GPIO ICs Series

Key Encoder IC

BU1851GUW

● Description

Key Encoder IC can monitor up to 8x8 matrix (64 keys), which means to be adaptable to Qwerty keyboard. We adopt the architecture that the information of the only key which status is changed, like push or release, is encoded into the 8 bits data. This can greatly reduce the CPU load which tends to become heavier as the number of keys increase. (Previously, all key's status is stored in the registers.)

Furthermore, auto sleep function contribute to low power consumption, when no keys are pressed. It is also equipped with the various functions such as ghost key rejection, N-key Rollover, Built-in power on reset and oscillator.

● Features

1) Monitor up to 64-matrix keys

2) Under 5μA Stand-by Current

3) Built-in Power On Reset

4) Ghost key rejection

● Absolute maximum ratings
(Ta=25℃)

Item	Symbol	Value	Unit	comment
Supply Voltage[*1]	VDD	-0.3 ~ +4.5	V	
Input voltage	VI	-0.3 ~ VDD +0.3[*1]	V	
Storage temperature range	Tstg	-55 ~ +125	℃	
Package power	PD	272[*2]	mW	

This IC is not designed to be X-ray proof.

[*1] It is prohibited to exceed the absolute maximum ratings even including +0.3 V.

[*2] Package dissipation will be reduced each 2.72mW/℃ when the ambient temperature increases beyond 25℃.

● Operating Conditions

Item	Symbol	Limit			Unit	Condition
		Min	Typ	Max		
Supply voltage range（VDD）	VDD	2.20	3.30	3.60	V	
Input voltage range	V_{IN}	-0.2	-	VDD+0.2	V	
Operating temperature range	Topr	-30	25	+85	℃	
External clock	Fclk	0.8	1.0	1.2	MHz	CLKSEL=VDD
External resistor	Rxi	118.8	120	121.2	kΩ	To Xi pin, when CLKSEL=VSS

TESTM1	I	Test Pin[*2]	I	F
TESTM2	I			
TESTM3	I			

[*1] Note: This pin must be open in normal operation.
[*2] Note: All these pins must be tied down to GND in normal operation.
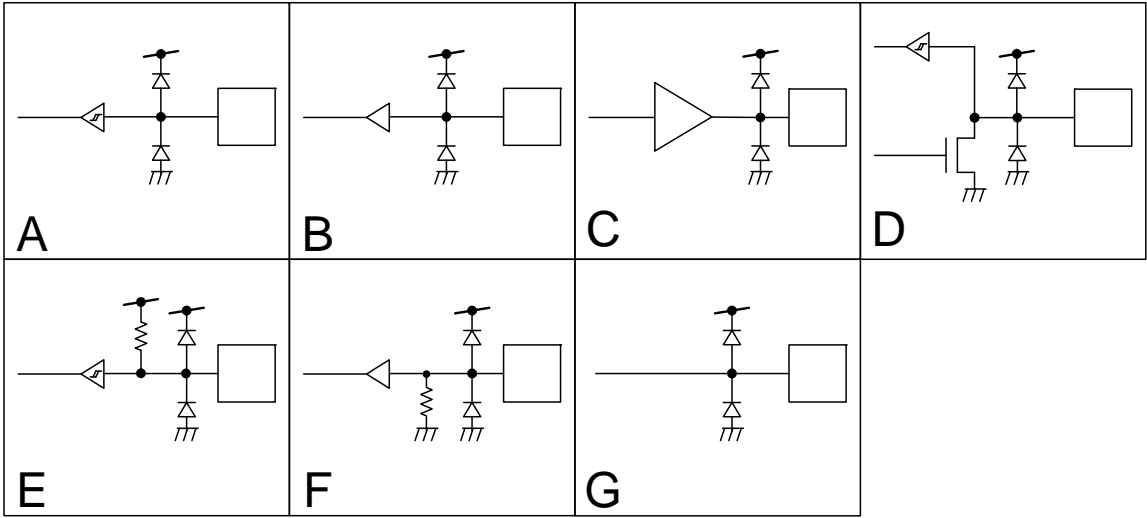

Fig.4 Equivalent IO circuit diagram

● Functional Description

1. Power mode
The device enters the state of Power Down when XRST="Low". When XRST=High after powered, the device enters the standby state.

