RICOH

R1243x SERIES

30V Input 2A Buck DC/DC Converter

NO.EA-206-111123

OUTLINE

The R1243x Series is the CMOS-based Step-Down DC/DC Converter with internal Nch high side Tr. (0.175Ω), which can provide the maximum 2A output current. The IC consists of an Oscillator, a PWM control circuit, a Reference Voltage unit, an Error amplifier, phase compensation circuits, a slope circuit, a soft start circuit, protection circuits, internal voltage regulators, and a switch for bootstrap circuit. The R1243x Series can make up a Step-Down DC/DC Converter with the following external components: an inductor, resistors, a diode, and capacitors.

The R1243x series are current mode operating type DC/DC converter which does not require external current sense resistor, and it works high speed response time, high efficiency and compatible with ceramic capacitors.

There are two types for the oscillator frequency. A/B version's frequency is fixed 1000kHz, and C/D version's frequency is fixed 330kHz.As a protection function, it has cycle by cycle peak current limit function, short protection function, thermal shutdown function and UVLO.

There are two types for short protection, A/C version has latch protection function with 2ms delay time, and B/D version has fold back protection function that keep operating at short condition with lower operating frequency and limiting the Lx current.

The R1243 Series has the built-in soft start time (Typ. 0.4ms). In addition to this, the soft start time is adjustable by adding an external capacitor. The R1243x Series has the FLG pin, which mainly monitors the FB pin voltage and gives the flag output by the Nch open drain if the abnormal condition is detected.

Since the packages for these ICs are HSOP-8E, and DFN(PLP)2527-10, therefore high density mounting of the ICs on boards is possible.

FEATURES

- Operating Voltage ..... 4.5V ~ 30V
- Standby Function ..... Typ. 0μA, Max. 10μA (V_{IN}=30V, CE="L")
- Supply Current ..... Typ. 0.7mA (V_{IN}=30V V_{FB}=1.0V)
- Output Voltage Range..... 0.8V ~ 18V (Adjustable with external resistor)
- Feed Back Voltage..... 0.5V with 1.4% accuracy
- Output Current ..... Max. 2A
- Peak Current Limit Function ..... Typ. 3.8A
- Internal Nch MOSFET Driver ..... Typ. 175mΩ
- Maximum Duty Cycle ..... Min. 85%
- Operating Frequency ..... Ver.A/B 1000kHz, Ver.C/D 330kHz
- Short protection delay time for Output Latch ..... Typ. 2ms : Ver.A/C
- Built-in Foldback Protection and its Frequency ... 1/4 frequency at fold condition : Ver.B/D
  ..... Ver.B 250kHz, Ver.D 82.5kHz
- Internal Soft Start Time ..... Typ. 0.4ms, with TSS pin open
- External Soft Start Time ..... Typ. 12ms, with C_{SS}=0.1μF
- Flag Output Function ..... Typ. 0.25ms, FLG "OFF" delay time
- UVLO Released Voltage ..... Typ. 4.0V
- Thermal Shutdown Function ..... Typ. 160°C, with 35°C hysteresis
- Package ..... HSOP-8E, DFN(PLP)2527-10

*)This is an approximate value, because output current depends on conditions and external parts.

APPLICATIONS

- Power source for digital home appliance
- Power source for hand-held communication equipment, cameras, video instruments such as VCRs, camcorders.
- Power source for battery-powered equipment.
- Battery Charger

SELECTION GUIDE

In the R1243x Series, type of short protection (Latch or Foldback), frequency (1000kHz, or 330kHz), and package for the ICs can be selected at the user's request.

Product Name	Package	Quantity per Reel	Pb Free	Halogen Free
R1243S001∗-E2-FE	HSOP-8E	1,000pcs	Yes	Yes
R1243K001∗-TR	DFN(PLP)2527-10	5,000pcs	Yes	Yes

∗ : Latch or Foldback, frequency can be selected at the user's request

(A) Fixed frequency 1000kHz, Latch protection
(B) Fixed frequency 1000kHz, Foldback protection
(C) Fixed frequency 330kHz, Latch protection
(D) Fixed frequency 330kHz, Foldback protection

ABSOLUTE MAXIMUM RATINGS

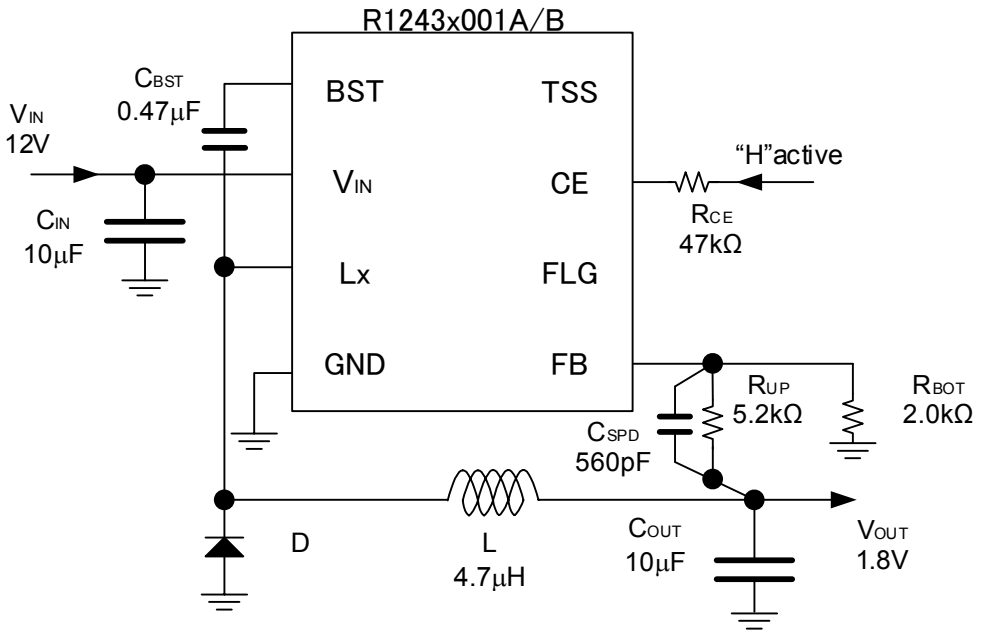
RECOMMENDED OPERATING CONDITIONS (ELECTRICAL CHARACTERISTICS)

All of electronic equipment should be designed that the mounted semiconductor devices operate within the recommended operating conditions. The semiconductor devices cannot operate normally over the recommended operating conditions, even if when they are used over such conditions by momentary electronic noise or surge. And the semiconductor devices may receive serious damage when they continue to operate over the recommended operating conditions.

