LMX2377U

PLLatinum™ Ultra Low Power Dual Frequency Synthesizer for RF Personal Communications 2.5 GHz/1.2 GHz

General Description

The LMX2377U device is a high performance frequency synthesizer with integrated dual modulus prescalers. The LMX2377U device is designed for use as a local oscillator for the first and second RF of a dual conversion radio transceiver.

A 16/17 or a 32/33 prescale ratio can be selected for the Main synthesizer. An 8/9 or a 16/17 prescale ratio can be selected for the Aux synthesizer. Using a proprietary digital phase lock technique, the LMX2377U device generates very stable, low noise control signals for UHF and VHF voltage controlled oscillators. Both the Main and Aux synthesizers include a two-level programmable charge pump. The Main synthesizer has dedicated Fastlock circuitry.

Serial data is transferred to the devices via a three-wire interface (Data, LE, Clock). The low voltage logic interface allows connection to 1.8V devices. Supply voltages from 2.7V to 5.5V are supported. The LMX2377U features ultra low current consumption, typically 3.5 mA at 3.0V.

The LMX2377U devices are available in 20-Pin TSSOP, 24-Pin CSP, and 20-Pin UTCSP surface mount plastic packages.

Features

- Ultra Low Current Consumption
- Upgrade and Compatible to the LMX2370
- 2.7V to 5.5V Operation
- 1.8V to 5.0V MICROWIRE Logic Interface
- Selectable Synchronous or Asynchronous Powerdown Mode:

 $I_{CC-PWDN} = 1 \mu A typical$

■ Selectable Dual Modulus Prescaler: Main: 16/17 or 32/33

Aux: 8/9 or 16/17

- Selectable Charge Pump TRI-STATE® Mode
- Programmable Charge Pump Current Levels Main and Aux: 0.95 or 3.8 mA
- Selectable Fastlock[™] Mode for the Main Synthesizer
- Open Drain Analog Lock Detect Output
- Available in 20-Pin TSSOP, 24-Pin CSP, and 20-Pin UTCSP

Applications

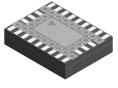

- Mobile Handsets (GSM, GPRS, W-CDMA, CDMA, PCS, AMPS, PDC, DCS)
- Cordless Handsets (DECT, DCT)
- Wireless Data
- Cable TV Tuners

Pin Descriptions

| Pin Name | Pin No. 20-Pin UTCSP | Pin No. 24-Pin CSP | Pin No. 20-Pin TSSOP | I/O | Description |
|----------------------|-------------------------|-----------------------|----------------------------|-----|--|
| V _{CC} | 20 | 24 | 1 | _ | Power supply bias for the Main PLL analog and digital circuits. $V_{\rm CC}$ may range from 2.7V to 5.5V. Bypass capacitors should be placed as close as possible to this pin and be connected directly to the ground plane. |
| V _P Main | 1 | 2 | 2 | - | Main PLL charge pump power supply. Must be $\geq V_{CC}$. |
| D _o Main | 2 | 3 | 3 | 0 | Main PLL charge pump output. The output is connected to the external loop filter, which drives the input of the VCO. |
| GND | 3 | 4 | 4 | T- | Ground for the Main PLL digital circuitry. |
| f _{IN} Main | 4 | 5 | 5 | П | Main PLL prescaler input. Small signal input from the VCO. |

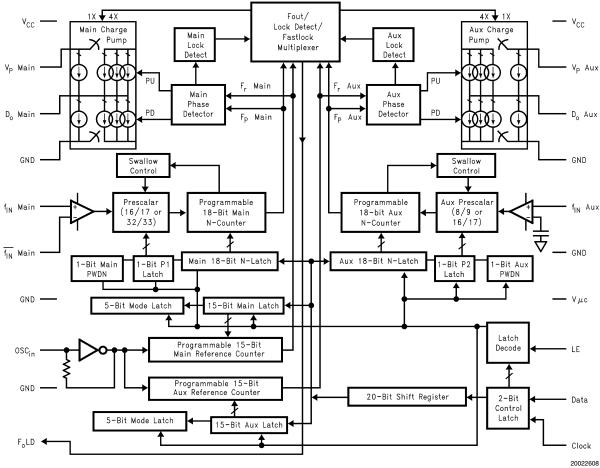

Pin Descriptions (Continued)

