

SOT23, Low-Power μ P Supervisory Circuits with Battery Backup

General Description

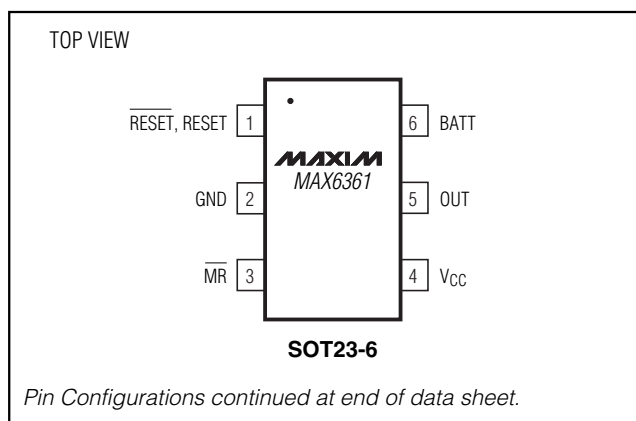

The MAX6361/MAX6363/MAX6364 supervisory circuits reduce the complexity and number of components required for power-supply monitoring and battery control functions in microprocessor (μ P) systems. The circuits significantly improve system reliability and accuracy compared to that obtainable with separate ICs or discrete components. Their functions include μ P reset, backup-battery switchover, and power failure warning.

The MAX6361/MAX6363/MAX6364 operate from supply voltages as low as +1.2V. The factory preset reset threshold voltage ranges from 2.32V to 4.63V (see *Ordering Information*). These devices provide a manual reset input (MAX6361), battery-on output (MAX6363), and an auxiliary adjustable reset input (MAX6364). In addition, each part type is offered in three reset output versions: an active-low push-pull reset, an active-low open-drain reset, and an active-high push-pull reset (see *Selector Guide* at end of data sheet).

Applications

Computers	Fax Machines
Controllers	Industrial Control
Intelligent Instruments	POS Equipment
Critical μ P/ μ C	Portable/Battery-Powered
Power Monitoring	Equipment

Pin Configurations

Selector Guide appears at end of data sheet.

Typical Operating Circuit appears at end of data sheet.

Features

- ◆ Low +1.2V Operating Supply Voltage (V_{CC} or V_{BATT})
- ◆ Precision Monitoring of +5.0V, +3.3V, +3.0V, and +2.5V Power-Supply Voltages
- ◆ Debounced Manual Reset Input (MAX6361)
- ◆ Battery-On Output Indicator (MAX6363)
- ◆ Auxiliary User-Adjustable RESET IN (MAX6364)
- ◆ Three Available Output Structures
Push-Pull RESET, Open-Drain RESET, Push-Pull RESET
- ◆ RESET/RESET Valid Down to 1.2V Guaranteed (V_{CC} or V_{BATT})
- ◆ Power-Supply Transient Immunity
- ◆ 150ms (min) Reset Timeout Period
- ◆ Small 6-Pin SOT23 Package

Ordering Information

PART	TEMP. RANGE	PIN-PACKAGE
MAX6361LUT__-T	-40°C to +85°C	6 SOT23-6
MAX6361PUT__-T	-40°C to +85°C	6 SOT23-6
MAX6361HUT__-T	-40°C to +85°C	6 SOT23-6
MAX6363LUT__-T	-40°C to +85°C	6 SOT23-6
MAX6363PUT__-T	-40°C to +85°C	6 SOT23-6
MAX6363HUT__-T	-40°C to +85°C	6 SOT23-6
MAX6364LUT__-T	-40°C to +85°C	6 SOT23-6
MAX6364PUT__-T	-40°C to +85°C	6 SOT23-6
MAX6364HUT__-T	-40°C to +85°C	6 SOT23-6

Note: These parts offer a choice of reset threshold voltages. From Table 1, select the suffix corresponding to the desired threshold voltage and insert it into the part number to complete it. When ordering from the factory, there is a 2500-piece minimum on the SOT package (tape-and-reel only).