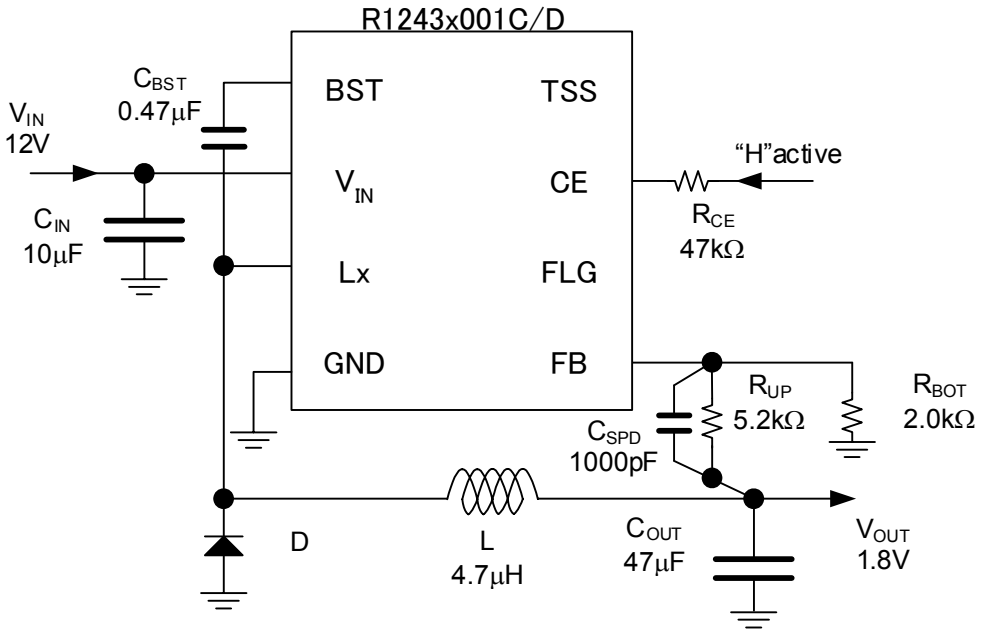
Typical Applications and Notes Concerning External Parts

Typical Applications

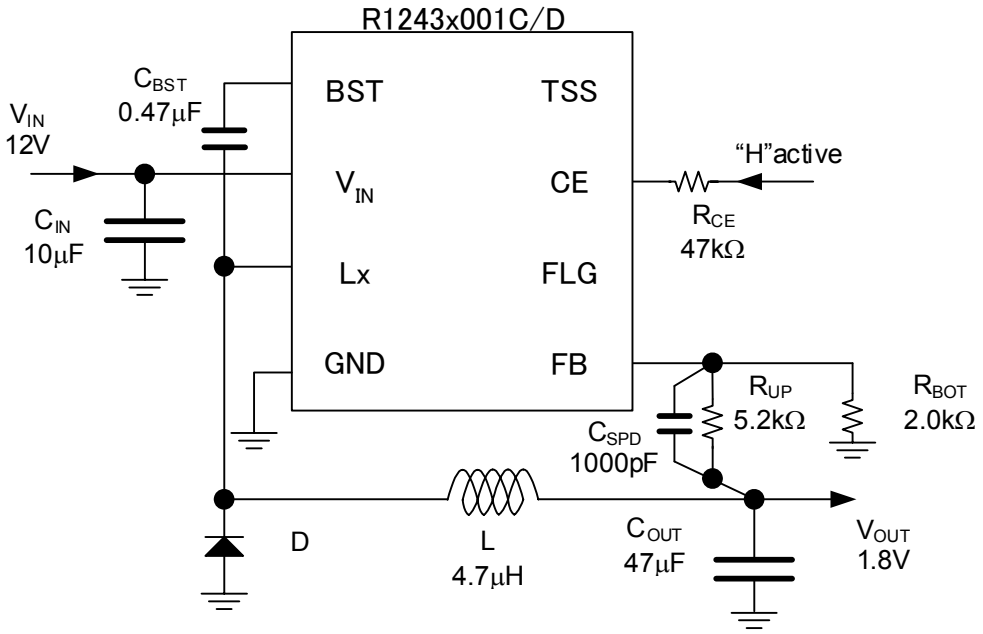
R1243x001A/B, V_{OUT}=1.8V, t_{SS}=0.4ms setting.



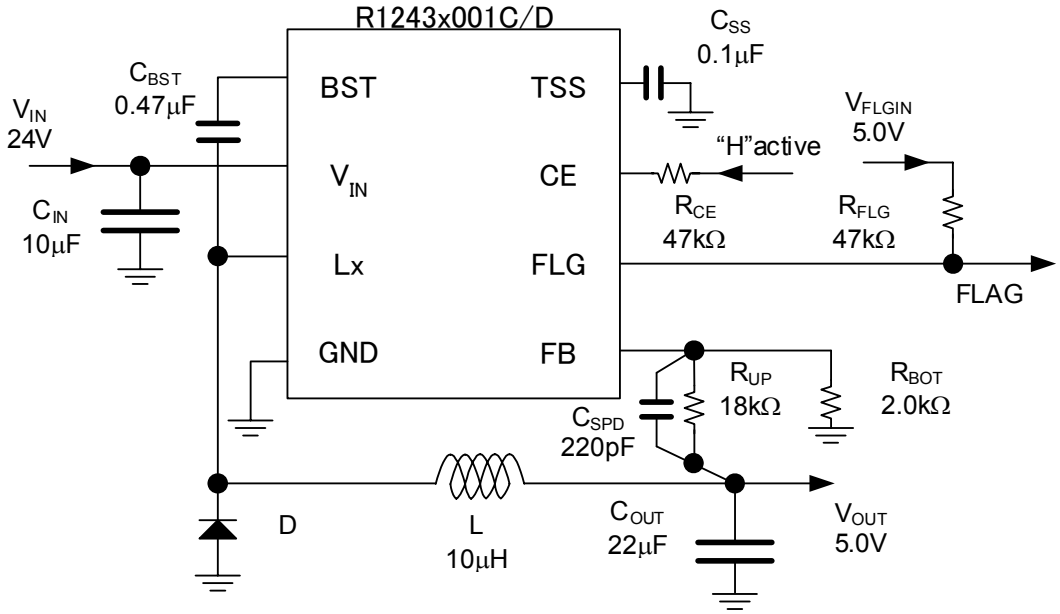
R1243x001C/D, V_{OUT}=1.8V, t_{SS}=0.4ms setting.



R1243x001A/B, V_{OUT}=5.0V, t_{SS}=12ms setting, Flag function using.



R1243x001C/D, V_{OUT}=5.0V, t_{SS}=12ms setting, Flag function using.



FLG pin is open-drain output that is pulled to ground at the conditions below:

·CE="L" (Shut down) ·UVLO (Released voltage Typ.4.0V) ·Thermal Shutdown

·V_{FB} Over Voltage Detection (Typ.0.6V) ·V_{FB} Under Voltage Detection (Typ.0.4V)

·Active Latch function (Ver.A/C)

·T_{SS} pin's Over Voltage Protection after the completion of soft start (Typ.3V)

When the R1243x starts up, without the conditions above, after soft-start time, V_{FB} under voltage detection (Typ. 0.4V) is released, then after the released delay time (Typ. 0.25ms) the output of FLG pin pulled to “H”. However, if V_{OUT} is used as V_{FLGIN}, even if the soft start time hasn't finished, the output of FLG pin becomes “H” or same as V_{OUT} and released delay time disappears.

Therefore, if soft-start time is used for the circuit sequence, the difference of the operation depending on the V_{FLGIN} (connected to V_{OUT} directly or other voltage source) must be cared.

