HI 83203 Multiparameter Bench Photometer for Aquaculture

Dear Customer,

Thank you for choosing a Hanna product. Please read this instruction manual carefully before using the instrument. This manual will provide you with the necessary information for the correct use of the instrument. If you need additional technical information, do not hesitate to e-mail us at tech@hannainst.com. This instrument is in compliance with $\boldsymbol{\epsilon} \boldsymbol{\epsilon}$ directives.

PRELIMINARY EXAMINATION

Please examine this product carefully. Make sure that the instrument is not damaged. If any damage occurred during shipment, please notify your Dealer.

Each Meter is supplied complete with:

- Two Sample Cuvettes and Caps
- Cloth for wiping cuvettes (4 pcs)
- Scissors
- AC/DC Power Adapter
- Instruction Manual
- Rigid carrying case

<u>Note</u>: Save all packing material until you are sure that the instrument works correctly. Any defective item must be returned in its original packing with the supplied accessories.

GENERAL DESCRIPTION

HI 83203 is a multiparameter bench photometer dedicated for Aquaculture analysis. It can measure 13 different methods using specific liquid or powder reagents. The amount of reagent is precisely dosed to ensure maximum reproducibility.

HI 83203 bench photometer can be connected to a PC via an USB cable. The optional **HI 92000** Windows® Compatible Software helps users manage all their results.

SPECIFICATIONS

Light Life	Life of the instrument
Light Detector	Silicon Photocell
Environment	0 to 50°C (32 to 122°F);
	max 90% RH non-condensing
Power Supply	external 12 Vdc power adapter
	built-in rechargeable battery
Dimensions	235 x 200 x 110 mm (9.2 x 7.87 x 4.33")
Weight	0.9 Kg

For specifications related to each method (e.g. range, precision, etc.) refer to the related measurement section.

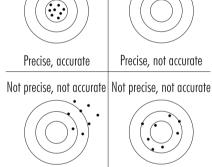

PRECISION AND ACCURACY

<u>Precision</u> is how closely repeated measurements agree with each other. Precision is usually expressed as standard deviation (SD).

<u>Accuracy</u> is defined as the nearness of a test result to the true value.

Although good precision suggests good accuracy, precise results can be inaccurate. The figure explains these definitions.

For each method, the precision is expressed in the related measurement section as standard deviation at a specific concentration value of the analite. The standard deviation is obtained with a single instrument using a representative lot of reagents.

PRINCIPLE OF OPERATION

Absorption of Light is a typical phenomenon of interaction between electromagnetic radiation and matter. When a light beam crosses a substance, some of the radiation may be absorbed by atoms, molecules or crystal lattices.

If pure absorption occurs, the fraction of light absorbed depends both on the optical path length through the matter and on the physical-chemical characteristics of substance according to the Lambert-Beer Law:

$$\begin{array}{rl} -\log \ \mathrm{I/I}_{\circ} = \varepsilon_{\lambda} \ \mathrm{c} \ \mathrm{d} \\ & & \\ \mathrm{A} \ = \varepsilon_{\lambda} \ \mathrm{c} \ \mathrm{d} \end{array}$$

Where:

-log I/I_=Absorbance (A)

- I_{\circ} = intensity of incident light beam
- I = intensity of light beam after absorption
- ε_{λ} = molar extinction coefficient at wavelength λ
- c^{\sim} = molar concentration of the substance
- d = optical path through the substance

Therefore, the concentration "c" can be calculated from the absorbance of the substance as the other factors are known.

Photometric chemical analysis is based on the possibility to develop an absorbing compound from a specific chemical reaction between sample and reagents.

Given that the absorption of a compound strictly depends on the wavelength of the incident light beam, a narrow spectral bandwidth should be selected as well as a proper central wavelength to optimize measurements. The optical system of **HI 83203** is based on special subminiature tungsten lamps and narrow-band interference filters to guarantee both high performance and reliable results.

Four measuring channels allow a wide range of tests.

