

### FEATURES

#### AC PERFORMANCE

500 ns Settling to 0.01% for 10 V Step  
75 V/ $\mu$ s Slew Rate  
0.0001% Total Harmonic Distortion (THD)  
13 MHz Gain Bandwidth  
Internal Compensation for Gains of +2 or Greater

#### DC PERFORMANCE

0.5 mV max Offset Voltage (AD746B)  
10  $\mu$ V/ $^{\circ}$ C max Drift (AD746B)  
175 V/mV min Open Loop Gain (AD746B)  
2  $\mu$ V p-p Noise, 0.1 Hz to 10 Hz  
Available in Plastic Mini-DIP, Cerdip and Surface Mount Packages  
Available in Tape and Reel in Accordance with EIA-481A Standard  
MIL-STD-883B Processing also Available  
Single Version: AD744

### APPLICATIONS

Dual Output Buffers for 12- and 14-Bit DACs  
Input Buffers for Precision ADCs, Wideband Preamplifiers and Low Distortion Audio Circuitry

### CONNECTION DIAGRAM

Plastic Mini-DIP (N)  
Cerdip (Q) and  
Plastic SOIC (R) Packages

The AD746 is available in three 8-pin packages: plastic mini DIP, hermetic cerdip and surface mount (SOIC).

### PRODUCT HIGHLIGHTS

1. The AD746 offers exceptional dynamic response for high speed data acquisition systems. It settles to 0.01% in 500 ns and has a 100% tested minimum slew rate of 50 V/ $\mu$ s (AD746B).
2. Outstanding dc precision is provided by a combination of Analog Devices' advanced processing technology, laser wafer drift trimming and well-matched ion-implanted JFETs. Input offset voltage, input bias current and input offset current are specified in the warmed-up condition and are 100% tested.
3. Differential and multichannel systems will benefit from the AD746's very close matching of ac characteristics. Input offset voltage specs are fully tested and guaranteed to a maximum of 0.5 mV (AD746B).
4. The AD746 has very close, guaranteed matching of input bias current between its two amplifiers.
5. Unity gain stable version AD712 also available.

### PRODUCT DESCRIPTION

The AD746 is a dual operational amplifier, consisting of two AD744 BiFET op amps on a single chip. These precision monolithic op amps offer excellent dc characteristics plus rapid settling times, high slew rates and ample bandwidths. In addition, the AD746 provides the close matching ac and dc characteristics inherent to amplifiers sharing the same monolithic die.

The single pole response of the AD746 provides fast settling: 500 ns to 0.01%. This feature, combined with its high dc precision, makes it suitable for use as a buffer amplifier for 12- or 14-bit DACs and ADCs. Furthermore, the AD746's low total harmonic distortion (THD) level of 0.0001% and very close matching ac characteristics make it an ideal amplifier for many demanding audio applications.

The AD746 is internally compensated for stable operation as a unity gain inverter or as a noninverting amplifier with a gain of 2 or greater. It is available in four performance grades. The AD746J is rated over the commercial temperature range of 0 to +70 $^{\circ}$ C. The AD746A and AD746B are rated over the industrial temperature range of -40 $^{\circ}$ C to +85 $^{\circ}$ C. The AD746S is rated over the military temperature range of -55 $^{\circ}$ C to +125 $^{\circ}$ C and is available processed to MIL-STD-883B, Rev. C.

## NOTES

<sup>1</sup>Input Offset Voltage specifications are guaranteed after 5 minutes of operation at  $T_A = +25^\circ\text{C}$ .

<sup>2</sup>PSRR test conditions:  $+V_S = 15\text{ V}$ ,  $-V_S = -12\text{ V}$  to  $-18\text{ V}$  and  $+V_S = 12\text{ V}$  to  $18\text{ V}$ ,  $-V_S = -15\text{ V}$ .

<sup>3</sup>Bias Current Specifications are guaranteed maximum at either input after 5 minutes of operation at  $T_A = +25^\circ\text{C}$ . For higher temperature, the current doubles every  $10^\circ\text{C}$ .

<sup>4</sup>Gain =  $-1$ ,  $R_I = 2\text{ k}\Omega$ ,  $C_I = 10\text{ pF}$ .

<sup>5</sup>Defined as voltage between inputs, such that neither exceeds  $\pm 10\text{ V}$  from ground.

<sup>6</sup>Typically exceeding  $-14.1\text{ V}$  negative common-mode voltage on either input results in an output phase reversal.

Specifications subject to change without notice.

Specifications in **boldface** are tested on all production units at final electrical test. Results from those tests are used to calculate outgoing quality levels. All min and max specifications are guaranteed, although only those shown in **boldface** are tested on all production units.

## NOTES

<sup>1</sup>Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

**CAUTION**

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as  $4000\text{ V}$  readily accumulate on the human body and test equipment and can discharge without detection. Although the AD746 features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

## POWER SUPPLY BYPASSING

The power supply connections to the AD746 must maintain a low impedance to ground over a bandwidth of 13 MHz or more. This is especially important when driving a significant resistive or capacitive load, since all current delivered to the load comes from the power supplies. Multiple high quality bypass capacitors are recommended for each power supply line in any critical application. A 0.1  $\mu\text{F}$  ceramic and a 1  $\mu\text{F}$  tantalum capacitor as shown in Figure 20 placed as close as possible to the amplifier

(with short lead lengths to power supply common) will assure adequate high frequency bypassing, in most applications. A minimum bypass capacitance of 0.1  $\mu\text{F}$  should be used for any application.

If only one of the two amplifiers inside the AD746 is to be utilized, the unused amplifier should be connected as shown in Figure 21a. Note that the noninverting input should be grounded and that  $R_L$  and  $C_L$  are not required.

### A HIGH SPEED 3 OP AMP INSTRUMENTATION AMPLIFIER CIRCUIT

The instrumentation amplifier circuit shown in Figure 23 can provide a range of gains from 2 up to 1000 and higher. The circuit bandwidth is 2.5 MHz at a gain of 2 and 750 kHz at a gain of 10; settling time for the entire circuit is less than 2  $\mu$ s to within 0.01% for a 10 volt step, ( $G = 10$ ).

$$\text{CIRCUIT GAIN} = \frac{20,000}{R_G} + 1$$

### THD Performance Considerations

The AD746 was carefully optimized to offer excellent performance in terms of total harmonic distortion (THD) in signal processing applications. The THD level when operating the AD746 in inverting gain applications will show a gradual rise from the distortion floor of 20 dB/decade (see Figure 28). In noninverting applications, care should be taken to balance the source impedances at both the inverting and noninverting inputs, to avoid distortion caused by the modulation of input capacitance inherent in all BiFET op amps.
