

Single channel high-side driver with analog current sense for automotive applications

Datasheet – production data

Features

| | | |
|-----------------------------------|-------------------|---------------------|
| Max transient supply voltage | V _{CC} | 41 V |
| Operating voltage range | V _{CC} | 4.5 to 28 V |
| Max on-state resistance (per ch.) | R _{ON} | 6 mΩ |
| Current limitation (typ) | I _{LIMH} | 90 A |
| Off-state supply current | I _S | 2 µA ⁽¹⁾ |

1. Typical value with all loads connected.

■ General

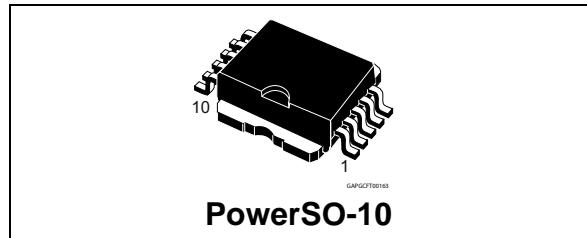

- Very low standby current
- 3.0 V CMOS compatible inputs
- Optimized electromagnetic emissions
- Very low electromagnetic susceptibility
- Compliance with European directive 2002/95/EC
- Very low current sense leakage

■ Diagnostic functions

- Proportional load current sense
- High current sense precision for wide currents range
- Diagnostic enable pin
- Off-state open-load detection
- Output short to V_{CC} detection
- Overload and short to ground (power limitation) indication
- Thermal shutdown indication

■ Protection

- Inrush current active management by power limitation
- Undervoltage shutdown
- Overvoltage clamp
- Load current limitation
- Self limiting of fast thermal transients
- Protection against loss of ground and loss of V_{CC}
- Overtemperature shutdown with auto restart (thermal shutdown)

PowerSO-10

- Reverse battery protected with self switch of the Power MOSFET
- Electrostatic discharge protection

Applications

- All types of resistive, inductive and capacitive loads

Description

The VN5E006ASP-E is a single channel high-side driver manufactured using ST proprietary VIPower® M0-5 technology and housed in PowerSO-10 package. The device is designed to drive 12 V automotive grounded loads delivering protection, diagnostics. It also implements a 3 V and 5 V CMOS-compatible interface for use with any microcontroller.

The device integrates advanced protective functions such as load current limitation, inrush and overload active management by power limitation, overtemperature shut-off with auto-restart and overvoltage active clamp. A dedicated analog current sense pin is associated with every output channel providing enhanced diagnostic functions including fast detection of overload and short-circuit to ground through power limitation indication, over-temperature indication, short-circuit to V_{CC} diagnosis and on-state and off-state open-load detection. The current sensing and diagnostic feedback of the whole device can be disabled by pulling the DE pin low to share the external sense resistor with similar devices.