| Pin Name | Pin No. 20-Pin UTCSP | Pin No. 24-Pin CSP | Pin No. 20-Pin TSSOP | I/O | Description |
|----------------------|-------------------------|-----------------------|----------------------------|-------------|--|
| f _{IN} Main | 5 | 6 | 6 | I | Main prescaler complementary input. For single ended operation, this pin should be AC grounded. The LMX2377U Main PLL can be driven differentially when the bypass capacitor is omitted. |
| GND | 6 | 7 | 7 | <u> — </u> | Ground for the Main PLL analog circuitry. |
| OSC _{in} | 7 | 8 | 8 | I | Reference oscillator input. It has an approximate $V_{\rm CC}/2$ input threshold and can be driven from an external CMOS or TTL logic gate. |
| GND | 8 | 10 | 9 | | Ground for the Aux PLL digital circuitry, MICROWIRE, F _o LD, and oscillator circuits. |
| F _o LD | 9 | 11 | 10 | 0 | Programmable multiplexed output pin. Functions as a general purpose CMOS TRI-STATE output, Main/Aux PLL open drain analog lock detect output, N and R divider output or Fastlock output, which connects a parallel resistor to the external loop filter. |
| Clock | 10 | 12 | 11 | 1 | MICROWIRE Clock input. High impedance CMOS input. Data is clocked into the 22-bit shift register on the rising edge of Clock. |
| Data | 11 | 14 | 12 | I | MICROWIRE Data input. High impedance CMOS input. Binary serial data. The MSB of Data is shifted in first. The last two bits are the control bits. |
| LE | 12 | 15 | 13 | I | MICROWIRE Latch Enable input. High impedance CMOS input. When LE transitions HIGH, Data stored in the shift register is loaded into one of 4 internal control registers. |
| Vµс | 13 | 16 | 14 | _ | Power supply bias for the MICROWIRE circuitry. Must be \leq V _{CC} . Typically connected to the same supply level as the microprocessor or baseband controller to enable programming at low voltages. |
| GND | 14 | 17 | 15 | _ | Ground for the Aux PLL analog circuitry. |
| f _{IN} Aux | 15 | 18 | 16 | I | Aux PLL prescaler input. Small signal input from the VCO. |
| GND | 16 | 19 | 17 | _ | Ground for the Aux PLL digital circuitry, MICROWIRE, F _o LD, and oscillator circuits. |
| D _o Aux | 17 | 20 | 18 | 0 | Aux PLL charge pump output. the output is connected to an external loop filter, which drives the input of the VCO. |
| V _P Aux | 18 | 22 | 19 | — | Aux PLL charge pump power supply. Must be $\geq V_{CC}$. |
| V _{CC} | 19 | 23 | 20 | _ | Power supply bias for the Aux PLL analog and digital circuits, F_oLD , and oscillator circuits. V_{CC} may range from 2.7V to 5.5V. Bypass capacitors should be placed as close as possible to this pin and be connected directly to the ground plane. |
| NC | _ | 1, 9, 13, 21 | _ | | No Connect |

Detailed Block Diagram

Notes:

- 1. V_{CC} supplies power to the Main and Aux prescalers, Main and Aux feedback dividers, Main and Aux reference dividers, Main and Aux phase detectors, the OSC_{in} buffer, and F₀LD circuitry.
- 2. Vµc supplies power to the MICROWIRE circuitry.
- 3. V_P Main and V_P Aux supply power to the charge pumps. They can be run separately as long as V_P Main $\geq V_{CC}$ and V_P Aux $\geq V_{CC}$.

Absolute Maximum Ratings (Notes 1,

2, 3)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/ Distributors for availability and specifications.

Power Supply Voltage

 $\begin{array}{lll} V_{\rm CC} \ \text{to GND} & -0.3 \text{V to } +6.5 \text{V} \\ V_{\rm P} \ \text{Main to GND} & -0.3 \text{V to } +6.5 \text{V} \\ V_{\rm P} \ \text{Aux to GND} & -0.3 \text{V to } +6.5 \text{V} \\ \end{array}$

Power Supply Voltage

 V_{CC} to GND +2.7V to +5.5V V_{P} Main to GND V_{CC} to +5.5V V_{P} Aux to GND V_{CC} to +5.5V Operating Temperature (T_{A}) -40°C to +85°C

Note 1: Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Recommended Operating Conditions indicate conditions for which the device is intended to be functional, but do not guarantee specific performance limits. For guaranteed specifications and test conditions, refer to the Electrical Characteristics section. The guaranteed specifications apply only for the conditions listed.

Note 2: This device is a high performance RF integrated circuit with an ESD rating <2 kV and is ESD sensitive. Handling and assembly of this device should only be done at ESD protected work stations.

Note 3: GND = 0V

Note 4: Some of the values in this range are illegal divide ratios (B < A). To obtain continuous legal division, the Minimum Divide Ratio must be calculated. Use N \geq P * (P-1), where P is the value of the prescaler selected.

Note 5: Refer to the LMX2377U $f_{\mbox{\scriptsize IN}}$ Sensitivity Test Setup section

Note 6: Refer to the LMX2377U Charge Pump Test Setup section

Note 7: Refer to the Charge Pump Current Specification Definitions for details on how these measurements are made.

Note 8: Refer to the LMX2377U OSC_{in} Sensitivity Test Setup section

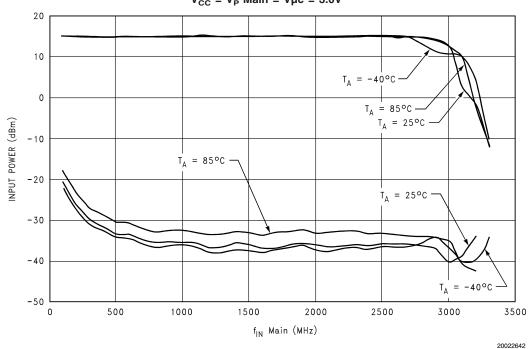

Note 9: Refer to the LMX2377U Serial Data Input Timing section

Note 10: Normalized Phase Noise Contribution is defined as : $L_N(f) = L(f) - 20 \log (N) - 10 \log (F_{\phi})$, where L(f) is defined as the single side band phase noise measured at an offset frequency, f, in a 1 Hz bandwidth. The offset frequency, f, must be chosen sufficiently smaller than the PLL's loop bandwidth, yet large enough to avoid substantial phase noise contribution from the reference source. N is the value selected for the feedback divider and F_{ϕ} is the Main/Aux phase detector comparison frequency.

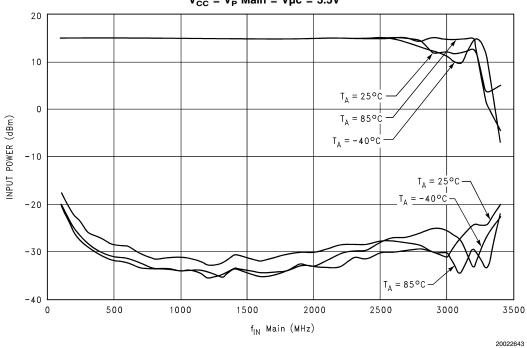

Note 11: The synthesizer phase noise is measured with the LMX2370TMEB/LMX2370SLBEB/LMX2370SLEEB Evaluation boards and the HP8566B Spectrum Analyzer.

