Datasheets 2012/13

Also available at
www.thiim.com

Electronic modules

- Control relays
- Monitoring relays
- Phase failure relays
- Engine starter relays
- Synchronizers
- Isolation amplifiers, transmitters
- Transducers

The standard products cover a wide selection of transducers and electronic control relays.

Additionally we produce for special applications, covering all stages from development to final production and testing.

The products are flexible in design and customization is possible.

		Type	Input	Function	Input or supply Range	Page
Control relays						
Current, Single phase		**IMCA**	AC-DC	Multifunction, 12 ranges for under or over current in one unit	0.5mA - 10A	1
		IDRA	DC	Low cost. 4 standard currents	3 - 16A	3
	NEW	**ILUA**	DC	Current loop relay	4 – 20mA	5
	NEW	**ILUB**	DC	Current loop relay w. precision adjustment	4 – 20mA	5
With through hole for CT	NEW	**IMAA**		Current, Earth leakage and Differential current Multifunction with 12 current ranges in one unit	5mA - 100A	7
	NEW	**IADA**	AC	Current detecting relay with delayed drop out. 12VDC supply.	9-16VDC	9
		DDCA	DC	Current, Earth leakage and Differential current. 6 current settings	5-200mA	11
DC earth leakage monitor	NEW	**DDEA**	DC	Current, Earth leakage for dc unearthedit systems	0,2mA-30mA	13
Voltage, Single Phase		**UMCA**	AC-DC	Multifunction, 11 ranges in one	50mV - 500V	15
		UAWA	AC	Window voltage relay. Individual Low & high voltage setting.	100 - 415V	17
Incl frequency control	NEW	**UFWA**	AC	Window voltage & frequency relay. Individual Low & high voltage setting	100 – 415V	19
Voltage, 3 phase 4 wire		**PNDA**	AC 4w	Phase under voltage & phase sequence	100 - 480V	21
		PNDI	AC 4w	Phase under voltage & phase sequence with true time delay	100 - 480V	21
Current and Voltage Single phase	NEW	**IUAB**	AC	Current relay with voltage compensated setpoint	0,2A-2,5A	23
Battery Control relays						
	NEW	**BMCA**	DC	Replacement for BVCA, BVCB, BVCC Battery low voltage monitoring relay. For 12V, 24V, 48V & 110V batteries.	8 - 180 VDC	25
	NEW	**BMCD**	DC	Replacement for BVCD, BVCE, BVCF Battery high/low voltage monitoring relay. For 12V, 24V, 48V & 110V batteries.	8 - 180 VDC	25
	NEW	**BMWB**	DC	Universal DC voltage relay. Individual Low & High voltage plus hysteresis setting	12.5 - 340V	27
	NEW	**BVSA**	DC	Battery symmetry monitoring relay	12, 24, 48V	29
	NEW	**BMSA**	DC	Battery symmetry monitoring relay with digital setting and display	24 - 256V	31
	NEW	**BRIA**	DC	Symmetry setting: 1 to 20% of cell voltage DC ripple relay. Setting: 0.4 – 6.4% ripple	18 – 340V	35
Phase failure relays, 3 or 4 wire						
Voltage and asymmetry		**PADA**	AC 3w	Unbalance & Balanced under & over voltage	100 - 480V	37
		PADI	AC 3w	PADA with true time delay	100 - 480V	37
		PANA	AC 4w	PADA with test for Neutral	100 - 480V	37
		PANI	AC 4w	PADA with test for Neutral and true time delay	100 - 480V	37
Incl phase rotation		**PAHA**	AC 3w	Phase rotation w. 2 relays, Unbalance & Balanced under & over voltage	100 - 480V	39
		PAHI	AC 3w	PAHA with true time delay	100 - 480V	39
		PAMA	AC 4w	PAHA with test for Neutral	100 - 480V	39
		PAMI	AC 4w	PAHA with test for Neutral and true time delay	100 - 480V	39
Frequency, voltage and asymmetry	NEW	**PAFA**	AC 3w	Frequency 50, 60 and 400Hz, Unbalance & Balanced under & over voltage	100 - 480V	41
	NEW	**PAGA**	AC 4w	PAFA with test for Neutral	100 - 480V	41
Incl phase rotation	NEW	**PAFB**	AC 3w	PAFA with test for Phase rotation	100 - 480V	41
	NEW	**PAGB**	AC 4w	PAFA with test for Phase rotation and Neutral	100 - 480V	41
Phase, Neutral & Ground monitoring relays 3, 4 and 5 wire	NEW	**PMSA**	AC	RMS Neutral to Ground plus RMS Phase to Neutral or RMS Phase to Phase measurement	50 - 830V Sup. 18-288V	43
Load monitoring relays						
Power factor Cos φ		**LMCA**	Ph.Angle	Over or Under load. 2, 3 and 4 wire	24 - 440V 0,5 - 10A	47
Active power	NEW	**LMWB**	AC Watt	Real Watt. Min. & Max. load or 2 individuak Min. or Max. values. Analogue adjustment. 2, 3 and 4 wire. Terminals for PTC monitoring of motors.	0 - 480V 0 - 12A	49
Active power		**LMWD**	AC Watt	Over & Under load or 2 x Overload. Digital adj., Analogue output. 2, 3 and 4 wire	70 - 500V 0,1 - 10A	51
Engine & generator relays						
Starter		**ESPA**	DC	Programmable start or pause firs. 1-15 trials	9 - 30V	53
Starter inhibit and over speed		**FRAA**	Freq.	Frequency range from 10 to 5120Hz. Transformer, Namur or optocoupler input	12V	55
		FRBA	Freq.	Frequency range from 10 to 5120Hz. Transformer, Namur or optocoupler input	24V	55
Starter inhibit		**FAAA**	Freq.	Frequency range from 10 to 5120Hz. Transformer, Namur or optocoupler input	24V	57
Over speed		**FABA**	Freq.	Frequency range from 10 to 5120Hz. Transformer, Namur or optocoupler input	24V	57
Synchronizer		**SYND**	AC 2w	Synchronization of grid and generators.	100 - 500V	59
		SYPD	Bus 3w.	Optional 96x96 Panel indicator to SYND	Bus 3 wire	61
Isolation amplifiers						
Multi function		**AISA**	DC	Programmable: 8 input and 8 output volt/mA ranges. Includes power supply	24 - 440V	63
Multifunction, mV input		**AISB**	DC	Programmable: 4 mV input and 8 volt/mA output ranges. Includes power supply	24 - 440V	65
Multifunction, Volt input.	NEW	**UISA**	DC	Programmable w.16 input volt ranges and, 8 output V/mA ranges. Incl. power supply	24 - 440V	67
	NEW	**UISB**	DC	Programmable w.16 input volt ranges and current loop output. Incl. power supply	24 - 440V	67
Volt in and current loop out		**UIDA**	DC	2 input ranges: 4.8 - 24V and 6 - 30V to current loop.	4 - 20mA	69
Current loop isolator		**AITA**	DC	Current loop. 3 loops 4 to 20mA. Loop powered	4 - 20mA	71
		AITB	DC	Current loop. 1 loop 4 to 20mA. Loop powered	4 -20mA	73
Temperature transmitters		**TAMA**	Temp.	76 selectable input ranges from PT100 sensor to 6 standard selectable DC outputs	-100 to + 400°C	75
		TAMB	Temp.	TAMA with 1 C/O limit contact	-100 to + 400°C	75
Transducers						
Current		**IAMA**	AC	Dual range: 1 & 5Aac in to 6 standard V/mA output ranges.	24 - 440V	77
		IAMB	AC	Dual range: 1 & 5Aac in to 4 - 20mA current loop out	24 - 440V	77
Voltage		**UAMA**	AC	Dual range: 250 & 500Vac in to 6 standard V/mA output ranges	24 - 440V	77
		UAMB	AC	Dual range: 250 & 500Vac in to 4 - 20mA current loop out	24 - 440V	77
Frequency	NEW	**FAMA**	Freq.	Min. & Max. range specified from 1 to 5000Hz. 8 V/mA output ranges	24 - 440V	79
Power Active		**WAAA**	AC Watt	1 - Phase 2 wire. Select from 19 Volt or mA unipolar or bipolar outputs	24 -440V	81
		WABA	AC Watt	3 - Phase 3 & 4 wire symmetrical load.	24 -440V	81
		WACA	AC Watt	3 - Phase 3 wire asymmetrical load (Aron coupling)	24 -440V	81
		WADA	AC Watt	3 - Phase 3 & 4 wire asymmetrical load	24 -440V	81
Power Reactive		**WRBA**	AC Var	3 - Phase 3 & 4 wire symmetrical load	24 -440V	81
		WRCA	AC Var	3 - Phase 3 wire asymmetrical load (Aron coupling)	24 -440V	81
		WRDA	AC Var	3 - Phase 3 & 4 wire asymmetrical load	24 -440V	81

MULTIFUNCTION CURRENT RELAY

Type: IMCA

FEATURES

- **For AC and DC current**
- **Balanced input for noise immunity**
- **Input current range from 0.5 mA to 10 A**
- **12 programmable input ranges**
- **4 programmable times for power up reset**
- **4 programmable time ranges**
- **Separate adjustable ON and OFF delay**
- **Relay function can be inverted**
- **Adjustable upper or lower limit and differential**
- **Latch function available**
- **LEDs indicate the state of the input**
- **LEDs indicate the timing function**
- **LED indicates the state of the relay**
- **SMD technology**
- **0-1 V DC control output for full scale**
  (Only in 45 mm. housing)

Description:
The current relay is designed with a microcontroller. With programmable range, function and timing it can be programmed to cover all kinds of applications.

The monitored current is fed through an internal shunt with a voltage drop of 50 mV at full range. For extreme noise immunity the voltage is then amplified in a balanced amplifier, rectified, averaged and compared with a preset reference voltage.
AC and DC current between 1 mA and 10 A can be measured directly. By means of a current transformer or a shunt resistor the range can be extended without limits.

Application:
Level comparator used with transducers and transmitters. Over- or undercurrent monitoring of loads, batteries, generators, mains etc.

SPECIFICATIONS

INPUT DC or AC current

Range	From 0.5 mA to 10 A
Input Range:	Setpoint Range
B1 and B5	0.5 - 2.5 mA
0.01 A	1 - 5 mA
socket type 1008	2 - 10 mA
B1 and B4	5 - 25 mA
0.1 A	10 - 50 mA
socket type 1009	20 - 100 mA
B1 and B3	50 -250 mA
1 A	0.1 - 0.5 A
socket type 1000	0.2 - 1 A
B1 and B2	0.5 - 2.5 A
10 A	1 - 5 A
socket type 1001	2 - 10 A
AC frequency range	45 to 440 Hz
Max. continuous input	1.42 x I_{NOM}
Input resistance	0.1 / I_R Ω (10 Ω, 1 Ω, 0.1 Ω, 0.01 Ω)
Power up, set or reset	Dip switch settings. Fixed 2 sec. 5 sec. 10 sec. 20 sec.
Time range during run	Dip switch settings. Adjustable 0 - 5 sec. 0 - 20 sec. 0 - 80 sec. 0 - 320 sec.
Differential	Adjustable from 1 to 50 % of setting

PERFORMANCE PARAMETERS

TIMING	
Response time	Approx. 100 msec.
ELECTRICAL	
Temp. dependence	Typ. ± 0.02 % / °C
Supply dependence	Typ. ± 0.01 % / % DU

OUTPUT Relay, 1 C/O or 2 C/O

Contact rating	6 A, 250 VAC , 1500 W
Mechanical life	30 Million operations
DC output	0 - 1 V DC (Only in 45 mm.)

SUPPLY

AC and DC with isolated switchmode	18-360 VDC and 20-264 VAC
AC supply range with transformer	24 V (From 20 to 28 V) 110 V (From 99 to 140 V) 230 V (From 198 to 264 V) 400 V (From 342 to 484 V)
AC frequency range	45 to 440 Hz
Power consumption	4 VA, 3 W

GENERAL

Temperature range	- 25 °C to + 55 °C ambient
Humidity	Up to 90 % RH non-condensing
Dielectric test voltage	Input to supply 4000 VAC Coil to relay contacts 4000 VAC Pole to pole (45 mm.) 2500 VAC
Weight	0.19 kg in 35 mm. housing 0.26 kg in 45 mm. housing

DC HIGH CURRENT RELAY

Type: IDRA

FEATURES

- **Cost effective solution**
- **4 current sensitivities: 3, 6, 10, 16 A**
- **Compact size**
- **3 models with flying leads for high continuous current**

Description:
The IDRA DC current relay is a miniaturized and cost effective solution for monitoring the presence of a DC current. The units for currents above 10 A are, in order to allow for a high continuous current, supplied with 500 mm flying leads of 2.5, 4.0 or 6.0 mm².

The current is monitored by means of a Reed Relay, and the set point is fixed.

Application:
Used as input to PLC's for over or under current surveillance of DC loads or charging currents.