Table 1. Pin function

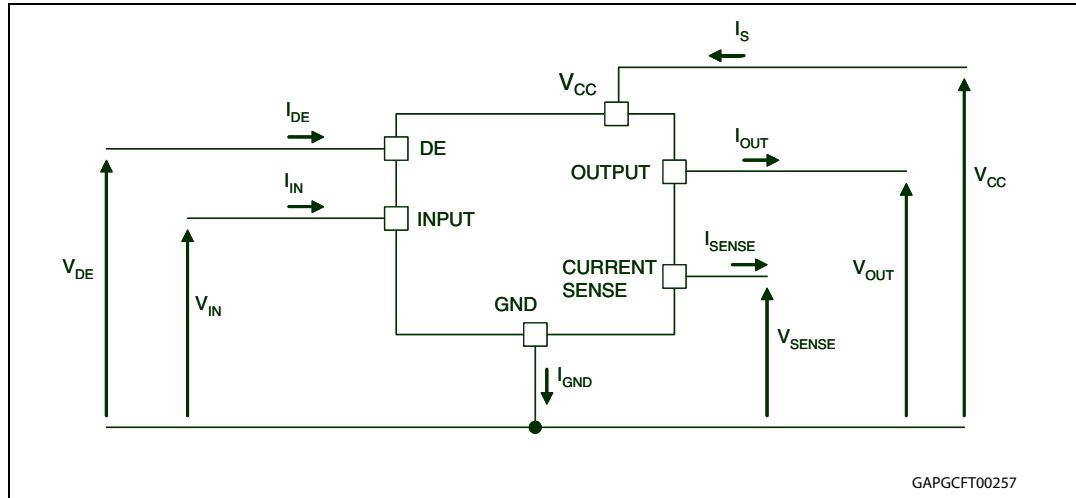

| Name | Function |
|-----------------|--|
| V _{CC} | Battery connection. |
| OUTPUT | Power output. |
| GND | Ground connection. |
| INPUT | Voltage controlled input pin with hysteresis, CMOS compatible. Controls output switch state. |
| CURRENT SENSE | Analog current sense pin, delivers a current proportional to the load current. |
| DE | Active high diagnostic enable pin. |

Figure 2. Configuration diagram (top view)**Table 2. Suggested connections for unused and not connected pins**

| Connection / pin | Current sense | N.C. | Output | Input | DE |
|------------------|----------------------|------|-------------|-----------------------|-----------------------|
| Floating | Not allowed | X | X | X | X |
| To ground | Through 1KΩ resistor | X | Not allowed | Through 10KΩ resistor | Through 10KΩ resistor |

2 Electrical specifications

Figure 3. Current and voltage conventions

2.1 Absolute maximum ratings

Stressing the device above the ratings listed in the “Absolute maximum ratings” tables may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not implied. Exposure to the conditions in this section for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality documents.

Table 3. Absolute maximum ratings

| Symbol | Parameter | Value | Unit |
|---------------------|--|---|------|
| V _{CC} | DC supply voltage | 28 | V |
| V _{CCPK} | Transient supply voltage ($T < 400$ ms, $R_{LOAD} > 0.5 \Omega$) | 41 | V |
| -V _{CC} | Reverse DC supply voltage | 16 | V |
| I _{OUT} | DC output current | Internally limited | A |
| -I _{OUT} | Reverse DC output current | 60 | A |
| I _{IN} | DC input current | -1 to 10 | mA |
| I _{DE} | DC diagnostic enable input current | -1 to 10 | mA |
| V _{CSENSE} | Current sense maximum voltage | V _{CC} -41 +V _{CC} | V |
| E _{MAX} | Maximum switching energy (single pulse) ($L = 1.4$ mH; $R_L = 0 \Omega$; $V_{bat} = 13.5$ V; $T_{jstart} = 150$ °C; $I_{OUT} = I_{limL}(Typ.)$) | 600 | mJ |
| V _{ESD} | Electrostatic discharge (Human Body Model: $R = 1.5$ kΩ; $C = 100$ pF) | 2000 | V |

Table 3. Absolute maximum ratings (continued)

| Symbol | Parameter | Value | Unit |
|-----------|--|------------|------|
| V_{ESD} | Charge device model (CDM-AEC-Q100-011) | 750 | V |
| T_j | Junction operating temperature | -40 to 150 | °C |
| T_{STG} | Storage temperature | -55 to 150 | °C |

2.2 Thermal data

Table 4. Thermal data

| Symbol | Parameter | Maximum value | Unit |
|----------------|---|--|------|
| $R_{thj-case}$ | Thermal resistance junction-case (one channel ON) | 0.45 | °C/W |
| $R_{thj-amb}$ | Thermal resistance junction-ambient | See Figure 36 in the thermal section | °C/W |

2.3 Electrical characteristics

$8 \text{ V} < V_{CC} < 28 \text{ V}$; $-40^\circ\text{C} < T_j < 150^\circ\text{C}$, unless otherwise specified.

