

Two 1-Bit, 10MHz, 2nd-Order Delta-Sigma Modulators

FEATURES

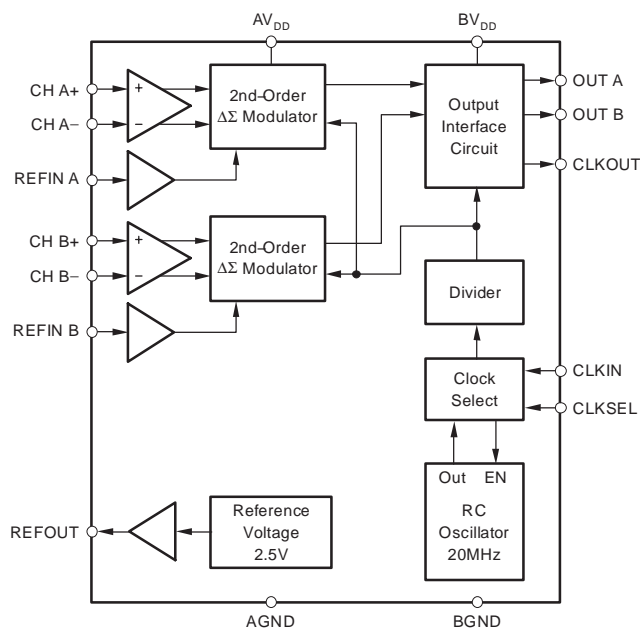

- 16-Bit Resolution
- 14-Bit Linearity
- $\pm 2.5V$ Input Range at 2.5V
- Internal Reference Voltage: 2%
- Gain Error: 0.5%
- Two Independent Delta-Sigma Modulators
- Two Input Reference Buffers
- On-Chip 20MHz Oscillator
- Selectable Internal or External Clock
- Operating Temperature Range:
–40°C to +85°C
- QFN-24 (4x4) Package

APPLICATIONS

- Motor Control
- Current Measurement
- Industrial Process Control
- Instrumentation
- Resolver

DESCRIPTION

The ADS1205 is a two-channel, high-performance, delta-sigma ($\Delta\Sigma$) modulator with more than 98dB dynamic range, operating from a single +5V supply. The differential inputs are ideal for direct connection to transducers in an industrial environment. With the appropriate digital filter and modulator rate, the device can be used to achieve 16-bit analog-to-digital (A/D) conversion with no missing codes. Effective resolution of 14 bits can be obtained with a digital filter bandwidth of 40kHz at a modulator rate of 10MHz. The ADS1205 is designed for use in high-resolution measurement applications including current measurements, smart transmitters, industrial process control, and resolvers. It is available in a QFN-24 (4x4) package.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

All trademarks are the property of their respective owners.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

Package/Ordering Information

For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI web site at www.ti.com.

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range unless otherwise noted⁽¹⁾

	ADS1205	UNIT
Supply voltage, AGND to AV _{DD}	–0.3 to 6	V
Supply voltage, BGND to BV _{DD}	–0.3 to 6	V

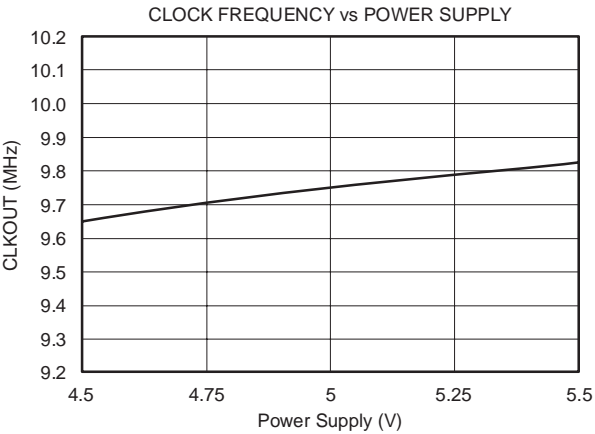

Figure 27

GENERAL DESCRIPTION

The ADS1205 is a two-channel, 2nd-order, CMOS device with two delta-sigma modulators, designed for medium- to high-resolution A/D signal conversions from DC to 39kHz (filter response –3dB) if an oversampling ratio (OSR) of 64 is chosen. The output of the converter (OUT_X) provides a stream of digital ones and zeros. The time average of this serial output is proportional to the analog input voltage.

The modulator shifts the quantization noise to high frequencies. A low-pass digital filter should be used at the output of the delta-sigma modulator. The filter serves two functions. First, it filters out high-frequency noise. Second, the filter converts the 1-bit data stream at a high sampling rate into a higher-bit data word at a lower rate (decimation).

An application-specific integrated circuit (ASIC) or field-programmable gate array (FPGA) could be used to implement the digital filter. Figure 28 and Figure 29 show typical application circuits with the ADS1205 connected to an FPGA or ASIC.