4 to 20 mA DC CURRENT RELAY WITH SENSOR SHORT PROTECTION

Type: ILUA & ILUB

FEATURES

- **Includes a 35 mA current limit for a loop powered external sensor in order to secure against shorted sensor wires**
- **Includes an alarm LED for a shorted or broken sensor wire**
- **Adjustable differential**
- **0 to 2 sec. adjustable ON and OFF delay**
- **LEDs indicate the state of input, fault and relay**
- **Extremely compact solution**

Description:
The current relay is designed to be used as a trip relay in a 4 to 20 mA current loop. The ILUA comes with single turn potentiometers for the set point and the differential, and the ILUB with multiturn potentiometers for precise setting. The differential is adjustable from 1 to 20% of the set tripping current. The relay is powered from an external 16 to 32 VDC source, and includes a 35 mA current limiter to the attached sensor, as well as an under current monitor for a broken sensor wire. If the sensor current goes higher or lower than the limits, a Red LED will be lit and in case of an over current the internal relay will be released. The relays are provided with a common 0 to 2 sec. adjustable timer for pull In and drop Out. The timer can as an option be specified up to 30 sec. and disabled for either pull In or drop Out delay.

Operation:
The level of the input current is shown by the Yellow LED for currents below the set point (-differential) and the Green LED for currents above the set point (-differential). Under normal conditions the relay is released at low current and will pull in at the set tripping point, indicated by a Yellow LED. When the relay is energized, the current has to drop below the set point minus the set differential for drop out. Precautions must be taken for low set point currents in order to secure that the set point minus the differential is above the minimum of the sensor range of 4 mA.

Application:
Used with sensors, transducers and transmitters as an alarm or control relay. Surveillance of all kinds of physical measures, which can be converted to a 4 to 20 mA signal.

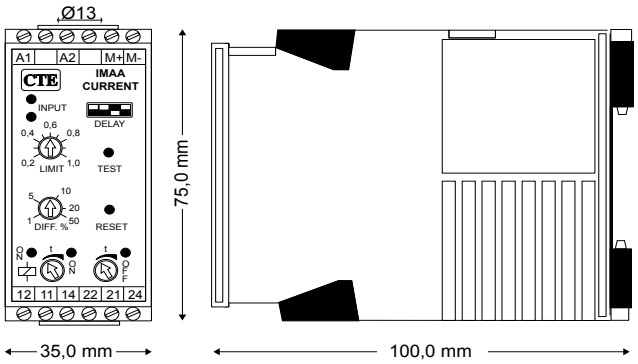
OPTIONAL EXTRAS

TIME MODULES - type TAI, TAO and TAB.

The modules cause delay on operate, delay on release and delay on both operate and release. The delay is adjustable and can be specified up to 30 sec. On applying the supply voltage, the delay on operate will follow the power up reset period.
As standard the ILUA and ILUB are supplied with a TAB 02 timing module.

SPECIAL FACTORY ADJUST - type SFA.
The relay can be factory preadjusted according to customers specifications.



5mA to 100A MULTI-FUNCTION AC CURRENT RELAY WITH INTERNAL CT

Type: IMAA

FEATURES

- **Applications includes differential current (earth leakage) measurement with manual 30mA fault test**
- **12 programmable input ranges for over or under current**
- **Adjustable differential and upper or lower limit**
- **20mA output signal at max. range for current monitoring**
- **Separate adjustable ON and OFF delay**
- **4 programmable time ranges for ON and OFF delay**
- **4 programmable Power Up delays**
- **Relay function can be inverted**
- **Relay can be set to latch IN or latch OUT.**
- **Electrical and manual reset of latch**
- **LEDs indicate the state of input, timing and relay**

Description:
The current relay is designed to cover all possible AC current monitoring and control applications - including differential current measuring (earth leakage) - in the range from 5mA to 100A. Higher sensitivity can be achieved by pulling the current carrying wire multiple times through the relay.
The wide range, 4 decades, are divided into 12 sub ranges for easy adjusting. For an external monitoring of the actual input, there is a 20mA output signal related to the max. of the set range.

The differential is adjustable from 1 to 50% of the set tripping current. By means of DIP switches, the actual relay function can be set to detect over or under current with fail safe relay function. The relay function can be inversed and set to latch in or out with manual or electrical reset. Furthermore several ranges of Power Up delay, as well as adjustable ON and OFF delay makes this relay the ultimate choice for AC current measuring.

Used as an earth leakage relay - with up to 2 wires of 6mm2 (63A) through the relay - the setting of a 30mA limit can simply be done by pressing the test button - for a 30mA fault current through the CT - and adjusting the trip point to drop out.

Application:
Differential (earth leakage) AC current monitoring. Level comparator used with transducers and transmitters. Over- or undercurrent surveillance of all kinds of loads, heaters, motors, generators, mains current etc.

AC CURRENT DETECTING RELAY WITH DELAYED DROP OUT

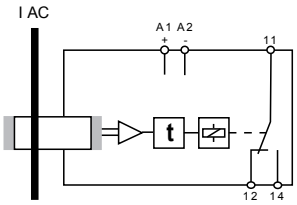
Type: IADA

FEATURES

* **Cost effective solution**
* **Minimize energy consumption**
* **Minimize environmental noise**
* **Compact size**
* **Direct powered from the starter battery**

CONNECTION DIAGRAM

Rail mounting



Description:
The IADA AC current relay is a miniaturized and cost effective solution for monitoring the presence of an AC current. The unit detects current from 50 mA and above and accepts continuous currents only limited by the cable size through the CT in the front.

Operation:
When powered from either 12 or 24 V DC the relay will pull when the wire through the CT conducts an AC current of more than 50 mA. When the current drops down below 40 mA the relay will drop out after the set delay of up to 60 sec. has expired.

Application:
Automatic idle and run control of small petrol or diesel motor powered generator sets. When the motor is idling, the output voltage will only be a fraction of the nominal voltage and not able to feed the connected units. The generator set will run with a low power consumption and low noise. But as soon as a connected load is switched on, a small load current will be detected by the IADA and the motor will be switched from idling to run in order to supply the power for the load. In order to minimize the number of switches the IADA comes with an adjustable drop out delay. When the load is disconnected the build-in timer in the IADA starts to count down and after the set time the relay will drop out and the motor go back to the idle condition.

SPECIFICATIONS

DIFFERENTIAL DC CURRENT RELAY

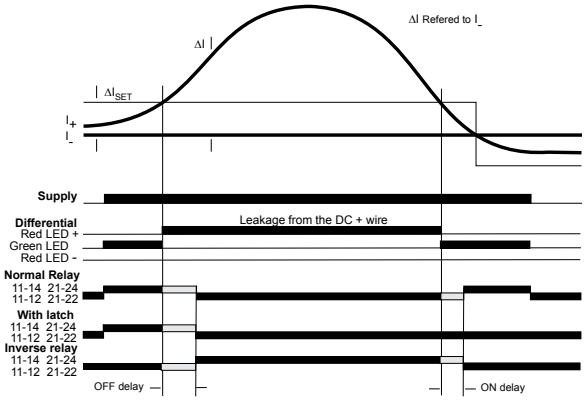
DC Earth Leakage Relay

Type: DDCA

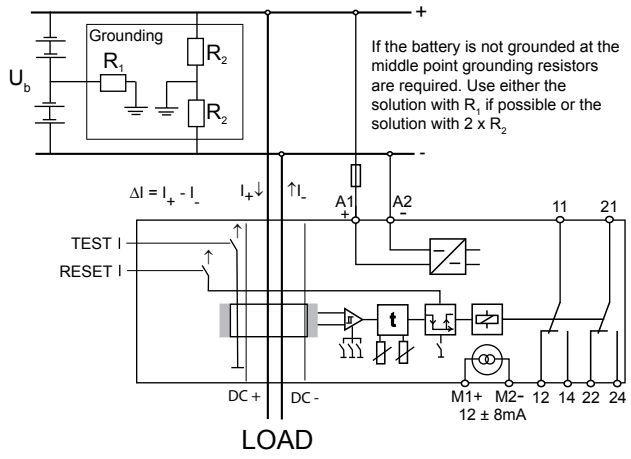
FEATURES

- **Early warning for Insulation deterioration and Earth leakage**
- **Minimum current detection**
- **6 Ranges from 5 to 200mA selected by DIP switches**
- **Wide DC supply range from 18 to 340 V**
- **Directional 12 ± 8mA output and LED indication for supervision and easy trouble shooting**
- **Integrated current transformer Ø14mm or Ø29mm**
- **Extremely compact and µ metal screened transformer for high accuracy and noise immunity**
- **Time delay - on and off - individually adjustable**
- **Relay function can be inverted**
- **Latch function can be selected**
- **LEDs indicate the status of the relay, latch and timing function**
- **Test and Reset switch**

FUNCTION DIAGRAM



CONNECTION DIAGRAM



Description:

The differential DC current relay is designed to monitor IT systems for insulation deterioration. The DDCA is able to selectively indicate faults in branched systems. In addition to this it shows if the fault is related to the positive or the negative wire for easy maintenance. Used with only one wire through the sensing core, it can monitor a circuit for connectivity and function. If the DC current drops below the set value, the relay will trip. This is another key feature as the DDCA allows, up to the cable capacity, AC and DC Amps to flow under normal conditions without having the usual voltage drop and heat from a shunt resistor.

Operation:

Set the DIP switches (123) to the requested sensitivity, latching relay (5) to On or Off and the relay (6) to Normal (fail safe) or Inverse function. When the power is connected to A1 and A2, and with no differential current through the sensing coil, the green LEDs for Differential and Relay ON (normal function) will be on. When a differential current above the set limit is detected, one of the red Differential LED's will be switched on, showing the polarity of the cable leaking to ground. (For leak currents above 15A both red Differential LEDs will be switched on indicating that the DDCA is saturated and cannot detect which cable is leaking). When high current is detected, the OFF delay starts to elapse, indicated by a green LED, and the relay will drop out when the set time has expired. If the latch function is selected the relay will stay de-energized (normal function) and the red Latch LED will be on until the Reset button is activated. If the latch function is not active and the differential current drops below the set level, the green Differential LED will be switched on and the ON delay starts to elapse, indicated by a green LED. The relay will pull in (normal function) when the set time has expired.

Test and Reset function:

The Test switch activates a real functional test as it conducts a DC current through a separate winding on the sensing core. The Reset switch will while activated release the latch function.

Application:

Selective DC earth leakage detection in single and branched systems. The DDCA is the solution for pure DC installations used in UPS and control systems for chemical, petrochemical, mining industry as well as seagoing vessels. The DDCA is also ideal in AC installations including loads with rectifiers e.g. in variable speed drives, causing the AC monitors to malfunction.

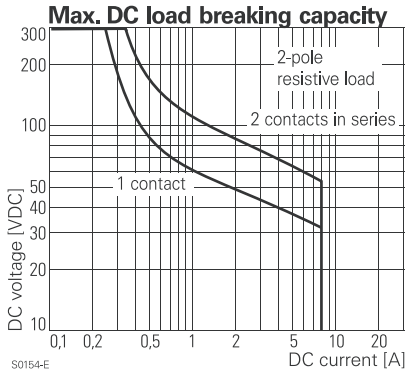
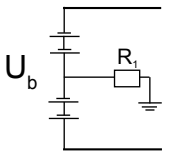
RELAY CONTACTS

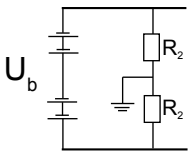


Calculations of grounding resistors for not grounded batteries



R_1* = Max $\frac{U_b}{4\,\Delta I_{set}}\,\Omega$

Size of resistor W** = Min. 0,4 $\frac{U_b^2}{R_1}$ Watt



R_2* = Max $\frac{U_b}{2\,\Delta I_{set}}\,\Omega$

Size of resistor W** = Min. 1,6 $\frac{U_b^2}{R_2}$ Watt

Examples for U_b = 48V, ΔI_{set} = 5mA

R_1 = Max $\frac{48}{4 \times 0{,}005}$ = Max. 2400Ω

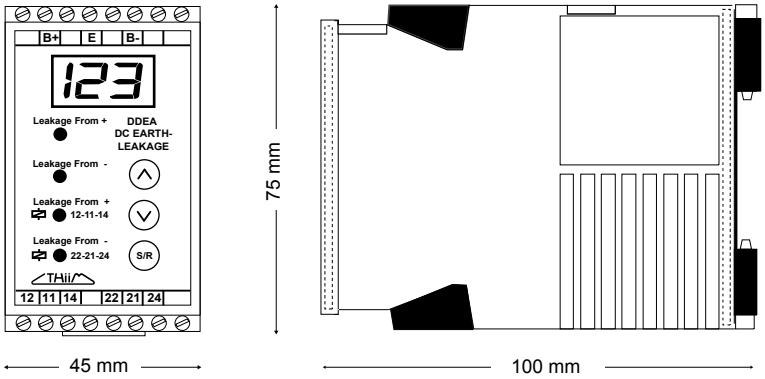
W = Min. 0,4 $\frac{48^2}{2400}$ = Min. 0,384 Watt

R_2 = Max $\frac{48}{2 \times 0{,}005}$ = Max. 4800Ω

W = Min. 1,6 $\frac{48^2}{4800}$ = Min. 0,768 Watt

* The calculation of the resistor is based on a safety factor of 2 corresponding to a detection of a short from one pole to ground down to half battery voltage.
A resistor selected according to the maximum resistor value as calculated above will limit the leak current to 2 times ΔI_{set} in case of direct short to ground.
If it is a branched circuit with distributed "acceptable" leaks, it is recommended to use a lower value of the resistor.