Table 5. Power section

| Symbol | Parameter | Test conditions | Min | Typ | Max | Unit |
|---------------|---|--|-----|-------------------|-------------------|------------------|
| V_{CC} | Operating supply voltage | | 4.5 | 13 | 28 | V |

| $V_{DE(\text{hyst})}$ | DE hysteresis voltage | | 0.25 | | | V |
| V_{DECL} | DE clamp voltage | $I_{DE} = 1 \text{ mA}$ | 5.5 | | 7 | V |
| | | $I_{DE} = -1 \text{ mA}$ | | -0.7 | | |

Table 8. Protections and diagnostic⁽¹⁾

| Symbol | Parameter | Test conditions | Min. | Typ. | Max. | Unit |
|-------------|--|--|--------------|--------------|-------------|------|
| I_{limH} | Short circuit current | $V_{CC} = 13 \text{ V}$ | 63.5 | 90 | 127 | A |
| | | $5 \text{ V} < V_{CC} < 24 \text{ V}$ | | | 127 | |
| I_{limL} | Short circuit current during thermal cycling | $V_{CC} = 13 \text{ V}; T_R < T_j < T_{TSD}$ | | 25 | | A |
| T_{TSD} | Shutdown temperature | | 150 | 175 | 200 | °C |
| T_R | Reset temperature | | $T_{RS} + 1$ | $T_{RS} + 5$ | | °C |
| T_{RS} | Thermal reset of status | | 135 | | | °C |
| T_{HYST} | Thermal hysteresis ($T_{TSD} - T_R$) | | | 7 | | °C |
| V_{DEMAG} | Turn-off output voltage clamp | $I_{OUT} = 2 \text{ A}; V_{IN} = 0; L = 6 \text{ mH}$ | V_{CC-28} | V_{CC-31} | V_{CC-35} | V |
| V_{ON} | Output voltage drop limitation | $I_{OUT} = 1.2 \text{ A}; T_j = -40 \text{ °C...}150 \text{ °C}$ (see Figure 8 .) | | 25 | | mV |

- To ensure long term reliability under heavy overload or short circuit conditions, protection and related diagnostic signals must be used together with a proper software strategy. If the device is subjected to abnormal conditions, this software must limit the duration and number of activation cycles.

Table 9. Current sense ($8 \text{ V} < V_{CC} < 18 \text{ V}$)

| Symbol | Parameter | Test conditions | Min | Typ | Max | Unit |

Table 11. Truth table

| Conditions | Enable | Input | Output | Sense ($V_{DE} = 5\text{ V}$) ⁽¹⁾ |
|---|--------|-------|-------------------------------|---|
| Normal operation | H | L | L | 0 |
| | H | H | H | Nominal |
| Overtemperature | H | L | L | 0 |
| | H | H | L | V_{SENSEH} |
| Undervoltage | H | L | L | 0 |
| | H | H | L | 0 |
| Overload | H | H | X (no power limitation) | Nominal |
| | H | H | Cycling (power limitation) | V_{SENSEH} |
| Short circuit to GND (Power limitation) | H | L | L | 0 |
| | H | H | L | V_{SENSEH} |
| Open load OFF State (with external pull up) | H | L | H | V_{SENSEH} |
| Short circuit to V_{CC} (external pull up disconnected) | H | L | H | V_{SENSEH} |
| | H | H | H | < Nominal |
| Negative output voltage clamp | H | L | L | 0 |

1. If the V_{DE} is low, the SENSE output is at a high impedance, its potential depends on leakage currents and external circuit.

Table 12. Electrical transient requirements (part 1)

| ISO 7637-2: 2004(E) Test Pulse | Test levels ⁽¹⁾ | | Number of pulses or test times | Burst cycle/pulse repetition time | | Delays and impedance |
|--------------------------------------|----------------------------|--------|--------------------------------------|--------------------------------------|--------|-------------------------|
| | III | IV | | | | |
| 1 | -75 V | -100 V | 5000 pulses | 0.5 s | 5 s | 2 ms, 10 Ω |
| 2a | +37 V | +50 V | 5000 pulses | 0.2 s | 5 s | 50 μs, 2 Ω |
| 3a | -100 V | -150 V | 1h | 90 ms | 100 ms | 0.1 μs, 50 Ω |
| 3b | +75 V | +100 V | 1h | 90 ms | 100 ms | 0.1 μs, 50 Ω |
| 4 | -6 V | -7 V | 1 pulse | | | 100 ms, 0.01 Ω |
| 5b ⁽²⁾ | +65 V | +87 V | 1 pulse | | | 400 ms, 2 Ω |

