MAXIM

3-Pin, Ultra-Low-Power SC70/SOT µP Reset Circuits

General Description

The MAX6326/MAX6327/MAX6328/MAX6346/MAX6347/ MAX6348 microprocessor (µP) supervisory circuits monitor the power supplies in µP and digital systems. These devices provide excellent circuit reliability and low cost by eliminating external components and adjustments when used with 2.5V, 3V, 3.3V, and 5V powered circuits.
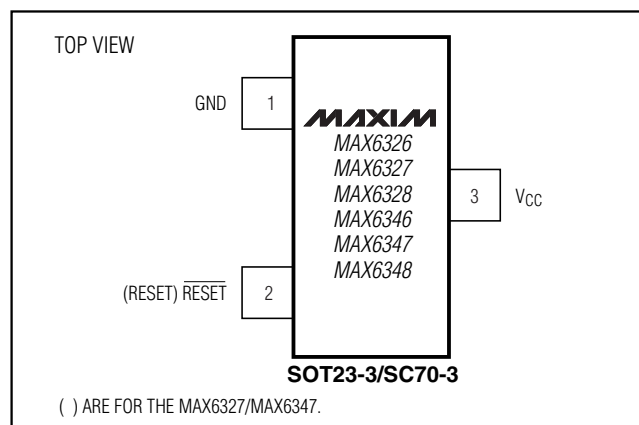

These circuits perform a single function: they assert a reset signal whenever the V_{CC} supply voltage declines below a preset threshold, keeping it asserted for at least 100ms after V_{CC} has risen above the reset threshold. The only difference between the devices is their output. The MAX6326/MAX6346 (push-pull) and MAX6328/ MAX6348 (open-drain) have an active-low reset output. The MAX6327/MAX6347 have an active-high push-pull reset output. All of these parts are guaranteed to be in the correct state for V_{CC} down to 1V. The reset comparator is designed to ignore fast transients on V_{CC}. Reset thresholds are factory-trimmable between 2.2V and 4.63V, in approximately 100mV increments. Twenty-one standard versions are available. Contact the factory for availability of nonstandard versions.

Ultra-low supply currents (1µA max for the MAX6326/ MAX6327/MAX6328) make these parts ideal for use in portable equipment. All six devices are available in space-saving SOT23 and SC70 packages.

Features

♦ **Ultra-Low 1µA (max) Supply Current (MAX6326/MAX6327/MAX6328)**

♦ **Precision Monitoring of 2.5V, 3V, 3.3V, and 5V Power-Supply Voltages**

♦ **Reset Thresholds Available from 2.2V to 4.63V**

♦ **Fully Specified Over Temperature**

♦ **100ms (min) Power-On Reset Pulse Width**

♦ **Low Cost**

♦ **Available in Three Versions: Push-Pull RESET, Push-Pull RESET, and Open-Drain RESET**

♦ **Power-Supply Transient Immunity**

♦ **No External Components**

♦ **3-Pin SC70/SOT23 Packages**

♦ **Pin Compatible with MAX803/MAX809/MAX810**

†*The MAX6326/MAX6327/MAX6328/MAX6346/MAX6347/ MAX6348 are available in factory-set V_{CC} reset thresholds from 2.2V to 4.63V, in approximately 0.1V increments. Choose the desired reset-threshold suffix from Table 1 and insert it in the blank spaces following "R." There are 21 standard versions with a required order increment of 2500 pieces. Sample stock is generally held on the standard versions only (see the Selector Guide). Required order increment is 10,000 pieces for nonstandard versions (Table 2). Contact factory for availability. All devices available in tape-and-reel only.*

Selector Guide appears at end of data sheet.

ABSOLUTE MAXIMUM RATINGS

Terminal Voltage (with respect to GND)
V_{CC} ....-0.3V to +6V
$\overline{RESET}$, RESET (push-pull) ....-0.3V to (V_{CC} + 0.3V)
$\overline{RESET}$ (open drain)..-0.3V to +6V
Input Current (V_{CC})...20mA
Output Current (RESET, $\overline{RESET}$).......................................20mA
Rate of Rise (V_{CC})...100V/µs

Continuous Power Dissipation (T_A = +70°C)
  3-Pin SC70 (derate 2.7mW/°C above +70°C)...............174mW
  3-Pin SOT23 (derate 4mW/°C above +70°C)................320mW
Operating Temperature Range ....-40°C to +85°C
Storage Temperature Range ....-65°C to +150°C
Lead Temperature (soldering, 10s) ....+300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

(V_{CC} = full range, T_A = -40°C to +85°C, unless otherwise noted. Typical values are at T_A = +25°C and V_{CC} = 3V.) (Note 1)
PARAMETER	SYMBOL	CONDITIONS		MIN	TYP	MAX	UNITS

µP Reset Circuits

Applications Information

Interfacing to µPs with Bidirectional Reset Pins

Since the $\overline{RESET}$ output on the MAX6328/MAX6348 is open drain, these devices interface easily with microprocessors (µPs) that have bidirectional reset pins, such as the Motorola 68HC11. Connecting the µP supervisor's $\overline{RESET}$ output directly to the microcontroller's (µC's) $\overline{RESET}$ pin with a single pull-up resistor allows either device to assert reset (Figure 1).

Negative-Going V_CC Transients

In addition to issuing a reset to the µP during power-up, power-down, and brownout conditions, these devices are relatively immune to short-duration, negative-going V_{CC} transients (glitches).

The *Typical Operating Characteristics* show the Maximum Transient Duration vs. Reset Threshold Overdrive graph, for which reset pulses are not generated. The graph shows the maximum pulse width that a negative-going V_{CC} transient may typically have when issuing a reset signal. As the amplitude of the transient increases, the maximum allowable pulse width decreases.

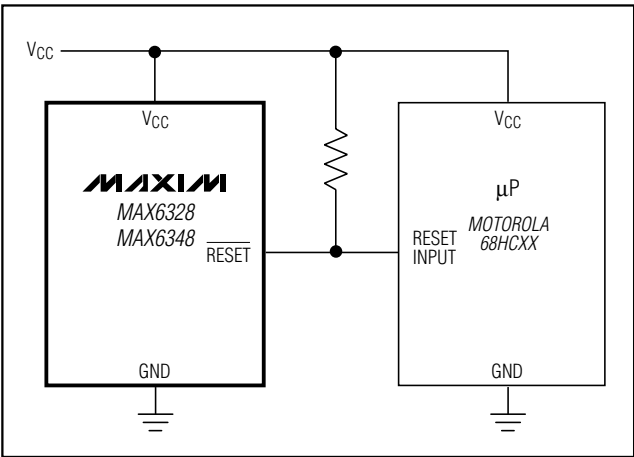

Figure 1. Interfacing to µPs with Bidirectional Reset Pins