Instrument block diagram (optical layout)

A microprocessor controlled special tungsten lamp emits radiation which is first optically conditioned and beamed to the sample contained in the cuvette. The optical path is fixed by the diameter of the cuvette. Then the light is spectrally filtered to a narrow spectral bandwidth, to obtain a light beam of intensity $- I_{\circ}$ or - I - .

The photoelectric cell collects the radiation -I - that is not absorbed by the sample and converts it into an electric current, producing a potential in the mV range.

The microprocessor uses this potential to convert the incoming value into the desired measuring unit and to display it on the LCD.

The measurement process is carried out in two phases: first the meter is zeroed and then the actual measurement is performed.

The cuvette has a very important role because it is an optical element and thus requires particular attention. It is important that both the measurement and the calibration (zeroing) cuvette are optically identical to provide the same measurement conditions. Most of methods use the same cuvette for both, so it is important that measurements take place in the same optical point. The instrument and the cuvette cap have special marks that must be aligned in order to obtain better reproducibility.

The surface of the cuvette must be clean and not scratched. This is to avoid measurement interference due to unwanted reflection and absorption of light. It is recommended not to touch the cuvette walls with hands. Furthermore, in order to maintain the same conditions during the zeroing and the measurement phases, it is necessary to close the cuvette to prevent any contamination.

FUNCTIONAL DESCRIPTION

INSTRUMENT DESCRIPTION

- 1) Cuvette Lid
- Liquid Crystal Display (LCD). 2)
- 3) Splash proof keypad.
- ON/OFF power switch 4)
- 5) Power input connector
- 6) USB connector

KEYPAD DESCRIPTION

The keypad contains 8 direct keys and 3 functional keys with the following functions:

Press to perform the function displayed above it. The functions are screen related.

- Press to exit the current screen.
- METHOD

Press to access the select method menu.

- Press to move up in a menu or a help screen, to increment a set value, to access second level functions.
- Press to move down in a menu or a help screen, to decrement a set value, to access second level functions.
- Press to log the current reading. LOG
- Press to recall the log. RCL
- Press to display the help screen. HELP
- Press to access the setup screen. SETUP

NEED TO KNOW

HI 83203 has a powerful interactive user support that assists the user during the analysis process. Each step in the measurement process is help supported. A tutorial mode is available in the Setup Menu.

TIPS FOR AN ACCURATE MEASUREMENT

The instructions listed below should be carefully followed during testing to ensure most accurate results.

- Color or suspended matter in large amounts may cause interference, they should be removed by treatment with active carbon and filtration.
- Ensure the cuvette is filled correctly: the liquid in the cuvette forms a convexity on the top; the bottom of this convexity must be at the same level of the 10 mL mark.

COLLECTING AND MEASURING SAMPLES

- In order to measure exactly 0.5 mL of reagent with the 1 mL syringe:
 - (a) push the plunger completely into the syringe and insert the tip into the solution.
 - (b) pull the plunger up until the lower edge of the seal is exactly on the 0.0 mL mark.

(c) take out the syringe and clean the outside of the syringe tip. Be sure that no drops are hanging on the tip of the syringe, if so eliminate them. Then, keeping the syringe in vertical position above the cuvette, push the plunger down into the syringe until the lower edge of the seal is exactly on the 0.5 mL mark. Now the exact amount of 0.5 mL has been added to the cuvette, even if the tip still contains some solution.

USING LIQUID AND POWDER REAGENTS

- Proper use of the dropper:
 - (a) for reproducible results, tap the dropper on the table for several times and wipe the outside of the dropper tip with a cloth.
 - (b) always keep the dropper bottle in a vertical position while dosing the reagent.

- Proper use of the powder reagent packet:
 - (a) use scissors to open the powder packet;
 - (b) push the edges of the packet to form a spout;
 - (c) pour out the content of the packet.