1. The above test levels must be considered referred to $V_{CC} = 13.5V$ except for pulse 5b.

2. Valid in case of external load dump clamp: 40V maximum referred to ground.

Table 13. Electrical transient requirements (part 2)

| ISO 7637-2: 2004(E) test pulse | Test level results ⁽¹⁾ | |
|--------------------------------------|-----------------------------------|----|
| | III | IV |
| 1 | C | C |

3 Application information

Figure 32. Application schematic

3.1 MCU I/Os protection

When negative transients are present on the V_{CC} line, the control pins are pulled negative to approximately -1.5V.

ST suggests the insertion of resistors (R_{prot}) in the lines to prevent the microcontroller I/O pins from latching up.

The values of these resistors provide a compromise between the leakage current of the microcontroller, the current required by the HSD I/Os (input levels compatibility) and the latch-up limit of the microcontroller I/Os.

$$-V_{CCpeak}/I_{latchup} \leq R_{prot} \leq (V_{O\mu C} - V_{IH}) / I_{IHmax}$$

Calculation example:

For V_{CCpeak} = -1.5 V and I_{latchup} ≥ 20 mA; V_{O\mu C} ≥ 4.5 V

$$75 \Omega \leq R_{prot} \leq 240 \text{ k}\Omega$$

Recommended values: R_{prot} = 10 kΩ, C_{EXT} = 10 nF

3.2 Load dump protection

D_{Id} is necessary (voltage transient suppressor) if the load dump peak voltage exceeds the V_{CCPK} max rating. The same applies if the device is subject to transients on the V_{CC} line that are greater than the ones shown in the ISO 7637-2: 2004(E) table.

