses an advanced, 2.5V HiP3 process technology and is fully compatible with TTL devices.

ZF

PBGA 503

Flip-chip Plastic Ball Grid Array

Screening

This product is manufactured in full compliance with :

- PBGA upscreenings based upon Atmel standards
- Full military temperature range (T_j = -55°C,+125°C)
- Industrial temperature range (T_j = -40°C,+110°C)

PCI Bridge Memory Controller

PC107A Preliminary Specification alpha Site

Rev. 2137A-HIREL-06/02

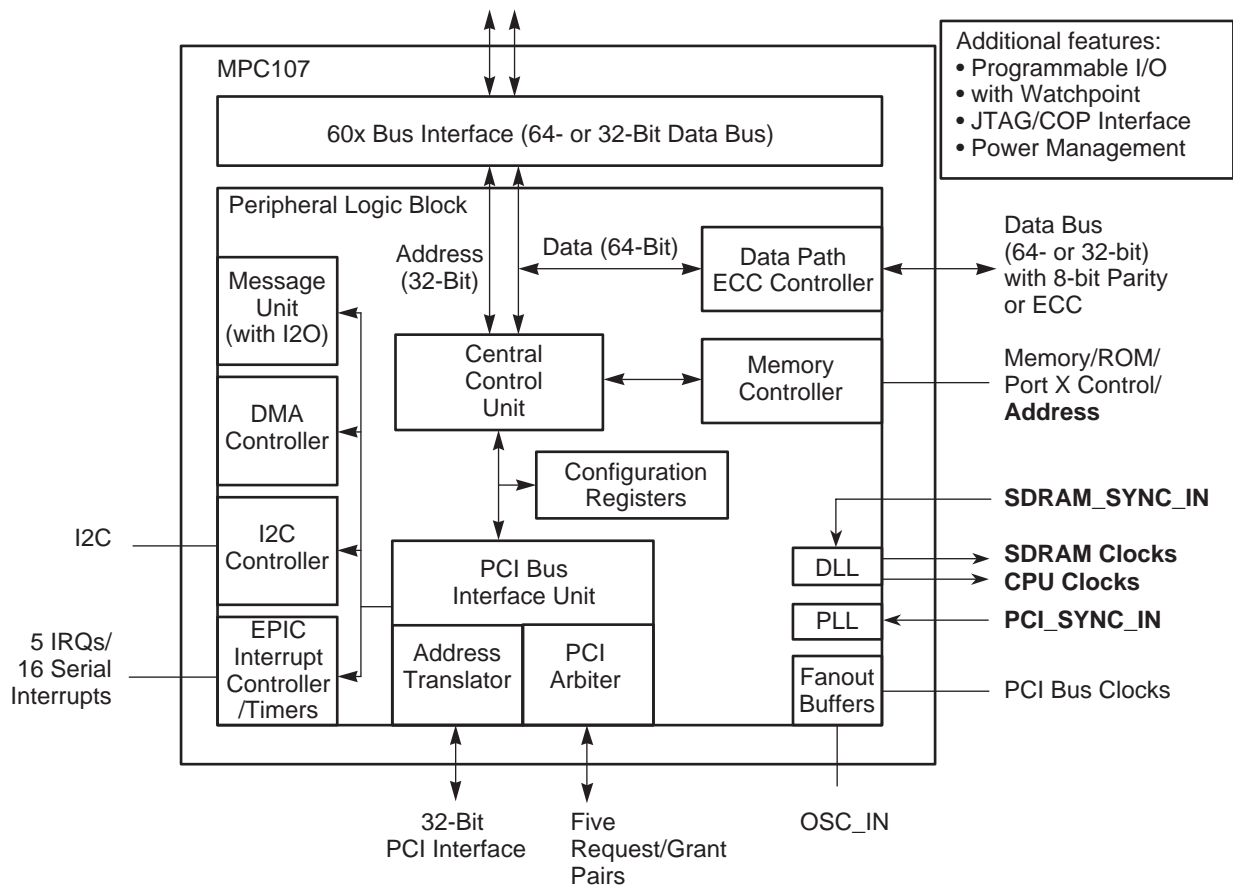

General Description

Simplified Block Diagram The PC107A integrates a PCI bridge, memory controller, DMA controller, EPIC interrupt controller/timers, a message unit with an Intelligent Input/Output (I₂O) message controller, and an Inter-integrated Circuit (two-wire interface) controller. The integration reduces the overall packaging requirements and the number of discrete devices required for an embedded system.

Figure 1 shows the major functional units within the PC107A. Note that this is a conceptual block diagram intended to show the basic features rather than an attempt to show how these features are physically implemented.

Figure 1. PC107A Block Diagram

General Parameters

The following list provides a summary of the general parameters of the PC107A:

Parameter	
Technology	0.29 μ m CMOS, five-layer metal
Die size	50 mm ²
Transistor count	0.96 million
Logic design	Fully-static
Package	Surface mount 503 Plastic Ball Grid Array (C4/PBGA)
Core power supply	2.5V \pm 5% V DC (nominal; see Table 3 on page 12 for recommended operating conditions)
I/O power supply	3.0V to 3.6V DC

Features

The PC107A provides an integrated high-bandwidth, high-performance interface between up to two 60x processors, the PCI bus, and main memory. This section summarizes the features of the PC107A. Major features of the PC107A are as follows:

- Memory Interface
 - 64-/32-bit 100 MHz bus
 - Programmable timing supporting either FPM DRAM, EDO DRAM or SDRAM
 - High-bandwidth bus (32-/64-bit data bus) to DRAM
 - Supports one to eight banks of 4-, 16-, 64-, or 128-Mbit memory devices, and up to four banks of 256-Mbit SDRAM devices
 - Supports 1-Mbyte to 1-Gbyte DRAM memory
 - 144 Mbytes of ROM space
 - 8-, 32-, or 64-bit ROM
 - Write buffering for PCI and processor accesses
 - Supports normal parity, read-modify-write (RMW), or ECC
 - Data-path buffering between memory interface and processor
 - Low-voltage TTL logic (LVTTTL) interfaces
 - Port X: 8-, 32-, or 64-bit general-purpose I/O port using ROM controller interface with programmable address strobe timing
- 32-bit PCI Interface Operating up to 66 MHz
 - PCI 2.1-compliant
 - PCI 5.0V tolerance
 - Support for PCI locked accesses to memory
 - Support for accesses to PCI memory, I/O, and configuration spaces
 - Selectable big- or little-endian operation
 - Store gathering of processor-to-PCI write and PCI-to-memory write accesses
 - Memory prefetching of PCI read accesses
 - Selectable hardware-enforced coherency
 - PCI bus arbitration unit (five request/grant pairs)
 - PCI agent mode capability
 - Address translation unit
 - Some internal configuration registers accessible from PCI

- Two-channel Integrated DMA Controller (Writes to ROM/Port X Not Supported)
 - Supports direct mode or chaining mode (automatic linking of DMA transfers)
 - Supports scatter gathering-read or write discontinuous memory
 - Interrupt on completed segment, chain, and error
 - Local-to-local memory
 - PCI-to-PCI memory
 - PCI-to-local memory
 - PCI memory-to-local memory
- Message Unit
 - Two doorbell registers
 - An extended doorbell register mechanism that facilitates interprocessor communication through interrupts in a dual-local-processor system
 - Two inbound and two outbound messaging registers
 - I₂O message controller
- Two-wire Interface Controller with Full Master/Slave Support (Except Broadcast All)
- Embedded Programmable Interrupt Controller (EPIC)
 - Five hardware interrupts (IRQs) or 16 serial interrupts
 - Four programmable timers
- Integrated PCI Bus, CPU, and SDRAM Clock Generation
- Programmable PCI Bus, 60x, and Memory Interface Output Drivers
- Dynamic Power Management – Supports 60x Nap, Doze, and Sleep Modes
- Programmable Input and Output Signals with Watchpoint Capability
- Built-in PCI Bus Performance Monitor Facility
- Debug Features
 - Error injection/capture on data path
 - IEEE 1149.1 (JTAG)/test interface
- Processor Interface
 - Supports up to two PowerPC™ microprocessors with 60x bus interface
 - Supports various operating frequencies and bus divider ratios
 - 32-bit address bus, 64/32-bit data bus supported at 100 MHz
 - Supports full memory coherency
 - Supports optional local bus slave
 - Decoupled address and data buses for pipelining of 60x accesses
 - Store gathering on 60x-to-PCI writes
 - Concurrent transactions on 60x and PCI buses supported

Pin Assignments

Pinout Listings

Table 1 provides the pinout listing for the PC107A, 503 PBGA package.