USING CUVETTES

Proper mixing of the cuvette is done by shaking the cuvette, moving the cuvette up and down. The
movement may be gentle or vigorous. This mixing method is indicated with "shake gently" or "shake
vigorously", and one of the following icons:

- It is possible to take multiple readinas in a row, but it is recommended to take a new zero readina for each sample and to use the same cuvette for zeroina and measurement when possible (for most precise results follow the measurement procedures carefully).
- Discard the sample immediately after the reading is taken, or the glass might become permanently stained.
- All the reaction times reported in this manual are at 20°C (68°F). As a general rule of thumb, they should be doubled at 10°C (50°F) and halved at 30°C (86°F).

REAGENT BLANK CORRECTION

• Some methods require a "reagent blank correction". The blank and the sample are prepared exactly in the same way, only the blank is deionized water instead of sample.

A blank cuvette may be used more than once: stability and storing conditions are described for each method in the related chapter.

INTERFERENCES

• In the method measurement section the most common interferences that may be present in an average wastewater matrix have been reported. It may be that for a particular treatment process other compounds do interfere with the method of analysis.

HEALTH & SAFETY

The chemicals contained in the reagent kits may be hazardous if improperly handled. Read the Material Safety Data Sheet (MSDS) before performing tests.

Safety equipment: Wear suitable eve protection and clothing when required, and follow instructions carefully. Reagent spills: If a reagent spill occurs, wipe up immediately and rinse with plenty of water.

If reagent contacts skin, rinse the affected area thoroughly with water. Avoid breathing released vapors.

OPERATIONAL GUIDE

POWER CONNECTION AND BATTERY MANAGEMENT

The meter can be powered from an AC/DC adapter (included) or from the built-in rechargeable battery. Note: Always turn the meter off before unplugging it to ensure no data is lost.

When the meter switches ON, it verifies if the power supply adapter is connected. The battery icon on the LCD will indicate the battery status:

- battery is charging from external adapter

- battery capacity (no external adapter)

- battery Low (no external adapter)

METHOD SELECTION

- Turn ON the instrument via the ON/OFF power switch.
- The meter will perform an autodiagnostic test. During this test, the Hanna Instrument logo will appear on the LCD. After 5 seconds, if the test was successful, the last selected method will appear on the display.
- In order to select the desired method press METHOD and a screen with the available methods will appear.
- Press \blacktriangle \checkmark keys to highlight the desired method. Press Select.

- After the desired method was selected, follow the measurement described in the related section.
- Before performing a test you should read all the instructions carefully.

DATA MANAGEMENT

The instrument features a data log function to help you keep track of all your analysis. The data log can hold 200 individual measurements. Storing, viewing and deleting the data is possible using LOG and RCL keys.

Storing data: You can store only a valid measurement. Press **LOG** and the last valid measurement will be stored in a stack as a record with date and time stamps.

Viewing and deleting: You can view and delete the data log by pressing the **RCL** key. Deleting is based on the LIFO (last in, first out) scheme. Additionally, you can delete the data records all at once.

CHEMICAL FORM

Chemical form conversion factors are pre-programmed into the instrument and are method specific. In order to view the displayed result in the desired chemical form press the \blacktriangle or \checkmark to access to the second level of functions and then press the **Chem Frm** functional key to toggle between the existing chemical forms for the selected method.

SETUP

In the Setup mode the instrument's parameters can be changed. Some parameters affect the measuring sequence and others are general parameters that change the behavior or appearance of the instrument.

Press **SETUP** to enter the setup mode.

Press ESC or SETUP to return to the main screen.

A list of setup parameters will be displayed with currently configured settings. Press **HELP** for additional information.

Press the \blacktriangle \blacktriangledown keys to select the parameter and select a new value as follows:

Backlight

Values: 0 to 8.

Press **Modify** functional key to access the backlight value. Use the \triangleleft functional keys or the \blacktriangle \checkmark keys to increase/ decrease the value.

Press **Accept** functional key to confirm or **ESC** to return to the setup menu without saving the new value.

Backlight ⊂G 0 8 4 Accept <

Contrast

Values: 0 to 20.

This option is used to set the display's contrast. Press **Modify** functional key to change the display's contrast.

Use the \blacktriangleleft functional keys or the \blacktriangle \checkmark keys to increase/ decrease the value.

Press **Accept** functional key to confirm the value or **ESC** to return to the setup menu without saving the new value.