Notes Concerning to External Parts

- External components have to be connected as close as possible to the IC and have to be wired as short as possible. Especially, the capacitor connected between V_{IN} and GND pin must be wired the shortest. If the impedances of the power supply line and the GND line are high, the operation can be unstable due to the switching current, which fluctuates the power line of the inside the IC. The impedances of power supply line and GND line must be as low as possible. It is necessary to give careful consideration to the large current flowing into the power supply, GND, L_X, V_{OUT} and inductor when designing their wirings. The wiring of output voltage setting resistance (R_{UP}) and the wiring of inductor must be separated from load wiring.
- The capacitors to be used in the R1243x Series must be low ESR ceramic capacitors. The C_{IN} capacitor between V_{IN} and GND should be equal or more than 10μF. Please pay attention to the bias-dependent properties and the temperature variability characteristics of the ceramic capacitors.
- The internal phase compensation of this IC is designed within the recommended values of inductor and C_{OUT} ceramic capacitor. If the inductor value is small, the peak values of the switching current increase along with the load current. When the peak value of the switching current reaches to the current limit, the over current protection circuit may start to function.
- If the parasitic capacitor of the schottky diode is large, the operation may result in unstable because of the large switching current when the switch is turned on. Please use the schottky diode with 100pF or less when the reverse voltage is 10V.
- The output voltage (V_{OUT}) can be calculated by this equation: $V_{OUT} = V_{FB} \times (R_{UP}+R_{BOT}) / R_{BOT}$. By changing R_{UP} and R_{BOT}, the output voltage (V_{OUT}) is adjustable. If resistance values of R_{UP} and R_{BOT} are high, the impedance of the FB pins become high, and the IC becomes vulnerable to an influence of noise. R_{BOT} is recommended to be between 1.0kΩ to 4.7kΩ. If the operation become unstable due to the high impedance, it is important to consider lowering the impedance.
- In the IC, ESD protection diode is connected between CE pin and V_{IN} pin. If there is a possibility that the CE pin voltage becomes higher than the V_{IN} pin voltage, it is recommended to insert a 10kΩ resistance or more in order to prevent the large current flowing from CE pin into V_{IN} pin.
- Connect the reverse side of the IC pad to GND. To improve the radiation of heat of the multiple-layered board, it is effective to make the Via on the connection part of the reverse side of the IC pad to release the heat to multiple layers.
- The flag resistor (R_{FLG}) is recommended to be between 10kΩ to 100kΩ. If the flag function is not used, FLG pin has to be left open or connected to GND.
- If the soft start time adjustment function is not used, TSS pin must be left open. In this case, soft start time is set as 0.4ms (Typ.).
- After the completion of the soft start, latch function (Ver.A/C) starts to function. The internal counter starts counting up when the overcurrent protection circuits runs the current limit detection. When the internal counter counts up to 2ms(Typ.), latch function turns off the output. The turned off output can be reset when CE pin is changed to “L”, and also V_{IN} pin voltage became less than 3.8V (Typ.), which is UVLO detecting voltage. If the output voltage becomes more than the setting voltage (FB pin voltage is 0.50V (Typ.) within the latch timer period, the counter restores the default. Therefore, the careful attention is required when the power-supply voltage’s start-up is slow and the output voltage is not reached to the setting voltage within the latch timer period after the completion of the soft start.
- After the completion of the soft start, fold back function (Ver.B/D) starts to function. The fold back function limits the oscillation frequencies into 1/4 when FB pin voltage becomes less than 0.35V (Typ.). Therefore, the careful attention is required when the power-supply voltage’s start-up is slow and the output voltage

is not reached to the 70% (Typ.) of the setting voltage even for a short period of time after the completion of the soft start.

- The quality of the power supply circuit using the R1243x Series largely depends on the external components. The careful attention is required for the external component parameters.
- The careful attention is required for the maximum ratings (voltage, current, and wattage) of the external components, board layout pattern and the IC.
- The table on the next page shows the recommended values for setting output voltage.

Soft Start Time Adjustment Function

The soft start time (t_{SS}) of the R1243x Series is adjustable by adding the soft start time adjusting capacitor (C_{SS}) to the TSS pin. The soft start time can be set longer than the internal soft start time (Typ.0.4ms).

For example, if the soft start time adjusting capacitor (C_{SS}) is 0.1µF, the externally adjusted soft start time will be 12ms (Typ.). If there is no need of adjusting the soft start time, leave TSS pin as open so that the internal soft start time (Typ.0.4ms) will be applied.

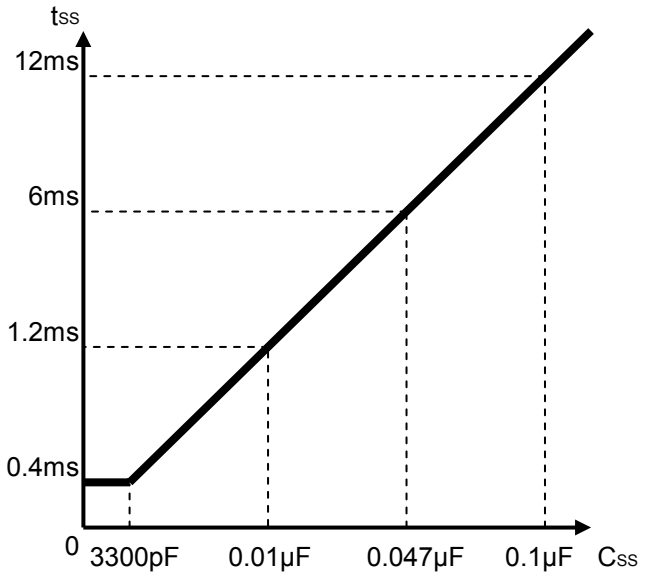

Fig.1 C_{SS} vs t_{SS}(Typ.)

FLAG Function

The R1243 Series has the flag output function by using the Nch open drain. If any abnormal condition is detected, the IC turns the Nch transistor on and turns the FLG pin low. If the condition returns to normal, the IC turns the Nch transistor off and turns the FLG pin high after the flag off delay time (Typ.0.25ms).

The followings are the abnormal conditions the IC can detect.

·CE="L" (Shut down) ·UVLO (Released voltage Typ.4.0V) ·Thermal Shutdown
·V_{FB} Over Voltage Detection (Typ.0.6V) ·V_{FB} Under Voltage Detection (Typ.0.4V)
·Active Latch function (Ver.A/C)
·T_{SS} pin's Over Voltage Protection after the completion of soft start (Typ.3V)

The flag resistors (R_{FLG}) have to be between 10kΩ to 100kΩ. If the flag function is not used, FLG pin has to be left open or connected to GND.

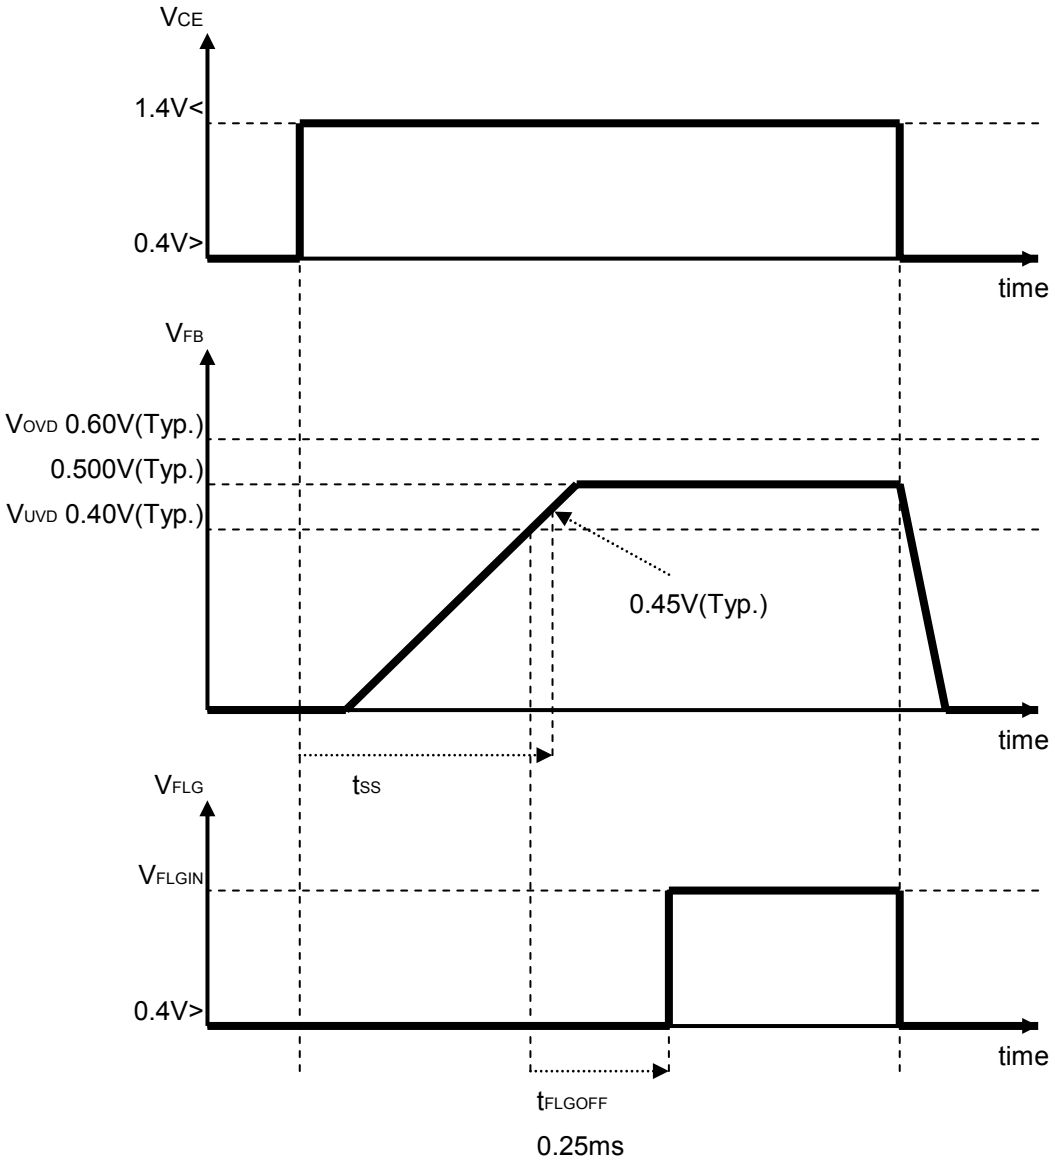

Fig.2 FLAG function sequence

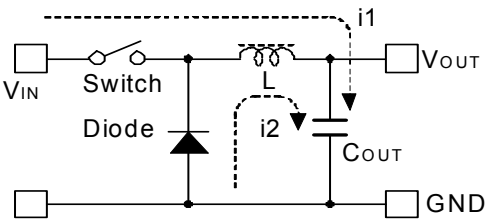
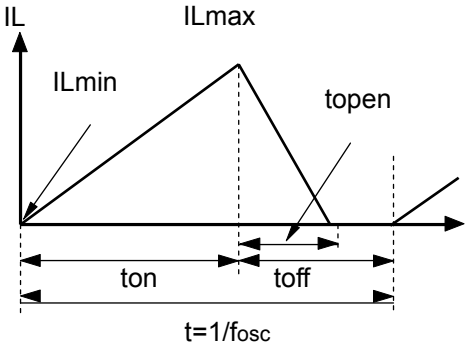
Operation of The Buck Converter and The Output Current

The DC/DC converter charges energy in the inductor when switch is ON, and discharges the energy from the inductor when switch is OFF and controls with less energy loss, so that a lower output voltage than the input voltage is obtained. The operation will be explained with reference to the following diagrams:

< Basic Circuits >



< Current through >



Step 1: Switch turns on and current IL (=i1) flows, and energy is charged into C_{OUT}. At this moment, IL increases from IL_{min} (=0) to reach IL_{max} in proportion to the on-time period (t_{on}) of Switch.

Step 2: When Switch turns off, a rectifier Diode turns on in order that L maintains IL at IL_{max}, and current IL (=i2) flows.

Step 3: IL (=i2) decreases gradually and reaches $IL=IL_{min}=0$ after a time period of t_{open}, and Diode turns off. Provided that in the continuous mode, next cycle starts before IL becomes to 0 because t_{off} time is not enough. In this case, IL value increases from this IL_{min} (>0).

In the case of PWM control system, the output voltage is maintained by controlling the on-time period (t_{on}), with the oscillator frequency (f_{osc}) being maintained constant.

Output Current and Selection of External Components

The relation between the output current and external components is as follows:

When Switch of L_X is ON:

(Wherein, Ripple Current P-P value is described as I_{RP}, ON resistance of Switch and Diode of L_X are respectively described as R_{ONH} and V_F and the DC resistor of the inductor is described as R_L.)

$$V_{IN} = V_{OUT} + (R_{ONH} + R_L) \times I_{OUT} + L \times I_{RP} / t_{on} \quad \text{Equation 1}$$

When Switch is "OFF"(Diode is "ON") as t_{off}:

$$L \times I_{RP} / t_{off} = V_F + V_{OUT} + R_L \times I_{OUT} \quad \text{Equation 2}$$

Put Equation 2 to Equation 1 and solve for ON duty of Switch, $t_{on} / (t_{off} + t_{on}) = D_{ON}$,

$$D_{ON} = (V_{OUT} + V_F + R_L \times I_{OUT}) / (V_{IN} + V_F - R_{ONH} \times I_{OUT}) \quad \text{Equation 3}$$

Ripple Current is as follows:

$$I_{RP} = (V_{IN} - V_{OUT} - R_{ONH} \times I_{OUT} - R_L \times I_{OUT}) \times D_{ON} / f_{OSC} / L \quad \text{Equation 4}$$

The peak current (I_{Lmax}) passing through the inductor and the switch is obtained by the following equation.

$$I_{Lmax} = I_{OUT} + I_{RP} / 2 \quad \text{Equation 5}$$

The valley Current (I_{Lmin}) is obtained by the following equation.

$$I_{Lmin} = I_{OUT} - I_{RP} / 2 \quad \text{Equation 6}$$

If the valley current is smaller than 0 ($I_{Lmin}<0$), the step-down DC/DC converter enters the discontinuous current mode.

The current condition for the discontinuous current mode is as follows.

$$I_{OUT} < I_{RP} / 2 \quad \text{Equation 7}$$

It is important to note the peak current (I_{Lmax}) and the valley current (I_{Lmin}) when making the input/output conditions or selecting the external components.

*The above explanation is based on the ideal operation of the continuous mode.

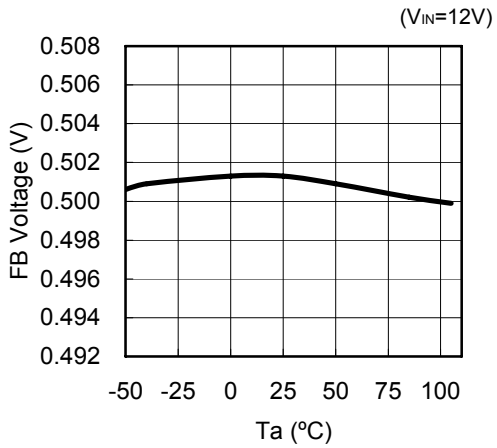
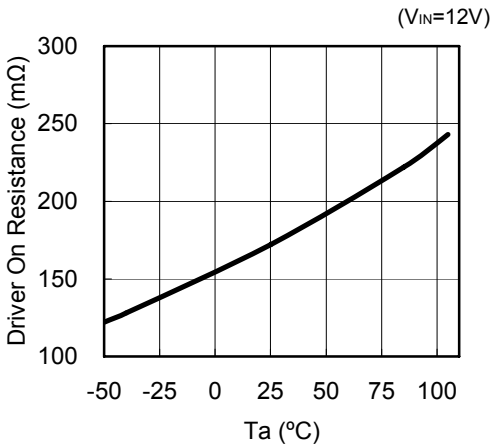
R1243x001x



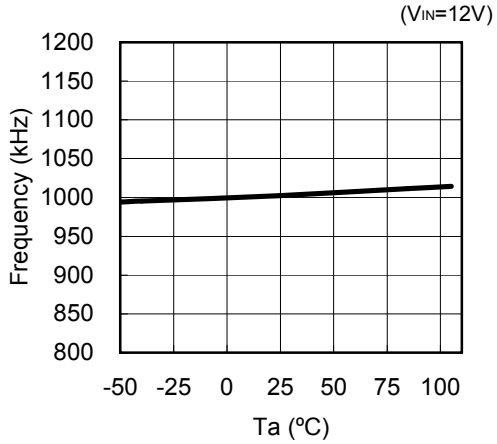
2) Driver On Resistance vs Temperature

R1243x001x



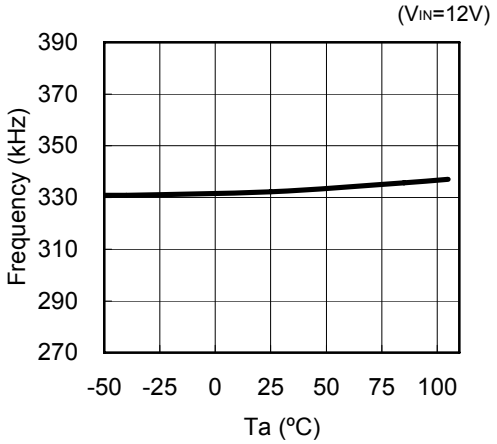
3) Oscillator Frequency vs Temperature

R1243x001A/R1243x001B



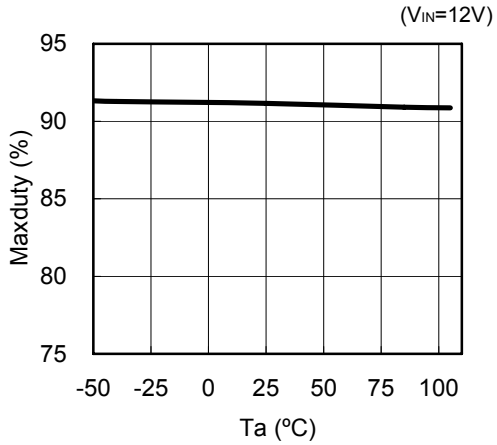
4) Oscillator Frequency vs Temperature

R1243x001C/R1243x001D



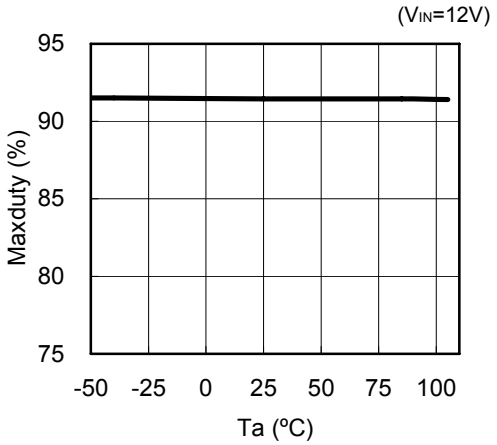
5) Maxduty vs Temperature

R1243x001A/R1243x001B



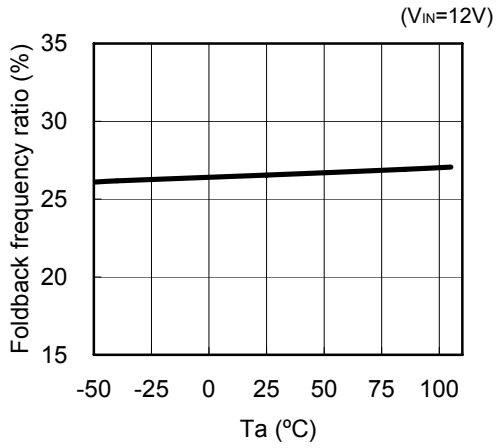
6) Maxduty vs Temperature

R1243x001C/R1243x001D



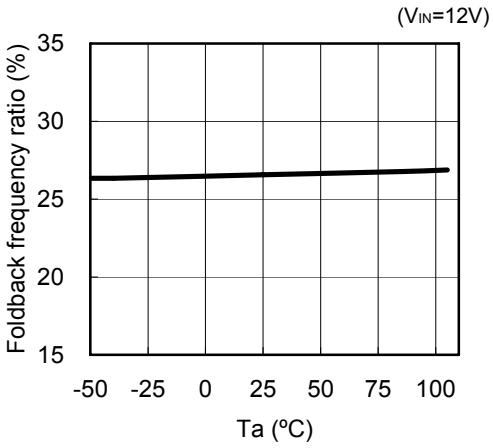
7) Foldback Frequency vs Temperature

R1243x001A/R1243x001B



8) Foldback Frequency vs Temperature

R1243x001C/R1243x001D

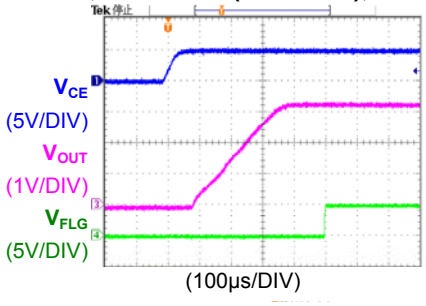


9) Soft Start Waveform

R1243x001x

tSS=0.4ms

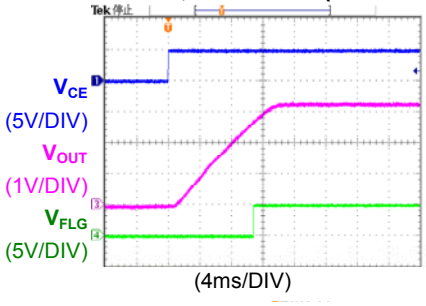
(R1243S001A, VIN=12V, VOUT=3.3V, tSS=open, VFLGIN=5.0V, ROUT=3.3Ω(IOUT=1.0A), Ta=25ºC)