Charge Pump Current Specification Definitions

I1 = Charge Pump Sink Current at $VD_0 = V_P - \Delta V$

I2 = Charge Pump Sink Current at $VD_0 = V_P/2$

I3 = Charge Pump Sink Current at $VD_0 = \Delta V$

I4 = Charge Pump Source Current at $VD_0 = V_P - \Delta V$

I5 = Charge Pump Source Current at VD₀ = V_P/2

I6 = Charge Pump Source Current at $VD_0 = \Delta V$

 $\Delta V = Voltage$ offset from the positive and negative rails. Dependent on the VCO tuning range relative to V_{CC} and GND. Typical values are between 0.5V and 1.0V.

 $V_{\mbox{\footnotesize{P}}}$ refers to either $V_{\mbox{\footnotesize{P}}}$ Main or $V_{\mbox{\footnotesize{P}}}$ Aux

VDo refers to either VDo Main or VDo Aux

 ${\rm ID_0}$ refers to either ${\rm ID_0}$ Main or ${\rm ID_0}$ Aux

Charge Pump Output Current Magnitude Variation Vs Charge Pump Output Voltage

$$ID_o Vs VD_o = \frac{(|II| - |I3|)}{(|II| + |I3|)} \times 100\%$$

$$= \frac{(|I4| - |I6|)}{(|I4| + |I6|)} \times 100\%$$

Charge Pump Output Sink Current Vs Charge Pump Output Source Current Mismatch

$$ID_{o}$$
 SINK Vs ID_{o} SOURCE =
$$\frac{|I2| - |I5|}{\frac{1}{2}(|I2| + |I5|)} \times 100\%$$

Charge Pump Output Current Magnitude Variation Vs Temperature

$$ID_{o} \text{ Vs } T_{A} = \frac{|I_{2}||_{T_{A}} - |I_{2}||_{T_{A} = 25^{\circ}C}}{|I_{2}||_{T_{A} = 25^{\circ}C}} \times 100\%$$

$$= \frac{|I_{5}||_{T_{A}} - |I_{5}||_{T_{A} = 25^{\circ}C}}{|I_{5}||_{T_{A} = 25^{\circ}C}} \times 100\%$$

The block diagram above illustrates the setup required to measure the LMX2377U device's Main charge pump sink current. The same setup is used for the LMX2370TMEB/LMX2370SLEEB Evaluation Boards. The Aux charge pump measurement setup is similar to the Main charge pump measurement setup. The purpose of this test is to assess the functionality of the Main charge pump.

This setup uses an open loop configuration. A power supply is connected to $V_{\rm cc}$ and swept from 2.7V to 5.5V. The MICROWIRE power supply, Vµc, is tied to $V_{\rm cc}.$ By means of a signal generator, a 10 MHz signal is typically applied to the $f_{\rm IN}$ Main pin. The signal is one of two inputs to the phase detector. The 3 dB pad provides a 50 Ω match between the PLL and the signal generator. The OSC in pin is tied to $V_{\rm cc}.$ This establishes the other input to the phase detector. Alternatively, this input can be tied directly to the ground plane. With the $D_{\rm o}$ Main pin connected to a Semiconductor Parameter Analyzer in this way, the sink, source, and TRI-STATE currents can be measured by simply toggling the **Phase Detector Polarity** and **Charge Pump State** states in Code

Loader. Similarly, the LOW and HIGH currents can be measured by switching the **Charge Pump Gain's** state between **1X** and **4X** in Code Loader.

LEVEL SHIE

Let F_r represent the frequency of the signal applied to the OSC_{in} pin, which is simply zero in this case (DC), and let F_p represent the frequency of the signal applied to the f_{IN} Main pin. The phase detector is sensitive to the rising edges of F_r and F_p . Assuming positive VCO characteristics; the charge pump turns ON and sinks current when the first rising edge of F_p is detected. Since F_r has no rising edge, the charge pump continues to sink current indefinitely.

Toggling the **Phase Detector Polarity** state to negative VCO characteristics allows the measurement of the Main charge pump source current. Likewise, selecting **TRI-STATE** (TRI-STATE ID $_{\rm o}$ Main Bit = 1) for **Charge Pump State** in Code Loader facilitates the measurement of the TRI-STATE surrent

The measurements are repeated at different temperatures, namely $T_A = -40$ °C, +25 °C, and +85 °C.

LMX2377U f_{IN} Sensitivity Test Setup DC Power Supply 2.7V - 5.5V LMX2370SLBEB **EVALUATION** 10 MHz REF OUT **BOARD** SIGNAL GENERATOR 100 pF 100 MHz - 2500 MHz D Main 100 pF RF2 OUT GND LMX2377U fin Au 100 pF 3 dB f_{IN} Main PLL PAD CODE f_{IN} Main LOADER 100 pF LE Data μ WIRE OSC: PC UNIVERSAL COUNTER LEVEL SHIFT 20022640

The block diagram above illustrates the setup required to measure the LMX2377U device's Main input sensitivity level. The same setup is used for the LMX2370TMEB/LMX2370SLEEB Evaluation Boards. The Aux input sensitivity test setup is similar to the Main input sensitivity test setup. The purpose of this test is to measure the acceptable signal level to the $f_{\rm IN}$ Main input of the PLL chip. Outside the acceptable signal range, the feedback divider begins to divide incorrectly and miscount the frequency.