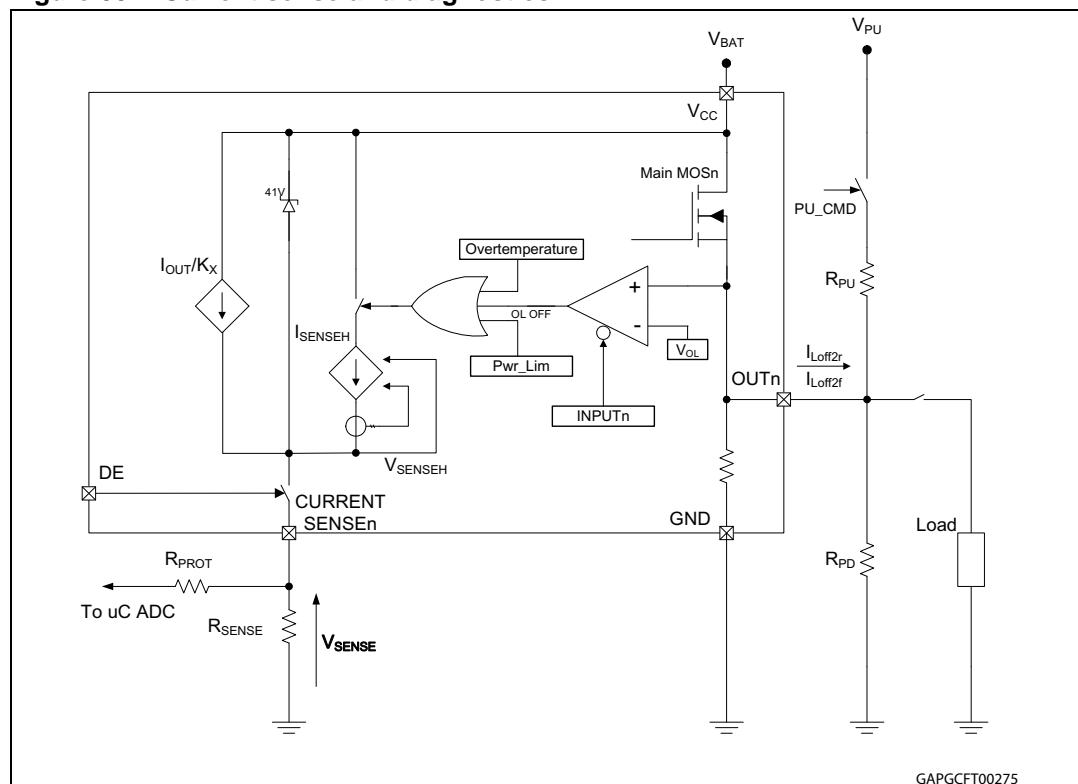

3.3 Current sense and diagnostic

The current sense pin performs a double function (see [Figure 33: Current sense and diagnostics](#)):

- **Current mirror of the load current in normal operation**, delivering a current proportional to the load one according to a known ratio K_X .
The current I_{SENSE} can be easily converted to a voltage V_{SENSE} by means of an external resistor R_{SENSE} . Linearity between I_{OUT} and V_{SENSE} is ensured up to 5V minimum (see parameter V_{SENSE} in *Table 9: Current sense (8 V < V_{CC} < 18 V)*). The current sense accuracy depends on the output current (refer to current sense electrical characteristics *Table 9: Current sense (8 V < V_{CC} < 18 V)*).
 - **Diagnostic flag in fault conditions**, delivering a fixed voltage V_{SENSEH} up to a maximum current I_{SENSEH} in case of the following fault conditions (refer to *Truth table*):
 - Power limitation activation
 - Overtemperature
 - Short to V_{CC} in OFF-state
 - Open-load in OFF-state with additional external components.

A logic level low on DE pin sets at the same time all the current sense pins of the device in a high impedance state, thus disabling the current monitoring and diagnostic detection. This feature allows multiplexing of the microcontroller analog inputs by sharing of sense resistance and ADC line among different devices.

Figure 33. Current sense and diagnostics

3.3.1 Short to V_{CC} and off-state open-load detection

Short to V_{CC}

A short circuit between V_{CC} and output is indicated by the relevant current sense pin set to V_{SENSEH} during the device off state. Small or no current is delivered by the current sense during the on state depending on the nature of the short circuit.

OFF-state open-load with external circuitry

Detection of an open-load in off mode requires an external pull-up resistor R_{PU} connecting the output to a positive supply voltage V_{PU}.

It is preferable V_{PU} to be switched off during the module standby mode in order to avoid the overall standby current consumption to increase in normal conditions, i.e. when load is connected.

An external pull down resistor R_{PD} connected between output and GND is mandatory to avoid misdetection in case of floating outputs in off-state (see [Figure 33: Current sense and diagnostics](#)).

R_{PD} must be selected in order to ensure V_{OUT} < V_{OLmin} unless pulled up by the external circuitry:

$$V_{OUT}|_{\text{Pull-up_OFF}} = R_{PD} \cdot I_{L(\text{off2})f} < V_{OLmin} = 2V$$

R_{PD} ≤ 22 KΩ is recommended.