Table 1. PC107A Pinout Listing

Signal Name	Package Pin Number	Pin Type	Supply Voltage	Output Driver Type	Notes
60x Processor Interface Signals					
A[0–31]	AE22, AE16, AA14, AE17, AD21, AD14, AD20, AB16, AB20, AB15, AA20, AD13, Y15, AE12, AD15, AB9, AB14, AA8, AC13, Y12, Y11, AE15, AE13, AA16, Y13, AB8, AD12, AE10, AB13, Y9, Y8, AD9	I/O	BV _{DD}	DRV_CPU	(4)

MTP[1–2]	B12, B13	I/O	GV _{DD}	DRV_MEM_ADDR	(4)(9)

- Notes:
1. This pin has an internal pull-up resistor which is enabled only when the PC107A is in the reset state. The value of the internal pull-up resistor is not guaranteed, but is sufficient to ensure that a logic "1" is read into configuration bits during reset.
 2. This pin is a reset configuration pin.
 3. MDL[0] is a reset configuration pin and has an internal pull-up resistor which is enabled only when the MPC107 is in the reset state. The value of the internal pull-up resistor is not guaranteed, but is sufficient to insure that a logic '1' is read into configuration bits during reset.
 4. Multi-pin signals such as AD[0–31] or DL[0–31] have their physical package pin numbers listed in order corresponding to the signal names. Ex: AD0 is on pin D21, AD1 is on pin D23,... AD31 is on pin N23.
 5. SDMA[10–1] are reset configuration pins and have internal pull-up resistors which are enabled only when the MPC107 is in the reset state. The values of the internal pull-up resistors is not guaranteed, but are sufficient to ensure that logic "1"s are read into the configuration bits during reset.
 6. Recommend a weak pull-up resistor (2 k Ω – 10 k Ω) be placed on this PCI control pin to LV_{DD}.
 7. V_{IH} and V_{IL} for these signals are the same as the PCI V_{IH} and V_{IL} entries in Table 6, "DC Electrical Specifications."
 8. Recommend a weak pull-up resistor (2 k Ω – 10 k Ω) be placed on this pin to OV_{DD}.
 9. Recommend a weak pull-up resistor (2 k Ω – 10 k Ω) be placed on this pin to GV_{DD}.
 10. This pin has an internal pull-up resistor; the value of the internal pull-up resistor is not guaranteed, but is sufficient to prevent unused inputs from floating.
 11. This pin is affected by programmable PCI_HOLD_DEL parameter, see "PCI Signal Output Hold Timing" on page 26."
 12. This pin is an open drain signal.
 13. This pin is a sustained tri-state pin as defined by the *PCI Local Bus Specification*.
 14. See "Connection Recommendations" on page 39 for additional information on this pin.
 15. A weak pull-up resistor is recommend (2 k Ω – 10 k Ω) to be placed on this pin to BV_{DD}.
 16. If BV_{DD} = 2.5V \pm 5%, this microprocessor interface pin needs to be DC voltage level shifted from OV_{DD} (3.3V \pm 0.3V) to 2.5V \pm 5%; this can typically be accomplished with a two resistor voltage divider circuit since the signal is an output only signal.

Figure 2. PC107A Microprocessor Signal Groups

Detailed Specification

Scope

This drawing describes the specific requirements for the PC107A, in compliance with Atmel standard screening.

Applicable Documents

1. MIL-STD-883: Test methods and procedures for electronics.
2. SQ32S0100.0: Quality levels for supplied components.

Requirements

General

The microcircuits are in accordance with the applicable documents and as specified herein.

Design and Construction

Terminal Connections

The terminal connections are shown in Table 1, "PC107A Pinout Listing," on page 5.

Absolute Maximum Ratings

The tables in this section describe the PC107A DC electrical characteristics. Table 2 provides the absolute maximum ratings.

Table 2. Absolute Maximum Ratings

Symbol	Characteristic ⁽¹⁾	Value	Unit	Symbol
V_{DD}	Supply Voltage – Core	-0.3 to 2.75	V	V_{DD}
GV_{DD}	Supply Voltage – Memory Bus Drivers	-0.3 to 3.6	V	GV_{DD}
BV_{DD}	Supply Voltage – Processor Bus Drivers	-0.3 to 3.6	V	BV_{DD}
OV_{DD}	Supply Voltage – PCI and Standard I/O Buffers	-0.3 to 3.6	V	OV_{DD}
AV_{DD}/LAV_{DD}	Supply Voltage – PLLs and DLL	-0.3 to 2.75	V	AV_{DD}/LAV_{DD}
LV_{DD}	Supply Voltage – PCI Reference	-0.3 to 5.4	V	LV_{DD}
V_{IN}	Input Voltage ⁽²⁾	-0.3 to 3.6	V	V_{IN}
T_J	Operational Die-Junction Temperature Range	-55 to 125	°C	T_J
T_{STG}	Storage Temperature Range	-55 to 150	°C	T_{STG}

- Notes:
1. Functional and tested operating conditions are given in Table 3. Absolute maximum ratings are stress ratings only and functional operation at the maximums is not guaranteed. Stresses beyond those listed may affect device reliability or cause permanent damage to the device.
 2. PCI inputs with $LV_{DD} = 5V \pm 5\%$ V DC may be correspondingly stressed at voltages exceeding $LV_{DD} + 0.5$ V DC.

Recommended Operating Conditions

Table 3 provides the recommended operating conditions for the PC107A.

Table 3. Recommended Operating Conditions

Symbol	Characteristic		Recommended Value	Unit	Notes
V _{DD}	Supply Voltage		2.5 ± 5%	V	(4)
GV _{DD}	Supply Voltages for Memory Bus Drivers		3.3 ± 5%	V	(6)
BV _{DD}	Supply Voltages for Processor Bus Drivers		3.3 ± 5%	V	(6)
			2.5 ± 5%		
OV _{DD}	I/O Buffer supply for PCI and Standard		3.3 ± 0.3	V	(4)
AV _{DD}	PLL Supply Voltage		2.5 ± 5%	V	(5)
LAV _{DD}	DLL Supply Voltage		2.5 ± 5%	V	(5)
LV _{DD}	PCI Reference		5.0 ± 5%	V	(7)(8)
			3.3 ± 0.3	V	(7)(8)
V _{IN}	Input Voltage	PCI Inputs	0 to 3.6 or 5.75	V	(1)(2)
		All Other Inputs	0 to 3.6	V	(3)
T _J	Die-Junction Temperature		-55°C to 125°C	°C	

- Notes:
1. PCI pins are designed to withstand LV_{DD} + 0.5V dc when LV_{DD} is connected to a 5.0V DC power supply.
 2. PCI pins are designed to withstand LV_{DD} + 0.5V dc when LV_{DD} is connected to a 3.3V DC power supply.
 3. Input voltage (V_{IN}) must not be greater than the supply voltage (V_{DD}/AV_{DD}/LAV_{DD}) by more than 2.5V at all times including during power-on reset.
 4. OV_{DD} must not exceed V_{DD}/AV_{DD}/LAV_{DD} by more than 1.8V at any time including during power-on reset.
 5. V_{DD}/AV_{DD}/LAV_{DD} must not exceed OV_{DD} by more than 0.6V at any time including during power-on reset.
 6. BV_{DD}/GV_{DD} must not exceed V_{DD}/AV_{DD}/LAV_{DD} by more than 1.8V at any time including during power-on reset.
 7. LV_{DD} must not exceed V_{DD}/AV_{DD}/LAV_{DD} by more than 5.4V at any time including during power-on reset.
 8. LV_{DD} must not exceed OV_{DD} by more than 3.6V at any time including during power-on reset.

Figure 3 shows the supply voltage sequencing and separation cautions.

Figure 3. Supply Voltage Sequencing and Separation Cautions

- Notes:
1. Numbers associated with waveform separations correspond to caution numbers listed in Table 3, "Recommended Operating Conditions," on page 12.
 2. Refer to "Power Supply Voltage Sequencing" on page 38 for additional information.
 3. Refer to Table 9 on page 23 for additional information on PLL Relock and reset signal assertion timing requirements.
 4. Refer to Table 10 on page 23 for additional information on reset configuration pin setup timing requirements.
 5. $\overline{\text{HRESET}}$ must transition from a logic 0 to a logic 1 in less than one SDRAM_SYNC_IN clock cycle for the device to be in the non-reset state.
 6. $\overline{\text{HRESET_CPU}}$ negates 2^{17} memory clock cycles after $\overline{\text{HRESET}}$ negates.

Figure 4 shows the undershoot and overshoot voltage of the memory interface of the PC107A.

Figure 4. Overshoot/Undershoot Voltage

Thermal Information

Package Characteristics

Table 4 provides the package thermal characteristics for the PC107A.

Table 4. PBGA Package Thermal Characteristics

Symbol	Characteristic ⁽¹⁾	Value	Unit
θ_{JC}	Die Junction-to-Case Thermal Resistance	< 0.1	°C/W
θ_{JB}	Die Junction-to-Board Thermal Resistance	5.2	°C/W
θ_{JA}	Package Junction-to-Ambient Thermal Resistance ⁽²⁾	See Figure 5	

- Notes:
1. Refer to "System Design Information" on page 38 for more details about thermal management.
 2. $T_J = T_A + P_D \times \theta_{JA}$
 T_J = Die junction temperature.
 T_A = System air ambient temperature near the package.
 P_D = Average power consumed by IC in Watts.
 θ_{JA} = Thermal resistance from die junction to ambient air in °C/W

Thermal Management Information

This section provides thermal management information for the plastic ball grid array (PBGA) package for air-cooled applications. Proper thermal control design is primarily dependent upon the system-level design — the heat sink, airflow and thermal interface material.

Figure 5 depicts the die junction-to-ambient thermal resistance for two typical cases:

1. A heat sink is not attached to the PBGA package and there exists high board-level thermal loading of adjacent components. See “Typical Upper Limit” curve in Figure 5.
2. A heat sink is not attached to the PBGA package and there exists low board-level thermal loading of adjacent components. See “Typical Lower Limit” curve in Figure 5.

Figure 5 shows the die junction-to-ambient resistance.

