Thru 1x4™

1 IN/4 OUT MIDI THRU BOX

Thru 1x4™

1 IN/4 OUT MIDI THRU BOX

The **Thru 1x4** MIDI Thru Box allows any received MIDI signal to be sent to up to four separate MIDI devices. The MIDI signal received at the Thru 1x4 MIDI IN is "echoed" unchanged out all four of the MIDI OUTs simultaneously.

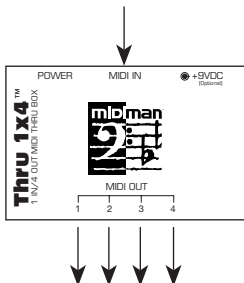

Thru 1x4 can be used whenever you have a MIDI signal that needs to go to multiple destinations. Also, if you are sending MIDI to many different units by using each of their Thrus and are concerned that one of your devices may be causing a MIDI delay, you can use the Thru 1x4 to distribute the MIDI output with absolutely NO signal delay.

Thru 1x4 draws power directly from the MIDI Out of any instrument or sequencer connected to its MIDI IN -- so it needs no external power supply. The instrument which is connected to the Thru 1x4's MIDI IN must be turned On in order for the 1x4 to receive power. When this is done, the red power LED will light.

To use Thru 1x4, connect its MIDI IN to the MIDI

Thru 1x4 Hook-Up Diagram

From MIDI Out of Master Keyboard or Sequencer

To Various Instrument's MIDI Ins

Out of the instrument or sequencer you are "Thruing." Next, connect each of Thru 1x4's MIDI OUTs to the various instrument's MIDI Ins. All of Thru 1x4's MIDI OUTs are identical so it doesn't matter which MIDI OUT is connected to which MIDI In.

Thru 1x4 is designed to consume almost no power. However, very, very, rarely you may encounter some older MIDI device which requires more power than Thru 1x4 can deliver. This can only happen if the

instrument draws more power than allowed in the MIDI specification. If you encounter this situation, there is a standard 9 volt, center pin positive, power jack on the side of Thru 1x4. You can go to your local electronic store and buy a universal power adaptor or call us at MIDIMAN to purchase one directly.

If you have any questions about your Thru 1x4 please call tech support at:
