

## Quad smart power solid state relay for complete H-bridge configurations

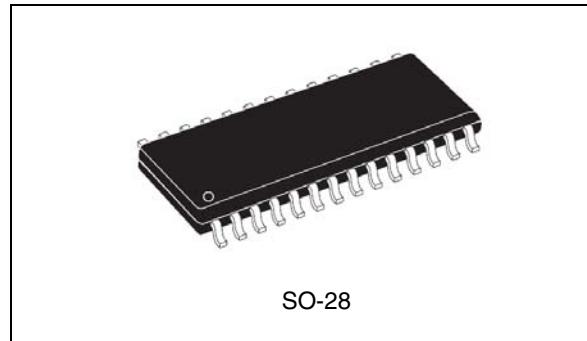

### Features

Type	R <sub>DS(on)</sub>	I <sub>OUT</sub>	V <sub>CC</sub>
VN770KP-E	225 mΩ <sup>(1)</sup>	9 A <sup>(2)</sup>	36 V

1. Total resistance of one side in bridge configuration
  2. Typical current limitation value
- ECOPACK®: lead free and RoHS compliant
  - Automotive Grade: compliance with AEC guidelines
  - Suited as low voltage bridge
  - Linear current limitation
  - Very low standby power dissipation
  - Short circuit protected
  - Status flag diagnostic (open drain)
  - Integrated clamping circuits
  - Undervoltage protection
  - ESD protection

### Description

The VN770KP-E is a device formed by three monolithic chips housed in a standard SO-28 package: a double high side and two low side switches. Both the double high side and low side switches are made using STMicroelectronics VIPower™ M0-3 Technology.

This device is suitable to drive a DC motor in a bridge configuration as well as to be used as a quad switch for any low voltage application.

The dual high side switches have built-in thermal shutdown to protect the chips from over temperature and current limiter blocks to protect the device from short circuit. Status output is provided to indicate open load in off and on-state and over temperature.

The low side switches are two OMNIFET II types (fully auto protected Power MOSFET in VIPower™ technology). They have built-in thermal shutdown, linear current limitation and overvoltage clamping. Fault feedback for thermal intervention can be detected by monitoring the voltage at the input pin.

Note:

To ensure long term reliability under heavy overload or short circuit conditions, protection and related diagnostic signals must be used together with a proper software strategy. If the device is subjected to abnormal conditions, this software must limit the duration and number of activation cycles.

### 3 Application recommendations

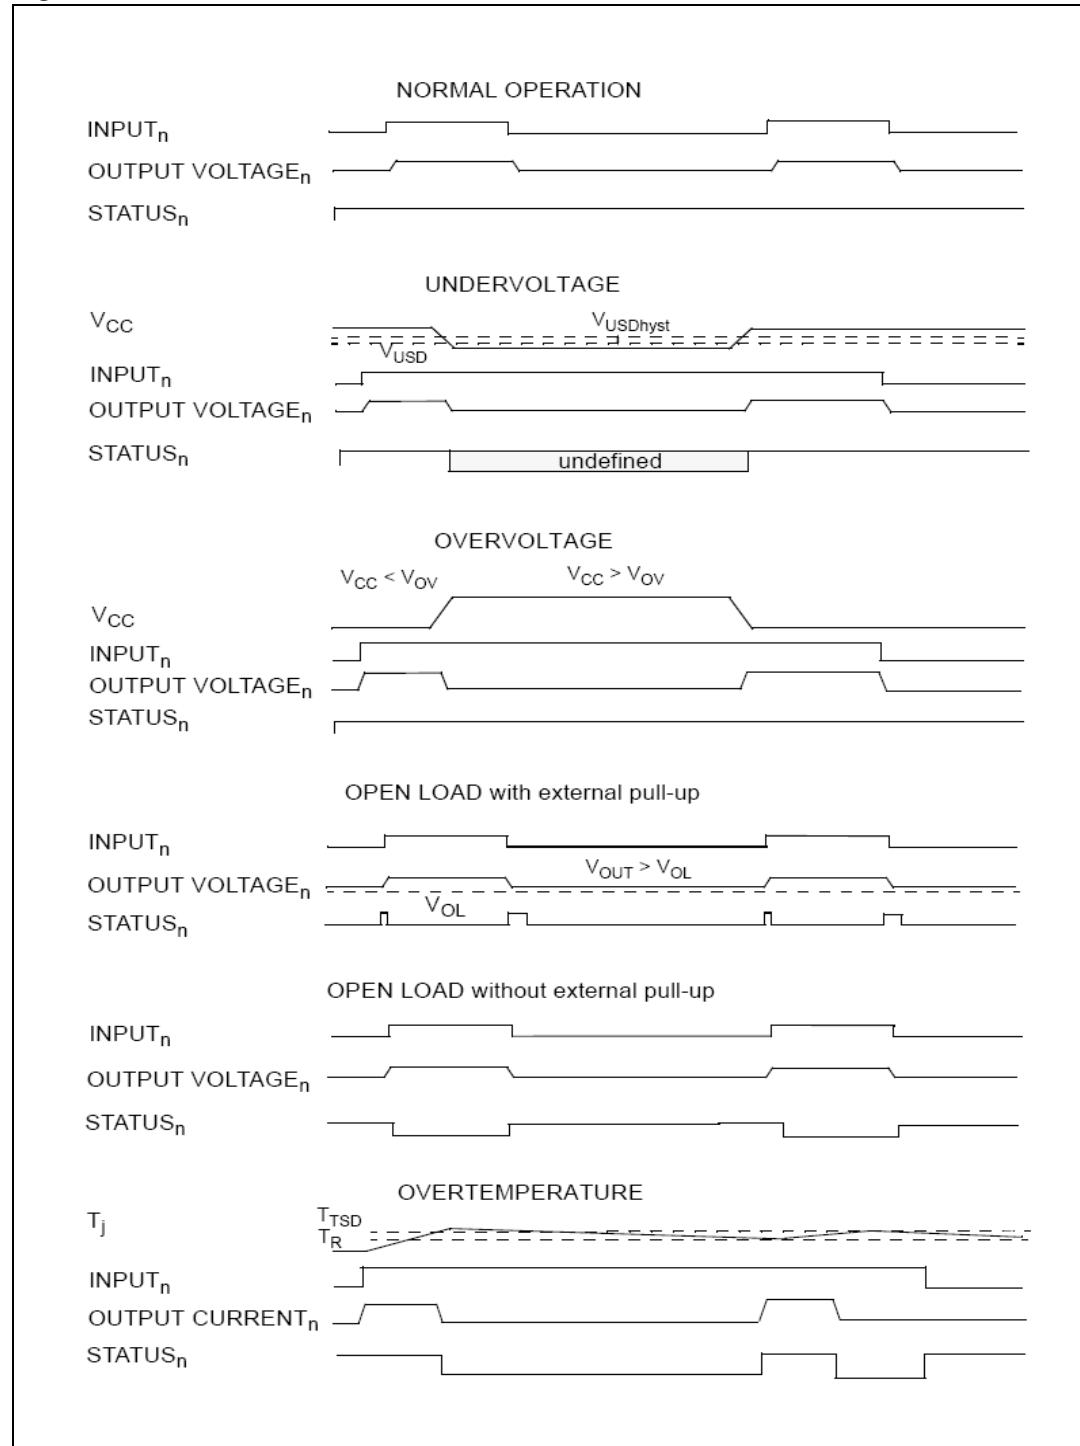

**Figure 44. Application diagram bridge drivers**

Most motor bridge drivers use a reverse battery protection diode (D) inside the supply rail. This diode prevents a reverse current flow back to  $V_{BATT}$  in case the bridge becomes disabled via the logic inputs while motor inductance still carries energy. In order to prevent a hazardous overvoltage at circuit supply terminal ( $V_{CC}$ ), a blocking capacitor (C) is needed to limit the voltage overshoot. As basic orientation,  $50\mu F$  per 1A load current is recommended. As an alternative, a Zener protection (Z) is also suitable.

Even if a reverse polarity diode is not present, it is recommended to use a capacitor or Zener at  $V_{CC}$  because a similar problem appears in case the supply terminal of the module has intermittent electrical contact to the battery or gets disconnected while the motor is operating.

### 4.2.1 Thermal resistances definition

Values according to the PCB heatsink area.

R<sub>thHS</sub> = R<sub>thHS1</sub> = R<sub>thHS2</sub> = high side chip thermal resistance junction to ambient (HS<sub>1</sub> or HS<sub>2</sub> in on-state)

R<sub>thLS</sub> = R<sub>thLS3</sub> = R<sub>thLS4</sub> = low side chip thermal resistance junction to ambient

R<sub>thHSL</sub> = R<sub>thHS1L</sub> = R<sub>thHS2L</sub> = mutual thermal resistance junction to ambient between high side and low side chips

R<sub>thL</sub> = R<sub>thLS3L</sub> = mutual thermal resistance junction to ambient between low side chips

### 4.2.2 Thermal calculation in transient mode<sup>(b)</sup>

$$T_{jHS12} = Z_{thHS} \times P_{dHS12} + Z_{thHSL} \times (P_{dLS3} + P_{dLS4}) + T_{amb}$$

$$T_{jLS3} = Z_{thHSL} \times P_{dHS12} + Z_{thLS} \times P_{dLS3} + Z_{thL} \times P_{dLS4} + T_{amb}$$

$$T_{jLS4} = Z_{thHSL} \times P_{dHS12} + Z_{thL} \times P_{dLS3} + Z_{thLS} \times P_{dLS4} + T_{amb}$$

### 4.2.3 Single pulse thermal impedance definition

Values according to the PCB heatsink area.

Z<sub>thHS</sub> = high side chip thermal impedance junction to ambient

Z<sub>thLS</sub> = Z<sub>thLS3</sub> = Z<sub>thLS4</sub> = low side chip thermal impedance junction to ambient

Z<sub>thHSL</sub> = Z<sub>thHS1L</sub> = Z<sub>thHS2L</sub> = mutual thermal impedance junction to ambient between high side and low side chips

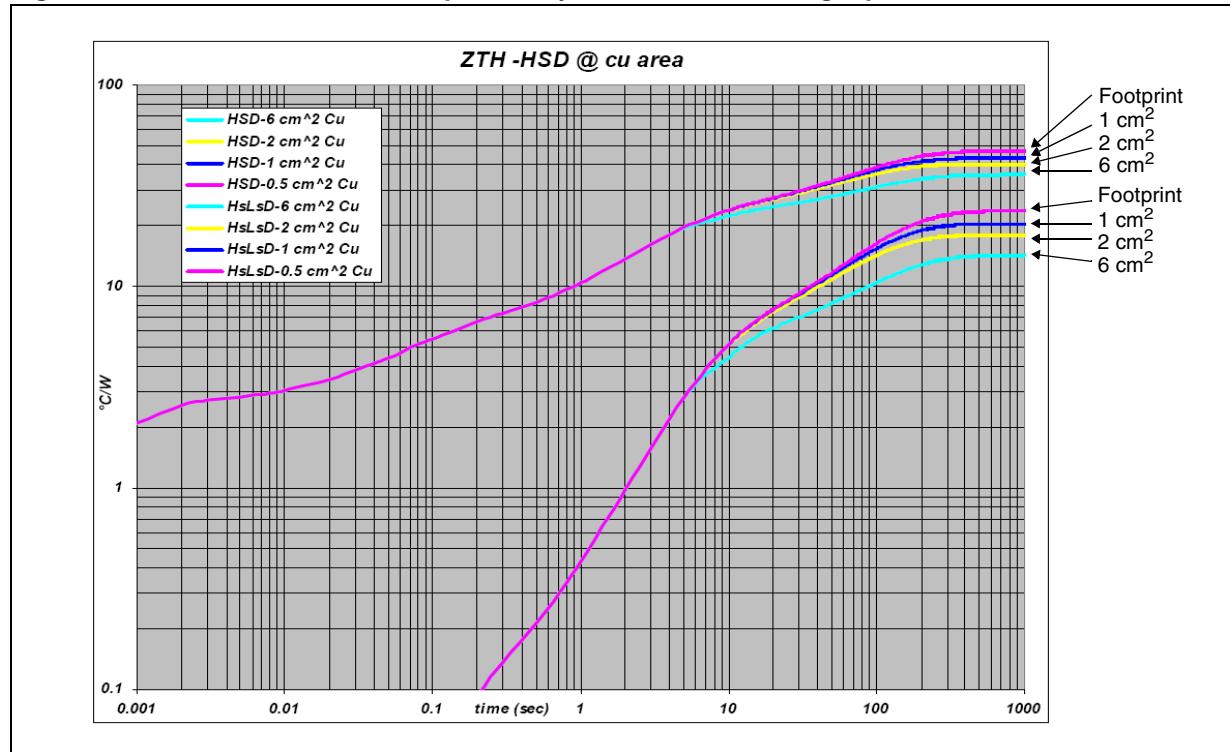