MAX6361/MAX6363/MAX6364

SOT23, Low-Power μ P Supervisory Circuits with Battery Backup

ABSOLUTE MAXIMUM RATINGS

Terminal Voltages (with respect to GND)

V _{CC} , BATT, OUT	-0.3V to +6V
RESET (open drain)	-0.3V to +6V
BATT ON, MR, RESET IN	-0.3V to (V _{OUT} + 0.3V)
RESET, RESET	-0.3V to (V _{OUT} + 0.3V)

Input Current

V _{CC} Peak	1A
V _{CC} Continuous	250mA
BATT Peak	250mA
BATT Continuous	40mA
GND	75mA

Output Current

OUT	Short-Circuit Protection for up to 10s
RESET, RESET, BATT ON	20mA

Continuous Power Dissipation (T_A = +70°C)

6-Pin SOT23 (derate 8.70mW/°C above +70°C)	696mW

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

(V_{CC} = +2.4V to +5.5V, V_{BATT} = 3V, T_A = -40°C to +85°C, reset not asserted, typical values are at T_A = +25°C, unless otherwise noted.) (Note 1)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Operating Voltage Range, V _{CC} or V _{BATT}	V _{CC} , V _{BATT}	No load (Note 2)	0		5.5	V
Supply Current (excluding I _{OUT})	I _{CC}	No load, V _{CC} > V _{TH}	V _{CC} = 2.8V	10	30	μ A
			V _{CC} = 3.6V	11	35

Pin Description

PIN	NAME	FUNCTION
1	RESET	Active-High Reset Output (for H versions). RESET remains high while V_{CC} is below the reset threshold and for at least 150ms (t_{RP}) after V_{CC} rises above the reset threshold. RESET also asserts when \overline{MR} or RESET IN is low.
	$\overline{\text{RESET}}$	Active-Low Reset Output (for L and P versions). $\overline{\text{RESET}}$ remains low while V_{CC} is below the reset threshold and for at least 150ms (t_{RP}) after V_{CC} rises above the reset threshold. $\overline{\text{RESET}}$ also asserts when \overline{MR} or RESET IN is low.
2	GND	Ground
3	\overline{MR}	MAX6361 Manual-Reset Input. Maintaining logic low on \overline{MR} asserts a reset. Reset output remains asserted for at least 150ms (t_{RP}) after \overline{MR} transitions from low to high. Leave unconnected or connected to V_{CC} if not used.
	BATT ON	MAX6363 Battery-On Output. BATT ON goes high in battery backup mode.
	RESET IN	MAX6364 Reset Input. When RESET IN falls below 1.235V, reset is asserted. Reset output remains asserted as long as RESET IN is low and for at least 150ms (t_{RP}) after RESET IN goes high.
4	V_{CC}	Supply Voltage. Reset is asserted when V_{CC} drops below the reset threshold voltage (V_{TH}). Reset remains asserted until V_{CC} rises above V_{TH} and for at least 150ms after V_{CC} rises above V_{TH} .
5	OUT	Output. OUT sources from V_{CC} when it is above the reset threshold (V_{TH}), and from the greater of V_{CC} or BATT when V_{CC} is below V_{TH} .
6	BATT	Backup-Battery Input. When V_{CC} falls below the reset threshold, BATT switches to OUT if V_{BATT} is 20mV greater than V_{CC} . When V_{CC} rises 20mV above V_{BATT} , V_{CC} switches to OUT. The 40mV hysteresis prevents repeated switching if V_{CC} falls slowly.

Detailed Description

The *Typical Operating Circuit* shows a typical connection for the MAX6361/MAX6363/MAX6364 family. OUT powers the static random-access memory (SRAM). OUT is internally connected to V_{CC} if V_{CC} is greater than the reset threshold, or to the greater of V_{CC} or V_{BATT} when V_{CC} is less than the reset threshold. OUT can supply up

to 150mA from V_{CC} . When V_{CC} is higher than V_{BATT} , the BATT ON (MAX6363) output is low. When V_{CC} is lower than V_{BATT} , an internal MOSFET connects the backup battery to OUT. The on-resistance of the MOSFET is a function of backup-battery voltage and is shown in the Battery to Out On-Resistance vs. Temperature graph in the *Typical Operating Characteristics* section.

SOT23, Low-Power μ P Supervisory Circuits with Battery Backup

Backup-Battery Switchover

In a brownout or power failure, it may be necessary to preserve the contents of the RAM. With a backup battery installed at BATT, the MAX6361/MAX6363/MAX6364 automatically switch the RAM to backup power when V_{CC} falls. The MAX6363 has a BATT ON output that goes high when in battery-backup mode. These devices require two conditions before switching to battery-backup mode:

- 1) V_{CC} must be below the reset threshold.
- 2) V_{CC} must be below V_{BATT} . Table 2 lists the status of the inputs and outputs in battery-backup mode. The device will not power up if the only voltage source is on BATT. OUT will only power up from V_{CC} at startup.