** The calculation of the resistor size is based on a safety factor of 1,6 corresponding to an acceptable increase in battery voltage of up to 26%.



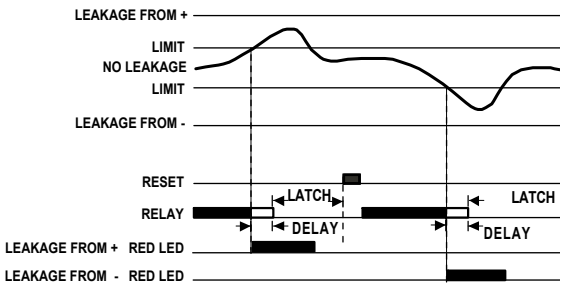
EARTH LEAKAGE MONITOR FOR DC UNEARTHED IT SYSTEMS

Type: DDEA

FEATURES

- **Monitors Insulation deterioration and faults and gives an early warning if a leak current exceeds a preset level**
- **Programmable leak current limit from 0.2 to 30 mA**
- **Universal unit for a wide range of distribution system voltages U_n from 20 to 500 V.**
- **Self-supplied from the distribution system**
- **Time delay - on and off - individually adjustable**
- **Relay function 2x1C/O (leak from + or -) or 1x2C/O**
- **The relays work in Fail Safe mode**
- **Latch function can be selected**
- **3-digit display shows actual current leak**
- **LEDs indicate the status of the relay, latch and timing function**

FUNCTION DIAGRAM

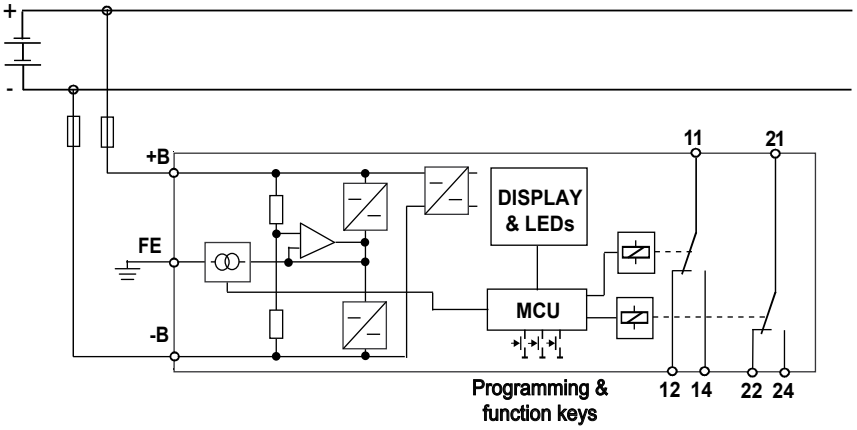


Description:
The DC earth leakage relay is designed to monitor unearthed DC IT systems for insulation deterioration or faults. The DDEA, that is power supplied from the system to be monitored, is connected to earth through an active current limited circuitry, trying to keep the earth voltage at half the system voltage. If there is a leak to ground from one of the supply lines the DDEA will compensate in order to keep the earth voltage at half the supply voltage. When the compensation current rises to a higher level than the set point the relay will switch, and the DDEA will let the earth float with the limited compensation current still running. This ensures that the special features of an unearthed system are still available while the fault can be found and repaired. The internal relays can be set to work in parallel for a fault or individually for faults in the positive or the negative line. In the unlikely case that there is a balanced leak from both the positive and the negative supply line it will not be detected by the DDEA.

Operation:
In order to minimize the size of the DDEA the unit is powered by 3 independent switch mode supplies. Two supplies are used to either source or drain current from the earth terminal and a third supply powers the electronics. The DDEA is with leak currents below 10mA either sourcing or draining with a DC current. At higher leak current, high supply voltage and high ambient temperature the DDEA automatically changes mode to a safe pulse pause mode where the pulses (leak and measuring current) are 600 msec and the pause up to 20 sec. or long enough to keep the temperature in the box below 65 °C.
If LATCH is selected the relays can be reengaged - if the leak current is under the set point - by pressing the S/R button on the front.

Application:
Unearthed systems can function even with a direct short from any point in the wiring to ground, but another short or leak from another point in the system can be fatal. Either direct with heavy currents, overheating or indirect through component malfunction. The DDEA solves the problem by monitoring the circuit and giving an early warning as soon as it senses a leak current greater than the set value. Securing the ground level at half system voltage reduces at the same time personal risks for electric shock.

CONNECTION DIAGRAM



Please note
If the two relay contacts are in "Fault" position and all LED's are red and the display shows "FFF", then the DDEA is defect and must be replaced.

DDEA Set-up parameters

To enter Setup Menu pres S/R button for app. 5sec.
If no activity on the buttons for 50sec., then the setup will end without saving data. To return to factory default see below

Step 1: Set Trip to over current. Relay ON to OFF
LEDs: "Leakage to +" and "Leakage to –" are blinking Red
Set trip value from 0,1 to 30,0 mA
Press Up or Down keys to change trip value and press S/R for next Setup menu

Step 2: Set Return to acceptable current. Relay Off to ON
LEDs: "Leakage to +" and "Leakage to –" are blinking Green
Set return value 0,1 to "trip value" x,x mA
Press Up or Down keys to change trip value and press S/R for next Setup menu

Step 3: Set Delay time from ON to OFF
LEDs: "Relay Leakage to +" and Relay Leakage to –" are blinking Red
Set OFF time delay from 0,0 to 99,9 sec.
Press Up or Down keys to change trip value and press S/R for next Setup menu

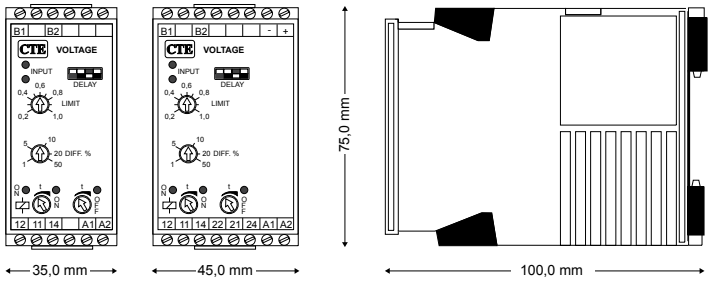
Step 4: Set Delay time from OFF to ON
LEDs: "Relay leakage to +" and "Relay leakage to –" are blinking Green
Set ON delay time from 0,0 to 99,9 sec.
Press Up or Down keys to change trip value and press S/R for next Setup menu

Step 5: Set Latch OFF (0) or ON (1)
If latch OFF all 4 LEDs are Green
If latch ON all 4 LEDs are Red
Press Up or Down keys to change latch setting and press S/R for next Setup menu

Step 6: Set Relay Function
Function 1: Individual functioning C/O contact for leakage to + and for leakage to -. Relay LEDs blinking Red and Green out of phase
Function 2: 2 parallel functioning C/O contacts for leakage to + or leakage to –. Relay LEDs are blinking Red and Green in phase
Press Up or Down keys to change the relay function and press S/R to Store Data and Exit setup

To return to factory default setup values press "S/R" and "UP" buttons simultaneously for app. 5 sec.

Over current trip:	10,0	mA
Return trip:	9,8	mA
Delay time ON to OFF:	2,0	sec.
Delay time OFF to ON:	2,0	sec.
Latch:	OFF	(0)
Relay function:	Function 1	(Individual)



MULTIFUNCTION VOLTAGE RELAY

Type: UMCA

FEATURES

- **For AC and DC voltage**
- **Balanced input for noise immunity**
- **Input voltage range from 50 mV to 500 V**
- **11 programmable input ranges**
- **4 programmable times for power up reset**
- **4 programmable time ranges**
- **Separate adjustable ON and OFF delay**
- **Relay function can be inverted**
- **Adjustable upper or lower limit and differential**
- **Latch function available**
- **LEDs indicate the state of the input**
- **LEDs indicate the timing function**
- **LED indicates the state of the relay**
- **SMD - technic**
- **0-1 V DC control output for full scale (Only in 45 mm. housing)**

Description:
The voltage relay is designed with a microcontroller. With programmable range, function and timing it can be programmed to cover a wide range of applications.

The voltage to be monitored is fed into a resistive divider and, for extreme noise immunity, amplified in a balanced amplifier, rectified, averaged, and compared with a preset reference voltage.

AC and DC voltages between 50 mV and 500 V can be measured directly. By means of a voltage transformer or a resistive divider the range can be extended without limits.

For applications in DC systems a special feature of the balanced amplifier permits voltages against the negative supply line to be measured directly without DC separation between input and supply.

Application:
Level comparator used with transducers and transmitters. Over- or undervoltage monitoring of, loads, batteries, generators, mains etc.

MAINS VOLTAGE MONITORING RELAY

Type: UAWA

FEATURES

- **Separate adjustment for upper and lower limit**
- **Separate dipswitch setting for upper and lower limit function**
- **LED indicates the state of the input**
- **LED indicates the state of relay**
- **LEDs indicate the timing function**
- **Time delay separate adjustable**

Description:
The voltage relays are designed for applications where a voltage needs to be monitored for deviations from a nominal value U_N. UAWA are combined over- and under voltage relays (window discriminator relays).

The relay can by means of a dipswitch be set to work as either an under voltage relay or as an over voltage relay only.

Operation:
When the supply voltage is applied, the - power up reset - period begins. If the nominal voltage is applied to the input, the internal relay pulls in the end of the reset period.
If the input voltage exceeds the adjusted upper or lower limit the relay drops out.

If the input voltage comes between the lower limit plus the differential and the upper limit minus the differential, the relay pulls in.
The differential is fixed 2 % of the nominal input voltage (the center voltage of the window).

As under voltage relay only, the relay remains energized for input voltages exceeding the upper limit.

As over voltage relay only, the relay remains energized for input voltage under the lower range limit.

Application:
To monitor mains- and generator voltages in emergency power systems. To protect electrical and electronic equipment from damage because of over- or under voltage. On special request, the relay can be modified to monitor the value of any voltage, e.g. from sensors and transmitters.

MAINS FREQUENCY & VOLTAGE MONITORING RELAY

Type: UFWA

FEATURES

- **Adjustable version with individual under- and overvoltage settings and under- and overfrequency settings**
- **Function setting with dipswitch**
- **Ceramic resenator controlled reference**
- **Time delay - on and off - individually adjustable**
- **One unit for three mains voltages**
- **LEDs indicate the state of the frequency**
- **LED indicates the state of input**
- **LED indicates the state of relay**
- **LEDs indicate the timing function**

Description:
The combined voltage and frequency relays are designed for applications where a voltage and/or a frequency needs to be monitored. UFWA are combined over- and under voltage and frequency relays.
The relay can by means of dipswitches and trimmers be set to work as:
1) an under voltage and frequency relay
2) an over voltage and frequency relay
3) a frequency relay only
4) or as an under and over voltage and frequency relay

Operation:
When the supply voltage is applied, the - power up reset - period begins. If the nominal voltage and/or frequency is applied to the input, the internal relay pulls in the end of the reset period.
If the input voltage/frequency exceeds the adjusted upper or lower limits the relay drops out.
If the input voltage/frequency comes between the lower limit plus the differential and the upper limit minus the differential, the relay pulls in.
The voltage differential is fixed 2 % of the nominal input voltage.
The frequency differential is fixed 10 % of tripping deviation.
As under voltage relay only, the relay remains energized for input voltages exceeding the upper limit.
As over voltage relay only, the relay remains energized for input voltage under the lower limit.
As frequency relay only, the relay remains energized for input frequencies within the lower and upper limits.
As under and over and frequency relay, the relay remains energized for voltage and frequency within the limits.

Application:
To monitor mains voltages and frequencies. To protect electrical and electronic equipment from damage because of over- or under voltage. On special request, the relay can be modified to monitor higher or lower frequencies.

3 PHASE UNDER VOLTAGE CONTROL RELAY WITH PHASE SEQUENCE DETECTION

Type: PNDA & PNDI (4 wire system)

FEATURES

- **Accurate under voltage detection of each phase against neutral**
- **Phase sequence detection inhibit the relay with wrong sequence**
- **Adjustable Sensitivity from -5 to -25% of nominal voltage**
- **Adjustable differential from -5 to -80% of under voltage offset from nominal. Voltage range 0,25 to 20% of under voltage**
- **Time delay - on and off - individually adjustable**
- **One unit for three mains voltages**
- **6 LEDs indicate the state of input, phase sequence, timing function and relay**

Description:
The 3 phase 4 wire voltage relays are designed for applications where the three phases need to be individually monitored for under voltage against neutral and correct phase sequence. The PNDA and PNDI contain a standard timing function. In addition the PNDI offers a true time delay on drop out even at total power failure. The relay works in "fail safe" mode and need no external power supply.

Operation:
Under normal phase conditions the relay is energized - contacts 11-14 and 21-24 closed - and the green "input" LED and the yellow "relay" LED are switched on.

If one or more phase voltages are below the preset under voltage value, the red "input" LED will be switched on and stay on untill all three phase voltages are above the set value plus the preset differential, given by a percentage of the under voltage offset from the nominal value.

If the state of the relay is not corresponding to the input signal, the yellow LED indicating delay "ON" or "OFF" will be on untill the relay changes state and corresponds to the input.

In case of wrong phase sequence the relay will not be energized and the red "inversed phase sequence" LED will be on indicating the fault.

AC CURRENT RELAY WITH VOLTAGE COMPENSATED SETPOINT

Type: IUAB

FEATURES

- **LED guidance for easy installation**
- **Two ranges for precise setting**
- **Red and green LEDS indicate the state of the input and the relay**

Description:
The current relay IUAB is designed for monitoring up to 10 parallel connected equal loads. As soon as one of the loads is defective, and no longer draws current, the relay will give an alarm by dropping out.

If the load is resistive or in general dependent on the supply voltage, the load current will vary with the actual voltage. A supply voltage change of -10% will cause the load current to drop 10%, or the same as if one of the loads was lost at normal supply voltage. Commonly used current relays would send a false alarm as this is still an OK condition. With this relay the current set point is related to the actual supply voltage and the set point will vary with the same percentage as the supply voltage change. By using this set point compensation it is possible, without getting false alarms, to monitor load changes down to 10% or detect one defect load out of ten equal loads.

In order to simplify the installation the IUAB has two yellow LED's suggesting the direction of the adjustment on the current setting spindle. When the two yellow LED's are equally lit the current set point is precisely 5% under the actual current. This means that the unit is adjusted to give an alarm if the current drops by 5% from the current value.

The current setting on the front refers to a current set point at nominal voltage.

The standard unit is made with a 1:1 voltage current relation as for resistive loads. If the relation is different from this or even inverse as for switch mode supplies used in e.g. fluorescent tubes, the voltage current relation can be modified to the actual application.

Application:
Monitoring e.g. heaters and lamps.

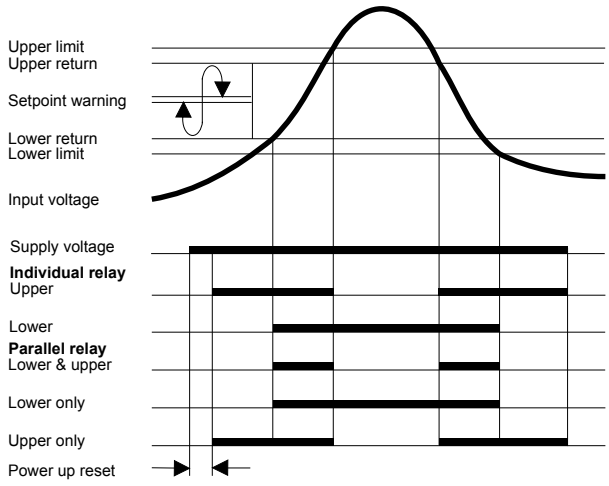
DC VOLTAGE MONITO-RING RELAY

Type:BMWB

FEATURES

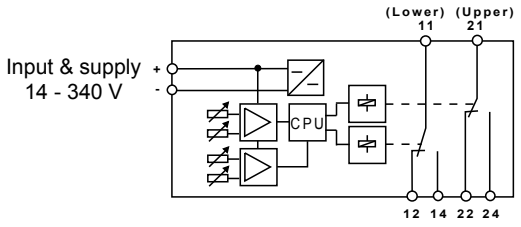
- **Includes two relays for use in parallel or for individual under and over voltage signalisation**
- **Accurateadjustmentforupperlimit,upperreturn, lower limit and lower return by means of multiturn potentiometers**
- **Easy dipswitch setting selects function as under and over voltage relay, window relay or under or over voltage relay only**
- **LEDs indicate the state of the input**
- **LED indicates the state of the relay**
- **LEDs indicate when the timing function is active**

FUNCTION DIAGRAM



CONNECTION DIAGRAM

Rail mounting



Description:

BMWB is a combined over and/or under voltage relay.
The voltage relay is designed for precise monitoring of a wide range of DC voltages from 14V to 340V.
With a build in high efficiency switch mode power supply, the BMWB is able to cover the whole measuring range without the need of an external supply.
The BMWB can by means of dipswitches be set to work as a relay for monitoring under voltage and over voltage with two individual C/O contacts, or the contacts can be paralleled and the BMWB be used as a window discriminator relay where both C/O contacts are in the powerless position outside the window.
With the paralleled relays the BMWB can be set to only register under or over voltage.

Operation:

When the supply voltage is applied, the - power up reset - period begins. If a voltage within the allowed voltage range is applied to the input, the internal relay pulls in at the end of the reset period.
If the input voltage exceeds the adjusted upper or lower limit, the corresponding relay or both relays drops out.
If the input voltage comes between the upper return and the lower return, the relay pulls in.
As under voltage relay only, the relays remains energized for input voltages exceeding the upper limit.
As over voltage relay only, the relay remains energized for input voltage under the lower range limit, until it drops out due to power loss at inputs below 14 V.

Application:

Voltage monitoring in UPS, stationary and mobile battery installations.

BATTERY SYMMETRY MONITORING RELAY

Type: BVSA

FEATURES

- **Supply from the battery**
- **LEDs indicate the status and the fault conditions**
- **Latch for symmetry failure**
- **Adjustable symmetry level**
- **Adjustable Timeoff delay to prevent false alarm**
- **Test and reset button on the relay**
- **Terminals for remote test and reset**

Description:
The BVSA is designed to give an early warning for cells, in a battery system, that are performing different from the other cells. The battery system being monitored must consist of two equal blocks coupled in series with an accessible centerpoint.

Operation:
The measuring system is based on a comparison of the voltage from the two blocks. Over the lifetime they are charged and discharged equally and the voltage will, within close limits, be the same as long as all cells in both blocks are healthy. At the end of the lifetime, or if a cell is shorted, the two blocks will perform different. The BVSA will sense the difference in performance and the internal relay will give an early warning by dropping out. Information about which battery block that is defect is indicated by the LEDs on the front. In order to prevent false alarm the BVSA includes a timing function.

Application:
Detection of an early failure in battery cells within a battery system. For a complete monitoring system the BVSA can be used together with a standard battery voltage monitoring relay - type BMCD (HI/LOW)

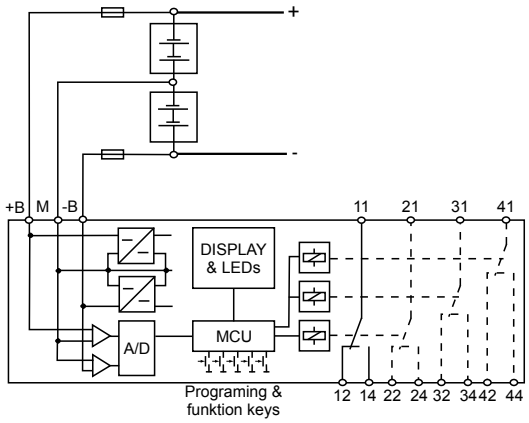
BATTERY SYMMETRY MONITORING RELAY

Type: BMSA

FEATURES

- **Early warning for Cell deterioration like Sulphating or internal Short Circuit**
- **All in one unit by Multi Range from 24 to 512 Volt**
- **No current leak through the middle point connection**
- **Optional Over and Under voltage monitoring**
- **Easy set-up by keying in actual parameters or loading in through a RS 232 connection**
- **Time delay - On and Off - can be set individually**
- **Latched Relay function can be selected**
- **LEDs indicate the status of the relay, latch and timing function**
- **Reset and individual Test keys for +B and -B**
- **RoHS technology**
- **Extremely compact and low power consumption**

CONNECTION DIAGRAM



Contact information:
Symmetry relay: 11, 12 , 14 and 21, 22, 24
Optional: Under voltage relay: 31, 32, 34. Excludes 21, 22, 24
Optional: Over voltage relay: 41, 42, 44. Excludes 21,22, 24

For a healthy battery the following contacts will be closed:
11-14, 31-34 and 41-42

Description:
The multipurpose Battery Symmetry Relay BMSA is designed to monitor and give an early warning if one or more cells are performing different from an average cell in the battery. The battery must consist of two blocks of cells coupled in series with an accessible middle point used as a reference potential. No current will be drawn from the middle point. The Symmetry Relay monitors that the positive and the negative battery blocks perform equally independent of the actual charge and load level. The two battery blocks do not need to be of equal voltage (same number of cells), but the individual cells must be equal and have the same history. The BMSA accepts up to twice as many cells in one block as in the other. The nominal voltage range of each block can be set from 12V to 256V and the actual voltage must be within the range of 9 to 300V allowing a battery voltage ranging from 18V to 600V. For high battery voltages exceeding 300V the middle point connection is critical. If it can (even accidentally) be disconnected, the maximum battery voltage must be kept below 300V.
As an option, the BMSA can be extended to monitor the actual battery voltage for under and over voltage. The option will include individual relays for under and over voltage.

Operation:
When the BMSA is powered up for the first time it will need to be configured to the application. The configuration can be done either by using the keys on the front, or through a RS232 port in the side of the unit. When it is programmed it is ready to monitor the battery. For detailed information of the function of the Display and the LED's, please see the block diagram. The display will show the two battery block voltages, the total battery voltage and the average cell voltage difference between the two battery blocks in %. For each readout, the LED's on the front will indicate what the display is showing. The display can be set to show one particular measured value, or continuously cycle through the different measurements, one after the other in a specified time sequence. When the BMSA is connected to the battery, and the battery is OK, then the internal relay will pull in. When the cell difference exceeds the set maximum, the OFF delay will start to expire and the yellow LED "Toff" will be lit. After the set time delay the relay will drop out. Depending on the latch setting, the relay will remain out or may go in again if the battery returns to a healthy condition. The BMSA is constantly checking the battery connections and blinks with the LED: +B, -B or both LED's if the connection to battery plus, minus or the middle point is disconnected.

Test and Reset function:
The two test keys offset the measured voltage from either battery block by 10%. The display and the function of the BMSA will respond to the change with a new voltage and cell difference information and the relay will operate. The reset key is used for releasing the Latch function and for programming.

Application:
The BMSA is used on batteries in back up supplies where, by matching two batteries against each other, a warning can be given as soon as a cell in one of the battery blocks starts to deteriorate. As the BMSA is not depending on the actual charge and load status, it is a powerful supervision of only occasionally used batteries in emergency systems.

Definitions and limitations

Nominal cell voltage x.xx is used to calculate the voltage range to be used. The range is set according to the battery with the highest No. of cells.
If the battery has a total nominal voltage up to 48V, it will be measured in the 70V range.
If the battery has a total nominal voltage higher than 48V, it will be measured in the 300V range.

Number of cells times nominal voltage of the cells, must be within the range from 12V to 256V for each of the two Batteries.

The actual voltage of each of the two batteries must be within the range of 9 to 300 volts.
NOTE: If the middle point M is not connected or disconnected, the maximum voltage of ±B must be below 340V.

Cell voltage difference in % is the percentual difference between the average voltage of the cells in the + Battery compared to the cells in the - Battery.
The calculation is (100 * ((Av. Cell + Batt) - (Av. Cell - Batt))) / (0.5 * ((Av. Cell + Batt) + (Av. Cell - Batt))) %.

Cell voltage difference in % can be set from 1% to 20%.
1% is equal to a cell voltage difference of 20mV for two cells of 2.0V and 120mV between two 12V batteries at 12V.
20% is equal to a cell voltage difference of 400mV for two cells of 2.0V and 2,4V between two 12V batteries at 12V.

The resolution of the voltage measurement is calculated up to 70V to be 70/4096 = 17.1mV. In the range up to 300V it is 73.2mV.
The practical resolution over the temperature range is 2 to 3 times the calculated values.

Time delay ON or OFF can be set from 0.1 to 99.9 sec.

Less than 0,1mA will be drawn from the middle point. Total supply will be taken from the +B and -B.

Optional
Over and under voltage measuring with one separate relay for each function.

DC RIPPLE RELAY

Type: BRIA

FEATURES

- **One unit for all voltages from 18 to 340Vdc**
- **4 voltage sub-ranges for high accuracy**
- **High sensitivity. Adjustable from 0.4 to 6.4%**
- **3 ripple sensitivity ranges for an easy adjustment**
- **Excellent accuracy and equal sensitivity for ripple frequencies from 30 to 3000Hz.**
- **No separate supply power needed**
- **Time delay - ON and OFF - individually adjustable**
- **Compact. 35mm box with 2 C/O contacts**

Description:
The ripple relay BRIA is developed to supervise thyristor rectifiers for faulty thyristors. The relay is extremely sensitive, stable and detects with high accuracy ripple levels exceeding the set sensitivity in the frequency range from 30 to 3000 Hz.. Supply power is taken from the input, and by using a wide range switchmode supply, the same relay can be used in systems with voltages from 18 to 340Vdc. In order to have the same precision for all system voltages, the range 18 to 340Vdc is divided into 4 overlapping subranges, selected by two DIP-switches. By use of another DIP-switch, the sensitivity range can be set from 0.4 to 1.6%, 0.8 to 3.2% or 1.6 to 6.4% of the system voltage.

Operation:
The input voltage is divided into two signals. In order to measure the ripple in % of the varying system voltage, one part is averaged and used to set the internal reference voltage. The other signal, the AC signal related to the ripple, is amplified and conditioned through a bandpass filter in order to avoid false triggering due to frequencies outside the measuring range from 30 to 3000 Hz. The rectified mean value is then compared to a set part of the reference voltage. When the relay is powered up, and the ripple on the input is below the set limit, then the internal relay will pull in and the contacts 11-14 and 21-24 will close. The indication will be a green LED for the input and a yellow for the relay. If the ripple content of the input voltage increases and exceeds the set sensitivity, then the OFF delay starts to elapse, indicated by the red input LED and a yellow timing LED. The relay will drop out when the set OFF delay has expired and the yellow relay LED will extinguish. If the ripple content decreases by 10% of the set limit, the ON delay starts to elapse, indicated by the green input LED and a yellow timing LED. The relay will pull in when the set ON delay has expired and the yellow relay LED will be lit.

Application:
Supervision of DC Power supplies in general or battery chargers in UPS systems.

3 PHASE VOLTAGE CONTROL RELAY

PADA, PADI

PANA, PANI

FEATURES

- **Detect phase-loss and phase-regeneration in three phase systems**
- **High sensitivity for the protection of motors and power transformers**
- **Insensitive to harmonics and spikes as the detection system includes a narrow band pass filter**
- **Adjustable version with individual adjustments for unbalanced and balanced under- and overvoltage settings**
- **Function setting with dipswitch**
- **Time delay - on and off - individually adjustable**
- **One unit for three mains voltages**
- **LED indicates the state of input, relay and timing function**

Description:
The phase failure relays are designed for applications where a three-phase system needs to be monitored for unbalance or deviation in balanced voltage. The relays includes a standard timing function. In addition the PADI and PANI offers a true time delay on drop out even at total power failure. The relay works in "fail safe" mode and need no external power supply. If an external stable power supply is available the 45mm housing offers seperate terminals for internal power.

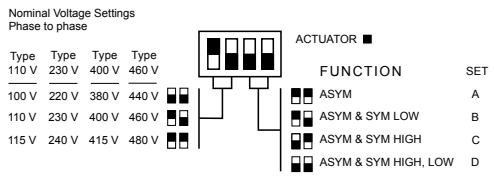
A - function monitors the three-phase system for unbalance due to phase angle and phase voltage deviations e.g. a blown fuse or a bad connection.
B - function monitors the three-phase system for both unbalance (as the A - function) and balanced under voltage.
C - function monitors the three-phase system for both unbalance (as the A - function) and balanced over voltage.
D - function Monitors the three-phase system for all possible deviations by monitoring unbalance and balanced under-and over voltage.

Unbalance due to phase angle and phase voltage deviations is very accurately measured by measuring the inverse phase system relatively to the main system. The method is independent of the actual balanced voltage and very insensitive to electrical noise.

Balanced voltage is measured by rectifying and adding the three-phase voltages.

Operation:
Under normal phase conditions the relay is energized and the green LEDs are switched on. If a phase failure is detected, or the supply voltage for the electronic system is lost, the relay drops out and the LED, related to the type of failure, is switched off.

PROGRAMMABLE FEATURES



Application:
To switch off motors automatically before damage due to faulty supply, and to switch them on again as soon as the supply is re-established. E.g. pumps, oilburners, ventilators and refrigerators.
To monitor the three-phase main system and control the use of local emergency generators.
To prevent motors from being switched on to a faulty supply e.g. cranes and elevators.

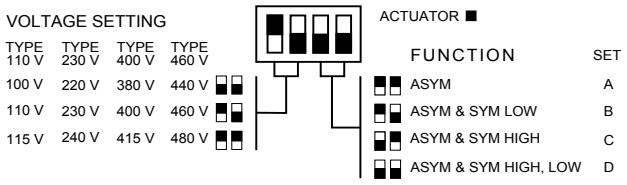
3-PHASE SEQUENCE CONTROL & PHASE MONITORING RELAY

3 wire: PAHA & PAHI
4 wire: PAMA & PAMI

FEATURES

- **Active contact function for both phase sequences with two relays**
- **Detects phase sequence, phase failure, phase regeneration and phase loss in three-phase mains**
- **High sensitivity for the protection of installations, control gear, motors and power transformers**
- **Time delay - on and off - individually adjustable. PAHI and PAMI includes a true time delay independent of the power supply**
- **Insensitive to harmonics and spikes as the detection system includes a narrow band pass filter**
- **Adjustable set points with individual adjustments for unbalanced and balanced under and over voltage settings**
- **Function setting with DIP-switch**
- **12 standard mains voltages covered by just 4 units**
- **LED indication of the state of input, relay and timing function**

PROGRAMMABLE FEATURES



Description:
The PAHA & PAHI are 3 wire relays for sequence control and phase monitoring. The PAHI includes a true time delay. The PAMA & PAMI are 4 wire relays for sequence control and phase and neutral monitoring. The PAMI includes a true time delay.

The phase sequence and phase and neutral monitoring relays are designed for applications where the sequence of a three-phase system needs to be controlled. In addition to the sequence control the relays monitors the three-phase system for phase unbalance, and according to the selected setting, they can further monitor balanced under or over voltage, as well as both under and over voltage. The relays work in "fail-safe" mode and the 35mm modules need no external power supply. If an external stable power supply is available, the 45mm modules offer separate terminals for the internal power.

Unbalance, due to phase angle and phase voltage deviation, is very accurately measured by measuring the inverse phase system relatively to the main system. The method is independent of the actual balanced voltage and perfect for the protection of three-phase motors, generators and transformers. The measuring system is insensitive to higher harmonics and secures the relays from false triggering due to "noisy" power lines. As the measuring system includes the phase angles in the measurement, it provides full protection against regenerated phases. Balanced voltage is measured by adding the three individual rectified phase voltages.

Operation:
Under normal phase conditions the green input LED is on and one of the sequence sensitive relays will be energized, indicated by a yellow LED. The yellow LED, next to the description, shows the sequence of the three-phase system. If there is a phase deviation beyond one of the set levels, the failure will be detected, and the red input LED will go on. During the set delay period the yellow timing LED for off delay will be on. At the end of the timing period the relay will drop out and only the red input LED will stay on. If the common phase voltage drops below -40%, the relay will drop out, even if the under voltage detection is disabled. If the phase or the separate supply voltage is lost, the relay and all LED's will de-energize with out delay for PAHA and PAMA. The PAHI and PAMI will be able to hold the relays for more than 6 sec.

Application:
To prevent motors from rotating in the wrong direction and being switched on to a faulty supply. Motor protection by controlling the direction of rotation and on-off switching depending on supply conditions. E.g. pumps, compressors, ventilators and refrigerators. Automatic control of phase sequence and monitoring of phase and neutral voltages in mobile equipment like refrigerated containers, control and distribution panels and machines used on building sites and on service jobs.

3 PHASE & 3 PHASE + N VOLTAGE & FREQUENCY CONTROL RELAY

PAFA, PAGA
PAFB, PAGB

FEATURES

- **Detect phase-loss and phase-regeneration in three phase systems**
- **High sensitivity for protection of motors and power transformers**
- **Insensitive to harmonics and spikes as the detection system includes a narrow band pass filter**
- **Adjustable version with individual adjustments for unbalanced and balanced under- and overvoltage settings and under- and overfrequency settings**
- **Function setting with dipswitch**
- **Ceramic resenator controlled reference**
- **Time delay - on and off - individually adjustable**
- **One unit for three mains voltages**
- **LEDs indicate the state of the frequency**
- **LED indicates the state of input**
- **LED indicates the state of relay**
- **LEDs indicate the timing function**

Description:
The phase failure relays are designed for applications where a three-phase system needs to be monitored for unbalance or deviation in balanced voltage or deviation in frquency. PADF includes a standard timing function. the PADF offers seperate terminals for internal power.

A - function monitors the three-phase system for unbalance due to phase angle and phase voltage deviations e.g. a blown fuse or a bad connection.
B - function monitors the three-phase system for both unbalance (as the A - function) and balanced under voltage.
C - function monitors the three-phase system for both unbalance (as the A - function) and balanced over voltage.
D - function Monitors the three-phase system for all possible deviations by monitoring unbalance and balanced under-and over voltage.

Unbalance due to phase angle and phase voltage deviations is very accurately measured by measuring the inverse phase system relatively to the main system. The method is independent of the actual balanced voltage and very insensitive to electrical noise.

Balanced voltage is measured by rectifying and adding the three-phase voltages.

Operation:
Under normal phase conditions the relay is energized and the green LEDs are switched on. If a phase failure is detected, or the supply voltage for the electronic system is lost, the relay drops out and the LED, related to the type of failure, is switched off.

Application:
To switch off motors automatically before damage due to faulty supply, and to switch them on again as soon as the supply is re-established. E.g. pumps, oilburners, ventilators and refrigerators.
To monitor the three-phase main system and control the use of local emergency generators.
To prevent motors from being switched on to a faulty supply e.g. cranes and elevators.
To monitor the mains frequency and control the use of local generators or stand-by supplies.
To protect dieselgenerator plants against over and under speed.
To protect electrical and electronic equipment from damage due to over and under frequency

SPECIFICATIONS

INPUT

Phase to phase voltage	Type B110:	100, 110 and 115
Selectable by dipswitch	Type B230:	220, 230 and 240
	Type B400:	380, 400 and 415
Input resistance	300 kΩ	100 < U_N < 200 V
	500 kΩ	200 < U_N < 500 V
Frequency range	45 to 66 Hz	Unbalance
Balanced under voltage	Approx. - 40 %	A & C Function
	0 to - 20 %	B & D Function
Balanced over voltage	0 to + 20 %	C & D Function
Differential		
Unbalance	2 % of U_N	
Balanced	2 % of U_N	

PERFORMANCE PARAMETERS

TIMING	
Response time	Approx. 500 msec. with small variation
	Approx. 100 msec. with drop out
Time range during run	Separate On and Off delay
	0 - 10 sec. adjustable
Frequency unit	
Differential	Fixed approx. 10 % of tripping deviation.
Ref. deviation	± 0.5 %
Ref. temp. dependence	± 0.3 % (-20 to 80°C)
Response time	max 200 msec.
ELECTRICAL	
Unbalance sensitivity	5 to 25 %
Temp. dependence	Typ. ± 0.02 % / °C
Supply dependence	Typ. ± 0.01 % / % ΔU_N

* Unbalance is tested by varying one phase against neutral keeping the two other phases on nominal value against neutral.

OUTPUT Relay, 2 C/O

Contact rating	6 A, 250 VAC, 1500 W
Mechanical life	30 Million operations

SUPPLY AC/DC voltage from A1 & A2

AC supply range	110 V (From 80 to 138 V)
with transformer	230 V (From 176 to 288 V)
Standard voltage	400 V (From 304 to 498 V)
	460 V (From 352 to 576 V)
	24 to 480V can be specified
AC frequency range	45 to 440 Hz
Power consumption	4 VA, 2 W

GENERAL

Temperature range	- 25 °C to + 55 °C ambient	
Humidity	Up to 90 % RH non-condensing	
Dielectric test voltage	Coil to relay contacts	4000 VAC
	Pole to pole (45 mm.)	2500 VAC
	11-12-14 to 21-22-24	
Weight	0.22 kg

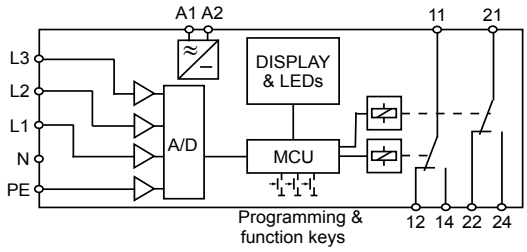
RMS VOLTAGE MONITORING RELAY

Type: PMSA

FEATURES

- **ALL IN ONE UNIT:**
  Multi Range from 50 to 830 Volt for use in Single-phase, Two-phase or Three-phase systems with or without Neutral and Ground
- **True RMS voltage measurement**
- * **Measures Neutral to Ground voltage and 3 x Phase to Phase or 3 x Phase to Neutral**
- **Over and Under voltage monitoring with individual relays or window function with 2 C/O contacts**
- **One Relay can be dedicated to the Neutral to Ground monitoring**
- **Easy set-up by keying in actual parameters or through a RS 232 interface**
- **Time delay - On and Off - can be set individually**
- **Latched Relay function can be selected**
- **LEDs indicate the status of the relay, latch, timing and display information**
- **Extremely compact and low power consumption**

FUNCTION DIAGRAM



Contact information:

Relay programmed to Type 1: If enabled. Neutral to Ground plus
Under voltage: 1 C/O, terminal 11-12-14
Over voltage: 1 C/O, terminal 21-22-24

Relay programmed to Type 2: If enabled. Neutral to ground plus
Voltage Window 2 C/O, terminal 11-12-14 , 21-22-24

Relay programmed to Type 3:
Under- or Over voltage or Window func.: 1 C/O, term. 11-12-14
Neutral to Ground voltage: 1 C/O, terminal 21-22-24

Description:
The RMS voltage monitoring relay PMSA is a universal 2, 3, 4 and 5 wire Multi-voltage unit that measures under as well as over voltages in star or delta configuration. The PMSA is designed to fulfill the demand for one unit for all applications in order to reduce overall costs. The PMSA is build with a strong MCU that can handle 40000 13 bit voltage samples/sec for a precise and true RMS conversion.
The two internal relays can be used for Phase and Neutral to Ground voltage measurements, or one relay can be used for Phase measurements and the other relay dedicated for Neutral to Ground measurement.