Power On Reset
A Power On Reset logic is implemented in this device. Therefore, it will operate correctly even if the XRST port is not used. In this case, the XRST port must be connected to high (VDD), and the PORENB port must be connected to low (VSS). If you don't want to use Power On reset, you must connect PORENB port to high (VDD).

Power Down State
The device enters Power Down state by XRST="Low". An internal circuit is initialized, and key encoding and 3wire interface are invalid. Power On Reset becomes inactive during this state.

Stand-by State
The device enters the stand-by state by setting XRST to "High". In this state, the device is waiting for keys pressed. When a key is pressed, the state will change to operation. Power On Reset is active in this state if PORENB = low.

Operating State
The device enters the operating state by pressing keys. The device will scan the key matrix and encode the key code, and then the 3wire interface tries to start communication by driving KINT "Low". See sec.2 for the details. After communicating with host device, when no keys are pressed, the device returns to the stand-by state. Power On Reset is active in this state if PORENB=low.
2. 3wire Interface

Fig.5 Protocol

Figure 5 shows the protocol of BU1851. BU1851 protocol basically consists of 3 wire configuration (KINT, KSCL, and KSDA) as shown above. Note that this 3wire interface is completely different from I2C and other standard bus interface.

Procedure
1. When BU1851 detects key events, KINT interrupt is generated to host with driving Low.
2. After the host detects KINT interrupt, the host is supposed to send start bit.
3. After BU1851 detects start bit, the 8bit data (key code) transmission on KSDA will start synchronized with the rising edge of KSCL clock signal, which is sent from the host.
4. 8 bit data are followed by "0" (9th bit is always "0"), and then BU1851 drives High on KINT line.

timeout
Fig.6 shows the 3wire timeout sequence. It is suppose to happen when Host doesn't response anything in a certain time.
1. bu1851 generates KINT interrupt.
2. But Host doesn't response within 500ms.
3. BU1851 stops KINT, and tries to communicate again by generating KINT.
4. BU1851 will go into the stand-by state when the communication fails five times.

Fig.6 3wire timeout

See also "3wire interface AC characteristics".

3. Key code Assignment

Table 1 shows the key code assignment. These key codes are sent through KSDA line corresponding to the pushed or released keys as indicated in section 2.

Table.1 Key code

		ROW0	ROW1	ROW2	ROW3	ROW4	ROW5	ROW6	ROW7
COL0	M	0x01	0x11	0x21	0x31	0x41	0x51	0x61	0x71

COL7	M	0x08	0x18	0x28	0x38	0x48	0x58	0x68	0x78
	B	0x88	0x98	0xA8	0xB8	0xC8	0xD8	0xE8	0xF8

M: Make Key (the code when the key is pressed)
B: Break Key (the code when the key is released)

4. Ghost Key Rejection

Ghost key is an inevitable phenomenon as long as key-switch matrices are used. When three switches located at the corners of a certain matrix rectangle are pressed simultaneously, the switch that is located at the last corner of the rectangle (the ghost key) also appears to be pressed, even though the last key is not pressed. This occurs because the ghost key switch is electrically shorted by the combination of the other three switches (Fig.7). Because the key appears to be pressed electrically, it is impossible to distinguish which key is the ghost key and which key is pressed. The BU1851 solves the ghost key problem to use the simple method. If BU1851 detects any three-key combination that generates a fourth ghost key, and BU1851 does not report anything, indicating the ghost keys are ignored. This means that many combinations of three keys are also ignored when pressed at the same time. Applications requiring three-key combinations (such as <Ctrl><Alt><Del>) must ensure that the three keys are not wired in positions that define the vertices of a rectangle (Fig. 8). There is no limit on the number of keys that can be pressed simultaneously as long as the keys do not generate ghost key events.