Figure 5. Die Junction-to-Ambient Thermal Resistance

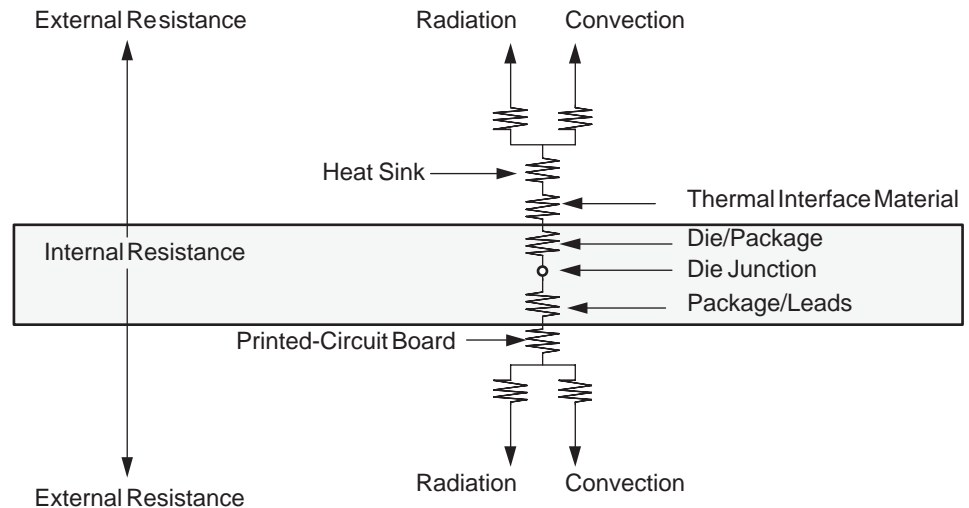

Internal Package Conduction Resistance

For the PBGA packaging technology, the intrinsic conduction thermal resistance paths are as follows:

- The die junction-to-case thermal resistance,
- The die junction-to-ball thermal resistance.

Figure 6 depicts the primary heat transfer path for a package with an attached heat sink mounted to a printed-circuit board.

Figure 6. C4 Package with Heat Sink Mounted to a Printed-Circuit Board

Note: The internal versus external package resistance

For this PBGA package, heat is dissipated from the component via several concurrent paths. Heat is conducted through the silicon and may be removed to the ambient air by convection and/or radiation. In addition, a second, parallel heat flow path exists by conduction in parallel through the C4 bumps and the epoxy under-fill, to the plastic substrate for further convection cooling off the edges. Then from the plastic substrate, heat is conducted via the leads/balls to the next-level interconnect (printed-circuit board) whereupon the primary mode of heat transfer is by convection and/or radiation.

Power Consideration

Power Dissipation

Table 5 provides the preliminary power consumption estimates for the PC107A.

At recommended operating conditions (see Table 3 on page 12) with $GV_{DD} = 3.3V \pm 5\%$ and $LV_{DD} = 3.3V \pm 5\%$

Table 5. Power Consumption

Mode	PCI_SYNC_IN/Core Frequency (MHz)								Unit	Notes
	25/50		33/33		33/66		66/100			
	V _{DD} Pwr	I/O Pwr	V _{DD} Pwr	I/O Pwr	V _{DD} Pwr	I/O Pwr	V _{DD} Pwr	I/O Pwr		
Maximum	477	1341	334	1105	636	1655	954	1635	mW	
Typical	400	1125	300	925	550	1325	800	1375	mW	(1)(2)
Doze	375	850	250	775	500	975	750	1125	mW	(1)(2)
Nap	375	875	250	825	500	1025	750	1150	mW	(1)(2)
Sleep	175	875	125	825	225	1025	325	1150	mW	(1)(2)
Sleep	125	725	100	650	175	875	275	1025	mW	(1)(2)(3)
Sleep	125	575	100	500	175	650	250	675	mW	(1)(3)(4)
Sleep	10	400	10	425	10	425	25	500	mW	(1)(3)(4)(5)
Reset	550	850	350	675	700	975	1050	950	mW	(1)(2)

Notes:

1. Power is measured with $V_{DD} = 2.625V$, $GV_{DD} = OV_{DD} = BV_{DD} = 3.45V$ at $0^{\circ}C$ and one DIMM populated in test system.
2. All clock drivers enabled.
3. Memory refresh off.
4. One PCI_CLK, one CPU_CLK, and one SDRAM_CLK enabled.
5. PLL off.

Electrical Characteristics

This section provides the AC and DC electrical specifications and thermal characteristics for the PC107A.

Static Characteristics

DC Electrical Specification

Table 6 provides the DC electrical characteristics for the PC107A.

At recommended operating conditions (see Table 3 on page 12)

Table 6. DC Electrical Specifications

Characteristics	Conditions ⁽¹⁾	Symbol	Value		Unit
			Min	Max	
Input High Voltage ⁽²⁾	PCI only	V_{IH}	$0.65 \cdot OV_{DD}$ ⁽³⁾	LV_{DD}	V
Input Low Voltage	PCI only	V_{IL}	–	$0.3 \cdot OV_{DD}$	V
Input High Voltage ⁽²⁾	All other pins ($GV_{DD} = 3.3V$)	V_{IH}	2.0	–	V
Input High Voltage ⁽²⁾	All other pins ($BV_{DD} = 2.5V$)	V_{IH}	1.7	–	V
Input Low Voltage	All inputs except PCI_SYNC_IN	V_{IL}	GND	0.8	V
PCI_SYNC_IN Input High Voltage		CV_{IH}	2.4	–	V
PCI_SYNC_IN Input Low Voltage		CV_{IL}	GND	0.4	V
Input Leakage Current for pins using DRV_PCI driver ⁽⁴⁾	$0.5V \leq V_{IN} \leq 2.7V$ at $LV_{DD} = 4.75$	I_L	–	± 70	μA
Input Leakage Current all others ⁽⁴⁾	$LV_{DD} = 3.6V$ ($GV_{DD} \leq 3.465$)	I_L	–	± 10	μA
Output High Voltage	$I_{OH} = \text{Driver Dependent}^{(5)}$ ($GV_{DD} = 3.3V$)	V_{OH}	2.4	–	V
Output Low Voltage	$I_{OL} = \text{Driver Dependent}^{(5)}$ ($GV_{DD} = 3.3V$)	V_{OL}	–	0.4	V
Output High Voltage	$I_{OH} = \text{Driver Dependent}^{(5)}$ ($BV_{DD} = 2.5V$) All outputs except CPUCLKS[0-2]	V_{OH}	1.85	–	V
	$I_{OH} = \text{Driver Dependent}^{(5)}$ ($BV_{DD} = 2.5V$) CPUCLKS[0-2] Only	V_{OH}	2.0	–	V

- Notes:
1. These specifications are for the default driver strengths indicated in Table 7 on page 19.
 2. See Figure 20 on page 32 for pins with internal pull-up resistors.
 3. The minimum Input high voltage is not compliant with the *PCI Local Bus Specification* (Rev 2.1) which specifies $0.5 \cdot OV_{DD}$ for minimum input high voltage.
 4. Leakage current is measured on input pins and on output pins in the high impedance state. The leakage current is measured for nominal OV_{DD}/LV_{DD} and V_{DD} or both OV_{DD}/LV_{DD} and V_{DD} must vary in the same direction.
 5. See Table 7 on page 19 for the typical drive capability of a specific signal pin based upon the type of output driver associated with that pin as listed in Table 1 on page 5.
 6. Capacitance is periodically sampled rather than 100% tested.

Output Driver Characteristics Table 7 provides information on the characteristics of the output drivers referenced in Table 1 on page 5. The values are from the PC107A IBIS model (v1.1) and are not tested, for additional detailed information see the complete IBIS model listing at <http://www.motorola.com/semiconductor>.

Table 7. Drive Capability of PC107A Output Pins

Driver Type	Programmable Output Impedance (Ohms)	Supply Voltage	I _{OH}	I _{OL}	Unit	Notes
DRV_CPU	20	BV _{DD} = 3.3V	36.6	18.1	mA	(2)(5)
		BV _{DD} = 2.5V	21.4	15.6	mA	(3)(6)(7)
	40 (default)	BV _{DD} = 3.3V	18.6	9.2	mA	(2)(5)
		BV _{DD} = 2.5V	10.8	7.9	mA	(3)(6)(7)
DRV_PCI	25	OV _{DD} = 3.3V	12.0	12.4	mA	(1)(4)
	50 (default)	OV _{DD} = 3.3V	6.1	6.3	mA	(1)(4)
DRV_MEM_ADDR DRV_PCI_CLK	8 (default)	GV _{DD} = 3.3V	89.0	42.3	mA	(2)(5)
	13.3	GV _{DD} = 3.3V	55.8	26.4	mA	(2)(5)
	20	GV _{DD} = 3.3V	36.6	18.1	mA	(2)(5)
	40	GV _{DD} = 3.3V	18.6	9.2	mA	(2)(5)
DRV_MEM_DATA	20 (default)	GV _{DD} = 3.3V	36.6	18.1	mA	(2)(5)
	40	GV _{DD} = 3.3V	18.6	9.2	mA	(2)(5)

Notes:

1. For DRV_PCI, I_{OH} read from the IBIS listing in the pull-up mode, I(Min) column, at the 0.33V label by interpolating between the 0.3V and 0.4V table entries' current values which corresponds to the PCI V_{OH} = 2.97 = 0.9*OV_{DD} (OV_{DD} = 3.3V) where Table Entry Voltage = OV_{DD} - PCI V_{OH}.
2. For all others with GV_{DD} or BV_{DD} = 3.3V, I_{OH} read from the IBIS listing in the pull-up mode, I(Min) column, at the 0.9V table entry which corresponds to the V_{OH} = 2.4V where Table Entry Voltage = G/BV_{DD} - V_{OH}.
3. For all others with BV_{DD} = 2.5V, I_{OH} read from the IBIS listing in the pull-up mode, I(Min) column, at the 0.65V table entry by interpolating between the 0.6V and 0.7V table entries' current values which corresponds to the V_{OH} = 1.85V where Table Entry Voltage = BV_{DD} - V_{OH}.
4. For DRV_PCI, I_{OL} read from the IBIS listing in the pull-down mode, I(Min) column, at 0.33V = PCI V_{OL} = 0.1*OV_{DD} (OV_{DD} = 3.3V) by interpolating between the 0.3V and 0.4V table entries.
5. For all others with GV_{DD} or BV_{DD} = 3.3V, I_{OL} read from the IBIS listing in the pull-down mode, I(Min) column, at the 0.4V table entry.
6. For all others with BV_{DD} = 2.5V, I_{OL} read from the IBIS listing in the pull-down mode, I(Min) column, at the 0.4V table entry.
7. For BV_{DD} = 2.5V, the I_{OH} and I_{OL} values are estimated from the io_mem_data_XX_2.5 and io_mem_addr_XX_2.5 sections of the IBIS model where XX = driver output impedance (20 or 40Ω).