The setup uses an open loop configuration. A power supply is connected to $V_{\rm cc}$ and the bias voltage is swept from 2.7V to 5.5V. The MICROWIRE power supply, Vµc, is tied to $V_{\rm cc}$. The Aux PLL is powered down (PWDN Aux Bit = 1). By means of a signal generator, an RF signal is applied to the $f_{\rm IN}$ Main pin. The 3 dB pad provides a 50 Ω match between the PLL and the signal generator. The OSC $_{\rm in}$ pin is tied to $V_{\rm cc}$. The N value is typically set to 10000 in Code Loader, i.e. Main N_CNTRB Word = 312 and Main N_CNTRA Word = 16 for PRE Main Bit = 1. The feedback divider output is routed to the $F_{\rm o}$ LD pin by selecting the Main PLL N Divider

Output word (F_oLD Word = 6 or 14) in Code Loader. A Universal Counter is connected to the F_oLD pin and tied to the 10 MHz reference output of the signal generator. The output of the feedback divider is thus monitored and should be equal to f_{IN} Main/ N.

The f_{IN} Main input frequency and power level are then swept with the signal generator. The measurements are repeated at different temperatures, namely $T_{\text{A}} = -40\,^{\circ}\text{C}$, $+25\,^{\circ}\text{C}$, and $+85\,^{\circ}\text{C}$. Sensitivity is reached when the frequency error of the divided RF input is greater than or equal to 1 Hz. The power attenuation from the cable and the 3 dB pad must be accounted for. The feedback divider will actually miscount if too much or too little power is applied to the f_{IN} Main input. Therefore, the allowed input power level will be bounded by the upper and lower sensitivity limits. In a typical application, if the power level to the f_{IN} Main input approaches the sensitivity limits, this can introduce spurs and degradation in phase noise. When the power level gets even closer to these limits, or exceeds it, then the Main PLL loses lock.

LMX2377U OSC_{in} Sensitivity Test Setup DC Power Supply 2.7V - 5.5V LMX2370SLBEB **EVALUATION** BOARD GNI D_o Main RF2 OUT GND LMX2377U fin Au RF1 OUT f_{IN} Main PLL GNE f_{IN} Main ۷μο CODE LOADER 100 pF GND LE Data osc_{in} μWIRE 0Ω SIGNAL GENERATOR OSC: PC 2 MHz - 100 MHz 1000 pF 51Ω 0Ω 10 MHz REF OUT UNIVERSAL COUNTER LEVEL SHIFT BUFFER 20022641

The block diagram above illustrates the setup required to measure the LMX2377U device's OSC $_{\rm in}$ buffer sensitivity level. The same setup is used for the LMX2370TMEB/LMX2370SLEEB Evaluation Boards. This setup is similar to the $f_{\rm IN}$ sensitivity setup except that the signal generator is now connected to the OSC $_{\rm in}$ pin and both $f_{\rm IN}$ pins are tied to V $_{\rm CC}$. The 51 Ω shunt resistor matches the OSC $_{\rm in}$ input to the signal generator. The R counter is typically set to 1000, i.e. Main R_CNTR Word = 1000 or Aux R_CNTR Word = 1000. The reference divider output is routed to the F $_{\rm o}$ LD pin by selecting the Main PLL R Divider Output word (F $_{\rm o}$ LD Word = 2 or 10) or the Aux PLL R Divider Output word (F $_{\rm o}$ LD Word = 1 or 9) in Code Loader. Similarly, a Universal

Counter is connected to the F_oLD pin and is tied to the 10 MHz reference output from the signal generator. The output of the reference divider is monitored and should be equal to OSC_{in}/ Main R_CNTR or OSC_{in}/ Aux R_CNTR.

Again, $V_{\rm CC}$ is swept from 2.7V to 5.5V. The MICROWIRE power supply, $V_{\mu c}$, is tied to $V_{\rm cc}$. The OSC_{in} input frequency and voltage level are then swept with the signal generator. The measurements are repeated at different temperatures, namely $T_A = -40^{\circ}\text{C}$, $+25^{\circ}\text{C}$, and $+85^{\circ}\text{C}$. Sensitivity is reached when the frequency error of the divided input signal is greater than or equal to 1 Hz.

LMX2377U f_{IN} Impedance Test Setup DC Power Supply 2.7V - 5.5V LMX2370SLBEB **EVALUATION BOARD** NETWORK ANALYZER 100 pF D_o Main 100 pF RF2 OUT GND LMX2377U fin Au RF1 OUT f_{IN} Main GNE PLL f_{IN} Main ۷μο CODE LOADER 100 pF 1.6 GND osc_{in} Data μ WIRE 0Ω PC LEVEL SHIFT BUFFFR 20022679

The block diagram above illustrates the setup required to measure the LMX2377U device's Main input impedance. The Aux input impedance and reference oscillator impedance setups are very much similar. The same setup is used for the LMX2370TMEB/ LMX2370SLEEB Evaluation Boards. Measuring the device's input impedance facilitates the design of appropriate matching networks to match the PLL to the VCO, or in more critical situations, to the characteristic impedance of the printed circuit board (PCB) trace, to prevent undesired transmission line effects.

Before the actual measurements are taken, the Network Analyzer needs to be calibrated, i.e. the error coefficients need to be calculated. Therefore, three standards will be used to calculate these coefficients: an **open**, **short** and a **matched load**. A 1-port calibration is implemented here.

To calculate the coefficients, the PLL chip is first removed from the PCB. The Network Analyzer port is then connected to the RF1 OUT connector of the evaluation board and the desired operating frequency is set. The typical frequency range selected for the LMX2377U device's Main synthesizer is from 100 MHz to 2500 MHz. The standards will be located down the length of the RF1 OUT transmission line. The transmission line adds electrical length and acts as an offset from the reference plane of the Network Analyzer; therefore,

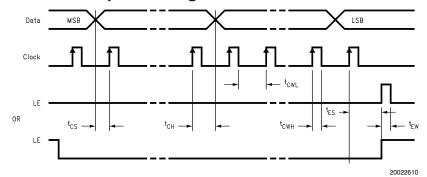

it must be included in the calibration. Although not shown, 0 Ω resistors are used to complete the RF1 OUT transmission line (trace).