The overall performance (that is, speed and accuracy) depends on the selection of an appropriate OSR and filter type. A higher OSR produces greater output accuracy while operating at a lower refresh rate. Alternatively, a lower OSR produces lower output accuracy, but operates at a higher refresh rate. This system allows flexibility with the digital filter design and is capable of A/D conversion results that have a dynamic range exceeding 98dB with an OSR = 256.

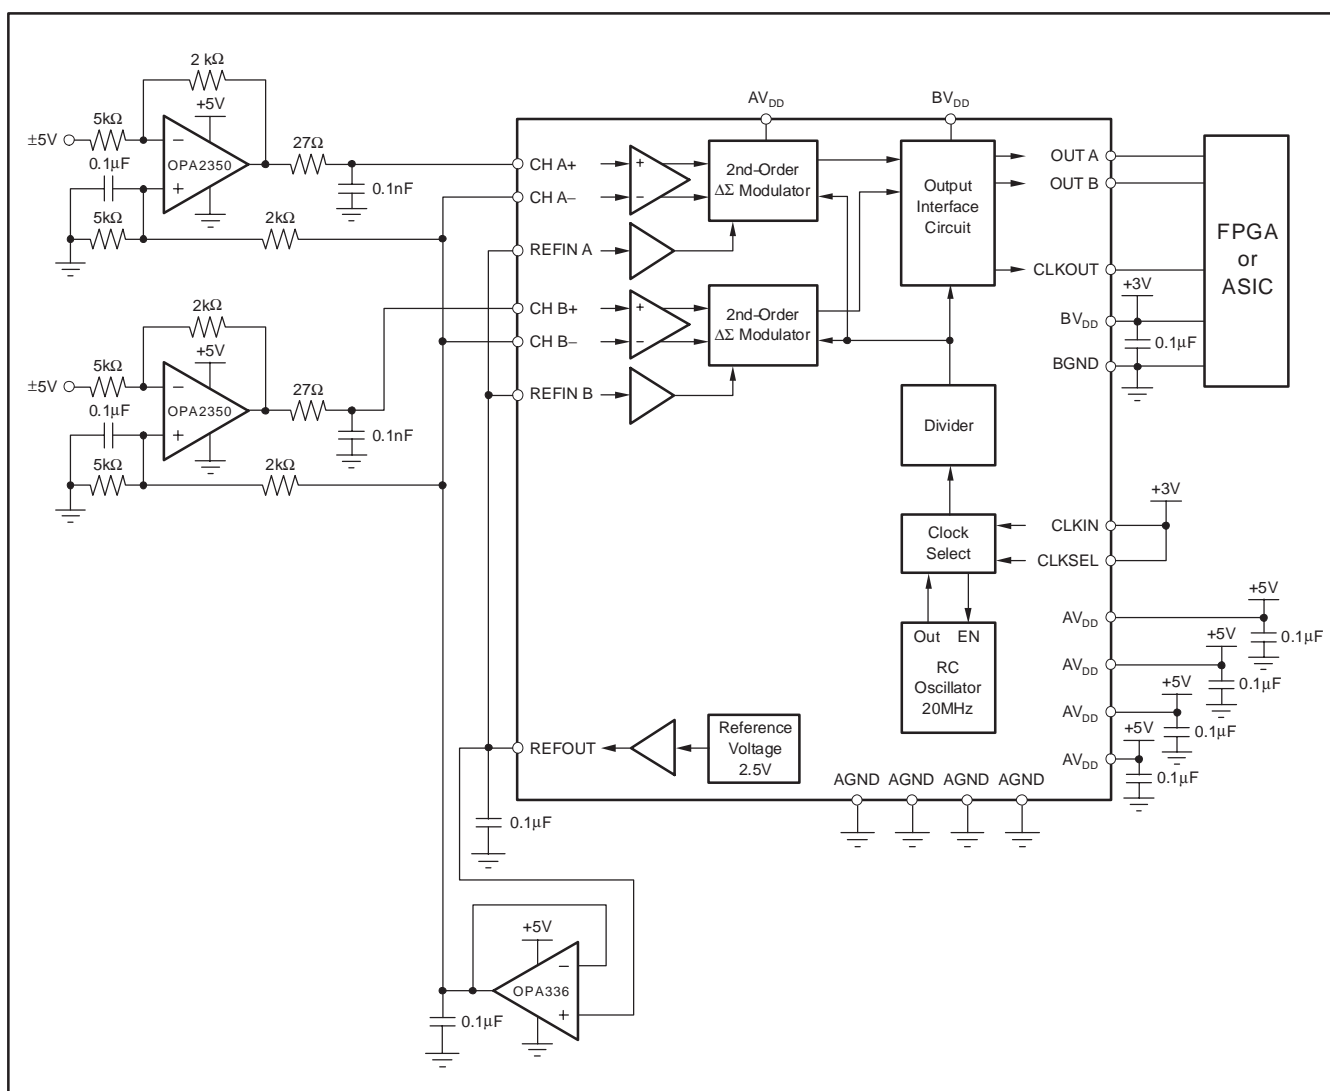

Figure 28. Single-Ended Connection Diagram for the ADS1205 Delta-Sigma Modulator

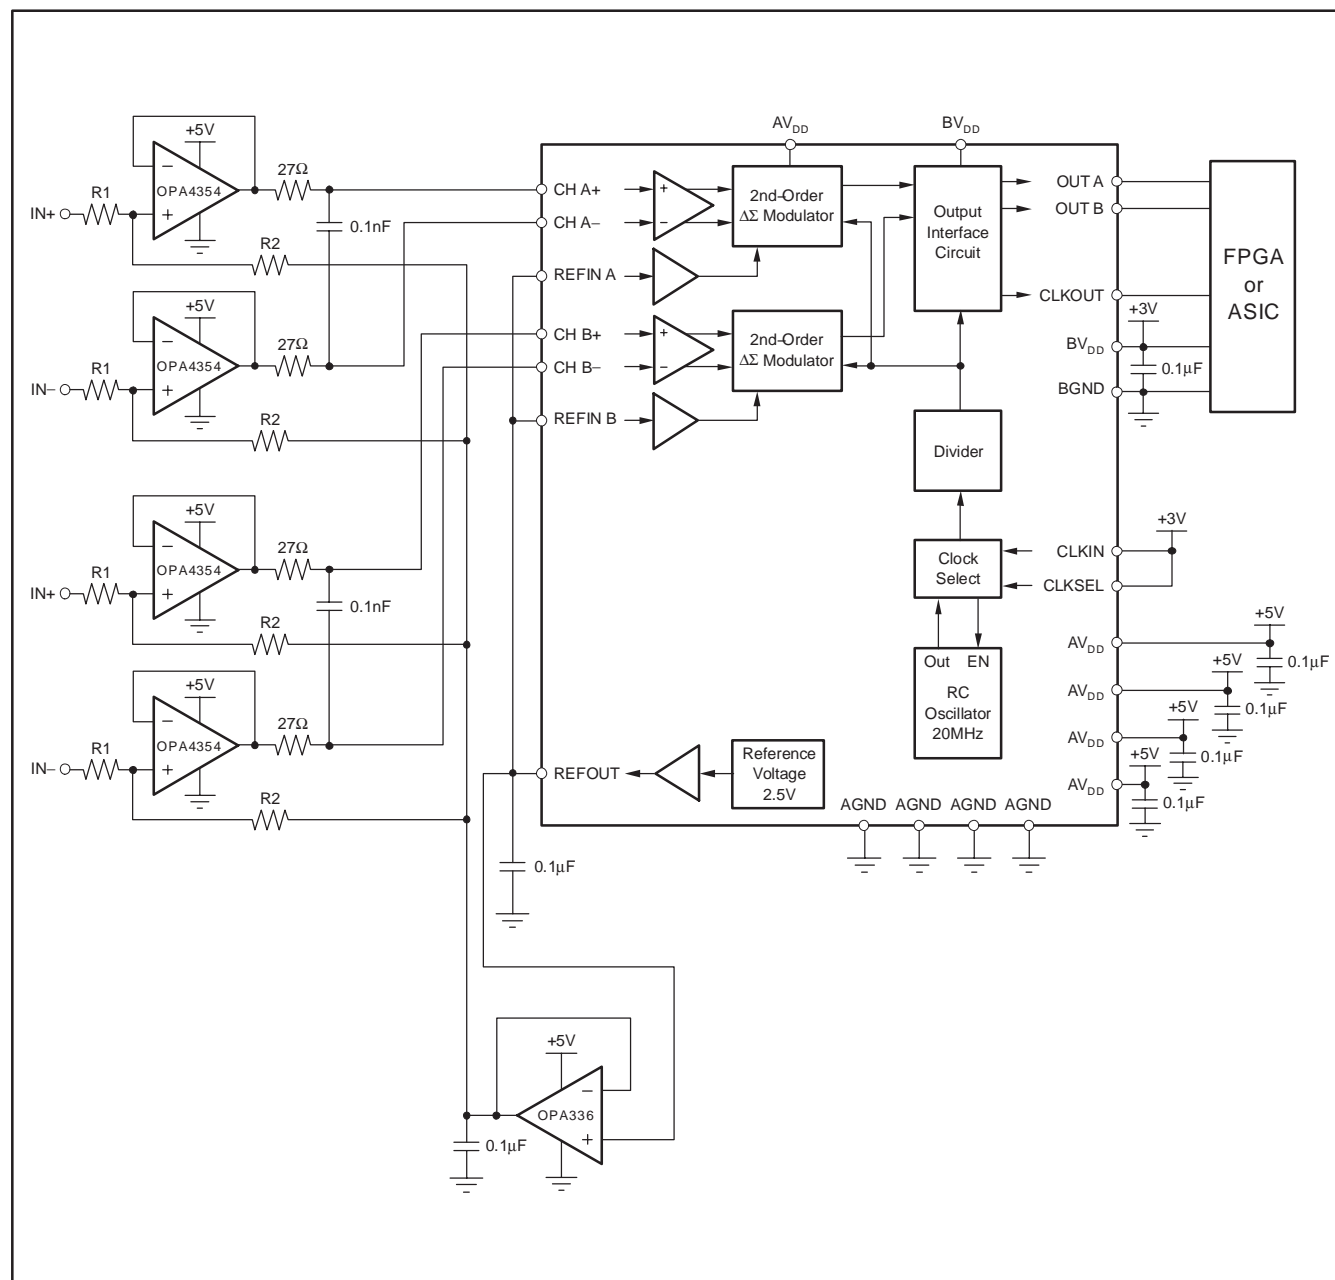

Figure 29. Differential Connection Diagram for the ADS1205 Delta-Sigma Modulator

THEORY OF OPERATION

The differential analog input of the ADS1205 is implemented with a switched-capacitor circuit. This circuit implements a 2nd-order modulator stage, which digitizes the analog input signal into a 1-bit output stream. The clock source can be internal as well as external. Different frequencies for this clock allow for a variety of solutions and signal bandwidths. Every analog input signal is continuously sampled by the modulator and compared to a reference voltage that is applied to the REFINx pin. A digital stream, which accurately represents the analog input voltage over time, appears at the output of the corresponding converter.

ANALOG INPUT STAGE

Analog Input