Contrast		
0		20
	8	
Accept	•	

Date / Time

This option is used to set the instrument's date and time. Press **Modify** functional key to change the date/time. Press the $\triangleleft \blacktriangleright$ functional keys to highlight the value to be modified (year, month, day, hour, minute or second). Use the $\blacktriangle \checkmark$ keys to change the value.

Press **Accept** functional key to confirm or **ESC** to return to the setup without saving the new date or time.

Time format

Option: AM/PM or 24 hour.

Press the functional key to select the desired time format.

Date format

Press Modify functional key to change the Date Format. Use the ▲ ▼ keys to select the desired format. Press Accept functional key to confirm or ESC to return to the setup menu without saving the new format.

Language

Press the corresponding functional key to change the option. If the new selected language cannot be loaded, the previously selected language will be reloaded.

Tutorial

Option: Enable or Disable.

If enabled this option will provide the user short guides, related to the current screen.

Press the functional key to enable/disable the tutorial mode.

Beeper

Option: Enable or Disable.

When enabled, a short beep is heard every time a key is pressed. A long beep alert sounds when the pressed key is not active or an error condition is detected.

Press the functional key to enable/disable the beeper.

HELP MODE

HI 83203 offers an interactive contextual help mode that assists the user at any time.

To access help screens press HELP.

The instrument will display additional information related to the current screen. To read all available data, scroll the text using the

▲ ▼ keys.

Press **Support** functional key to access a screen with Hanna service centers and their contact details.

Press **Accessories** functional key to access a page with instrument accessories.

To exit support or accessories screens press **ESC** and the instrument will return to the previous help screen.

To exit help mode just press **HELP** or **ESC** key again and the meter will display the last screen the user was in before entering help mode.

MEASUREMENT PROCEDURE

- Select the *Ammonia MR* method using the procedure described in the *Method Selection* section (see page 11).
- Fill the cuvette with 10 mL of unreacted sample (up to the mark) and replace the cap.
- Place the cuvette into the holder and close the lid.

10 mL

 Press ZERO key. The display will show "-0.0-" when the meter is zeroed and ready for measurement.

- Remove the cuvette.
- Add 4 drops of HI 93715A-0 First reagent (6 drops for seawater analysis). Replace the cap and mix the solution.
- Add 4 drops of HI 93715B-0 Second reagent (10 drops for seawater analysis). Replace the cap and mix the solution.
- Reinsert the cuvette into the instrument.

EIIGST

 Press TIMER and the display will show the countdown prior to the measurement or, alternatively, wait for 3 minutes and 30 seconds and press READ. When the timer ends the meter will perform the reading. The instrument displays the results in mg/L of ammonia nitrogen (NH₃-N).

- Press the \blacktriangle or \blacktriangledown to access the second level of functions.
- Press the Chem Frm functional key to convert the result in mg/L of ammonia (NH₃) and ammonium (NH₄⁺).

• Press the \blacktriangle or \blacktriangledown to go back to the measurement screen.

INTERFERENCES

Interference may be caused by:

acetone, alcohols, aldehydes, glycine, hardness above 1 g/L, iron, organic chloramines, sulfide, various aliphatic and aromatic amines.

0 to 1000 µg/L Ranae Resolution 1 µa/L $\pm 10 \,\mu$ g/L $\pm 5\%$ of reading Accuracy Typical EMC $\pm 1 \mu q/L$ Deviation Tungsten lamp with narrow band interference filter @ 575 nm Light Source Adaptation of the EPA method. The reaction between copper and the bicinchoninate Method reagent causes a purple tint in the sample.

REQUIRED REAGENTS

Code Description Quantity HI 93747-0 Bicinchoninate 1 packet

REAGENT SETS

HI 93747-01 Reagents for 100 tests HI 93747-03 Reagents for 300 tests For other accessories see page 46.

MEASUREMENT PROCEDURE

- Select the *Copper LR* method using the procedure described in the *Method Selection* section (see page 11).
- Fill the cuvette with 10 mL of unreacted sample (up to the mark) and replace the cap.