To implement an **open** standard, the end of the RF1 OUT trace is simply left open. To implement a **short** standard, a 0 Ω resistor is placed at the end of the RF1 OUT transmission line. Last of all, to implement a **matched load** standard, two 100 Ω resistors in parallel are placed at the end of the RF1 OUT transmission line. The Network Analyzer calculates the calibration coefficients based on the measured S₁₁ parameters. With this all done, calibration is now complete.

The PLL chip is then placed on the PCB. A power supply is connected to $V_{\rm CC}$ and swept from 2.7V to 5.5V. The MICROWIRE power supply, Vµc, is tied to $V_{\rm cc}.$ The OSC $_{\rm in}$ pin is tied to the ground plane. Alternatively, the OSC $_{\rm in}$ pin can be tied to $V_{\rm CC}.$ In this setup, the complementary input ($f_{\rm IN}$ Main) is AC coupled to ground. With the Network Analyzer still connected to RF1 OUT, the measured $f_{\rm IN}$ Main impedance is displayed.

Note: The impedance of the reference oscillator is measured when the oscillator buffer is powered up (PWDN Main Bit = 0 **or** PWDN Aux Bit = 0), and when the oscillator buffer is powered down (PWDN Main Bit = 1 **and** PWDN Aux Bit = 1).

LMX2377U Serial Data Input Timing

Notes:

- 1. Data is clocked into the 22-bit shift register on the rising edge of Clock
- 2. The MSB of Data is shifted in first.

1.0 Functional Description

The basic phase-lock-loop (PLL) configuration consists of a high-stability crystal reference oscillator, a frequency synthesizer such as the National Semiconductor LMX2377U, a voltage controlled oscillator (VCO), and a passive loop filter. The frequency synthesizer includes a phase detector, current mode charge pump, programmable reference R and feedback N frequency dividers. The VCO frequency is established by dividing the crystal reference signal down via the reference divider to obtain a comparison reference frequency. This reference signal, F_r, is then presented to the input of a phase/frequency detector and compared with the feedback signal, F_p , which was obtained by dividing the VCO frequency down by way of the feedback divider. The phase/frequency detector measures the phase error between the F_r and F_p signals and outputs control signals that are directly proportional to the phase error. The charge pump then pumps charge into or out of the loop filter based on the magnitude and direction of the phase error. The loop filter converts the charge into a stable control voltage for the VCO. The phase/frequency detector's function is to adjust the voltage presented to the VCO until the feedback signal's frequency and phase match that of the reference signal. When this "Phase-Locked" condition exists, the VCO frequency will be N times that of the comparison frequency, where N is the feedback divider ratio.

1.1 REFERENCE OSCILLATOR INPUT

The reference oscillator frequency for both the Main and Aux PLLs is provided from an external reference via the OSC_{in} pin. The reference buffer circuit supports input frequencies from 2 to 40 MHz with a minimum input sensitivity of 0.5 V $_{PP}$. The reference buffer circuit has an approximate $V_{CC}/2$ input threshold and can be driven from an external CMOS or TTL logic gate. Typically, the OSC_{in} pin is connected to the output of a crystal oscillator.

1.2 REFERENCE DIVIDERS (R COUNTERS)

The reference dividers divide the reference input signal, OSC_{in}, by a factor of R. The output of the reference divider circuits feeds the reference input of the phase detector. This reference input to the phase detector is often referred to as the comparison frequency. The divide ratio should be chosen such that the maximum phase comparison frequency ($F_{\phi Main}$ or $F_{\phi Aux}$) of 10 MHz is not exceeded.

The Main and Aux reference dividers are each comprised of 15-bit CMOS binary counters that support a continuous integer divide ratio from 2 to 32767. The Main and Aux reference divider circuits are clocked by the output of the reference buffer circuit which is common to both.

1.3 PRESCALERS

The f_{IN} Main and $\overline{f_{IN}}$ Main input pins drive the input of a bipolar, differential-pair amplifier. The output of the bipolar, differential-pair amplifier drives a chain of ECL D-type

flip-flops in a dual modulus configuration. The output of the prescaler is used to clock the subsequent feedback dividers. The Main PLL complementary inputs can be driven differentially, or the negative input can be AC coupled to ground through an external capacitor for single ended configuration. A 16/17 or a 32/33 prescale ratio can be selected for the LMX2377U Main synthesizer. On the other hand, the Aux PLL is only intended for single ended operation. An 8/9 or a 16/17 prescale ratio can be selected for the LMX2377U Aux synthesizer.

1.4 PROGRAMMABLE FEEDBACK DIVIDERS (N COUNTERS)

The programmable feedback dividers operate in concert with the prescalers to divide the input signal f_{IN} by a factor of N. The output of the programmable reference divider is provided to the feedback input of the phase detector circuit. The divide ratio should be chosen such that the maximum phase comparison frequency ($F_{\phi Main}$ or $F_{\phi Aux}$) of 10 MHz is not exceeded.