Dynamic Electrical Characteristics

Clock AC Specifications

Table 8 provides the clock AC timing specifications as defined in Section.

At recommended operating conditions (see Table 3 on page 12) with GV_{DD} = 3.3V ± 5% and LV_{DD} = 3.3V ± 0.3V

Table 8. Clock AC Timing Specifications

Num	Characteristics and Conditions ⁽¹⁾	Min	Max	Unit	Notes
1a	Frequency of Operation (PCI_SYNC_IN)	12.5	66	MHz	(8)
1b	PCI_SYNC_IN Cycle Time	80	15	ns	(8)
2, 3	PCI_SYNC_IN Rise and Fall Times	—	2.0	ns	(2)
4	PCI_SYNC_IN Duty Cycle Measured at 1.4V	40	60	%	
5a	PCI_SYNC_IN Pulse Width High Measured at 1.4V	6	9	ns	(3)
5b	PCI_SYNC_IN Pulse Width Low Measured at 1.4V	6	9	ns	(3)
7	PCI_SYNC_IN Jitter	—	< 150	ps	
9a	PCI_CLK[0–4] Skew (Pin to Pin)	—	500	ps	
9b	SDRAM_CLK[0–3] Skew (Pin to Pin)	—	350	ps	
9c	CPU_CLK[0–2] Skew (Pin to Pin)	—	350	ps	
9d	SDRAM_CLK[0–3]/CPU_CLK[0–2] Jitter	—	150	ps	
10	Internal PLL Relock Time	—	100	μs	(3)(4)(6)
15	DLL Lock Range with DLL_EXTEND = 0 disabled	$0 \leq (NT_{clk} - t_{loop} - t_{fix0}) \leq 7$		ns	(7)
16	DLL Lock Range with DLL_EXTEND = 1 enabled (default)	$0 \leq (NT_{clk} - T_{clk}/2 - t_{loop} - t_{fix0}) \leq 7$		ns	(7)
17	Frequency of Operation (OSC_IN)	12.5	66	MHz	(8)
18	OSC_IN Cycle Time	80	15	ns	(8)
19	OSC_IN Rise and Fall Times	—	5	ns	(5)
20	OSC_IN Duty Cycle Measured at 1.4V	40	60	%	
21	OSC_IN Frequency Stability	—	100	ppm	

- Notes:
1. These specifications are for the default driver strengths indicated in Table 7 on page 19.
 2. Rise and fall times for the PCI_SYNC_IN input are measured from 0.4V to 2.4V.
 3. Specification value at maximum frequency of operation.
 4. Relock time is guaranteed by design and characterization. Relock time is not tested.
 5. Rise and fall times for the OSC_IN input is guaranteed by design and characterization. OSC_IN input rise and fall times are not tested.
 6. Relock timing is guaranteed by design. PLL-relock time is the maximum amount of time required for PLL lock after a stable V_{DD} and PCI_SYNC_IN are reached during the reset sequence. This specification also applies when the PLL has been disabled and subsequently re-enabled during sleep mode. Also note that \overline{HRESET} must be held asserted for a minimum of 255 bus clocks after the PLL-relock time during the reset sequence.
 7. DLL_EXTEND is bit 7 of the PMC2 register <72>. N is a non-zero integer (1 or 2). T_{clk} is the period of one SDRAM_SYNC_OUT clock cycle in ns. t_{loop} is the propagation delay of the DLL synchronization feedback loop (PC board runner) from SDRAM_SYNC_OUT to SDRAM_SYNC_IN in ns; 6.25 inches of loop length (unloaded PC board runner) corresponds to approximately 1 ns of delay. t_{fix0} is a fixed delay inherent in the design when the DLL is at tap point 0 and the DLL is contributing no delay; t_{fix0} equals approximately 3 ns. See Figure 9 on page 22 for DLL locking ranges.
 8. See Table 19 on page 37 for PCI_SYNC_IN input frequency range for specific PLL_CFG[0–3] settings.

Figure 7 shows the PCI_SYNC_IN Input Clock Timing Diagram, Figure 8 illustrates how Table 8 clock specifications relate to the PC107A Clocking diagram, and Figure 9 shows the DLL Locking Range Loop Delay vs. Frequency of Operation.

Figure 7. PCI_SYNC-IN Input Clock Timing Diagram

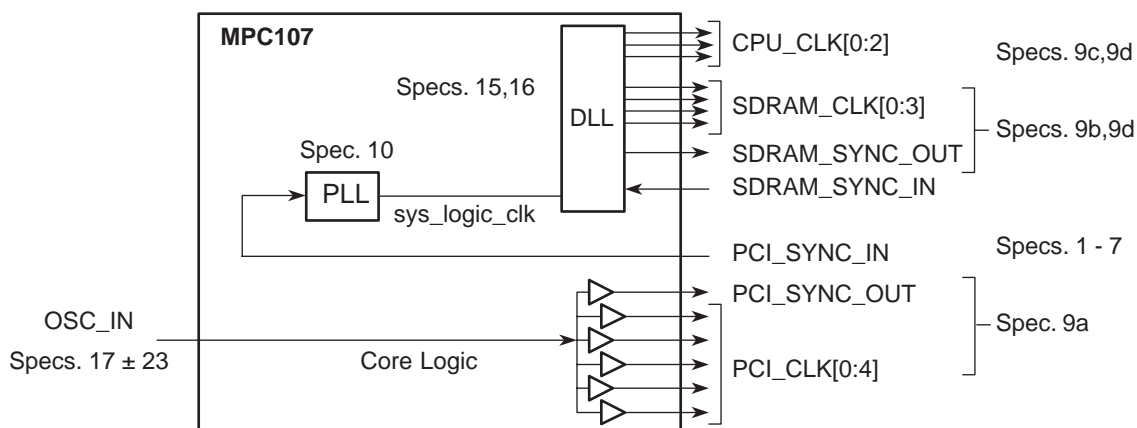

Figure 8. Clock Subsystem Block Diagram

Note: Specification numbers are from Table 8.

Figure 9. DLL Locking Range Loop Delay vs. Frequency of Operation

Operating Frequency

This section provides the AC electrical characteristics for the PC107A. After fabrication, functional parts are sorted by maximum core frequency as shown in Figure 9 and “Clock AC Specifications” on page 19 and tested for conformance to the AC specifications for that frequency. The core frequency is determined by the bus (PCI_SYNC_IN) clock frequency and the settings of the PLL_CFG[0–3] signals. Parts are sold by maximum processor core frequency; see “Ordering Information” on page 42.

Table 9 provides the operating frequency information for the PC107A.

At recommended operating conditions (see Table 3 on page 12) with $LV_{DD} = 3.3V \pm 0.3V$.

Table 9. Operating Frequency

Characteristic ⁽¹⁾	66 MHz		100 MHz		Unit
	Min	Max	Min	Max	
Core (memory bus/processor bus) Frequency	25	66	25	100	MHz
PCI Input Frequency (PCI_SYNC_IN)	12.5 - 66				MHz

Note: 1. Caution: The PCI_SYNC_IN frequency and PLL_CFG[0–3] settings must be chosen such that the resulting peripheral logic/memory bus frequency, CPU (core) frequency, and PLL (VCO) frequencies do not exceed their respective maximum or minimum operating frequencies. Refer to the PLL_CFG[0–3] signal description in “Clock Relationships Choice” on page 37 for valid PLL_CFG[0–3] settings and PCI_SYNC_IN frequencies.

Input AC Timing Specifications

Table 10 provides the input AC timing specifications. See Figure 10 on page 24 and Figure 11 on page 24.