The topology of the analog inputs of ADS1205 is based on a fully differential switched-capacitor architecture. This input stage provides the mechanism to achieve low system noise, high common-mode rejection (108dB), and excellent power-supply rejection.

The input impedance of the analog input is dependent on the modulator clock frequency (f_{CLK}), which is also the sampling frequency of the modulator. Figure 30 shows the basic input structure of one channel of the ADS1205. The relationship between the input impedance of the ADS1205 and the modulator clock frequency is:

$$Z_{IN} = \frac{100k\Omega}{f_{MOD}/10MHz} \quad (1)$$

The input impedance becomes a consideration in designs where the source impedance of the input signal is high. This high impedance may cause degradation in gain, linearity, and THD. The importance of this effect depends on the desired system performance. There are two

restrictions on the analog input signals, CH x+ and CH x-. If the input voltage exceeds the range ($GND - 0.3V$) to ($V_{DD} + 0.3V$), the input current must be limited to 10mA because the input protection diodes on the front end of the converter will begin to turn on. In addition, the linearity and the noise performance of the device are ensured only when the differential analog voltage resides within $\pm 2V$ (with V_{REF} as a midpoint); however, the FSR input voltage is $\pm 2.5V$.

Modulator

The ADS1205 can be operated in two modes. When $CKLSEL = 1$, the two modulators operate using the internal clock, which is fixed at 20MHz. When $CKLSEL = 0$, the modulators operate using an external clock. In both modes, the clock is divided by two internally and functions as the modulator clock. The frequency of the external clock can vary from 1MHz to 33MHz to adjust for the clock requirements of the application.

The modulator topology is fundamentally a 2nd-order, switched-capacitor, delta-sigma modulator, such as the one conceptualized in Figure 31. The analog input voltage and the output of the 1-bit digital-to-analog converter (DAC) are differentiated, providing analog voltages at X2 and X3. The voltages at X2 and X3 are presented to their individual integrators. The output of these integrators progresses in a negative or positive direction. When the value of the signal at X4 equals the comparator reference voltage, the output of the comparator switches from negative to positive, or positive to negative, depending on its original state. When the output value of the comparator switches from high to low or vice versa, the 1-bit DAC responds on the next clock pulse by changing its analog output voltage at X6, causing the integrators to progress in the opposite direction. The feedback of the modulator to the front end of the integrators forces the value of the integrator output to track the average of the input.

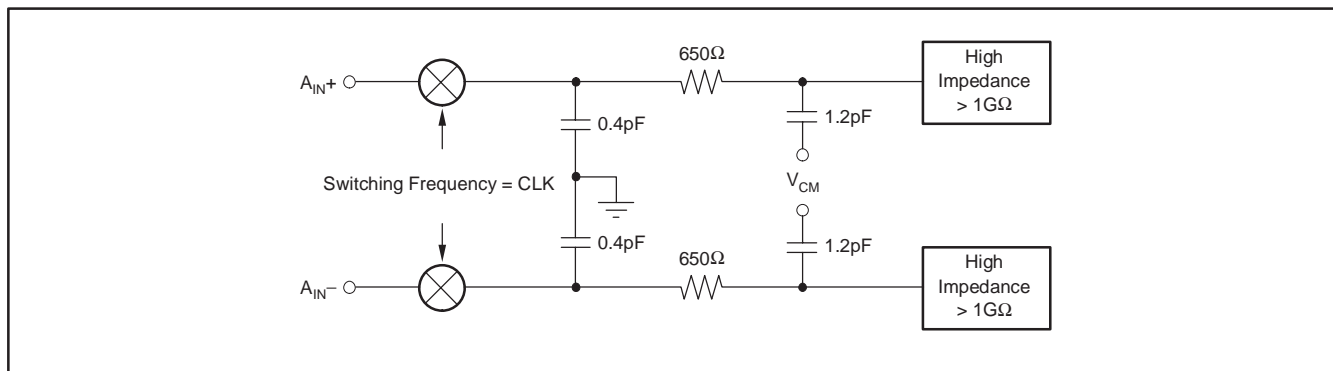

Figure 30. Input Impedance of the ADS1205

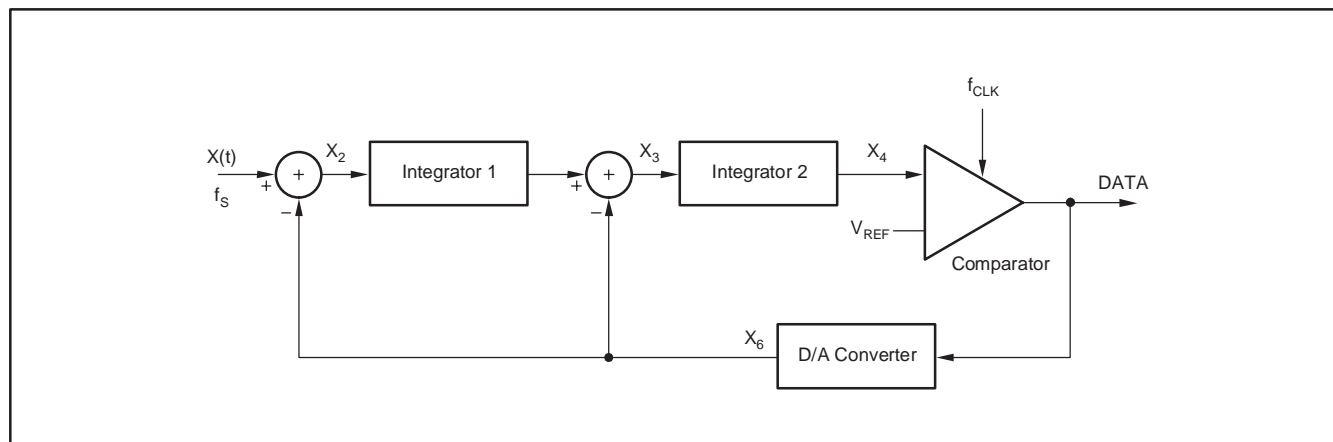

Figure 31. Block Diagram of the 2nd-Order Modulator

DIGITAL OUTPUT

A differential input signal of 0V will ideally produce a stream of ones and zeros that are high 50% of the time and low 50% of the time. A differential input of +2V produces a stream of ones and zeros that are high 80% of the time. A differential input of -2V produces a stream of ones and zeros that are high 20% of the time. The input voltage versus the output modulator signal is shown in Figure 32.

DIGITAL INTERFACE

INTRODUCTION

The analog signal connected to the input of the delta-sigma modulator is converted using the clock signal applied to the modulator. The result of the conversion, or modulation, is generated and sent to the OUTx pin from the delta-sigma modulator. In most applications where a direct connection is realized between the delta-sigma modulator

and an ASIC or FPGA (each with an implemented filter), the two standard signals per modulator (CLKOUT and OUTx) are provided from the modulator. The output clock signal is equal for both modulators. If CLKSEL = 1, CLKIN must always be set either high or low.

MODES OF OPERATION

The system clock of the ADS1205 is 20MHz by default. The system clock can be provided either from the internal 20MHz RC oscillator or from an external clock source. For this purpose, the CLKIN pin is provided; it is controlled by the mode setting, CLKSEL.

The system clock is divided by two for the modulator clock. Therefore, the default clock frequency of the modulator is 10MHz. With a possible external clock range of 1MHz to 33MHz, the modulator operates between 500kHz and 16.5MHz.