Mg/L

Copper LR (Cu2+)

10 ml

- Place the cuvette into the holder and close the lid.
- Press ZERO key. The meter will show "-0.0-" when the meter is zeroed and ready for measurement.

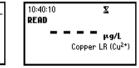

- Remove the cuvette.
- Add the content of one packet of HI 93747-0 Bicinchoningte. Replace the cap and shake gently for about 15 seconds.

- Reinsert the cuvette into the instrument.
- Press TIMER and the display will show the countdown prior to the measurement or, alternatively, wait for 45 seconds and press READ. When the timer ends the meter will perform the reading.

• The instrument displays the results in mg/L of copper.

INTERFERENCES Interference may be caused by: Silver

Cvanide

For samples overcoming buffering capacity of reagent (around pH 6.8), pH should be adjusted between 6 and 8.

MEASUREMENT PROCEDURE

- Select the *Nitrate* method using the procedure described in the *Method Selection* section (see page 11).
- Using the pipette, fill the cuvette with 6 ml of sample, up to half of its height, and replace the cap.

- Place the cuvette into the holder and close the lid.
- Press ZERO key. The display will show "-0.0-" when the meter is zeroed and ready for measurement.

• Remove the cuvette and add the content of one packet of HI 93728-0 reagent.

- Replace the cap and immediately shake vigorously up and down for exactly 10 seconds. Continue to mix by inverting the cuvette gently for 50 seconds, while taking care not to induce air bubbles. Powder will not completely dissolve. Time and way of shaking could sensitively affect the measurement.
- Reinsert the cuvette into the instrument, taking care not to shake it.
- Press TIMER and the display will show the countdown prior to the measurement or, alternatively, wait for 4 minutes and 30 seconds and press READ. When the timer ends the meter will perform the reading. The instrument displays the results in ma/L of nitrate-nitroaen.

INTERFERENCES

۵

Interference may be caused by the following ions:

ferrous, ferric, cupric, mercurous, silver, antimonious, bismuth, auric, lead, metavanadate and chloroplatinate. Strongly reducing and oxidizing reagents.

High levels of nitrate (above 100 mg/L) could yield falsely high readings due to a minute amount of reduction to nitrite that could occur at these levels.

DISSOLVED OXYGEN

REAGENT SET

HI 93732-01 Reagents for 100 tests HI 93732-03 Reagents for 300 tests For other accessories see page 46.

MEASUREMENT PROCEDURE

- Select the *Dissolved Oxygen* method using the procedure described in the *Method Selection* section (see page 11).
- Fill one 60 mL glass bottle completely with the unreacted sample.
- Replace the cap and ensure that a small part of the sample spills over.
- Remove the cap and add 5 drops of HI 93732A-0 and 5 drops of HI 93732B-0.
- Add more sample, to fill the bottle completely. Replace the cap again and ensure that a part of the sample spills over. This is to make sure that no air bubbles have been trapped inside, which could alter the reading.
- Invert several times the bottle. The sample becomes orange-yellow and a flocculent agent will appear.

• Let the sample stand and the flocculent agent will start to settle.

 After approximately 2 minutes, when the upper half of the bottle becomes limpid, add 10 drops of HI 93732C-0.

• Replace the cap and invert the bottle until the settled flocculent dissolves completely. The sample is ready for measurement when it is yellow and <u>completely limpid</u>.

c II

x 10

• Fill the cuvette up to the mark with 10 mL of the unreacted (original) sample, and replace the cap. This is the blank.

• Press ZERO key. The display will show "-0.0-" when the meter is zeroed and ready for measurement.

- Remove the cuvette.
- Fill another cuvette up to the mark with 10 mL of the reacted sample and replace the cap.
- Reinsert the cuvette into the instrument.
- Press READ to start the reading. The instrument will display the results in mg/L of dissolved oxygen.

INTERFERENCES

Interferences may be caused by reducing and oxidizing materials.