At recommended operating conditions (see Table 3 on page 12) with $GV_{DD} = 3.3V \pm 5\%$ and $LV_{DD} = 3.3V \pm 0.3V$

Table 10. Input AC Timing Specifications

Num	Characteristics	Min	Max	Unit	Notes
10a	PCI Input Signals Valid to PCI_SYNC_IN (Input Setup)	3.0	—	ns	(2)(3)
10b	Memory Interface Signals Valid to SDRAM_SYNC_IN (Input Setup)	2.0	—	ns	(1)(3)
10c	Epic, Misc. Debug Input Signals Valid to SDRAM_SYNC_IN (Input Setup)	2.0	—	ns	(1)(3)
10d	Two-wire interface Input Signals Valid to SDRAM_SYNC_IN (Input Setup)	2.0	—	ns	(1)(3)
10e	Mode select Inputs Valid to \overline{HRESET} (Input Setup)	$9 \cdot t_{CLK}$	—	ns	(1)(3)(5)
10f	60x Processor Interface Signals Valid to SDRAM_SYNC_IN (Input Setup)	2.0	—	ns	(1)(3)
11a1	PCI_SYNC_IN (SDRAM_SYNC_IN) to Inputs Invalid (Input Hold)	1.0	—	ns	(2)(3)

Table 10. Input AC Timing Specifications (Continued)

Num	Characteristics	Min	Max	Unit	Notes
11a2	Memory Interface Signals SDRAM_SYNC_IN to Inputs Invalid (Input Hold)	0.5	—	ns	(1)(3)
11a3	60x Processor Interface Signals SDRAM_SYNC_IN to Inputs Invalid (Input Hold)	0	—	ns	(1)(3)
11b	HRESET to Mode select Inputs Invalid (Input Hold)	0	—	ns	(1)(3)(5)

- Notes:
1. All memory, processor and related interface input signal specifications are measured from the TTL level (0.8 or 2.0V) of the signal in question to the $V_M = 1.4V$ of the rising edge of the memory bus clock, SDRAM_SYNC_IN. SDRAM_SYNC_IN is the same as PCI_SYNC_IN in 1:1 mode, but is twice the frequency in 2:1 mode (processor/memory bus clock rising edges occur on every rising and falling edge of PCI_SYNC_IN). See Figure 10.
 2. All PCI signals are measured from $OV_{DD}/2$ of the rising edge of PCI_SYNC_IN to $0.4 \cdot OV_{DD}$ of the signal in question for 3.3V PCI signaling levels. See Figure 11.
 3. Input timings are measured at the pin.
 4. t_{CLK} is the time of one SDRAM_SYNC_IN clock cycle.
 5. All mode select input signals specifications are measured from the TTL level (0.8 or 2.0V) of the signal in question to the $V_M = 1.4V$ of the rising edge of the HRESET signal. See Figure 12 on page 25.

Figure 10. Input – Output Timing Diagram Referenced to SDRAM_SYNC_IN

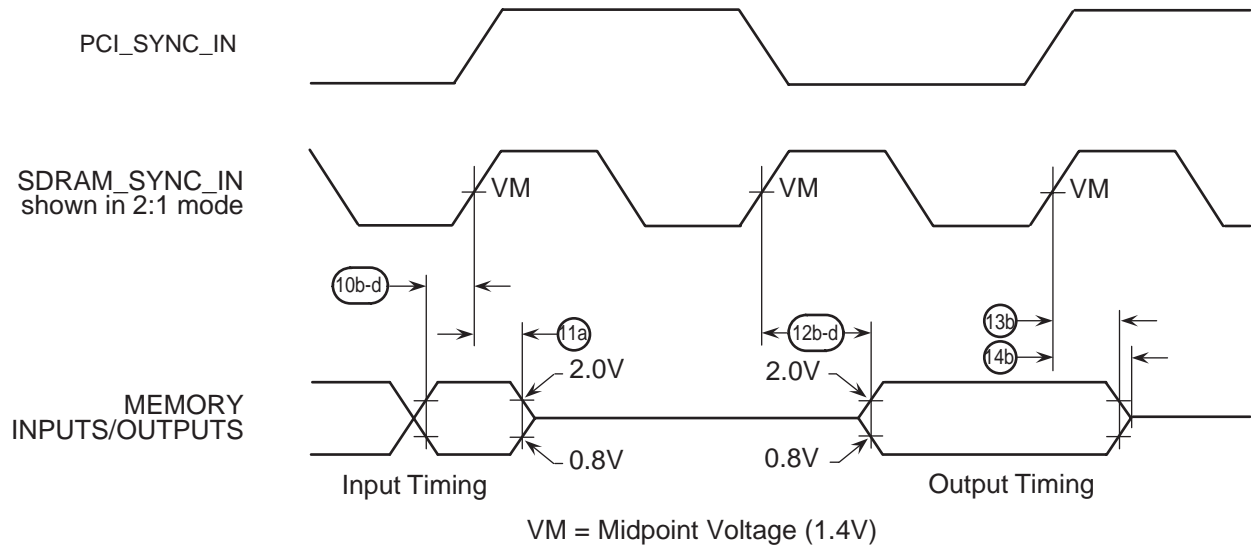

Figure 11. Input – Output Timing Diagram Referenced to PCI_SYNC_IN

Figure 12. Input Timing Diagram for Mode Select Signals

Output AC Timing Specification

Table 11 provides the processor bus AC timing specifications for the PC107A. See Figure 10 on page 24 and Figure 11 on page 24.

At recommended operating conditions (see Table 3 on page 12) with $LV_{DD} = 3.3V \pm 0.3V$

Table 11. Output AC Timing Specifications

Num	Characteristics ⁽³⁾⁽⁶⁾	Min	Max	Unit	Notes
12a	PCI_SYNC_IN to Output Valid, 66 MHz PCI, with SDMA4 pulled-down to logic 0 state. See Figure 14.	—	6.0	ns	(2)(4)
	PCI_SYNC_IN to Output Valid, 33 MHz PCI, with SDMA4 in the default logic 1 state. See Figure 14.	—	11.0	ns	(2)(4)
12b	Memory Interface Signals, SDRAM_SYNC_IN to Output Valid	—	5.5	ns	(1)
12b1	Memory Interface Signal: CKE (100 MHz Device), SDRAM_SYNC_IN to Output Valid	—	5.5	ns	(1)
12b2	Memory Interface Signal: CKE (66 MHz Device), SDRAM_SYNC_IN to Output Valid	—	6.0	ns	(1)
12c	Epic, Misc. Debug Signals, SDRAM_SYNC_IN to Output Valid	—	9.0	ns	(1)
12d	Two-wire interface, SDRAM_SYNC_IN to Output Valid	—	5.0	ns	(1)
12e	60x Processor Interface Signals, SDRAM_SYNC_IN to Output Valid	—	5.5	ns	(1)
13a	Output Hold, 66 MHz PCI, with SDMA4 and SDMA3 pulled-down to logic 0 states. See Table 12.	1.0	—	ns	(2)(4)(5)
	Output Hold, 33 MHz PCI, with SDMA4 in the default logic 1 state and SDMA3 pulled-down to logic 0 state. See Table 12.	2.0	—	ns	(2)(4)(5)
13b	Output Hold (For All Others)	1		ns	(1)
14a	PCI_SYNC_IN to Output High Impedance (T_{off} for PCI)	—	14.0	ns	(2)(4)
14b	SDRAM_SYNC_IN to Output High Impedance (For All Others)	—	4.0	ns	(1)

- Notes:
1. All memory and related interface output signal specifications are specified from the $V_M = 1.4V$ of the rising edge of the memory bus clock, SDRAM_SYNC_IN to the TTL level (0.8 or 2.0V) of the signal in question. SDRAM_SYNC_IN is the same as PCI_SYNC_IN in 1:1 mode, but is twice the frequency in 2:1 mode (processor/memory bus clock rising edges occur on every rising and falling edge of PCI_SYNC_IN). See Figure 10 on page 24.
 2. All PCI signals are measured from $OV_{DD}/2$ of the rising edge of PCI_SYNC_IN to $0.285 \cdot OV_{DD}$ or $0.615 \cdot OV_{DD}$ of the signal in question for 3.3V PCI signaling levels. See Figure 11 on page 24.
 3. All output timings assume a purely resistive 50Ω load (See Figure 13 on page 26). Output timings are measured at the pin; time-of-flight delays must be added for trace lengths, vias, and connectors in the system.

4. PCI Bussed signals are composed of the following signals: $\overline{\text{LOCK}}$, $\overline{\text{IRDY}}$, $\overline{\text{C/BE}}[0-3]$, $\overline{\text{PAR}}$, $\overline{\text{TRDY}}$, $\overline{\text{FRAME}}$, $\overline{\text{STOP}}$, $\overline{\text{DEVSEL}}$, $\overline{\text{PERR}}$, $\overline{\text{SERR}}$, $\overline{\text{AD}}[0-31]$, $\overline{\text{REQ}}[4-0]$, $\overline{\text{GNT}}[4-0]$, $\overline{\text{IDSEL}}$, $\overline{\text{INTA}}$.
5. PCI hold times can be varied, see “PCI Signal Output Hold Timing” on page 26 for information on programmable PCI output hold times. The values shown for item 13a are for PCI compliance.
6. These specifications are for the default driver strengths indicated in Table 7 on page 19.

Figure 13. AC Test Load for the PC107A

PCI Signal Output Hold Timing

In order to meet minimum output hold specifications relative to PCI_SYNC_IN for both 33 MHz and 66 MHz PCI systems, the PC107A has a programmable output hold delay for PCI signals. The initial value of the output hold delay is determined by the values on the SDMA4 and SDMA3 reset configuration signals. Further output hold delay values are available by programming the PCI_HOLD_DEL value of the PMCR2 configuration register.

Table 12 describes the bit values for the PCI_HOLD_DEL values in PMCR2.