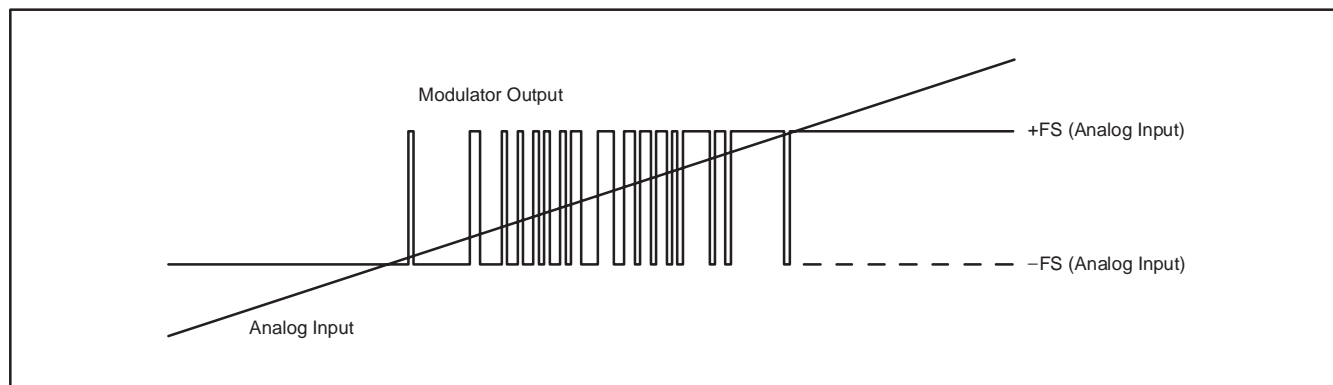

Figure 32. Analog Input vs Modulator Output of the ADS1205

FILTER USAGE

The modulator generates only a bitstream, which does not output a digital word like an A/D converter. In order to output a digital word equivalent to the analog input voltage, the bitstream must be processed by a digital filter.

A very simple filter, built with minimal effort and hardware, is the Sinc³ filter:

$$H(z) = \left(\frac{1 - z^{-OSR}}{1 - z^{-1}} \right)^3 \quad (2)$$

This filter provides the best output performance at the lowest hardware size (for example, a count of digital gates). For oversampling ratios in the range of 16 to 256, this is a good choice. All the characterizations in the data sheet are also done using a Sinc³ filter with an oversampling ratio of OSR = 256 and an output word length of 16 bits.

In a Sinc³ filter response (shown in Figure 33 and Figure 34), the location of the first notch occurs at the frequency of output data rate $f_{DATA} = f_{CLK}/OSR$. The -3dB point is located at half the Nyquist frequency or $f_{DATA}/4$. For some applications, it may be necessary to use another filter type for better frequency response.

This performance can be improved, for example, by a cascaded filter structure. The first decimation stage can be a Sinc³ filter with a low OSR and the second stage a high-order filter.

For more information, see application note SBAA094, *Combining the ADS1202 with an FPGA Digital Filter for Current Measurement in Motor Control Applications*, available for download at www.ti.com.

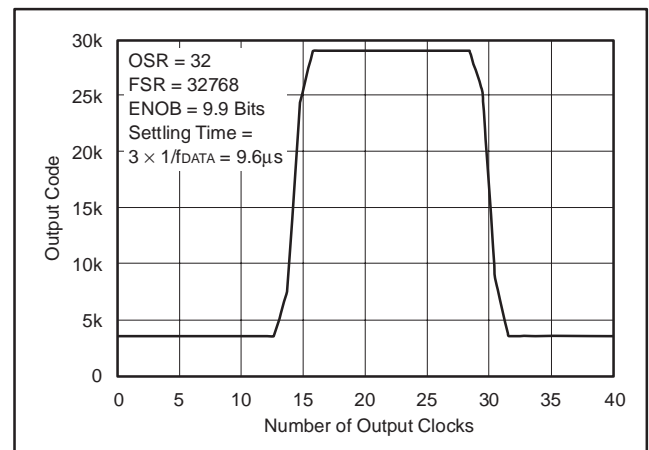

Figure 34. Pulse Response of Sinc³ Filter
($f_{MOD} = 10\text{MHz}$)