R1243x001x

tSS=12ms

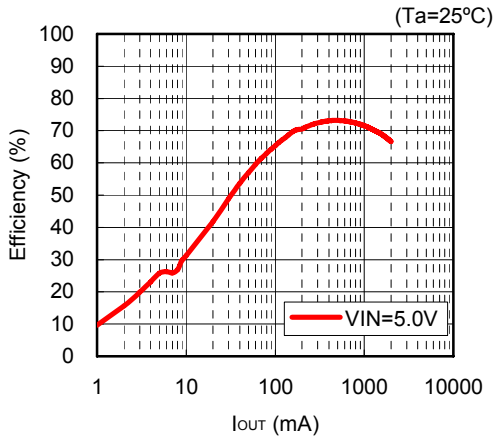
(R1243S001A, VIN=12V, VOUT=3.3V, CSS=0.1µF, VFLGIN=5.0V, ROUT=3.3Ω(IOUT=1.0A), Ta=25ºC)



10) Efficiency vs Load Current

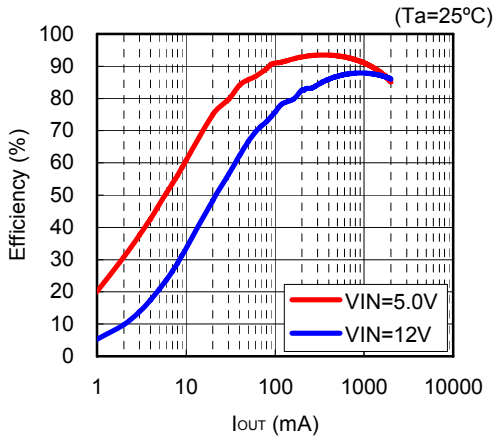
R1243x001A/B

VOUT=0.8V

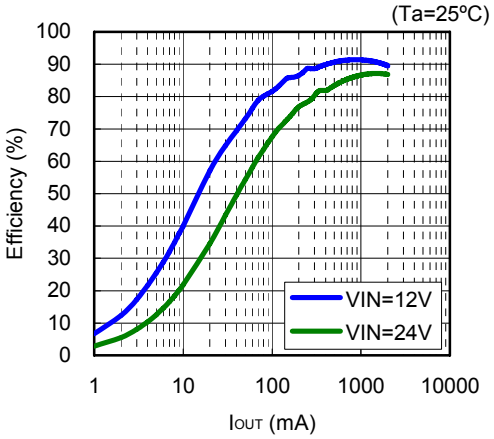


R1243x001A/B

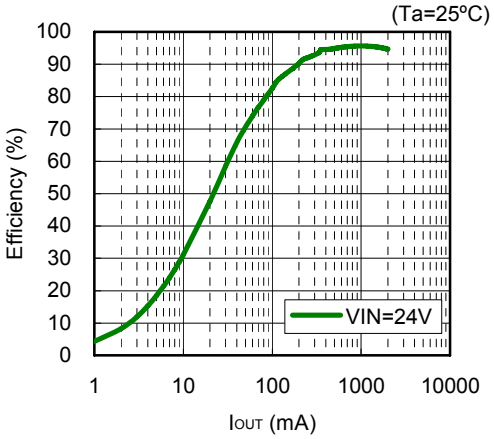
VOUT=3.3V



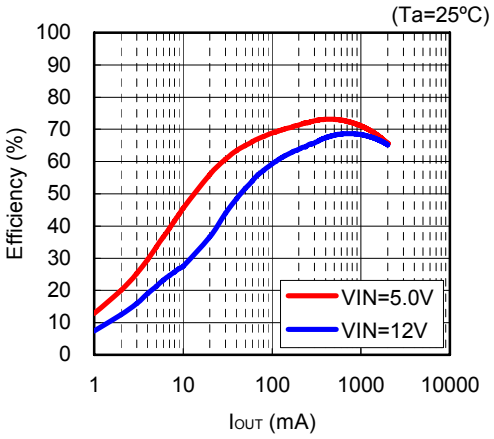
R1243x001A/B
V_{OUT}=5.0V



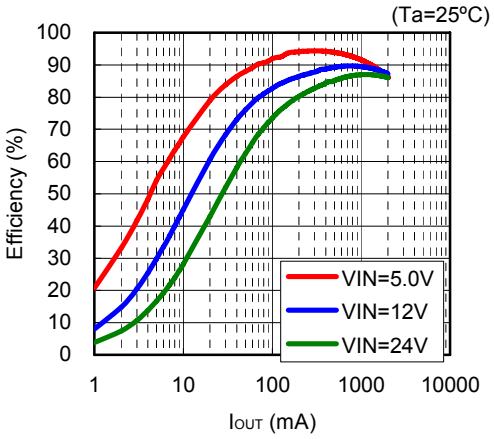
R1243x001A/B
V_{OUT}=18V



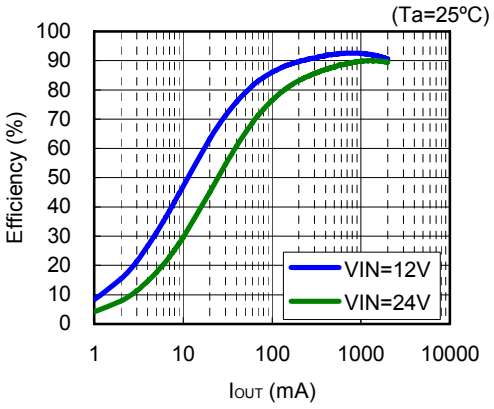
R1243x001C/D
V_{OUT}=0.8V



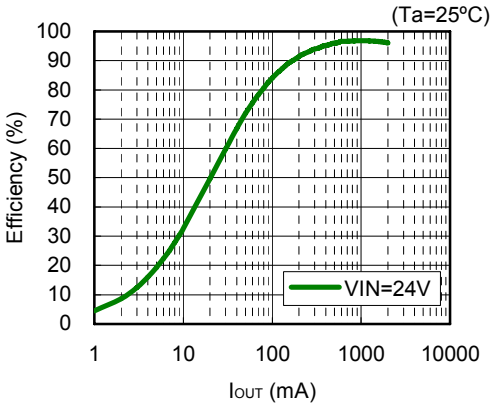
R1243x001C/D
V_{OUT}=3.3V



R1243x001C/D
V_{OUT}=5.0V



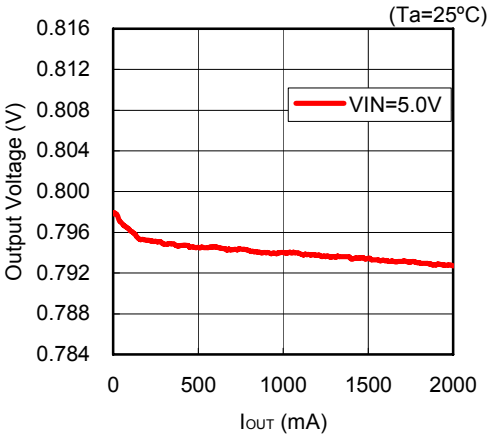
R1243x001C/D
V_{OUT}=18V



11) Load Regulation

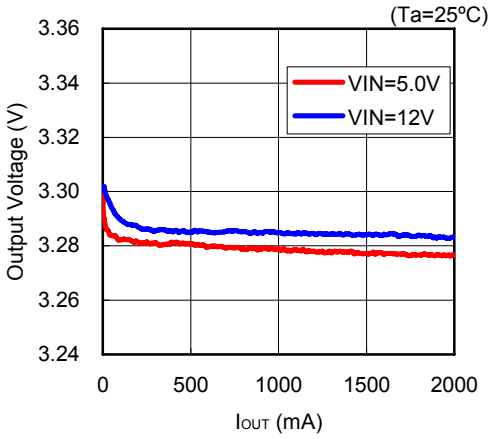
R1243x001A/B

V_{OUT}=0.8V



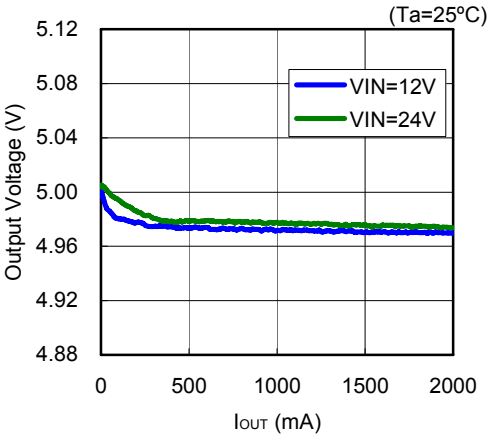
R1243x001A/B

V_{OUT}=3.3V



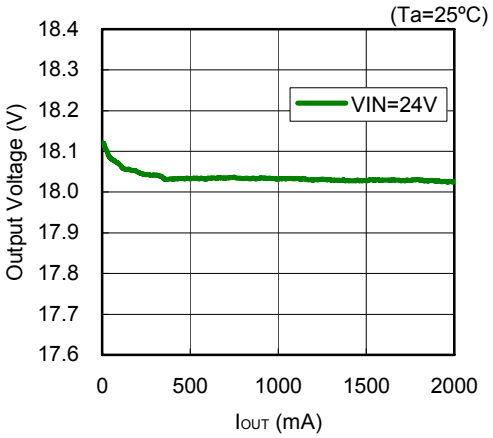
R1243x001A/B

V_{OUT}=5.0V



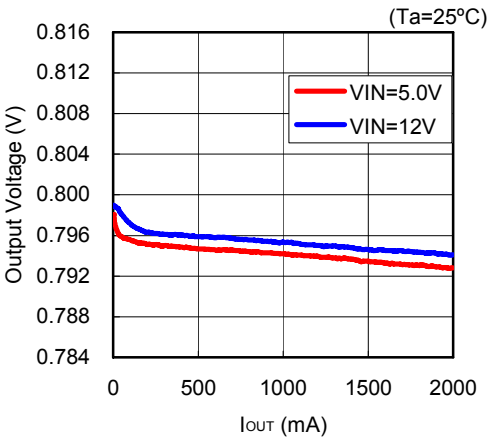
R1243x001A/B

V_{OUT}=18V



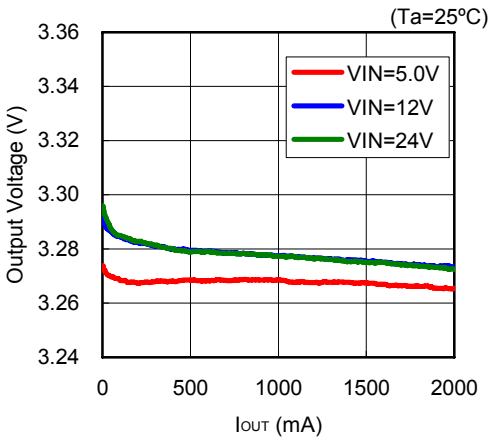
R1243x001C/D

V_{OUT}=0.8V



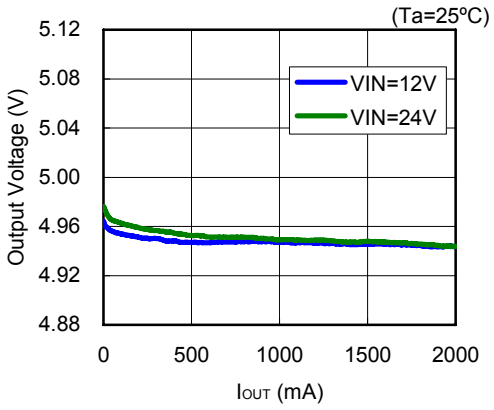
R1243x001C/D

V_{OUT}=3.3V



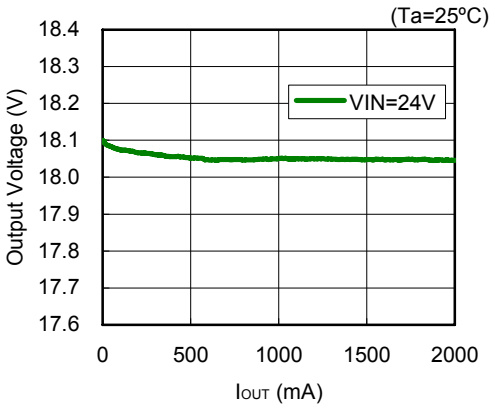
R1243x001C/D

V_{OUT}=5.0V



R1243x001C/D

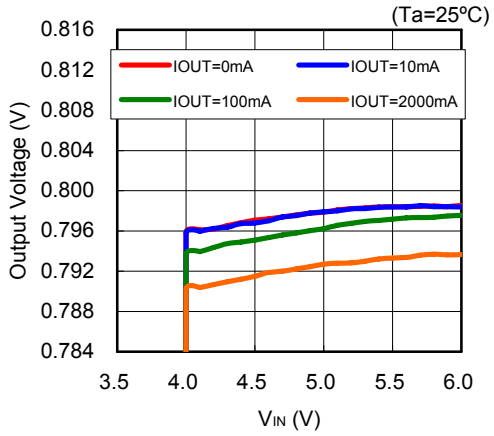
V_{OUT}=18V



12) Line Regulation

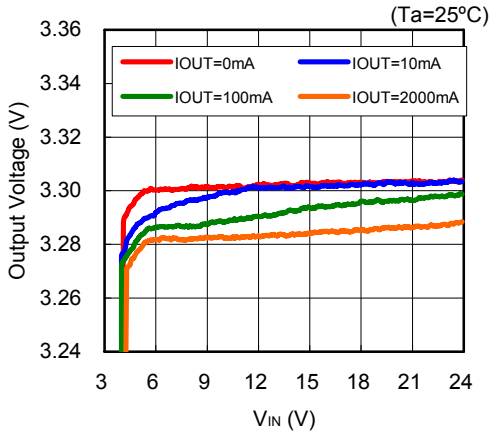
R1243x001A/B

V_{OUT}=0.8V



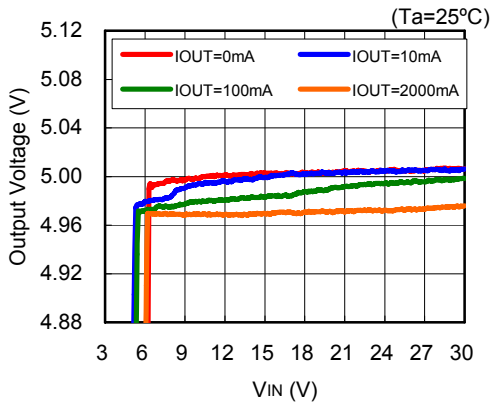
R1243x001A/B

V_{OUT}=3.3V



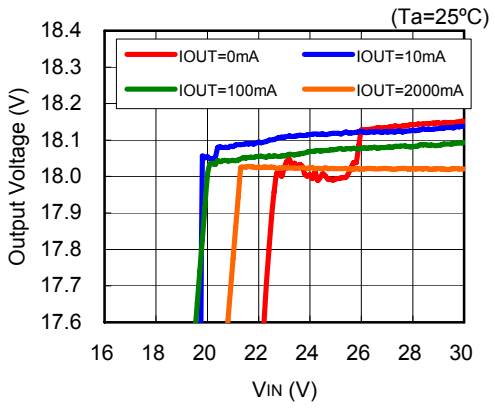
R1243x001A/B

V_{OUT}=5.0V



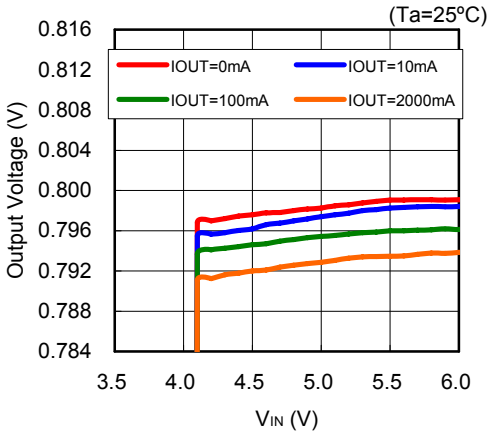
R1243x001A/B

V_{OUT}=18V



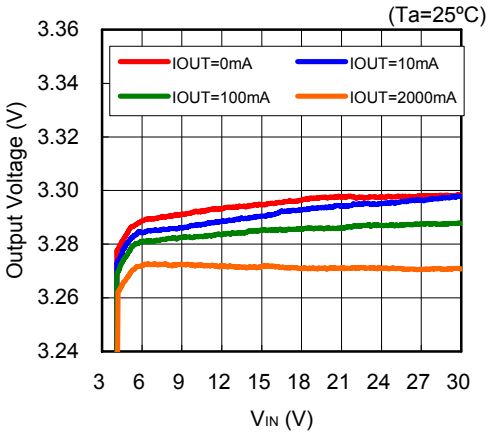
R1243x001C/D

V_{OUT}=0.8V