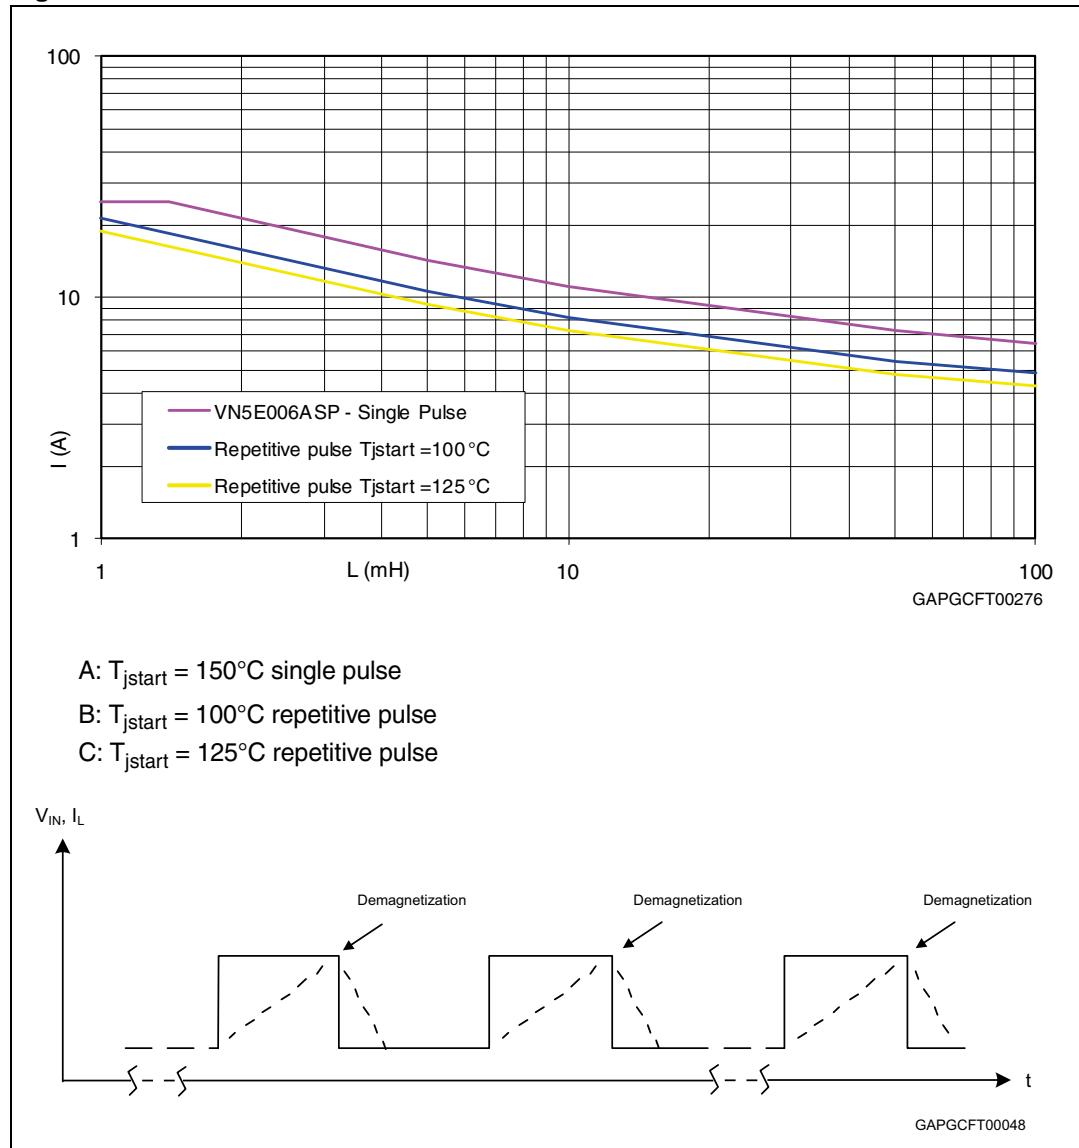

For proper open load detection in off state, the external pull-up resistor must be selected according to the following formula:

$$V_{OUT}|_{\text{Pull-up_ON}} = \frac{R_{PD} \cdot V_{PU} - R_{PU} \cdot R_{PD} \cdot I_{L(\text{off2})r}}{R_{PU} + R_{PD}} > V_{OLmax} = 4V$$

For the values of V_{OLmin}, V_{OLmax}, I_{L(Off2)r} and I_{L(Off2)f} see [Table 10: Open-load detection \(8 V < V_{CC} < 18 V, V_{DE} = 5 V\)](#).

3.4 Maximum demagnetization energy ($V_{CC} = 13.5$ V)

Figure 34. Maximum turn-off current versus inductance

Note:

Values are generated with $R_L = 0 \Omega$.

In case of repetitive pulses, T_{jstart} (at beginning of each demagnetization) of every pulse must not exceed the temperature specified above for curves A and B.

4 Package and PCB thermal data