Operation:
Star connection:
1, 2 or 3 phase with Neutral and an optional Ground. The PMSA is measuring the voltage of each phase against Neutral, or in a 3 phase system an "Internal Neutral" made by a resistor star coupling. Phase to Neutral voltages are individually monitored for under as well as over voltage. Both voltages and differential can be set indvidually. If the Ground "PE" is connected PMSA can monitor the voltage between Neutral and PE and activate an alarm signal if it exceeds a preset limit.
Delta connection:
2 or 3 phase with an optional Neutral and Ground. The PMSA is measuring the voltage of each phase against the other phase(s). The phase to phase voltages are individually monitored for under as well as over voltage. Both voltages and the differential can be set individually. If the Neutral and Ground "PE" is connected PMSA can monitor the voltage between Neutral and PE and activate an alarm signal if it exceeds a preset limit.
General:
The PMSA has two relays working in fail-safe mode. They can be used for an individual over and under voltage alarm or in parallel where they are both pulled in if the phase voltages are within the set limits. If the voltages are within the limits the relays will pull in after the power-up and the on-delay period has elapsed. If a voltage come outside the set limits the relays drop out after the off-delay period has elapsed.
Latch function:
If the relays are set to Latch they will pull in immediately at power-up and remain in until the PMSA after the power-up delay measures a fault and the off-delay has elapsed. After dropping out they will remain out until the PMSA have been reset manually by pressing the S/R button on the unit or by turning off the power supply.

Application:
Generally where humans and equipment have to be protected against unexpected voltages caused by broken wires - especially the Neutral - or voltages that are not within acceptable limits for the connected equipment.

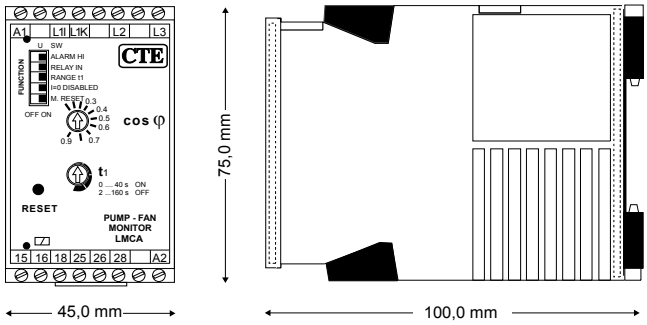
and if enabled from N to PE. If the Neutral is not connected an internal artificial Neutral will be used for the measurement N to PE



LOAD MONITOR

Power Factor cos φ

Type: LMCA

FEATURES

- **Fan monitoring (V-belt break)**
- **Filter monitoring (filter blockage)**
- **Protection for single and 3-phase lightly loaded motors.**
- **Current transformer may be connected for I_N > 10 A**
- **Suitable for frequency converter**
- **Voltage range: 1-phase 24-230 V, 3-phase 24 - 400 V**
- **Current range 0,5 - 10 A**

Description:
The load monitor determines the phase angle cos φ, which is the phase shift between current and voltage of asynchronous motors. The load monitor is directly connected to the motor and no additional sensors are required.

Because the phase angle depends on motor loading, it represents a directly measurable variable for the motor loading.

The set point cos φ reacts either to an excessive or insufficient freely selectable phase angle. After a set period of time, the relay R switches to failure position and the LED is switched on.

Application:
Load monitoring of pumps and fans and other lightly loaded motors.

Controling the input flow rate at which new material is fed into, for instance, a grinding gear based on the current load status.

Under load monitoring can recognize power transmission faults (for example, when a V-belt breaks) or flow interruptions to centrifugal pumps and radial fans.

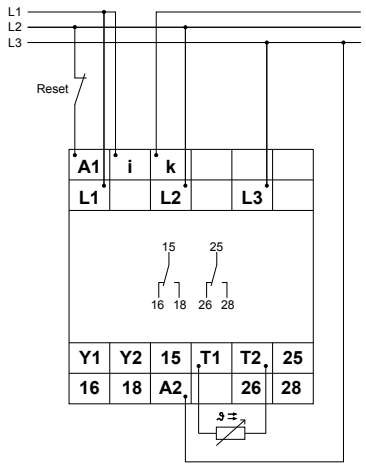
LOAD MONITOR
Real Power Watt
Type: LMWB

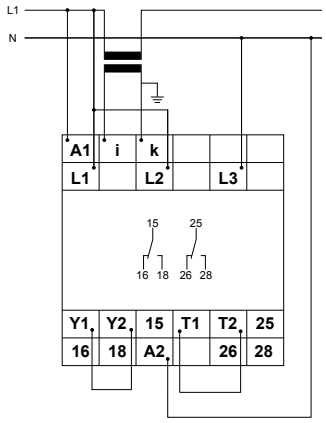
FEATURES

- **True power monitor for motors and other loads**
- **Temperature monitoring of motor windings**
- **Single and symmetric 3-Phase loads**
- **0,75kW, 1,5kW, 3kW and 6kW ranges w/o ext. CT**
- **Min. and max. monitoring with individual or parallel working relays or 2 max. or 2 min. thresholds with individual relays**
- **Adjustable start-up delay 1-100s**
- **Off delay 0,1-50s**
- **Recognition of disconnected load**
- **Reset Key**
- **Fault latch**
- **Supply voltages selectable via power modules**

CONNECTION DIAGRAM
Three-phase connection with temperature monitoring. I_N < 12A



Single-phase connection with current transformer and fault latch



DESCRIPTION:
The unit monitors the true power supplied to a single phase or a symmetrical 3-phase load up to 7,2 kW without using external current transformers. For a higher resolution the LMWB has 4 ranges. The overload current can be up to 6 or 12A continuously depending on range.

The LMWB has two adjustable set points that can be used for setting either one maximum and one minimum level or two individual min. or max. levels. The status of the load and each level is signalled by separate LED's and output relays.

When the load exceeds the set points an adjustable time delay controls the time from the fault is recognised until the relay drops out. During the delay time the LED related to the set point will indicate the condition by flashing until the relay reacts and the LED being permanently on.

The relays can be latched in their fault position by bridging the terminals Y1 and Y2. The LED's will be on during the time where the relays are latched independently of the actual load status. Releasing the latch can be done by interrupting the power supply or pressing the reset key.

The unit is equipped with a start-up delay in order to suppress error messages during machine start. The delay period starts when supply voltage is applied.

For a complete load protection the LMWB include a temperature monitor that can be used with the standard PTC resistors used in motor windings. The temperature monitor is overriding the load function on relay 2.

LOAD MONITOR
Real Power Watt
Type: LMWD

FEATURES

- **Real power monitoring**
- **23 to 6930 W without current transformer**
- **Voltage range: 3-phase 120 - 500 V, 1-phase 70 - 290 V**
- **Minimum and maximum monitoring or 2 switchable maximum thresholds**
- **Start-surge delay**
- **Switching delay**
- **Digital adjustment**
- **Analog output**

Description:
The unit monitors the load (active power) 1- and 3-phase motors or any 1 -phase or symmetric at 3-phase load. No additional sensors are required. 20 ranges for the load's-current up to 10 A are available. The motors impedance is corrected by CTE's unique compensation method to improve accuracy of measurement. Two setpoints can be adjusted for either one maximum and one minimum level or two distinct maximum levels. The status of each level is signalized by a separated output relay. Each setpoint is equipped with an individual adjustable time delay for the output of an error message. During timing between error and error message the associated status LED is flashing. Relay position and latch function of output relays is selectable by DIP-switch.

The unit is equipped with a start-up-delay (signalized by flashing of a green LED) post connection of auxiliary voltage to suppress error message during machine start.

Application:
Load monitoring for motors.

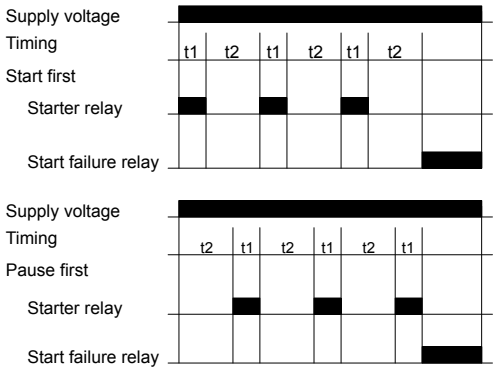
ENGINE STARTER RELAY

Type: ESPA

FEATURES

- **Extremely resistant to supply voltage drops**
- **Up to 15 programmable start attempts**
- **First timing period either start or pause**
- **Start and pause time are separatly adjustable**
- **Free contact for start failure**
- **LEDs indicate start, pause or start failure**
- **Small outlines**

FUNCTION DIAGRAM



Description:
The engine starter relay is designed for automatic start of petrol, gas or diesel engines. The relays are provided with a separate alarm contact for start failure.

Operation:
The starter relay is a cyclic timer with independently adjustable time periods t1 and t2 making one cycle. The output relay is energized through t1 and de-energized through t2.
If the relay is coded for start first the period t1 begins when the supply voltage is applied. This is followed by the periods t2, t1, t2 etc. The number of cycles is counted.
If the relay is coded for pause first the period t2 begins when the supply voltage is applied. This is followed by the periods t1, t2, t1 etc. The number of cycles is counted.
When the counter has counted to the precoded amount of cycles and the time for the last cycle is expired the relay drops out and the start failure relay pulls in. The start failure relay can be released and the counter reset by removing the power supply.

Application:
Automatic starting of engines driving generators, refrigerators and pumps.

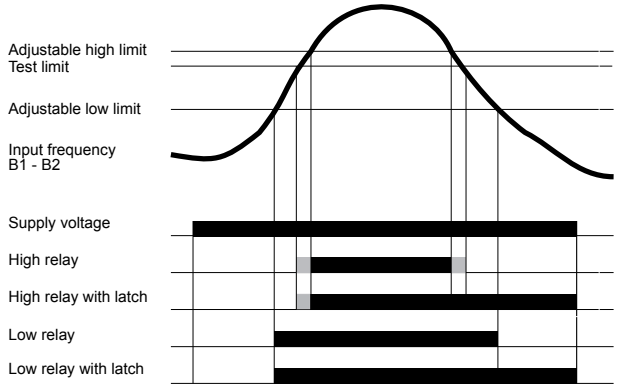
COMBINED STARTER INHIBIT & OVER-SPEED RELAYS

Type: FRAA for 12 V
Type: FRBA for 24 V

FEATURES

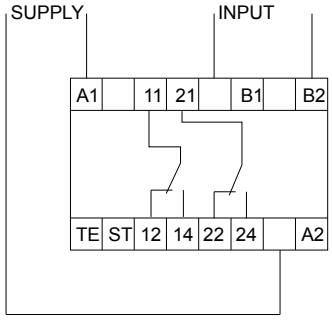
- **Extremely resistant to supply voltage drops**
- **Measurement of r.p.m. is based on frequency**
- **Both relays detect high frequency in less than 300 msec.**
- **The high range setting can be adjusted and tested at normal speed**
- **LEDs indicate the state of the input**

FUNCTION DIAGRAM



CONNECTION DIAGRAM

Rail mounting



Low range	11, 12, 14
High range	21, 22, 24

Description:
The starter inhibit & over-speed relay are designed for automatic start of petrol, gas or diesel engines and to prevent engine damage due to failure in the automatic speed control system.

The relays are very accurate monitoring the frequency from either a magnetic pick-up, a tacho generator or the main generator.

Operation:
When the supply voltage is applied, the LED corresponding to the input frequency (r.p.m.) is switched on. If the frequency (r.p.m.) exceeds the setting the relay pulls in with a time delay of max. 300 msec. When the frequency comes below the setpoint, the relay is de-energized with a delay of approximately 1.5 sec. If the latch function is specified , though, the relay remains energized. The latch function is released by removing the power supply.

