

FEATURES

- Generates + and – from Single Input
- Up to $\pm 18V$ Output
- Only Needs Four $1\mu F$ Capacitors
- No Inductors
- 10mA Output Current Minimum
- Operates Down to 4V
- No Latchup
- 8-Pin Minidip

APPLICATIONS

- Line Drivers
- Op Amp Suppliers
- Battery Splitters
- RS232 Power

DESCRIPTION

The LT[®]1026 is a switched capacitor voltage doubler and inverter on a single monolithic die. Capable of operating from a 4V to 10V input, it provides $\pm 7V$ to $\pm 18V$ output. Output currents of over 10mA are available. Two charge pumps first double the input voltage then invert the doubled voltage. Manufactured in bipolar technology, the LT1026 is not susceptible to latchup and generates up to 36V.

The LT1026 offers a convenient way of generating additional system voltages without using inductors. Powering interface circuits, op amps or data acquisition circuitry off logic supplies is simplified. Other Linear Technology voltage converters such as the low power LTC[®]1044 CMOS and 100mA bipolar LT1054 are available.

LT, LTC and LT are registered trademarks of Linear Technology Corporation.

TYPICAL APPLICATION

Voltage Doubler and Inverter

Output Voltage

LT1026 • TA02

LT1026

ABSOLUTE MAXIMUM RATINGS

Supply Voltage 10V
 V^+ 20V
 V^- -20V
Short-Circuit Duration 10 sec

Operating Temperature Range
LT1026C 0°C to 70°C
LT1026I -40°C to 85°C
LT1026M -55°C to 125°C
Lead Temperature (Soldering, 10 sec) 300°C

APPLICATIONS INFORMATION

The LT1026 is a nonregulating voltage converter that converts a single input voltage into both a positive and negative output at up to 15mA. A positive input voltage is first doubled and then the doubled voltage is inverted. The voltage output level is dependent on both the input voltage and the output loading. The total output current available depends on the individual loading of the outputs since loading on one output affects the load and the voltage of the other.

Only four external components are needed for operation. Two charge pump capacitors and two output storage capacitors. Nominal value for these capacitors is 1 μ F, but the LT1026 will operate (with reduced performance) down to 0.1 μ F. Higher value capacitors (22 μ F) will reduce ripple and slightly lower output impedance. For higher output currents the outputs of several converters may be paralleled with common output capacitors.

The substrate diodes are an inherent part of the IC, and must always be reversed biased to isolate the individual transistors. In the LT1026 the substrate is tied to the negative output. If the negative output is not used, such as when only the voltage doubler output is needed, $-V_{OUT}$ must be tied to ground so the substrate diodes are properly biased. The substrate diodes must never become forward biased even during overload conditions. For example, pulling $-V_{OUT}$ positive with respect to ground can forward bias the substrate diodes. Clamping the substrate to ground with an external diode would be needed to ensure proper operation and prevent the substrate from carrying any current.

No overload protection is included on the LT1026. Neither output is damaged by momentary shorts, but during sustained shorts the resulting high current flow will over-heat the IC.

TYPICAL APPLICATIONS

TYPICAL APPLICATIONS

Standard Configuration Voltage Doubler and Inverter

Voltage Quadrupler

Parallel Converters for Higher Output Current and Lower Output Impedance

TYPICAL APPLICATIONS

5V Powered RS232 Line Driver

PACKAGE DESCRIPTION

H Package
8-Lead TO-5 Metal Can (0.230 PCD)
(LTC DWG # 05-08-1321)

PACKAGE DESCRIPTION

Dimensions in inches (millimeters) unless otherwise noted.

J8 Package

8-Lead CERDIP (Narrow 0.300, Hermetic)

(LTC DWG # 05-08-1110)