The programmable feedback divider circuit is comprised of an A counter (swallow counter) and a B counter (programmble binary counter). The Main N CNTRA and the Aux N_CNTRA counters are both 5-bit CMOS swallow counters, programmable from 0 to 31. The Main N_CNTRB and Aux N_CNTRB counters are both 13-bit CMOS binary counters, programmable from 3 to 8191. A continuous integer divide ratio is achieved if $N \ge P^* (P-1)$, where P is the value of the prescaler selected. Divide ratios less than the minimum continuous divide ratio are achievable as long as the binary programmable counter value is greater than the swallow counter value (N_CNTRB ≥ N_CNTRA). Refer to **Sections** 2.5.1, 2.5.2, 2.7.1 and 2.7.2 for details on how to program the N_CNTRA and N_CNTRB counters. The following equations are useful in determining and programming a particular value of N:

 $N = (P \times N_CNTRB) + N_CNTRA$

 $f_{IN} = N \times F_{\phi}$ **Definitions:**

 F_{ϕ} : Main or Aux phase detector comparison

frequency

f_{IN}: Main or Aux input frequencyN_CNTRA: Main or Aux A counter valueN CNTRB: Main or Aux B counter value

P: Preset modulus of the dual modulus

prescaler

Main synthesizer: P = 16 or 32 Aux synthesizer: P = 8 or 16

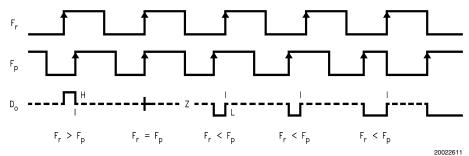

1.0 Functional Description (Continued)

1.5 PHASE/FREQUENCY DETECTORS

The Main and Aux phase/frequency detectors are driven from their respective N and R counter outputs. The maximum frequency for both the Main and Aux phase detector inputs is 10 MHz. The phase/frequency detector outputs control the respective charge pumps. The polarity of the pump-up or pump-down control signals are programmed using the PD_POL Main or PD_POL Aux control bits, de-

pending on whether the Main or Aux VCO characteristics are positive or negative. Refer to **Sections 2.4.2** and **2.6.2** for more details. The phase/frequency detectors have a detection range of -2π to $+2\pi$. The phase/frequency detectors also receive a feedback signal from the charge pump in order to eliminate dead zone.

PHASE COMPARATOR AND INTERNAL CHARGE PUMP CHARACTERISTICS

Notes:

- 1. The minimum width of the pump-up and pump-down current pulses occur at the Do Main or Do Aux pins when the loop is phase locked.
- 2. The diagram assumes positive VCO characteristics, i.e. PD_POL Main or PD_POL Aux = 1.
- 3. Fr is the phase detector input from the reference divider (R counter).
- 4. F_p is the phase detector input from the programmable feedback divder (N counter).
- 5. Do refers to either the Main or Aux charge pump output.

1.6 CHARGE PUMPS

The charge pump directs charge into or out of an external loop filter. The loop filter converts the charge into a stable control voltage which is applied to the tuning input of the VCO. The charge pump steers the VCO control voltage towards $V_{\rm P}$ Main or $V_{\rm P}$ Aux during pump-up events and towards GND during pump-down events. When locked, $D_{\rm o}$ Main or $D_{\rm o}$ Aux are primarily in a TRI-STATE mode with small corrections occuring at the phase comparator rate. The charge pump output current magnitude can be selected by toggling the $ID_{\rm o}$ Main or $ID_{\rm o}$ Aux control bits.

1.7 MICROWIRE SERIAL INTERFACE

The programmable register set is accessed via the MICROWIRE serial interface. The supply for the MICROWIRE circuitry is separate from the rest of the IC to allow direct connection to 1.8V devices. The interface is comprised of three signal pins: Clock, Data and LE (Latch Enable). Serial data is clocked into the 22-bit shift register on the rising edge of Clock. The last two bits decode the internal control register address. When LE transitions HIGH, data stored in the shift register is loaded into one of four control registers depending on the state of the address bits. The MSB of Data is loaded in first. The synthesizers can be programmed even in power down mode. A complete programming description is provided in Section 2.0 Programming Description.

1.8 MULTI-FUNCTION OUTPUTS

The LMX2377U device's F_oLD output pin is a multi-function output that can be configured as the Main synthesizer Fast-Lock output, an open drain analog lock detect output, counter reset, or used to monitor the output of the various reference divider (R counter) or feedback divider (N counter) circuits. The F_oLD control word is used to select the desired output function. When the PLL is in powerdown mode, the F_oLD output is pulled to a LOW state. A complete programming description of the multi-function output is provided in **Section 2.8** F_oLD .

1.8.1 Open Drain Analog Lock Detect Output

An analog lock detect status generated from the phase detector is available on the $\rm F_oLD$ output pin if selected. The lock detect output goes to a high impedance state when the charge pump is inactive. It goes low when the charge pump is active during a comparison cycle. When viewed with an oscilloscope, and when a pull-up resistor is used, narrow negative pulses are observed when the charge pump turns on. The lock detect output signal is an open drain configuration.

Three separate lock detect signals are routed to the multiplexer. Two of these monitor the 'lock' status of the individual synthesizers. The third detects the condition when both the Main and Aux synthesizers are in a 'locked state'. External circuitry however, is required to provide a steady DC signal to indicate when the PLL is in a locked state. Refer to **Section 2.8 F_oLD** for details on how to program the different lock detect options.

1.0 Functional Description (Continued)

1.8.2 Open Drain FastLock Output

The LMX233xU Fastlock feature allows faster loop response time during lock aquisition. The loop response time (lock time) can be approximately halved if the loop bandwidth is doubled. In order to achieve this, the same gain/ phase relationship at twice the loop bandwidth must be maintained. This can be achieved by increasing the charge pump current from 0.95 mA (ID, Main Bit = 0) in the steady state mode, to 3.8 mA (ID, Main Bit = 1) in Fastlock. When the F, LD output is configured as a FastLock output, an open drain device is enabled. The open drain device switches in a parallel resistor R2' to ground, of equal value to resistor R2 of the external loop filter. The loop bandwidth is effectively doubled and stability is maintained. Once locked to the correct frequency, the PLL will return to a steady state condition. Refer to Section 2.8 FoLD for details on how to configure the FoLD output to an open drain Fastlock output.