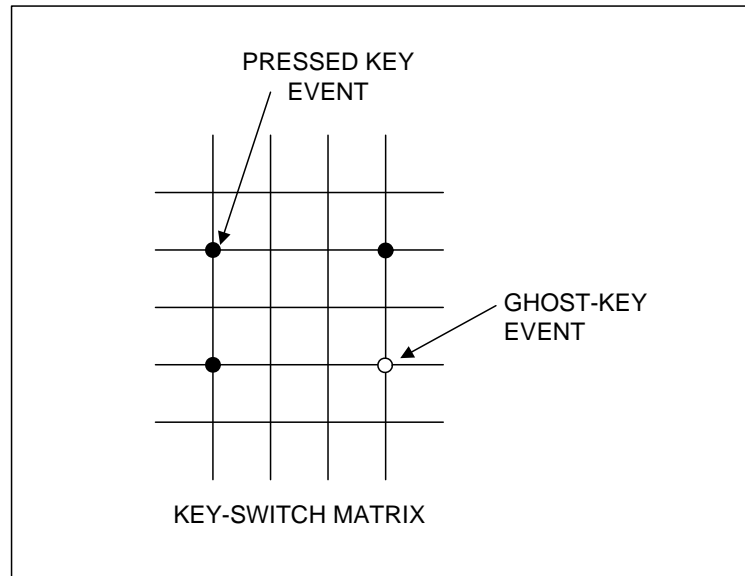

Fig.7 Ghost key phenomenon

VBGA035W040

<Tape and Reel information>
Tape	Embossed carrier tape (with dry pack)
Quantity	2500pcs
Direction of feed	E2 (The direction is the 1pin of product is at the upper left when you hold reel on the left hand and you pull out the tape on the right hand)

＊Order quantity needs to be multiple of the minimum quantity.

Notes

No copying or reproduction of this document, in part or in whole, is permitted without the consent of ROHM Co.,Ltd.

The content specified herein is subject to change for improvement without notice.

The content specified herein is for the purpose of introducing ROHM's products (hereinafter "Products"). If you wish to use any such Product, please be sure to refer to the specifications, which can be obtained from ROHM upon request.

Examples of application circuits, circuit constants and any other information contained herein illustrate the standard usage and operations of the Products. The peripheral conditions must be taken into account when designing circuits for mass production.

Great care was taken in ensuring the accuracy of the information specified in this document. However, should you incur any damage arising from any inaccuracy or misprint of such information, ROHM shall bear no responsibility for such damage.

The technical information specified herein is intended only to show the typical functions of and examples of application circuits for the Products. ROHM does not grant you, explicitly or implicitly, any license to use or exercise intellectual property or other rights held by ROHM and other parties. ROHM shall bear no responsibility whatsoever for any dispute arising from the use of such technical information.

The Products specified in this document are intended to be used with general-use electronic equipment or devices (such as audio visual equipment, office-automation equipment, communication devices, electronic appliances and amusement devices).

The Products specified in this document are not designed to be radiation tolerant.

While ROHM always makes efforts to enhance the quality and reliability of its Products, a Product may fail or malfunction for a variety of reasons.

Please be sure to implement in your equipment using the Products safety measures to guard against the possibility of physical injury, fire or any other damage caused in the event of the failure of any Product, such as derating, redundancy, fire control and fail-safe designs. ROHM shall bear no responsibility whatsoever for your use of any Product outside of the prescribed scope or not in accordance with the instruction manual.

The Products are not designed or manufactured to be used with any equipment, device or system which requires an extremely high level of reliability the failure or malfunction of which may result in a direct threat to human life or create a risk of human injury (such as a medical instrument, transportation equipment, aerospace machinery, nuclear-reactor controller, fuel-controller or other safety device). ROHM shall bear no responsibility in any way for use of any of the Products for the above special purposes. If a Product is intended to be used for any such special purpose, please contact a ROHM sales representative before purchasing.

If you intend to export or ship overseas any Product or technology specified herein that may be controlled under the Foreign Exchange and the Foreign Trade Law, you will be required to obtain a license or permit under the Law.

Thank you for your accessing to ROHM product informations.