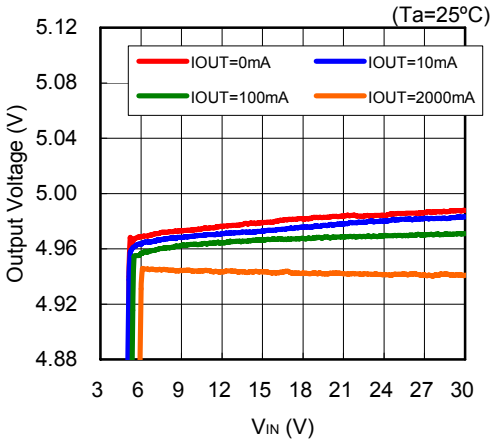
R1243x001C/D

V_{OUT}=3.3V



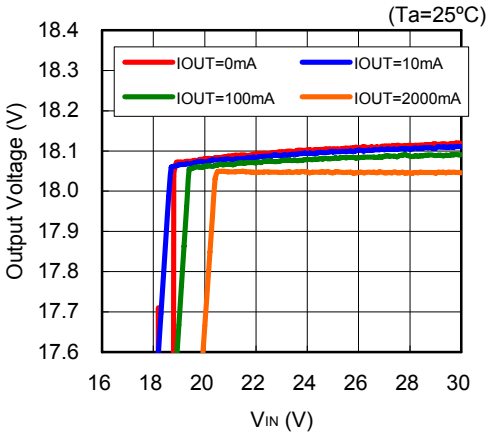
R1243x001C/D

V_{OUT}=5.0V



R1243x001C/D

V_{OUT}=18V



1. The products and the product specifications described in this document are subject to change or discontinuation of production without notice for reasons such as improvement. Therefore, before deciding to use the products, please refer to Ricoh sales representatives for the latest information thereon.
2. The materials in this document may not be copied or otherwise reproduced in whole or in part without prior written consent of Ricoh.
3. Please be sure to take any necessary formalities under relevant laws or regulations before exporting or otherwise taking out of your country the products or the technical information described herein.
4. The technical information described in this document shows typical characteristics of and example application circuits for the products. The release of such information is not to be construed as a warranty of or a grant of license under Ricoh's or any third party's intellectual property rights or any other rights.
5. The products listed in this document are intended and designed for use as general electronic components in standard applications (office equipment, telecommunication equipment, measuring instruments, consumer electronic products, amusement equipment etc.). Those customers intending to use a product in an application requiring extreme quality and reliability, for example, in a highly specific application where the failure or misoperation of the product could result in human injury or death (aircraft, spacevehicle, nuclear reactor control system, traffic control system, automotive and transportation equipment, combustion equipment, safety devices, life support system etc.) should first contact us.
6. We are making our continuous effort to improve the quality and reliability of our products, but semiconductor products are likely to fail with certain probability. In order to prevent any injury to persons or damages to property resulting from such failure, customers should be careful enough to incorporate safety measures in their design, such as redundancy feature, firecontainment feature and fail-safe feature. We do not assume any liability or responsibility for any loss or damage arising from misuse or inappropriate use of the products.
7. Anti-radiation design is not implemented in the products described in this document.
8. Please contact Ricoh sales representatives should you have any questions or comments concerning the products or the technical information.

RICOH COMPANY., LTD. Electronic Devices Company

■Ricoh presented with the Japan Management Quality Award for 1999.
Ricoh continually strives to promote customer satisfaction, and shares the achievements of its management quality improvement program with people and society.

■Ricoh awarded ISO 14001 certification.
The Ricoh Group was awarded ISO 14001 certification, which is an international standard for environmental management systems, at both its domestic and overseas production facilities. Our current aim is to obtain ISO 14001 certification for all of our business offices.

RoHS Compliant
Ricoh completed the organization of the Lead-free production for all of our products. After Apr. 1, 2006, we will ship out the lead free products only. Thus, all products that will be shipped from now on comply with RoHS Directive.