1.8.3 Counter Reset

Three separate counter reset functions are provided. When the F_oLD is programmed to **Reset Aux PLL Counters**, both the Aux feedback divider and the Aux reference divider are held at their load point. When the **Reset Main PLL Counters** is programmed, both the Main feedback divider and the Main reference divider are held at their load point. When the **Reset All Counters** mode is enabled, all feedback dividers and reference dividers are held at their load point. When the device is programmed to normal operation, both the feedback divider and reference divider are enabled and resume counting in 'close' alignment to each other. Refer to **Section 2.8 F_oLD** for more details.

1.8.4 Reference Divider and Feedback Divider Output

The outputs of the various N and R divders can be monitored by selecting the appropriate F_oLD word. This is essential when performing OSC_{in} or f_{IN} sensitivity measurements. Refer to the **Test Setups** section for more details. Refer to **Section 2.8** F_oLD for details on how to route the appropriate divder output to the F_oLD pin.

1.9 POWER CONTROL

Each synthesizer in the LMX2377U device is individually power controlled by device powerdown bits. The powerdown word is comprised of the PWDN Main (PWDN Aux) bit, in conjuction with the TRI-STATE ID_o Main (TRI-STATE ID_o Aux) bit. The powerdown control word is used to set the operating mode of the device. Refer to Sections 2.4.4, 2.5.4, 2.6.4, and 2.7.4 for details on how to program the Main or Aux powerdown bits.

When either the Main synthesizer or the Aux synthesizer enters the powerdown mode, the respective prescaler, phase detector, and charge pump circuit are disabled. The D_o Main (D_o Aux), f_{IN} Main (f_{IN} Aux), and $\overline{f_{IN}}$ Main pins are all forced to a high impedance state. The reference divider and feedback divider circuits are held at the load point during powerdown. The oscillator buffer is disabled when both the Main and Aux synthesizers are powered down. The OSCin pin is forced to a HIGH state through an approximate 100 k Ω resistance when this condition exists. When either synthesizer is activated, the respective prescaler, phase detector, charge pump circuit, and the oscillator buffer are all powered up. The feedback divider, and the reference divider are held at load point. This allows the reference oscillator, feedback divider, reference divider and prescaler circuitry to reach proper bias levels. After a finite delay, the feedback and reference dividers are enabled and they resume counting in 'close' alignment (the maximum error is one prescaler cycle). The MICROWIRE control register remains active and capable of loading and latching data while in the powerdown mode.

Synchronous Powerdown Mode

In this mode, the powerdown function is gated by the charge pump. When the device is configured for synchronous powerdown, the device will enter the powerdown mode upon completion of the next charge pump pulse event.

Asynchronous Powerdown Mode

In this mode, the powerdown function is NOT gated by the completion of a charge pump pulse event. When the device is configured for asynchronous powerdown, the part will go into powerdown mode immediately.

| TRI-STATE ID _o | PWDN | Operating Mode |
|---------------------------|------|--|
| 0 | 0 | PLL Active, Normal Operation |
| 1 | 0 | PLL Active, Charge Pump Output in High Impedance State |
| 0 | 1 | Synchronous Powerdown |
| 1 | 1 | Asynchronous Powerdown |

Notes:

- 1. TRI-STATE ${\rm ID_o}$ refers to either the TRI-STATE ${\rm ID_o}$ Main or TRI-STATE ${\rm ID_o}$ Aux bit .
- 2. PWDN refers to either the PWDN Main or PWDN Aux bit.

2.0 Programming Description

2.1 MICROWIRE INTERFACE

The 22-bit shift register is loaded via the MICROWIRE interface. The shift register consists of a 20-bit Data[19:0] Field and a 2-bit Address[1:0] Field as shown below. The Address Field is used to decode the internal control register address. When LE transitions HIGH, data stored in the shift register is loaded into one of 4 control registers depending on the state of the address bits. The MSB of Data is loaded in first. The Data field assignments are shown in **Section 2.3 CONTROL REGISTER CONTENT MAP**.

| MSB | | LSB |
|------------|---|--------------|
| Data[19:0] | | Address[1:0] |
| 21 | 2 | 1 0 |

2.2 CONTROL REGISTER LOCATION

The address bits Address[1:0] decode the internal register address. The table below shows how the address bits are mapped into the target control register.

| Addre | ss[1:0] | Target |
|-------|---------|----------|
| Fie | eld | Register |
| 0 | 0 | Aux R |
| 0 | 1 | Aux N |
| 1 | 0 | Main R |

2.4.2 PD_POL Aux AUXILIARY SYNTHESIZER PHASE DETECTOR POLARITY

Aux R[17]

The PD_POL Aux bit is used to control the Aux synthesizer's phase detector polarity based on the VCO tuning characteristics.

| Control Bit | Register Location | Description | Function | | | |
|-------------|-------------------|--------------------------------|---|---|--|--|
| | | | 0 | 1 | | |
| PD_POL Aux | Aux R[17] | Aux Phase Detector Polarity | Aux VCO Negative Tuning Characteristics | Aux VCO Positive Tuning Characteristics | | |

Aux VCO Characteristics

2.4.3 ID_o Aux AUXILIARY SYNTHESIZER CHARGE PUMP CURRENT GAIN

Aux R[18]

The ${\rm ID_o}$ Aux bit controls the Aux synthesizer's charge pump gain. Two current levels are available.

| Control Bit | Register Location | Description | Fund | ction |
|---------------------|-------------------|-----------------|---------|---------|
| | | | 0 | 1 |
| ID _o Aux | Aux R[18] | Aux Charge Pump | LOW | HIGH |
| | | Current Gain | 0.95 mA | 3.80 mA |

2.4.4 TRI-STATE ID. Aux AUXILIARY SYNTHESIZER CHARGE PUMP TRI-STATE CURRENT

Aux R[19]

The TRI-STATE ID_o Aux bit allows the charge pump to be switched between a normal operating mode and a high impedance output state. This happens asynchronously with the change in the TRI-STATE ID_o Aux bit.