Table 12. Power Management Configuration Register 2-0x72

Bit	Name	Reset value	Description
6–4	PCI_HOLD_DEL	xx0	<p>PCI output hold delay values relative to PCI_SYNC_IN. The initial values of bits 6 and 5 are determined by the reset configuration pins SDMA4 and SDMA3, respectively. As these two pins have internal pull-up resistors, the default value after reset is 0b110.</p> <p>While the minimum hold times are guaranteed at shown values, changes in the actual hold time can be made by incrementing or decrementing the value in these bit fields of this register via software or hardware configuration. The increment is in approximately 400 picosecond steps. Lowering the value in the three bit field decreases the amount of output hold available.</p> <p>000 66 MHz PCI. Pull-down SDMA4 configuration pin with a 2 kΩ or less value resistor. This setting guarantees the minimum output hold, item 13a, and the maximum output valid, item 12a, times as specified in Figure 11 are met for a 66 MHz PCI system. See Figure 14 on page 27.</p> <p>001</p> <p>010</p> <p>011</p> <p>100 33 MHz PCI. This setting guarantees the minimum output hold, item 13a, and the maximum output valid, item 12a, times as specified in Figure 11 are met for a 33 MHz PCI system. See Figure 14 on page 27.</p> <p>101</p> <p>110 (Default if reset configuration pins left unconnected)</p> <p>111</p>

Figure 14. PCI_HOLD_DEL Effect on Output Valid and Hold Time

Two-wire Interface AC Timing Specifications

Table 13 provides the two-wire interface input AC timing specifications for the PC107A. At recommended operating conditions (see Table 3 on page 12) with $V_{DD} = 3.3V \pm 0.3V$

Table 13. Two-wire Interface Input AC Timing Specifications

Num	Characteristics	Min	Max	Unit	Notes
1	Start condition hold time	4.0	–	CLKs	(1)(2)
2	Clock low period (The time before the PC107A will drive SCL low as a transmitting slave after detecting SCL low as driven by an external master)	$8.0 + (16 \times 2^{FDR[4:2]}) \times (5 - 4(\{FDR[5], FDR[1]\} == b'10) - 3(\{FDR[5], FDR[1]\} == b'11) - 2(\{FDR[5], FDR[1]\} == b'00) - 1(\{FDR[5], FDR[1]\} == b'01))$	–	CLKs	(1)(2)(4)(5)
3	SCL/SDA rise time (from 0.5V to 2.4V)	–	1	ms	
4	Data hold time	0	–	ns	(2)
5	SCL/SDA fall time (from 2.4V to 0.5V)	–	1	mS	
6	Clock high period (Time needed to either receive a data bit or generate a START or STOP)	5.0	–	CLKs	(1)(2)(5)
7	Data setup time	3.0	–	ns	(3)
8	Start condition setup time (for repeated start condition only)	4.0	–	CLKs	(1)(2)
9	Stop condition setup time	4.0	–	CLKs	(1)(2)

- Notes:
- Units for these specifications are in SDRAM_CLK/CPU_CLK units.
 - The actual values depend on the setting of the Digital Filter Frequency Sampling Rate (DFFSR) bits in the Frequency Divider Register two-wire interface FDR. Therefore, the noted timings in the above table are all relative to qualified signals. The qualified SCL and SDA are delayed signals from what is seen in real time on the two-wire interface bus. The qualified SCL, SDA signals are delayed by the SDRAM_CLK/CPU_CLK clock times DFFSR times 2 plus 1 SDRAM_CLK/CPU_CLK clock. The resulting delay value is added to the value in the table (where this note is referenced). See Figure 16 on page 31.
 - Timing is relative to the Sampling Clock (not SCL).
 - FDR[x] refers to the Frequency Divider Register I2CFDR bit x.
 - Input clock low and high periods in combination with the FDR value in the Frequency Divider Register (I2CFDR) determine the maximum two-wire interface input frequency. See Figure 16 on page 31.

Table 14 provides the two-wire interface Frequency Divider Register (I2CFDR) information for the PC107A.

At recommended operating conditions (see Table 3 on page 12) with $V_{DD} = 3.3V \pm 5\%$

Table 14. PC8240 Maximum Two-wire Interface Input Frequency

FDR Hex ⁽²⁾	Divider (Dec) ⁽²⁾	Max Two-wire Interface Input Frequency ⁽¹⁾			
		SDRAM_CLK/ CPU_CLK at 25 MHz	SDRAM_CLK/ CPU_CLK at 33 MHz	SDRAM_CLK/ CPU_CLK at 50 MHz	SDRAM_CLK/ CPU_CLK at 100 MHz

- Notes:
1. Values are in kHz unless otherwise specified.
 2. FDR Hex and Divider (Dec) values are listed in corresponding order.
 3. Multiple Divider (Dec) values will generate the same input frequency but each Divider (Dec) value will generate a unique output frequency as shown in Table 15 on page 30.

Table 15 provides the two-wire interface output AC timing specifications for the PC107A.
At recommended operating conditions (see Table 3 on page 12) with $GV_{DD} = 3.3V \pm 5\%$
and $LV_{DD} = 3.3V \pm 0.3V$

Table 15. Two-wire Interface Output AC Timing Specifications

Num	Characteristics	Min	Max	Unit	Notes
1	Start condition hold time	$(FDR[5] == 0) \times (D_{FDR}/16) / 2N + (FDR[5] == 1) \times (D_{FDR}/16) / 2M$	–	CLKs	(1)(2)(5)
2	Clock low period	$D_{FDR} / 2$	–	CLKs	(1)(2)(5)
3	SCL/SDA rise time (from 0.5V to 2.4V)	–	–	mS	(3)
4	Data hold time	$8.0 + (16 \times 2^{FDR[4:2]}) \times (5 - 4(\{FDR[5], FDR[1]\} == b'10) - 3(\{FDR[5], FDR[1]\} == b'11) - 2(\{FDR[5], FDR[1]\} == b'00) - 1(\{FDR[5], FDR[1]\} == b'01))$	–	CLKs	(1)(2)(5)
5	SCL/SDA fall time (from 2.4V to 0.5V)	–	< 5	ns	(4)
6	Clock high time	$D_{FDR} / 2$	–	CLKs	(1)(2)(5)
7	Data setup time (PC107A as a master only)	$(D_{FDR} / 2) - (\text{Output data hold time})$	–	CLKs	(1)(5)
8	Start condition setup time (for repeated start condition only)	$D_{FDR} + (\text{Output start condition hold time})$	–	CLKs	(1)(2)(5)
9	Stop condition setup time	4.0	–	CLKs	(1)(2)

- Notes:
- Units for these specifications are in SDRAM_CLK/CPU_CLK units.
 - The actual values depend on the setting of the Digital Filter Frequency Sampling Rate (DFFSR) bits in the Frequency Divider Register I2CFDR. Therefore, the noted timings in the above table are all relative to qualified signals. The qualified SCL and SDA are delayed signals from what is seen in real time on the two-wire interface bus. The qualified SCL, SDA signals are delayed by the SDRAM_CLK/CPU_CLK clock times DFFSR times 2 plus 1 SDRAM_CLK/CPU_CLK clock. The resulting delay value is added to the value in the table (where this note is referenced). See Figure 16 on page 31.
 - Since SCL and SDA are open-drain type outputs, which the PC107A can only drive low, the time required for SCL or SDA to reach a high level depends on external signal capacitance and pull-up resistor values.
 - Specified at a nominal 50 pF load.
 - D_{FDR} is the decimal divider number indexed by FDR[5:0] value. Refer to the two-wire Interface chapter's Serial Bit Clock Frequency Divider Selections table. FDR[x] refers to the Frequency Divider Register I2CFDR bit x. N is equal to a variable number that would make the result of the divide (Data Hold Time value) equal to a number less than 16. M is equal to a variable number that would make the result of the divide (Data Hold Time value) equal to a number less than 9.

Note: The delay is the Local Memory clock times DFFSR times 2 plus 1 Local Memory clock.

EPIC Serial Interrupt Mode AC Timing Specifications

Table 16 provides the EPIC serial interrupt mode AC timing specifications for the PC107A.

At recommended operating conditions (see Table 3 on page 12) with $V_{DD} = 3.3V \pm 0.3V$

Table 16. EPIC Serial Interrupt Mode AC Timing Specifications

Num	Characteristics	Min	Max	Unit	Notes
1	S_CLK Frequency	1/14 SDRAM_SYNC_IN	1/2 SDRAM_SYNC_IN	MHz	(1)
2	S_CLK Duty Cycle	40	60	%	
3	S_CLK Output Valid Time	–	6	nS	
4	Output Hold Time	0	–	nS	
5	$\overline{S_FRAME}$, S_RST Output Valid Time	–	1 sys_logic_clk period + 6	nS	(2)
6	S_INT Input Setup Time to S_CLK	1 sys_logic_clk period + 2	–	nS	(2)
7	S_INT Inputs Invalid (Hold Time) to S_CLK	–	0	nS	(2)

- Notes:
1. See the PC107A User's Manual for a description of the EPIC Interrupt Control Register (EICR) describing S_CLK frequency programming.
 2. S_RST, $\overline{S_FRAME}$, and S_INT shown in Figure 19 and Figure 20 depict timing relationships to sys_logic_clk and S_CLK and do not describe functional relationships between S_RST, $\overline{S_FRAME}$, and S_INT. See the PC107A User's Manual for a complete description of the functional relationships between these signals.
 3. The sys_logic_clk waveform is the clocking signal of the internal peripheral logic from the output of the peripheral logic PLL; sys_logic_clk is the same as SDRAM_SYNC_IN when the SDRAM_SYNC_OUT to SDRAM_SYNC_IN feedback loop is implemented and the DLL is locked. See the PC107A User's Manual for a complete clocking description.