MEASUREMENT PROCEDURE

- Select the *Phosphate LR* method using the procedure described in the *Method Selection* section (see page 11).
- Rinse, cap and shake the cuvette several times with unreacted sample. Fill the cuvette with 10 mL of sample up to the mark and replace the cap.
- Place the cuvette into the holder and close the lid.
- Press ZERO key. The display will show "-0.0-" when the meter is zeroed and ready for measurement.

• Remove the cuvette and add the content of one packet of HI 93713-0 reagent. Replace the cap and shake gently (for about 2 minutes) until the powder is completely dissolved.

- Reinsert the cuvette into the instrument.
- Press TIMER and the display will show the countdown prior to the measurement or, alternatively, wait for 3 minutes and press READ. When the timer ends the meter will perform the reading. The instrument displays concentration in mg/L of phosphate (PQ₄³).

• Press the \blacktriangle or \blacktriangledown to access the second level of functions.

Phosphate LR (P03-) Zero Timer Read

Press the Chem Frm functional key to convert the result in mg/L of phosphorus (P) and phosphorus pentoxide (P₂O₅).

• Press the \blacktriangle or \blacktriangledown to go back to the measurement screen.

INTERFERENCES

Interference may be caused by: Iron above 50 mg/L Silica above 50 mg/L Silicate above 10 mg/L

Copper above 10 mg/L

Hydrogen sulfide, arsenate, turbid sample and highly buffered samples also interfere.

ERRORS AND WARNINGS

The instrument shows clear warning messages when erroneous conditions appear and when measured values are outside the expected range. These messages are described below.

13:00:10
▲ Warning
No Light
Zero

No Light: The light source is not functioning properly.

13:00:57	
Zero	

Light Leak: There is an excess amount of ambient light reaching the detector.

Inverted cuvettes: The sample and the zero cuvettes are inverted.

Warning Inverted cuvets

13:01:36

13:06:01 A Warning Battery Low Zero

∆Warning

Battery Low: The battery capacity is lower than 10%.

Light Low: The instrument cannot adjust the light level. Please check that the sample does not contain any debris.

Light Low Zero

13:08:00

13:09:07 **Murning** Light High Zero **Light High**: There is too much light to perform a measurement. Please check the preparation of the zero cuvette.

DATA MANAGEMENT

The analyzed data can be managed using Hanna's product **HI 92000**, Windows® Compatible Software.

WARRANTY

All Hanna Instruments meters are warranted for two years against defects in workmanship and materials when used for its intended purpose and maintained according to the instructions.

This warranty is limited to repair or replacement free of charge.

Damages due to accident, misuse, tampering or lack of prescribed maintenance are not covered.

If service is required, contact your dealer. If under warranty, report the model number, date of purchase, serial number and the nature of the failure. If the repair is not covered by the warranty, you will be notified of the charges incurred.

If the instrument is to be returned to Hanna Instruments, first obtain a Returned Goods Authorization Number from the Customer Service Department and then send it with shipment costs prepaid. When shipping any instrument, make sure it is properly packaged for complete protection.

To validate your warranty, fill out and return the enclosed warranty card within 14 days from the date of purchase.

Recommendations for Users

Before using these products, make sure that they are entirely suitable for your specific application and for the environment in which they are used. Operation of these instruments may cause unacceptable interferences to other electronic equipments, this requiring the operator to take all necessary steps to correct interferences.

Any variation introduced by the user to the supplied equipment may degrade the instruments' EMC performance.

To avoid damages or burns, do not put the instrument in microwave ovens. For yours and the instrument safety do not use or store the instrument in hazardous environments.

Hanna Instruments reserves the right to modify the design, construction and appearance of its products without advance notice.

HANNA LITERATURE

Hanna publishes a wide range of catalogs and handbooks for an equally wide range of applications. The reference literature currently covers areas such as:

- Water Treatment
- Process
- Swimming Pools
- Agriculture
- Food
- Laboratory

and many others. New reference material is constantly being added to the library.

For these and other catalogs, handbooks and leaflets contact your dealer or the Hanna Customer Service Center nearest to you. To find the Hanna Office in your vicinity, check our home page at www.hannainst.com.