Test function:
If the testfunction is included, the over-speed limit can be adjusted by connecting the terminals TE and ST and adjust the limit to normal speed. When the connection TE - ST is removed the r.p.m. setting will be increased with e.g. 10% again.
Standard test limits over normal speed are 10%, 15%, 20% or 25% of setting.

Application:
Automatic starters for engines in generator sets, refrigerators and pump units.

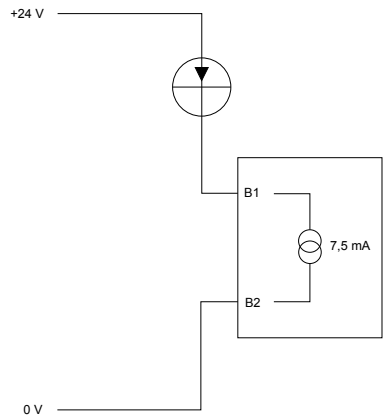
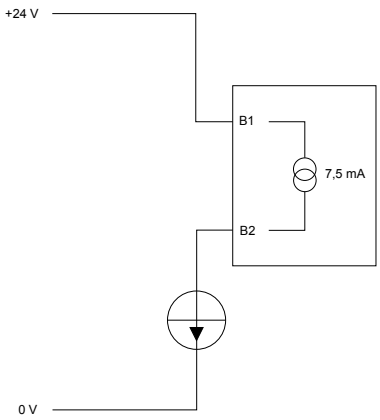
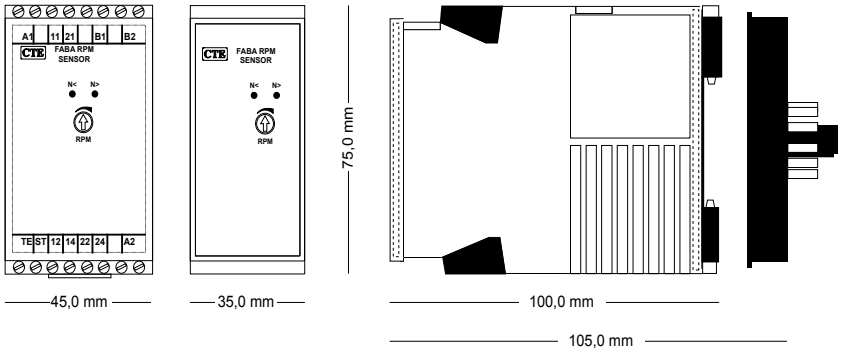
OPTOCOUPLER INPUT:







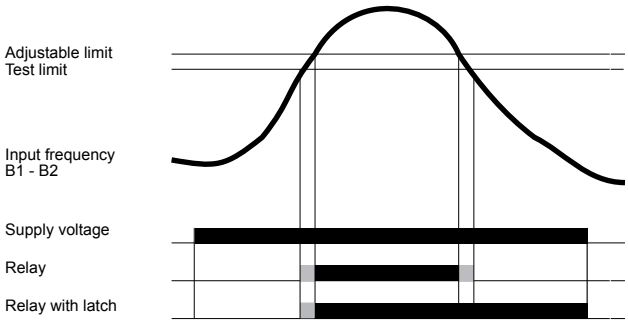
STARTER INHIBIT RELAY
Type: FAAA & FXAA

OVER-SPEED RELAY
Type: FABA & FXBA

FEATURES

* **Extremely resistant to supply voltage drops**
* **Insensitive to noise on input line**
* **Measurement of r.p.m. is based on frequency**
* **Detects over-speed in less than 300 msec.**
* **The over-speed setting can be adjusted and tested at normal speed**
* **Latch function can be specified**
* **LEDs indicate the state of the input**

FUNCTION DIAGRAM



Description:
The starter inhibit relays and the over-speed relays are designed to be used with petrol, gas or diesel engines. FAAA and FXAA are used to inhibit the starter as soon as the engine runs by itself. FABA and FXBA are used to prevent engine damage due to failure in the automatic speed control system.
The relays accurately monitor the frequency from either a magnetic pick-up, a tacho generator or the main generator.

Operation:
When the supply voltage is applied, the LED corresponding to the input frequency (r.p.m.) is switched on. If the frequency (r.p.m.) exceeds the setpoint, the relay pulls in with a time delay of max. 300 msec. At lowest frequency setting.
When the frequency comes below the set point, the relay is de-energized with a delay of approximately 1.5 sec. However if the latch function is specified, the relay remains energized. The latch function is released by disconnecting the power supply.
o
Test function:
If the test function is included then the over-speed limit can be adjusted by connecting the terminals TE and ST and setting the limit to normal speed. When the connection TE - ST is removed the r.p.m. setting will be increased by e.g. 10 % again.
Standard test limits over normal speed are 10%, 15%, 20% or 25%.

Application:
Automatic starters for engines in generator sets, refrigerators and pump units.

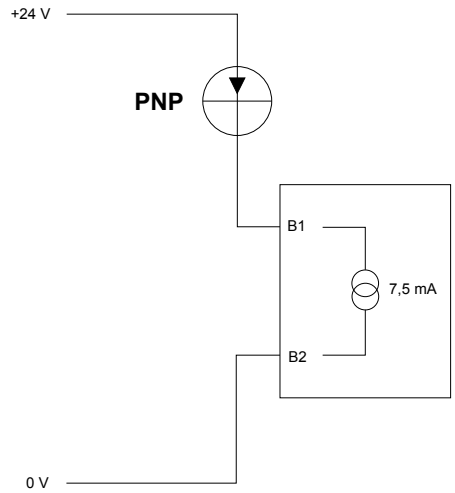
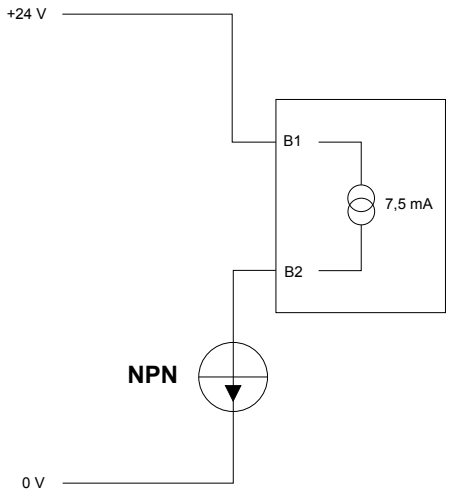
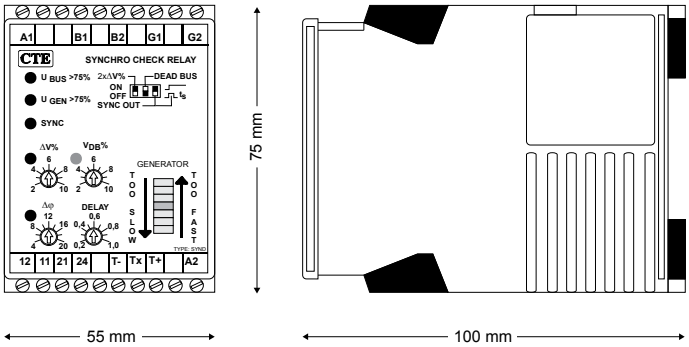
OPTOCOUPLER INPUT:







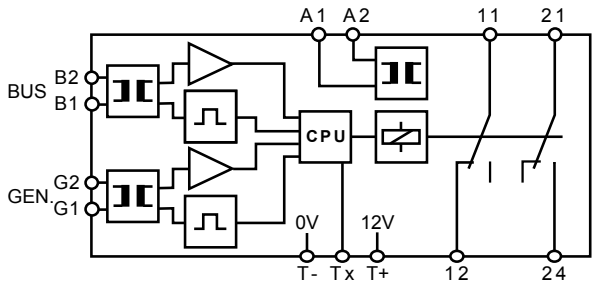
SYNCHRO CHECK RELAY

Type: SYND

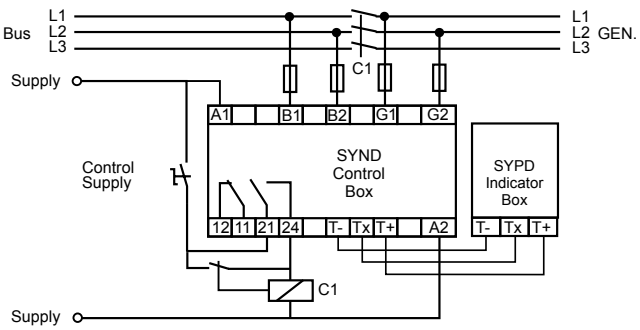
FEATURES

- **Multi function check relay**
- **Extremely compact**
- **Rail mounting for easy cabling on the baseplate**
- **Three wire interface to an optional panel indicator**
- **Microcontroller and SMD - technic for accurate and reliable function.**
- **LED indication of bus and generator status**

FUNCTION DIAGRAM



CONNECTION DIAGRAM



Description:
The synchro check relay type SYND is a multifunction unit that can be set to both constant or pulse output as well as to enable or disable synchronization to a “dead bus”. The unit is designed with a micro controller to monitor the bus and the generator voltage, as well as the phase differential between two grids.

The SYND ensure the right conditions before the connection of the generator to the bus, in order to avoid damage to the generator and malfunction or damage to the connected equipment.

The unit is specially designed for DIN rail mounting on the base of the control box for an easy connection to the two bus systems.

For a front panel indication of the function, the SYND can be connected through a simple three wire digital interface to the optional panel indicator type SYPD.

Operation:
Dead Bus OFF: When the voltage on the Mains Bus, L1 - L2, and the Generator Bus, L1 - L2, both are above 75% of the nominal value, the SYND will monitor the voltage difference $\Delta V\%$. As soon as ΔV is below the set limit, the SYND will start monitoring the phase difference $\Delta\varphi$. If the phase difference $\Delta\varphi$ is continuously below the set limit during the elapse of the set delay time t_d and the voltages still within the limits, the internal relay will pull in for 100 m sec. if pulse output is selected, or stay in as long as the conditions are within the limits for synchronisation.

Dead Bus ON: *Be careful when this function is selected. Personal injury can occur if the bus is disconnected for maintenance. Too the load of the generator can be excessive*. When the Mains Bus voltage is detected to be under the Dead Bus $V_{DB}\%$ set limit V the Mains Bus is defined to be dead and the internal relay will pull in if the Generator voltage is above 75% of nominal value. The relay will drop out or stay in according to the function setting on the SYPD as described above.

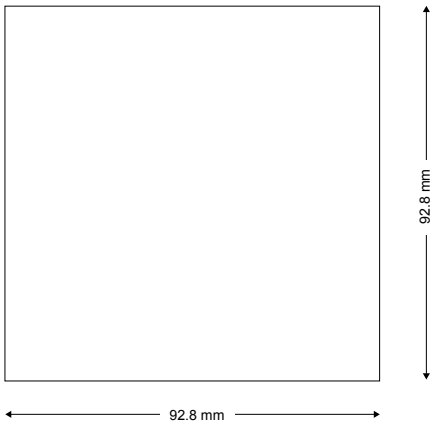
PANEL INDICATOR FOR SYNCHRO CHECK RELAY

Type: SYPD

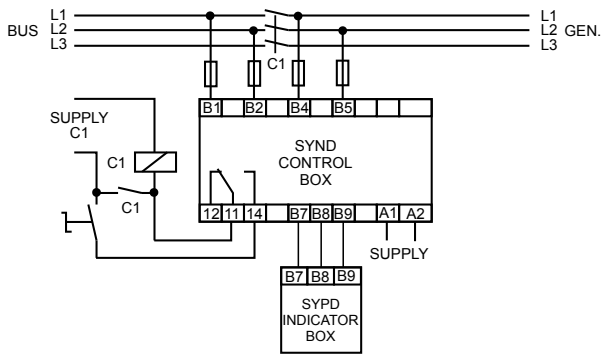
FEATURES

- **Remote indication**
- **Easy three wire connection**
- **No connection to high voltage**
- **Optional IP65 cover**

PANEL HOLE



CONNECTION DIAGRAM



Description:
The indicator type SYPD, is designed to give a remote visual indication of the status of two generators or a generator and the mains as registered by the Synchro Check Relay type SYND. For an easy installation, the SYPD is using a three wire serial interface to the SYND. Mechanically, the SYPD is delivered in a standard DIN case 96 x 96 mm. IP65 can be achieved by use of a silicon rubber cover.

Operation:
The SYPD displays U_{bus}>75% or a Dead Bus, U_{gen}>75%, ΔV<limit and Δφ<limit. The green LEDs are ON when the corresponding values are within the tolerances. When the synchronisation is achieved, the Sync LED, displaying the status of the relay in the SYND, gives a short blink or stays ON, depending on the selected function of the SYND. The difference in frequencies, between the two bus systems, is indicated by a running light on the circular LEDs at the scale centre. The larger the difference in frequency - the higher the velocity of the running light. One revolution per sec. corresponds to one Hz difference. The direction of the running light depends on whether the generator is too fast or too slow to cut in.