Figure 19. EPIC Serial Interrupt Mode Output Timing Diagram

Figure 20. EPIC Serial Interrupt Mode Input Timing Diagram

IEEE 1149.1 (JTAG) AC Timing Specifications

Table 17 provides the JTAG AC timing specifications for the PC107A while in the JTAG operating mode.

At recommended operating conditions (see Table 3 on page 12) with $LV_{DD} = 3.3V \pm 0.3V$

Table 17. JTAG AC Timing Specifications (Independent of PCI_SYNC_IN)

Num	Characteristics ⁽⁴⁾	Min	Max	Unit	Notes
	TCK Frequency of Operation	0	25	MHz	
1	TCK Cycle Time	40	–	ns	
2	TCK Clock Pulse Width Measured at 1.5V	20	–	ns	
3	TCK Rise and Fall Times	0	3	ns	
4	TRST_ Setup Time to TCK Falling Edge	10	–	ns	(1)
5	TRST_ Assert Time	10	–	ns	
6	Boundary Scan Input Data Setup Time	5	–	ns	(2)
7	Boundary Scan Input Data Hold Time	15	–	ns	(2)
8	TCK to Output Data Valid	0	30	ns	(3)
9	TCK to Output High Impedance	0	30	ns	(3)
10	TMS, TDI Data Setup Time	5	–	ns	
11	TMS, TDI Data Hold Time	15	–	ns	
12	TCK to TDO Data Valid	0	15	ns	
13	TCK to TDO High Impedance	0	15	ns	

- Notes:
1. \overline{TRST} is an asynchronous signal. The setup time is for test purposes only.
 2. Non-test (other than TDI and TMS) signal input timing with respect to TCK.
 3. Non-test (other than TDO) signal output timing with respect to TCK.
 4. Timings are independent of the system clock (PCI_SYNC_IN).

Figure 23. JTAG Boundary Scan Timing Diagram

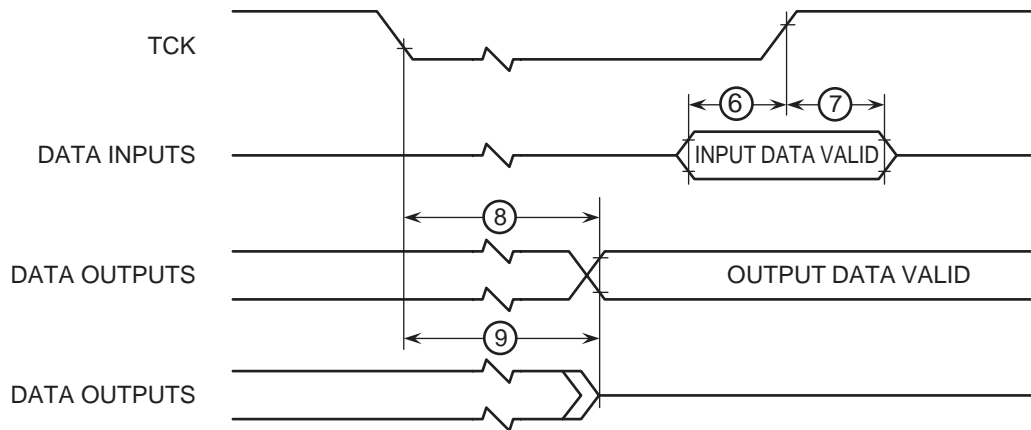

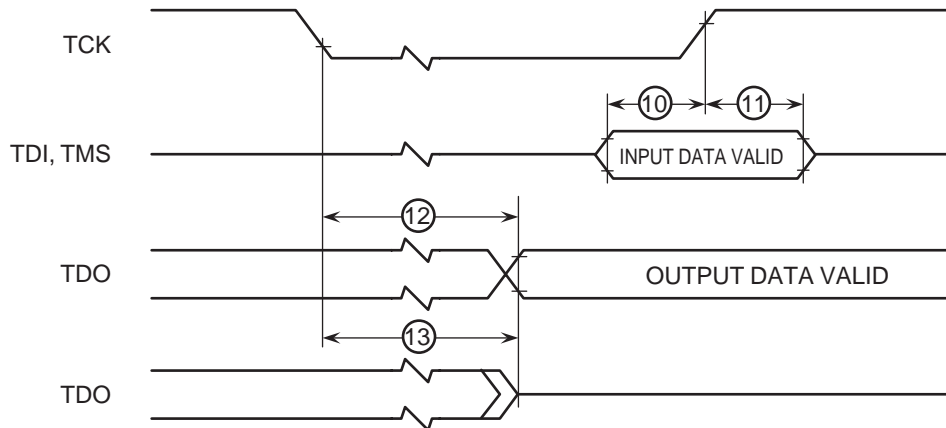

Figure 24. Test Access Port Timing Diagram

Preparation for Delivery

Packaging

Microcircuits are prepared for delivery in accordance with internal standards.

Certificate of Compliance

Atmel offers a certificate of compliance with each shipment of parts, affirming the products are in compliance either with internal specifications and guaranteeing the parameters not tested at temperature extremes for the entire temperature range.

Handling

MOS devices must be handled with certain precautions to avoid damage due to accumulation of static charge. Input protection devices have been designed in the chip to minimize the effect of this static buildup. However, the following handling practices are recommended:

- Devices should be handled on benches with conductive and grounded surfaces.
- Ground test equipment, tools and operator.
- Do not handle devices by the leads.
- Store devices in conductive foam or carriers.
- Avoid use of plastic, rubber or silk in MOS areas.
- Maintain relative humidity above 50% if practical.

Package Mechanical Data

Package Parameters

The PC107A uses a 33 mm x 33 mm, 503 pin Plastic Ball Grid Array (PBGA) package. The plastic package parameters are as provided in the following list.

Table 18. Package Parameters

Parameter	
Package Outline	33 mm x 33 mm
Interconnects	503
Pitch	1.27 mm
Solder Attach	62 Sn/36 Pb/2 Ag
Solder Balls	62 Sn/36 Pb/2 Ag
Solder Balls Diameter	0.60 mm - 0.90 mm
Maximum Module Height	2.75 mm
Co-planarity Specification	0.20 mm
Maximum Force	6.0 lbs. total, uniformly distributed over package (5.4 grams/ball)

Mechanical Dimensions

Figure 25 shows the top surface, side profile, and pinout of the PC107A, 503 PBGA package.

Figure 25. PC107A Package Dimensions and Pinout Assignments

- Notes:
1. Dimensioning and tolerancing per A.
 2. Dimensions in millimeters.
 3. Dimension b is the maximum solder ball diameter measured parallel to datum A.
 4. D2 and E2 define the area occupied on the die and underfill actual size of this area may be smaller than shown. D3 and E3 are the minimum clearance from the package edge to the chip capacitors.
 5. Capacitors may not be present on all devices.
 6. Caution must be taken not to short expose metal capacitor pads on package top.

Clock Relationships Choice

The PC107A's internal PLL is configured by the PLL_CFG[0–3] signals. For a given PCI_SYNC_IN (PCI bus) frequency, the PLL configuration signals set the Core/Memory/Processor PLL (VCO) frequency of operation for the PCI-to-Core/Memory/Processor frequency multiplying, if any. All valid PLL configurations for the PC107A are shown in Table 19.

Table 19. PC107A Microprocessor PLL Configuration

Ref	PLL_CFG [0–3] ⁽²⁾	66 MHz Part		100 MHz Part		PCI: Core Ratio	VCO Multiplier
		PCI_SYNC_IN Range (MHz)	Core/Mem/CPU Range (MHz)	PCI_SYNC_IN Range (MHz)	Core/Mem/CPU Range (MHz)		
1	0001	25 ⁽⁵⁾ – 50 ⁽⁴⁾	25 – 50	25 ⁽⁵⁾ – 50 ⁽⁴⁾	25 – 50	1	4
2	0010	12.5 ⁽⁵⁾ – 25 ⁽⁴⁾	25 – 5	12.5 ⁽⁵⁾ – 25 ⁽⁴⁾	25 – 5	2	4
3	0011	Bypass		Bypass		Bypass	Bypass
5	0101	25 ⁽⁵⁾ – 33	50 – 66	25 ⁽⁵⁾ – 50	50 – 100	2	2
8	1000	16 ⁽⁵⁾ – 22	50 – 66	16 ⁽⁵⁾ – 33	50 – 100	3	2
9	1001	33 ⁽⁵⁾ – 44	50 – 66	33 ⁽⁵⁾ – 66	50 – 100	1.5	2
C	1100	20 ⁽⁵⁾ – 26	50 – 66	20 ⁽⁵⁾ – 40	50 – 100	2.5	2
D	1101	50 ⁽⁵⁾ – 66	50 – 66	50 ⁽⁵⁾ – 66	50 – 66	1	2
F	1111	Clock off ⁽³⁾	Not Usable	Clock off ⁽³⁾	Not Usable	Off	Off

- Notes:
1. PLL_CFG[0–3] settings not listed (00000100, 0110, 0111, 1010, 1011, and 1110) are reserved.
 2. In PLL Bypass mode, the PCI_SYNC_IN input signal clocks the internal core directly, the PLL is disabled, and the PCI: core mode is set for 1:1 mode operation. The AC timing specifications given in this document do not apply in PLL Bypass mode.
 3. In Clock Off mode, no clocking occurs inside the PC107A regardless of the PCI_SYNC_IN input.
 4. Limited due to maximum memory VCO = 200 MHz.
 5. Limited due to minimum VCO = 100 MHz.
 6. Range values are shown rounded down to the nearest whole number (decimal place accuracy removed) for clarity.

System Design Information

PLL Power Supply Filtering

The AV_{DD} and LAV_{DD} power signals are provided on the PC107A to provide power to the peripheral logic/memory bus PLL and the SDRAM clock delay-locked loop (DLL), respectively. To ensure stability of the internal clocks, the power supplied to the AV_{DD} and LAV_{DD} input signals should be filtered of any noise in the 500 kHz to 10 MHz resonant frequency range of the PLLs. A separate circuit similar to the one shown in Figure 26 using surface mount capacitors with minimum effective series inductance (ESL) is recommended for each of the AV_{DD} and LAV_{DD} power signal pins. Consistent with the recommendations of Dr. Howard Johnson in *High Speed Digital Design: A Handbook of Black Magic* (Prentice Hall, 1993), multiple small capacitors of equal value are recommended over using multiple values.

The circuits should be placed as close as possible to the respective input signal pins to minimize noise coupled from nearby circuits. Routing directly as possible from the capacitors to the input signal pins with minimal inductance of vias is important but proportionately less critical for the LAV_{DD} pin.

Figure 26. PLL Power Supply Filter Circuit

Power Supply Voltage Sequencing

The notes in Table 3 on page 12 contain cautions illustrated in Figure 3 on page 13 about the sequencing of the external bus voltages and internal voltages of the PC107A. These cautions are necessary for the long term reliability of the part. If they are violated, the electrostatic discharge (ESD) protection diodes will be forward biased and excessive current can flow through these diodes. Figure 3 shows a typical ramping voltage sequence where the DC power sources (voltage regulators and/or power supplies) are connected as shown in Figure 27. The voltage regulator delay shown in Figure 3 can be zero if the various DC voltage levels are all applied to the target board at the same time. The ramping voltage sequence shows a scenario in which the $V_{DD}/AV_{DD}/LAV_{DD}$ power plane is not loaded as much as the OV_{DD}/GV_{DD} power plane and thus $V_{DD}/AV_{DD}/LAV_{DD}$ ramps at a faster rate than OV_{DD}/GV_{DD} .

If the system power supply design does not control the voltage sequencing, the circuit of Figure 27 can be added to meet these requirements. The MUR420 diodes of Figure 27 control the maximum potential difference between the 3.3 bus and internal voltages on power-up and the 1N5820 Schottky diodes regulate the maximum potential difference on power-down.

Figure 27. Example Voltage Sequencing Circuits

Decoupling Recommendations

Due to the PC107A's dynamic power management feature, large address and data buses, and high operating frequencies, the PC107A can generate transient power surges and high frequency noise in its power supply, especially while driving large capacitive loads. This noise must be prevented from reaching other components in the PC107A system, and the PC107A itself requires a clean, tightly regulated source of power. Therefore, it is recommended that the system designer place at least one decoupling capacitor at each V_{DD} , OV_{DD} , GV_{DD} , and LV_{DD} pin of the PC107A. It is also recommended that these decoupling capacitors receive their power from separate V_{DD} , OV_{DD} , GV_{DD} , and GND power planes in the PCB, utilizing short traces to minimize inductance. These capacitors should have a value of 0.1 μF . Only ceramic SMT (surface mount technology) capacitors should be used to minimize lead inductance, preferably 0508 or 0603, oriented such that connections are made along the length of the part.

In addition, it is recommended that there be several bulk storage capacitors distributed around the PCB, feeding the V_{DD} , OV_{DD} , GV_{DD} , BV_{DD} , and LV_{DD} planes, to enable quick recharging of the smaller chip capacitors. These bulk capacitors should have a low ESR (equivalent series resistance) rating to ensure the quick response time necessary. They should also be connected to the power and ground planes through two vias to minimize inductance. Suggested bulk capacitors-100 – 330 μF (AVX TPS tantalum or Sanyo OSCON).

Connection Recommendations

To ensure reliable operation, it is highly recommended to connect unused inputs to an appropriate signal level. Unused active low inputs should be tied to OV_{DD} . Unused active high inputs should be connected to GND. All NC (no-connect) signals must remain unconnected.

Power and ground connections must be made to all external V_{DD} , OV_{DD} , GV_{DD} , LV_{DD} , BV_{DD} , and GND pins of the PC107A.

The PCI_SYNC_OUT signal is intended to be routed halfway out to the PCI devices and then returned to the PCI_SYNC_IN input of the PC107A.

The SDRAM_SYNC_OUT signal is intended to be routed halfway out to the SDRAM devices and then returned to the SDRAM_SYNC_IN input of the PC107A. The trace length may be used to skew or adjust the timing window as needed. See Motorola application note "AN1794/D" for more information on this topic.

The $\overline{\text{TRST}}$ signal must be asserted during reset to ensure proper initialization and operation of the PC107A. It is recommended that the $\overline{\text{TRST}}$ signal be connected to the system HRESET signal or pulled down with a 100 Ω - 1 k Ω resistor.

Pull-up/Pull-down Resistor Requirements

The data bus input receivers are normally turned off when no read operation is in progress; therefore, they do not require pull-up resistors on the bus. The processor data bus signals are: $\overline{DH}[0-31]$, $\overline{DL}[0-31]$, and $\overline{PAR}[0-7]$. The memory data bus signals are: $\overline{MDH}[0-31]$, $\overline{MDL}[0-31]$, and $\overline{PAR/AR}[0-7]$.

If the 32-bit data bus mode is selected, the input receivers of the unused data and parity bits ($\overline{DL}[0-31]$, $\overline{DP}[4-7]$, $\overline{MDL}[0-31]$, and $\overline{PAR}[4-7]$) will be disabled, and their outputs will drive logic zeros when they would otherwise normally be driven. For this mode, these pins do not require pull-up resistors, and should be left unconnected by the system to minimize possible output switching.

It is recommended that \overline{ARTRY} , \overline{TA} , and \overline{TS} have weak pull-up resistors ($2\text{ k}\Omega - 10\text{ k}\Omega$) connected to BV_{DD} .

It is recommended that $\overline{MTP}[1-2]$ and $\overline{TEST2}$ have weak pull-up resistor ($2\text{ k}\Omega - 10\text{ k}\Omega$) connected to GV_{DD} .

It is recommended that the following signals be pulled up to OV_{DD} with weak pull-up resistors ($2\text{ k}\Omega - 10\text{ k}\Omega$): \overline{SDA} , \overline{SCL} , $\overline{TEST1}$, and $\overline{FTP}[3-3]$.

It is recommended that the following PCI control signals be pulled up to LV_{DD} with weak pull-up resistors ($2\text{ k}\Omega - 10\text{ k}\Omega$): \overline{DEVSEL} , \overline{FRAME} , \overline{IRDY} , \overline{LOCK} , \overline{PERR} , \overline{SERR} , \overline{STOP} , \overline{TRDY} and \overline{INTA} . The resistor values may need to be adjusted stronger to reduce induced noise on specific board designs.

The following pins have internal pull-up resistors enabled at all times: $\overline{REQ}[06-4]$, \overline{TCK} , \overline{TDI} , \overline{TMS} , and \overline{TRST} , $\overline{BR1}$, $\overline{HRESET_CPU}$, \overline{MCP} , \overline{QACK} , \overline{SRESET} , \overline{TEST} and $\overline{TRIG_OUT}$. See Table 1, "PC107A Pinout Listing," on page 5 for more information.

The following pins have internal pull-up resistors enabled only while device is in the reset state: $\overline{MDL0}$, \overline{FOE} , $\overline{RCS0}$, \overline{SDRAS} , \overline{SDCAS} , \overline{CKE} , \overline{SDBAO} , and $\overline{SDMA}[10-1]$. See Table 1, "PC107A Pinout Listing," on page 5 for more information.

The following pins are reset configuration pins: $\overline{MDL0}$, \overline{FOE} , $\overline{RCS0}$, \overline{SDBAO} , $\overline{SDMA}[10-1]$, and $\overline{PLL_CFG}[0-3]$. These pins are sampled during reset to configure the device.

Any other unused active low input pins should be tied to a logic one level via weak pull-up resistors ($2\text{ k}\Omega - 10\text{ k}\Omega$) to the appropriate power supply listed in Table 3 on page 12. Unused active high input pins should be tied to GND via weak pull-down resistors ($2\text{ k}\Omega - 10\text{ k}\Omega$).

Definitions

Datasheet Status Description

Table 20. Datasheet Status

Datasheet Status		Validity
Objective specification	This datasheet contains target and goal specifications for discussion with customer and application validation.	Before design phase
Target specification	This datasheet contains target or goal specifications for product development.	Valid during the design phase
Preliminary specification α -site	This datasheet contains preliminary data. Additional data may be published later; could include simulation results.	Valid before characterization phase
Preliminary specification β -site	This datasheet contains also characterization results.	Valid before the industrialization phase
Product specification	This datasheet contains final product specification.	Valid for production purposes
Limiting Values		
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.		
Application Information		
Where application information is given, it is advisory and does not form part of the specification.		

Life Support Applications

These products are not designed for use in life support appliances, devices or systems where malfunction of these products can reasonably be expected to result in personal injury. Atmel customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Atmel for any damages resulting from such improper use or sale.

Differences with Commercial Part

Table 21. Differences with Commercial Part

	Commercial Part	Military Part