The effective number of bits (ENOB) can be used to compare the performance of ADCs and delta-sigma modulators. Figure 35 shows the ENOB of the ADS1205 with different filter types. In this data sheet, the ENOB is calculated from the SNR:

$$\text{SNR} = 1.76\text{dB} + 6.02\text{dB} \times \text{ENOB} \quad (3)$$

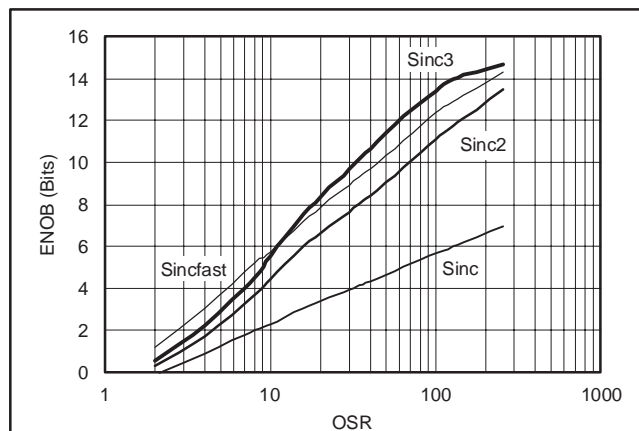

Figure 35. Measured ENOB vs OSR

In motor control applications, a very fast response time for overcurrent detection is required. There is a constraint between 1μs and 5μs with 3 bits to 7 bits resolution. The time for full settling is dependent on the filter order. Therefore, the full settling of the Sinc³ filter needs three data clocks and the Sinc² filter needs two data clocks. The data clock is equal to the modulator clock divided by the OSR. For overcurrent protection,

filter types other than Sinc³ might be a better choice. A simple example is a Sinc² filter. The Sincfast is a modified Sinc² filter:

$$H(z) = \left(\frac{1 - z^{-\text{OSR}}}{1 - z^{-1}} \right)^2 (1 + z^{-2 \times \text{OSR}}) \quad (4)$$

Figure 36 compares the settling time of different filter types operating with a 10MHz modulator clock.

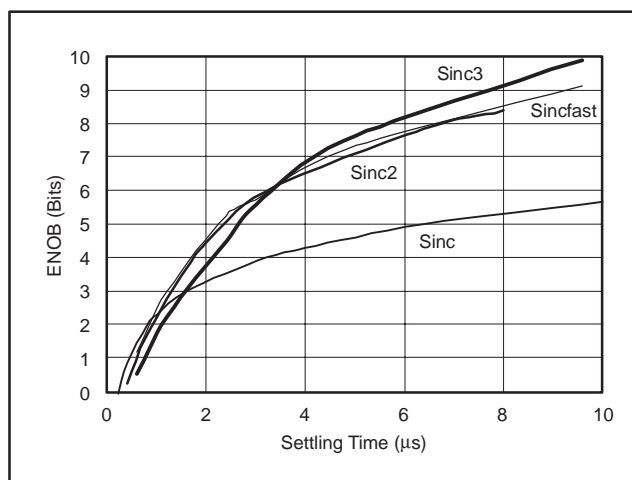

Figure 36. Measured ENOB vs Settling Time

LAYOUT CONSIDERATIONS

POWER SUPPLIES

An applied external digital filter rejects high-frequency noise. PSRR and CMRR improve at higher frequencies because the digital filter suppresses high-frequency noise. However, the suppression of the filter is not infinite, so high-frequency noise still influences the conversion result.

Inputs to the ADS1205, such as CH x+, CH x–, and CLKIN, should not be present before the power supply is on. Violating this condition could cause latch-up. If these signals are present before the supply is on, series resistors should be used to limit the input current to a maximum of 10mA. Experimentation may be the best way to determine the appropriate connection between the ADS1205 and different power supplies.

GROUNDING

Analog and digital sections of the design must be carefully and cleanly partitioned. Each section should have its own ground plane with no overlap between them. Do not join the ground planes; instead, connect the two with a moderate signal trace underneath the converter. However, for different applications with DSPs and switching power supplies, this process might be different.

For multiple converters, connect the two ground planes as close as possible to one central location for all of the converters. In some cases, experimentation may be required to find the best point to connect the two planes together.

DECOUPLING

Good decoupling practices must be used for the ADS1205 and for all components in the design. All decoupling capacitors, specifically the 0.1μF ceramic capacitors, must be placed as close as possible to the pin being decoupled. A 1μF and 10μF capacitor, in parallel with the 0.1μF ceramic capacitor, can be used to decouple AV_{DD} to AGND as well as BV_{DD} to BGND. At least one 0.1μF ceramic capacitor must be used to decouple every AV_{DD} to AGND and BV_{DD} to BGND, as well as for the digital supply on each digital component.

The digital supply sets the I/O voltage for the interface and can be set within a range of 2.7V to 5.5V.

In cases where both the analog and digital I/O supplies share the same supply source, an RC filter of 10Ω and 0.1μF can be used to help reduce the noise in the analog supply.