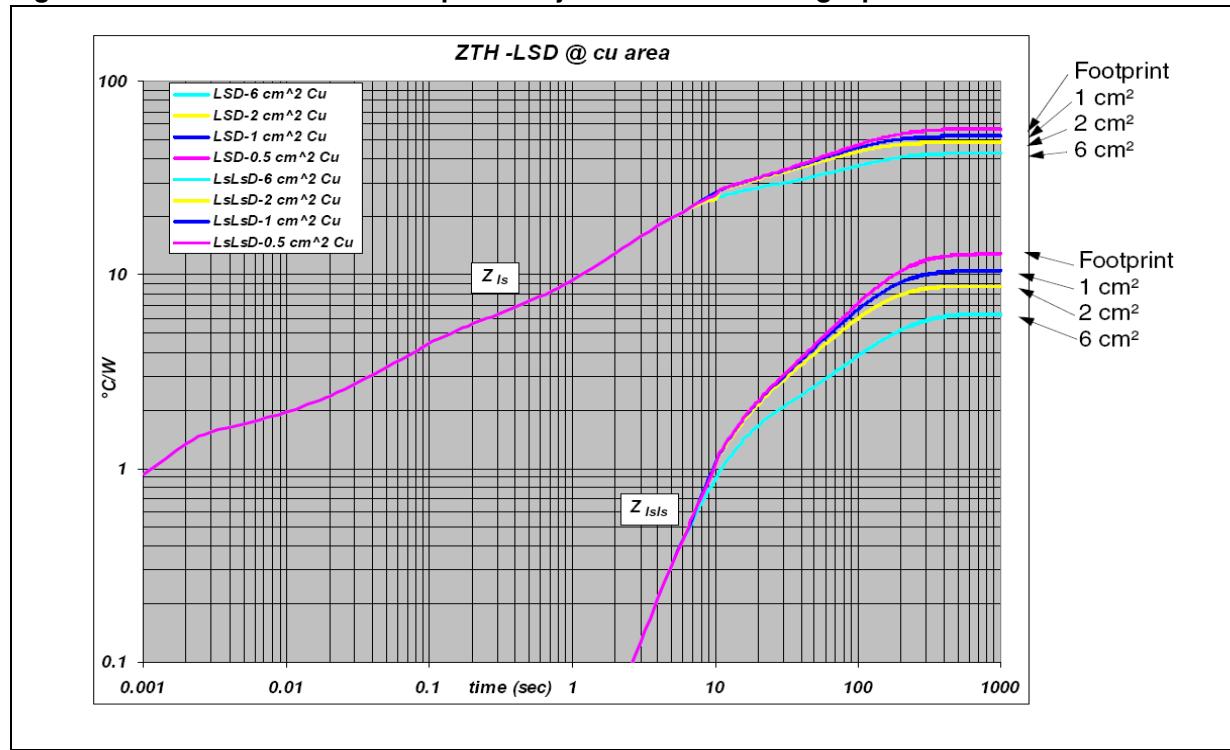

Z<sub>thL</sub> = Z<sub>thLS3L</sub> = mutual thermal impedance junction to ambient between low side chips

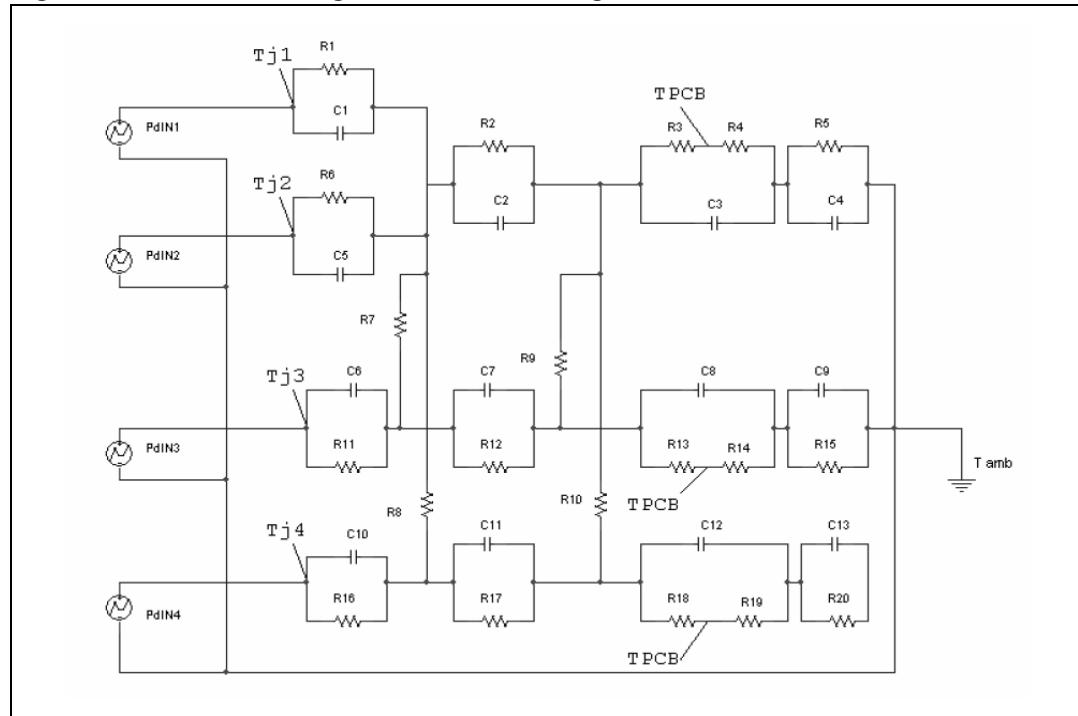

### 4.2.4 Pulse calculation formula

$$Z_{TH\delta} = R_{TH} \cdot \delta + Z_{THtp} (1 - \delta)$$

where  $\delta = t_p/T$

b. Calculation is valid in any dynamic operating condition. P<sub>d</sub> values set by user.