Manual Reset Input (MAX6361 only)

Many μ P-based products require manual reset capability, allowing the operator, a test technician, or external logic circuitry to initiate a reset. For the MAX6361, a logic low on \overline{MR} asserts reset. Reset remains asserted while \overline{MR} is low, and for a minimum of 150ms (t_{RP}) after it returns high. \overline{MR} has an internal 20k Ω pull-up resistor. This input can be driven with TTL/CMOS logic levels or with open-drain/collector outputs. Connect a normally open momentary switch from \overline{MR} to GND to create a manual reset function; external debounce circuitry is not required. If \overline{MR} is driven from long cables or the device is used in a noisy environment, connect a 0.1 μ F capacitor from \overline{MR} to GND to provide additional noise immunity.

Reset In (MAX6364 only)

RESET IN is compared to an internal 1.235V reference. If the voltage at RESET IN is less than 1.235V, reset is asserted. The RESET IN comparator may be used as an undervoltage detector to signal a failing power supply. It can also be used as a secondary power-supply reset monitor.

Reset Output

A μ P's reset input starts the μ P in a known state. The MAX6361/MAX6363/MAX6364 μ P supervisory circuits assert a reset to prevent code-execution errors during power-up, power-down, and brownout conditions. RESET is guaranteed to be a logic low or high depending on the device chosen (see *Ordering Information*). RESET or \overline{RESET} asserts when V_{CC} is below the reset threshold and for at least 150ms (t_{RP}) after V_{CC} rises above the reset threshold. RESET or \overline{RESET} also asserts when \overline{MR} is low (MAX6361) and when RESET IN is less than 1.235V (MAX6364).

Applications Information

Operation Without a Backup Power Source

The MAX6361/MAX6363/MAX6364 were designed for battery-backed applications. If a backup battery is not used, connect V_{CC} to OUT and connect BATT to GND.

Replacing the Backup Battery

If BATT is decoupled with a 0.1 μ F capacitor to ground, the backup power source can be removed while V_{CC} remains valid without danger of triggering a reset pulse. The device does not enter battery-backup mode when V_{CC} stays above the reset threshold voltage.

Negative-Going V_{CC} Transients

These supervisors are relatively immune to short-duration, negative-going V_{CC} transients. Resetting the μ P when V_{CC} experiences only small glitches is usually not desirable.

The *Typical Operating Characteristics* section shows a graph of Maximum Transient Duration vs. Reset Threshold Overdrive for which reset is not asserted. The graph was produced using negative-going V_{CC} pulses, starting at V_{CC} and ending below the reset threshold by the magnitude indicated (reset threshold overdrive). The graph shows the maximum pulse width

Table 1. Reset Threshold Ranges

SUFFIX	RESET THRESHOLD RANGES (V)		
	MIN	TYP	MAX
46	4.50	4.63	4.75
44	4.25	4.38	4.50
31	3.00	3.08	3.15
29	2.85	2.93	3.00
26	2.55	2.63	2.70
23	2.25	2.32	2.38

Table 2. Input and Output Status in Battery-Backup Mode

PIN	STATUS
V_{CC}	Disconnected from OUT
OUT	Connected to BATT
BATT	Connected to OUT. Current drawn from the battery is less than 1 μ A (at V_{BATT} = 2.8V, excluding I_{OUT}) when V_{CC} = 0.
RESET/ \overline{RESET}	Asserted
BATT ON	High state
\overline{MR} , RESET IN	Inputs ignored

*Sample stock generally held on standard versions only. Contact factory for availability of nonstandard versions.

that a negative-going V_{CC} transient can typically have without triggering a reset pulse. As the amplitude of the transient increases (i.e., goes further below the reset threshold), the maximum allowable pulse width decreases. Typically, a V_{CC} transient that goes 100mV below the reset threshold and lasts for 30 μ s will not trigger a reset pulse.

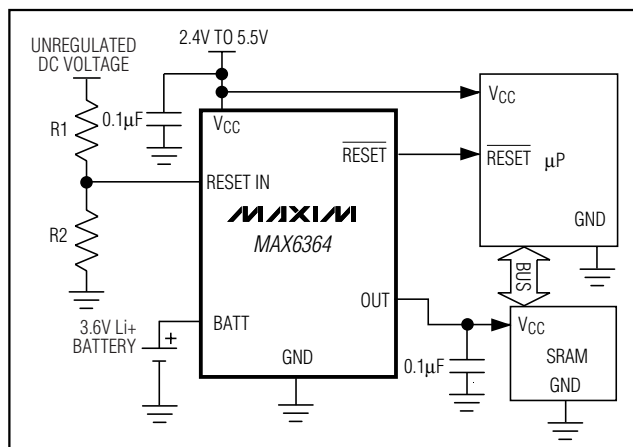

A 0.1 μ F bypass capacitor mounted close to the V_{CC} pin provides additional transient immunity.