PACKAGING INFORMATION

Orderable Device	Status ⁽¹⁾	Package Type	Package Drawing	Pins	Package Qty	Eco Plan ⁽²⁾	Lead/Ball Finish	MSL Peak Temp ⁽³⁾
ADS1205IRGER	ACTIVE	QFN	RGE	24	3000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR
ADS1205IRGERG4	ACTIVE	QFN	RGE	24	3000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR
ADS1205IRGET	ACTIVE	QFN	RGE	24	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR
ADS1205IRGETG4	ACTIVE	QFN	RGE	24	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS) or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

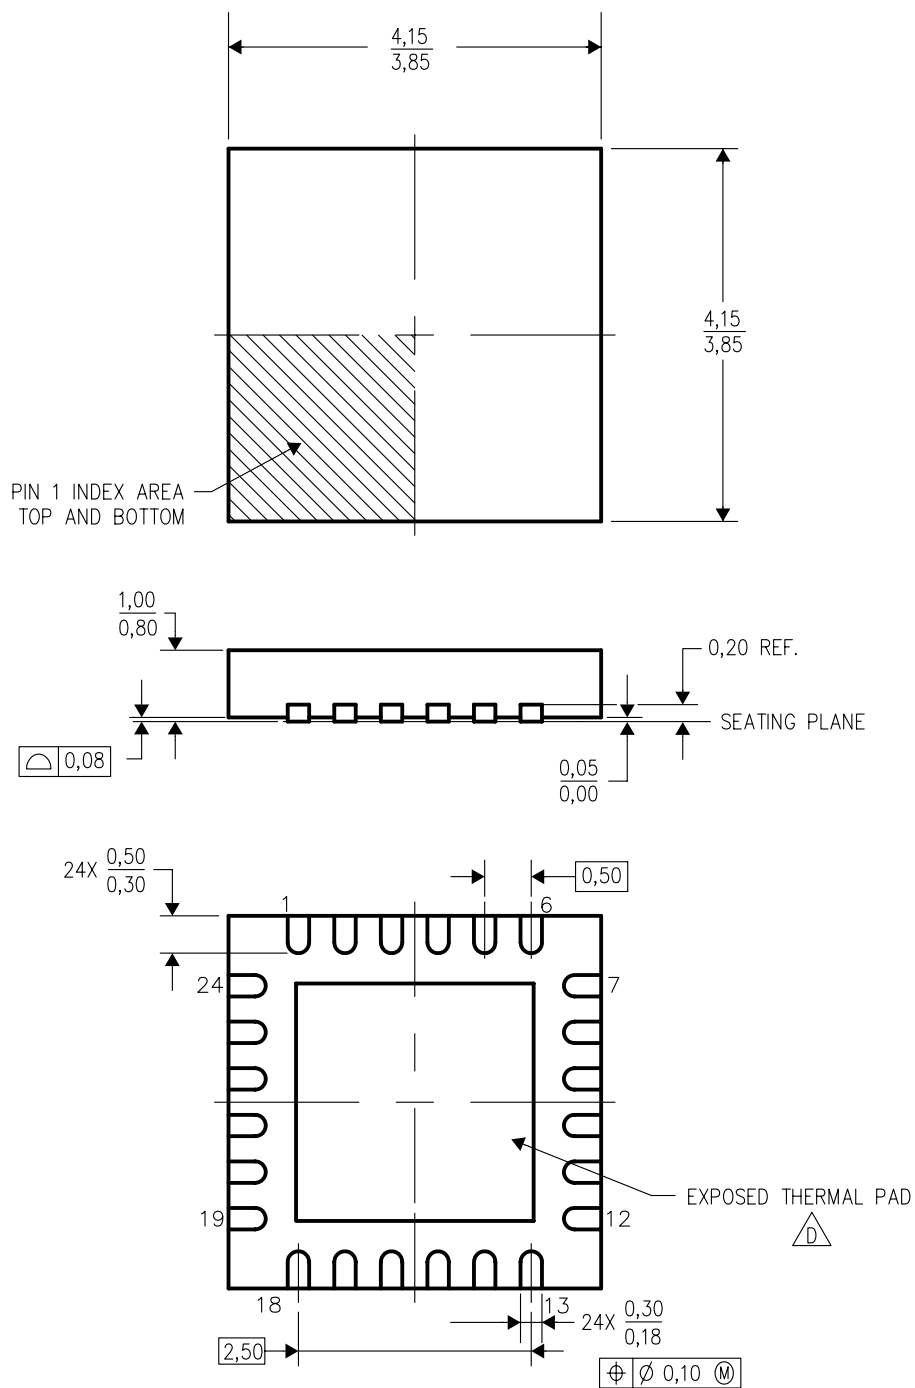

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

RGE (S-PQFP-N24)

PLASTIC QUAD FLATPACK

4204104/C 11/04

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - B. This drawing is subject to change without notice.
 - C. Quad Flatpack, No-Leads (QFN) package configuration.
 -  D. The package thermal pad must be soldered to the board for thermal and mechanical performance. See the Product Data Sheet for details regarding the exposed thermal pad dimensions.
 - E. Falls within JEDEC MO-220.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.