Application:
Front panel indication of the status of the two bus systems and the function of the Synchro Check Relay SYND.

Specification:

Box and frame	Dimensions as per DIN43700 and DIN 43718 IP52 (IP65) according to IEC 144 and DIN 40050 Heat resistant ABS Self extinguishing as per UL 94 Glass or Macrolon front

ISOLATION AMPLIFIER

Type: AISA

FEATURES

- **Galvanic separation > 4kV**
- **8 programmable input ranges**
- **8 programmable output ranges**
- **Excellent linearity**
- **Small outlines**

Description:
The isolation amplifier is buildt with a linear optocoupler. It is designed for galvanic separation and conversion between different standards of analog input and output signals. Linearized optic transmission is used to achieve high accuracy.

Application:
To interface between different kinds of analog sensors and receiving instruments, such as indicators, recorders, alarm units and PLCs.

- **8 programmable output ranges**
- **Excellent linearity**
- **Small outline**

Description:
The mV transmitter is designed to convert low level noise sensitive signals into high level signals and improve the noise immunity by adding a galvanic separation.
AISB is build with a linearized optic transmission for high accuracy.
The mV transmitter is a version of the isolation amplifier.

Application:
The mV transmitter is designed for the transmission of signals from distant sensors to the control room or for interface between sensor and PC or PLC. Sensors can be of any kind like: Shunt, measuring bridges or used in weight cells or in temperature units.

ISOLATION AMPLIFIER

Type: UISA and UISB

FEATURES

- **Galvanic separation > 4kV**
- **16 programmable input ranges**
- **8 programmable output ranges**
- **Excellent accuracy and linearity**

Description:
The isolation amplifier UISA is developed to meet high demands for accuracy, quality and flexibility. With 16 selectable DC voltage inputs and 8 selectable standard outputs, it covers a broad range of applications. As an option, the units can be supplied with adjustable gain and offset. The gain adjustment can be set to expand 10% of the input range to the full output range, and the offset can offset the range up to ± 100%. By using the full offset an increasing signal on the input, can be converted to a decreasing signal on the output. UISB is a reduced version with 4 to 20 mA output only.

Operation:
By means of a high performance linearized optic transmission (class. 0.2), the input and the output is galvanic separated with an isolation voltage of more than 4kVac. The UISA and UISB is designed to be used with a range of dc and ac supply voltages, that all include galvanic isolation of more than 4kVac from the supply to both the Input and the output circuitry.

Application:
To interface and monitor DC voltages and convert the actual voltage to a standard signal being used as an input to a PC, a PLC or any other electronic device for control or alarm purpose.

VOLTAGE CONVERTER AND LOOP ISOLATOR

Type: UIDA

FEATURES

- **Loop powered isolator**
- **Input 4,8 - 24V and 6 - 30V**
- **Prevents interference from electrostatic fields and ground loops**
- **Working voltage up to 1000 V_{RMS}**
- **Transient overvoltage up to 8000 V_{peak}**
- **Excellent linearity**
- **Small outlines, 17,5 mm. wide**

Description:
The loop isolator is designed to convert a voltage signal on the input into a 4 - 20mA current output. The use of a galvanic separation between the input and the output prevents signal distortion and instrumentation damages due to electrical noise, voltage spikes and ground loop currents. The UIDA does not need an external supply, as the input is powered from the voltage source and the output is powered from the loop. The insulation is based on a high performance linear optocoupler with an excellent linearity and a low coupling capacitance.

Application:
For use in instrumentation with current loop I/O as used by PLCs, sensors, recorders, indicators, alarm units etc.

TRIPLE LOOP ISOLATOR

Type: AITA

FEATURES

- **3 Loop isolators 4 - 20 mA in one unit**
- **Prevent lightning from spreading over the system**
- **Working voltage max.: 1000 V_{RMS}**
- **Transient overvoltage max.: 8000 V_{peak}**
- **Excellent linearity**
- **Small outlines, 35 mm. wide**

Description:
The loop isolator is designed to separate a 4 - 20 mA loop into two galvanically separated 4-20 mA loops in order to prevent signal distortion and instrumentation damages due to electrical noise or voltage spikes and ground loop currents.
The insulation is based on a high performance linear optocoupler with an excellent linearity and a low coupling capacitance.

Application:
For use in instrumentation with current loop I/O as used by PLCs, sensors, recorders, indicators, alarm units etc.

PT100 TEMPERATURE TRANSMITTER

Type: TAMA & TAMB

FEATURES:

- **74 programmable input ranges**
- **6 programmable output ranges**
- **Excellent linearity < 0.2%**
- **Build-in relay with adjustable limit (only in type TAMB)**
- **LED indicates the state of the relay (only in type TAMB)**
- **Small outlines**

Description:
The measuring transducers type TAMA and TAMB are used for measuring the temperature with a PT100 sensor according to DIN IEC 751.

Application:
Monitoring temperatures in: motors, generators, heaters, air-condition systems, chemical processes and machine parts. The transducer is especially well suited for pre-amplification and range setting in front of instrumentation, PLCs, PC and microprocessor control systems.

Temperature and Span setting

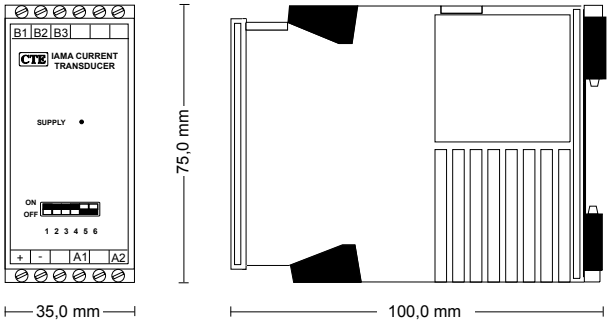
The starting temperature of the measurement interval can be defined from -375°C to +375°C in steps of 25°C.

The temperature span can be defined from 25°C to 400°C .

Examples

From -25°C to +75°C.
- Dipswitch 1 and 2 are set to -OFFSET.
- Dipswitch 6 is set to ON.
- Span is set to 100°C.
- Output is chosen according to requirement.

From +0°C to +400°C.
- Dipswitch 1 and 2 are set to +OFFSET.
- Dipswitch 3-6 is set to OFF.
- Span is set to 400°C.
- Output is chosen according to requirement.



CURRENT AND VOLTAGE TRANSDUCERS

Type: IAMA, UAMA
IAMB, UAMB

FEATURES

- **Standard dual range. Current: 1A and 5A or Voltage: 250V and 500V**
- **All ranges class 0.5 according to EN60688. Class 0.2 on request**
- **8 outputs available on IAMA and UAMA**
- **Isolation > 4kV. Input, output and supply.**
- **All standard AC voltages for power supply. Combined AC and DC supply as option**
- **Version with plug-in supply modules for easy stocking**

Description:
The transducers type IAMA for current and UAMA for voltage are developed to meet high demands for quality and by offering 8 selectable outputs it covers a broad range of applications. IAMB and UAMB are reduced versions with 4 to 20mA output only.

Operation:
The input current or voltage is, by means of a high-grade transformer (class. 0.2) with an isolation voltage of more than 4kV, galvanic isolated from the transducer circuitry and the output. After the transformer the measured signal is rectified, averaged and corresponding to the DIP-switch settings, converted to the required current or voltage output signal.

Application:
PLC, PC and microprocessor controlled Instrumentation.

FREQUENCY MEASURING TRANSDUCER

Type: FAMA

FEATURES

- **High input resistance**
- **Low response time**
- **Excellent linearity**
- **All ranges class 0.5 according to EN60688.**
- **8 outputs available**
- **Isolation > 4kV. Input, output and supply.**
- **All standard AC voltages for power supply. Optional combined AC and DC supply.**

Description:
The transducer type FAMA is used to measure the frequency of an input voltage. The output is a load independent DC voltage or current signal. The input can be connected directly or via transformers.

Operation:
The input voltage is transformed to a suitable signal level. At each zero-crossing the input creates a rectangular pulse with a constant height and width. The pulse train, with a frequency proportional to that of the input voltage, is filtered and in amplifier converted to a load independent DC output. The input voltage can also be used as supply voltage. The supply voltage is galvanically separated by the plug-in transformer.

Applications:
Instrumentation, PLCs, PC and microprocessor control systems .

SPECIFICATIONS

INPUT FAMA AC voltage
- Nominal input V_N — Specify from 10 to 600 V
- Max. continuous input — $40\sqrt{U_N}$ V rms. 10 V < U_N < 300 V; 720 V rms. U_N > 300 V
- Input resistance — approx. 2 KΩ / V
- AC frequency range — 0 to 5000 Hz

PERFORMANCE PARAMETERS
- TIMING
- Response time — < 200 msec. 0-90% or 100-10%
- ELECTRICAL
- Precision — Class 0.5
- Linearity — < 0.2 %
- Supply dependence — < ± 0.01 % / % DU supply
- Temp. dependence — < ± 0.01 % / °C
- Ripple — < 1 % pp

OUTPUT

The output amplifier is protected against open and short circuit.

SUPPLY
- AC and DC with isolated switchmode supply — 18-360 VDC and 20-264 VAC
- AC supply range with transformer — 24 V (From 20 to 28 V); 110 V (From 99 to 140 V); 230 V (From 198 to 264 V); 400 V (From 342 to 484 V)
- Frequency range — 45 to 440 Hz (transformer)
- Power consumption — 2.5 VA, 1.1 W
- Frequency range — 45 to 440 Hz
- Power consumption — 2.5 VA, 1.5 W
- PLUG-IN supply module — According to specifications

GENERAL
- Temperature range — - 25 °C to + 55 °C
- Humidity — Up to 90 % RH non-condensing
- Dielectric test voltage — Input to output 4000 VAC; Input to supply (internal) 4000 VAC; Output to supply (internal) 4000 VAC
- Weight — 0.20 kg with internal supply

CE

International Standards
- EMC directive 89/336: EN50081 - Emission; EN50082 - Immunity
- Low voltage directive 73/23: EN60255 - Electrical Relays; EN60688 - Measuring transducers

ORDERING INFORMATION

EXAMPLE: FAMA 450 1 550 1 400 2 B 230 D A 3 C

TYPE
- Frequency measuring transducer — FAMA

FREQUENCY RANGE

Lower level
- The first three figures of the frequency in Hz, e.g. 45.0 Hz — xxx

Followed by:
- 0 for Hz = 1.00 to 9.99 — 0
- 1 for Hz = 10.0 to 99.9 — 1
- 2 for Hz = 100 to 999 — 2

High level
- The first three figures of the frequency in Hz, e.g. 55.0 Hz — xxx

Followed by:
- 0 for Hz = 1.00 to 9.99 — 0
- 1 for Hz = 10.0 to 99.9 — 1
- 2 for Hz = 100 to 999 — 2

VOLTAGE RANGE
- The first three figures of the voltage in Volt, e.g. 400 V — 400

Followed by:
- 1 for V = 10.0 to 99.9 — 1
- 2 for V = 100 to 999 — 2

SUPPLY VOLTAGE
- 18-360 VDC and 20-264VAC — E400
- 20-28VAC — B024
- 99-140VAC — B110
- 198-264VAC — B230
- 342-484VAC — B400
- 352-576VAC — B460

OUTPUT
- Programmable with dipswitch — D

0 - 10 mA, 2 - 10 mA,
0 - 20 mA, 4 - 20 mA,
0 - 5 V, 1 - 5V
0 - 10 V, 2 - 10 V

HOUSING

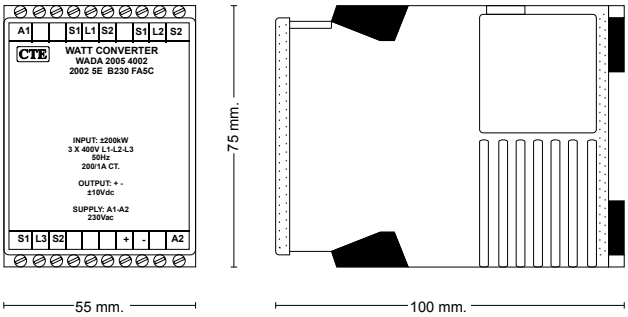
- Extended code — E



MEASURING TRANSDUCER MODULE

Type: WAxA (Watt) - Active power
Type: WRxA (VAr) - Reactive power

FEATURES

- **Small outlines**
- **High input sensitivity**
- **Low response time**
- **Excellent linearity**
- **19 outputs available**
- **According to EN60688**

Description:
The input transformers for voltage and current separate the inputs galvanically from the converter. The signals are amplified to suitable levels and led to the multiplier. The multiplication is made by changing the voltage signal to a pulse-width modulated square wave, and the current to a voltage signal representing the amplitude of the current, thus giving a pulse area equal to the actual momentary power. Using a high frequency for the square pulses ensures an accurate measurement even with a high level of signal distortion (higher harmonics). The signal from the multiplier passes an active filter and an output circuit to ensure a low ripple and stable output signal. Output signals are short-circuit and open-circuit protected.