Furthermore, the TRI-STATE ${\rm ID_o}$ Aux bit operates in conjuction with the PWDN Aux bit to set a synchronous or an asynchronous powerdown mode.

| Control Bit | Register Location | Description | Function | | |
|-------------------------------|-------------------|--------------------------------------|-------------------------------------|--|--|
| | | | 0 | 1 | |
| TRI-STATE ID _o Aux | Aux R[19] | Aux Charge Pump TRI-STATE Current | Aux Charge Pump Normal Operation | Aux Charge Pump Output in High Impedance State | |

2.5 AUXILIARY N REGISTER

The Aux N register contains the Aux N_CNTRA, Aux N_CNTRB, PRE Aux, and PWDN Aux control words. The Aux N_CNTRA and Aux N_CNTRB control words are used to setup the programmable feedback divider. The detailed description and programming information for each control word is discussed in the following sections.

| Reg. | . Most Significant Bit SHIFT REGISTER BIT LOCATION Least Signific | | | | | | | | | | | | | | nificar | nt Bit | |
|----------|---|---|--|--|--|--|--|--|--|--|--|--|--|---|------------|--------|---|

| Aux N | PWDN PRE Aux N_CNTRB[12:0] Aux N_CNTRA[4:0] | | | | | | | | | | | | | 0 | 1 | | |

2.5.1 Aux N_CNTRA[4:0] AUXILIARY SYNTHESIZER SWALLOW COUNTER (A COUNTER)

Aux N[2:6]

The Aux N_CNTRA control word is used to setup the Aux synthesizer's A counter. The A counter is a 5-bit swallow counter used in the programmable feedback divider. The Aux N_CNTRA control word can be programmed to values ranging from 0 to 31.

| Divide Ratio | | | Aux N_CNTRA[4:0] | | |
|--------------|---|---|------------------|---|---|
| | 4 | 3 | 2 | 1 | 0 |
| 0 | 0 | 0 | 0 | 0 | 0 |
| 1 | 0 | 0 | 0 | 0 | 1 |
| • | • | • | • | • | • |
| 31 | 1 | 1 | 1 | 1 | 1 |

2.5.2 Aux N_CNTRB[12:0] AUXILIARY SYNTHESIZER PROGRAMMABLE BINARY COUNTER (B COUNTER) Aux N[7:19]

The Aux N_CNTRB control word is used to setup the Aux synthesizer's B counter. The B counter is a 13-bit programmable binary counter used in the programmable feedback divider. The Aux N_CNTRB control word can be programmed to values ranging from 3 to 8191.

| Divide | | Aux N_CNTRB[12:0] | | | | | | | | | | | | | |
|--------|----|-------------------|----|---|---|---|---|---|---|---|---|---|---|--|--|
| Ratio | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | |

2.5.3 PRE Aux AUXILIARY SYNTHESIZER PRESCALER SELECT

Aux N[20]

The Aux synthesizer utilizes a selectable dual modulus prescaler.

| Control Bit | Register Location | Description | Function | | |
|-------------|-------------------|----------------------|---------------------------|-----------------------------|--|
| | | | 0 | 1 | |
| PRE Aux | Aux N[20] | Aux Prescaler Select | 8/9 Prescaler Selected | 16/17 Prescaler Selected | |

2.5.4 PWDN Aux AUXILIARY SYNTHESIZER POWERDOWN

Aux N[21]

The PWDN Aux bit is used to switch the Aux PLL between a powered up and powered down mode.

Furthermore, the PWDN Aux bit operates in conjuction with the TRI-STATE ID_o Aux bit to set a synchronous or an asynchronous powerdown mode.

| Control Bit | Register Location | Description | Function | | |
|-------------|-------------------|---------------|----------------|-------------------|--|
| | | | 0 | 1 | |
| PWDN Aux | Aux N[21] | Aux Powerdown | Aux PLL Active | Aux PLL Powerdown | |

2.6 MAIN R REGISTER

The Main R register contains the Main R_CNTR, PD_POL Main, ID_o Main, and TRI-STATE ID_o Main control words, in addition to two bits that compose the F_oLD control word. The detailed description and programming information for each control word is discussed in the following sections.

| Reg. | Most | Sign | ifican | t Bit | | | | | SH | IFT R | EGIS | ΓER E | IT LC | CATI | ON | | | | Leas | t Sigr | nificar | nt Bit |

| | | | Characteristics Characteristics | | | |

Main VCO Characteristics

$2.6.3~\mathrm{ID_o}$ Main

MAIN SYNTHESIZER CHARGE PUMP CURRENT GAIN

Main R[18]

The IDo Main bit controls the Main synthesizer's charge pump gain. Two current levels are available.

| Control Bit | Register Location | Description | Function | | |
|----------------------|-------------------|------------------|-----------------|------|--|
| | | | 0 | 1 | |
| ID _o Main | Main R[18] | Main Charge Pump | LOW | HIGH | |
| | | Current Gain | 0.95 mA 3.80 mA | | |

2.6.4 TRI-STATE ID Main MAIN SYNTHESIZER CHARGE PUMP TRI-STATE CURRENT

Main R[19]

The TRI-STATE ${\rm ID_o}$ Main bit allows the charge pump to be switched between a normal operating mode and a high impedance output state. This happens asynchronously with the change in the TRI-STATE ${\rm ID_o}$ Main bit.

Furthermore, the TRI-STATE ${\rm ID_o}$ Main bit operates in conjuction with the PWDN Main bit to set a synchronous or an asynchronous powerdown mode.

| Control Bit | Register Location | Description | Function | | |

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

- 1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
- 2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
